

MetaBank Saves 80% on Data Documentation Time

MetaBank, through its Meta Payment Systems® (MPS) division, needed a platform that allowed MPS to have better controls around their data importation process.

THE CHALLENGE

“MetaBank needed a platform that allowed us to have better controls around the data importation process. It was all being done using SSIS, but the documentation and orchestration was not up to what we wanted to see. Also, we did not have visibility into running SSIS packages, the logging that we used was homemade and it was not consistent from one package to another. Workbench filled both needs,” said Ron Van Zanten, SVP of Data Systems Meta Payment Systems.

THE SOLUTION

Workbench documentation and auditing provided reduced time spent on internal audits, SSIS package monitoring and a greater understanding of data lineage.

WHY WORKBENCH

MetaBank (MPS) documentation is always up-to-date, so it can be leveraged as a second line of defense for our processes. Our standards are the first line, and internal audit using Workbench is the second.

THE BENEFITS

80% Reduction in Documentation and Auditing Time

Reduced the time it took to do documentation by 80%.

Better Data Tracking

Gained the ability to track data as it travels from one system to another. Data lineage tracking is achievable from importation to reports.

Fewer Bugs Deployed

The number of bugs has been reduced because of the ability to do an impact analysis of changes before updates are deployed.

“ Our standards are the first line of defense, and an internal audit using Workbench is the second. ”
