1. 1. Starting Guides 31

1.1 1.1. About the program ... 32
1.2 1.1.1 What else is it good for? ... 35
1.3 1.1.2 What you See is what you get: as Standalon EXE-File ... 37
1.4 1.2. System Requirements ... 39
1.5 1.3. How to Start ... 41
1.6 1.3.1 The Scripting Process ... 44
1.7 1.3.2 Commands you should start with ... 50
1.8 1.3.3 Compiling a Standalone Executable ... 53
1.9 1.3.4 Compiling a package (SPRE) ... 60
1.10 1.3.5 The Script Execution Process ... 68
1.11 1.4. The Prototype Parameter System ... 73
1.12 1.5. Speed Considerations ... 80
1.13 1.5.1 FAQ - How to 86
1.14 1.5.2 Using Variables ... 92
1.15 1.5.3 More about Variables ... 96
1.16 1.5.5 Global and Local Variables ... 100
1.17 1.5.6 Using the data stacks ... 104
1.18 1.5.7 Using Text-Strings ... 110
1.19 1.5.8 Basic String Operations ... 113
1.20 1.5.9. Organizing data items in blocks ... 117
1.21 1.6.1. Program Flow Control ... 121
1.22 1.6.2. Looping around ... 126
1.23 1.6.3 Flexible Loops ... 132
1.24 1.7. Application and PID ... 137
1.25 1.7.1 Applications and Threads ... 145
1.26 1.8. Selecting the Application (Topwindow) ... 150
1.27 1.8.1 The "Client" and the "Non-Client" Parts of a window ... 156
1.28 1.9. Locating Child-Windows ... 162
1.29 1.9.1 Types of controls ... 170
1.29.1 1.9.1.1 Types of Controls ... 170
1.29.2 1.9.1.2 Working with controls ... 174
1.29.3 1.9.1.3 Button Control ... 182
1.29.4 1.9.1.4 Checkmark Control ... 184
1.29.5 1.9.1.5 Radio Button Control ... 191
1.29.6 1.9.1.6 Edit-Textbox Control ... 194
1.29.7 1.9.1.7 Dropdown- Combobox Control ... 198
1.29.8 1.9.1.8 Treeview Control ... 202

© 2023 Theo Gottwald * https://www.smart-package.com

1.29.9 1.9.1.9 Page- Tab Control ... 208
1.29.10 1.9.1.A Listbox Control ... 210
1.30 1.9.2 WEB-based controls ... 212
1.30.1 1.9.2.1 WEB-based Textbox ... 212
1.31 1.A Special Issues ... 215
1.32 1.B Error Management ... 224
1.33 1.C Direct Engine and Compatible Engine ... 231
1.34 Contact ... 236
1.34.1 Hotline ... 236
1.35 General Issues ... 238
1.35.1 C. Licence Issues ... 238
1.35.2 B. General Explanation ... 240
1.35.3 A. Components of the System ... 242

2. 2. Components 245

2.36 1. PreProcessor & EXE-Compiler ... 246
2.36.1 1.0 Pre-Processor ... 246
2.36.2 1.1 #INC: - Pre-Processor File-Include ... 248
2.36.3 1.2 #ONCE / # OEND - Multiple Include Protection ... 251
2.36.4 1.3 : - MACRO-Definitions ... 253
2.36.5 1.4 #IF ... #EIF - Decisions in Macros ... 262
2.37 2. EXE-Compiler ... 267
2.37.1 2.0.0 Smarty's EXE-Compiler ... 267
2.37.2 2.1.1 '#RAU: - Run As User ... 271
2.37.3 2.1.2 #AOS: - Choose valid OS for executable ... 273
2.37.4 2.1.3 '#EXE: - Set Executable Path and Name ... 277
2.37.5 2.1.4 '#EXV: - Execute on System Desktop ... 280
2.37.6 2.1.5 '#HID: - Hidden Desktop Scripts ... 283
2.37.7 2.1.7 '#SPI: - Special Instructions ... 287
2.37.8 2.1.8 '#INC: - Include Files and Folders into the Executable ... 290
2.37.9 2.1.9 '#EXC: - Exclude Files or Dirs from Executable ... 295
2.37.10 2.1.A #LIB: - User-Library Path ... 298
2.37.11 2.1.B #CRY: - enCrypt the Script ... 302
2.37.12 2.1.C '#AFT: - RUn AFTER Compile ... 310
2.37.13 2.2.1 '#ICO: - Choose own Icon ... 313
2.37.14 2.2.2 '#ICF: - Icon from Icon-Folder ... 316
2.37.15 2.2.3 '#ICS:- Icon from internal Icon-Set ... 318
2.37.16 2.3.0. '#MAN: - Manifest for Executable ... 321
2.37.17 2.3.1. '#MAU: - UI-Access for Manifest for Executable ... 325
2.37.18 2.4.0. '#VER: - Version-Informations ... 328
2.37.19 2.5.0. '#CIL: - Direct Compiler Interface ... 332
2.38 3. System-Variable and Specialfolders ... 334
2.38.1 3.1 Systemvariables ... 334

*© 2023 Theo Gottwald * https://www.smart-package.com*

2.38.2 3.2 Standard-Search Pattern ... 341
2.38.3 3.3 Specialfolders ... 345
2.38.4 3.4 System-Colors ... 349
2.38.5 3.5 Hexadezimal, Decimal and Binary and more ... 352
2.38.6 3.6 Using Quadrant-Coordinates ... 356
2.39 4. Special features ... 361
2.39.1 4.1 : - Definiton-Command ... 361
2.39.2 4.2 :on_Error - Label ... 364
2.39.3 4.3 Variables, global and local ... 366
2.39.4 4.4 The global and local Stack ... 369
2.39.5 API-Error-Codes ... 372
2.39.6 Regular Expressions ... 381
2.39.7 Language-ID's ... 386
2.39.8 MSI - Parameters ... 389

3. 3. Script Language 392

3.40 ! Smarty's Script language ... 393
3.41 ! User-Macros ... 399
3.41.1 ! User-Macros ... 399
3.41.2 Firefox ... 401
3.41.3 Graphical Subprograms ... 406
3.41.4 Point-Convert-Lib ... 412
3.41.5 Testing-Macros ... 415
3.42 Background Operation ... 421
3.42.1 ! Smarty's Background Operations ... 421
3.42.2 DRS. - Drop Result ... 427
3.42.3 GRS. - Get Result ... 430
3.42.4 IRS. / NRS. - If Result available ... 434
3.42.5 WRS. - Wait for Result ... 436
3.43 BIT. - Work with Bits ... 441
3.43.1 ! Smarty's BIT. - Operations ... 441
3.43.2 BIT.16to32 - concatenate 2 Words to 32 Bit DWord ... 446
3.43.3 BIT.16to8 - Split 1 Word into 2 Bytes ... 449
3.43.4 BIT.32to16 - Split 1 DWord into 2 Words ... 452
3.43.5 BIT.8to16 - concatenate 2 Bytes to 16 Bit Word ... 455
3.43.6 BIT.AND - Use logical AND with Bits ... 458
3.43.7 BIT.Clear - Set Bit to 0 ... 461
3.43.8 BIT.Get - check if Bit is set ... 464
3.43.9 BIT.LShift - Shift Bits to Left, insert 0 ... 467
3.43.10 BIT.NOT - Use logical NOT with Bits ... 470
3.43.11 BIT.OR - Use logical OR with Bits ... 473
3.43.12 BIT.RotateLeft - Rotate Bits Left ... 476
3.43.13 BIT.RotateRight - Rotate Bits Right ... 479
3.43.14 BIT.RShift - Shift Bits to Right, insert 0 ... 482

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.43.15 BIT.Set - Set Bit to 1 ... 485
3.43.16 BIT.Show - Show Bits in Binary-Numbers ... 488
3.43.17 BIT.Store - Set Bit to 1 or 0 ... 491
3.43.18 BIT.ToBin - change Parameter to Binary-Format ... 494
3.43.19 BIT.Toggle - Switch Bit ... 498
3.43.20 BIT.ToVal - change Parameter to Value-Format ... 501
3.43.21 BIT.XOR - Use logical XOR with Bits ... 505
3.44 Browser and Office (Acc.-Engine) ... 508
3.44.1 OFC. - Office-Commands ... 508
3.44.1.1 MS-Excel Scripting ... 508
3.44.1.1.1 !Excel-Scripting ... 508
3.44.1.1.2 !Sample-Scripts: Neuro-Net Cell ... 513
3.44.1.1.3 CLOSE ... 516
3.44.1.1.4 EXIST ... 518
3.44.1.1.5 FORMULA GET ... 520
3.44.1.1.6 FORMULA SET ... 522
3.44.1.1.7 GET_CELL...BY COORD ... 524
3.44.1.1.8 GET_CELL...BY RANGE ... 527
3.44.1.1.9 LASTROW / LASTCOLUMN ... 530
3.44.1.1.10 LETTER_TO_NUMBER ... 532
3.44.1.1.11 NUMBER_TO_LETTER ... 534
3.44.1.1.12 OPEN ... 536
3.44.1.1.13 PAGE_UPDOWN ... 538
3.44.1.1.14 SAVE ... 540
3.44.1.1.15 SAVEAS ... 542
3.44.1.1.16 SCROLL_LEFTRIGHT ... 545
3.44.1.1.17 SCROLL_UPDOWN ... 547
3.44.1.1.18 SENDKEY ... 549
3.44.1.1.19 WRITE ... 552
3.44.2 ! Smarty's Browser and Office Commands ... 554
3.44.3 AFT. / AFF.. - Acc.- Find Text ... 558
3.44.4 AGR. / AGF. - Accessibility Get Rect ... 564
3.44.5 AMS. - Acc.-Multi Scan ... 570
3.44.6 AVF. - Accesibility Visual Find ... 575
3.44.7 CBR. - Control Browser ... 582
3.44.8 GAI. - Get-Acc-Information ... 591
3.44.9 IBR. / NBR. - If Browser ... 595
3.44.10 LAP. - Locate at Point ... 599
3.44.11 LBR. - Launch (Mini-)Browser ... 601
3.44.12 NAV - NAVigate to Object ... 606
3.44.12.1 ! NAV. - NAVigate in Dialog ... 606
3.44.12.2 NAV - "Down" ... 612
3.44.12.3 NAV - "DownAll" ... 613
3.44.12.4 NAV - "Left" ... 614
3.44.12.5 NAV - "LeftAll" ... 615
3.44.12.6 NAV - "Right" ... 616
3.44.12.7 NAV - "RightAll" ... 617

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.44.12.8 NAV - "Up" ... 618
3.44.12.9 NAV - "UpAll" ... 619
3.44.12.10 NAV - Example 1 ... 620
3.44.12.11 NAV - Example 2 ... 621
3.44.13 Roles and States from the Acc.-System (E8) ... 622
3.44.14 SAO. - Search Accessible Object ... 625
3.44.15 WBR. - Wait Browser ... 630
3.45 Control specific operations ... 635
3.45.1 BTC. - Button-Check ... 635
3.45.2 CDD. - Combo Drop Down ... 638
3.45.3 GBC. - Get-Button-Check ... 640
3.45.4 GCI. - Get-Combo-Item ... 642
3.45.5 LBE. - ListBox Entry ... 649
3.45.6 LVI. - Listview Command ... 651
3.45.7 SCI. - Set-Combo-Item ... 657
3.45.8 SMH. - Set Menu Hook ... 660
3.45.9 TVF. - Tree View Find ... 665
3.45.10 TVI. - Tree View Item ... 668
3.46 Data-Block Commands ... 671
3.46.1 ! Smarty's Data-Block Commands ... 671
3.46.2 CNB. - Create New Block ... 672
3.46.3 GBE. - Get Block Element ... 675
3.46.4 GBN. - Get Block Number ... 677
3.46.5 GFB. - Get-From-Block ... 680
3.46.6 SBE. - Set Block Element ... 682
3.46.7 SIB. - Set-In-Block ... 685
3.47 Date and Time Calculation ... 688
3.47.1 ! Smarty's Date & Time Calculations ... 688
3.47.2 DAT. - Date and Time Information (System independent) ... 689
3.47.3 DTC. - Date and Time Calculation ... 693
3.47.4 IAT. / NAT. - If After Timestamp ... 699
3.47.5 IBT. / NBT. - If Before Timestamp ... 704
3.47.6 IDC. / NDC. - If Date Condition ... 709
3.47.7 TCA. - Time Calculation ... 715
3.47.7.1 TCA.Add ... 717
3.47.7.2 TCA.Between ... 720
3.47.7.3 TCA.Diff ... 723
3.47.7.4 TCA.Divide ... 726
3.47.7.5 TCA.GetPart ... 729
3.47.7.6 TCA.Make ... 732
3.47.7.7 TCA.Overflow ... 735
3.47.7.8 TCA.Split ... 737
3.47.8 VDF. - Verify Date Format ... 739
3.47.9 VTF. - Verify Time Format ... 742
3.47.10 Time to Value Commands ... 745
3.47.10.1 DTV. - Date to Value ... 746

 *© 2023 Theo Gottwald * https://www.smart-package.com*

3.47.10.2 TTV. - Time to Value ... 751
3.47.10.3 VTD. - Value to Date ... 756
3.47.10.4 VTT. - Value to Time ... 760
3.48 Debugging - Commands ... 763
3.48.1 ! Smarty's Debugging Commands ... 763
3.48.2 DBM. - DeBugMode ... 765
3.48.3 DBO. - Debug Raw Output ... 767
3.48.4 DBP. - Debug Print ... 769
3.48.5 DBV. - Debug Print Variable ... 771
3.48.6 DIP. - Delayed Instruction Processing ... 773
3.48.7 DMP. - Dump internat Informations ... 775
3.48.8 GRI. - Get Run Information ... 778
3.48.9 PAU. - Pause ... 783
3.48.10 USM. - Use silent Mode ... 786
3.49 E-Mail Commands ... 789
3.49.1 ! Smarty's Send-Mail ... 789
3.49.2 SMA . - Send e-Mail ... 797
3.49.3 SMB. - Send Mail Background ... 799
3.49.4 SMP. - Set e-Mail Parameter ... 803
3.50 Encryption and Hash Functions ... 812
3.50.1 ! Smarty's Encryption and Hashing Commands ... 812
3.50.2 GEC. - Get Encryption ... 825
3.50.3 GMD. - Get Message Digest ... 831
3.50.4 HIT. - Hide Text ... 835
3.50.5 SHA. - Safer Hash Algo ... 840
3.50.6 XOR. - XOR - Encryption ... 843
3.51 Environment Variables and Global Signals ... 851
3.51.1 EVE. - Environment Variable Expand ... 851
3.51.2 EVG. - Environment Variable Get ... 854
3.51.3 EVS. - Environment-Variable-Set ... 857
3.51.4 IGS. / NGS. - If-Global-Signal (Mutex) ... 859
3.51.5 SGS. - Set Global Signal (Mutex) ... 861
3.52 Execute-Commands ... 867
3.52.1 ! Smarty's Execution Commands ... 867
3.52.2 EXA. - Execute Asynchron ... 872
3.52.3 EXB. - Execute-Blocking ... 876
3.52.4 EXC. - Execute Batch Command ... 879
3.52.5 EXD. - Execute Direct ... 881
3.52.6 EXE. - Execute Programm ... 883
3.52.7 EXF. - Execute File/Document ... 885
3.52.8 EXH. - Execute-Handle ... 890
3.52.9 EXM. - Execute MSI ... 892
3.52.10 EXO. - Execute Open Document ... 895
3.52.11 EXR. - Executer-from-Registry ... 902

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.52.12 EXS. - Execute Shell ... 905
3.52.13 EXU. - Execute Uninstall ... 910
3.52.14 EXV. - Execute via System-Desktop ... 912
3.52.15 EXX. - Execute-Extended ... 916
3.53 FEX. - Enumerations ... 920
3.53.1 ! Smarty's FEX-Commands ... 920
3.53.2 EFX. - Exit - FEX ... 922
3.53.3 FEF. - For-Each-File(/Dir) ... 924
3.53.4 FEL. - For-Each-Line ... 927
3.53.5 FEM. - For Each Member ... 929
3.53.6 FEP. - For-Each-Process ... 932
3.53.7 FER. - For-Each-Registry ... 935
3.53.8 FEV. - For-Each-Variable(-Line) ... 937
3.54 Filesystem-Commands ... 940
3.54.1 ! Smarty's File-Commands ... 940
3.54.2 ATF. - Append-to-File ... 946
3.54.3 CFF. - Copy-From-File ... 948
3.54.4 CFI. - Copy-From_IniFile ... 951
3.54.5 CHD. - Change Directory and Drive ... 955
3.54.6 COP. - Copy File ... 957
3.54.7 CSC. - Create ShortCut ... 960
3.54.8 CTF. - Copy-To-File ... 964
3.54.9 CTI. - Copy-To-Inifile ... 966
3.54.10 CVF. - Convert File ... 969
3.54.11 DCP. - Directory Copy ... 971
3.54.12 DEL. - Delete File ... 974
3.54.13 FIF. - Find in File ... 977
3.54.14 FIL. - File-Commands ... 983
3.54.14.1 FileDiff ... 983
3.54.14.2 Compare ... 987
3.54.14.3 Join Delete ... 990
3.54.14.4 Join File ... 994
3.54.14.5 Length ... 998
3.54.14.6 Split File ... 1001
3.54.14.7 Generate numbered Files ... 1006
3.54.14.8 Find free Number ... 1009
3.54.14.9 Generate numbered Name ... 1012
3.54.14.10 Move numbered Files ... 1015
3.54.14.11 Swap Files ... 1018
3.54.15 FPC. - Filepath Physical Convert ... 1020
3.54.16 GFD. - Get File Date ... 1023
3.54.17 GFI. - Get File Information ... 1026
3.54.18 GFL.-Get File Language ... 1031
3.54.19 GFT. - Get-File-Token ... 1037
3.54.20 GFV. - Get File Version ... 1040
3.54.21 GLC. - Get-Line-Count ... 1043

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.54.22 GSI. - Get Shortcut Information ... 1046
3.54.23 IEF. / NEF. - If - exist - File ... 1050
3.54.24 IVA. - If Volume available ... 1053
3.54.25 LFF. - Line-From-File ... 1056
3.54.26 LFN. - Long-File-Name ... 1058
3.54.27 LFT. - Line-From-Text ... 1060
3.54.28 LOF. - Load-Text-File ... 1063
3.54.29 MDF. - Make-Direktory-File ... 1066
3.54.30 MKD. - Make-Directory ... 1068
3.54.31 MOV. - Move File/Dir ... 1070
3.54.32 REN. - Rename File/Dir ... 1074
3.54.33 RMD. - Remove-Directory ... 1077
3.54.34 SFD. - Set File Date ... 1080
3.54.35 SHF. - Shell-File-Operation ... 1082
3.54.36 WFF. - Wait-For-File ... 1085
3.55 Image/Pixel-Color Operations ... 1088
3.55.1 ! Smarty's Pixel-Operations ... 1088
3.55.2 ! Smarty's Pixel-Processing ... 1092
3.55.3 Additional Commands ... 1102
3.55.3.1 CAP. - Capture Screenshot ... 1103
3.55.3.2 CCD. - Calculate Color Distance ... 1109
3.55.3.3 CCV. - Color Conversion ... 1117
3.55.3.4 DPI. - Get Desktop DPI-Settings ... 1123
3.55.3.5 IDP. / NDP. - If desktop dpi Setting ... 1126
3.55.3.6 QFR. - Quadrant from RECT ... 1130
3.55.4 ANA. - Imageworks ... 1136
3.55.4.1 !The Human-Eye Recorder ... 1140

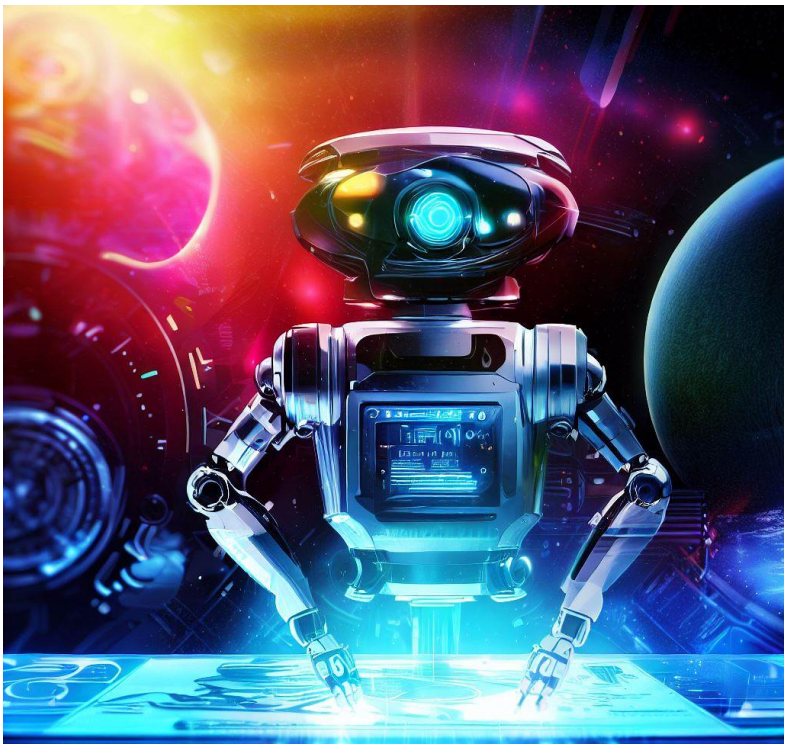
Introducing Smart Package Robot 2.0

What it is and what it is good for.



The Smart Package Robot (SPR) is a fascinating tool that allows you to automate tasks, almost like a magical scriptwriting system. It's built on Theo Gottwald's MiniRobots technology, so you might see the term "MiniRobot" sprinkled throughout our explanations like little breadcrumbs on a trail.

While we officially call it the "Smart Package Robot" (SPR), you might also stumble upon the name "IT-Robot". Why "IT-Robot", you ask?

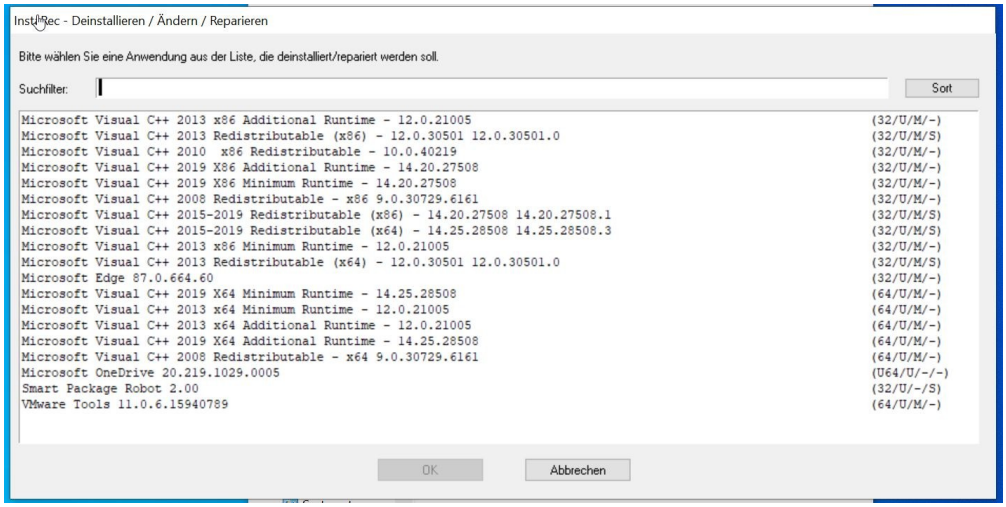
Well, it's because this incredible tool can capture or script almost any IT-related task you can think of. It's as if you had a little robot assistant sitting at your computer, typing away!

We've also given it the name "Smart Package Robot" (SPR) because we think it's really clever to let a robot handle the monotonous, repetitive work for you. Imagine a friendly robot taking care of all the dull stuff so you don't have to!

© 2023 Theo Gottwald * https://www.smart-package.com

One of the coolest features of the Smart Package Robot is that it can record the installation and uninstallation of software. With the built-in "InstaRec" and "UnInstaRec" programs, it's like having a video camera for your software, recording every step so you can play it back whenever you want

Pictures: InstaRec (for Installations)

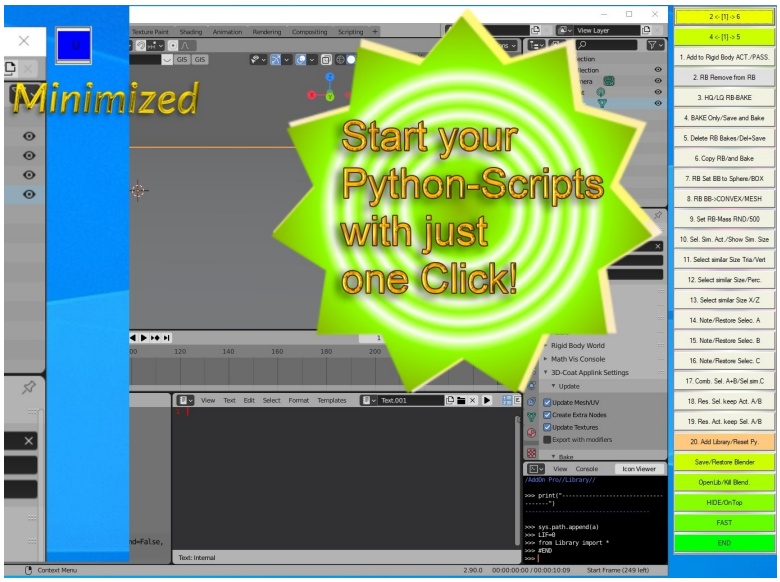


Picture: Un-InstaRec (for Uninstallations).

You can add a Buttonbar to any Programm and put your own Macros on these Buttons.
This way you can use the SPR as Software-Amplifier.

With SPR's nifty Buttonbar feature, you can customize any program by adding your own macros to buttons. Think of it as a way to supercharge your software, making SPR your personal software amplifier. This allows you to enhance the functionality of your software, adding new features and tools at the click of a button

© 2023 Theo Gottwald * https://www.smart-package.com



Picture: Quickbuttons AddOn for Blender (from www.blender.org)

But that is just one thing you can do with your new Smart Package Robot. With time, you'll discover many more things.

SPR can be used on any Windows OS, from Vista to Windows 10/x64.
If you still use Windows XP or lower, please contact us, we can provide you with a older version that may supports these windows versions.

Using SPR you will be able to script and automate many tasks of your daily work.
And you can compile your automation scripts into Standalone EXE-Files.

These files are very compact and can be distributed with any Software Distribution System that allows the distribution of Executable files.With SPR, you'll be able to script and automate many of your daily tasks, making your work more efficient and less monotonous. Plus, you can compile your automation scripts into standalone EXE files, perfect for distribution via any software system that supports executable files. These files are incredibly compact, making them easy to distribute and use across different systems

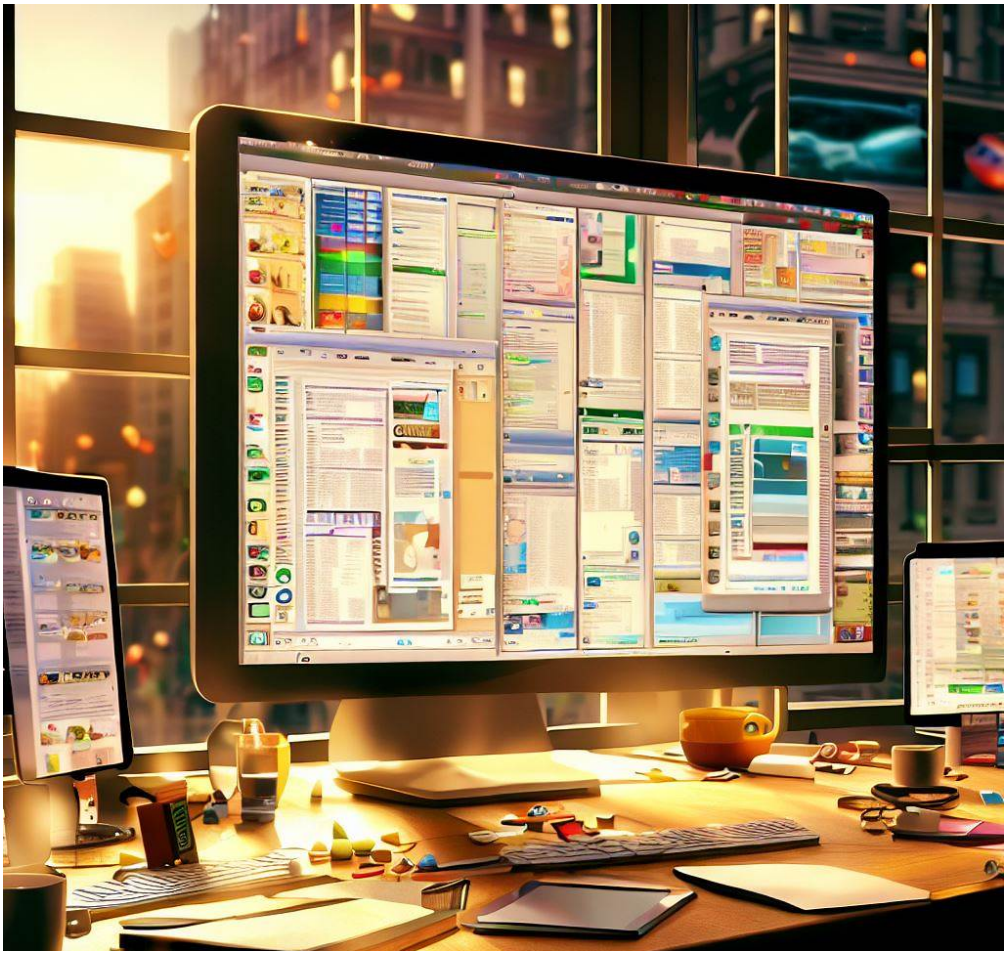
1.2 1.1.1 What else is it good for?

1.1. About the program Top 41 Next 39

Starting Guide

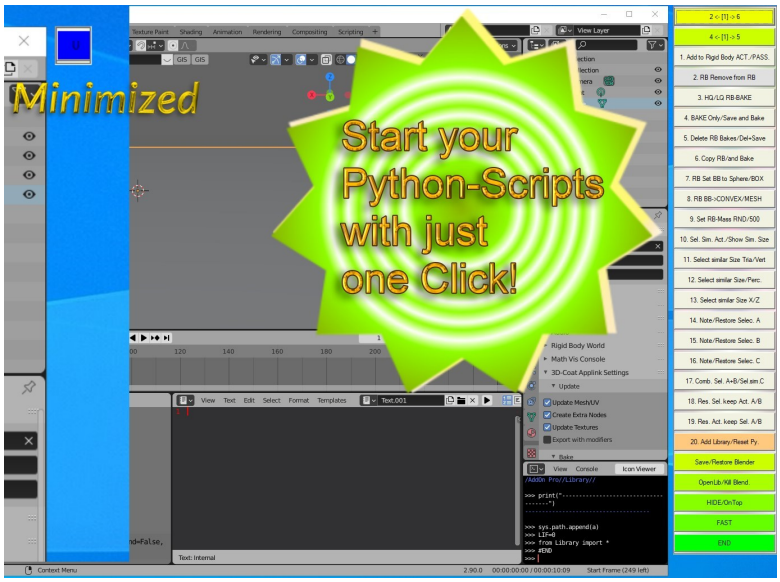
Smart Package Robot 2.0

What else it is good for?



Did you know that you can customize your Smart Package Robot (SPR) to have its very own button bar for any program?
You can put your personalized macros on these buttons, like sticking your favorite stickers on a notebook. In this way, the SPR becomes not just a tool, but a software amplifier, boosting your programs with extra features and capabilities.
It's like giving your software a supercharge, making it even more powerful and efficient.

© 2023 Theo Gottwald * https://www.smart-package.com



Picture: Quickbuttons AddOn for Blender (from www.blender.org)

Your journey with the Smart Package Robot (SPR) is just beginning, and there's so much more to discover. Over time, you'll unearth a treasure trove of features and abilities!
The SPR is like a chameleon, adapting to any Windows Operating System from Vista to Windows 10/x64. If you're still using Windows XP or an older version, don't worry! Just give us a call and we'll provide you with an older version that's compatible with your system.
With the SPR at your side, you'll have the power to script and automate a multitude of tasks, making your daily work as smooth as a magic carpet ride. Even better, you can transform your automation scripts into standalone EXE files.
These compact files can be shared far and wide through any software distribution system that allows executable files.

It's like having your own little robots ready to lend a hand wherever they're needed!

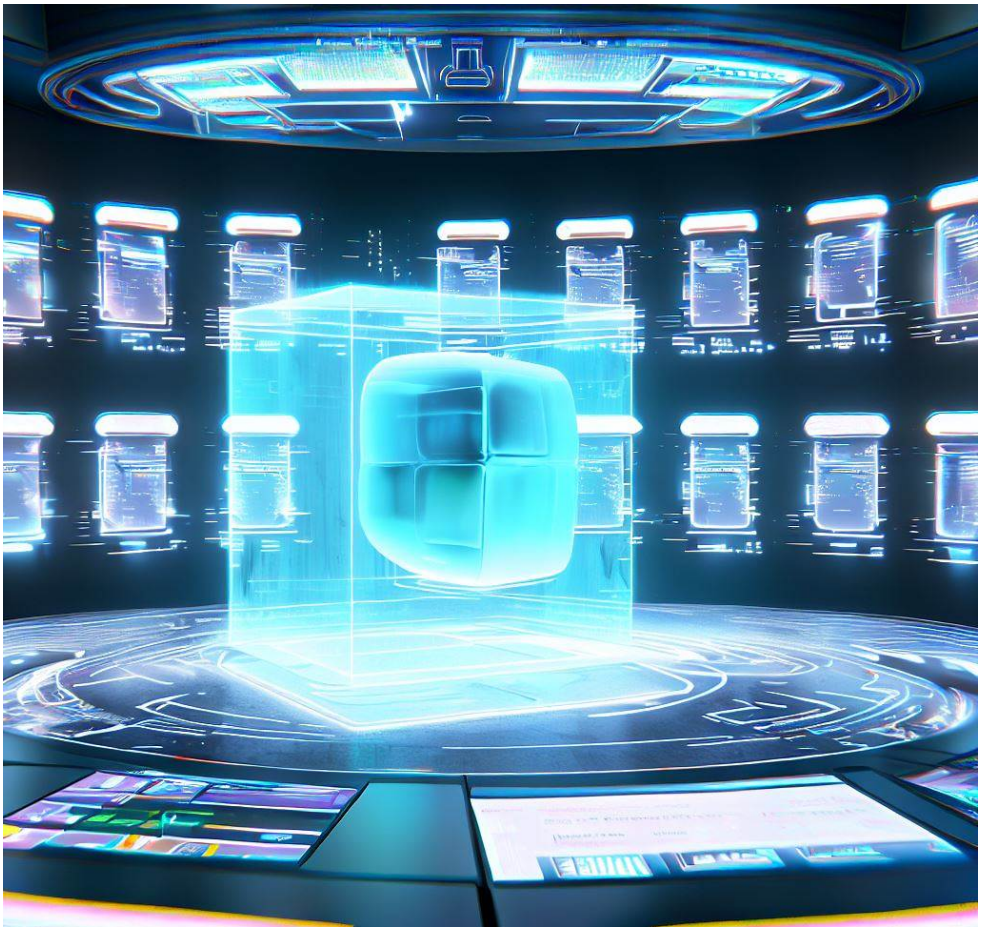
*© 2023 Theo Gottwald * https://www.smart-package.com*

1.3 1.1.2 What you See is what you get: as Standalon EXE-File

Starting Guide

Smart Package Robot 2.0

Why do we call them "Standalone-EXE" files?



Why do we use the term 'Standalone-EXE' files?

Well, it's because these files are self-sufficient and independent.
They don't require any other files or programs to run on the target system, which means you don't need to install SPR or anything else for that matter.
They are truly standalone!

What's more, these Standalone-EXE files are incredibly compact.
Believe it or not, they could even fit on an old-school floppy disk!
When you launch one of these files, it replays all of your recorded actions on the target machine, just like a perfectly rehearsed performance.

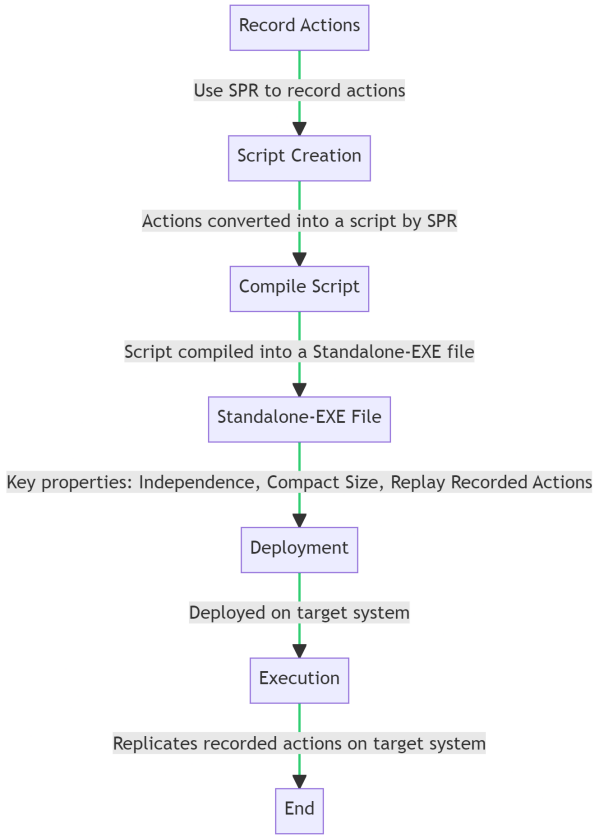
It's crucial to highlight that the underlying MiniRobots Technology does not rely on screen coordinates or fixed time delays, unlike some other automation systems. Instead, your scripts are synchronized with the actions of the setup program, mimicking the way a human would interact with the system.

© 2023 Theo Gottwald * https://www.smart-package.com

This makes SPR's automation more reliable and adaptable.

Moreover, the current version of MiniRobots does not depend on VB 6, Visual C, or any other runtimes being installed on the target system.
This makes SPR even more flexible and easy to use across various systems.

If you use the SPR for automated Setups, you may often follow this Path:



The flowchart follows these steps:

1. **Record Actions**: Use the SPR to record the desired actions on your own system.
2. **Script Creation**: The actions recorded are then converted into a script by SPR.
3. **Compile Script**: The script is then compiled into a Standalone-EXE file.
4. **Standalone-EXE File**: Highlight the key properties of this file - independence (no dependencies on the target system), compact size (small enough to fit on a floppy disk), and the capability to replay recorded actions.
5. **Deployment**: The Standalone-EXE file is then deployed on the target system where it can run without the need for SPR or any other program.
6. **Execution**: The Standalone-EXE file runs on the target system, replicating the recorded actions as if a human were performing them.

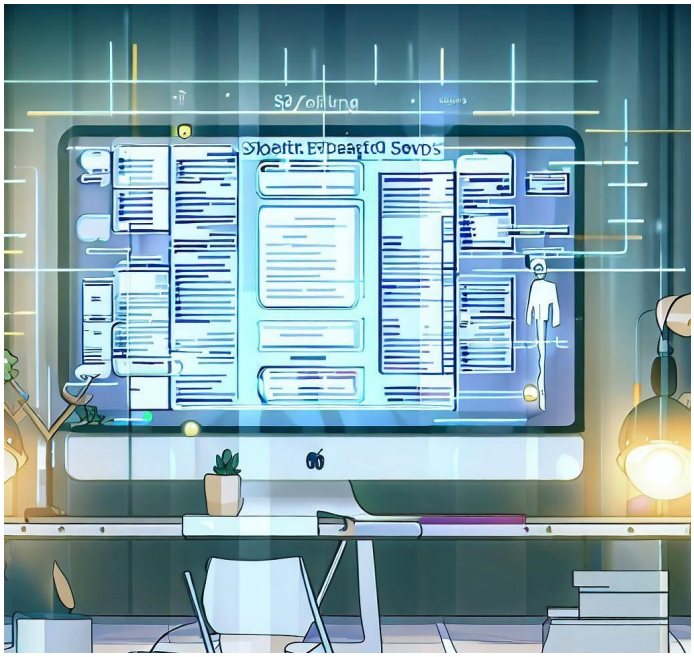
1.4 1.2. System Requirements

Starting Guide

System Requirements

What are the hardware and software requirements for this program?



The Smart Package Robot (SPR) for Windows is a versatile automation and scripting system.
It's compatible with most modern Windows operating systems (x86 or x64), making it a great fit for a wide range of computers.

The "standalone packages" created with SPR can be used on any newer Windows OS. This includes **Windows Vista™, Windows 7™, Windows 8™, Windows 10™, and Windows 11™.**

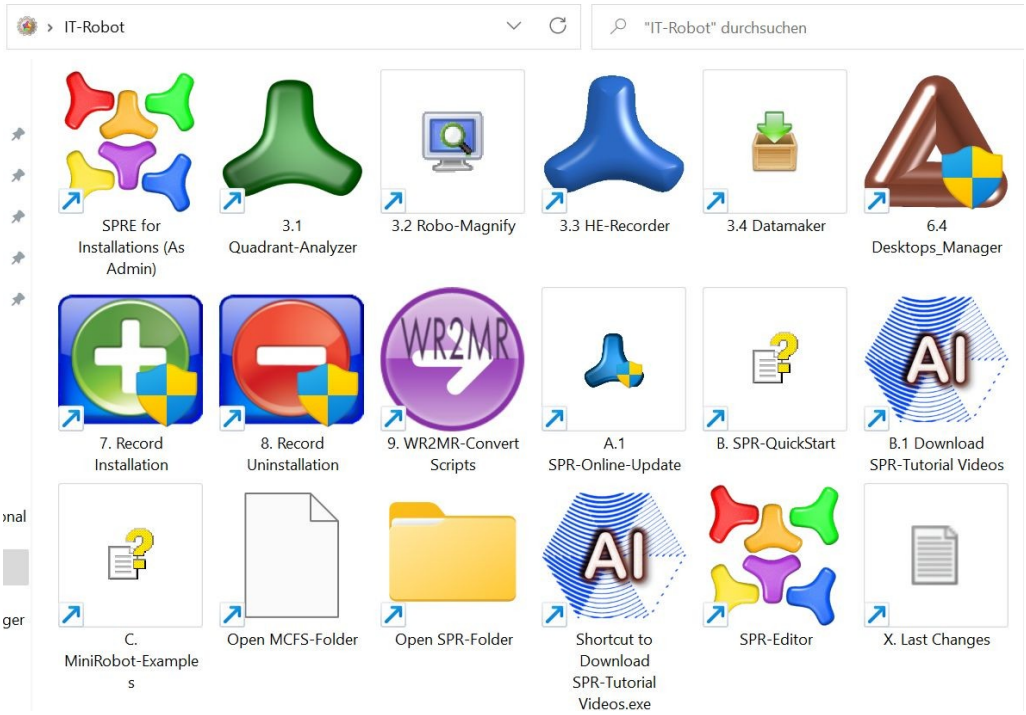
Just make sure your system is up-to-date and you're good to go!
When it comes to recording installations, there's one thing to note if you're using Windows Vista or a later version:
you'll need to turn off the User Account Control (UAC) and restart your computer.
But don't worry - this only applies to the computer where you're recording the installation.

As for the target machines, you won't have any issues regardless of whether UAC is on or off.
The standalone packages run with system rights from the software distribution agent, so they won't be affected by UAC settings.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Remember, all Windows and other trademarks mentioned belong to their respective owners.

Enjoy using the Smart Package Robot to automate your tasks and enhance your productivity



***If you need to use the SPR for Windows XP, please contact us, we can provide you with an older XP-compatible version.**

*© 2023 Theo Gottwald * https://www.smart-package.com*

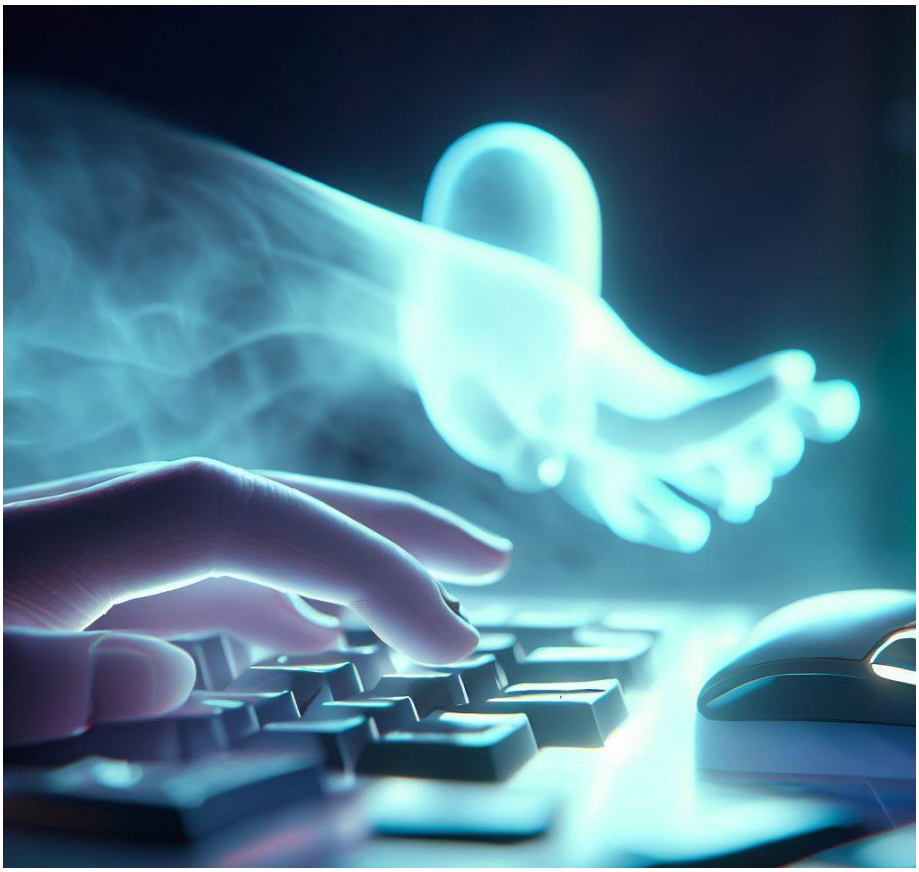
1.5 1.3. How to Start

Starting Guide

How to Start

Things you should be aware of before you begin using the program.

Picture a friendly ghost that moves your mouse, types on your keyboard, and carries out your tasks.
This isn't just any ghost - meet Smarty, your new virtual helper.



Smarty can perform a series of commands like moving your mouse and clicking your keyboa
But to unlock Smarty's potential, you'll need to learn its unique language - a scripting langua

Think of this scripting language as the secret handshake between you and Smarty.
It's how you tell Smarty exactly what you want it to do.

It may seem like a mystery at first, but with practice, it will start to make sense.
As an added bonus, Smarty is also fluent in **PowerShell** and **VBS-Code**!

*© 2023 Theo Gottwald * https://www.smart-package.com*

There are numerous videos on YouTube™ about the Smart Package Robot, both in German and English.
Watching these videos is a great way to learn how to navigate the SPR more comfortably.

To kick things off, let's create a simple "Hello World" program. Open the SPR-Editor and type:

```
MBX.Hello World!
```

Don't forget to save your script before running it. If you need help, refer to the floating bar buttons on the SPR-Editor (picture below) for guidance.
To run the script, click on the Play Button on the side of the SPR-Editor. Save the script in a location of your choice if needed.
The image below explains what each button on the SPR-Editor's floating bar does. Happy scripting with your new friend Smarty.

© 2023 Theo Gottwald * https://www.smart-package.com

For a deeper dive into Smarty's capabilities and to enhance your proficiency, here are some steps you can take:

1. Begin with the "Getting Started Guides":

This chapter is designed to introduce you to the basic principles and functions of the system.

It's a great starting point to get a handle on the foundations of the Smart Package Robot and its scripting language.

2. Utilize Online Learning Resources:

YouTube hosts a range of educational content on the Smart Package Robot, with both English and German language videos available.

These tutorials cover everything from basic scripting to advanced automation techniques.

They're a fantastic resource for visual learners and can be paused or replayed as often as needed.

3. Ask for Help When Needed:

If you're ever unsure or run into a challenge, don't hesitate to reach out to us.

We're here to assist you and ensure you have the best possible experience using the Smart Package Robot.

Our team can answer questions, provide clarification, and offer guidance to help you navigate any hurdles.

Remember, mastery comes with time and practice.

Enjoy the journey of learning and exploring the power of automation with Smarty.

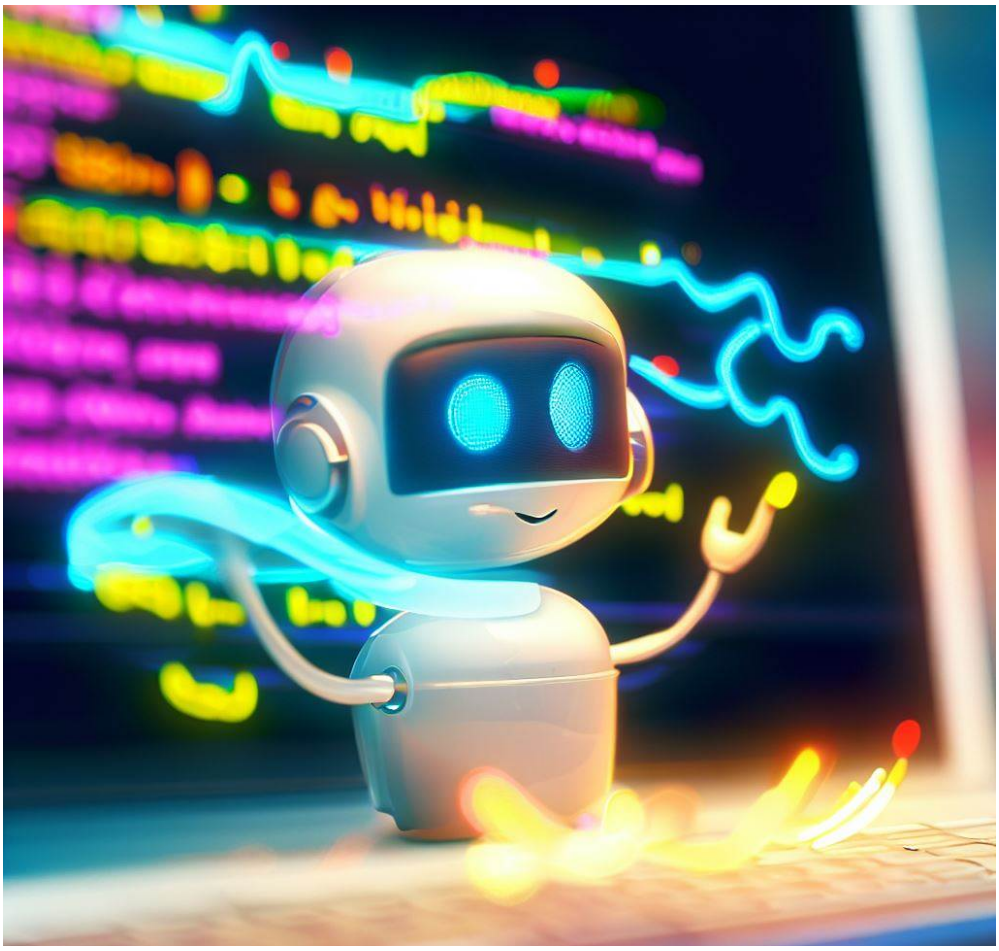
*© 2023 Theo Gottwald * https://www.smart-package.com*

1.6 1.3.1 The Scripting Process

Starting Guide

The Scripting Process

How Can You Create Your Scripts?



1.Using InstaRec to Record Scripts:

The InstaRec Recorder is like a reliable secretary, dutifully noting down your actions during an installation process.
You simply perform the installation steps as you usually would, and InstaRec does the rest, creating a script that can be replayed with ease.
This is particularly useful when you need to deploy the same installation on multiple systems.
You just need to perform the installation once, and then let the Smart Package Robot replicate it everywhere else.

2. Writing Scripts by Hand:

© 2023 Theo Gottwald * https://www.smart-package.com

For tasks that can't be recorded—perhaps because they involve complex or non-standard interactions—you can directly write your own scripts using the Smart Package Robot Editor.
This approach gives you the freedom to input the necessary commands manually, offering you total control over every detail of the automation process.
Think of it as a direct conversation between you and Smarty, where you tell Smarty exactly what to do.

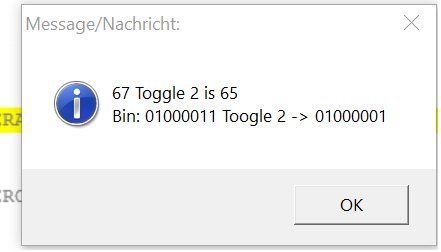
3. Recording with the Smart Package Robot Editor:

If your task isn't too complex and you don't want to launch InstaRec, the Smart Package Robot Editor has a built-in recording feature that can come in handy.
With a simple press of the 'N' (Normal) or 'P' (Popup) button, you can start recording your actions and creating a script on the fly.

4. Utilizing Sample Scripts as Templates:

In the installation directory of the Smart Package Robot, you'll find a treasure trove of resources in the "Sample Scripts Folder".
This is not just a collection of examples, but rather a launching pad for your own scripting journey.
Many of the sample scripts can serve as a template for your own tasks.
You can modify these templates as needed, add your own touch, or even combine different elements from various sample scripts to create a completely new automation process.
These templates are like the scaffolding of a building, providing a solid structure upon which you can construct your own unique scripts.
It's a great starting point for those new to scripting and a time-saver for more experienced users.
Consider these sample scripts as your personal scripting toolkit, helping you to master the art of automation with the Smart Package Robot.

```
VAN.$$LEA=1
VAN.$$P01=67
VAN.$$P02=2
BIT.Show|v$$P01|$$ERA|$$LEA
BIT.Toggle|$$P01|$$P02|$$P03|$$LEA
BIT.Show|v$$P03|$$ERC|$$LEA
MBX.$$P01 Toggle $$P02 is $$P03$crlf$Bin: $$ERA
BIT.Toggle|$$P03|$$P02|$$P04|$$LEA
BIT.Show|v$$P04|$$ERD|$$LEA
MBX.$$P03 Toggle $$P02 is $$P04$crlf$Bin: $$ERC
ENR.
```

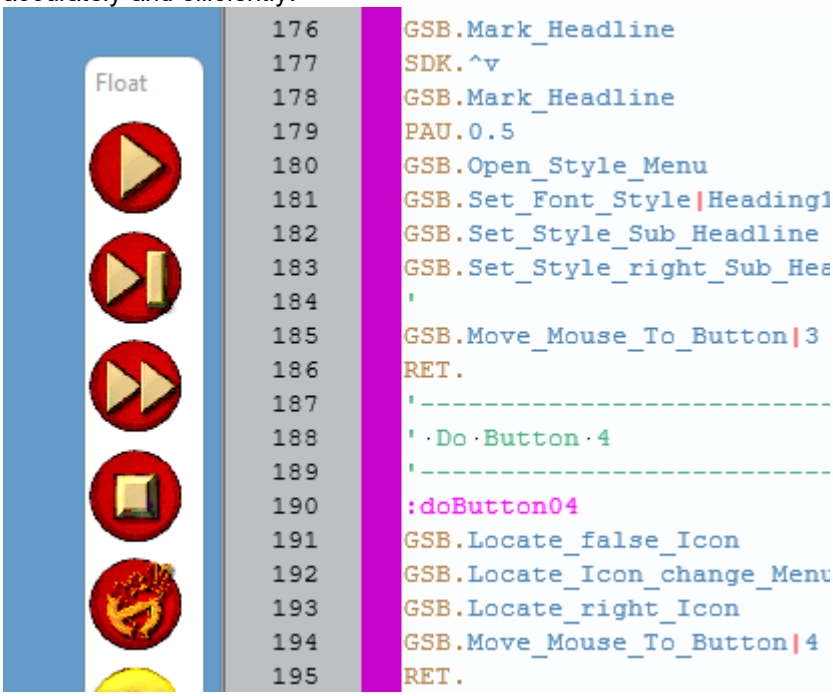


5. Understanding the Script Execution Process:

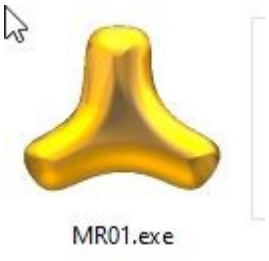
You've meticulously written or recorded your script, but what happens when you hit that "PLAY" button?
Let's break it down. As soon as you press "PLAY", the Smart Package Robot springs into action.
It starts by interpreting your script, understanding each command and preparing the necessary actions.
It's like a director reading through a script before the curtain rises on a play. This process ensures that everything is in order and ready to go.

© 2023 Theo Gottwald * https://www.smart-package.com

Following this, the Smart Package Robot performs each action sequentially, just as you have instructed.
It moves the cursor, clicks on buttons, types in information, and so on, all while maintaining the flow and timing you've set.
It's like watching a well-rehearsed performance, with each action smoothly transitioning into the next.
With the Smart Package Robot, you can be sure that your tasks will be performed accurately and efficiently.



Diving Into the Execution Process:
When you press "PLAY" in the SPR-Editor, it sets off a chain of events.
The first thing it does is to summon our dependable friend, **MR01.exe**.
This file is the "Robot Executable", the brains of the operation.
Think of **MR01.exe** as the marionette master who pulls all the strings.
It takes your script commands, interprets them, and brings your Smart Package Robot to life, guiding it to perform the tasks you've outlined.
In this way, your script becomes a set of precise, actionable instructions that **MR01.exe** uses to orchestrate the Smart Package Robot's actions.



Delving Deeper into MR01.exe
This is where the magic happens!
The **MR01.exe** is the heart and soul of your Smart Package Robot. Once you've hit "PLAY" in the SPR-Editor, the Robot Executable, **MR01.exe**, takes over.
It's responsible for translating and executing the majority, if not all, of your script commands.
It's as if **MR01.exe** takes your script and breathes life into it, making it dance to your tunes.

© 2023 Theo Gottwald * https://www.smart-package.com

Your Smart Package Robot's actions are orchestrated entirely within the confines of **MR01.exe**.
This is why we often say that the magic of automation lives within **MR01.exe .**

6. 6. The Art of Preprocessing:

The first pivotal step in executing your script lies in the hands of the "Pre-Processor." This diligent component meticulously prepares your script, making it ready for the ensuing "Speedcode Compiler."
The Pre-Processor's role is multifaceted, focusing on refining your script to be as precise and streamlined as possible, thereby facilitating a smooth execution.

Unraveling MACROs:
One of the key tasks of the Pre-Processor involves deciphering MACROs. MACROs are concise code substitutes that represent a more extensive piece of code.
They help keep your script compact and more readable. However, improper definition or usage of MACROs can introduce errors. The Pre-Processor, acting as a vigilant guard, checks and resolves these potential discrepancies, ensuring a seamless run of your script.

Integrating #INC Files:
The Pre-Processor also takes on the role of a detective when it comes to #INC files. These files are external entities containing supplementary code or resources, such as libraries or images, which are essential for your script to function.
The Pre-Processor hunts for any missing #INC files and incorporates them into your script, guaranteeing that all necessary elements are in place.

Bug Squashing:
Next, the Pre-Processor assumes the persona of a bug exterminator. It scans your script for coding bugs - pesky issues that may arise due to typos, incorrect syntax, or missing punctuation, like semicolons.
The Pre-Processor rectifies these bugs, ensuring your script can perform its dance without stumbling.

Syntax Error Checking:
Finally, the Pre-Processor morphs into a proofreader, looking out for syntax errors that can't be automatically corrected. Syntax errors occur when the computer cannot comprehend the script due to issues like missing brackets or incorrect variable names. If such errors are detected, the Pre-Processor not only identifies them but also suggests possible solutions for you to rectify them.

Once the Pre-Processor has diligently performed all of these tasks, it passes the refined script onto the Speedcode Compiler. The Compiler then transforms the preprocessed script into machine code, a language that your computer can understand and execute.
In this manner, the Pre-Processor plays a critical role in the script creation process, ensuring your script is as optimized and error-free as possible before it faces the Compiler.

7. The Speedcode-Compiler

In script creation, a significant hurdle lies in the time it takes to fetch a command.
The Speedcode Compiler, a pivotal component in the script execution process, addresses this by transforming various elements of the script into a format that facilitates quicker execution.
This transformative process is commonly known as "converting to Speedcode."

Efficient Label Formatting:

© 2023 Theo Gottwald * https://www.smart-package.com

The Speedcode Compiler begins its work by streamlining labels. Labels serve as milestones, marking specific segments in the script for easier navigation and comprehension.
By reformatting these labels into a more efficient format, the Speedcode Compiler significantly reduces the command fetch time.

Optimizing Conditional Statements:
Next, the Speedcode Compiler optimizes conditional statements.
These statements play a crucial role in steering the script's flow, determining which commands are executed and which are bypassed.
By reshaping these statements into a more conducive format, the Speedcode Compiler accelerates the command fetch process.

Loop Formatting:
Loops, which are employed to repeat a section of the script multiple times, are also a focal point for the Speedcode Compiler.
Improperly formatted loops can cause substantial delays. By remodeling loops into a more efficient format, the Speedcode Compiler curtails the command fetch time.

General Command Formatting:
Finally, the Speedcode Compiler reformats all commands into a format that expedites execution.
This includes any other commands not explicitly mentioned above, such as function calls, assignments, and more.

After the entire code has been converted to Speedcode, it is ushered to the next phase of the process.
This could involve further compilation, optimization, or direct execution of the script.
The overarching goal of this intricate process is to enhance the script's efficiency, thereby minimizing command fetch time and amplifying the script's overall performance.

8. The Script Execution

The Script execution is the grand finale in the script creation process.
It breathes life into your script.
This is the moment where the meticulously prepared script is let loose on a computer, with each command sequentially coming to life.

Just like an orchestra performing a symphony, the computer meticulously reads and performs each line of the script, usually from top to bottom.
The maestro, which is the computer in this case, reads the first line of the script, interpreting and executing the command it contains.
Next, it smoothly transitions to the second line, performing the same process.
This sequential performance continues unabated, line by line, until the final note - or in our case, the final line of the script.

To ensure a flawless performance, the execution of the script is closely monitored.
If all elements align harmoniously, the script executes without a hitch, each command sequentially springing into action, leading the script to its intended conclusion.
Once the final command has been executed, the task at hand is complete, marking the end of the process.

To sum up, script execution is the culminating point in the script creation process, turning lines of code into a symphony of actions.
Like a well-rehearsed ensemble, the script, if well-written, will perform seamlessly from start to finish, bringing your digital masterpiece to life.

*© 2023 Theo Gottwald * https://www.smart-package.com*

9. The Script End

In the grand theatre of script execution, the final act is often overlooked, but it's an essential part of the process: the cleanup phase.
This phase ensures a graceful and efficient exit, tying up loose ends by releasing the resources that were employed during the script's grand performance, such as memory, files, and other resources.

Picture this phase as the crew that enters the stage after the play has ended, tidying up the props and scenery.
Without them, the theatre would soon fall into disarray.
In the same way, the cleanup phase prevents memory leaks and other potential issues that could turn into major headaches down the line if resources aren't properly managed.

Now, if the script is a compiled executable, it doesn't just exit stage left without a word.
Instead, it leaves behind a parting gift: an error code.
This error code acts as a messenger, communicating the final status of the script's performance to the initiating process.
A standing ovation is represented by a value of zero, indicating a flawless execution, while any other number signals that there was a hiccup during the performance.
This error code can be used by the backstage crew (the initiating process) to figure out what went wrong and how to fix it in future performances.

In conclusion, the script end, or the cleanup phase, plays a vital but often underappreciated role in the execution process of a script. It ensures a tidy and efficient conclusion, diligently releasing resources, and, if it's a compiled executable, providing valuable feedback through an error code.

1.7 1.3.2 Commands you should start with

1.3. How to Start Previous 39 Top 41 Next 73

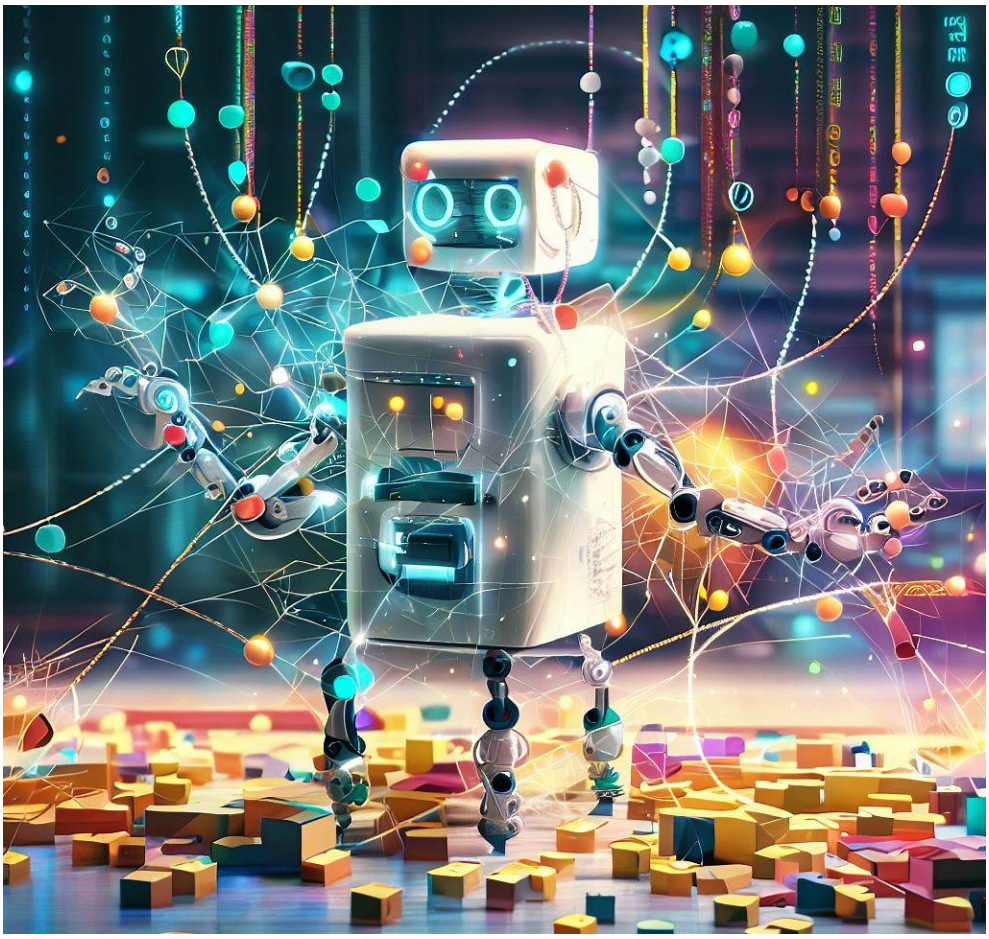
Starting Guide

Commands you should know

These are the commands that you should start with

1. Understand the Prototype Parameter-System

You need to understand some general concepts how the Robot-Script works.
"How do I tell the Robot what to do". For this the "Prototype Parameter System" is important.
So take a look:
The Prototype Parameter System 73



2. Know all Commands that are used by InstaRec

Here are some Commands that you should Know because they are used by InstaRec:

STW. 3814 (Find Application WIndow)
SCW. 3738 (Find Button etc. inside the Application Window)

© 2023 Theo Gottwald * https://www.smart-package.com

MLC. 2448 (Click with the Mouse using the Mousepointer "Compatible Engine")
MLE. 2492 (Click with the Mouse not using the Mousepointer "Direct Engine")
BSC. 2435 (Click as often as needed to close a Window)
BTC. 635 (Check or Uncheck Checkmarks)
WPT. 2913 (Wait until a Program has ended)
VAR. 3562 (Define a Variable)
DBC. 2863 (Set up a Parallel running Button-Clicker Robot)
END 2362 (End the Script immediately)

If you know what these few commands do, then you can do already a LOT of things.
Next possibly look at:
IAI. 2601 (Check if an Application is installed or not)
GEP. 2582 (Get Path of an registered Executable)
MBX. 2036 (Display a Messagebox)
IVV. 3534 (Check if a Varibale has some value or not)
CAL. 2315 (So mathematical and logical caluclations)

These are the most used commands.

3. Take a look at the more advanced commands

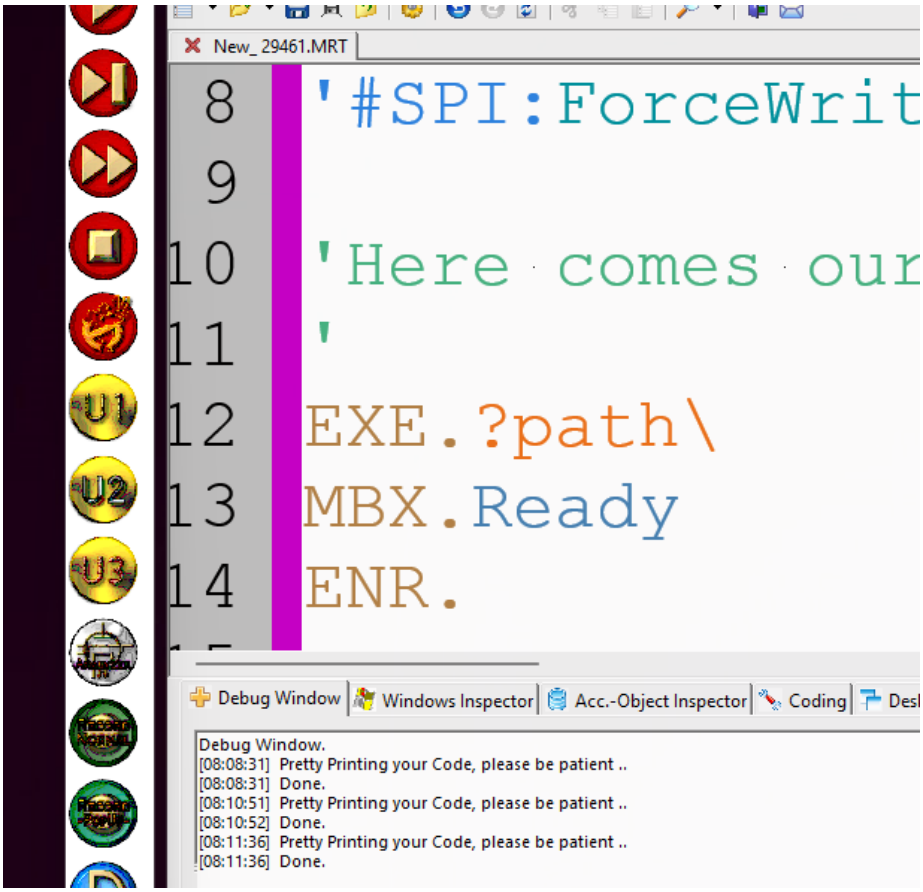
Here we have commands that use the Accessibility Engine and the graphical Commands.
Also we have the Commands to use the Buttonbar (Plugin01.exe).

AGR. 564 - (Find Element in Browser or Office Application)
PIL. 2702 - (Launch the Buttonbar)

4. Invest some time. Save more time.

You will also find a folder with "Sample Scripts". These scripts are carefully designed and commented.
Use them to see how things are done. Try them, change them. Play with the system. Make experiences.

© 2023 Theo Gottwald * https://www.smart-package.com



4. Later you can take a look on the advanced features. Try the MACRO-Option 253 and **create your own commands**. Include them into your scripts using the '#INC:-Preprocessor-command. 248

5. Its highly recommended that you make a training with a SPR*-Professional. Ask your distributor about the conditions.

6. Don't think the **SPR** is **only** usable for automated Software Installations. While this is the case, it is also **usable** for multiple **other tasks**.

7. Use it for Logging in to your favorite web-site, use it for automated testing. Let other people in your company also use it! You have the license to automate things! Use it.

* Smart-Package Robot

*© 2023 Theo Gottwald * https://www.smart-package.com*

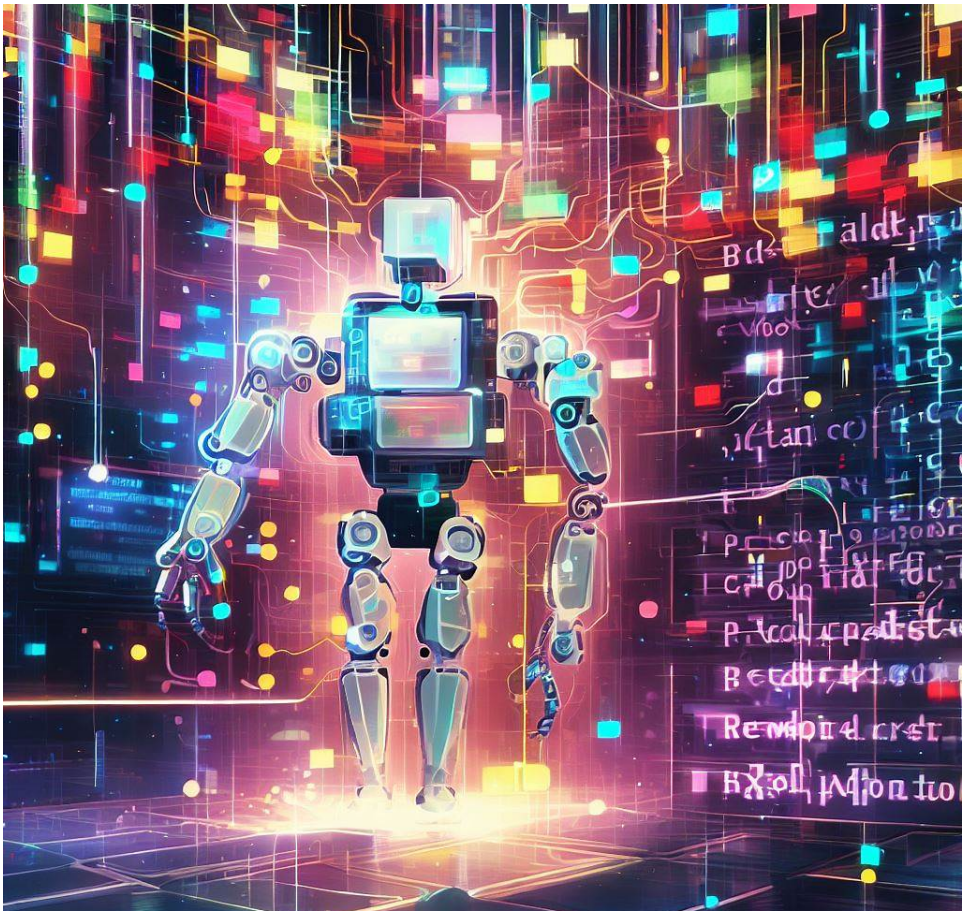
1.8 1.3.3 Compiling a Standalone Executable

1.3.3 Compiling a package (SPRE) Previous 86 Top 41 Next 92

Starting Guide

How to compile an Stand-Alone executable ...

Here is how you get your first executable running,

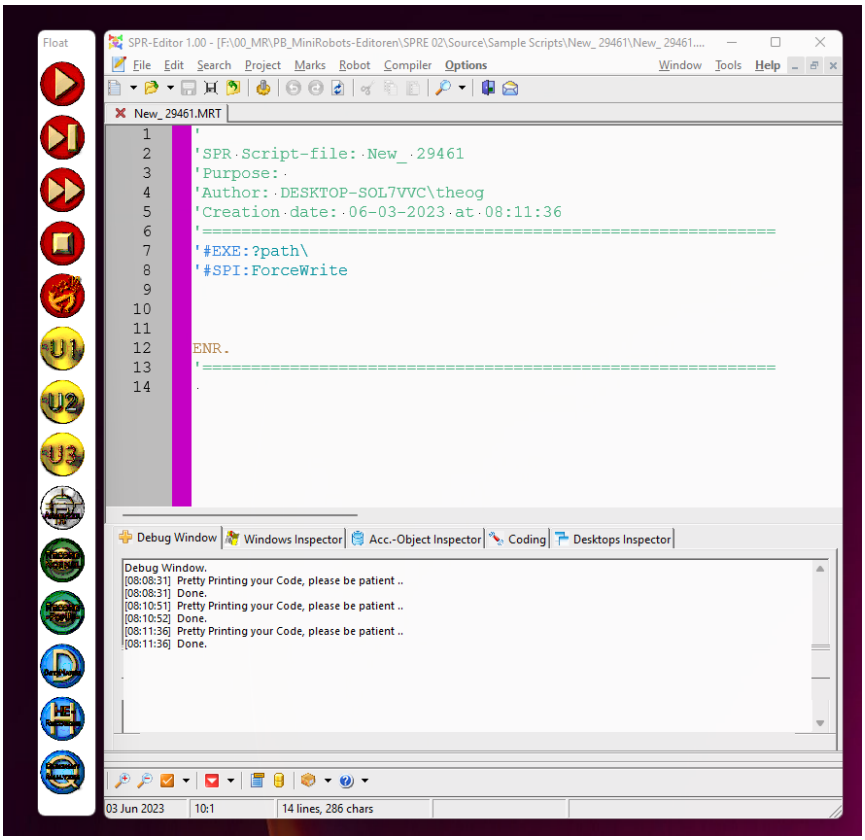


The SPRE is the most actual "Smart Package Robot Editor".

Step by Step:

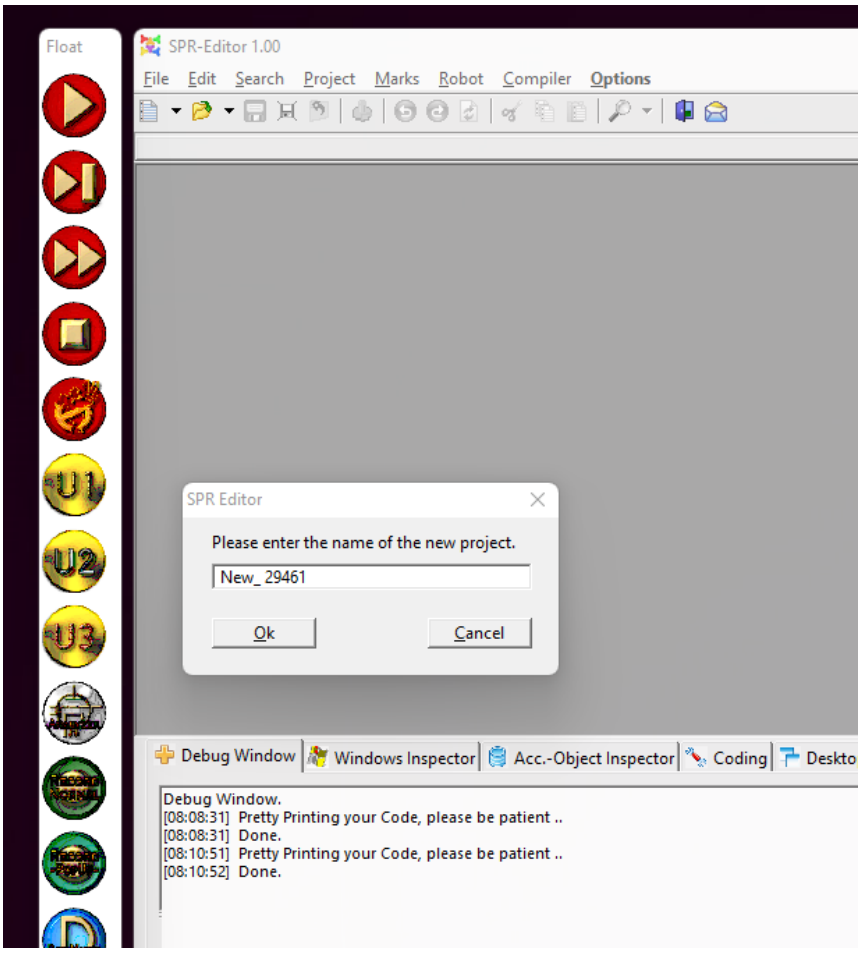
1. Start the SPR-Editor (SPRE) and select "New Project"

*© 2023 Theo Gottwald * https://www.smart-package.com*



2. In the window that appears, give your project a name, for example:

*© 2023 Theo Gottwald * https://www.smart-package.com*



3. Then click on "Ok".

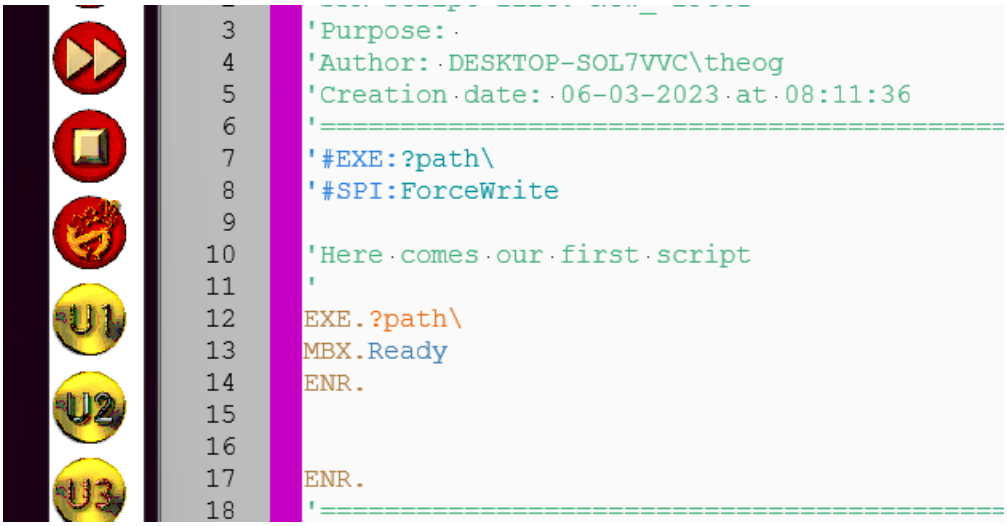
4. The Editor will automatically make an project folder for you, and open it. Looks somehow like this:

5. Now start typing your fist script

```
'Here comes our first script
'
EXE.?path\
MBX.Ready
ENR.
```

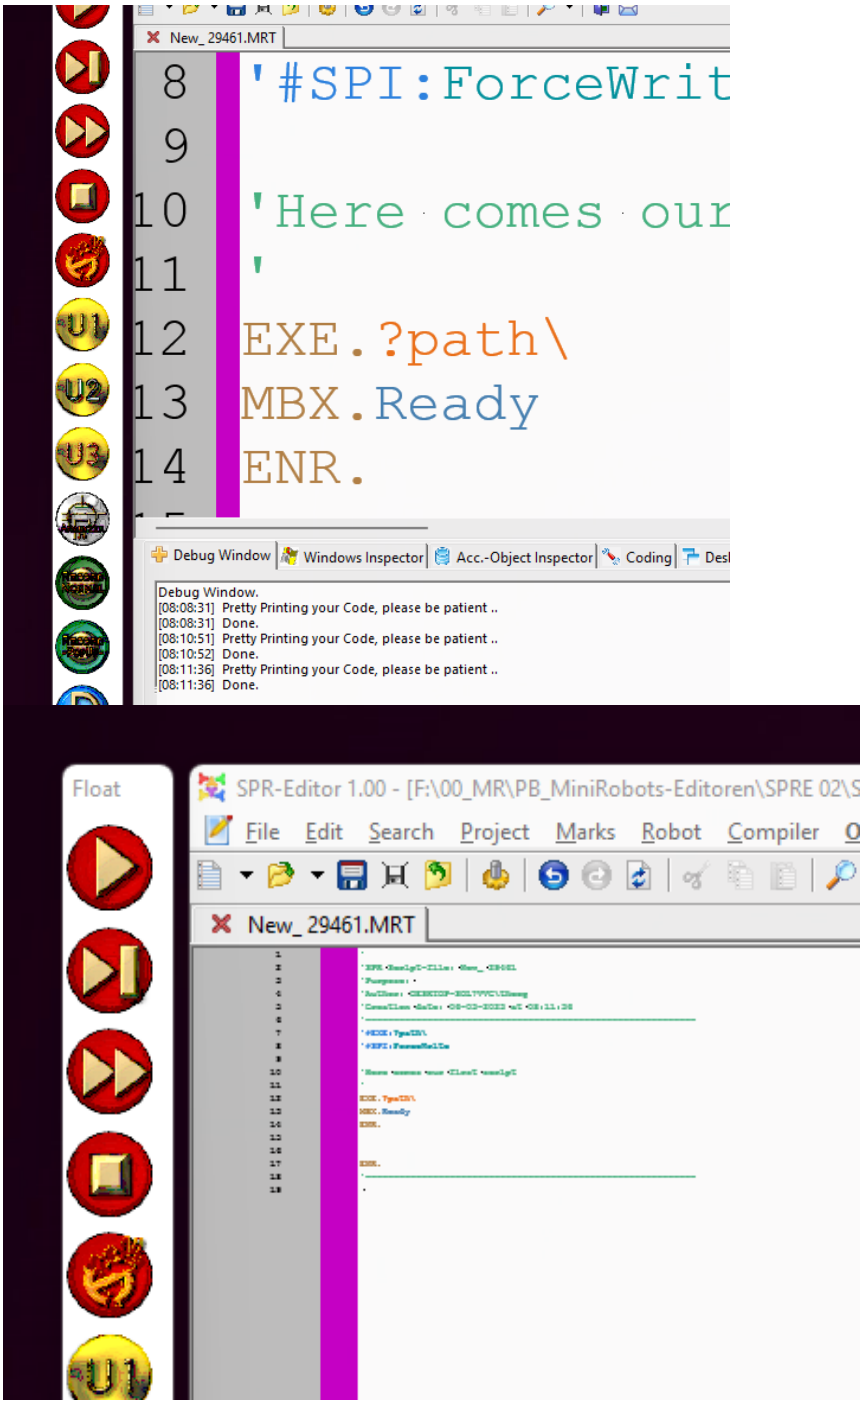
Which will look like this:

© 2023 Theo Gottwald * https://www.smart-package.com



6. If you press the left Ctrl Key on the keyboard (LCTRL) and rotate the Mouse wheel up or down,
you can change the size of the used Font.

© 2023 Theo Gottwald * https://www.smart-package.com

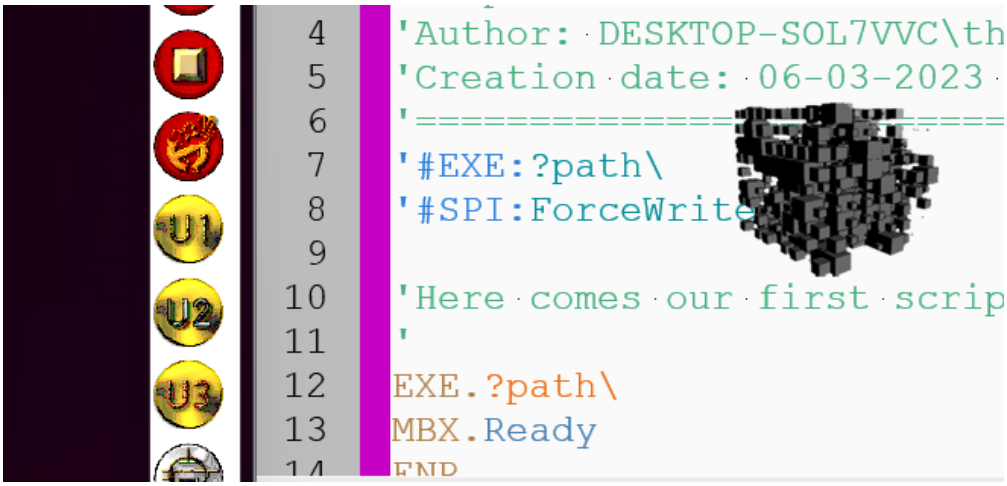


7. You may not exactly know at this time what each thing means, no problem. We'll take a look on this below at point 9.

At this time we just want to compile something into an executable.

8. Press the "Compile" Button in the Editor Toolbar.
You'll see a notice in the "Debug Window" of the Editor. Also there may be a compiler-animation in the Editor.
And you'll get an executable in your project folder. See pictures below.

© 2023 Theo Gottwald * https://www.smart-package.com



Note that the icon and the size of your executable depends on the version of this program you are using.

9. Let's first take a look on the script and see what it will do:

```
' This Line will open the path of the running script-file in
' an explorer window.
EXE.?path\

' This Line will show an Messagebox.
' Important: When you click or close the Messagebox,
' the temporary Executable Folder will also be closed/deleted.
MBX.Ready

' This command will just end the script.
ENR.
```

If you want more detailed Information about an command, just click on the command and then press the F1 Button.

10. Now we are ready to start our first executable. As you can see, there is a clear difference between the icons of the Scriptfile (ending with ".mrt" like "MiniRobots-Text") and the Executable/Package-Icon.

11. If you click on the Executable Icon twice, it will run and do what we expect.

12. Here is another way how you can compile an executable.

© 2023 Theo Gottwald * https://www.smart-package.com

Click on a Scriptfile (.mrt) with the right Mouse Button. You will see a menu somehow like this one. Now choose "Compile".

1.9 1.3.4 Compiling a package (SPRE)

1.3.4 Compiling a package (SPRE) Previous 86 Top 41 Next 92

Starting Guide

How to compile an Stand-Alone executable Package

Here is how you get additional Files packed into your Executable

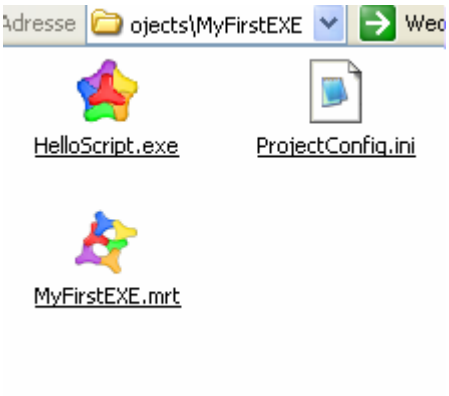
How do i include a folder into my package/executable?

You can easily include Setup-files into your executable.
Here is how to do this:

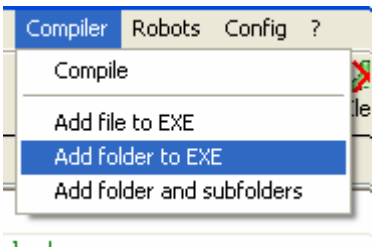
1. Create your project and Script as seen in the example above.

2. Copy the folder with the files that you want to include into the Project folder.
This look somehow like this:

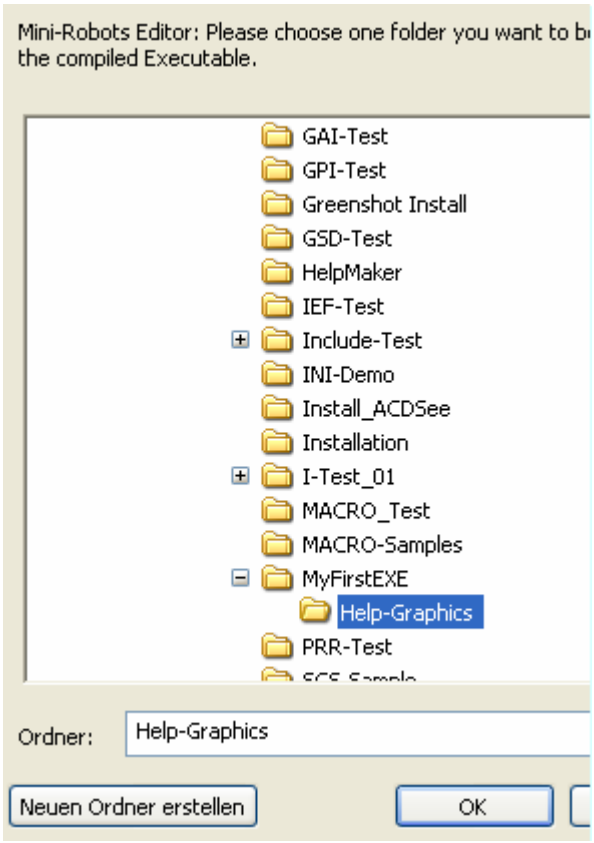
*© 2023 Theo Gottwald * https://www.smart-package.com*



3. Now click in the Editor Menu on "Compiler->Add folder to EXE".



4. In the appearing dialog choose the folder that we want to add to the package, and click the OK Button.



5. You will now get something like this:

© 2023 Theo Gottwald * https://www.smart-package.com

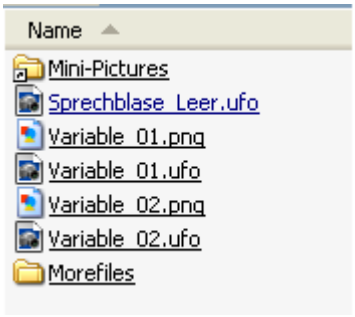
```
'-----------------------------
'Here comes our first script
'#INC:?pfad\Help-Graphics\
'#SPI:ForceWrite
'#EXE:?path\HelloScript.exe
EXO.?path\
MBX.Ready
```

The Editor has inserted this line:

```
'#INC:?pfad\Help-Graphics\
```

into your script. In fact this line makes the folder "Help-Graphics" that is in your project folder (=?path\) to be inserted into the executable.

Let me give you just a quick hint at this place. In case there would be sub folders in that folder, for example:



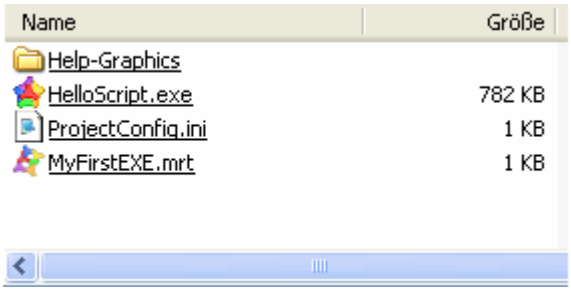
then these Sub-Folders will not be included, unless you add a "*" (asterisk) to the Line.
Like this:

```
' This will include folders AND all subfolders
'#INC:?pfad\Help-Graphics\*
```

First we'll leave the asterisk away and see what happens.

6. Press "Compile".

7. What wee see is, that the executable is a bit larger then before.

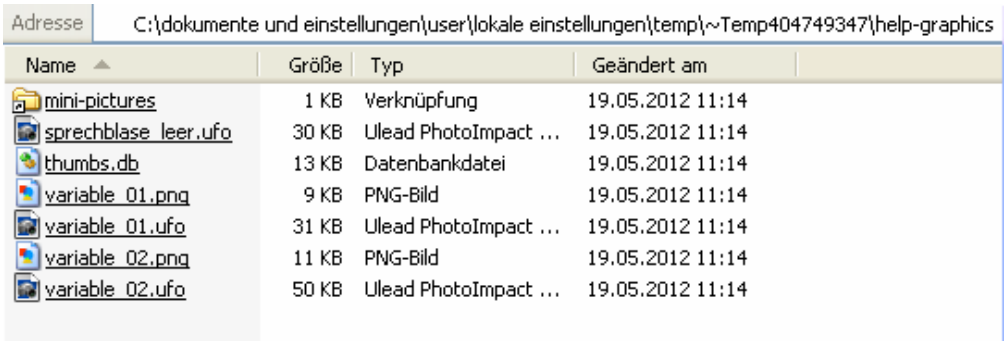


© 2023 Theo Gottwald * https://www.smart-package.com

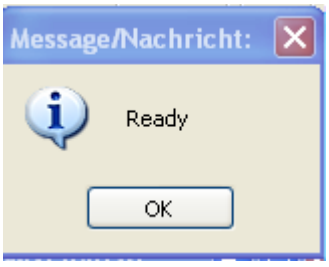
8. The package is larger because of the size of the additional files, we have packed into the package. Let's now start the package and see if the files are really in there!

9. Click the the "HelloScript.exe" twice to start it. A folder opens, somehow like this:

10. Enter the folder and take a look inside if it's all there.



11. It's all there - just the subfolder is missing, because we did not specify the additional "*" asterisk. We'll do that now. But first click on



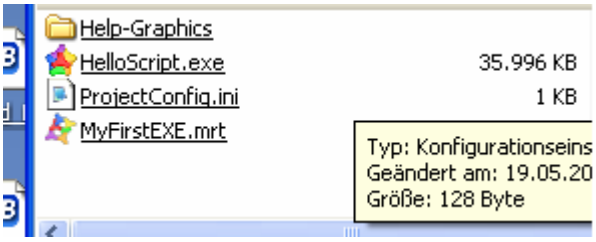
to make that folder disappear.

12. Now let's add that asterisk and re-compile our script:

© 2023 Theo Gottwald * https://www.smart-package.com

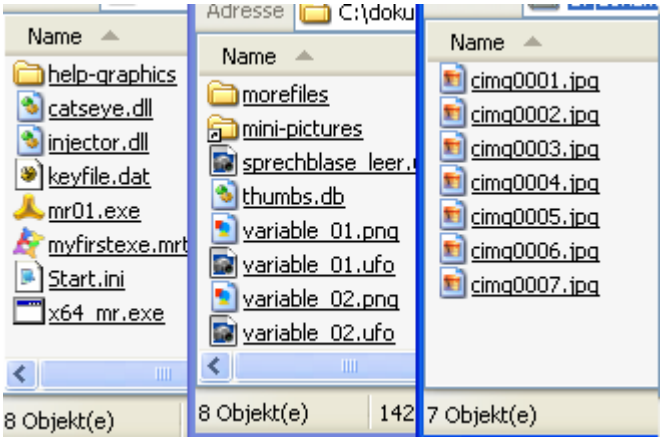
```
'Here comes our first script
'#INC:?pfad\Help-Graphics\*
'#SPI:ForceWrite
'#EXE:?path\HelloScript.exe
EXO.?path\
MBX.Ready
```

13. Press "Compile" again. Now the package got larger:



This time it got 35 MB. Don't worry the size limit for a single package is somewhere below 2 GB!

14. Now we'll start our package and see if anything gets unpacked properly.
Start the Package with a double click on "`MyFirstEXE.exe`".



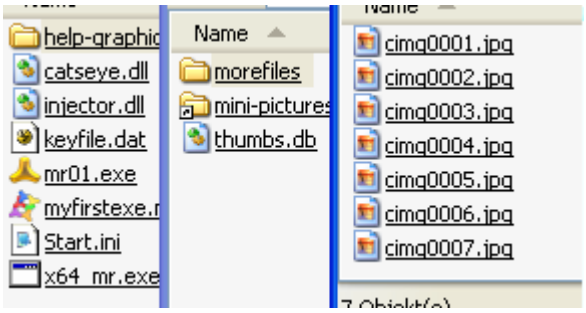
15. Everything is there as expected. Now let's get get a bit more deep into packaging.
We do not want to include those ".ufo" and those ".png" files into our package.

16. For this we can use the '`#EXC:` - Directive. Like this:

© 2023 Theo Gottwald * https://www.smart-package.com

```
'-----------------------------
'Here comes our first script
'#EXC:*.png|*.ufo
'#INC:?pfad\Help-Graphics\*
'#SPI:ForceWrite
'#EXE:?path\HelloScript.exe
EXO.?path\
```

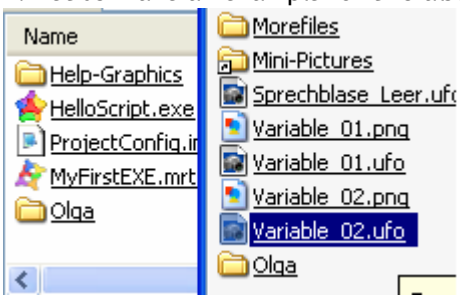
It works!



Hint: The `'#EXC:` - Directive must always before ALL Include Directives to work as expected. It will not influence inclusions before above itself.

Can I use that feature to exclude folders from the package also?

1. Let us make an example for this also. Here is our project-folder and a sub-folder:



2. Inside the folder "Help-Graphics" there is an folder named "Olga". We do **not** want to include this folder into our final package.

Take note that there is another folder named "Olga" in the Main Project folder. This folder shall be included with our package.

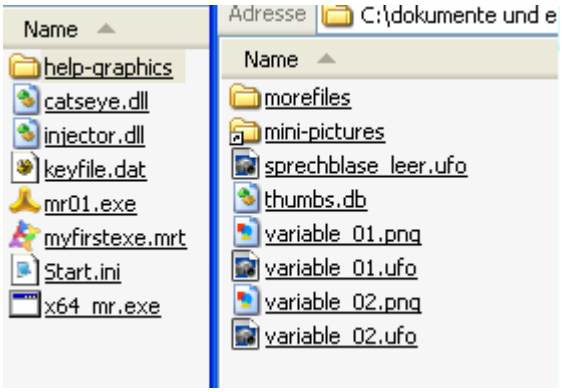
```
'#INC:?pfad\Help-Graphics\*
'#INC:?pfad\Olga\*
'#SPI:ForceWrite
```

Now comes the Exclusion. To exclude a folder, we can choose the name of the folder followed by a "\". We could simply write:

```
'Here comes our first script
'#EXC:olga\
'#INC:?pfad\Help-Graphics\*
```

© 2023 Theo Gottwald * https://www.smart-package.com

and here is what we get:



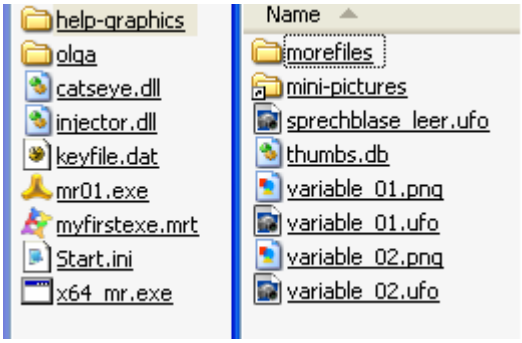
Good, the folder was not included in the package.

But look, the folder "Olga" from the Main-Project folder has also disappeared!
This way we told the compiler to exclude ALL Folders that have the name "Olga".

Now this is a special case, we'll solve it like this:

```
'Here comes our first script
'#EXC:Help-Graphics\Olga
'#INC:?pfad\Help-Graphics\*
```

And this is the result as expected.



Hint: You can use WildCards like "*","?" and "#" within the Exclusion Patterns.

Therefore even wildcard-patterns like this:

```
'#EXC:Help-*\Olga\
'#EXC:*elp-*\Olg?\
```

will do what you expect. The important point is that you do not forget the "\" at the end of the pattern, to signal that you are excluding a folder and not a file.

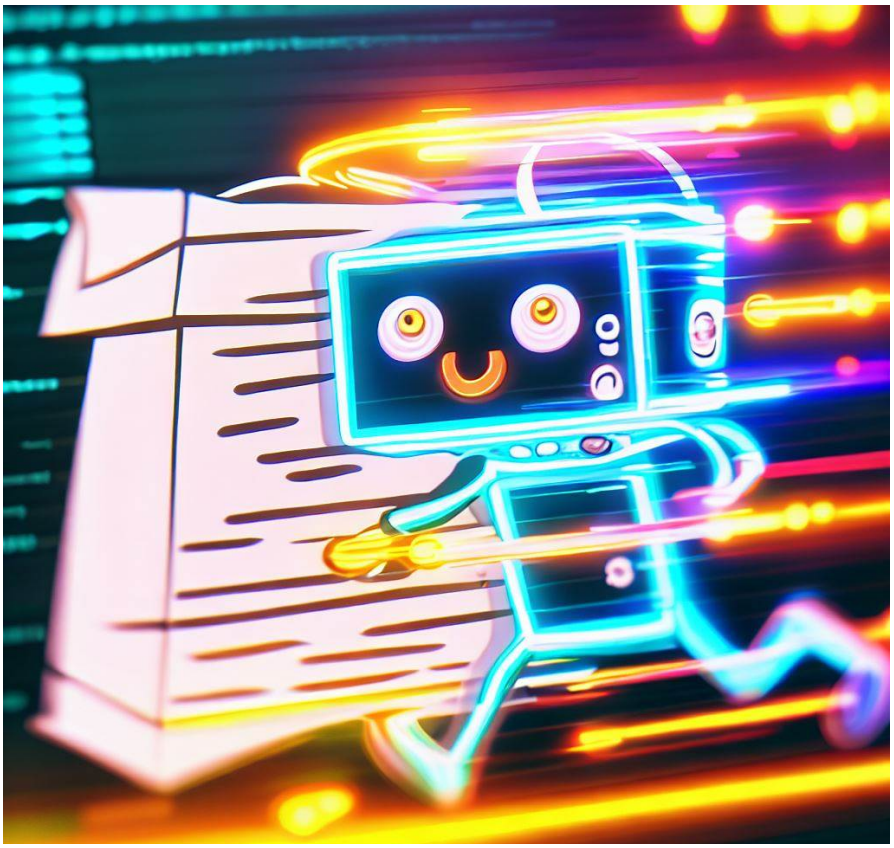
1.10 1.3.5 The Script Execution Process

1.3.5 Script execution Previous 39 Top 41 Next 73

Starting Guide

The Scripting Execution Process

How does the Robot make your Scripts run?



Understanding the Script Execution Process with the Smart Package Robot:

Creating a script, whether written or recorded, is only the first step in automating your tasks. The real magic happens when you initiate the execution process. Here's a simplified breakdown of what happens when you press the "PLAY" button in the Smart Package Robot (SPR):

Script Interpretation: As soon as you press "PLAY", the SPR springs into action. Its first task is to interpret your script. This involves understanding each command and preparing the necessary actions. Think of it as a director meticulously reading through a script before the curtain rises on a play. This careful preparation ensures that everything is in order and ready for execution.

Sequential Execution: Once the SPR has fully understood your script, it begins to perform each action in the order you've specified. This could involve moving the cursor,

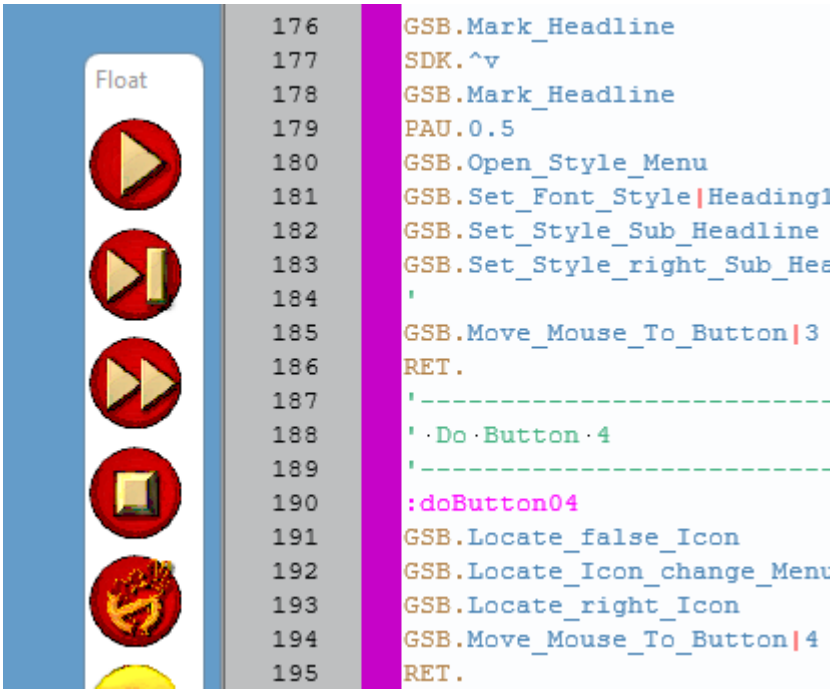
*© 2023 Theo Gottwald * https://www.smart-package.com*

clicking on buttons, typing in information, and more. The SPR maintains the flow and timing you've set, ensuring a smooth and efficient execution process.

Smooth Transitions: The execution process is akin to watching a well-rehearsed performance. Each action transitions smoothly into the next, creating a seamless automation process. This is where the SPR truly shines, as it replicates your actions with precision and accuracy.

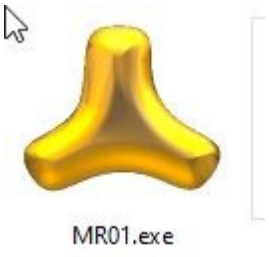
Accurate and Efficient Performance: With the SPR, you can be confident that your tasks will be performed accurately and efficiently. It's a reliable tool that takes the manual labor out of repetitive tasks, freeing up your time for more important matters.

Remember, the SPR is a powerful tool, but like any tool, its effectiveness depends on how well you use it. Take the time to familiarize yourself with its features and capabilities, and you'll soon be reaping the benefits of automation.



Diving Into the Execution Process:
When you press "PLAY" in the SPR-Editor, it sets off a chain of events.
The first thing it does is to summon our dependable friend, **MR01.exe**.
This file is the "Robot Executable", the brains of the operation.
Think of **MR01.exe** as the marionette master who pulls all the strings.
It takes your script commands, interprets them, and brings your Smart Package Robot to life, guiding it to perform the tasks you've outlined.
In this way, your script becomes a set of precise, actionable instructions that **MR01.exe** uses to orchestrate the Smart Package Robot's actions.

© 2023 Theo Gottwald * https://www.smart-package.com



Delving Deeper into MR01.exe
This is where the magic happens!
The **MR01.exe** is the heart and soul of your Smart Package Robot. Once you've hit "PLAY" in the SPR-Editor, the Robot Executable, **MR01.exe**, takes over.
It's responsible for translating and executing the majority, if not all, of your script commands.
It's as if **MR01.exe** takes your script and breathes life into it, making it dance to your tunes.
Your Smart Package Robot's actions are orchestrated entirely within the confines of **MR01.exe**.
This is why we often say that the magic of automation lives within **MR01.exe .**

6. 6. The Art of Preprocessing:

The first pivotal step in executing your script lies in the hands of the "Pre-Processor." This diligent component meticulously prepares your script, making it ready for the ensuing "Speedcode Compiler."
The Pre-Processor's role is multifaceted, focusing on refining your script to be as precise and streamlined as possible, thereby facilitating a smooth execution.

Unraveling MACROs:
One of the key tasks of the Pre-Processor involves deciphering MACROs. MACROs are concise code substitutes that represent a more extensive piece of code.
They help keep your script compact and more readable. However, improper definition or usage of MACROs can introduce errors. The Pre-Processor, acting as a vigilant guard, checks and resolves these potential discrepancies, ensuring a seamless run of your script.

Integrating #INC Files:
The Pre-Processor also takes on the role of a detective when it comes to #INC files. These files are external entities containing supplementary code or resources, such as libraries or images, which are essential for your script to function.
The Pre-Processor hunts for any missing #INC files and incorporates them into your script, guaranteeing that all necessary elements are in place.

Bug Squashing:
Next, the Pre-Processor assumes the persona of a bug exterminator. It scans your script for coding bugs - pesky issues that may arise due to typos, incorrect syntax, or missing punctuation, like semicolons.
The Pre-Processor rectifies these bugs, ensuring your script can perform its dance without stumbling.

Syntax Error Checking:
Finally, the Pre-Processor morphs into a proofreader, looking out for syntax errors that can't be automatically corrected. Syntax errors occur when the computer cannot comprehend the script due to issues like missing brackets or incorrect variable names.
If such errors are detected, the Pre-Processor not only identifies them but also suggests possible solutions for you to rectify them.

© 2023 Theo Gottwald * https://www.smart-package.com

Once the Pre-Processor has diligently performed all of these tasks, it passes the refined script onto the Speedcode Compiler. The Compiler then transforms the preprocessed script into machine code, a language that your computer can understand and execute. In this manner, the Pre-Processor plays a critical role in the script creation process, ensuring your script is as optimized and error-free as possible before it faces the Compiler.

7. The Speedcode-Compiler

In script creation, a significant hurdle lies in the time it takes to fetch a command. The Speedcode Compiler, a pivotal component in the script execution process, addresses this by transforming various elements of the script into a format that facilitates quicker execution.
This transformative process is commonly known as "converting to Speedcode."

Efficient Label Formatting:
The Speedcode Compiler begins its work by streamlining labels. Labels serve as milestones, marking specific segments in the script for easier navigation and comprehension.
By reformatting these labels into a more efficient format, the Speedcode Compiler significantly reduces the command fetch time.

Optimizing Conditional Statements:
Next, the Speedcode Compiler optimizes conditional statements.
These statements play a crucial role in steering the script's flow, determining which commands are executed and which are bypassed.
By reshaping these statements into a more conducive format, the Speedcode Compiler accelerates the command fetch process.

Loop Formatting:
Loops, which are employed to repeat a section of the script multiple times, are also a focal point for the Speedcode Compiler.
Improperly formatted loops can cause substantial delays. By remodeling loops into a more efficient format, the Speedcode Compiler curtails the command fetch time.

General Command Formatting:
Finally, the Speedcode Compiler reformats all commands into a format that expedites execution.
This includes any other commands not explicitly mentioned above, such as function calls, assignments, and more.

After the entire code has been converted to Speedcode, it is ushered to the next phase of the process.
This could involve further compilation, optimization, or direct execution of the script.
The overarching goal of this intricate process is to enhance the script's efficiency, thereby minimizing command fetch time and amplifying the script's overall performance.

8. The Script Execution

The Script execution is the grand finale in the script creation process.
It breathes life into your script.
This is the moment where the meticulously prepared script is let loose on a computer, with each command sequentially coming to life.

Just like an orchestra performing a symphony, the computer meticulously reads and performs each line of the script, usually from top to bottom.

© 2023 Theo Gottwald * https://www.smart-package.com

The maestro, which is the computer in this case, reads the first line of the script, interpreting and executing the command it contains.
Next, it smoothly transitions to the second line, performing the same process.
This sequential performance continues unabated, line by line, until the final note - or in our case, the final line of the script.

To ensure a flawless performance, the execution of the script is closely monitored.
If all elements align harmoniously, the script executes without a hitch, each command sequentially springing into action, leading the script to its intended conclusion.
Once the final command has been executed, the task at hand is complete, marking the end of the process.

To sum up, script execution is the culminating point in the script creation process, turning lines of code into a symphony of actions.
Like a well-rehearsed ensemble, the script, if well-written, will perform seamlessly from start to finish, bringing your digital masterpiece to life.

9. The Script End

In the grand theatre of script execution, the final act is often overlooked, but it's an essential part of the process: the cleanup phase.
This phase ensures a graceful and efficient exit, tying up loose ends by releasing the resources that were employed during the script's grand performance, such as memory, files, and other resources.

Picture this phase as the crew that enters the stage after the play has ended, tidying up the props and scenery.
Without them, the theatre would soon fall into disarray.
In the same way, the cleanup phase prevents memory leaks and other potential issues that could turn into major headaches down the line if resources aren't properly managed.

Now, if the script is a compiled executable, it doesn't just exit stage left without a word.
Instead, it leaves behind a parting gift: an error code.
This error code acts as a messenger, communicating the final status of the script's performance to the initiating process.
A standing ovation is represented by a value of zero, indicating a flawless execution, while any other number signals that there was a hiccup during the performance.
This error code can be used by the backstage crew (the initiating process) to figure out what went wrong and how to fix it in future performances.

In conclusion, the script end, or the cleanup phase, plays a vital but often underappreciated role in the execution process of a script. It ensures a tidy and efficient conclusion, diligently releasing resources, and, if it's a compiled executable, providing valuable feedback through an error code.

1.11 1.4. The Prototype Parameter System

Starting Guide

The Prototype Parameter System

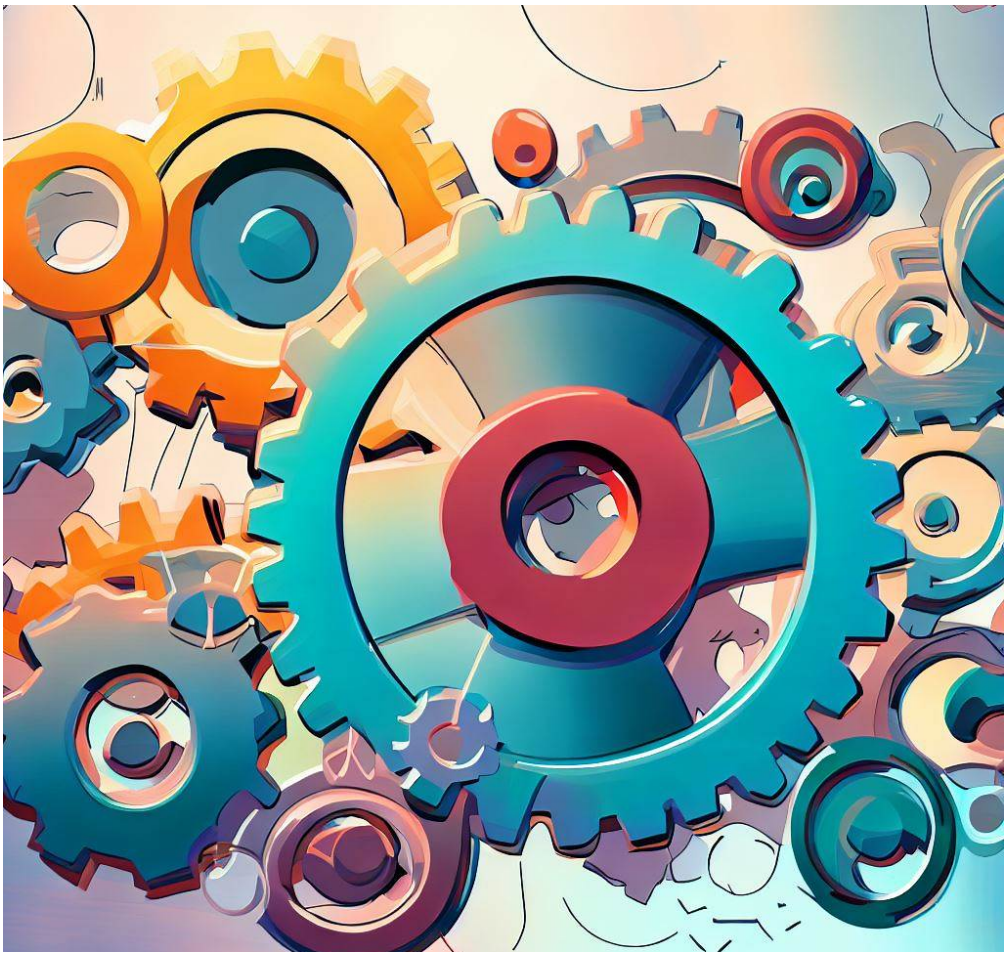
What are all these letters and parameters good for?

Intention

Let's imagine you're a puppeteer and you have a robot puppet.
To make your puppet do things, you need to tell it what to do using a special language called Robot-Script.
It's a bit like playing Simon says, but with a robot!

What is a Parameter?
First, let's think about how you might tell the robot to look for a button that says `"Next"`.
You could tell the robot using a command like this: `%Look_For_Button "Next"`.
In this command, `%Look_For_Button` is the action you want the robot to do, and `"Next"` is the detail about the action, which is called a **parameter**.
A parameter is like a piece of information that you add to the command to make it more specific.
So instead of just saying "Look for a button", you're saying "Look for a button that says `'Next'`.

© 2023 Theo Gottwald * https://www.smart-package.com



How can we handle more then one Parameter?
Sometimes, you might want to give the robot more than one piece of information at the same time.
For example, you might want to tell it to look for a button that says "Next" and is also a certain color.
You can do this using the pipe-symbol "|", like this: `%Look_For_Button "MyClass"|"Next"`.
In this command, "`MyClass`" and "`Next`" are both parameters.

What is the "Normal Parameter System"?
Just separating Parameters with a pipe-symbol "|", like this: `%Look_For_Button "MyClass"|"Next"`.
This is called the "**normal parameter system**". Each Parameter has a specified position that also tells the robot "what it is good for".

What is the "Prototype Parameter System"?
But sometimes, you might want to give the robot lots of pieces of information at the same time.
If you try to do this using the normal parameter system, it can get confusing because you have to count the pipe-symbols.
That's why we have something called the "**Prototype Parameter System**".
It's like a smarter way of giving the robot lots of pieces of information at the same time.
Let's see how it works.

*© 2023 Theo Gottwald * https://www.smart-package.com*

First, you need to know exactly what information you need to give to the robot.
For example, let's say you want to tell the robot to look for a button that says "Next" and is a certain color and is in a certain place on the screen.
You can do this using the prototype parameter system, like this:

```
SCW.t|Next
```

In this command, SCW. is the action you want the robot to do, t is the prototype parameter that tells the robot you're going to give it some text, and "Next" is the text you're giving it.
If you want to give the robot more than one piece of information at the same time, you can just add more prototype parameters and pieces of information, like this:

```
SCW.ct|button|Next
```

In this command, ct is the prototype parameter that tells the robot you're going to give it a class and some text, "button" is the class you're giving it, and "Next" is the text you're giving it.
The cool thing about the prototype parameter system is that you can give the robot any combination of information in any order, as long as the order of the prototype parameters matches the order of the pieces of information.

Many commands use the Prototype Parameter system. Let's go step-by-step into this.

What is an parameter, anyway?
Commands need parameters. For example, if we look for a button with the text "next" written on it, we could possbly write:

```
%Look_For_Button "Next"
```

In this case the command would be "%Look_For_Button" and "Next" would be the parameter. This is not a real command of our system, we just take it as an example.

What is a parameter? It's a part of a complete command.
The command is fixed and the parameter is the changing part of it.

The "Normal" parameter system:
Some commands use the normal parameter system. If we have more parameters, we could do like this:

```
%Look_For_Button "MyClass"|"Next"
```

In this case we have separated the Parameters using the "Pipe-Symbol" | .
This shows the Computer where one Paramter ends, and a new Parameter starts.
Also, if we do not need a Parameter we can just omit the Parameter. Like this:

```
%Look_For_Button |"Next"
```

This "normal Parameter System" will work up to a number of lets say 6 parameters.
Then it will start getting annoying. Because you have to count the delimiters.

© 2023 Theo Gottwald * https://www.smart-package.com

```
%Look_For_Button |"Next"|||
```

If you need 20 or more possible parameters, you may get totally lost with the normal parameter system.

```
%Look_For_Button |"Next"|||1||||||5
```

To solve this problem, we have developed the "Prototype Parameter System".
TO use it, we need to first answer the question:

Which parameters do i really need?

Not all Parameters are needed at any use of the specified command.
If we know which Parameters we do really need in our case, we can specify only these parameters.
The Prototype parameter system solves this issue with the prototype-field. Its always field **[P1],** directly after the command.

CMD.[Prototype-Field]|[Data defined by Prototypes, separated by "|"]

The prototype field contains some letters which are the "prototype" (model) of the following parameters.
The prototype field tells the robot which parameter has which meaning. Before it gets too technical lets see a simple example.

The solution: a prototyped parameter system.

Here is an Example of the prototype parameter system:

```
SCW.t|Next
```

In this case the prototype-field contains just the letter "t". If we look in the description of the command, we see that "t" is the "control text"-Parameter.
If this Parameter is used then the Script will search for a button (or anything) with the text "Next" on it.

This way the robot knows what he should look for. But what we need is not "anything" we want to search for a control with the class "button". Like this:

```
SCW.ct|button|Next
```

In this example we have two letters in the prototype field.
First a "c" - which is the "control class" in our case "button".
Second a "t" which is the control text. In our case "Next".

We could write the technically exactly same command like this:

```
SCW.tc|Next|button
```

© 2023 Theo Gottwald * https://www.smart-package.com

This is absolutely the same command.
The order of the prototypes does not play a role, other then the order of the Parameters must match the Order of the Prototypes.
Some prototypes need an extra information on the right side, like "c" and "t". Because you need to tell the robot which "text" or "class" you are looking for. But then there are prototypes that just tell the robot "move the window to the desktop center".
They do not need an extra parameter. It's just enough if they are there.
Here is an example which uses several prototypes. Doing so, the final Skript can be very short.

```
' We use STW here to test if the Application is already
running
' in that case we jump over the EXE-command and contine.
' We use the following flags:
' w ... 0 - Set waiting time to 0 seconds
' t ... "BCS - Testform" - this is the caption text of the
window we search for
' U ... "found" - jump to Label ":found" if the window already
exists
' X ... continue without errormessage if the window was not
found in time
' l ... center window on desktop
STW.wtUXl|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found
```

This Script, which has effectively just two lines of code and a Label, will test if a Program is already been started, and if not, start that Program.
The whole functionality in just two lines of code!

Here we have two prototypes that do not need an extra parameter on the right side. In this case we have the "X" and the "l". If given, they just flag something to the command.

```
"X" - continue without errormessage if the window was not
found in time
"l" - center window on desktop
```

Please note that **the meaning of the prototype letters are command dependent**. For example, in `GDF`. the prototype "f" means something else then the prototype "f" in `SCW`.
Also **Prototypes are case-dependent. So always use the right case for a Prototype!**

Prototypes help you to control the behavior of the command. Some need additional parameters and some do not.
The sequence of the prototypes must fit tot the sequence of parameters. Then the robot knows which parameter belongs to which prototype.

Why do we use the prototype system?

© 2023 Theo Gottwald * https://www.smart-package.com

Some commands have a lot of possible parameters. If we would use a fixed sequence of parameters, you would end up with making commands like this:

```
SCW.|||MyClass|Myytext|||||||1|||5
```

We think this is not acceptable for complex commands. Using the prototype system you can avoid such obstacles and write only those parameters that are needed.

The important sentence on the prototype parameter system
While the sequence of the prototypes themselves is mostly unimportant, the sequence of the following parameters must be matching the sequence of their prototypes perfectly. However there are exceptions.

The parameters may have a priority, which is from left (lowest) to right (highest)
In few cases, where prototypes have actions that can not be applied together, there are special rules.
For example, with the `STW.` command, the prototype "A" switches of the prototype "C" internally. If both are given, the last one beats the first one. See the examples below.

In this case the "A" Flag has priority over the "C" Flag, because its right of it.

```
STW.tCA|explorer
MMV.
```

In this case the "C" Flag is right of the "A" Flag and therefore has priority over the "A" Flag.

```
STW.tAC|explorer
MMV.
```

Remarks

Most often variables are allowed in the prototype field, but this may not yet be the case for all commands. The command:

```
%Look_For_Button "Next"
```

Is not a command in our system. You can however define it for yourself, using the MACRO-Feature- For example like this:

```
: %Look_For_Button 1
SCW.ct|Button|§§§01
END%
```

Note that you have to select a Top-Window (Application-Window) first using `STW.`

1.12 1.5. Speed Considerations

Starting Guide

Speed Considerations

Some general tips for using the Script language,

Get a Speed Dump

Mostly speed is not an issue for our tasks. But sometimes it is, and then you will be quite happy with your robot.
Because **he's really fast**.

If you want to see, how fast, this is your chapter.

How fast is the Robot?
On my Computer the Robot can process **~16.000.000 Cycles in one second.**
Each command needs a certain amount of such Cycles. For example an Empty Line or a Commented-Line needs 1 Cycle.
A Line with a `FOR`.-Loop may need 51 Cycles (see below). A `NEX.` may need 26 Cycles.

© 2023 Theo Gottwald * https://www.smart-package.com

The Speed Dump shows you how many Cycles each Command has needed.

We have just seen that we can easily measure, how long time a script needs from start to end.
But how much time does each line in the script need?

You can get the timing of each line of your code, using a speed-dump.
To get it, we will just add a single line to our code from above.

```
' Start our stop-watch
VAR.§§TIM=#dtime#
' Init counter variable
FOR.§§CNT|1|50
' Print the actual number
  PRT.§§CNT
NEX.
' Get the time how long we needed.
VAR.§§TIM=#dsince#
' This is the Speed Dump.
DMP.
' We need this kine, or else the Speed Dump will immediate
MBX.§§TIM
ENR.
```

In the picture below is the resulting speed dump i get here on my system. Let us take a close look on what all these numbers mean.

On the Left side you see the **Line-Number**. This Line number is not always identical with the Line number in the Editor. While in most cases the line numbers are identical, however if you have expanded Macros, they will not be identical.

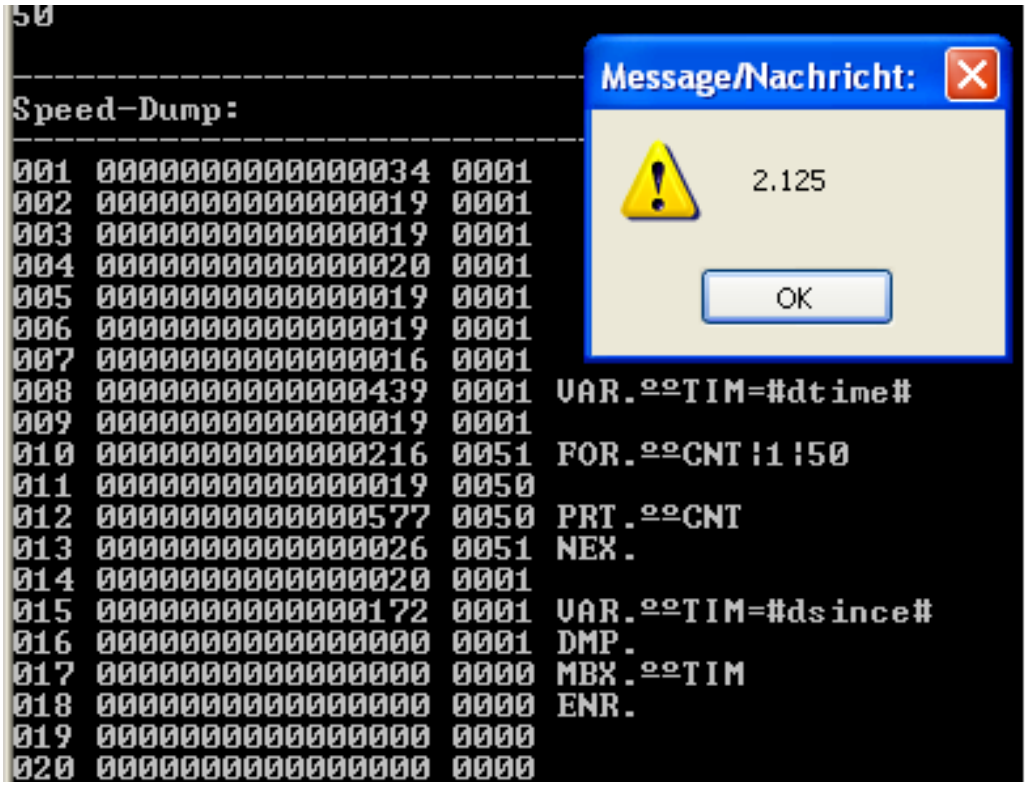
Next is a large number with a lot of zero's. That is the CPU "**cycle counter**".
This is not in seconds or milliseconds, its the amount of work the CPU had to do with your statement.

How much is it in seconds?
On my Computer the Robot can process **~16.000.000 Cycles in one second.**
But anyway, the higher the number - the longer it takes!

Next comes the "**Line execution counter**" a field that shows you, how often a line was executed.
As our loop was from 1 to 50, all lines inside the loop were executed 50 times. Thats why there is a 50 in that field.

Lastly you can see **the code of that line**.

© 2023 Theo Gottwald * https://www.smart-package.com



Does it only count to 9999 ?
No, it doesn't.
As you can see, the code execution counter shows only 4 zeroes. What will it do **above 9999**?
The answer is: It will just continue counting.

How fast is this?
But, how long does it take to count to ... for example **100200**?
The answer is, it need just **a bit more time then a second.**

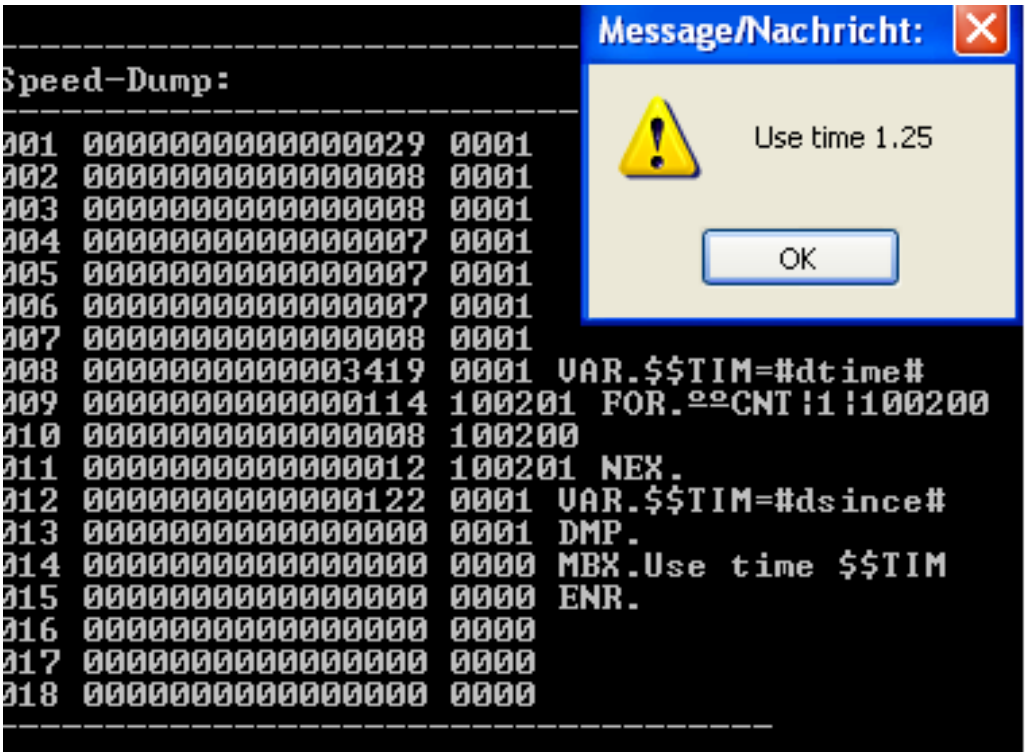
However you need to **run the script as a compiled executable.**
If it would be running in the editor, it would take too long time.

This is the script:

```
VAR.$$TIM=#dtime#
FOR.$$CNT|1|100200
  'PRT. $$CNT
NEX.
VAR.$$TIM=#dsince#
DMP.
MBX.Use time $$TIM
ENR.
```

And here is the result:

© 2023 Theo Gottwald * https://www.smart-package.com



Maybe we should have called it "Speed Robot" because it is really fast. This speed will help you to use it even for tasks you have never thought about before.

Sort those 100.000 Names ... check Files for errors. Test applications and create Log-Files.

Whatever it is, your robot is ready to do it with you.

© 2023 Theo Gottwald * https://www.smart-package.com

One more word about speed

One of the key features of the "Speed Robot" is its optimized use of CPU caches, which significantly increases its speed and performance. CPU caches are small, fast memory banks that store frequently used data, allowing the CPU to access it quickly. By utilizing these caches, the Speed Robot can access the data it needs more efficiently, resulting in faster execution times.

However, it is important to note that the initial execution of a command may be slower compared to successive calls of the same command. This is because the code needs to be loaded into the CPU cache for the first time, and potentially out of Windows virtual memory. Once the code is loaded into the cache, subsequent calls to the same command can be executed more quickly.

This optimization is especially beneficial for tasks that need to be performed repeatedly, such as processing large amounts of data. The more times the task is repeated, the more the robot's speed accelerates, making it an ideal tool for these types of tasks.

When testing the Speed Robot's performance, it's important to keep in mind that the best results will be achieved when the commands are already in the cache. This can be achieved by executing the commands once within the same script. This is because once the code is loaded into the cache, the CPU can access it more quickly, resulting in faster execution times.

In summary, the Speed Robot is optimized to use CPU caches, which increases its speed and performance. The initial execution of a command may be slower, but the

© 2023 Theo Gottwald * https://www.smart-package.com

robot's speed accelerates with each repetition, making it an ideal tool for tasks that need to be performed multiple times. To get the best results, make sure the commands are already in the cache by executing them once within the same script.

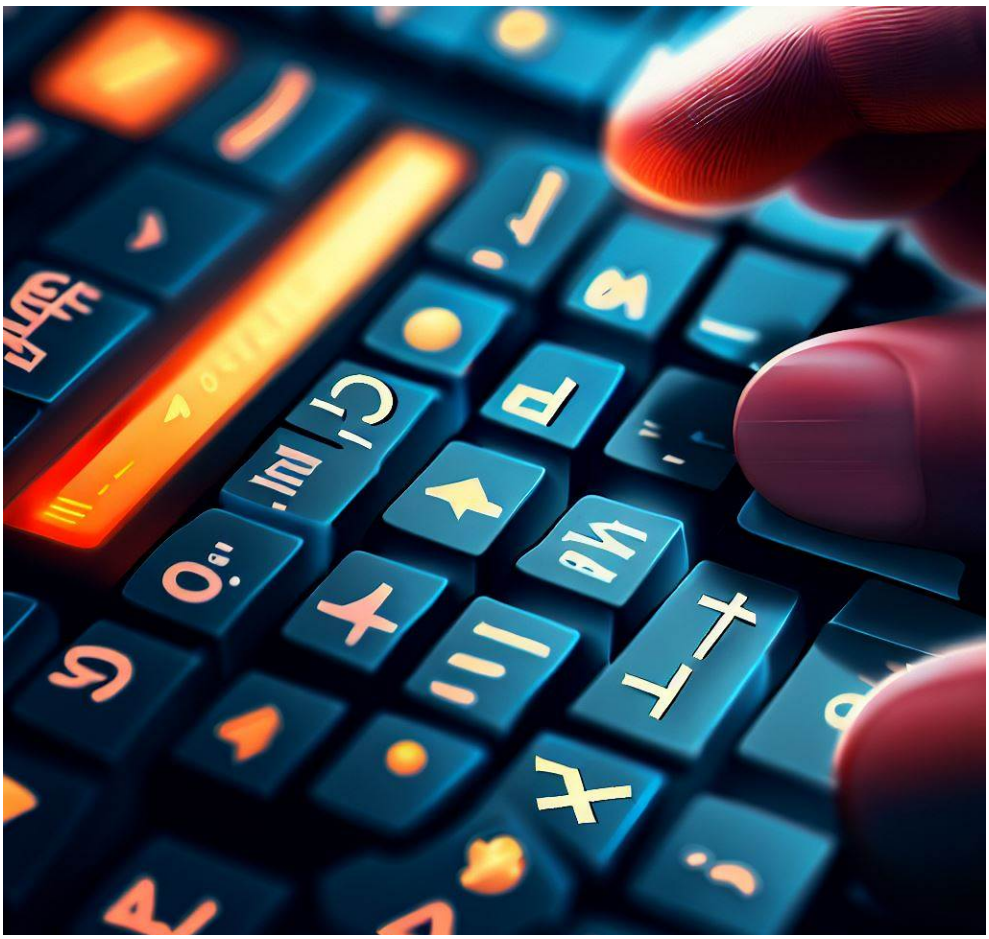
© 2023 Theo Gottwald * https://www.smart-package.com

1.13 1.5.1 FAQ - How to ...

Starting Guide

FAQ - How to do several things ...

More specific tips for using the Script language,



How do you get the § and the |-Character on non-german Keyboards?

Press "**ctrl-B**". The Editor will give you the **§** character.

Pressing "**ctrl-H**" will give you the **|** (Pipe) Character.

© 2023 Theo Gottwald * https://www.smart-package.com

How to read text from controls

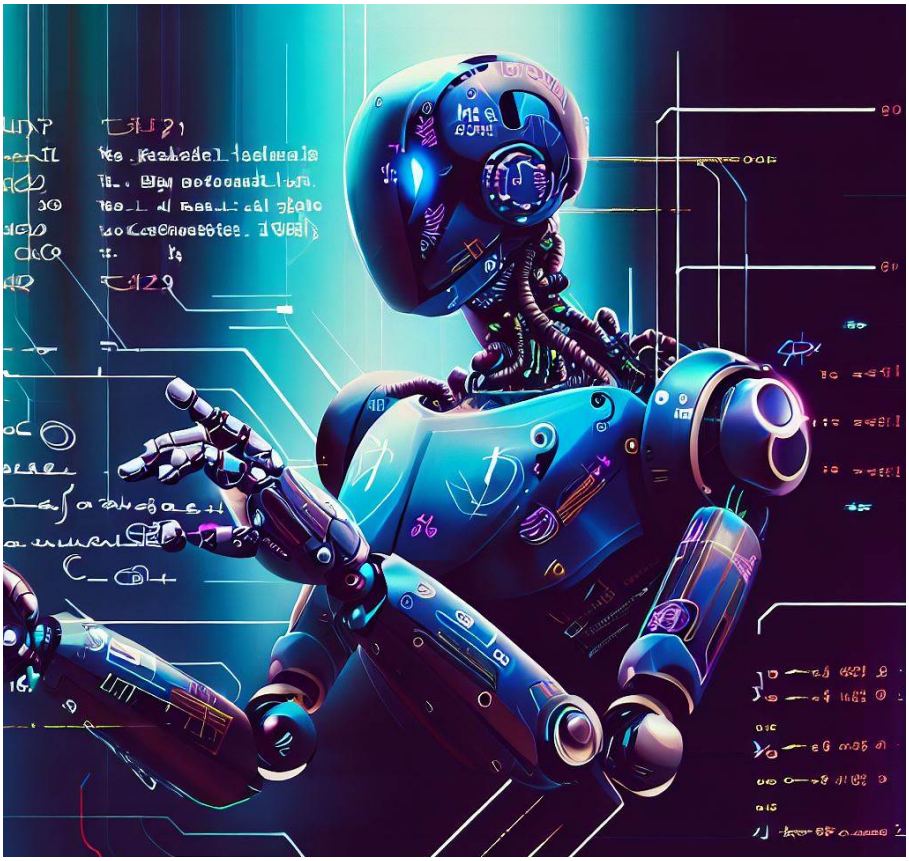
To read text from windows, use `CFW`.

```
STW.ct|PBWindowClass:0|TestApp
SCW.nc|1|SysIPAddress32
CFW.$$TXT|u
```

If `CFW.` does not work, or if you want to read from within "Browser" or Office-Programms, try `GAI`.

---

*© 2023 Theo Gottwald * https://www.smart-package.com*



Numeric parameters and formulas

Wherever you have numeric parameters, you can also use a formula. For example:

The command `PAU.` want a numeric parameter first. We could write:

```
' The script will Pause for 5 seconds
PAU.5
```

We can also use a variable here:

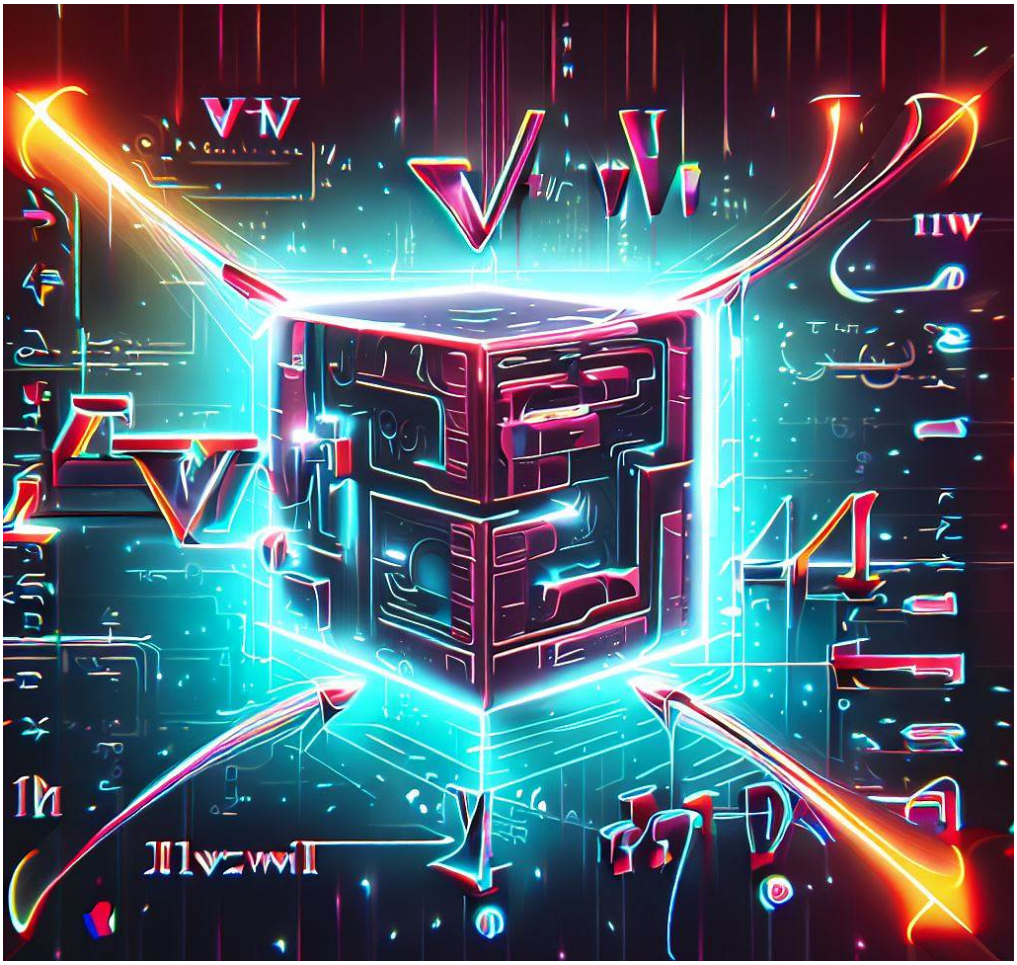
```
' The script will Pause for 5 seconds
: §§TIM=5
PAU.§§TIM
```

Now we can also use a formula here. The trick is, that we must put the formula into brackets (...).

```
' The script will Pause for 5 seconds
: §§TIM=1
PAU.(§§TIM*5)
```

You can use formulas at most places where numeric parameters are valid. The formula can use all expressions that are valid for the CAL.-command also.

© 2023 Theo Gottwald * https://www.smart-package.com



How to use formulas in decisions

There is the mathematical `IVV.` It is formed like this:

`IVV.` (Any Formula like in `CAL.`)

The brackets (...) are needed so I`VV.` knows that you want the mathematical `IVV.`

The result is tested against zero to decide whether the condition is true (if it is non-zero) or not true (when it is zero).
You can use formulas with all operators from `CAL.`, if you include them into (...).

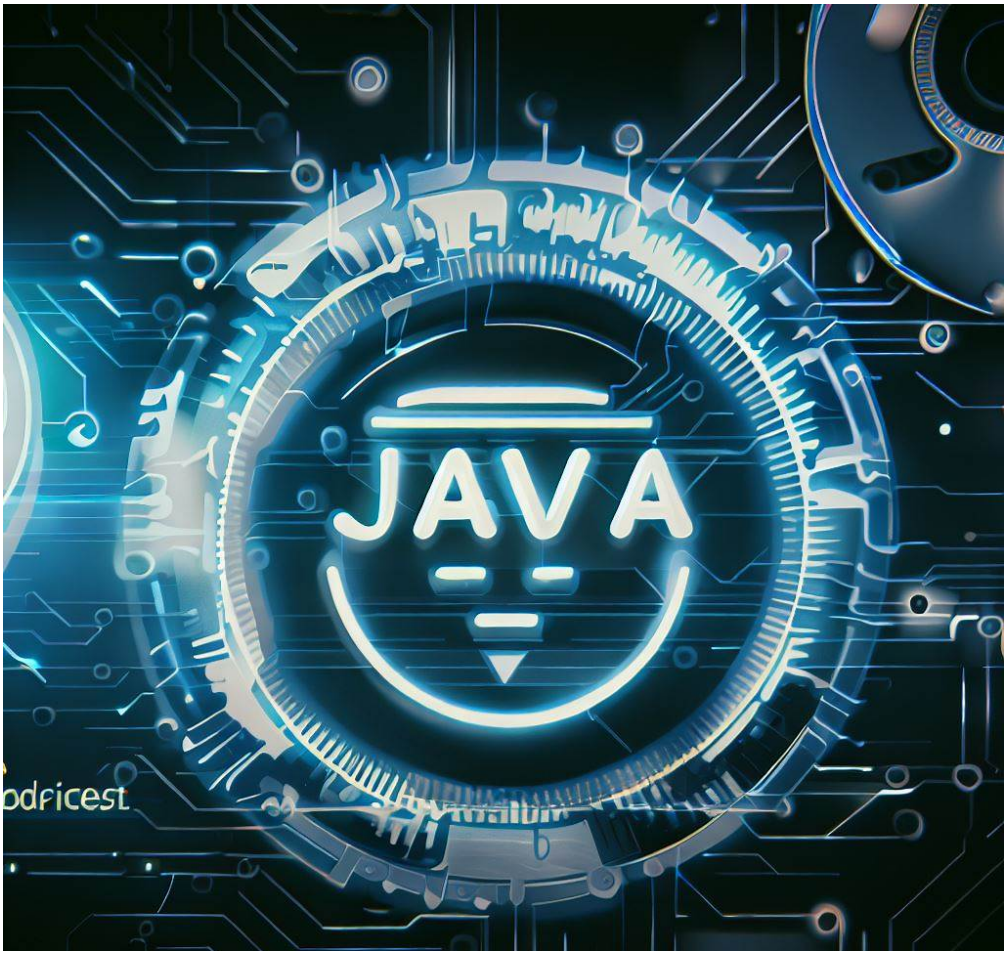
In that case the condition is true, when the result is NOT zero.

```
' This will make an OR'ed decision
IVV.($$MAA<9)+($$MAB>0)
' Do something if result is NOT zero
ELS.
' Do this if result is zero.
EIF.
```

You can also use a Syntax with delimiters "|". In this case you can use formulas on both sides as you wish.

```
'
IVV.($$MAA*5)|>|(8*1+0.5+$$XYZ)
```

© 2023 Theo Gottwald * https://www.smart-package.com



How to use the SPR with "Java-type" Setup programs

If you see that the `MEL.` command does not click anything and the window-class is "`Sunawt ...`" you are going to automate an "Java-type" Application.
Now the first step is, use only Compatible-Engine Commands like `MLC.` or `MLI.` for clicking on Buttons.
You may need to use the "Pattern Technology" (`ANA.-Command` etc.) or simple Mouse-Positions to locate Buttons.

Second, use Window-relative coordinates to locate the buttons.

If you are a more experienced user, use the Quadrant coordinate System and the `QFR.`-command.
This will scale your clicks when the User has a larger font size.

Third, there will be moments when the Setup is working, and your Script has to wait.
Of course you can simply use `PAU.` Command. But this is not the perfect solution.
With the SPR, use `RRA.` and `WRA.` instead.
These commands will react on "changes" in the Setup-Programs windows.
This way you can see when the Setup has finished his Job.

© 2023 Theo Gottwald * https://www.smart-package.com

Also there are quite a number of Pixel-Color Operations. You can use these to find out, if a Checkmark is set or to make more complex operations.
Also use Quadrant-Coordinates here to make things "Scale" when the User has another font-size.
To check which "DPI" is set on the local system, use `IDP.` and the `DPI.` command.

© 2023 Theo Gottwald * https://www.smart-package.com

1.14 1.5.2 Using Variables

1.5.1.2.1 Using Variables **Previous** 60 **Top** 41 **Next** 104

Starting Guide

Using Variables

Update: Due to the new `SAV.Save` and `SAV.Restore` Command the use of `$$XXX`-Variables (Script-local Variables) is not more recommended.
Just use the normal `$$XXX` (Global Variables) and make them "local" using the `SAV.`- and `SAV.Restore` Command.

What are Variables?

Variables are like containers that hold important information in a program or script. They help us keep track of different kinds of data, such as numbers or words. Just imagine having different boxes to store different things.

Variables are good because they allow us to:

1. Remember things: We can give a name to a variable, like "myNumber," and put a number inside it. Then we can use that number later in our program whenever we need it.

2. Change things: We can update the value inside a variable. For example, if we have a variable called "score" and we win a game, we can increase the score by adding more points to it.

3. Solve problems: Variables help us solve puzzles or perform calculations. We can use them to add numbers together, find the average of a group of numbers, or even create stories with different characters and their actions.

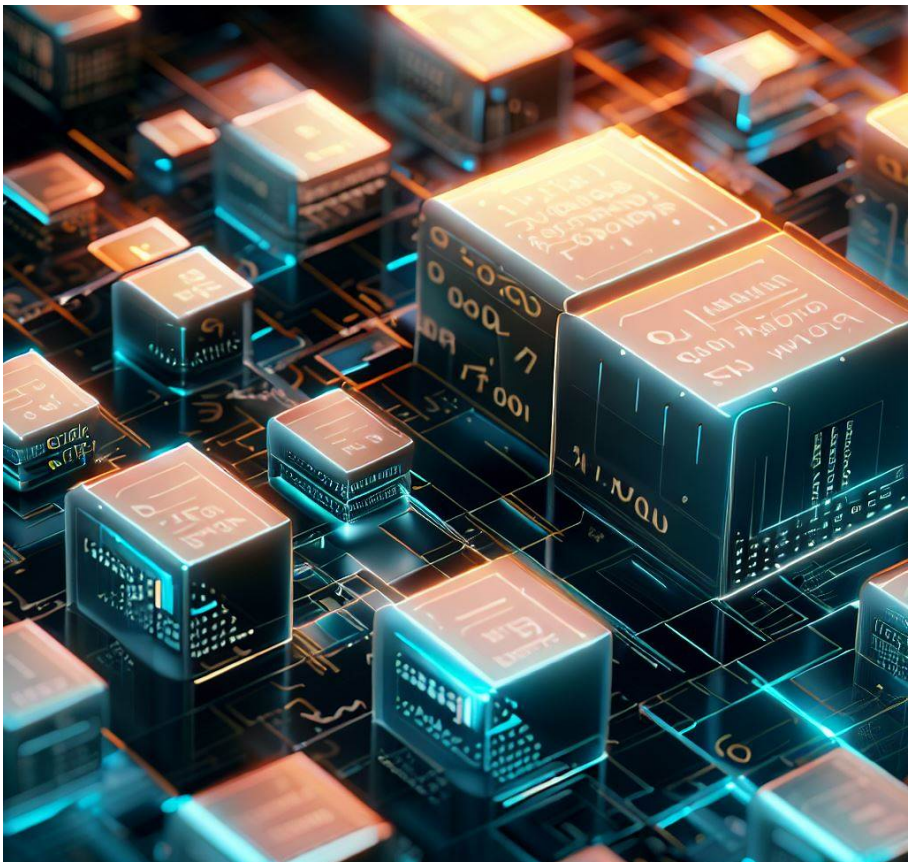
4. Make things easier to understand: By giving variables meaningful names, we can make our code easier to read and understand. Instead of using numbers directly in our

*© 2023 Theo Gottwald * https://www.smart-package.com*

program, we can use variable names like "numberOfApples" or "playerName" to make it clear what the values represent.

5. Play and be creative: Variables allow us to be creative and make our programs more interactive. We can create games where the player's score changes, or stories where the characters' names can be different each time we play.

In simple words, variables help us remember, change, and solve problems with different kinds of information in our programs. They make programming more fun and allow us to create amazing things with our imagination.



Intention

In the SPR (Smart Package Robot Script), variables are symbols that store numerical, text, or string data. They are used in scripts to store and manipulate information. In the SPR, variables are identified by their names, which always start with two dollar signs ($$). Here are some examples of valid variable names in the SPR:

```
$$A00
$$HAL
```

Please do NOT use Variables like:
`$$000` (3*Numeric) as these may have another usage and reference the Execution Stack.

These names can be chosen freely by the script writer, as long as they start with two dollar signs.
Variables allow scripts to be more dynamic and flexible, as they can hold different

© 2023 Theo Gottwald * https://www.smart-package.com

values at different points in the script. By using variables, you can store and retrieve data, perform calculations, and make your scripts more powerful and adaptable to different situations.

Variables are Symbols which contain numerical, text or string-data. When used in a script, **the variable name is replaced with the variable content.**
With the SPR, any Variable starts with two **$$** Signs. The following are valid names for variables.

```
$$AAA
$$FRA
```

You can even use Special-Characters and the Variable-Name will still be valid, like:

```
$$---  or $$###
```

Yet, we do not recommend this, unless for special Purposes.

Variables are Case-Sensitive!
Therefore this is not going to work:

```
VAR.$$FRA=10
MBX.$$fra
END.
```

This is going to work:

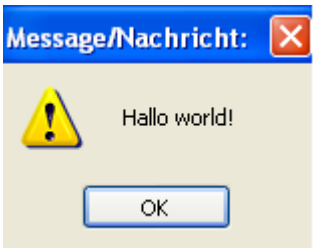
```
VAR.$$FRA=10
    MBX.$$FRA
    END.
```

Try the example below.

```
VAR.$$FIL=C:\MyDir\Mydir2
MBX.The dir was:$crlf$ $$FIL
ENR.
```

```
' You can take that further ...
VAR.$$TXT=Hallo world
VAR.$$TXA=$$TXT!
MBX.$$TXA
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com



When working with variables in the SPR, it is important to note that:

1. Variables do not need to be explicitly declared, and memory allocation is handled automatically.
2. Variables can be defined, changed and cleared at runtime.
3. Variables can only be accessed at runtime, the preprocessor does not have access to the variable's content.
4. Each variable has an internal variable type, which can be determined and manipulated with specific commands.

The SPR's handling of variables allows for a flexible and efficient programming experience, while also providing the necessary tools to work with variable types and memory allocation.

Important!

How do you get the §-Character on non-german Keyboards?

Press "**ctrl-B**".

The SPRE-Editor will give you the § character when you press left "Ctrl" and "**B**" on your keyboard.

Pressing "**ctrl-H**" will give you the | (Pipe) Character.

Here are some of the different Methods to assign values to variables.

- The : - Definiton-Command 361
- VAR. - Variable Set Value/Clear 3562
- VAB. - Variable Binary 3544
- VAC. - Variable reCt 3546
- VAN. - Variable Numeric 3553
- VAO. - Variable Once 3556
- VAP. - Variable Point 3560
- VAS. - Variable with String 3564
- VBA. - Variable Binary Append 3569
- OPT. - Optional Settings 2406

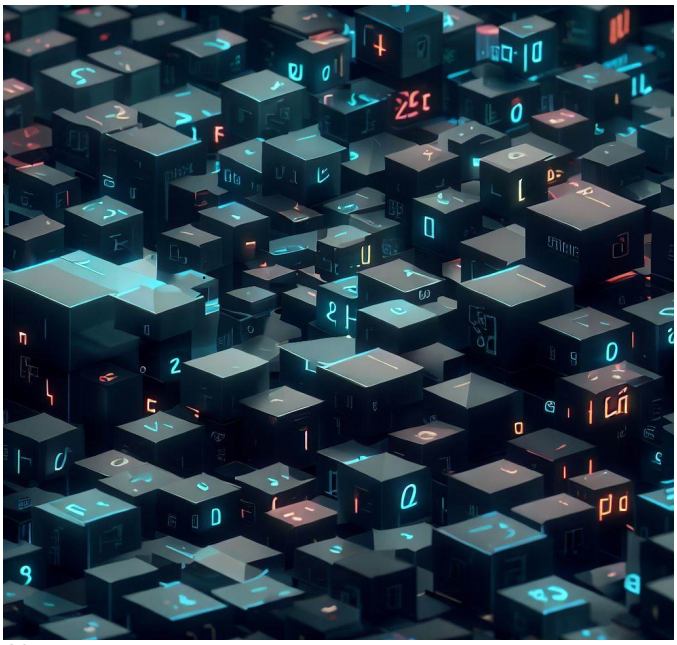
1.15 1.5.3 More about Variables

1.5.1.2.1 Using Variables **Previous** 60 **Top** 41 **Next** 104

Starting Guide

Variable Resolution

At some point the Robot will resolve the variables to their content.
During this topic, the content of the variables can contain more variables that may be also resolved or not depending on which commands you use.



Often variables are visualized as boxes that can contain something.

What is "variable resolution"?

It is the process, when a *variable-name* in the script is replaced with the *variable-content*.
In fact this is why variables are used.

Variable-resolution is: *the robot takes the **variable-name** and replaces it with the **variable content**.*

Generally the process is simple, but it can be more difficult in few cases. Let us see an example:

```
VAR.$$TXT=Computer
VAR.$$LIN=$$TXT
' Write the content of $$LIN in the Editor-Debug window
DBV.$$LIN
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

In this example, we first tell the robot that the variable $$TXT means "Computer".
In the second line, we tell it that $$LIN is the same as $$TXT, which means that $$LIN is also "Computer".
Looks easy. Is easy.

Resolving multiple variables
Lets make it a bit more tricky for the robot. What will the SPR do, if there are many variables in a variable?

```
' First we define three variables
VAR.$$TXA=Computer
VAR.$$TXB=Software
VAR.$$TXC=Center

' Now we assign them to $$LIN
VAR.$$LIN=$$TXA$$TXB$$TXC

' Write the content of $$LIN in the Editor-Debug window
DBV.$$LIN
```

The output is as expected:

```
ComputerSoftwareCenter
```

VAR. resolved all the variables.
Now lets go one step ahead. What will happen, if there will be variables inside these variables? Will they also be resolved?l
To do this we use a special Command, that is VAB. This Command will just take the right side and not go through a variable-resolution.

```
' First we define three variables
' Note that i have used VAB. instead of VAR.
VAB.$$TXA=Computer
VAB.$$TXB=$$TXA
DBV.Variable TXB contains >$$TXB<
' Here we use VAR. again
VAR.$$LIN=$$TXB
' Write the content of $$LIN in the Editor-Debug window
DBV.Variable LIN contains: <$$LIN>
ENR.
```

What do we expect to get here?
$$TXB contains $$TXA
and that is the result that we get.

```
Variable TXB contains >$$TXA<
Variable LIN contains: <$$TXA>
```

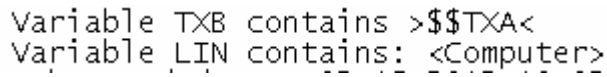
VAR. will resolve all variables on the first level, to be as binary compatible as possible, it will not make a "deep resolution".
Because this way, binary content inside a variable is safe. If you want a "deep resolution" choose VAV. instead.

© 2023 Theo Gottwald * https://www.smart-package.com

Let us give it a try:

```
' First we define three variables
' Note that i have used VAB. instead of VAR.
VAB.$$TXA=Computer
VAB.$$TXB=$$TXA
DBV.Variable TXB contains >$$TXB<
' Here we use VAV. to get a deep resolution
VAV.$$LIN=$$TXB
' Write the content of $$LIN in the Editor-Debug window
DBV.Variable LIN contains: <$$LIN>
ENR.
```

This is the result:



Now when we deal with text this is mostly an less important issue. Variable resolution becomes important when we deal with files that contain elements that could possibly be resolved.

For example, you want to have the phrase "`$$TXT is not 99`" in a Variable `$$LIN`.
If you try this:

```
VAR.$$TXT=Computer
VAR.$$LIN=$$TXT is not 99
```

then `$$TXT` will immediately be resolved to "Computer" and you do not get what you want.
Therefore we have a couple of different `VAR.`-commands with different behavior about variable-types and variable-resolution.
If you use `VAB.` instead of `VAR.` it will work.

```
VAR.$$TXT=Computer
VAB.$$LIN=$$TXT is not 99
' Output Variable to Editor
DBV.$$LIN
```

Important!

How do you get the §-Character on non-german Keyboards?

Press "**ctrl-B**".

The SPRE-Editor will give you the **§** character when you press left "Ctrl" and "**B**" on your keyboard.

Pressing "**ctrl-H**" will give you the | (Pipe) Character.

Here are some of the different Methods to assign values to variables.

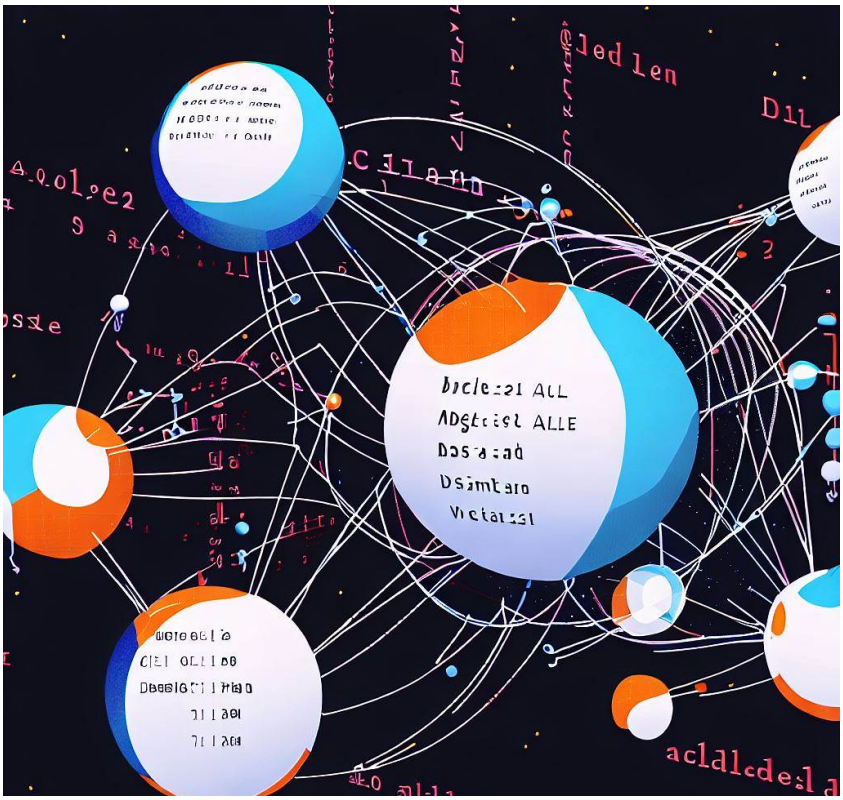
1.16 1.5.5 Global and Local Variables

1.5.1.2. Using Variables Previous 60 Top 41 Next 104

Starting Guide

Using Variables

There are two sorts of variables: global and local



Please prefer using the `SAV.` and `RES.` command before using "local variables".
In fact they are not more needed and more or less obsolete.
Yet they will be supported for compatibility.

VAR.$$TXT = VALUE

```
command|Target-side|    |value-side
```

Update: Due to the new `SAV.Save` and `SAV.Restore` Command the use of `$$XXX`-Variables (Script-local Variables) is not more recommended.
Just use the normal `$$XXX` (Global Variables) and make them "local" using the `SAV.`-Command.

Global Variables are valid everywhere in a Script.

© 2023 Theo Gottwald * https://www.smart-package.com

Local Variables are used inside "Sub-Scripts" which are called with the JNF.-Command.
Local variables contain their value until the script is left to the calling script. Then their content is lost.

If a script calls another script using JNF., the content of its local variables is preserved and automatically restored on return from the subscript.

$$xxx for global variables

Global variables keep their value anywhere in a script or subscript.

§§xxx for script-local variables

Local variables are cleared when the Script returns to the Main-Script, using RTS.
Local Variables and JNF. can be nested to unlimited depth.The Format for Variables is always:

Variable-names:
For xxx all letters or numbers as well as the "-" can be used.

Variable-names have a fixed length. Therefore we do not need any concatenation characters like in other scripting systems.
The variable-content can be any size, depending on the free memory in the windows system (memory fragmentation may play a role).
As a rule of thumb: several 100 MB should never be a problem.

There are few Variables which are reserved for Special Purposes which shall not be used for regular operations. Many Commands do return results directly into variables.

You can DUMP all currently used variables using the DMP.-Command.

```
' Dump Global Variables
DMP.2
MBX.Ready?
ENR.

' Dump Local Variables
DMP.3
MBX.Ready?
ENR.
```

For more Details see the DMP. Command.

When using the VAR.- type Commands,variable, Special-Folders 345 and Systemvariables 334 will be resolved!. The VAO. command for example does not resolve special folders or system-variables. If you choose VAB. the nothing will be resolved on the value-side.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

$$xxx global Variable
§§xxx **Script** local Variables
(local to Scripts until "ENR.")

Parameter Explanation

If the Parameter is omitted, the Variable is set to empty, which represents string with a of length 0, or a value of 0.

Example

```
' define global variable without Special-folders
: $$TXT=Hallo World

' define global variable with Special-folders and System-
variable Resolution
VAR.$$FIL=?progs\FS Office\Myprog.exe
PRT.$$FIL
' Display a list with all global Variables
DMP.4

' define local variable with Special-folders and System-
variable Resolution
VAR.§§FIL=?progs\FS Office\Myprog.exe
PRT.§§FIL
' Following clears variable §§NUM
: §§NUM=
' Display a list with all local Variables
DMP.5
```

Remarks

Global Variables are valid everywhere in a Script. Local Variables are used inside "Sub-Scripts" which are called with the `JNF`.-Command.

Such variables are cleared when the Script returns to the Main-Script, using `RTS`.
Local Variables and `JNF`. can be nested to unlimited depth.

Limitations:

How long can variables get? What is the maximum size? 100 MB ? 250, 500 MB ?
It depends on the amount of unfragmented Memory that the robot can get from the OS.
Under normal circumstances variables can always exceed a size of 50 or 100 MB (MegaBytes) without problems. Once you clear the variable with
`VAR.$$XXX=`

© 2023 Theo Gottwald * https://www.smart-package.com

the memory is safely returned to the OS. Of course this happens automatically when the script ends.

Please prefer using the `SAV.` and `RES.` command before using "local variables".
In fact they are not more needed and more or less obsolete.
Yet they will be supported for compatibility.

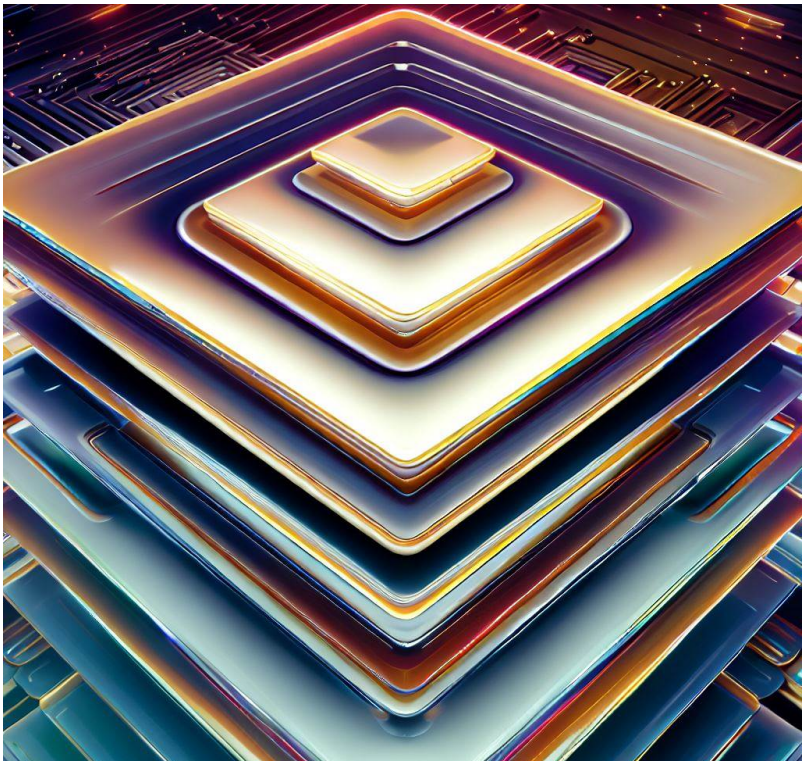
1.17 1.5.6 Using the data stacks

Starting Guide

The Stack and Top of Stack (TOS)



Intention

What can you do with a stack?

The stack is a space where you can store thousands of items. The stack can hold:

1. text- or
2. binary strings or
3. numeric items.

A stack is something that is similar to a stack of paper. The last thing you put on top of it, is the first thing you get back from it.
This is called a LIFO-Stack (LIFO -> Last in First Out). Now lets answer some basic questions about the stack.

© 2023 Theo Gottwald * https://www.smart-package.com

How many stacks do i have?
You have two stacks. The global, and the local stack. More to this later.
Both are nearly equal in practical use. We'll just use the default stack for the following samples.

How can i see what data actually on the stack is?
Just type this sequence:

```
' Show stack content
STS.DUMP
'  Keep concole window open until we press OK
MBX.Ready
```

you can also use:

```
DMP.6
MBX.!
ENR.
```

to see the content of the actual selected stack.

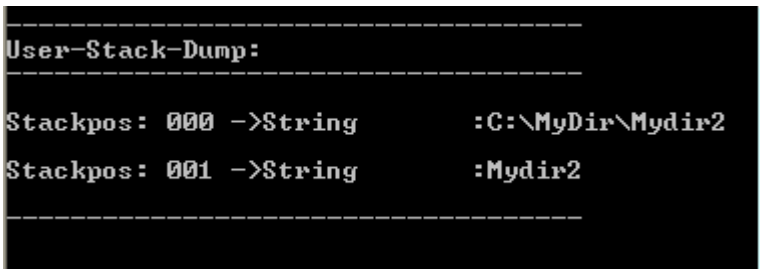
How can i put things on the stack?
You can use the commands:

- PUS. - Push Parameter onto Stack/Que 3013
- PUV. PUsh variables on the User-Stack 3019

But most often, you will just use just another command that will leave its result on the stack. In the following example, we will place one thing on the stack, and one will be placed on the stack by the ALB-command.

```
VAR.§§FIL=C:\MyDir\Mydir2
' In this case the result will be placed on the TOS
ALB.§§FIL
PUV.§§FIL
DMP.6
MBX.!
ENR.
```

And here is the output we get. It shows the two used Stack-Positions.



How do i get things back from the stack?

First, you can use these commands:

- POP. - POP Variable from Stack 3007

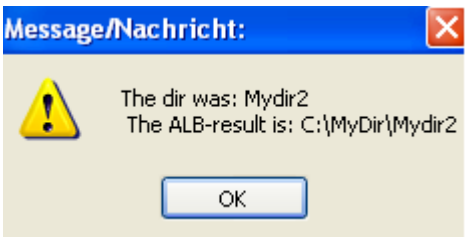
© 2023 Theo Gottwald * https://www.smart-package.com

- POV. - POp Variables from User-Stack 8010

but second there are a lot of other commands that may take parameters from the stack.

```
VAR.§§FIL=C:\MyDir\Mydir2
' In this case the result will be placed on the TOS
ALB.§§FIL
PUV.§§FIL
POV.$$TXA
POV.$$TXB
DMP.6
MBX.The dir was: $$TXA $crlf$ The ALB-result is: $$TXB
ENR.
```

Try this example. What you also see is, that once you access a stack element, its automatically removed. You will get a Messagebox like the one in the picture below.



Commands use it, too
Many commands leave their results on the stack. The stack organization can be customized to user needs.

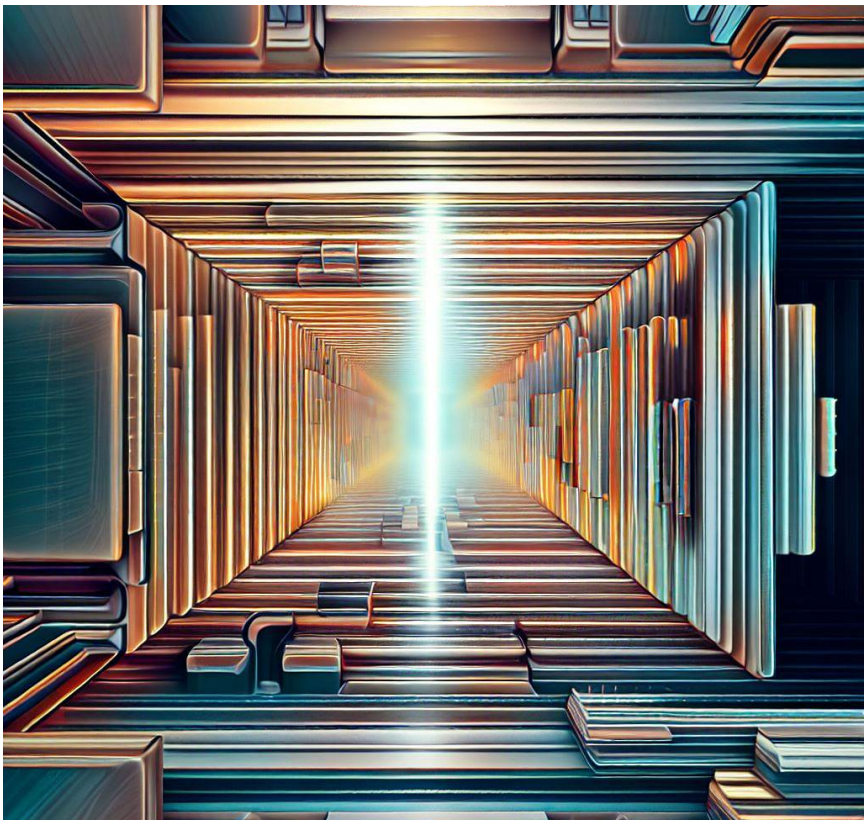
Customize your stacks
First you can change the number of elements the stack can hold. Use the STV. - command for this.

Any stack can be organized as a **stack** (LIFO - Last-In-First-Out) or as a **que** (First-In-First-Out). The default Stack setting is LIFO. Use the STS. - command to switch the stack between LIFO and FIFO. Note that if a stack gets to many elements, some overflowing elements are automatically deleted. These overflowing elements are generally the oldest elements. In a LIFO stack the oldest element is the first element added, while in FIFO (Que), the last added elements added ist the "oldest".

Another setting is, if t he stack element is remove if you touch it. Normally a stack element it deleted immediately when you touch it. This way you get all stack elements one-by-one, just by using `$tos$` which is always the TOS (Top of Stack) in the actual selected stack. If you want to get the TOS without having it removed, use `$dtos$`.

What if i jump into a subprogram that also uses the stack?
You can anytime take the whole stack-content and put it into a variable, using the STV.-command. When you return from your subprogram, you can "restore" the complete stack from that variable using the STV.-command.

© 2023 Theo Gottwald * https://www.smart-package.com



Use the script local stack
If you use Subscripts (scripts in separate files) you can take advantage of another feature.
Local and Global stacks. In fact, we have two stacks, a script-local stack and a global stack. The global stack is valid through the whole script execution. The local stack holds the same rules like the script local variables.

If a script calls another Subscript in another file, using the `JNF. command.` At this time the content of its local stack is preserved and automatically restored on return from the subscript. Thats the use of a local stack. To hold your script local data.

However, the Local stack is cleared when the Script returns upwards to a Main-Script, from which it was called, using `JNF./RTS`. Its the same sytem like when using script local variables.

How do I select the actual stack/que?
To select which stack you want to work with, use the `STS.GLOB` or `STS.LOCA` command.
These will make the selected stack to the actual stack.

If you want to know which stack is currently the actual stack, use the **`#stack#`** systemvariable. It will return a number that shows you if the Local or the Global stack is currently selected as the actual stack.
#stack# -> 1 GLOBAL Stack is selected
#stack# -> 2 LOCAL Stack is selected

*© 2023 Theo Gottwald * https://www.smart-package.com*

There are shortcuts to accessing the stack values inside your script.

§§000 to §§999
for directly accessing the local stack

$$000 to $$999
for directly accessing the global stack

§§000 - Top of Stack (TOS) local stack
$$000 - Top of Stack (TOS) global stack

The global stack keeps his content anywhere in a script or subscript.

There are different Methods to access the stack. First you can use the Stack-variables above to directly access the first 999 stack elements. Secondly you can use multiple stack-commands.

- PUS. - Push Parameter onto Stack/Que 3013
- PUV. PUsh variables on the User-Stack 3019
- POP. - POP Variable from Stack 3007
- POV. - POp Variables from User-Stack 3010
- STJ. - STack Job 3030
- STS. - Set STack Settings 3038
- STV. - Stack To/from Variable 3040

Most Commands may return results directly into stack-variables if you give these for the result.

Example

```
' Choose LOCAL Stack as Actual Stack
STS.LOCA
' Organize Stack as First-in-First-Out
STS.FIFO

' Put 10 Items on actual Stack
FOR.$$A01|1|10
  VAR.$$B00=Stackplace $$A01
  PUV.$$B00
NEX.

' Show all Items on Local Stack
DMP.5
MBX.Ready
ENR.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

The $$000 and §§000 refer to the TOS (Top of stack). See several example scripts in the examples folder.

Limitations:
Per default the maximum stack size limit is set to 25 Elements. This can be changed using the STS.SIZE command.
How long can stack-entry get? Can you strore a file in it?
What is the maximum size? 100 MB ? 250, 500 MB ?
It depends on the amount of unfragmented Memory that the robot can get from the OS.
Under normal circumstances any stack entry can always exceed a size of 50 or 100 MB (Megabyte) without problems. Once you clear the stack entry, in any way, the memory is safely returned to the OS. Of course this happens automatically when the script ends.

1.18 1.5.7 Using Text-Strings

1.5.1.4. Using Text-Strings **Previous** 104 **Top** 41 **Next** 117

Starting Guide

Working with text strings

How do you analyze and synthesize text-strings,

What is a text string?

We have two kinds of strings in our daily IT-work:

1. Text-strings - these are mostly letters, linefeeds. Text-Strings are, waht you see in textfiles.
2. Binary strings - this strings can contain any of the ASC-Characters 0 to 255

When dealing with **Binary strings**, you need to be careful, as they may accidentally contain sequences 334 that could be interpreted by the robot-system. This can be variable names as well as special folders or system-variables.

Therefore you should only use commands that do a "one time resolution". These commands will just replace the variable-name of the binary string with the string and they will not touch the inside.

This way you can deal with both types of strings if you know that, and use only commands that are suitable for the specific case.

What can i do with binary strings?

Binary strings can be

- read from disk using CFF. - Copy-From-File 948
- find about its length using LEN. - Length-of-String 3140
- write them back to disk using CTF - Copy-To-File 964
- patch them using GSS. - GetSplitString 3137 and VAB. - Variable Binary 3544
- Replace part of it using RPL. - RePLace in String 3143
- They can be encrypted 825 and decrypted using GEC. - Get Encryption 825
- you can verify them using a checksum with GMD. - Get Message Digest 831
- and you can merge them in a package using SIB. - Set-In-Block 685
- or extract them from a package using GFB. - Get-From-Block 680

and there is more but these are the most important uses for binary string data.

What can you do with text string?

- read from disk using CFF. - Copy-From-File 948
- write them back to disk using CTF - Copy-To-File 964
- read text strings from INI-Files using CFI. - Copy-From_IniFile 951
- write them back to an INI-File with CTI. - Copy-To-Inifile 966
- find about its length using LEN. - Length-of-String 3140

*© 2023 Theo Gottwald * https://www.smart-package.com*

- Find out if it contains a substring using IVC. / NVC. - If-Variable-Contains 3524
- Check it against a Standard-Search Pattern 341 with IVP./ NVP. - If-Variable-Pattern 3529
- break it into delimited parts using SBD. - String between Delimiter 3070
- Sort delimited parts of a string using SRT. - Sort Items 3147
- split them using GSS. - GetSplitString 3137 and VAR. - Variable Set Value/Clear 3562
- Replace part of it using RPL. - RePLace in String 3143
- They can be encrypted 825 and decrypted using GEC. - Get Encryption 825
- you can verify them using a checksum with GMD. - Get Message Digest 831
- and you can merge them in a package using SIB. - Set-In-Block 685
- or extract them from a package using GFB. - Get-From-Block 680
- work with a file path using GFT. - Get-File-Token 1037
- or use regular expression with GRE. - Get Regular Expressio 3128 and GRR. - Get Regular Replace 3131

and much more!

Let us look at some examples on how to deal with strings.

How do we define a Textstring?
Its as easy as this:

```
: $$TXT=Hello world!
```

this sequence defines a Test-String.
In the same way, you can use the VAR. - Variable Set Value/Clear 3562 command to define a text string.

```
VAR.$$TXT=Hello world!
```

There is no difference between these two.While you can also just leave the : away and write:
`$$TXT=Hello world! $crlf$It's $date$ today.`
which will do all the same.

THere are other commands to define variables.
`VAB.` for example will not resolve 3.1 Systemvariables 334 or 3.3 Specialfolders 345 but just leave the variable content as it is. The second form will do that. Let's see the difference in a practical example:

```
' Will NOT resolve specialfolders,systemavariables etc.
VAR.$$TXT=Hello world! $crlf$It's $date$ today.
DBV.$$TXT
' Will resolve specialfolders,systemavariables etc.
VAB.$$TXT=Hello world! $crlf$It's $date$ today.
DBV.$$TXT
MBX.READY
```

And this is the output in the Editor Debug-window:

© 2023 Theo Gottwald * https://www.smart-package.com

```
[11:38:24] MRE: Robot start: VAR-Sample.mrt (On line #1)
[11:38:24] [9] Hello world!
It's 14-01-2012 today.
[11:38:24] [13] Hello world! $crlf$It's $date$ today.
[11:38:27] MRE: Robot ended: VAR-Sample.mrt
```

As expected, `VAR.` has resolved the system-variables and the `VAB.` did not.

Note that we use `DBV.` here, and not `DBP.` Because `DBP.` itself will resolve all specialfolder and system-variables. Then we would not been able to see the difference.

Why do we need this difference?
It's mostly to protect your code from unwanted code-changes. There is no real speed penalty when using `VAR..`

Note that the ":"-Definition Operator 361 still resolves variable names. It does not make a binary compatible resolution (suitable for binary strings) like VAB. - Variable Binary 3544.

```
' Will NOT resolve specialfolders,systemavariables but
' will resolve variable names!
: $$TXT=Hello world! $crlf$It's $date$ today.
: $$TXT=$$TXT $$TXT
DBV.$$TXT
```

© 2023 Theo Gottwald * https://www.smart-package.com

1.19 1.5.8 Basic String Operations

1.5.1.4. Using Text-Strings **Previous** 104 **Top** 41 **Next** 117

Starting Guide

BASIC String Operations

How do you work with string-data?

Adding string

That is a very basic issue. We have two strings and we want to add them to one string
We have already done that in the example above. Adding strings is as easy as writing their variable names one after the other.

```
: $$TXA=Hello
: $$TXB= world!
: $$TXT=$$TXA$$TXB
DBV.$$TXT
```

The output is as expected:

```
[11:52:58] MRE: File saved as: 'F:\00_RPGM\C
[11:52:58] MRE: Robot start: VAR-Sample.mrt
[11:52:58] [14] Hello  world!
```

Are there any size limit for strings?

Generally there is a 32-bit size limit that limits string sizes to 2 GB. In real life the limits depend on your system, on the fragmentation of your memory. The limit will be less because string memory must be sequential. 500 MB should be no problem, if your RAM allows it even more. Note that the larger strings become, the slower the string operations may get.

```
: $$TXT=This text is going to be very large.
FOR.$$MUC|1|22
  VAR.$$TXT=$crlf$ $$TXT $crlf$ $$TXT
NEX.
LEN.$$TXT|$$SIZ
DBP.$$SIZ
DMP.1
MBX.READY
ENR.
```

This script is going to concatenate a string of Size ~180 MB. Once we are adding up 40 MB and more, it will start to get a bit slower.

---

*© 2023 Theo Gottwald * https://www.smart-package.com*

Subtracting / Splitting strings

We have a string, but we do only need a part of it. There are many such cases in real life.
For example you get a phone number from a list or file. Or from a text-box.

```
: $$TXT=07247/9851112
GES.f|$$TXT|/|$$RES
DBP.Predial is: $$RES
GES.h|$$TXT|/|$$RES
DBP.Number is: $$RES
ENR.
```

The output will be:

```
[10] Predial is: 07247
[12] Number is: 9851112
```

What, if we do not know how the number is written?
It may be like this:

```
: $$TXT=(07247)9851112
' Will split thestring at ANY of the given characters
GES.f|$$TXT|)/|$$RES
' removes left and right of $$TXT all of the given characters
VBT.$$RES|()/
DBP.Predial is: $$RES
```

The output will be as expected:

```
[10] Predial is: 07247
```

Let us try something else. We have now the Pre-Dial and we just want the **first two characters** of it into a variable.

```
' We define our string
: $$TXT=07247
' We want character 1 to 2 from $$TXT into $$RES
GSS.1|2|$$TXT|$$RES
DBP.Predial is: $$RES
```

The output will be:

```
[9] Predial is: 07
```

Now we want **the last three characters** from our string.

```
' We define our string
: $$TXT=07247
' We want the last three characters from $$TXT into $$RES
GSS.-3|-1|$$TXT|$$RES
DBP.Predial is: $$RES
```

The output will be:

```
[11] Predial is: 247
```

© 2023 Theo Gottwald * https://www.smart-package.com

Get and set ASCII-values

Next we want to get an ASC-Values[3047] of one of the characters.

```
: $$TXT=07247
ASC.$$TXT|$$RES|1
DBP.The ASC-Value of Character 1 is: $$RES
```

The output will be:
[11] The ASC-Value of Character 1 is: 48

Next we want to put an ASC-[3047]character into a variable. This way you can add any international character to an variable, even if you may not easily find it on your keyboard.

```
: $$ASC=99
CHR.$$ASC|$$RES
DBP.The Character of ASC-Value $$ASC is: $$RES
```

Now lets take a look on string based decisions.

String-based decisions

We have a string for example from a command-line-parameter[334] and if it contains the sequence **/u** we want to do something different in our script.

We do it like this:

```
' To really get the command-line of a compiled Script-exe
' we would use this:
' VAR.$$CMD=$cmdexe$
' As we run it from the Editor, we use:
VAR.$$CMD=parameter is /q etc.
VAR.$$STR=/q
IVC.$$CMD=$$STR
  DBP. We do it different
ELS.
  DBP.We do it normal
EIF.
STS.DUMP
MBX.Ready
```

As you can see, `IVC.` will also place the position where it has found the string on to the TOS[369].

Besides checking if a string is inside another, we can do basic string compare using IVS. / NVS. - If-Variable-String[3531] .

```
VAR.$$CMD=/q
VAR.$$STR=s/q
IVS.$$CMD=$$STR
  DBP. We do it different
ELS.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  DBP.We do it normal
EIF.
```

IVS. and IVC. contain many more options then i have shown in these examples. Take some time and try these commands yourself. Experimenting is the best way to get experience.

Debugging/dumping all used variables

You can DUMP all currently used variables using the DMP.-Command.

```
' Dump Global Variables
DMP.2
MBX.Ready?
ENR.

' Dump Local Variables
DMP.3
MBX.Ready?
ENR.
```

For more Details see the DMP. Command.

1.20 1.5.9. Organizing data items in blocks

1.5.1.5. Organizing data items in blocks **Previous** 110 **Top** 41 **Next** 121

Starting Guide

Organizing data items in blocks

How to use Blocks (sort of data arrays)

Normally a variable can hold just one item. For example:

```
VAR.$$TXA=Rainer
```

That is definitely ok for most uses. There are however situations when you want to store multiple items in the same variable, to handle them as one item.

For example, this is a set of three variables:

```
VAR.$$PRN=Rainer
VAR.$$LAS=Gottwald
VAR.$$JOB=Diver
```

Now we want to put all three items into one variable. We want to handle them like they are one thing, one block of data. What we do is, we put them into a block (data-block).
Later we will see how we get them out there again.

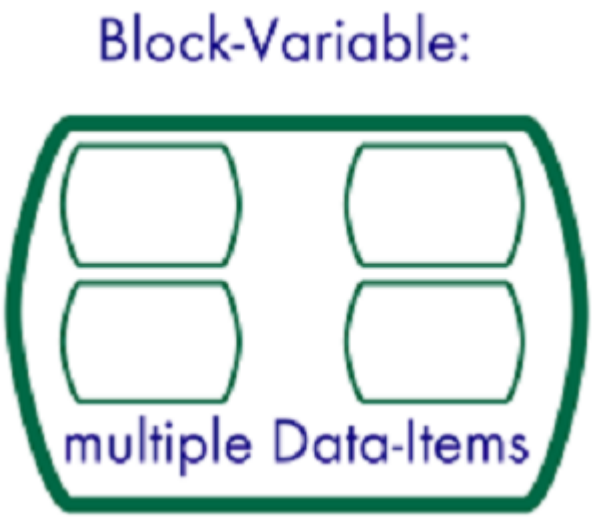
First we tell the robot that we want to have data block. And that we have three items. And that we want to have the data-block in the variable `$$BLOC`. You can choose any variable name for a block variable.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Tell the computer we want have a data-block for three items
CNB.$$BLO|3
```

Now we would go on and set the Block items, to values. We can use the `SBE.` or the `SIB.` command for that purpose. For example:

```
' Using SIB. we can set many block items in one strike
SIB.Element 01|Element 02|Element 03
```



```
' Using SBE. we are more flexible.
' The following will just set Element Nr.3
SBE.$$BLO|3|Element 03
```

Imagine you have Data that belongs together. For example, two names and a number.

Rainer Gottwald 3456
Anthon Robinson 3498
Oskar Schellbach 2467

Now how could we store them in variables and keep them together?
Of course you could store them in a delimited variable:

```
VAR.$$TXA=Rainer Gottwald 3456*Anthon Robinson 3498*Oskar
Schellbach 2467
```

This way we would have them delimited with the asterisk-sign * and we could get them easily out using the `SBD.` or the `SBM.` command. This is safe so long we are working with text.

If we have Binary data, that contains any of the 256 ASC-Characters this is not going to work. We can not use delimiters with Binary data. Thats where blocks enter the game.
Using blocks things are easy!

© 2023 Theo Gottwald * https://www.smart-package.com

Lets first create a Block for each Name and number:

```
CNB.$$BLO|3

Then we set the values into this block

SIB.$$PRE|$$NAM|$$NUM
```

Now the complete name and address data is in one block, `$$BLO.` We can add `$$BLO` to another block, just as we can add any variable to a block.

Blocks can be large, 10000 Elements per block is no problem possible.If blocks get larger, you may need too much time to change or retrieve single elements. After all it depends on your hardware, and on the size of the single elements.

```
' We create our two blockvariables
CNB.$$ADR|3
CNB.$$MAI|1
VAR.$$ITE=1
VAR.$$PRE=Rainer
VAR.$$NAM=Gott
VAR.$$NUM=3456
GSB.block
VAR.$$PRE=Anthon
VAR.$$NAM=Rob
VAR.$$NUM=3498
GSB.block

MBX.Ready
END.

:block
' Tell which block we want to fill
SBE.$$ADR
' Use the easy way to fill all elements in
SIB.$$ADR|$$PRE|$$NAM|$$NUM
' Now we fill the whole BLock into another one
SBE.$$MAI|$$ITE|$$ADR
VIC.$$ITE
RET.
```

What you can also see is, that we have "dimensioned" the Main Block `$$MAI` with only one element at start.

How do we extend a data-block?

Later we added a second element using `SBE.` Because we have added more items then the data block was dimensioned at this time, we have "extended" the data-block. Internally the data-block is going to be resized to the new size.

You can extend the element number of a block at any time by just adding the element using `SBE.` Extending a data-block will also work with `SIB.` Here is an example where `SIB.` extends a data-block to 3 items.:

```
CNB.$$BLO|1
SIB.Hallo|Thomas|Lange
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
GBN.$$BLO|$$RES
'GBE.$$BLO|3|$$E01
DBP.Blo hat $$RES Elemente
GFB.$$E01|$$E02|$$E03
DBP.$$E01- $$E02 - $$E03
MBX.Blo hat $$RES Elemente
ENR.
```

Blocks are internally checked for authenticity. This is done to prevent hard to track errors.
If you change bytes or the length of a block variable externally, the block may not be unpacked anymore.

Data blocks can contain all 256 ASC Characters (even binary files) and are binary-compatible. Therefore whether special folders nor system variables are resolved inside blocks. Variables are resolved one time.

There is no explicit limit on data-items per block. However timing considerations may set you a limit at around 10000 Items, depending on your available hardware. For a larger number of non-binary items, Member-Operations, using `SBD.` `FEM.` and `SBM.` may be significantly faster.

There is no Limit, on Data-Block nesting. You can put a data-block into another data-block and so on. The only limit is the overall variable size. And this depends on the amount of Memory in the computer, as well as the actual memory fragmentation.
On a strong system, data-blocks can easily reach a size of several hundreds of Megabyte.

1.21 1.6.1. Program Flow Control

Starting Guide

Program Flow Control

How to script decisions

Program decisions (IF ... ELSE ... ENDIF (Ixx) and Negative decisions (Nxx)

The script language supports a lot of "two way decision" commands. These are called "Ixx" because they always start with an "I" followed by two more letters. Two way decision commands let the script choose between two alternative ways.

In natural language we would say for example:

IF "File exists" THEN
... do something
ELSE (if the file does not exist)
.... do something else
ENDIF ' end of the statement

Translated to our script language this same logic would look like:

```
' This is a real filename we are looking for
VAR.$$FIL=?desktop\MRE.lnk
'IEF. = If Exists File (or folder if it ends with a "\")
IEF.$$FIL
      ' This will happen if the file exists
      MBX.The shortcut is available.
ELS.
      ' This will happen if the file DOES NOT exist
      MBX.The shortcut is not available.
EIF.
```

Often enough we only need a subset of the two-way decision. Especially if we only need to do something in one of the two cases. For example, if we need to delete a file only if it exists,

```
VAR.$$FIL=?desktop\MRE.lnk
IEF.$$FIL
      ' This will happen only if the file exists
      DEL.$$FIL
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Now what, if we need to do something if the file does not exist only?
Of course we could write this:

```
VAR.$$FIL=?desktop\MRE.lnk
IEF.$$FIL
ELS.
      ' This will happen only if the file does not exist
      DEL.$$FIL
EIF.
```

But that is not the proper way to do it.
Instead we can just change the "I" in "IEF." into an "N", making it to "NEF.". Like this:

```
VAR.$$FIL=?desktop\MRE.lnk
NEF.$$FIL
      ' This will happen only if the file does not exist
      DEL.$$FIL
EIF.
```

This will work for all "Ixx" commands, not just for IEF. There are many such Ixx-commands like IEF., take a look into the help and try some of them. And also try the negative version "Nxx".

And what do i use, if i want to select between multiple choices?

You can use the Multiple-choice commands `SCS. ... ESC.` These commands are technically similar to SELECT CASE ... END SELECT statements in many other scripting languages. You can choose between string and numeric value comparison.

You always start with SCS.(variable)
In case of numeric comparison, you use CAN. (CAse Numeric). In case you prefer string comparison, using the standard-search patterns 341, CAS. (CAse String) is the instruction of your choice. See this example:

```
: $$TXT=Karl Kovse
SCS.$$TXT
' Use a part of the string or standard search patterns
CAS.Karl
  PRT.This will come
CAS.Peter
  PRT.This will not come
CAE.
  PRT. This will not come
ESC.
MBX.Ready Sample 1
ENR.
```

Numeric comparison is done using the CAN. - instruction.

© 2023 Theo Gottwald * https://www.smart-package.com

```
: $$VAL=1
: $$TXT=5
SCS.$$TXT
' As you can see, you can use formulas here
CAN.(2*2+$$VAL)
  PRT.This will come
CAN.3
  PRT.This will not come
CAE.
  PRT. This will not come
ESC.
MBX.Ready
ENR.
```

Any formula that works with CAL. should also work with CAN. About CAS. you can use any search pattern, including variables. See this example:

```
: $$TXT=Karl Kovse
: $$STR=Karl&ANDTHEN:se
SCS.$$TXT
CAS.$$STR
  PRT.This will come
CAS.Peter
  PRT.This will not come
CAE.
  PRT. This will not come
ESC.
MBX.Ready Sample 1
ENR.
```

Can i define my own control flow instructions with Macros?

Yes, Macros enable you to define your own instructions 253. Even Control-Flow Instructions.
Lets make an example.

```
: %SELECT_CASE 1
SCS.§§§01
END%

: %CASE 1
CAN.§§§01
END%

: %CASE_ELSE 0
CAE.
END%

: %END_SELECT 0
ESC.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
END%

: $$TXT=Karl Kovse
: $$STR=Karl&ANDTHEN:se

' Now look how the final script looks.
' And it works exactly like before.
%SELECT_CASE $$TXT
  %CASE $$STR
   PRT.This will come
  %CASE Peter
   PRT.This will not come
  %CASE_ELSE
   PRT. This will not come
%END_SELECT
MBX.Ready Sample 1
ENR.
```

Lets see a more complex Macro Example. We want a command that checks if a variable is in a specified range, and if not corrects their values.

```
: %Check_Bounds 2
IVV.§§§01<§§§02
  : §§§01=§§§02
EIF.

#IF PARAMS>2
IVV.§§§01>§§§03
  : §§§01=§§§03
EIF.
#EIF
END%

: §§VAL=5

' Here we check only the lower bound
%Check_Bounds §§VAL|6
PRT. First Result is §§VAL

' Here we check the lower and the upper bound
%Check_Bounds §§VAL|1|4
PRT. Second Result is §§VAL

%Check_Bounds §§VAL|5|12
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRT. Third Result is §§VAL

MBX. Ready
ENR.

MBX.Ready Sample 1
ENR.
```

These Macros enable you to define your own instructions. You can define these Macros and put them into an separate file that you include to your script using `JNF`. This way you have them always at hand. Please note that MACROS are only expanded inside the robot.

*© 2023 Theo Gottwald * https://www.smart-package.com*

1.22 1.6.2. Looping around

Starting Guide

Looping around

Understanding Loops: The Power of Repetition

A conveyor belt is a good example of a repetitive activity

Looping around - what is "a Loop"?

Computers excel at performing repetitive tasks, tasks that might be monotonous if done manually. Let's delve into the concept of 'loops', a fundamental principle in programming that enables this powerful repetition. We'll begin with a straightforward example to ease your understanding.

Assume you want to count from 1 to 50. In a script you could do it like this:

```
'  This the most complicated way to do it.
' Init counter variable
: §§CNT=1
' This is just a Label (jump mark)
:Loop
' Print the actual number
PRT.§§CNT
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'Increment the number (do a +1)
VIC.§§CNT
' Leave the Loop, if we are above 50
IVV.§§CNT>50
    GTO.exit
EIF.
' Jump back to the start of our Loop
GTO.Loop
' Another Label
:exit
```

This is really a long script for a loop!
Lets try to a shorter version. We can change the "IVV." to a JIV.-command.

```
' Init counter variable
: §§CNT=1
' This is just a Label (jump mark)
:Loop
' Print the actual number
PRT.§§CNT
'Increment the number (do a +1)
VIC.§§CNT
' Leave the Loop, if we are above 50
JIV.§§CNT>50|exit
' Jump back to the start of our Loop
GTO.Loop
' Another Label
:exit
```

This will work but is not really a lot shorter. If we choose a JME. instead we will save one more line, because JME. make an Auto-Increment if we use the ">" operator. I'll also add some statements that do a time-measurement.:

```
' Remember actual time
VAR.§§TIM=#time#
' Init counter variable
: §§CNT=1
' This is just a Label (jump mark)
:Loop
' Print the actual number
PRT.§§CNT
' Leave the Loop, if we are above 50 and Auto-Increment
JME.§§CNT>50|exit
' Jump back to the start of our Loop
GTO.Loop
' Another Label
:exit
' Get time since last call to #dtime#
VAR.§§TIM=#since#
' Tell me how long time the execution needed.
MBX.§§TIM
```

If you run the script in the editor, you can see that we needed for example about 4 seconds. If you would run it as a compiled executable, it will easily be 100 or more times faster.

---

*© 2023 Theo Gottwald * https://www.smart-package.com*

The FOR .. NEX.-Loop
At this point, we could get a bit simpler when using `JOR`. I'll leave that for yourself to try. Instead we will now take the proper way of a "counting loop". It is the "FOR. ... NEX."-Loop.

Imagine you want to count from 1 to 10. How would you do that?
You would start counting with 1 ... 2 ... until you reach 10.

That is what the `FOR. ... NEX.` command is doing. If we count like In our example, from 1 to 10, it would look like this:

```
' This will count from 1 to 10
FOR.$$CNT|1|10
' ... we can do something with the number in $$CNT
NEX.
```

It will start counting from a given value (in our example it is 1), until another given value (in the example 10) is reached. All the way, we have the actual value in the variable `$$CNT`.

`FOR. .. NEX.` has **several Modes of Operation** to match all your needs.

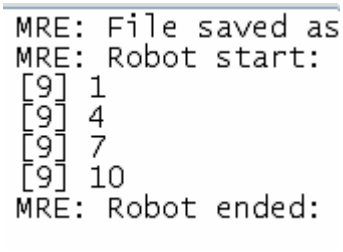
First, you can specify a STEP-value. It will look like this:

```
FOR.$$CNT|1|10|3
  DBP.$$CNT
NEX.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

You will see an Output in the Editor-Debug-Area like this:



The `[9]` tells you that the `DBP.$$CNT` command was in line 9 of our script. More important are the other numbers. They start with 1 and then the Counter always adds **3.**
That's exactly the **step-value** we have given!

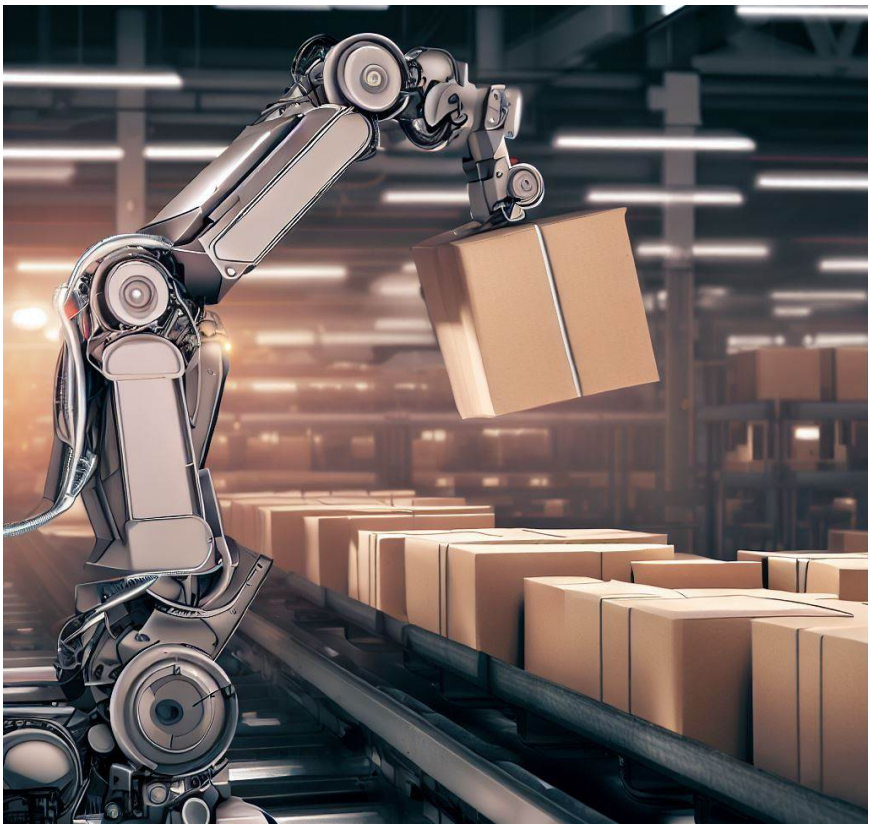
Here is another example, like the one we made before.

```
' Start our stop-watch
VAR.§§TIM=#dtime#
' Init counter variable
FOR.§§CNT|1|50
' Print the actual number
  PRT.§§CNT
NEX.
' Get the time how long we needed.
VAR.§§TIM=#dsince#
MBX.§§TIM

ENR.
```

How many seconds does it need on your computer? Using the proper counting loop, we saved a lot of lines and made all the same in for example 2 seconds!

© 2023 Theo Gottwald * https://www.smart-package.com



Do we need loops to wait for something?
Lets think of a situation, where we are waiting for files to appear or disappear.

Normally we do not need to use a loops to wait for one event to happen. The reason is that such loops are already built in. For example, to wait for a file, we can simply use the WFF. - "Wait For File" Instruction. We would write:

```
WFF.c:\Logfile.txt
```

to wait for the specified file to appear. In the opposite case, that we need to wait for a file to disappear, we would add a "<>" like that:

```
WFF.<>c:\Logfile.txt
```

This will wait for the file to "Not be there". You can also specify a timeout and test if the timeout time was reached, using the ITO. "If Time Out" - Instruction.

The same applies for many other tasks, where we can use the "Wait-For" Instruction Group.

But what do we do, if we want to wait for "one of several files" to appear?

I am using files in this example, but the same applies to any other system-object. Like windows, processes, or whatever.

To do this we must construct our own loop. This time we do not need to count anything, We need just to "Loop in a circle" until things happen.Like an endless loop.

© 2023 Theo Gottwald * https://www.smart-package.com

Until something happens. When this thing we are waiting for happens, then we leave the loop and do something.

© 2023 Theo Gottwald * https://www.smart-package.com

1.23 1.6.3 Flexible Loops

Starting Guide

Flexible Loops

Understanding Loops: The Power of Repetition

A conveyor belt is a good example of a repetitive activity

The conditional DOL. - OOP. Loop

For such situations you have the DOL. OOP. construct. Lets make a endless loop.

```
DOL.1
  PRT. I am in here forever!
OOP.
ENR.
```

Try this in the Editor, it will run in an endless loop, until you stop it. This was just for you to see how it works. Now we'll use it for a real world example.

© 2023 Theo Gottwald * https://www.smart-package.com

In reality you will have conditions when you jump out of this loop. Lets take a situation where we wait for two files. If one of them appears, we will leave the waiting loop.

```
VAR.§§FIA=?pfad\myfile1.txt
VAR.§§FIB=?pfad\myfile2.txt
' Here is our endless loop
DOL.1
  PRT. I am here!
' We test for File1
  IEF.§§FIA
    GTO.exit
  EIF.
' We test for File2
  IEF.§§FIB
    GTO.exit
  EIF.
  ' We'll give the CPU a tenth of a second sleep time
  ' always do this in endless loops to save CPU time.
  ' for other running programs
  PAU.0.1
OOP.
:exit
MBX. A file appeared!
ENR.
```

You can run this and when the file appears, the script will exit its endless loop.
While this script is completely correct, we will change it a bit. So we do not need an label "exit", and no GTO. "GOTO". We use the power of DOL. ... OOP.
These two statements allow you to construct whatever Loop you want.

```
VAR.§§FIA=?pfad\myfile1.txt
VAR.§§FIB=?pfad\myfile2.txt
' This variable will be set to 1 if the file is found
: §§XIT=0
' Loop will run WHILE §§XIT=0
DOL.§§XIT=0
  PRT. I am here!
' We test for File1
  IEF.§§FIA
    : §§XIT=1
  EIF.
' We test for File2
  IEF.§§FIB
    : §§XIT=1
  EIF.
  ' We'll give the CPU a tenth of a second sleep time
  ' always do this in endless loops to save CPU time.
  ' for other running programs
  PAU.0.1
OOP.
:exit
MBX. A file appeared!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

We would construct the same loop better as a "REPEAT ... UNTIL" loop. Because that is what we are doing. We REPEAT ... UNTIL a file is found. Therefore we change it again.

```
VAR.§§FIA=?pfad\myfile1.txt
VAR.§§FIB=?pfad\myfile2.txt
' This variable will be set to 1 if the file is found
: §§XIT=0
' Here is our loop
DOL.
  PRT. I am here!
' We test for File1
  IEF.§§FIA
    : §§XIT=1
  EIF.
' We test for File2
  IEF.§§FIB
    : §§XIT=1
  EIF.
  ' We'll give the CPU a tenth of a second sleep time
  ' always do this in endless loops to save CPU time.
  ' for other running programs
  PAU.0.1
' This loop will repeat UNTIL §§XIT=1
OOP.(§§XIT=1)
:exit
MBX. A file appeared!
ENR.
```

CPU-time considerations

Now let us see an endless loop:

```
 :Loop
... do something
GTO.Loop
```

This is just an example for an endless loop. You have many more options to build loop.
See here: 1.6.1. Program Flow Control

Now if you run this as a compiled executable it will run very fast!
Here is an example:

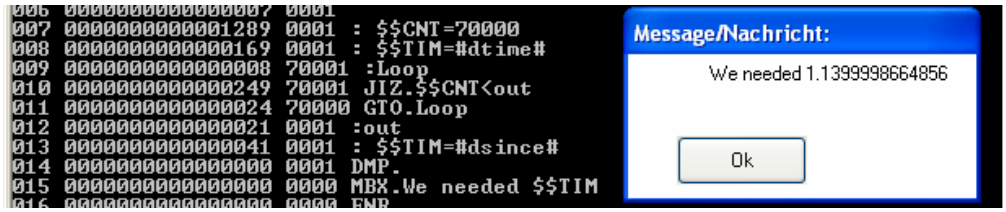
```
: $$CNT=70000
: $$TIM=#dtime#
:Loop
JIZ.$$CNT<out
GTO.Loop
:out
: $$TIM=#dsince#
DMP.
MBX.We needed $$TIM
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

This Loop will be processed about 70000 times in about a second, see picture below. This needs a good part of possible CPU-time. If you have a multicore CPU, it may take a complete core just to run in a circle.

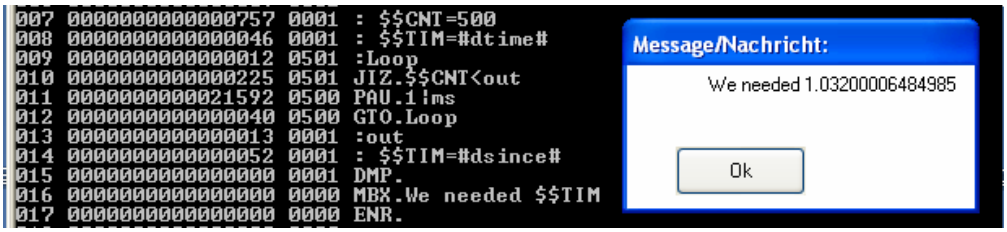
In most cases you wait for something to appear or something to disappear. You don't need 70000 checks per second, 100 would be more then enough.
Using the `PAU.` - Instruction, you can slow the process down and give CPU-time to other running processes.



We can change the script like this:

```
: $$CNT=500
: $$TIM=#dtime#
:Loop
JIZ.$$CNT<out
PAU.1|ms
GTO.Loop
:out
: $$TIM=#dsince#
DMP.
MBX.We needed $$TIM
ENR.
```

and get this result:



This time we just make 500 rounds (still a lot!) and in each round a rest of 1 ms.
1 ms = 1/1000 th part of a second.

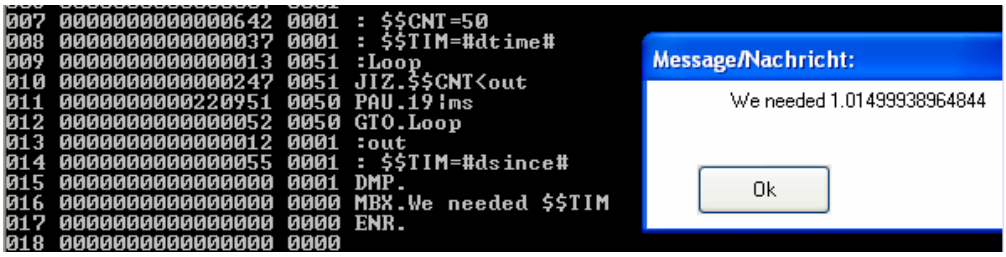
Lets get it down to about 50 rounds per second. This way we can finetune the CPU Usage of our script.

```
: $$CNT=50
: $$TIM=#dtime#
:Loop
JIZ.$$CNT<out
PAU.19|ms
GTO.Loop
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
:out
: $$TIM=#dsince#
DMP.
MBX.We needed $$TIM
ENR.
```

this will get the expected result, 50 rounds per second with a waiting time of about **19 ms** per round. Of course these time differ with the used system, CPU etc. You may get other values on your system.



However, this example should get you started how to "fine tune" Loops, for example in case you run server-based scripts.

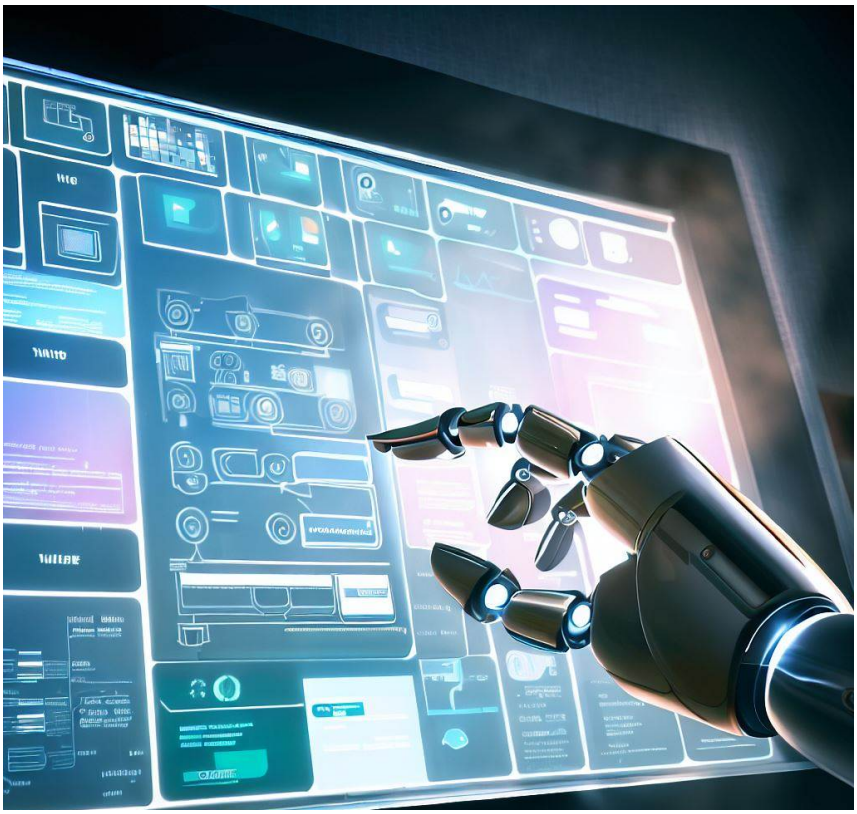
© 2023 Theo Gottwald * https://www.smart-package.com

1.24 1.7. Application and PID

Starting Guide

Application and PID

Understanding Applications and Processes



What is an application?

An application is a program that you interact with on your computer. When you start an application, typically a window appears which allows you to input commands and control the application via clicking and typing.

What is an application window?

An application window is an interface that allows you to interact with the application. It lets you control the application and view its output.

What happens when you close an application window?

Usually, when you close an application window, the corresponding application process also ends and is removed from the task manager. However, there are instances where the window is closed, yet the process remains in the task manager.

What does 'killing a process' mean?

© 2023 Theo Gottwald * https://www.smart-package.com

Killing a process refers to manually terminating it, typically through a tool like the task manager. When you kill a process, its associated application window will close and disappear from the task manager.

Can an application have multiple windows?

Yes, an application can operate with one, several, or even no windows.

Can a single window be linked to multiple processes?

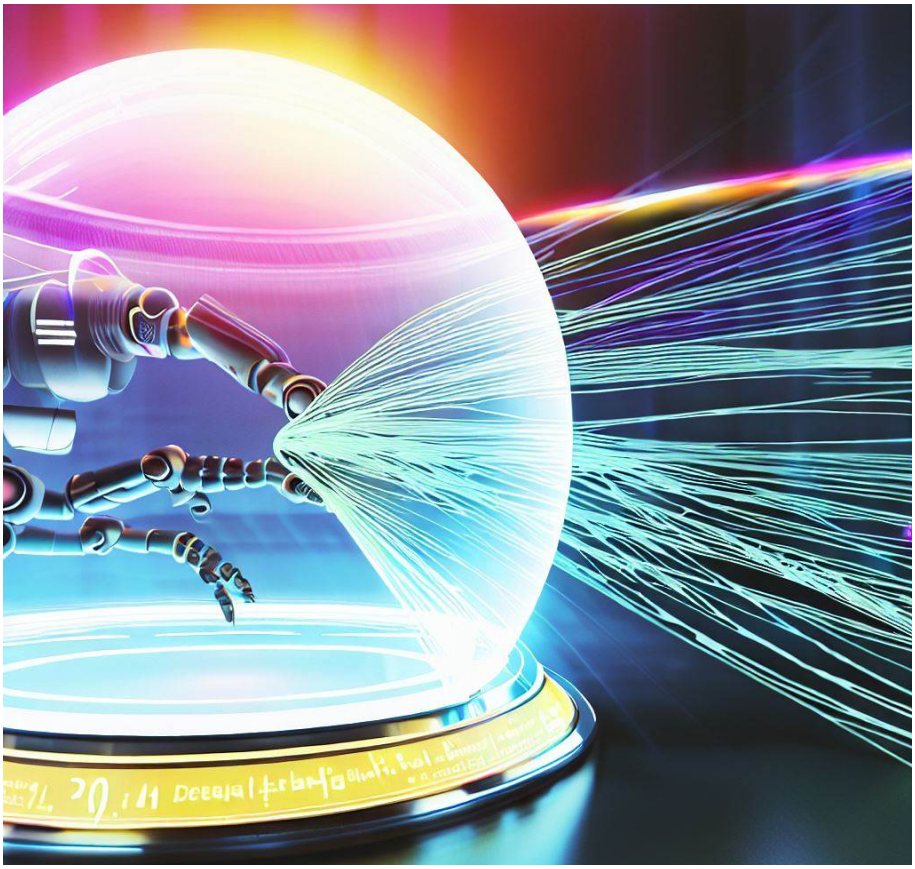
No, each window is directly associated with a single application process.

What is the difference between an application and a process?

A process refers to any task that's visible in the task manager, whether it's tied to a window or not. An application, on the other hand, requires a window because you need an interface to interact with and control it.

What is a PID or Process-ID?

PID stands for Process Identifier. In the context of computing, a PID is a unique numerical identifier assigned by the operating system to each running process. This allows the system and users to track and manage processes. It's similar to how each student in a school is assigned a unique roll number.



**A multitasking OS enables you to run hundreds or Processes at the same time.
Each of these processes can contain several parallel running Threads.
All of these are defined by a unique Process ID and Thread ID.**

What is a Thread?

© 2023 Theo Gottwald * https://www.smart-package.com

A Thread is "Multitasking inside of a Single process". If an Application has several Threads running, this means it has several small processes running at the same time.
A thread is the smallest unit of execution within a process. While a process contains the program code and its own memory space, a thread contains a program counter, a register set, and a stack space. Multiple threads within a process share the same data space with the main thread and can therefore communicate with each other more easily than if they were separate processes. Threads are sometimes called lightweight processes.

What is a Thread-ID (TID)?

Similar to a PID, a Thread-ID (TID) is a unique identifier assigned by the operating system to each thread within a process.
In computing, a thread is the smallest sequence of programmed instructions that can be managed independently by an operating system's scheduler. Essentially, a thread is a unit of execution within a process.

Each thread within a process has a unique identifier known as a Thread-ID or TID. This identifier allows the operating system to manage and keep track of individual threads within a process. It's important to note that a single process can have multiple threads, each with its own unique TID.

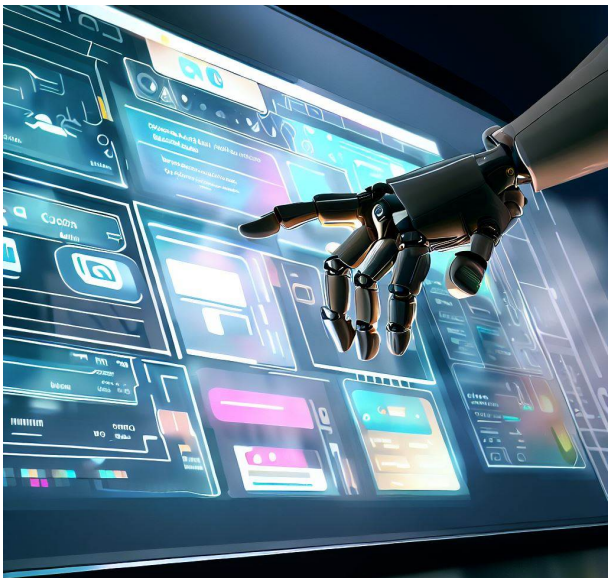
In terms of how threads are used, they allow for concurrent operations within a process, making it possible for multiple tasks to be performed at the same time within the same program. For example, in a web browser, one thread may display the user interface, another might handle network communication, and yet another might run JavaScript code on a webpage.

This allows for the tracking and management of individual threads. It's important to note that a single process can have multiple threads, each with its own unique TID.

How can robot-scripts interact with applications?

Robot scripts can be written to perform a variety of tasks within an application, such as clicking buttons, entering data, and more.

© 2023 Theo Gottwald * https://www.smart-package.com



What can we do with applications using the robot-scripts?
We can start an application in multiple ways. For example using:
EXA. - Execute Asynchron 872
EXB. - Execute-Blocking 876

We can kill an application using the commands:
KPN. - Kill Process by Name 2904

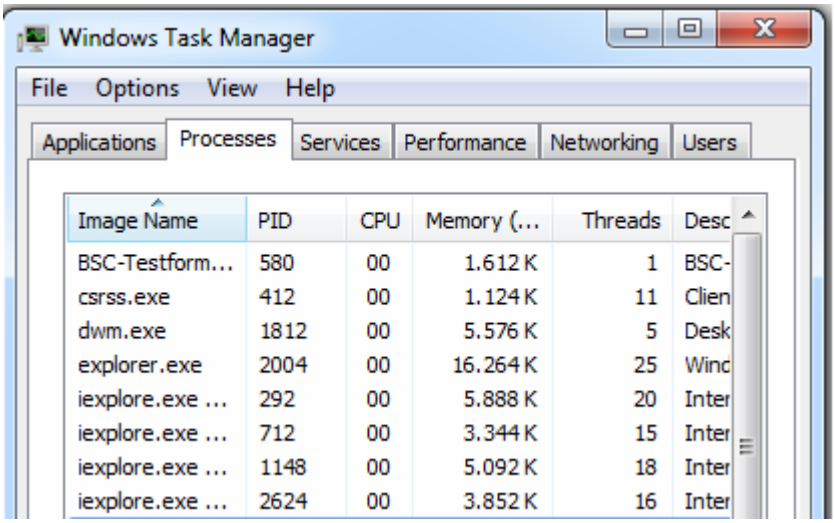
We can check if an specified application is actually running.
IEP. / NEP. - If-Exists-Process 2900

And finally we can enumerate/count all running processes using
FEP. - For-Each-Process 932

Which is less often used.

Lets take a look into the task-manager, which applications/processes are currently running:

© 2023 Theo Gottwald * https://www.smart-package.com



What we can see is that there are several processes with the same name "iexplore.exe".
But how do we find the one we need?

How can we select a specific process/application?

Rather then selecting a process "by name", we can use the process-ID (PID).
The PID is a number that is unique to each process. Having the PID, we can work with the process.

Using the PID we can do things like:
CPR. - Close-PRocess 2882

Find out which user has started the process:
GPU. - Get Process User 2898

we can wait until a process ends. Using
WPT. - Wait-Process-Termination 2913

If we have just started a process - for example with -
EXE. - Execute Programm 883

then we can use
WPR. - Wait-Process-Running 2911

to be sure the process we need is running. A PID is a magic number when dealing with applications and processes. If you have the PID, you can do anything you want with that process. As long as you have the sufficient rights.

How do we get the PID from an process or application?

1. We may get the PID directly from the starting command. Only starting commands that wait until the process is running, can support filling #pid#. Therefore see the description of the starting command if it supports #pid#.

If we use:

© 2023 Theo Gottwald * https://www.smart-package.com

```
EXE.?pfad\UltraVNC_1.0.9.6.1_Setup.exe
VAR.$$PID=#pid#
MBX.MY PID is: $$PID
```

we get the PID in the system variable `#pid#` automatically.

2. We get the PID from any window. It doesn't matter if its a Top-Level window or a control (child-window). If we have the window, we can get the PID like this:

```
STW.t|Testapp
' We'll put the PID of the process from that window
' into the variable $$PID using the GDF.-command
GDF.ap|$$PID
```

It does not need to be a Top-Window, it can be any actual localized window, try this

```
STW.t|Testapp
SCW.c|butto
GDF.ap|$$PID
' Will print the PID in the Debug-Area of the Editor
DBP.$$PID
ENR.
```

3. We can get the PID from the name of the EXE-File

```
VAR.$$FIL=?exepath\MR01.exe
GDF.fp|$$FIL|$$PID
' Will print the PID in the Debug-Area of the Editor
DBP.$$PID
ENR.
```

or we can use `IEF.` for that.

```
' Get the PID using IEP.
IEP.Testapp_01.exe
     MBX.#pid#
ELS.
     MBX. That Application is not running!
EIF.
ENR.
```

`GDF.` works with any process in the Task-Manager, no matter if that process has a window or not.

What makes IEP. (If exist process) so powerful?

IEP. primarly helps you to find out, if a process is running. For this you can specify the process in several ways, including the use of 3.2 Standard-Search Pattern 341.

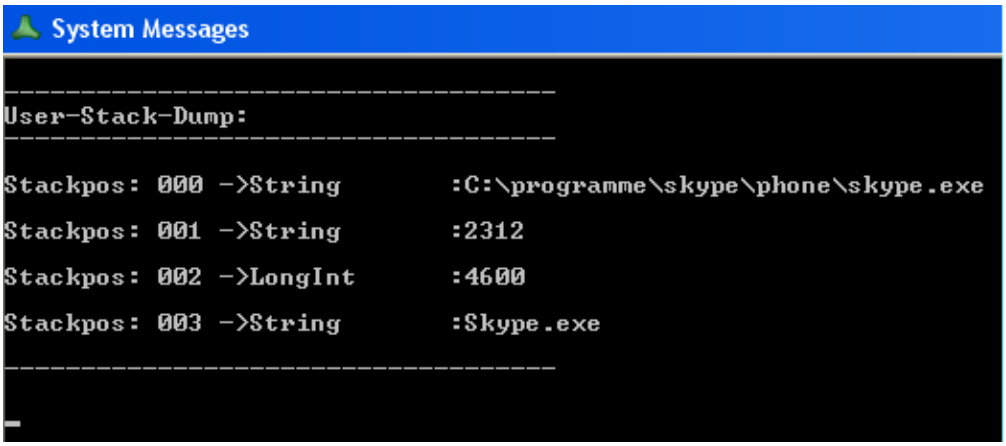
Assume you use IEP. to check if there is a process like this:

 © 2023 Theo Gottwald * https://www.smart-package.com

```
IEP.sky
  DMP.6
EIF.
MBX.Ready

ENR.
```

Now IEP. finds such a process. But what is the real name of the process?
sky ... what?
We have just specified "sky". As IEP. uses Standards Search Patterns, any part of thereal name is valid.
The name of the process must only contain that phrase. We get this information if we take a look on the actual stack.



`IEP.` provides us with a lot of information about the found process. In position zero

```
IEP.x64.exe
   MBX. Process ID is: #pid#
EIF.
```

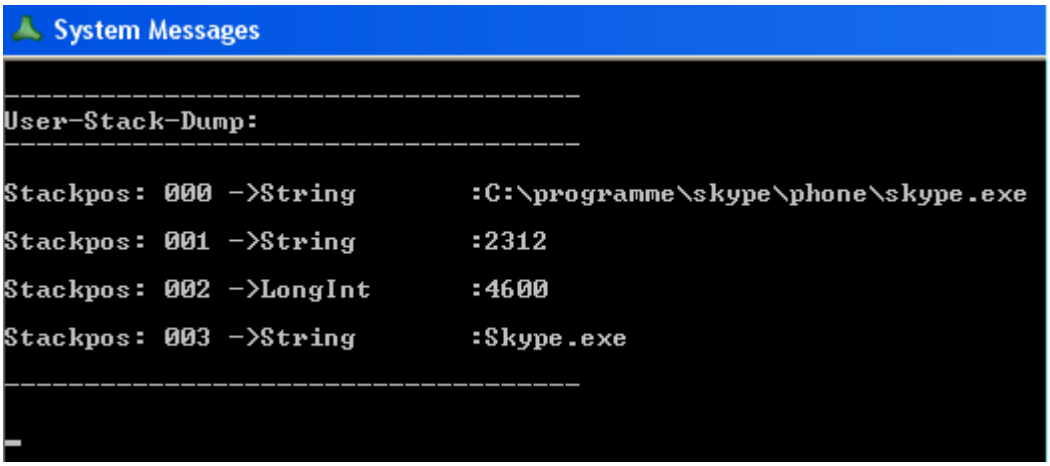
If you have multiple EXE running with the same name, you can specify a number. If the EXE is found, the #pid# is set to the EXE's Process-ID. Please note that #tid# is always set to zero.

You can specify a full path, or only the filename or a part of it. If you search for a dll, then the extension ".dll" must be included in the pattern.

You can use `NEP.`, the negative Form of this command (`NEP.` - Not Exists Process).

If a process is found, valuable information is placed on the actual stack. These include the full name and path of the found executable.

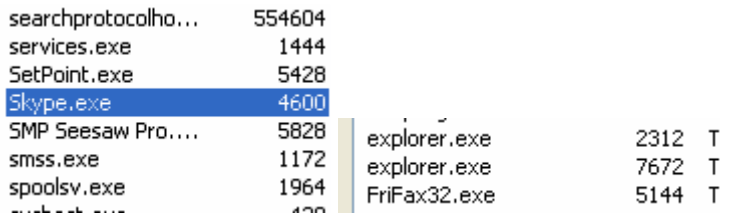
© 2023 Theo Gottwald * https://www.smart-package.com



Below are two snapshots of the windows-taskmanager. Skype.exe has the PID (process-id) 4600. Its on the stack on position 02 in the picture above.
The 2312 which is on position 01 (picture above) is the parent-process, that is the process which has started skype.exe.
In the task manager, we can see that this is the PID of the windows-explorer. This way you can find out which process has started another process.

If you give IEP. a variable as third parameter, then the stack will not get the full path of the found file. You will find it in the given variable instead.

Please note that the 2.4 The global and local Stack 369 as Que or as Stack will influence the sequence in which the items appear on the stack.



You can also use IEP. to verify, if a process with a specified **PID is alive** or not.
To do this, the Syntax is:

```
STS.GLOBAL
IEP.>1234
   MBX.PID 1234 (Filename=$$000) is alive!
EIF.
```

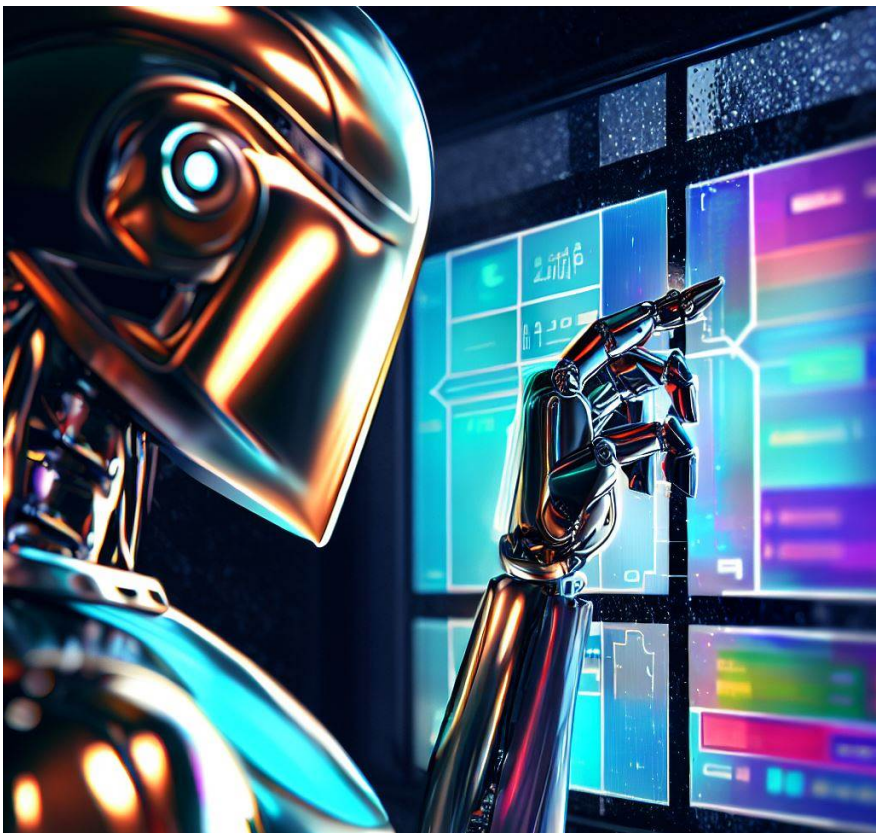
1.26 1.8. Selecting the Application (Topwindow)

1.8. Selecting the Application (Topwindow) Previous 137 Top 41 Next 156

Starting Guide

Selecting the Application Locating the Topwindow

Choosing the Application: Understanding and Interacting with Windows



On your command will the robot interact with Applications and windows.

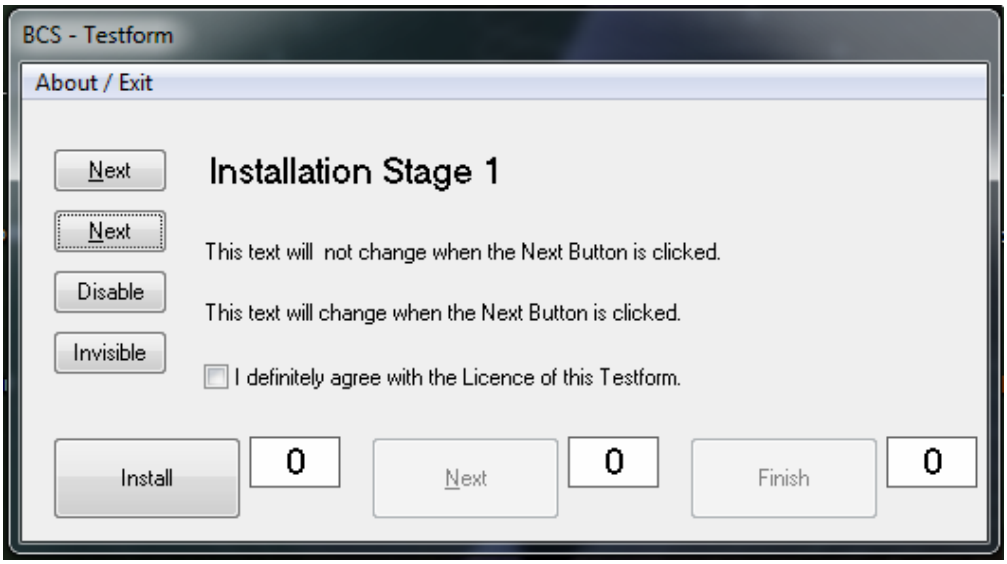
How do we instruct a robot to select a specific window for interaction?

At first glance, the concept of a 'window' might seem rudimentary, given our daily interactions with them. We routinely open, close, resize, minimize, and maximize windows in conjunction with applications. However, there's more to windows than meets the eye. Let's delve deeper into understanding what windows are and their significance.

Exploring Application Windows: The Gateway to Software Interaction

Before we proceed with our discussion on windows, let's take a moment to visually explore a window.

© 2023 Theo Gottwald * https://www.smart-package.com



The "Sample Apps" subfolder in your installation directory contains a variety of test applications. However, what you're interacting with is not the application itself, but its window. Since we control the application via the window's buttons and controls, it's easy to conflate the two. To delve deeper into the distinction between processes and applications, refer to Chapter 5: 5. Application and PID 32.

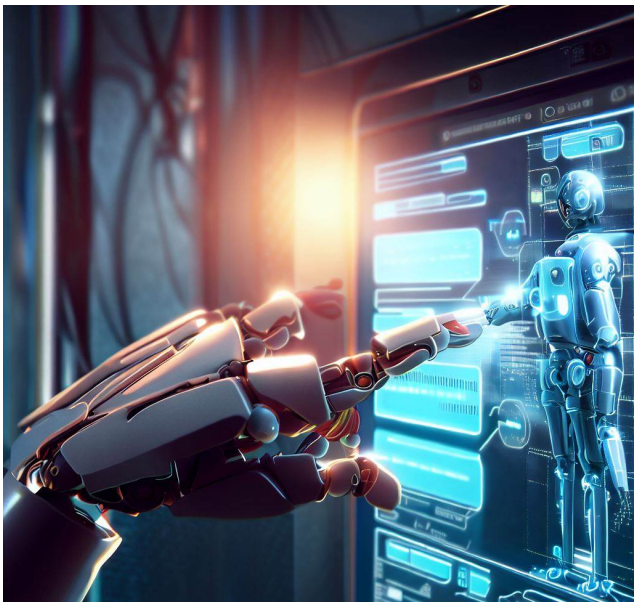
So, what can we do with these application windows?

Here's a rundown of the various actions you can perform:

1. Launch it by starting its associated application.
2. Move it around to adjust the window position on your screen.
3. Resize the window to fit your viewing preference.
4. Minimize it to temporarily remove it from view while keeping it running.
5. Maximize it to occupy the entire screen for a more immersive experience.
6. If it's minimized or maximized, you can "normalize" it back to its original size and position.
7. Close it to terminate the application.
8. Adjust its Z-Position, allowing you to bring it to the forefront or send it behind other windows.
9. Interact with its elements according to their roles, such as pressing a button or adjusting a slider.

Most of these actions can be performed effortlessly with your mouse.
And also the robot can do all of this.

© 2023 Theo Gottwald * https://www.smart-package.com

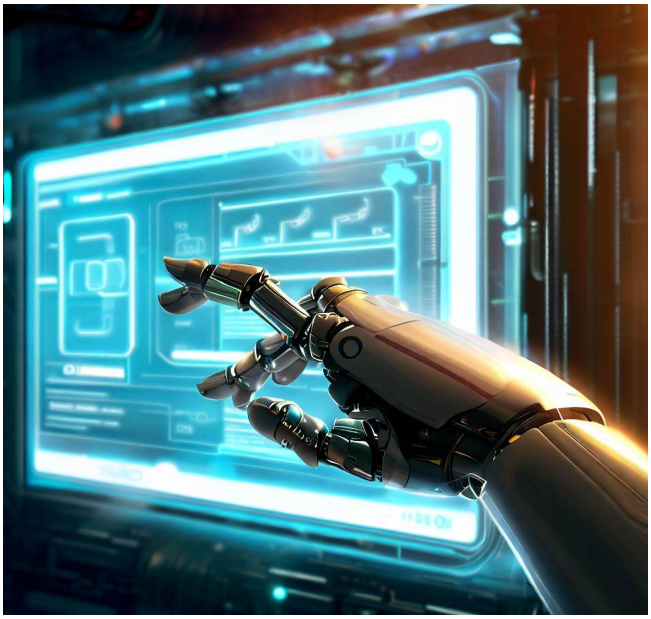


Harnessing Advanced Capabilities with the Robot

Utilizing the robot provides us with an expanded set of options for interacting with windows. With the robot, we can:

1. Disable any window, effectively preventing any interaction with it.
2. If a window is disabled, we can enable it, restoring its functionality.
3. Make the window invisible, hiding it from view without closing it.
4. If a window is invisible, we can make it visible again, bringing it back into view.
5. Change the text displayed in the window.
6. Perform a variety of other actions, depending on the specific type of window we're dealing with.

These advanced capabilities allow us to manipulate and control windows in ways that go beyond standard user interactions.



© 2023 Theo Gottwald * https://www.smart-package.com

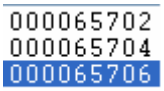
Unveiling the Secret of Windows: The Window Handle

Now, it's time to share a little-known fact about windows. Consider the analogy of a newborn child. Upon birth, the child is given a unique name that they carry throughout their life. If you wish to call upon the child, you use their name. Similarly, windows receive a unique identifier at their creation, but in their case, it's a number, not a name. Why a number? Because computers process numbers much faster than names.

Each window is assigned a unique number, known as the "window handle." This number is guaranteed to be unique, much like a person's name, but it's a numerical value, making it easier for the computer to process. The window handle allows you to interact with the window, much like using a person's name to get their attention.

So, if you want to instruct the robot to interact with a specific window, all you need is the window handle. It's unique and concise, making it an efficient way to identify windows.

Let's take a look at some examples of window handles before we proceed.



The Dynamic Nature of Window Handles

Indeed, using the window handle, such as

```
STW.h|65702
```

makes it straightforward to select a specific window for interaction.
It guarantees that you will access the exact window you desire.

However, there is a crucial aspect to consider: the lifespan of windows. Each window is created when you start your program and ceases to exist when you close your program or power off your computer. Here lies the challenge: Every time a window is born, it is assigned a new and unique window handle.

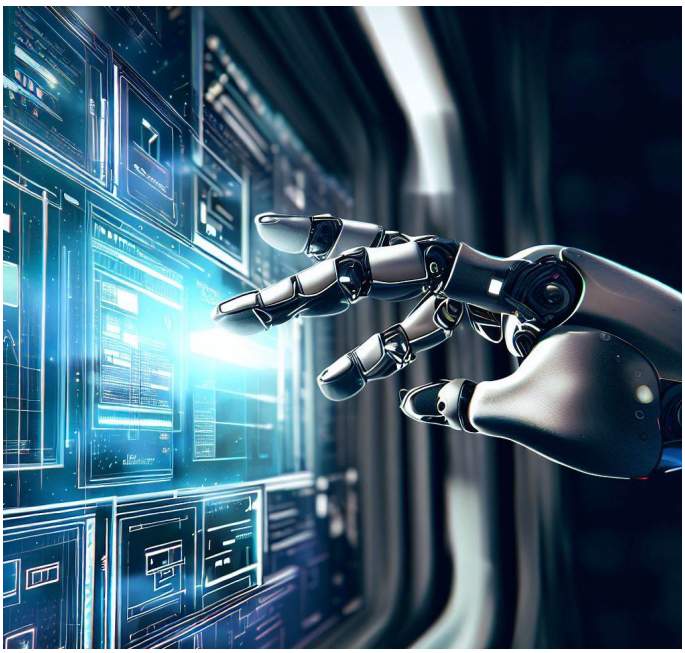
Knowing this, we must acknowledge that our script,

```
STW.h|65702
```

will not work if we run it again after closing the application and restarting it.
The window handle associated with the desired window will have changed due to the window's new instantiation.

Therefore, it is essential to consider the dynamic nature of window handles and adapt our approach accordingly.
But then ...

© 2023 Theo Gottwald * https://www.smart-package.com



How do we really select a window to deal with?

To effectively select a window for manipulation, we must obtain its unique handle. Once we have the window handle, we gain the ability to interact with the window as desired. The process of obtaining the handle involves "locating" the window and determining its handle and position.

Fortunately, we do not have to perform this task manually. The robot can handle it internally by retrieving a list of all available windows and selecting the specific window we desire.

To achieve this, we provide the robot with a set of window parameters that uniquely identify the desired window. These parameters should remain consistent, regardless of when or where the script is executed.

In many cases, we use the window's caption text as a parameter. For example:

```
' Locate the window
STW.t|BCS - Testform
' Store the window handle in the variable $$MYH
HTV.$$MYH
```

When the window becomes available, the robot will locate it and internally store its handle. We can then store the handle in a variable, such as `$$MYH`. From that point on, whenever we write:

```
STW.h|$$MYH
```

we can be confident that the script will locate the exact window we desire—the window with the handle stored in `$$MYH`.
If you wish to see the window handle, you can add the following line to the script:

```
' Locate the window
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.t|BCS - Testform
' Store the window handle in the variable $$MYH
HTV.$$MYH
MBX. The handle is: $$MYH
```

In practice, we often specify multiple parameters for increased reliability. This ensures that we locate the correct window, even if multiple windows share the same caption on the desktop.

Some commonly used window parameters include:

1. Window class: This parameter specifies the window class, which may look like:
   `STW.ct|PBWindowClass|BCS - Testform`

2. Window ID: Please note that the window ID should not be confused with the window handle. The window ID is often a unique and permanent number, but its usability varies depending on the window class. It is advisable to avoid using the window ID, especially if the window class begins with a "t," as in
   `"tnewcheckbox"`

3. Process ID: You can instruct the robot to select windows only from a known process ID (PID). If your application has only one window associated with its PID, you can write:

```
STW.p|2320
```

to locate the desired top window, regardless of whether it is a 32-bit or 64-bit application. If multiple windows share the same PID, there is no guarantee which window will be selected, although it is likely to be the topmost window.

Therefore, locate a Top-Window best with a combination of these parameters. There are a lot of parameters available, see the

The SPR-Editor's recording option and the Installation Recorder InstaRec are valuable tools that simplify the process of locating windows. With their automated functionality, they can intelligently choose the most suitable variant to locate the window, streamlining the window identification process. This feature saves time and effort by automatically determining the appropriate parameters based on the specific window being accessed. Whether you're using the SPR-Editor or the Installation Recorder InstaRec, these tools provide a convenient and efficient way to handle window location in your automation tasks.

1. STW. - Decription 3814

The next step is, that you learn about Child-Windows and how to locate then in the chapter:

7. Locating Child-Windows 32

* the Installation folder is the folder, where you have installed the robot program.

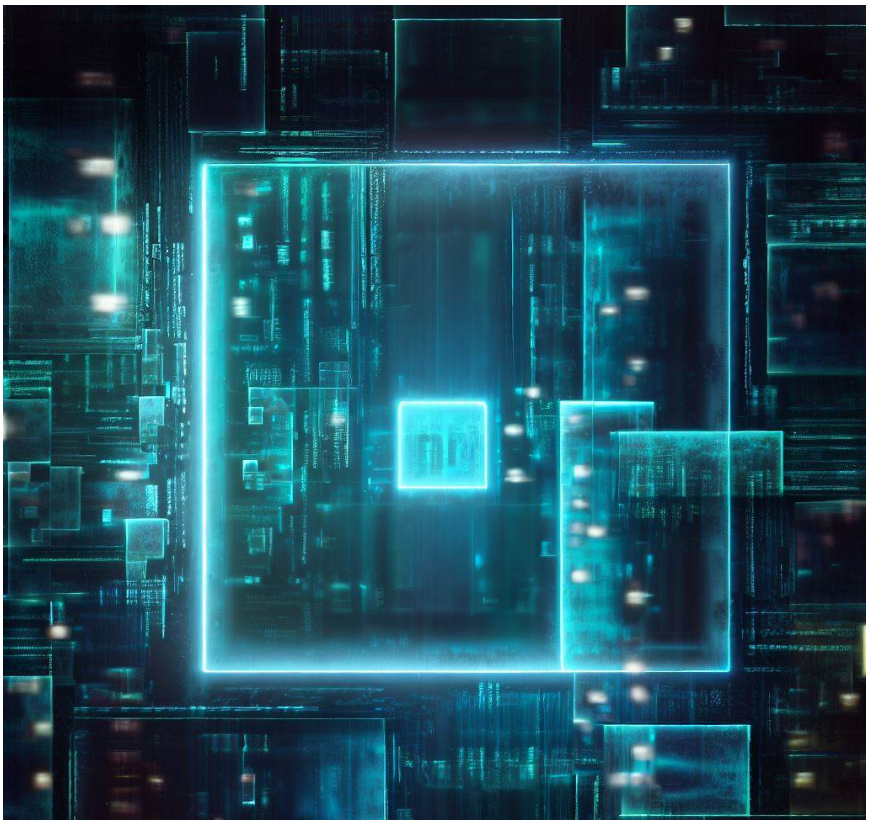
1.27 1.8.1 The "Client" and the "Non-Client" Parts of a window

Starting Guide

"Client" and "Non-Client" Area

Whats it, and what's it good for?



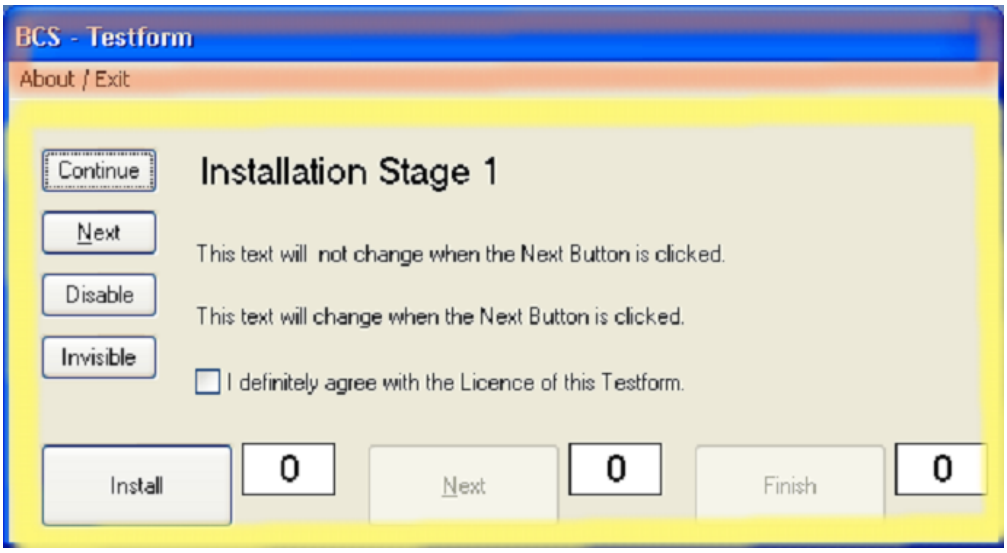
What is the "Client Area" of a window and why do we need it?

To answer this question best, think a moment like a developer of a windows-application.

Building a windows-application a developer can place controls, statics and pictures inside a window. But not really anywhere in the window, but only in the so called "Client Area".
That is the area, where a Software developer can place its controls.
The "Non Client Area" is the common part, that is equal to all windows. The parts that are drawn from the OS, to some degree independent from the Software in the "Client Area".

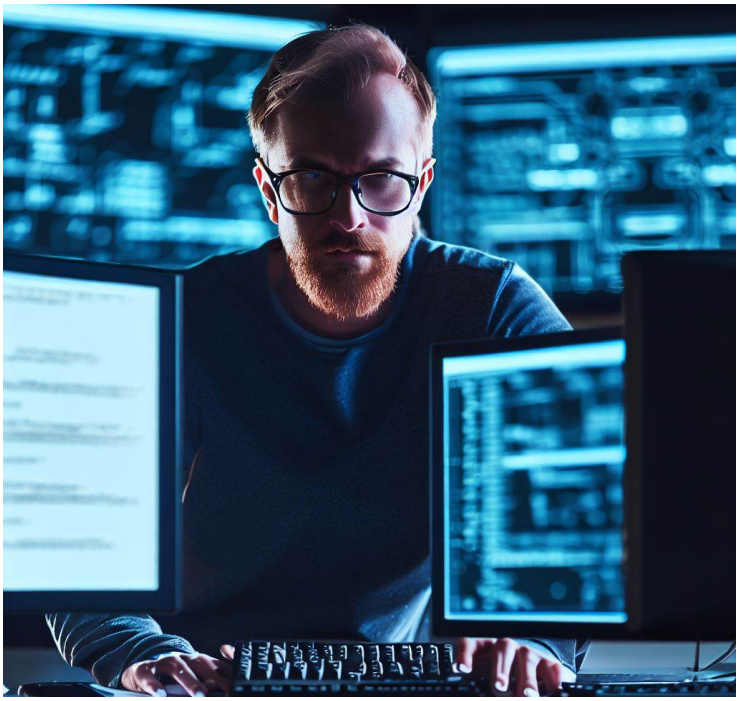
Lets take a look on the window below and see the difference between the "Client-Area" (yellow) and the "Non-Client Area" (orange color).

© 2023 Theo Gottwald * https://www.smart-package.com



As you can see, the following parts of a window belong to the "Non-Client Area":
- Complete Window Border
- Sizing, Foreground, Help, Close and Minimize Gadgets
- System Menu
- Real" Top-Menus, means Menus which belong directly to the Top-Window

The rest of the window is under the control of the software developer and is as such called "Client Area".



Here comes the "input focus" ...

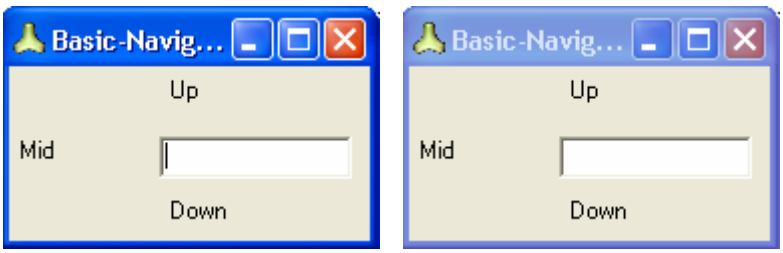
- When taking a Screenshot from a window, we must know if want the complete window or (as most often) just the "Client Area" of the window.

*© 2023 Theo Gottwald * https://www.smart-package.com*

When using IRA. or WRA. we should work with the Client Area only.

Otherwise simply giving the windows the "Input focus" would change the color of the "Non-client area. You can see this below.

The window below on the left side has the "Input focus". Please note the blinking cursor inside the textbox. The picture on the right side shows the same window without the input focus. As you can see the "non client area" has a completely different Color.



Note that also a blinking cursor like the one in the left picture may cause IRA. /WRA. and such, to notify "a change" in the client area.

Coordinate Systems

Coordinate Systems in our sense are 2-dimensional. They describe a location on the screen using an
X - value (Horizontal position)
Y - value (Vertical position)

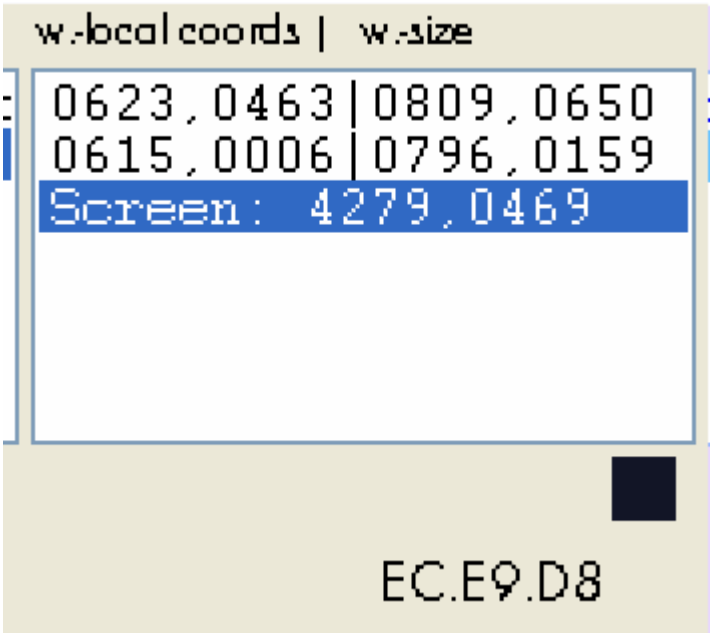
Our Coordinate systems generally have their zero (0,0)-Point in the upper, left corner.

We have three coordinate systems in use with windows.

© 2023 Theo Gottwald * https://www.smart-package.com

1. Screen-Coordinates

Screen-Coordinates have their zero (0,0)-Point in the upper, left corner of the desktop.
The total and maximum resolution is the Screen-Resolution.
If you have multiple Screens (Dual Screen), then the coordinate system goes over all available Screens.
The Screen-Coordinate where the mouse currently is, is displayed in the Windows-Inspector behind the "`Screen:`", see here:



© 2023 Theo Gottwald * https://www.smart-package.com

Screen coordinates have some disadvantages.

For example, if you have the coordinates of a button, and you move the window around, the screen coordinates are not more accurate.

Therefore we have a second coordinate system:

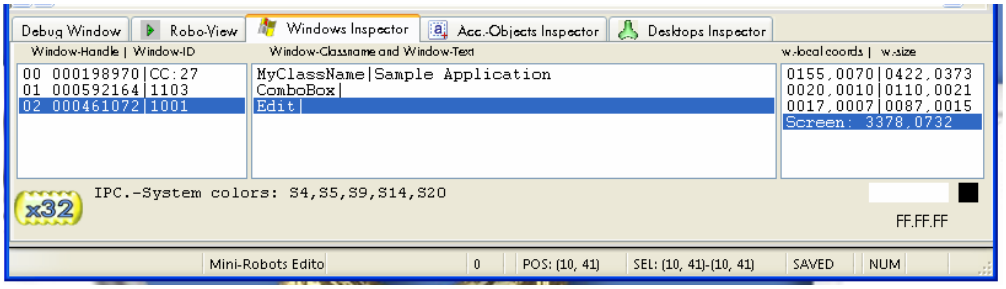
---

2. Window-relative coordinates:

These coordinates have their origin (0,0-Point) in the upper left corner of the "non-Client-Area" of the window. Therefore if you move the window, they will move with the window.

Window coordinates have the advantage that you can reach any part of a window, whether in the client- or in the Non-Client-Area. That's the reason why we use them most often. And their main-advantage is that they move with the window.

You can see the window coordinates right of each child- or Top-window in the windows-inspector. See the numbers on the right side. They show you first the current Mouse-Position in window-coordinates. And right of that you see the dimensions of the child-window.

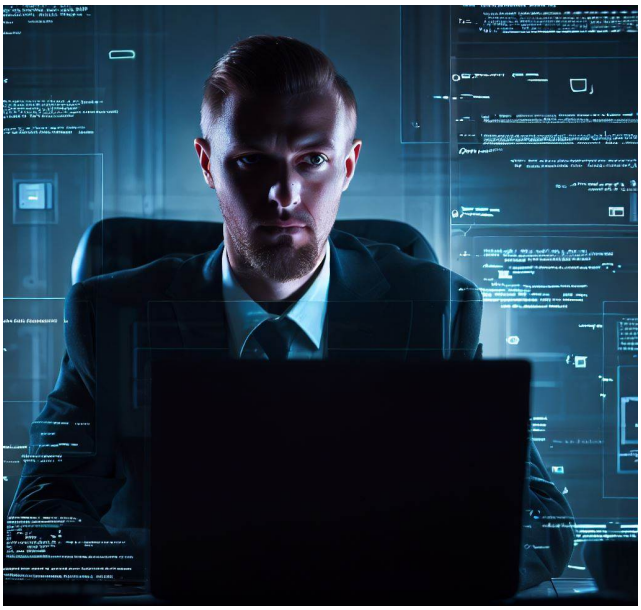


© 2023 Theo Gottwald * https://www.smart-package.com

But as anything, windows-coordinates have a small disadvantage when it comes to different Window-OS'es.

Imagine that the Title-bar would have another size on another window-OS.
In this case the Window coordinates will not be accurate anymore. This way, they may not work on another windows-system.

We have a third coordinate system that overcomes this problem:



3. Client-Coordinates

These coordinates have their origin (0,0-Point) in the upper left corner of the "Client-Area" of the window.
Therefore if you move the window, they will move with the window like window-coordinates. And they do not depend on the styles of the windows-outline. Because they only contain the "Client-Area".

The disadvantage of Client Coordinates is, that you can not easily get to any point outside the client Area. In fact you could do that by using negative coordinates.

Currently we do not use Client Coordinates, they are however implemented in the `CST.`-command so you can use them your self if you want.

*© 2023 Theo Gottwald * https://www.smart-package.com*

1.28 1.9. Locating Child-Windows

Starting Guide

Childwindows and how to locate them

What are these child-windows and why do we need them?

What is a child-window and why do we need it?

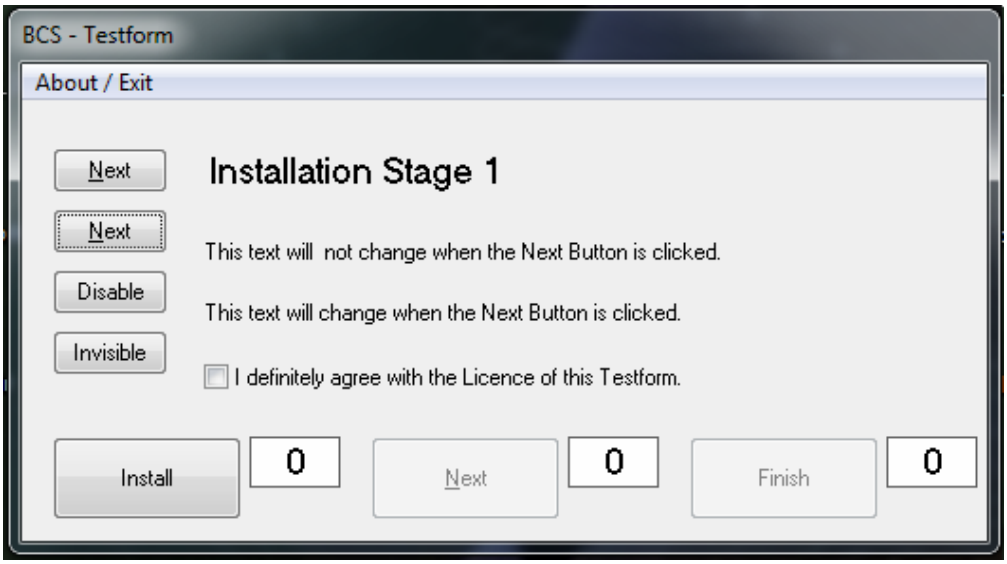
Before you start reading this chapter, make sure you are familiar with
6. Selecting the Application (Topwindow) 32

At this point i assume that you know the terms:
- Top-Window
- Window-Handle

and you should also be familiar with the chapter
5. Application and PID 32
means you should know what a process is and what a PID is.

Again we take a look on a window here.

© 2023 Theo Gottwald * https://www.smart-package.com



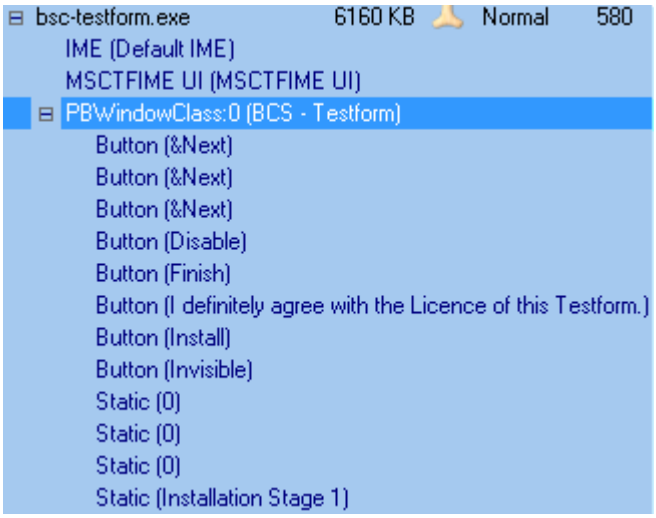
This is one of the Test-Applications in the "Sample Apps" Subfolder of your Installation folder*. In fact its not really the Application its just the Application window. Because we control the application via the window buttons and controls, we often think of the application as the window.

In this chapter we are not going to talk more about the whole window (the Top-Window). Instead we will take a look on the buttons and text-boxes on this window. These are the controls with which you control the application. And in fact, that is why they are called "controls". You can read their text. See if they are enabled or disabled.
You can press a button or type text into a text box (while not in this application).
And now let me lift the secret about Child-Windows.

What are "Child-Windows"?

So far it belongs to us, we can safely assume that Childwindows and "Controls" are just the same. A button is a child window. A text-box is a child-window. There are 50 child-windows in that Top-Window we see above. Technically for windows the Hierarchy of "Process, Top-Window and Child-Windows" look like this:

© 2023 Theo Gottwald * https://www.smart-package.com



To understand it a bit better, we need to know that the Windows OS protects the Memory in which an Application resides from any access through other applications. If an application tries to read or write behind that Protection Border, you will see that application crash with one of those GPF's (General Protection Fault) Error Messages you know.
And now imagine that in this protected Application Memory there is everything inside that belongs to that application, that includes the application windows.

Now back to the picture above. Below the Top-Window you can see a lot of Buttons and other Child-Windows. They are childs from that Top-Window. If the Top-Window is been destroyed (closed) all of these Child-Windows are also history.

What can we do with child-windows?

- we open them together with their Top-Window, by starting their application
- we can handle them according to their role (press a button, pull a slider etc.)

Using the robot you get advanced powers with child-windows:

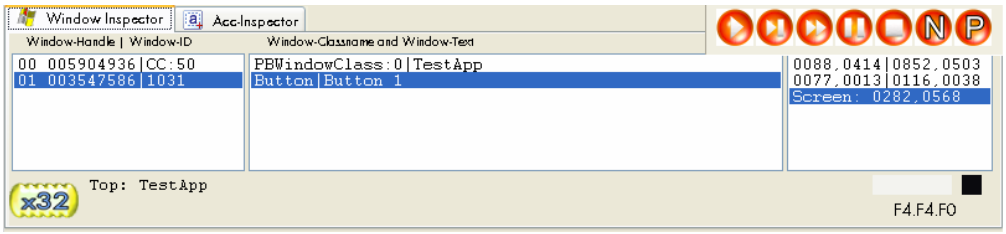
Using the robot we have more options, about what we can do with child-windows.
We can:
- change their window position and size
- minimize it (yes you can really minimize a child-window using the `SWS.m` command)
- maximize it
- if it was minimized or maximized, we can "normalize" it, to its normal size and position
- and finally we can close it
- we can disable any window
- if it was disabled, we can enable the window
- we can make the window invisible or
- if its invisible, we can make it visible again

we can also

© 2023 Theo Gottwald * https://www.smart-package.com

- change its displayed text using the `SDT.`-command
and do a lot more such things, depending on what sort of window we have to deal with.

Now its time to tell you a secret about child-windows.
This time its maybe not really a secret, if you have read the chapter about Top-Windows. Yes, its true. Child-Windows do also each have its unique window handle. A button has a window handle. As well as a checkmark or a textbox or whatever. They just look exactly like window-handles from top-windows. You can not see any difference.
Only if you look into the windows-inspector you will see that ...



The Top-Window is at the Top of the List and has a Level (the number on the very left) of "00". The child windows are below the Top-Window. They start with a Level of "01".

The Inspector will show you all windows below the mouse-pointer. He will show you the Level, the window handle and in the first line you see a "CC:50". This means that this Top-Window has 50 Child-Windows. Next in the Middle part you will see the "window class" and then a Pipe-Symbol (|) followed by the window-text.

On the right side in the Inspector you will see the actual Mouse-position relative to the window in which the mouse is in. And then again a pipe followed by the size of that window/child-window.

Below you can see the position of the mouse in Screen-coordinates (relative to the desktop window). "Screen: 0282,0568".

Now, how do we locate Child-Windows (buttons etc.)?

We do it using the `SCW.` command and in the same way like with Top Windows. While we have some more options with Child-Windows, then we had with Top-Windows.
Top-Windows do mostly not have a usable Window-ID.
Top-Windows do not have a "depth" because they are always on Level "00".
Child-Windows may have a valid ID and they always have a (depth=) Level of "01" or higher. Because they re below a Top-Window or below other Child windows in the Window-Hierarchy.
These are additional parameters we can use when addressing child-windows.

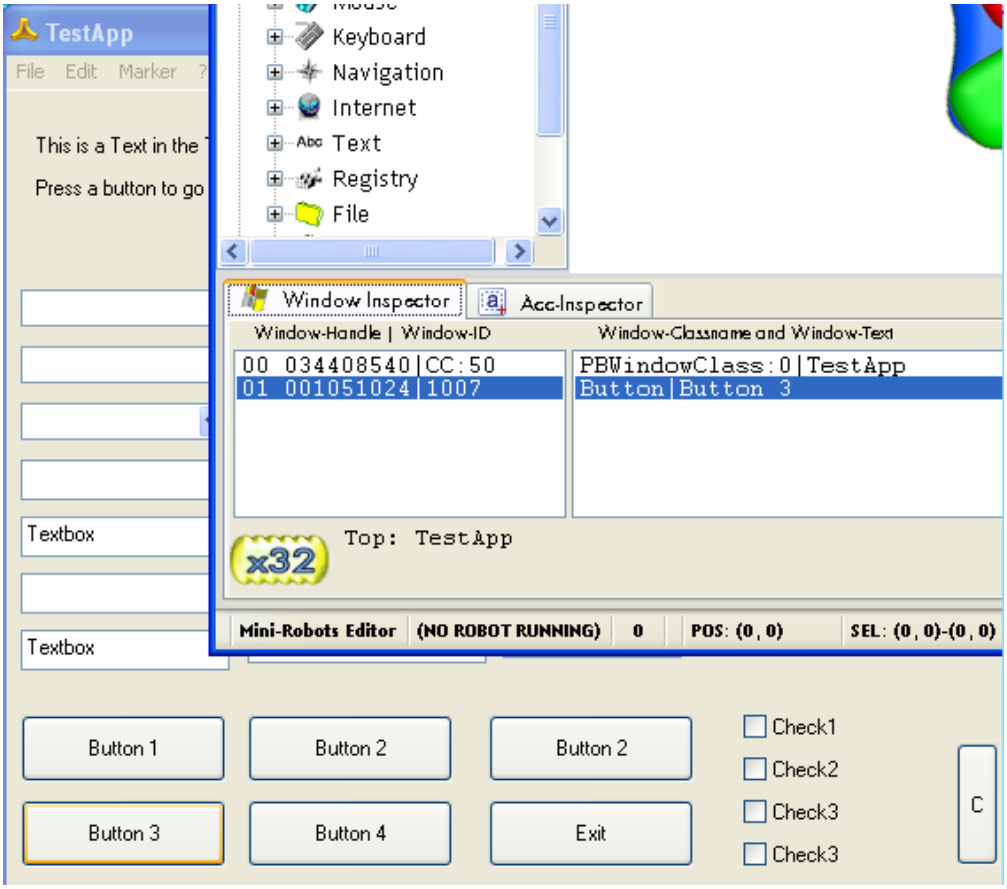
© 2023 Theo Gottwald * https://www.smart-package.com

Knowing all this, we can locate a Top-Window and a button inside this Top-Window like this:

```
STW.ct|PBWindowClass:0|BCS - Testform
' Locate the Child-Window
' c - the class must contain the word "Button"
' t- the text on the control must contain the phrase "&Next"
' w - wait up to 5 seconds for the window
SCW.ctw|Button|&Next|5
' Mouse Move to the center of the located window rectangle
MMV.
```

If you have problems to understand the parameters in the SCW., see the chapter
4. The Prototype Parameter System 240

The final test
Now lets if you can really do it.Lets make a test.You know there is a built in recording feature, but this time we will make it "from hand".
Take a look on the picture below.



It shows the windows-Inspector while the mouse is over "button 3" in our TestApp. This is the button we want to click. Lets make a complete script to locate a child-window "button 3" and click on it. As said before, you find the TestApp in the "Sample Apps" folder in the Installation folder* of the program. I recommend that you start it now, then we can make a practical exercise together.

How do we start?

© 2023 Theo Gottwald * https://www.smart-package.com

We always need to locate the Application-Window (Top-WIndow) first. This is done using the `STW.` command.

What parameters will we use?

We will use the window caption "TestApp" and we'll use a piece of the window class. As we can see in the Windows-Inspector, the complete window-class is "`PBWindowClass:0`". We do not want to write so much. We just need a unique part out of it. We take "`BWindowC`". This is completely valid as we can always just specify a part of a text.

We write:

```
' "bwindowc" is a part of the full classname as its shown
' in the Window-Inspector
STW.tc|TestApp|BWindowC
```

Now lets try if this works. We add one line:

```
STW.tc|TestApp|BWindowC
MMV.
```

and start our script. What happens?
The Mouse-Pointer will drive into the center of the located window.

To be 100% sure we have located the right window, we can use this:

```
STW.tc|TestApp|BWindowC
HTV.$$MYH
```

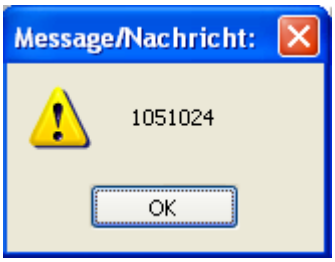
and start our script. We get this result. Watch number 34408540. Its exactly the same number, thar we see in the windows-inspector for Level "00". This proofs that we have located the right Top-Window. No doubt!

We are now inside the Application window. Now we must locate the button. We want to locate "button 3". In this case we will use the window-class and a text-part for the SCW.-command.
We write this:

```
STW.tc|TestApp|BWindowC
SCW.ct|butt|n 3
MBX.#hwn#
```

and start our script. We get the result below.

© 2023 Theo Gottwald * https://www.smart-package.com



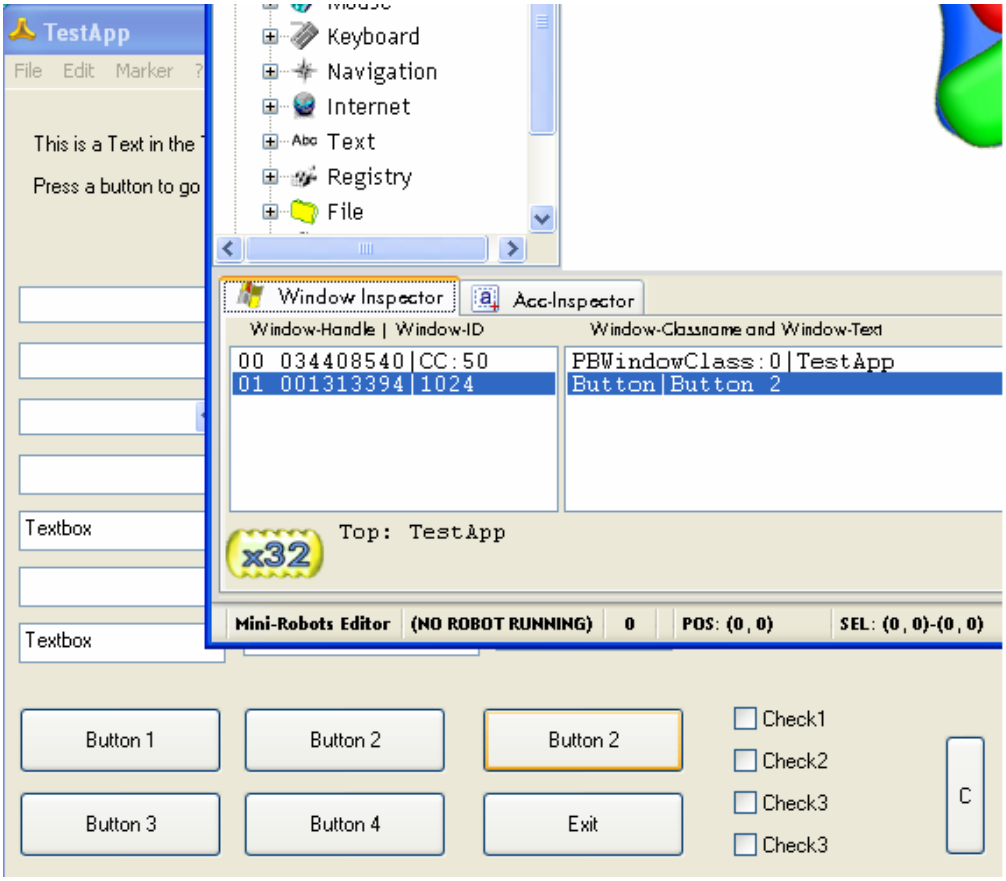
again this is exactly the same number that we see in the window inspector. This proofs that we have located the right window. Now lets make a click on it. To click on a button or whatever, we have many choices, how to click. In this case we will make a very normal Click with the left mouse-button. Just as if we would have done it manually. We write.

```
STW.tc|TestApp|BWindowC
SCW.ct|butt|n 3
MLC.
```

Start the script and watch what happens.

Ok, we will take one more example from this Area. Take a look on the picture below. As you can see, we have two Buttons "Button 2". How can we handle this situation? This time, we will use the "n" flag. It gives us the option to count the results and use result Nr.?, in our case we want to click on the second "fitting button". Let's try this first without click, just by moving the mouse there.

```
STW.tc|TestApp|BWindowC
SCW.ctn|butt|n 2|2
MMV.
```



© 2023 Theo Gottwald * https://www.smart-package.com

But ... the mouse moves to the first button! What is wrong here?
The answer is: nothing is wrong. We have no warranty, that the optical placement of a button anywhere in a Window is consistent with it's "count number". Technically the question is rather in which sequence the buttons have been created by the application. But we do not know the sequence, because this is up to the programmer. What we do is, we will just change the number to "1".

```
STW.tc|TestApp|BWindowC
SCW.sctn|butt|n 2|1
MMV.
```

That was the whole secret. Try and find the right number. No we just need to change the Move (`MMV.`) to a Click. In this case we have chosen another Mouse-Click, that will not move the mouse around, but just click. (`MLE..`).

```
STW.tc|TestApp|BWindowC
SCW.sctn|butt|n 2|1
MLE.
```

And thats all for now!
This was the chapter about locating child-windows. Take some time and experiment with it.
I am sure you will like it!

---

* the Installation folder is the folder, where you have installed the robot program.

1.29 1.9.1 Types of controls

1.29.1 1.9.1.1 Types of Controls

1.9.1 Types of controls Previous 174 Top 41 Next 182

Starting Guide

Types of Controls in Windows GUI

Controls in Windows GUI

What is a "control"?

In the context of Windows Graphical User Interface (GUI), controls are fundamental building blocks that are used to interact with the application. They are also known as "child windows" as they are typically contained within a parent window, which is the main application window.

Controls are used to perform various functions and to control the behavior of the application. They can accept user input, display text or images, or perform actions in response to user interactions.

Here are some of the common types of controls available in Windows GUI:

Buttons: Buttons are perhaps the most basic type of control. They are used to initiate actions when clicked.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Text Boxes: Text boxes are used to accept input from the user. They can be used to enter a single line of text, like a search box, or multiple lines of text, like a text editor.

Labels: Labels are used to display static text on the screen. They are often used to describe other controls or provide instructions to the user.

Check Boxes and Radio Buttons: Check boxes allow the user to select multiple options from a set, while radio buttons allow the user to select a single option from a set.

Drop-Down Lists and Combo Boxes: These controls allow the user to select an option from a predefined list. A combo box also allows the user to enter a custom value.

Sliders and Progress Bars: Sliders allow the user to select a value from a range by moving a slider thumb along a track. Progress bars are used to display the progress of a long-running operation.

List Boxes and List Views: These controls display a list of items to the user. The user can select one or more items from the list.

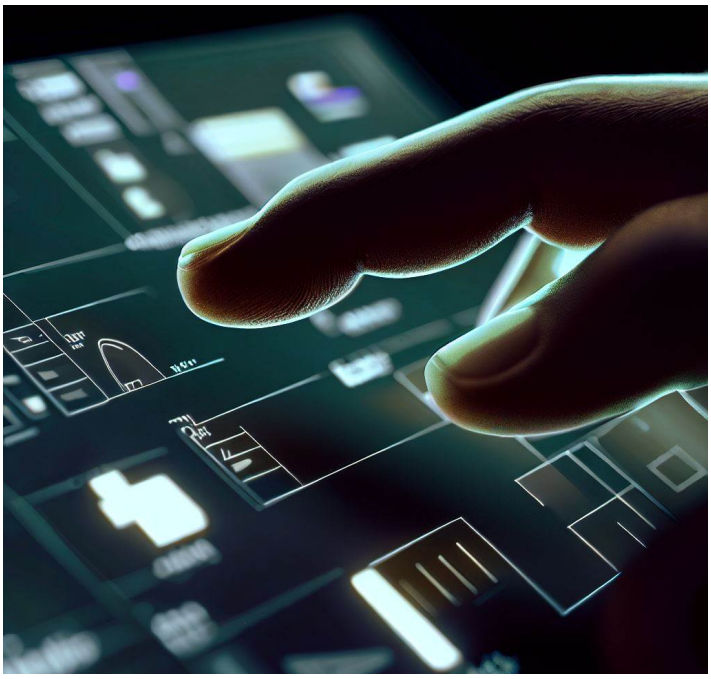
Tree Views and Grid Views: These controls are used to display hierarchical or tabular data.

Menus and Toolbars: Menus provide a way to organize commands in an application. Toolbars provide quick access to commonly used commands.

Each of these controls has its own properties, methods, and events that allow you to customize its appearance and behavior. The choice of control depends on the specific requirements of your application.

---

*© 2023 Theo Gottwald * https://www.smart-package.com*



Is Automation Limited to Controls?

Certainly not. In addition to automating controls, we can also identify "GUI elements" using Web/Browser Accessibility Technology.
Moreover, with the advent of new pattern recognition capabilities, we can automate interactions with all types of GUI elements.

Given the trend in modern software development to move away from traditional controls, it's increasingly likely that you'll need to familiarize yourself with these other technologies.
They offer a broader scope for automation and can significantly enhance the functionality and user experience of your software.

The most commonly used types of controls are:

1. Button Control
2. Checkmark Control
3. Combo Box/Dropdown List Control
4. Dialog Box Control
5. Edit/Textbox Control
6. Grid View Control
7. Label Control
8. Listbox Control
9. Menu Control
10. Page-Tab Control
11. Progress Bar Control
12. Radio Button (Option) Control
13. Scroll Bar Control
14. Slider Control

© 2023 Theo Gottwald * https://www.smart-package.com

15.Spinner Control
16.Status Bar Control
17.Toolbar Control
18.Tooltip Control
19.Treeview Control
20.Window Frame Control

In the following chapters we will take a closer look on some of these.

© 2023 Theo Gottwald * https://www.smart-package.com

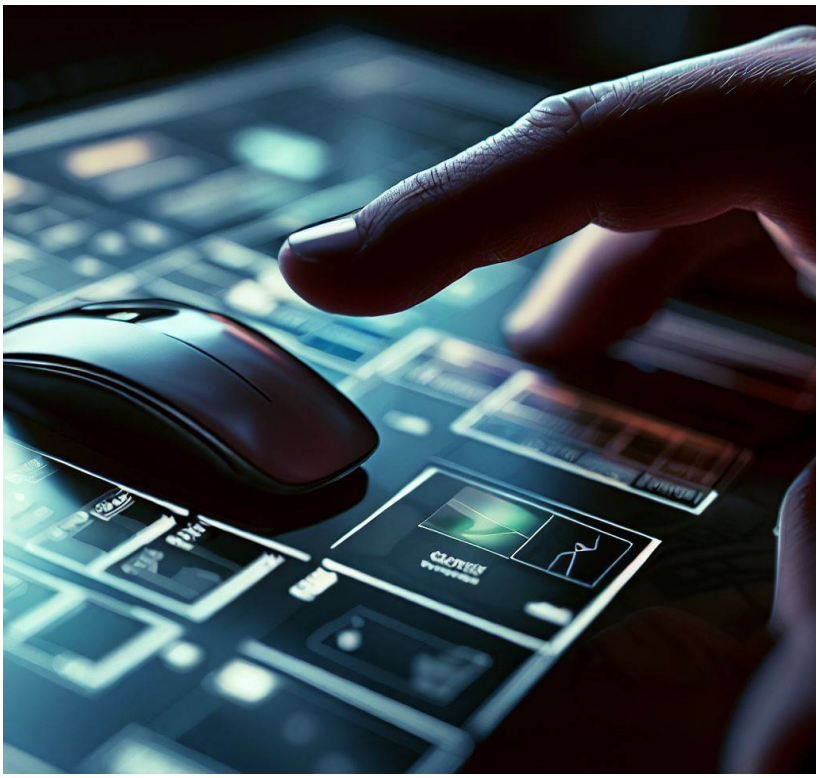
1.29.2 1.9.1.2 Working with controls

1.9.1 Types of controls Previous 162 Top 41 Next 170

Starting Guide

Working with controls

What can we do with controls?



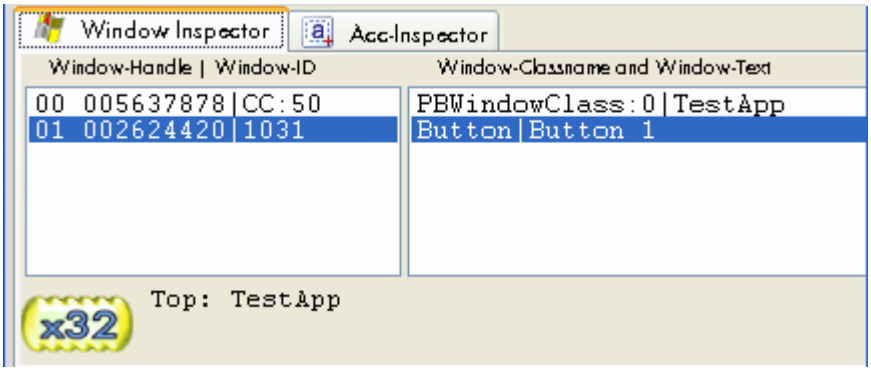
How do we classify controls?

We classify them by their "control class". You can see the class of a control in the "windows inspector" that is built into the editor. For this, just move the mouse over the control and take a look into the Inspector. In our example the class name is "button".

Move the mouse over this control.

Then you will see this in the inspector, and know "its a button control". BUt i believe you have had that idea "this is a button" before.

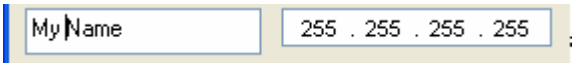
© 2023 Theo Gottwald * https://www.smart-package.com



What do we have to do with controls?

We need to work with controls in several ways. Some controls like buttons are simply clicked with the mouse.

Other controls like the text-box below, need to be read. Or we may need to type text into them.



Here is an example, that reads a text out of a control. The control is a "SysIPAddress-Control" in our TestApp, which you can find in the Sample Application folder.

```
STW.ct|PBWindowClass:0|TestApp
SCW.nc|1|SysIPAddress32
CFW.$$TXT|u
```

What can we do with controls?

An Automation System like this one needs to work with controls in several ways. Note that all things described here can be done with mostly any control, not only with the button control, that we take as example here. Now, what can we do with it?

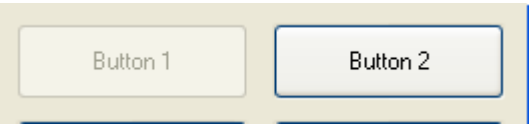
1. Controls can be **enabled or disabled** (use SWS3889.).
2. Controls can be made **visible or invisible** (use SWS3889.).
3. Controls can be **closed** (means they are destroyed, there is no way to get them back unless you restart the application)
4. Controls can be re-sized (change the size of a control)
5. Controls can be repositioned (move them around)
6. The Controls Text can be changed.
7. Then there are specific properties of controls that can be influenced. For example, a List box can change the actual selected item. Or a scroll bar can be moved up or down.

© 2023 Theo Gottwald * https://www.smart-package.com

You can try these with our TestApp anytime without danger. All changes you do to the Application will be lost when you close the Application. Nothing of these is permanent in any way. Here are some examples:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Button|Button 1
' This will disable the button
SWS.d
```

will disable the button 1, making him look like this:



Now its important to know that the system will not detect disabled buttons in its standard settings. To reverse this last operation, we have to change something:

```
STW.ct|PBWindowClass:0|TestApp
' We have added the "a" prototype
SCW.ncta|1|Button|Button 1
' This will enable the button again
SWS.e
```

Will bring the button back to life. SWS. gives you the power to make all sorts of control invisible. Or disabled. Or get them back. Here are some of the SWS.-Options. Note that you can use multiple of them in one line.

```
STW.ct|PBWindowClass:0|TestApp
' We have added the "a" prototype
SCW.ncta|1|Button|Button 1
' This will enable the button and make it invisible
SWS.ei

' These are some prototypes from the SWS.-command.
'
' a - activates the window after setting the state.
' e - enabled
' d - disabled
' v - visible
' i - invisble
' m - minimzed
' n - normal (not minimized)
' z - zoomed (maximized)
```

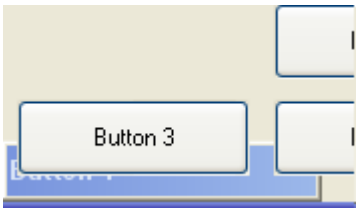
Can I maximize and minimize a control?

© 2023 Theo Gottwald * https://www.smart-package.com

It does not make much sense, but **Yes - you can!**

```
STW.ct|PBWindowClass:0|TestApp
SCW.ncta|1|Button|Button 1
' This will minimize the button
SWS.m
```

For example, a minimized Button looks like this:



If you double click it with the mouse he will get normal again. Be careful with **maximizing** of controls, as there is no easy way back. You may have to completely "close" the control like this:

```
STW.ct|PBWindowClass:0|TestApp
SCW.ncta|1|Button|Button 1
' This will completely remove the button
CLW.
```

to get rid of it.

And how about the text in controls, can we read it, and change it?

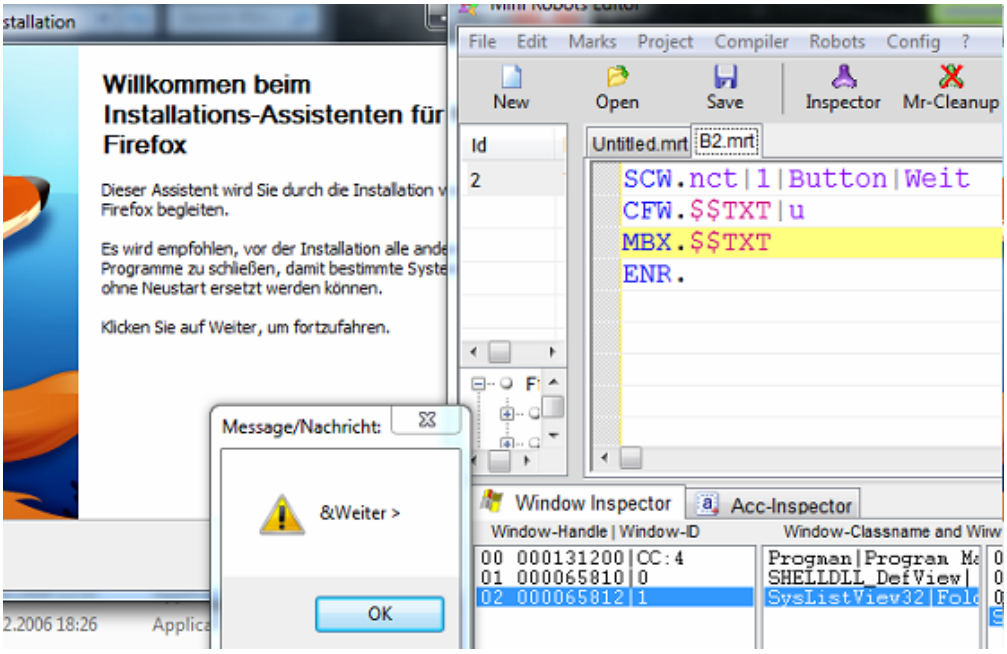
We are not really going to be complete with our list here. We will just look at the most important things, that we can do with controls. And one of these is, that you can read text from controls.
And you can change this text. Not from all controls, but you can try!
Let's try this with a button.

This time we'll not use our TestApp, but a real setup-program. This one:

© 2023 Theo Gottwald * https://www.smart-package.com

First we are going to read the text on that button:

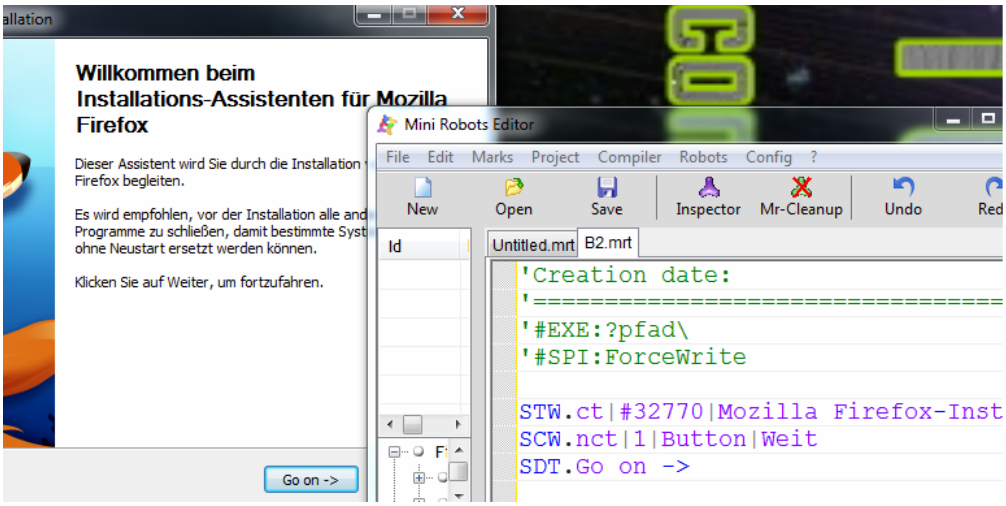
```
STW.ct|#32770|Mozilla Firefox-Installation
SCW.nct|1|Button|Weit
CFW.$$TXT|u
MBX.$$TXT
```



Which works as expected, see above picture.

Next we are going to change the text in these buttons.

© 2023 Theo Gottwald * https://www.smart-package.com



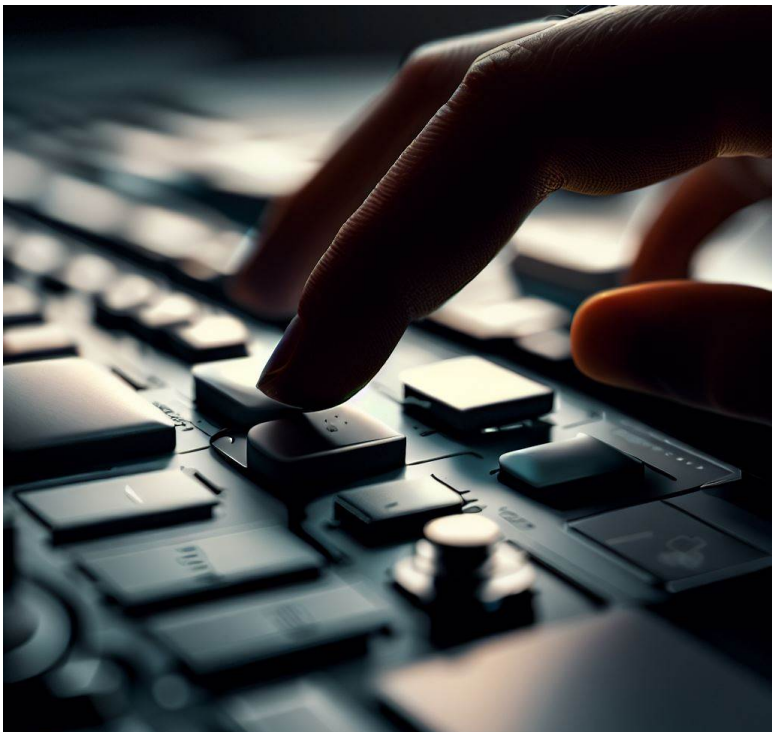
Now one final thing. Let us disable the "Cancel" button, so that nobody can press it.

This is our script:

```
STW.ct|#32770|Mozilla Firefox-Installation
' We use a pattern so that it will work in german and english
Setups
SCW.nct|1|Button|Abbrechen&OR:Cancel
SWS.d
ENR.
```

Which of course also worked as expected.

© 2023 Theo Gottwald * https://www.smart-package.com

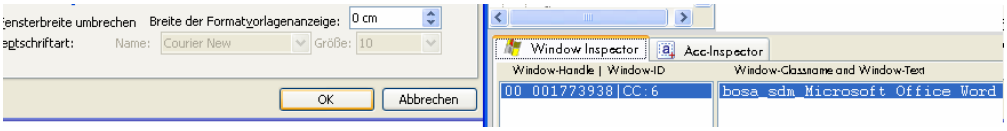


Are There Controls That Don't Support All These Features?

Indeed, there are. Certain dialog boxes contain controls that require a different approach because they aren't traditional windows controls. These include:

1. Dialogs in Office programs
2. Browser dialogs
3. Dialogs generated by Java

When working with these types of controls, the window inspector may not display the expected "button" class. For instance, consider this dialog from Word.



© 2023 Theo Gottwald * https://www.smart-package.com

Navigating Web-Based Controls

The SPR toolkit is adept at handling web-based controls. For instance, to pinpoint a button, you would employ the SAO, AGR, or NAV commands.

The effectiveness of automation scripts can vary depending on the browser used for dialogues. While Internet Explorer is no longer available, Firefox is recommended and highly compatible with our automation tools. Other browsers might pose challenges when trying to locate elements using our primary tools.

Nevertheless, we have a robust solution: a system of graphical recognition commands. These commands can be utilized in less compatible browsers and even in Java-based applications, which form a third category of applications.

It's crucial to understand that Java-based applications often resist scripting using traditional windows-control-commands. Even browser-control-commands, which typically work well in office applications, might not be effective here.

However, there's no cause for concern. Our fallback strategy always involves the use of graphical recognition commands. These commands are highly adaptable and can be employed in nearly any environment.

© 2023 Theo Gottwald * https://www.smart-package.com

1.29.3 1.9.1.3 Button Control

1.9.1 Types of controls Previous 170 Top 41 Next 184

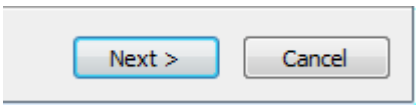
Starting Guide

Button Control

The simplest Control: Button Control

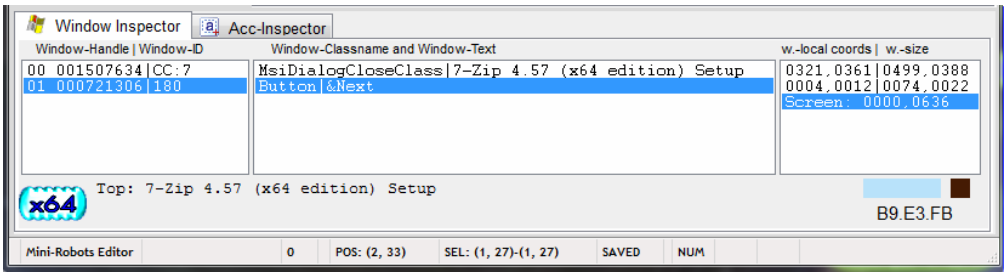
Buttons are mostly not round but somehow cornered.

Understanding the Button Control



A button control is a fundamental element in a GUI. It typically carries the window class "button" and is most commonly interacted with through a click action.
When inspected using the windows-inspector tool, a button control with the window class "button" will be displayed as follows:

© 2023 Theo Gottwald * https://www.smart-package.com



It's important to note that window classes can be named at the discretion of the application's programmer.
Therefore, the window class of a button may not always adhere to the standard "button" classification.

To interact with a button, any of the Mouse Click commands can be utilized:

- MLE. - Mouse-Left-Click Event 2492
- MLC - Mouse-Left-Click (Invisible) 2448
- MLM - Mouse Left click Move (Invinsible) 2457
- BSC. - Button Special Click 2435

or use the combination of

```
STW.ct|#32770|Mozilla Firefox-Installation
AGR.43|cancel&OR:Abbrech
MOS.
```

which will also click the button.

For a detailed comparison and understanding of the variations between these mouse click commands, please refer to the following section:
1.C Direct Engine and Compatible Engine 231

© 2023 Theo Gottwald * https://www.smart-package.com

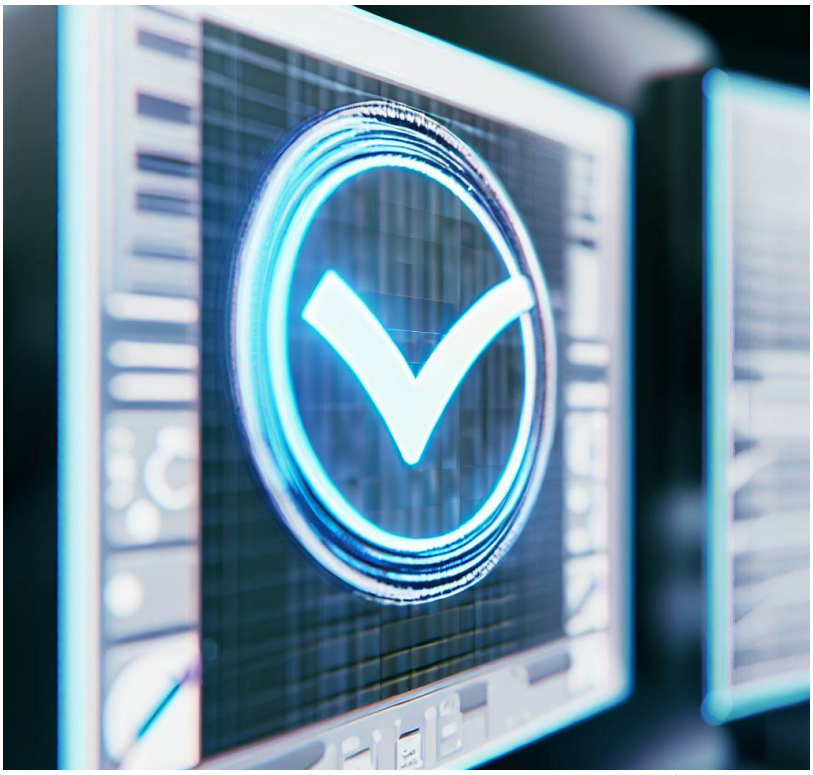
1.29.4 1.9.1.4 Checkmark Control

1.9.1 Types of controls Previous 182 Top 41 Next 191

Starting Guide

Checkmark Control

Selecting Options.



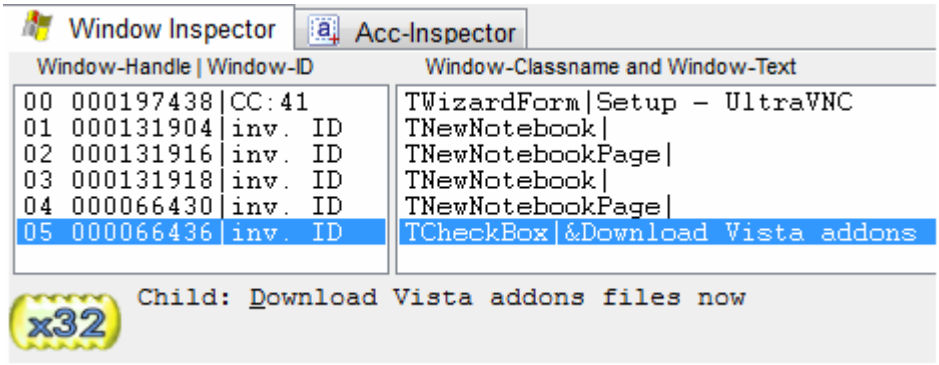
The checkmark control is often used to have the user to confirm something.

Understanding the Checkmark Control

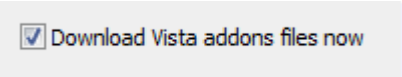
Firstly, let's take a look at a "Checkmark Control". Here's an example:

The windows-inspector for this control might appear as follows:

© 2023 Theo Gottwald * https://www.smart-package.com



The presence of "check" in the class-name "TCheckbox" is a strong indicator that we're dealing with a genuine checkmark.
Typically, checkmarks have two states: checked and unchecked.



It's important to note that Checkmark Controls differ from Radio Button Controls in that they operate independently of each other. Checking one will not alter the state of another checkmark within the same dialog.
To uncheck the checkmark above, you would use the following script:

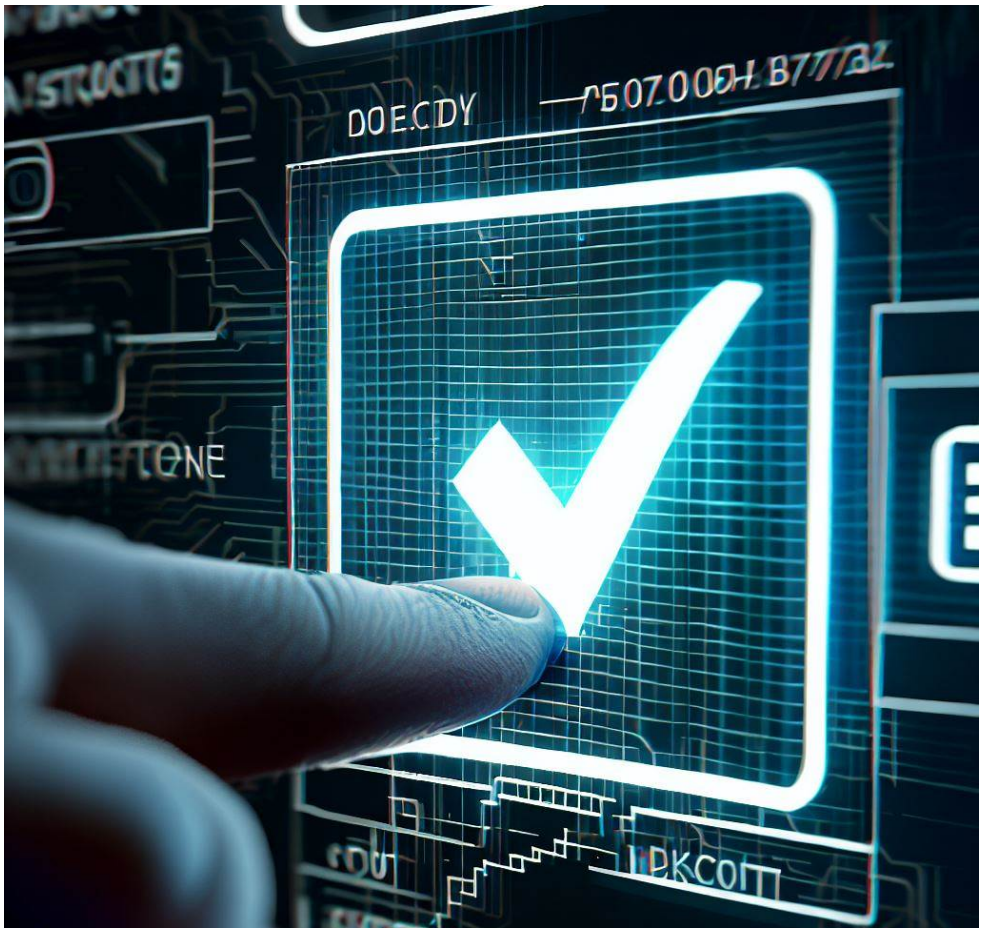
```
' Get the application Setup-window
STW.ct|TWizardForm|Setup - UltraVNC

' Locate the checkmark-child window
SCW.ct|TCheckBox|Download Vista

' Set the checkmark to unchecked
BTC.0

' End the script.
ENR.
```

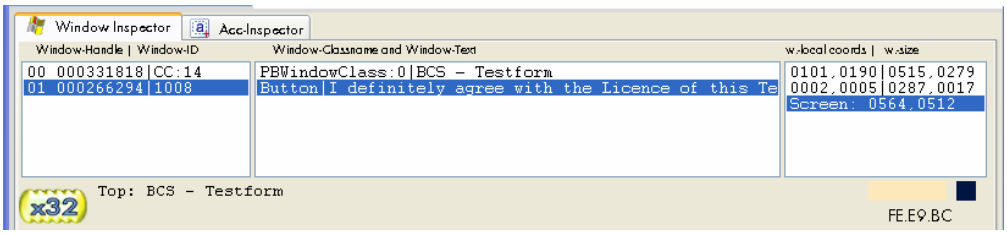
© 2023 Theo Gottwald * https://www.smart-package.com



Interacting with the Checkmark Control

Ideally, with the SPR, we don't merely click on a checkmark with the mouse.
Instead, we use the dedicated BTC command, accompanied by a parameter (0 or 1) that indicates the desired state of the checkmark.
This approach offers an advantage: it makes us independent of the checkmark's previous state.
Regardless of whether the checkmark was checked or unchecked, the BTC command will attempt to achieve the state we want.

The windows inspector displays a checkmark as follows:



Window Class Variations for Checkmark Controls

The window class for a checkmark might be labeled as "button", or it could contain "check" in the name. However, this isn't always the case. The window class could bear different names as well. Given that window classes can be named at the programmer's discretion, the window class for a checkmark control can vary.

© 2023 Theo Gottwald * https://www.smart-package.com

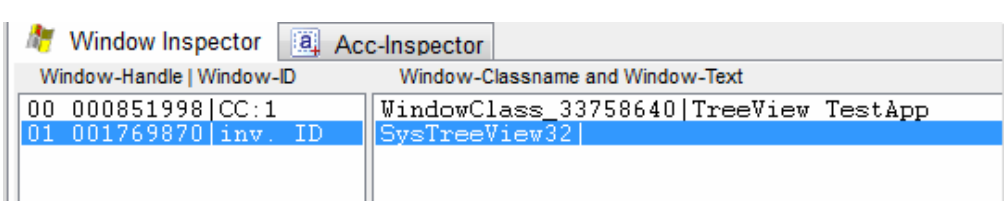
Normally you can change the value of an checkmark using the BTC.-command.

```
' BTC.-Sample
STW.ct|PBWindowClass:0|BCS - Testform
SCW.nct|1|Button|I definitely agree with the Licence of this
Testform.
BTC.1
```

There may be checkmark controls out there, that do not react on the BTC. - Button-Check-command as we would expect it.
In that case use the normal mouse clicks to change their state.

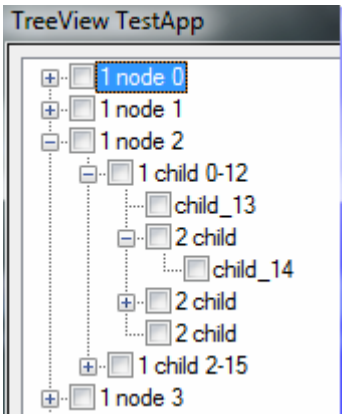
Understanding Treeview Controls with Built-In Checkmarks

Consider the treeview control shown below. It appears to have built-in checkmarks. The windows-inspector identifies it as "systreeview32". However, it's important to note that these are not actual checkmarks, and as such, the BTC command cannot be used with them!

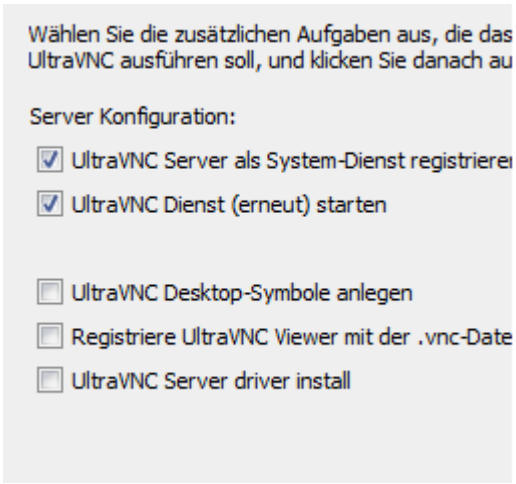


As the window-class shows, this is a treeview. And we need to use the treeview commands for it.

© 2023 Theo Gottwald * https://www.smart-package.com



This is not a checkmark control. It is a "Treeview-Checkmark". The windows-inspector will show it as a treeview "`systreeview32`".
In this case you need to use the `TVI.` 668 - or the TVF. - Tree View Find 665 - command with its options to check and uncheck the boxes.
There are other checkmarks out there which are also not true checkmarks. For example this one:



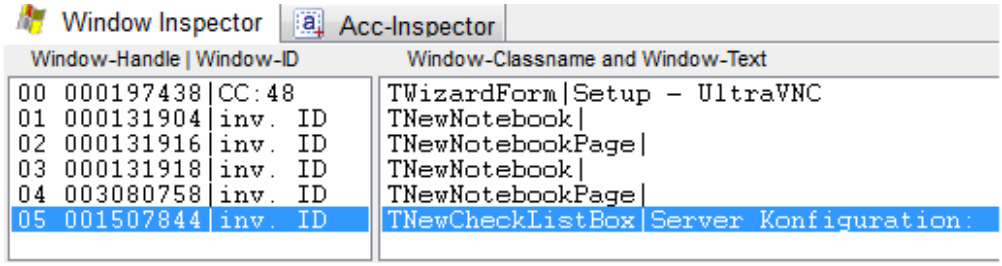
Understanding Listbox Controls with Checkmarks

© 2023 Theo Gottwald * https://www.smart-package.com

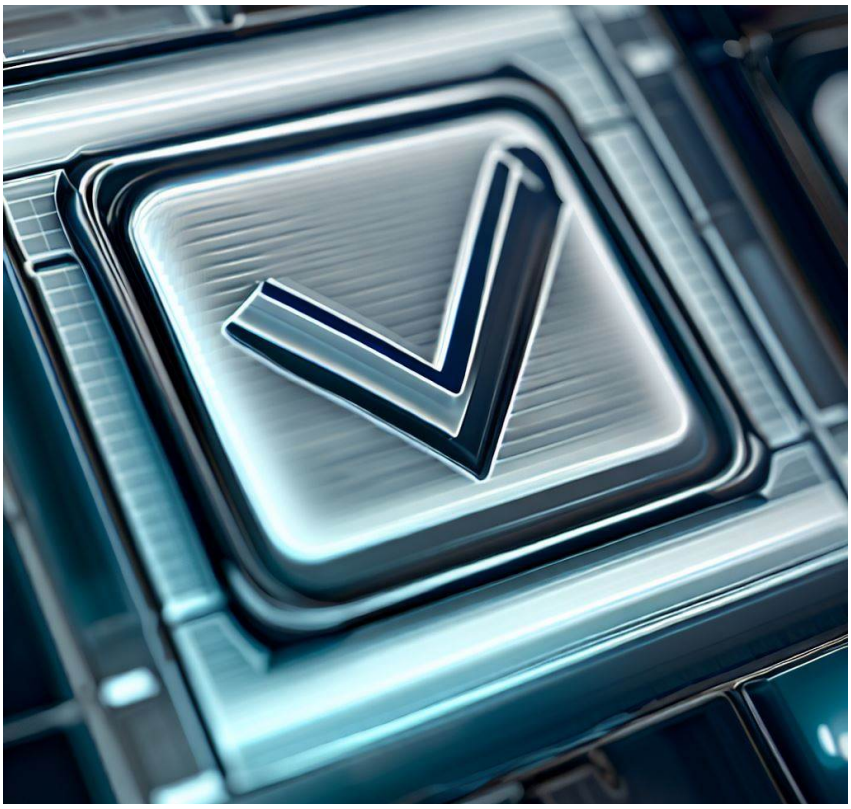
The elements you see are not actual checkmark controls. Instead, they are part of a Listbox that includes checkmarks. To check or uncheck these Listbox Checkmarks, you'll need to use the LBE command along with its options.
The windows-inspector, as shown below, identifies it as a Listbox, specifically "TNewCheckListBox".

To check the first checkmark in this case, you would use the following code:

```
STW.HBJwct|45|TWizardForm|Setup - UltraVNC
SCW.wctd|45|TNewCheckListBox|Server Konfiguration:|5
' This will check the Listbox-Checkmark
LBE.UltraVNC Server als System-Dienst &registrieren||1
```



In some cases, when the Listbox-commands do not work, you can often still locate the Listbox using the SAO 625. command. And then just click it with the mouse using MLI - Mouse Left Click qulckly (Invinsible) 2454, or use the MOS. - Mouseless Object Select 2509-command.



See also:

© 2023 Theo Gottwald * https://www.smart-package.com

These are the most used commands for checkmarks:

- BTC. - Button-Check 635
- GBC. - Get-Button-Check 640
- MLI - Mouse Left Click qulckly (Invinsible) 2454
- MLM - Mouse Left click Move (Invinsible) 2457
- SAO. - Search Accessible Object 625
- !. NAV - NAVigate in Dialog 606
- MOS. - Mouseless Object Select 2509
- TVI. - Tree View Invisible 668
- LBE. - Listbox-Entry 649

© 2023 Theo Gottwald * https://www.smart-package.com

1.29.5 1.9.1.5 Radio Button Control

1.9.1 Types of controls Previous 184 Top 41 Next 194

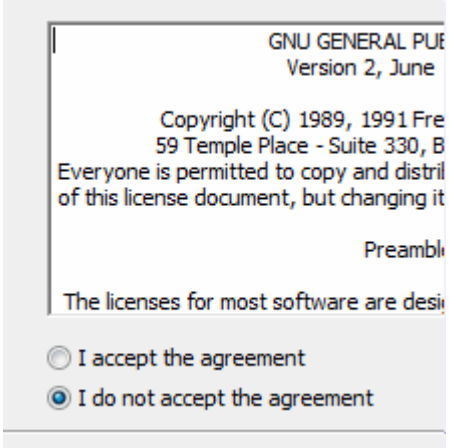
Starting Guide

Radio Button Control

What controls do we have to do with?

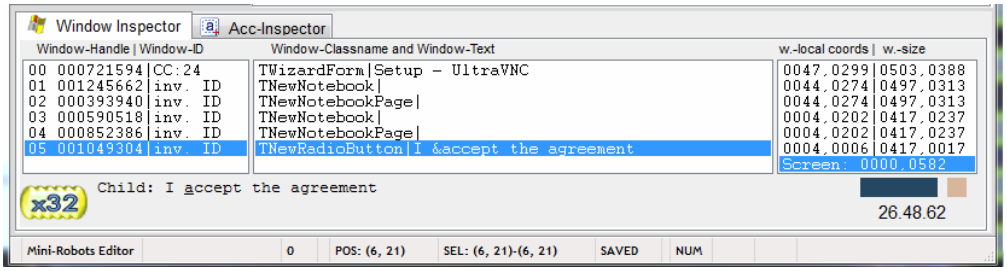
Exploring the Radio Button Control

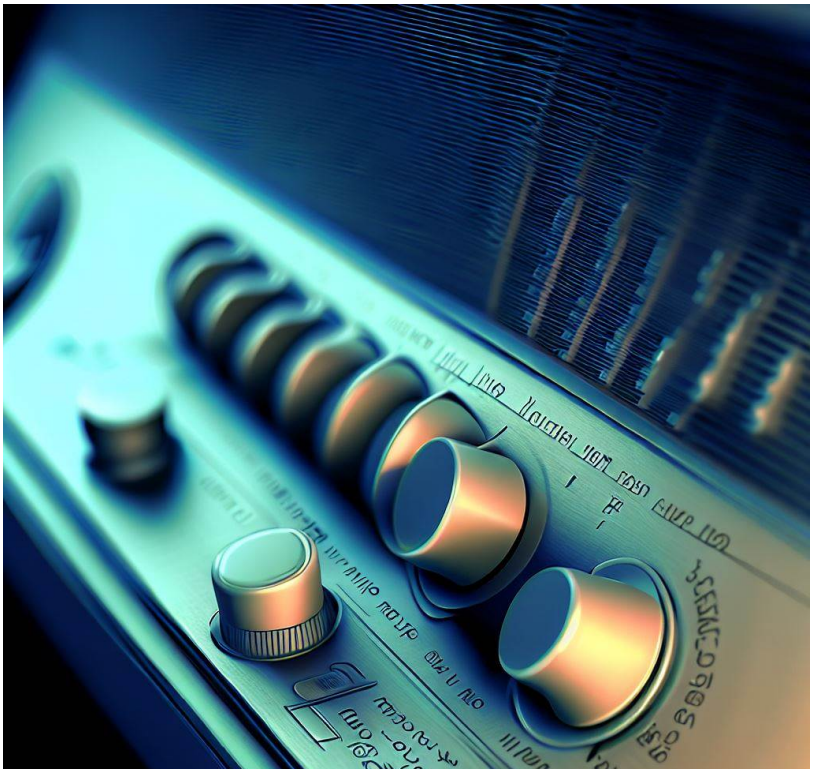
The control we're focusing on now is the Radio Button Control, also known as an "Option Control".
This is because it allows you to select one option from several available choices.
Let's take a look at a typical use case for this control.
For instance, you might encounter a Radio Button Control when presented with an agreement where you can choose to accept or decline.



© 2023 Theo Gottwald * https://www.smart-package.com

In this case the window class of the Option control is "TNewRadioButton". As window classes can be named freely by the programmer of an application, the window class can differ from this.





Interacting with the Radio Button Control

Here's a script that checks the Option Control:

```
STW.ct|TWizardForm|Setup - UltraVNC
SCW.ct|TNewRadioButton|I &accept the agreement
BTC.1
```

Simply changing the number to

```
BTC.0
```

would have the opposite effect. While some Radio Button Controls allow you to uncheck the buttons using the `BTC.0` command, others might not.
In such cases, you're limited to simulating a standard mouse click to select one of the radio buttons.

© 2023 Theo Gottwald * https://www.smart-package.com

You might wonder why it's called a "Radio Button Control". The term "Radio Button" harks back to old radios where pressing one button would automatically disengage any other pressed button. The same principle applies here. Once you click on any of these buttons, the others will switch off.

See also

Here is a list of commands that are often used with Radio Button controls:

- BTC. - Button-Check 635
- GBC. - Get-Button-Check 640
- MLI - Mouse Left Click quIckly (Invinsible) 2454
- MLM - Mouse Left click Move (Invinsible) 2457
- SAO. - Search Accessible Object 625
- !. NAV - NAVigate in Dialog 606
- MOS. - Mouseless Object Select 2509

© 2023 Theo Gottwald * https://www.smart-package.com

1.29.6 1.9.1.6 Edit-Textbox Control

1.9.1 Types of controls Previous 191 Top 41 Next 198

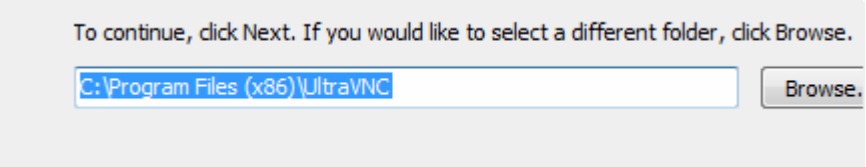
Starting Guide

Edit- or Textbox Control

What controls do we have to do with?

Interacting with the Edit or Textbox Control

The control we're focusing on now is the Textbox Control, also known as an "Edit Control".



There are two primary methods for inputting text into the Edit Control:
• Simulating Keyboard Typing (compatible engine)
• Directly Setting the Text of the Control (direct engine)

Typically, we favor the direct engine 231 for its numerous advantages in automated installations.
It's faster, more reliable, and functions even if the user isn't logged into the machine. The commands for the direct engine setting a textbox are:

- SDT. - SenD-window-Text 2278 (direct engine)

© 2023 Theo Gottwald * https://www.smart-package.com

- RST. - Replace Selected Text 2264 (direct engine)

Here's a script that sets a textbox using the direct engine:

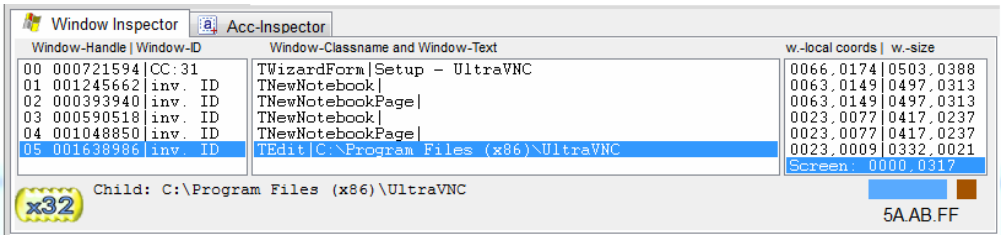
```
VAR.$$S00=?progs\UltraVNC
STW.wct|45|TWizardForm|Setup - UltraVNC
SCW.wcd|45|TEdit|5
RST.$$S00|0,-1
```

In some cases, depending on the target control, the direct engine might be ignored by the control. If this occurs, you'll need to use the compatible engine instead. The compatible engine simulates key presses like a human user and therefore can't be easily ignored by an application. For example, if you want to type text into a web browser, you'll need to use the compatible engine.

The most used compatible engine commands for setting a textbox are:

- SKP. Send-Key-Press 2289 (compatible engine)
- SKT. - Send-Key-Text 2293 (compatible engine)

Note that there are much more then these two.
Most Edit Controls have "edit" or "text" in their class name. However, as window classes can be named at the programmer's discretion, the window class for an Edit Control can vary.
Here's how a windows inspector would display a Edit-Control:



Exploring the Diversity of Edit Controls

There's a wide variety of Edit Controls beyond the two we've discussed. Most Edit Controls have "edit" or "text" in their class name. However, as window classes can be named at the programmer's discretion, the window class for an Edit Control can vary. Here's how a windows inspector would display an Edit Control:

It's important to note that text-boxes in a browser window, like the one shown below, are not traditional windows controls. They aren't genuine text-boxes and can only be accessed using compatible engine commands. This also applies to buttons and other web-based controls.

In such cases, you should use the Acc-Inspector instead. Utilize the SAO 625., MOS 2509., and compatible engine commands. Here's a script to get you started with web-based controls:

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Script to type into a WEB-based text-box using the
' compatible engine

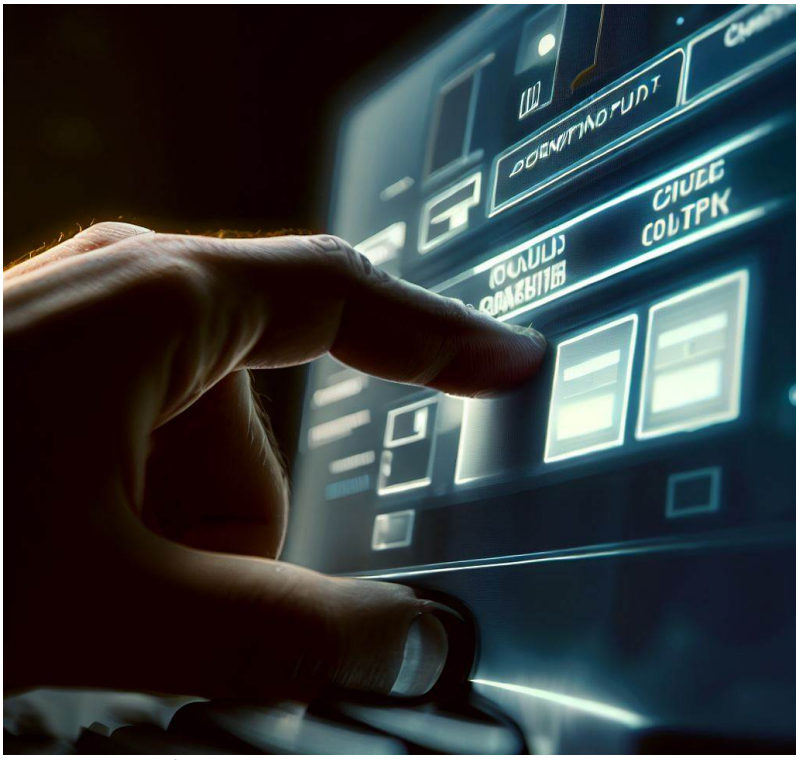
1.29.7 1.9.1.7 Dropdown- Combobox Control

1.9.1 Types of controls Previous 194 Top 41 Next 202

Starting Guide

Dropdown and Combobox Control

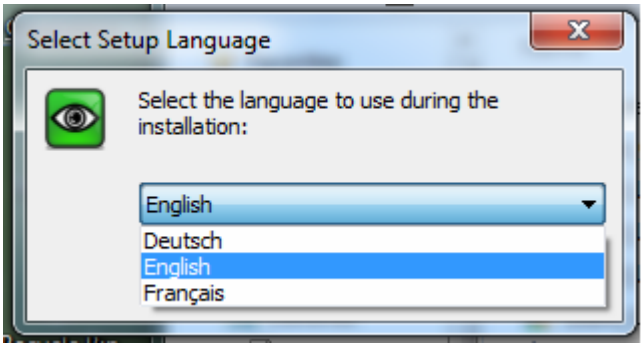
What controls do we have to do with?



A Dropdown Control is like a Listbox combined with a menu.

Understanding Dropdown and Combobox Controls

Below is an example of a "Dropdown Control".



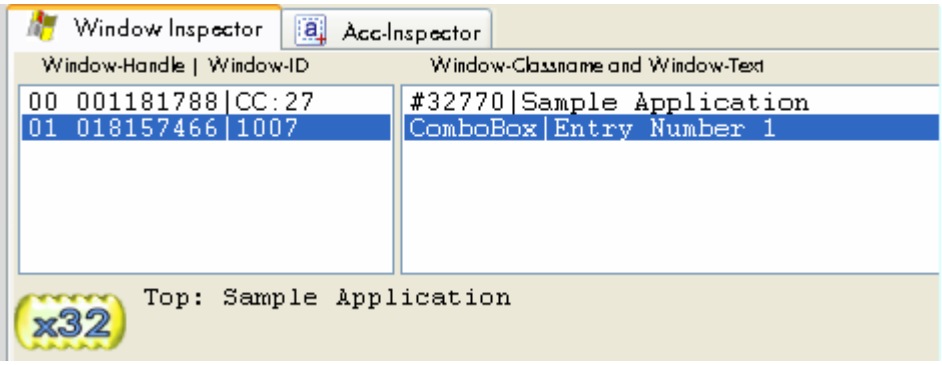
There are two distinct types of dropdown controls:

© 2023 Theo Gottwald * https://www.smart-package.com

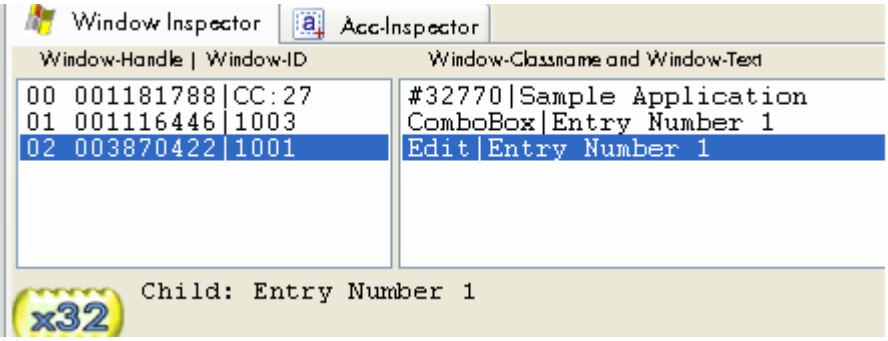
1. The standard Dropdown Control, which only allows selection.
2. The Combobox Control, which combines a dropdown and an edit-box control.

For convenience, we often refer to both as a Combobox Control. Regardless, both types of controls are addressed. Sometimes, the windows-inspector will clearly indicate the type of control you're dealing with.

Here's an example of a Dropdown Control:



In the image below, you'll notice an Edit Control beneath the Combobox Control. This is a true Combobox Control because it also includes an Edit Control, as you can see in the image below:



When you want to input text into the built-in text-box, you can locate either the Combo-Box or the Edit-Control. Normally, both will function as expected. These two scripts will both perform the same action and write some text into the control:

```
' Locate the Combobox-Control
STW.ct|#32770|Sample Application
SCW.nc|1|ComboBox
SCW.nc|1|Edit
SDT.Hallo

' Locate the Edit-Control below the Combobox
STW.ct|#32770|Sample Application
SCW.nc|1|ComboBox
SCW.nc|1|Edit
SDT.Hallo
```

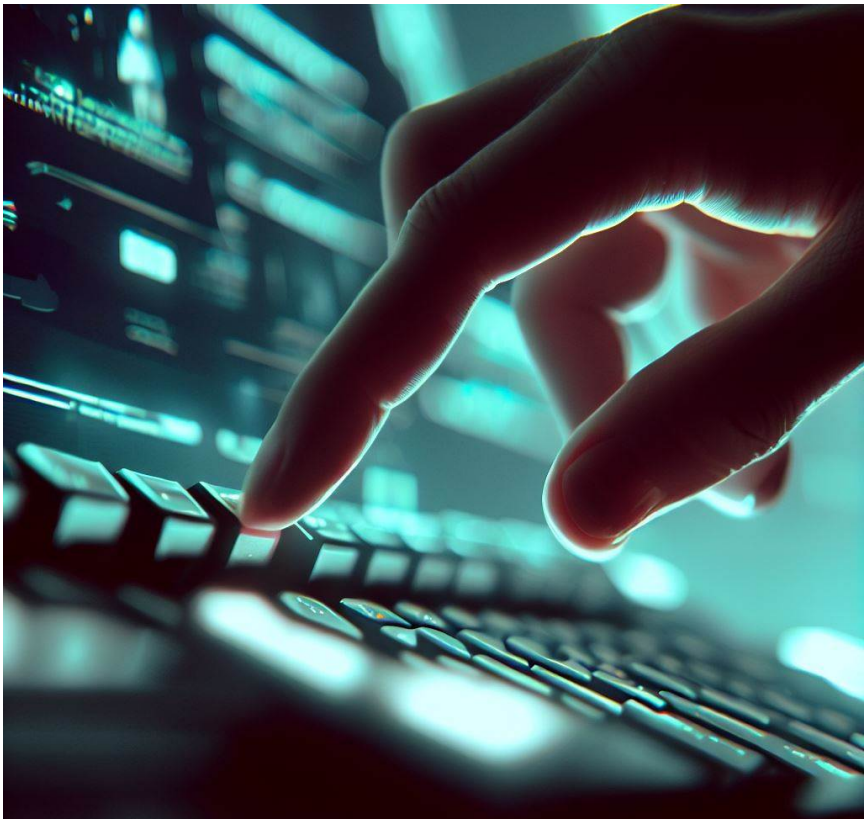
If you want to select an item from the Combo-Box, then you need to locate the Combo-Box.
You have two ways of doing so:

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.ct|#32770|Sample Application
SCW.c|ComboBox
SCI.Entry Number 1
```

or using the `SAO.`-command:

```
STW.ct|#32770|Sample Application
SAO.rn|46|{&NOTEXT}
SCI.Entry Number 1
```



Troubleshooting Dropdown-Controls

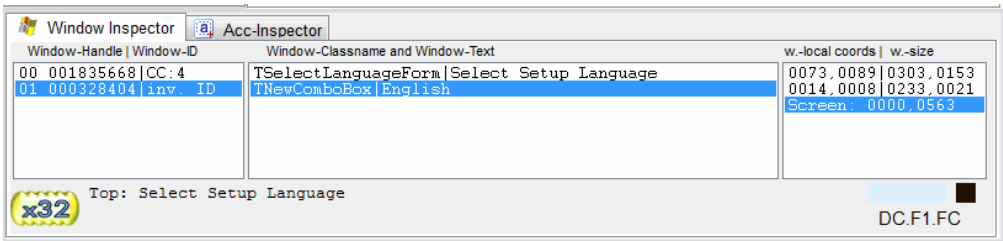
In a few applications, you might encounter a problem where a Dropdown-Control displays the value that you've sent using the SCI. (direct engine command). However, the application does not react to that value, or it reacts as if the value wasn't set. In these cases, the application reads the value once the Dropdown control is opened and closed. This is done using the CDD. - command.
A single `CDD.`-command without any parameters will open and close the currently located Dropdown control.

Here's a complete code example:

```
' Here is an complete code example.
STW.ct|TSelectLanguageForm|Select Setup Language
SCW.nc|1|TNewComboBox
SCI.english
' the following line opens and closes the dropdown control
```

© 2023 Theo Gottwald * https://www.smart-package.com

CDD.



As window classes can be named freely by the programmer of an application, the window class of dropdown controls can differ from those in the examples here.

Important Note:

Dropdown Controls in WEB-Browsers are not windows controls and do not react to neither SCI. or CDD. In this case, you need to use the command SAO. and MOS. or MLI. to open, select, and close the WEB-Browser based Control.

1.29.8 1.9.1.8 Treeview Control

1.9.1 Types of controls Previous 198 Top 41 Next 208

Starting Guide

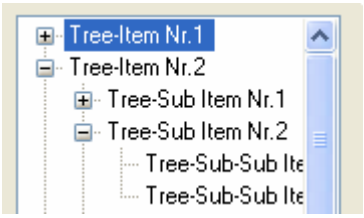
Treeview Control

What controls do we have to do with?

Treeview" as the AI imagines it.

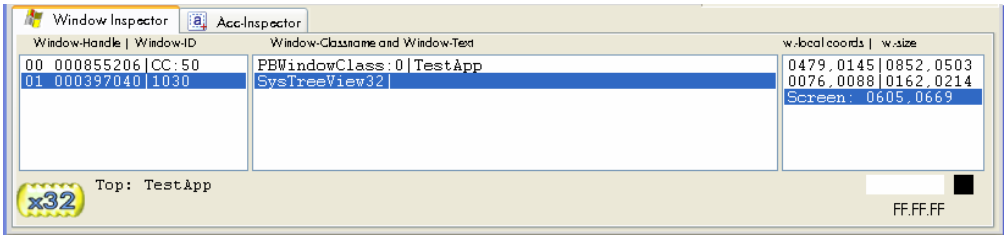
Navigating the Treeview Control

A Treeview Control might look something like this:

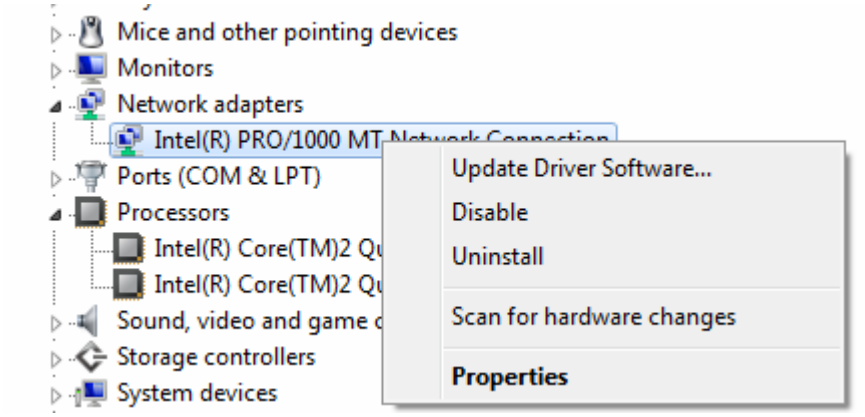


In the Windows Inspector, the Treeview displays a window class of `systreeview32`, as shown below:

© 2023 Theo Gottwald * https://www.smart-package.com



Treeviews have the capability to display icons, checkmarks, and even small menus. Here are a few examples:



To select an item in a Treeview Control, we have two options. One way is to describe a path, similar to a file-system path, but leading to a Treeview item instead of a file.
This is done using the TVI. - Tree View Invisible 668 command. You can use wildcards like ? and * in the item description. Here's an example:

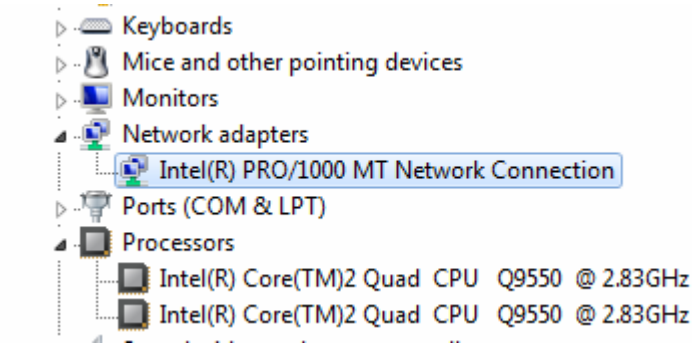
```
TVI.VM_WIN7_x64\Network adapters\Intel(R) PRO/10?? MT*
```

Alternatively, you can use the TVF. - Tree View Find 665 command to directly locate the item you want. In this case, you can use all 3.2 Standard-Search Pattern 341 to locate the item.
Here's an example:

```
TVF.Intel(R) PRO/1000

' Now here is a complete example, that will open a PopUp Menu
on
' the item we have located using TVI.
STW.wct|60|MMCMainFrame|Device Manager
SCW.wcd|60|SysTreeView32|7
TVI.VM_WIN7_x64\Network adapters\Intel(R) PRO/1000 MT*
' Open the Menu, click on Properties
SMH.Properti
MRC.
```

© 2023 Theo Gottwald * https://www.smart-package.com



Here's another example that would locate the first of the two Intel CPUs in the device manager:

```
TVI.VM_WIN7_x64\Processors\Intel(R) Core(TM)2 Quad  CPU*
```

What if we want to get the second of the two items? In that case, you would write:

```
TVI.VM_WIN7_x64\Processors\Intel(R) Core(TM)2 Quad  CPU*|2|
'Don't leave the second | away, its needed!
```

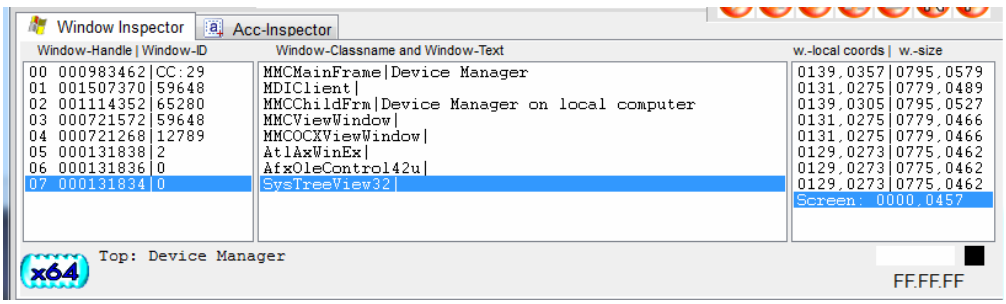
`TVI.` and `TVF.` have a special syntax. If they have just two parameters, the second parameter is the flags.
If they have three parameters, the second parameter is the count while the third parameter is the flags.

```
' You can do this
TVF.Intel(R)

' or do this using a flag
TVF.Intel(R)|i

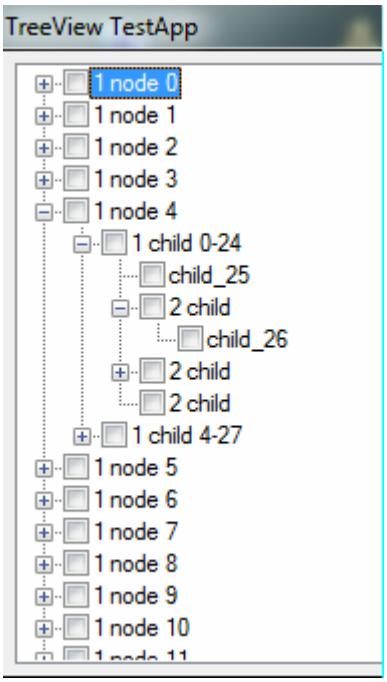
' or do this using a flag and a number to choose the second
' fitting element
TVF.Intel(R)|i|2
```

Now, here's what the Windows Inspector shows you when you analyze the Windows 7/x64 Device Manager:



The picture below shows another type of Treeview. This one contains checkmarks. You can check them using the

© 2023 Theo Gottwald * https://www.smart-package.com

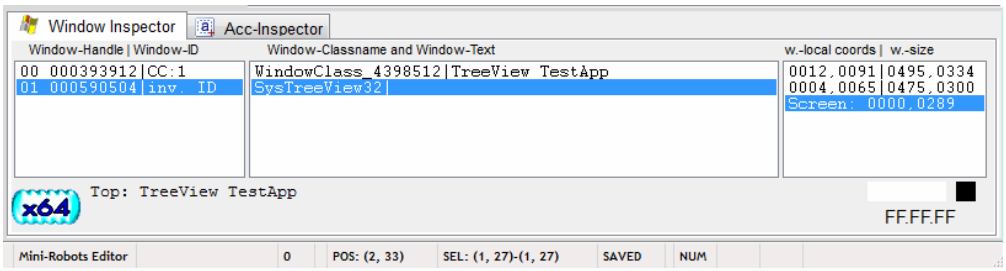


```
TVI. ..|b
```

and uncheck them using the

```
TVI...|d
```

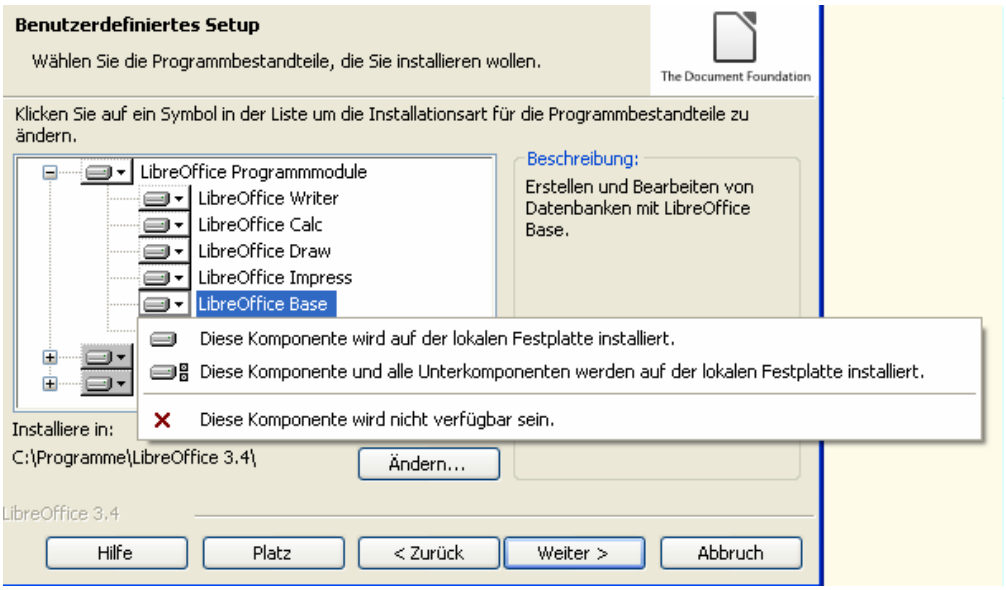
flags. Do not try `BTC.` here, it will not work.Below you can see the windows inspector showing the TestApp_x64 Treeview.



© 2023 Theo Gottwald * https://www.smart-package.com

Treeview" as the AI imagines it.

There's another type of Treeview that you should be aware of. It's an MSI-customizing Treeview:



This is a customizing Treeview Control. We have a separate chapter about it:

1.A Special Issues 215

1.29.9 1.9.1.9 Page- Tab Control

1.9.1 Types of controls Previous 202 Top 41 Next 210

Starting Guide

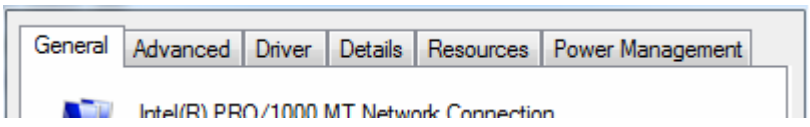
Page Tab Control

What controls do we have to do with?

A Page Tab Control is the digital Representation of a File-Tab.

Exploring the Page Tab Control

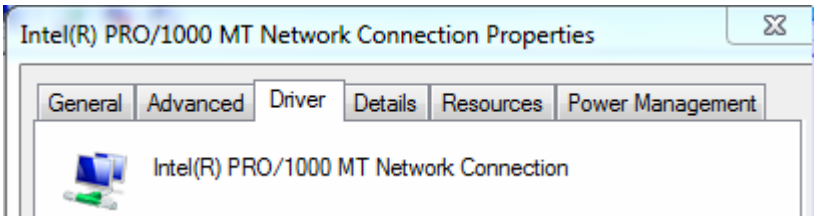
Let's first take a look at a "Page Tab Control":



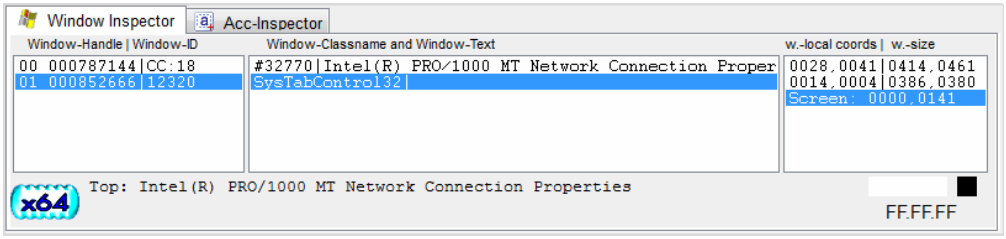
The control we're focusing on now is the Page Tab Control, the digital equivalent of a "File Tab".
It facilitates navigation between different forms.
The typical code to manage a TAB-Control looks like this:

```
STW.ct|#32770|Intel(R) PRO/1000 MT Network Connection Properties
SCW.nct|1|SysTabControl32|{&NOTEXT:}
SAO.rn|37|Driver
MLE.
```

© 2023 Theo Gottwald * https://www.smart-package.com



And here's how the Windows Inspector displays a Tab-Control:



To interact with it, use the SAO. - Search Accessible Object 625 .- and MLE. - Mouse-Left-Click Event 2492 commands.
As window classes can be named freely by the programmer of an application, the window class can differ from this.

© 2023 Theo Gottwald * https://www.smart-package.com

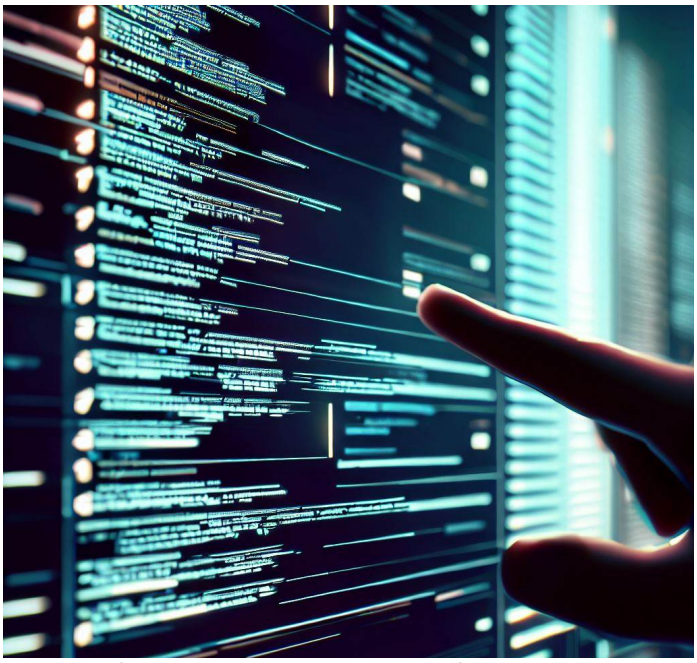
1.29.10 1.9.1.A Listbox Control

1.9.1 Types of controls Previous 208 Top 41 Next 212

Starting Guide

Listbox Control

What controls do we have to do with?



A Listbox Control is the representation of a digital list.

The Listbox Control.

This is a Listbox-Control. A listbox shows you a number of items. You can choose one or many items, by clicking at them with the mouse.

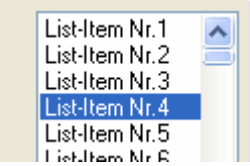
Here is a script to do just that. The LBE.-command will scroll the needed icon and is even able to check a Checkmark of a Listbox-Checkmark.
If LBE. doesn't work, try SAO. SAO. will however not scroll a Listbox, you have to bring the item into visible area yourself, using mouse or keyboard..

```
STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|ListBox|List-Item Nr.1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SAO.rn|34|List-Item Nr.4
MLE.

' This will check a "Listbox checkmark"
STW.wct|45|TWizardForm|Setup - UltraVNC
SCW.wctd|45|TNewCheckListBox|Server Konfiguration:|5
SFW.
LBE.UltraVNC &Desktop-Symbole anlegen||1
```



As window classes can be named freely by the programmer of an application, the window class can differ from this.

1.30 1.9.2 WEB-based controls

1.30.1 1.9.2.1 WEB-based Textbox

WEB-based Textbox **Previous** 210 **Top** 41 **Next** 215

Starting Guide

WEB-based Textbox

WEB-Browser based controls

The WEB-Browser based Textbox

To automate WEB-Sites or Intranet Sites, prefer using the Internet Explorer. That is first choice because you can control it best using the built in accessible engine robot commands.
The only alternative at this time is Firefox, who also can be controlled to a good degree.
Actually do not use Google Chrome or Opera, because with these it will not work.

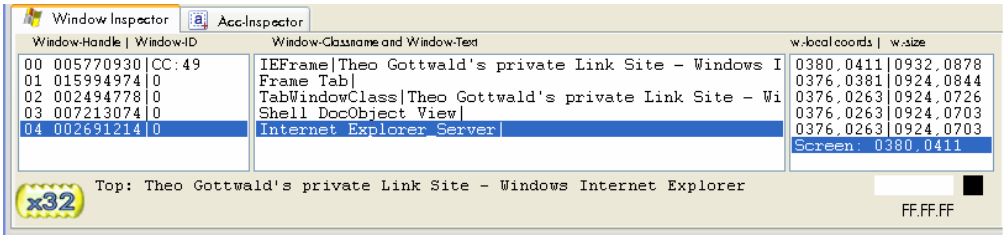
The first thing you need to know is, that the direct engine 231 commands for the keyboard are ignored by web-browser based controls.
Therefore, you will need to use the compatible engine 231 commands instead. The compatible engine simulates key.presses like a human user and therefore can not easily be ignored by an application. For example if you want to type text into a web-browser, you will need to use the compatible engine.

The compatible engine commands for setting a text-box are:

- SKP. Send-Key-Press 2289 (compatible engine)
- SKT. - Send-Key-Text 2293 (compatible engine)

This is **not** the case for mouse-clicks. You can use `MLE.` or `MOS.` (direct engine) to simulate mouse-clicks inside the browser.

Below you see the windows inspector showing an Internet Explorer window.



Note that text-boxes in a browser-window like the one below, are not windows controls. They are not even real text-boxes. Thats why they can only be accessed using compatible engine commands. The same is true for many other web-based controls.

*© 2023 Theo Gottwald * https://www.smart-package.com*

In such cases use the Acc.-Inspector instead. Use SAO625., MOS2509. and the compatible engine commands. Below is a script that wil get you started using web-based controls.

```
' Script to type into a WEB-based text-box using the
' compatible engine

' Check if the Internet-Explorer is already running

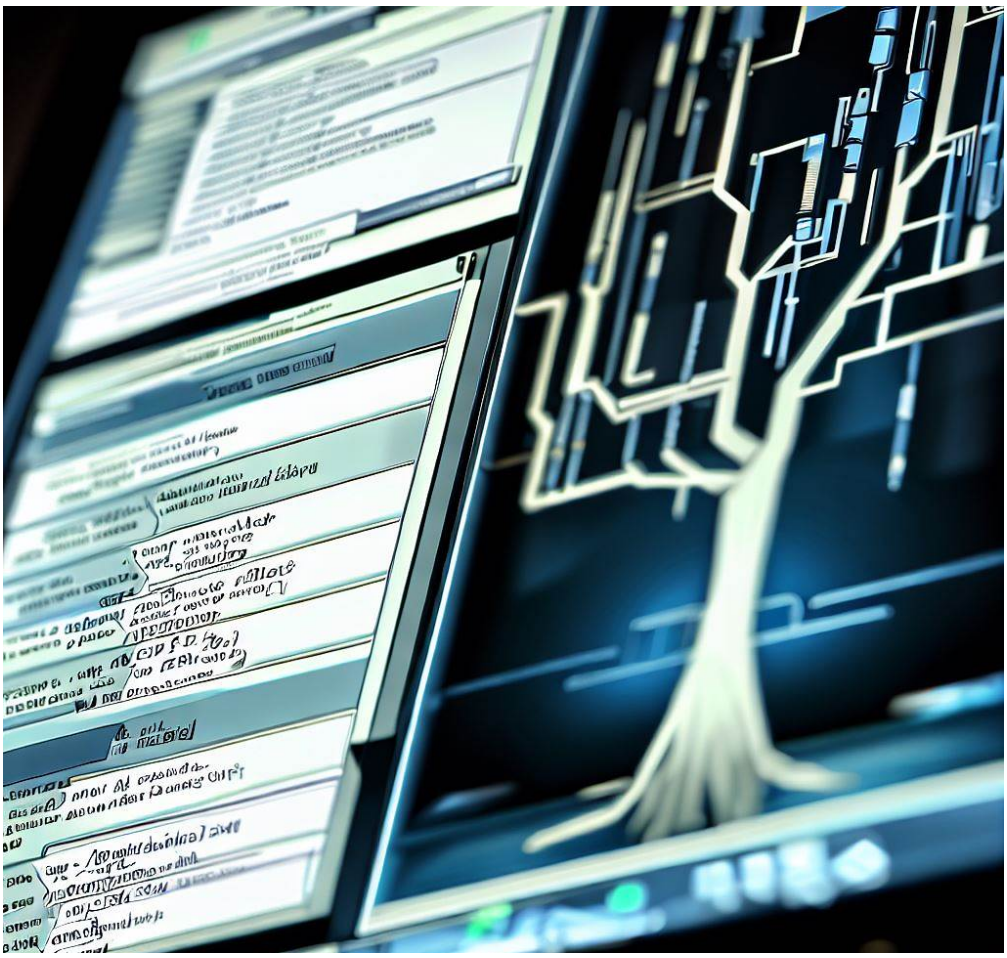
1.31 1.A Special Issues

Special Issues with visual setups Previous 212 Top 41 Next 224

Starting Guide

Special issues with visual Setup Automation

The MSI-Installer Treeview and other Topics

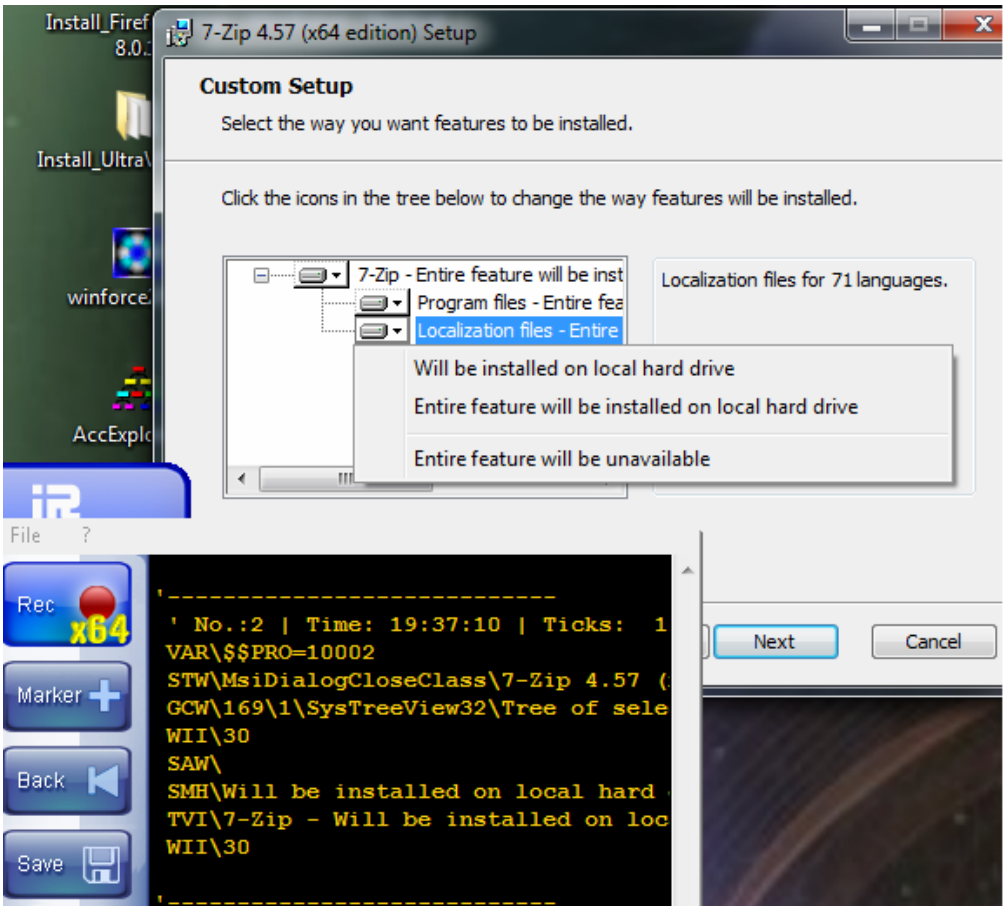


This is how AI thinks an Installer Treeview could look like.

Navigating the MSI Installation Treeview

Sooner or later, you'll encounter the MSI Setup Treeview.
The image below showcases an MSI Treeview with an open menu.

*© 2023 Theo Gottwald * https://www.smart-package.com*



As you can see, InstaRec is the simplest method for generating code for this type of interface. In most cases, this is all you need to create a functional script.
Let's examine the final recording to understand how it works. Later, we'll explore advanced features that can help troubleshoot more complex situations.
Here's an example of the code that InstaRec generates for a menu selection in an MSI Treeview:

```
VAR.$$PRO=10002
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edition)
Setup
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
WII.30
SFW.
SMH.Will be installed on local hard drive
TVI.7-Zip - Will be installed on local hard drive\Localization
files - Entire feature will be unavailable|i
WII.30
```

Let's go together through these lines to understand what each of them is good for.

First Line:

```
VAR.$$PRO=10002
```

© 2023 Theo Gottwald * https://www.smart-package.com

This Line will set the Variable $$PRO to the value of 10002. This is only needed in case of an error. For details see the chapter 1.B Error handling 224.

Second line:

```
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edition)
Setup
```

This line localizes the Application window. For details see 1.8. Selecting the Application (Topwindow) 150

Third line:

```
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
```

This line selects the control (child-window). In our case its the tree-control. For details on selecting a child-window read this: 1.9. Locating Child-Windows 162 .

Fourth line:

```
WII.30
```

This is a "Wait for Input Idle" command. It makes the robot wait until the tree-control can accept our input. For details see WII. - Wait-for-Input-Idle 2909 .

Fifth line:

```
SFW.
```

This is a "Set Foreground window" command. It's maybe not needed here, but as it does not cost a thing, InstaRec just places it here. It will bring the window on top of other windows that may possibly be at the same place.

Line No. six

```
SMH.Will be installed on local hard drive
```

Now it gets interesting. This is the SMH-command (Set Menu Hook). It doesn't really set a hook, the name is more for traditional reasons. However the SMH tells the robot that soon a menu may appear. And it tells the robot what to click in that menu. Like in most cases there is no need to always write the full string, as SMH. supports the 3.2 Standard-Search Pattern 341 .

```
SMH.installed&ANDTHEN:drive
```

would also have been ok in our current case. Now we have told the robot that a menu will come up. The next line will bring the menu up:

Line No. seven

```
TVI.7-Zip - Will be installed on local hard drive\Localization
files - Entire feature will be unavailable|i
```

© 2023 Theo Gottwald * https://www.smart-package.com

This line is the key part of the whole code-block. Therefore we will take a closer look at it. First we have a TVI. - command. This command does NOT support 3.2 Standard-Search Pattern 341
for compatibility reasons with WinRobots compatible Scripts.
Instead it supports the old wildcards the * and the ?. There is a difference however. While you could use these wildcards only at the start of the tree in WinRobots-Script, the more advanced MR-Engine allows you to use them anywhere in the command, even at multiple places.

And in case you prefer to use the 3.2 Standard-Search Pattern 341 you have as an alternative to TVI. the TVF.-command, that supports these more advanced Patterns.

Lets take a look at the TVI.-parameters. First we have the description of the Treeview Item.
Its like a path, even like a file-path. It also uses the \ as a divider of the tree branches. So we have these tree branches:

Root: `7-Zip - Will be installed on local hard drive`
then: `Localization files - Entire feature will be unavailable`

at last we see that there is a

```
|i
```

at the end of the TVI.-line. Taking a look in the help file here: TVI. - Tree View Invisible 668
we can see that this should open the MSI-Menu on the selected tree-item.

If you record MSI-Tree's using InstaRec, the result should always look somehow like this.
It should never contain screen or window coordinates. This can happen, if you move out of the menu window at recording time. If thats the case, you best do the whole thing again.

Now lets take a case where anything was properly recorded, but still doesn't work.

Troubleshooting: What to Do When Things Go Wrong?

Our example above presents a challenging situation for three reasons:
a) The item's position isn't perfect after localization.
b) The treeview is too small.
c) The "|i"-flag doesn't open the menu as expected.

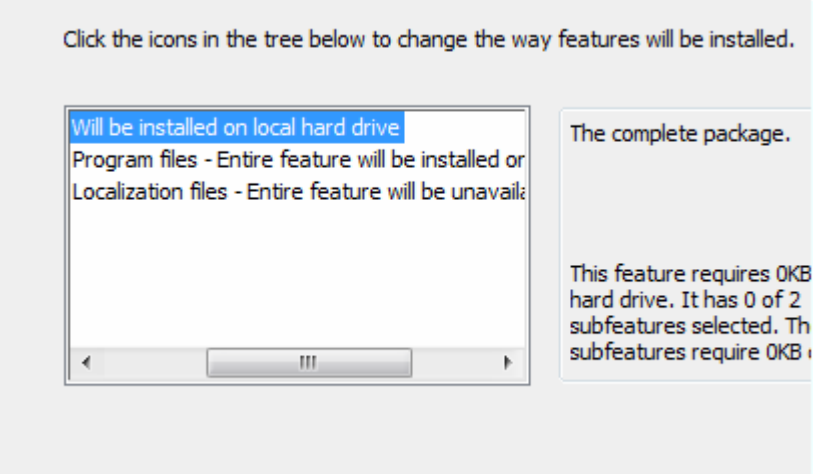
To address these issues, we need to break down the problem and analyze each step. Let's start by checking if the tree-item's localization is functioning correctly.

```
STW.HBJwct|45|MsiDialogCloseClass|7-Zip
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
' I have removed the |i here
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
TVI.7-Zip - Will be installed on local hard drive\Localization
files - Entire feature will be unavailable
' The Mouse should move to the tree-item
MMV.
```

This is what we get.



Yes, the Mouse moves into the middle of the tree-item. Thats normally just what we want, and its completely Ok. But now - how do we select the Menu from here?

First we will use the capability of the TVI.-command and shorten the recorded line a bit. This makes it easier for us to work with it.

```
TVI.7-Zip*\Localization files*
```

Will do the same as the large line from above. We have used the ability of using the * wildcard to shorten the line. Now back to our problem. We can't shorten the Tree-Item text, but we can resize the tree-control. And this is what we do.

```
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edition)
Setup
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
' resize the tree control
SWP.10,100|466,166|C

SCW.ct|static|The complete
CLW.

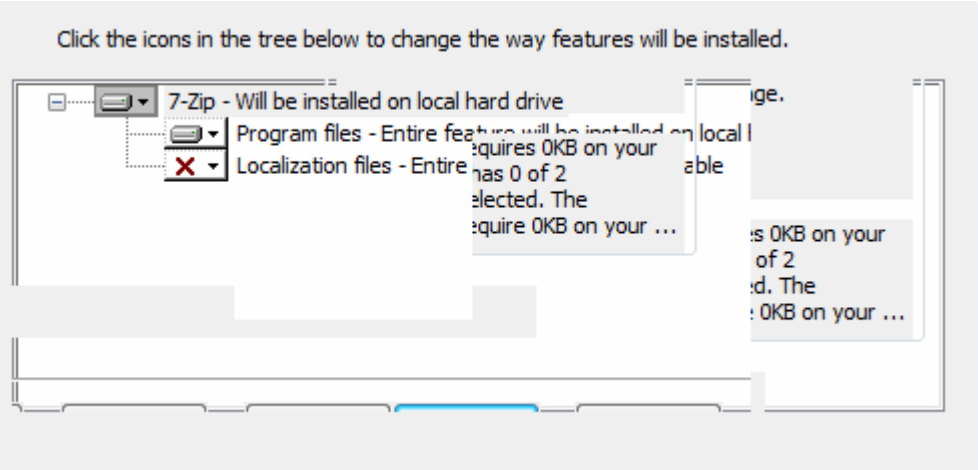
SCW.ct|static|this feature requires
CLW.

ENR.
```

The tree-control is too small. So we just make it larger.It looks like this (step-by-step):
After the:

```
SWP.10,100|466,166|C
```

© 2023 Theo Gottwald * https://www.smart-package.com



it looks a bit chaotic, but we are not yet ready. There are two statics in our way. As statics are child-windows, we can make them invisible, or just close them using the CLW.-command.

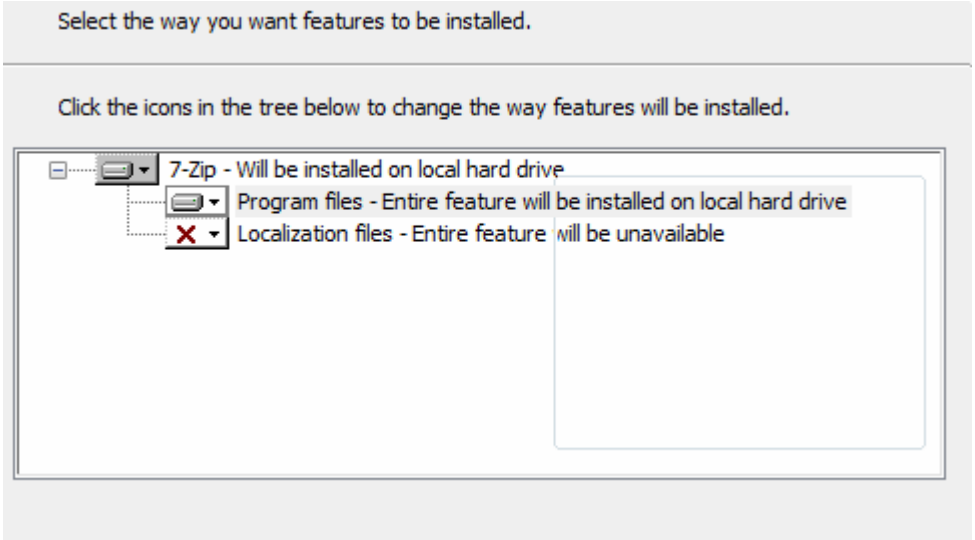
After these two lines:

```
SCW.ct|static|The complete
' Close the text-child-window
CLW.

SCW.ct|static|this feature requires
' Close the text-child-window
CLW.

' End the Testscript here
ENR.
```

These statics are history. We have a clear view now:



This means we have enough space also!

Now we try to solve the next problem: the menu doesn't open!
We use this code from the Editor.

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$PRO=10002
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edition)
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
WII.30
TVI.7-Zip*\Localization files*|1
MMV.
PAU.1
ENR.
```

What we see is, that the mouse moves really to the right point in the tree. But the click seems not to work! Next we try it ourselves.

```
VAR.$$PRO=10002
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 ed
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
WII.30
TVI.7-Zip*\Localization files*|1
MLE.
PAU.1
ENR.
```

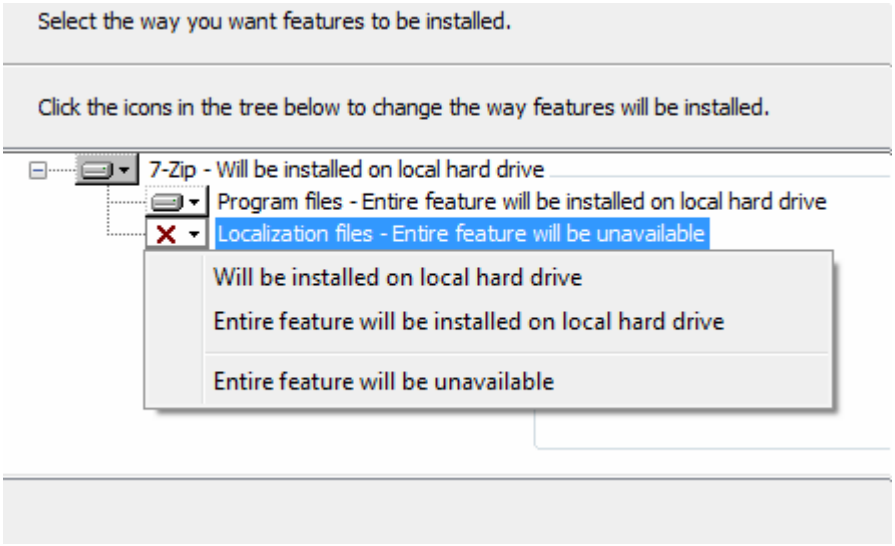
We have changed the MMV. (Mouse Move) to a MLE. (Direct Engine Mouse Click).
Starting the script, all we see is that the selection of the tree-item changes.
But no menu opens.

In such cases, we need to switch over to the "real Mouse-Click". We need the "compatible engine". In short, we need to use MLI. or MLC.

```
VAR.$$PRO=10002
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edi
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
WII.30
TVI.7-Zip*\Localization files*|1
MLI.
PAU.1
ENR.
```

And, voila - problem solved, here is our menu. That will do the Job! See the picture below.

© 2023 Theo Gottwald * https://www.smart-package.com



Now we just need to put the whole thing together.
First we prepare the tree-control.

```
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edition)
SCW.wctid|45|SysTreeView32|Tree of selections|169|1

SWP.10,100|466,166|C

SCW.ct|static|The complete
CLW.

SCW.ct|static|this feature requires
CLW.
```

Then we make our selection:

```
VAR.$$PRO=10002
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edition)
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
SMH.unavailable
TVI.7-Zip*\Localization files*|1
MLI.
WII.30
PAU.1
ENR.
```

Our Final, Functional Code

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$PRO=10002
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edition)
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
SMH.unavailable
TVI.7-Zip*\Localization files*|1
MLI.
WII.30
PAU.1
ENR.
```

Here's our final, working code.
If you're using this for software distribution, please note that it employs the "compatible engine."
As such, it must be distributed following the rules applicable to the compatible engine which needs a real Mouse-Pointer.

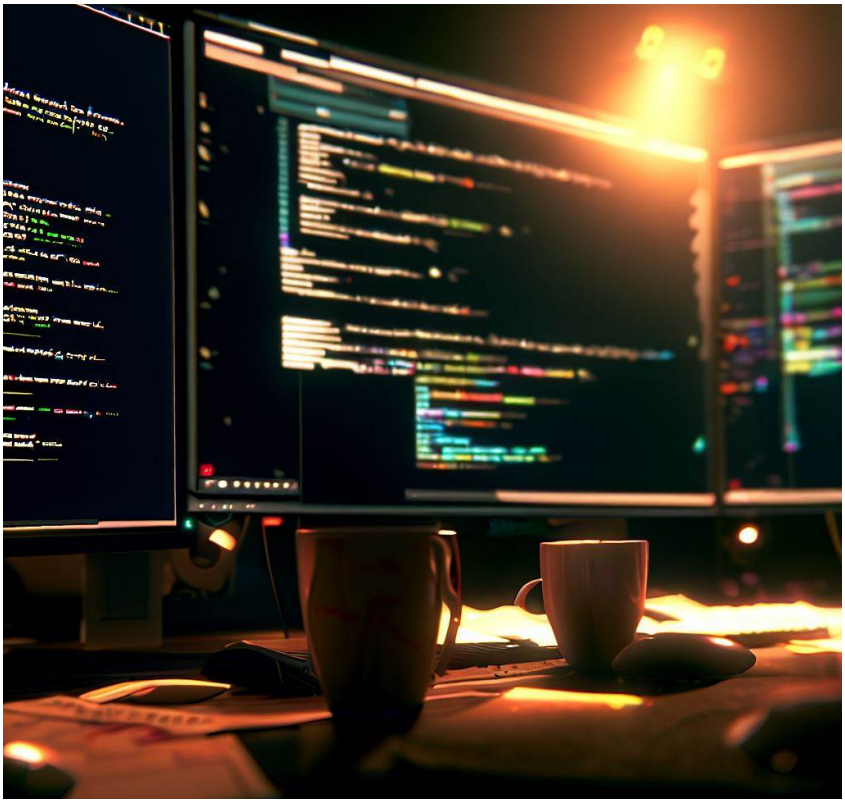
© 2023 Theo Gottwald * https://www.smart-package.com

1.32 1.B Error Management

Starting Guide

Error Management

How can we prevent error messages from being displayed to clients?



An Error is not something bad. It is a hint that shows where the right direction is.

What occurs when an error arises?

There's a high probability that you're using this program for software distribution or in other production environments.
In such scenarios, you wouldn't want error messages to be displayed.
The first tool you need for error handling is the command:

USM. [number]

In our subsequent tests, we'll utilize the following script and simply alter the parameters of the `USM.` command to observe the outcomes.
Here's the test script for reference:

```
'**********************************
' USM.-Demo
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
'**********************************
'
USM.32
STW.tw|Nix|0
MBX.Ready
ENR.
'------------------------------------------------------------
:on_Error
: $$ERF=?path\MR_Error.log

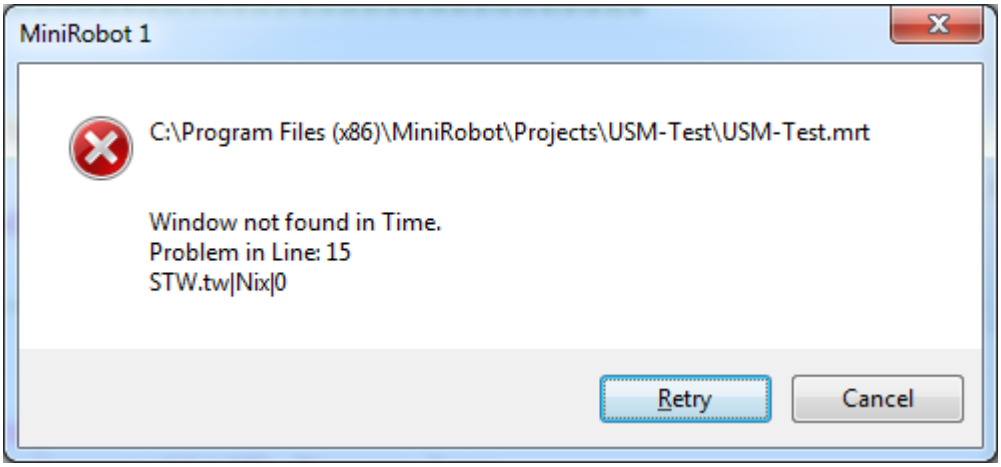
IEF.$$ERF
  COP.$$ERF|?cdesktop\MR_Error.log
EIF.
MBX. AN error happened!
ENR.
'------------------------------------------------------------
```

Manual Error handling starts with

```
USM.32
```

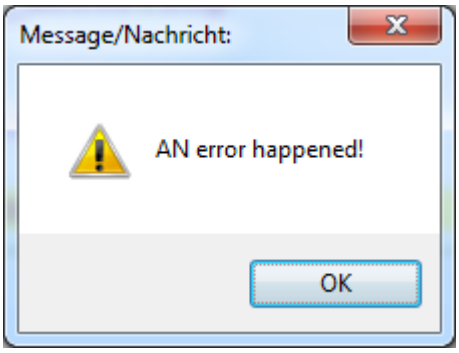
This is the default setting if you don't include the `USM.` command in your script. When you use `USM.32`, you'll get a response similar to the one shown in the image below in the event of an error.

Depending on whether you select "Retry" or "Cancel", the script will perform different actions each time.



If you select "RETRY", the script will internally treat the line where the error occurred as a comment, and it will continue executing from the next line as if no error had occurred.
As a result, you'll see the Messagebox from the normal script termination, as shown in the image below.

© 2023 Theo Gottwald * https://www.smart-package.com



If you pressed "CANCEL", which is the recommended selection, the script will go into "Error-Mode" and do one of two things.

1. If there is no Label `:on_Error` present in your actual script, the script will end immediately.
2. If there is a Label `:on_Error` present in your actual script, the script will just continue running at that label.

If the error happens in the section of the Label `:on_Error` then the script will not jump to this Label again, of course.

Lets take a look on this special Label. You can see how it really looks in the picture below.
One important thing is that you have a regular script end before the Label :on_Error.

You can use the `END.` or the `ENR.` statement for this. If you fail ending your script before that Label, then the script will anyway run into that code that comes after the :On_Error Label. Even if there was no error. And this is in most cases not useful.

```
' Code-Ende
END.

:on_Error
' If this command is executed an error has happened
SRV.$$PRO
' and the return code from the script will be the block number o

' Code-Ende
END.
```

`:on_Error` is a special Label. Its not a Label like any other!

If **`:on_Error`** is there, the script will jump there after an error and continue script execution there. `:on_Error` does NOT prevent error messages, For this you have to use the USM.-command.

InstaRec makes your scripts in a way that you can find the source of Errors.

Assume an error happened. The script runs into the `:on_Error` subprogram.

Now the next thing that happens is the `SRV.` - command. `SRV -> Set Return Value.`

© 2023 Theo Gottwald * https://www.smart-package.com

SRV. will set the Exit code for your compiled script. The Exit- or Return-code is likely the code that is shown in the Management console of your software distribution program.

Now the Full line is:

```
SRV.$$PRO
```

Hint: While the actual Robot program is the "**MR01.exe**", the executable that you have compiled is another program. If you just call the "MR01.exe" manually, use SEC. to set the "Return Error-Level". In all other cases SRV. will work fine.

$PRO is a variable. This means that it is replaced with a value at runtime. For more info on variables see here:

2.3 Variables, global and local 366

Then, what value has $$PRO at this time?
To understand this, let's take a look on a real recoding and see what $$PRO is.

This is an shortened example code, that InstaRec provides.

```
VAR.$$PRO=10002
STW.HBJwct|45|MsiDialogCloseClass|7-Zip 4.57 (x64 edition)
Setup
SCW.wctid|45|SysTreeView32|Tree of selections|169|1
WII.30
SFW.
SMH.Will be installed on local hard drive
TVI.*will be unavailable|i
WII.30
```

In the First Line of each block is the secret:

```
VAR.$$PRO=10002
```

This Line will set the Variable $$PRO to the value of 10002. We call this value the "blocknumber". Because each block of recorded code will have such a number.
If an error happens in this block, then $$PRO will give you a return code of 10002.

Why do we use 10002 and not just 2 ?

The reason is that the normal DOS Error Messages are in that range. Using Block number plus 10000, we are in a range that is free. Therefore if your software distribution tool shows you a return code of 10000+, then you know there has been a problem with a robot-script.

What do we get if there was no error?

In that case, the script will just run into the SRV.0 at the end of the script.

© 2023 Theo Gottwald * https://www.smart-package.com

```
' No.:12 | Time: 16:19:37 | Ticks:  1295
VAR.$$PRO=10012
' This command will set the return code.
SRV.0

' Code-Ende
END.

:on_Error
' If this command is executed an error has happened
SRV.$$PRO
' and the return code from the script will be the block number

' Code-Ende
END.
```

And we get a return code of zero. Which says that no error happend and all was Ok.

The combination of

```
SRV.0
END.
```

can be shortened to

```
END.0
```

from this version. End will internally just do the same, if it gets an Parameter.

Now how can we get rid of the messagebox with the error?

In case you distribute automated installations to clients, you may not want that error-messages appear on the clients desktop. Instead you want to have them in a log-file.

You can do this using the `USM.10` command.

The USM.10 is an simpe addition of an USM.8 and a USM.2.
It will do two things:

1. USM.8 will redirect all Output from Messageboxes into the console-window.
2. USM. 2 will redirect all console-window output to a file

And how do we get the real error-message?

This way we will get all Error-Messages into a log-file. This log file is by default at two possible places.

1. If you run the script from the editor, the log-file is in your "Project folder".
   That is, where the script itself is located.
2. If the robot runs without an Editor, the log-file is on the ?cdesktop\345.

You can however specify any other place for this error-log file and override the default settings, if you add a second parameter to the USM.-command. Like this:

```
USM.10|?pfad\My_Error.txt
```

© 2023 Theo Gottwald * https://www.smart-package.com

There are more less often used options for your error-handling

While having the script run without visible errors, and getting the error into an log-file at the place of your choice is all you will need in most cases. There are more choices.

Most of them just for special cases. The `USM.`-command with the "**0**" as parameter, will prevent the robot from showing any error-messages. The script will just immediately end.

However this will not help us in most cases. We will therefore look at better combinations.

`USM.4`

1. will ignore any error,
2. comment that line
3. and continue running the script as if nothing had happened.

Be careful with this option. If you add more options, the "4" will anyway prevent the `:on_Error` Label from being called, and also prevent the script from being ended.

`USM.16`

is another Option. `USM.16` will show up a **Messagebox** that will stay for less than a minute an then **automatically be closed**. After this, the script will continue running at the `:on_Error` Label, or just end if no such Label was found in the actual script.

`USM.8`

will redirect all Messages to the console-output.

`USM.2`

will redirect all Concole-Output to the a file. Note that this will redirect all console Output to the Error-Log-File.

`USM.1`

will just make a Message-Beep if an error occurs. It will not do anything else.It makes only sense, if you add the 1 to other options. For example, you can use `USM.11` which is 10+1.

`USM.64`

If an error happens, after the script already jumped to the `:on_Error` Label, this Error will not jump to the `:on_Error` Label again. Therefore after a Jump to the `:on_Error` Label, a internal flag is set, that prevents the robot from jumping there again. This is to prevent a endless-loop.
The `USM.64` will clear that internal flag. After it was called, the script will jump to the `:on_Error` Label, even if the error appeared after `:on_Error` Label was already been used.

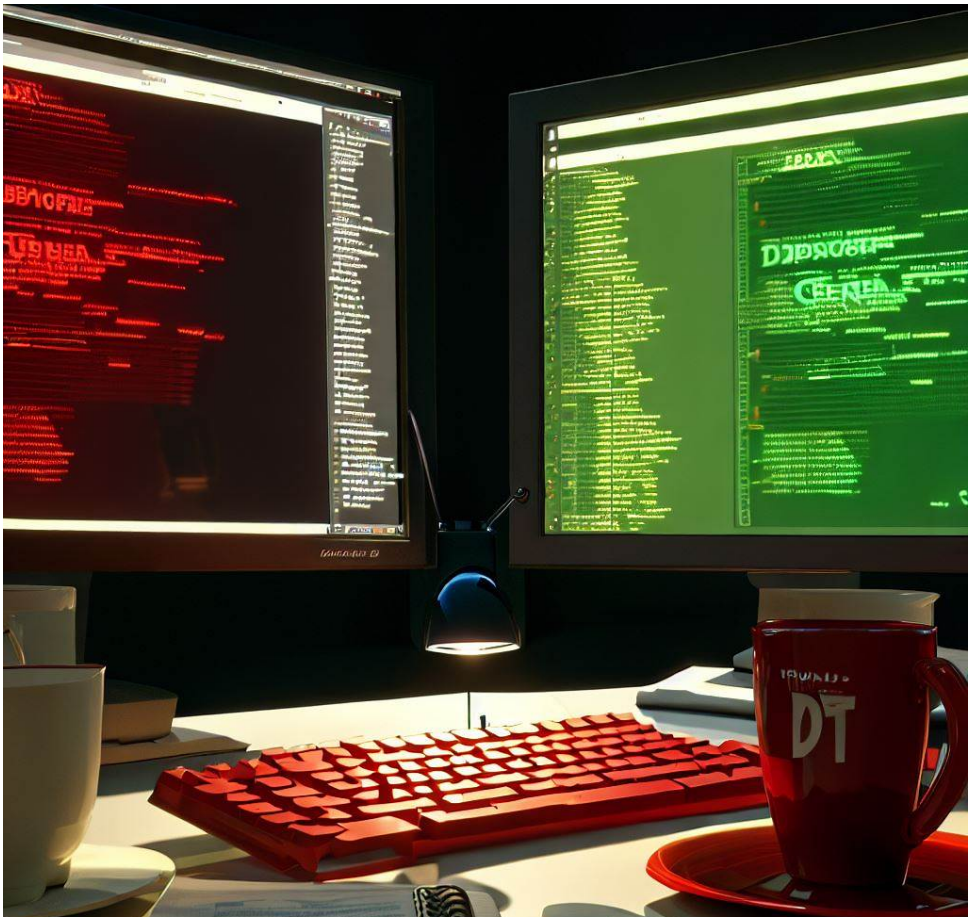
1.33 1.C Direct Engine and Compatible Engine

Starting Guide

Direct Engine and Compatible Engine

What it is and what it is good for.



The two engines: "direct engine" and "compatible engine".

When simulating Mouse and keyboard there are generally two ways to do so. Most often we go the direct way and talk directly to the "Target-Application" or Setup-Program. We sent them a Message telling them "Hey App, you got a Mouse-Click.". Or "Hey App, there is a keyboard event for you.".

Direct and compatible Engine only have to do with simulating Mouse and Keyboard action. They have nothing to do with window or Element-Localisation.

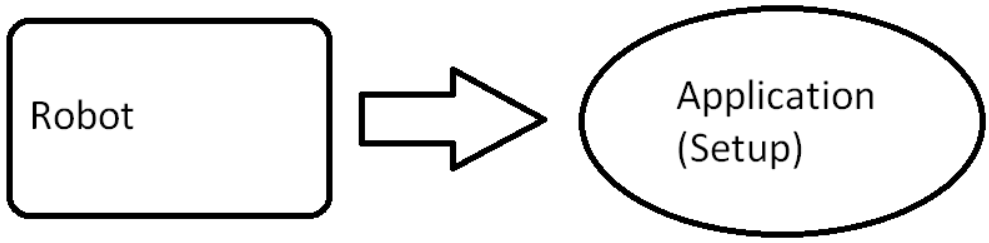
*© 2023 Theo Gottwald * https://www.smart-package.com*

This way we can work very efficient in simulating mouse and keyboard. Because the limit is just the speed in which the target application understands our messages. Here are some advantages of using the direct engine.

- Fast execution, capable of sending multiple commands per second.
- Can interact with invisible windows and disabled windows.
- Can interact with windows that are behind other windows.
- Does not require a physical mouse, keyboard, or desktop.
- Enables the execution of scripts without a logged-on user.
- Typing text is particularly fast with the Direct Engine.

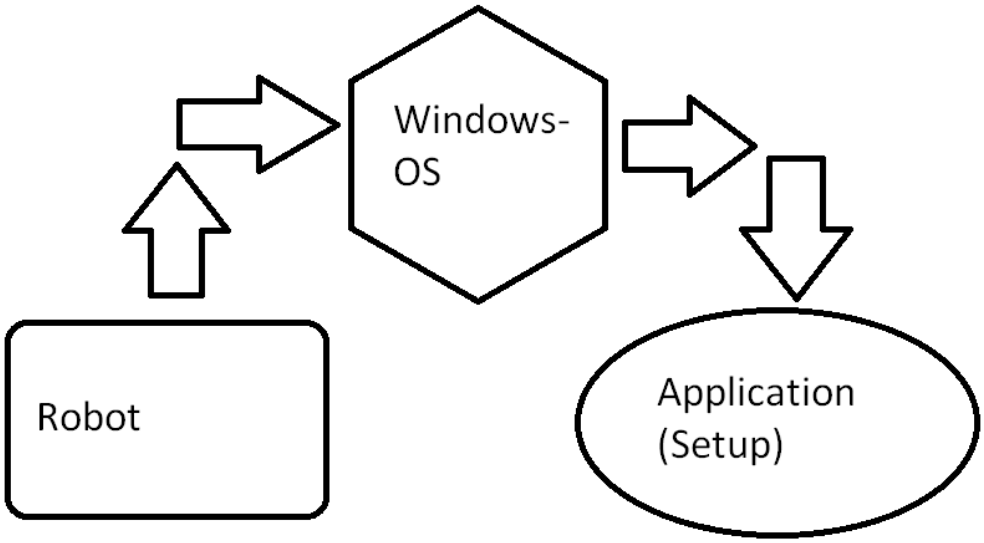
About the speed, there are differences between the commands. Typing text is much faster then using other options. You may be able to fill ten or more text fields in a second using the direct engine.

The Direct Engine



But unfortunately, not all applications and Setup-programs are willing to talk with the robot directly. Few of them, will just not react on direct engine commands. In this case we need to do what a manual user would do. We need to use the mouse and the keyboard. As we are very compatible this way, this is called the

The Compatible Engine.



The Compatible Engine sends the mouse and keyboard simulations to windows. Just like you, when you use the mouse and the keyboard. Therefore it will work in all

© 2023 Theo Gottwald * https://www.smart-package.com

applications for sure*. However being compatible has disadvantages in terms of speed.
Here is a list with the characteristics of the compatible Engine commands:

- Sends mouse and keyboard simulations to windows, mimicking user actions.
- Ensures compatibility with all applications.
- Slower compared to the Direct Engine but faster than manual interaction.
- Works on windows where the Direct Engine may not be effective.
- Cannot interact with invisible or deactivated windows.
- Requires a physical mouse, keyboard, and desktop.
- Suitable for scripts that run when the user is logged on.

Please note that the choice between the Direct Engine and the Compatible Engine depends on the target application's responsiveness and compatibility.
In most cases, the Direct Engine provides faster and more efficient automation, but the Compatible Engine ensures broader compatibility across various applications.

And how do you select between the two engines?

That's easy. You just choose the right command. You will find on the help-page of each command a hint, which engine is used.

Some commands support only one of both engines. In this case there is another command that supports the other engine. Some commands support all of the two engines and you choose by giving a parameter which engine to use..

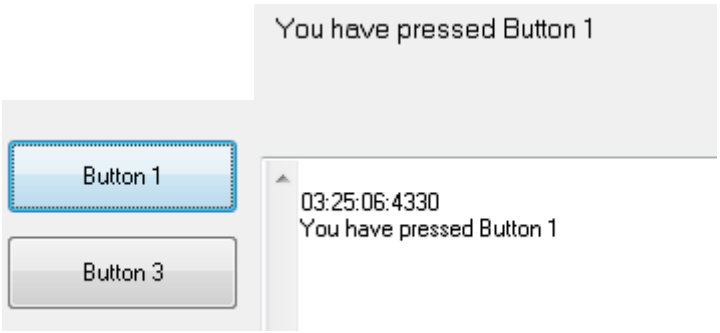
Let's test both engines so you get a feeling for the difference. First you should start the Test-Application in the "Sample Applications" Folder.

Then just run this script:

```
'Move pointer to Window-Area.
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Button|Button 1
MLE.

ENR.
```

Here is what you see in the Test-Application:



The Button gets selected and the Application tell you that "Button 1" was pressed.
However you did not see the mouse do anything, right?

© 2023 Theo Gottwald * https://www.smart-package.com

That is because the mouse is not involved when we use the direct engine. Now we change the program - just a bit. In fact we use the compatible Engine now. Look at the script.

The only change was that we have replaced the "`MLE. (Mouse Left Event)`" with a "`MLC. (Mouse left Click)`" command.

```
'Move pointer to Window-Area.
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Button|Button 1
MLC.

ENR.
```

That is all. Now it uses the compatible engine. Start the script again. Now you see the Mouse-Pointer move to the "button 1". In the same way like if you had clicked it manually. Thats why its called "compatible". It's just like "If you do it yourself". Anyway, moving the Mouse around is a bit slow. There must be a faster way, which is still compatible. And that is called "`MLI. (Mouse Left Click Invisible)`".

Try it yourself and replace the `MLC.` with an `MLI.` and run the script again. The effect on the Test-App is the same. However its a compatible click, that will work very fast in most of all cases. In those very few cases, where `MLI.` will not work, you can use `MLC.` or you can try `MLM (Mouse left Click Move).` And now we get to the next question:

How do i know which engine to choose?

The answer is simple. You have to try. There is no way to see or know it without trying. Record your setup using the InstaRec. Test your script from the Editor.

In most cases, its not the whole Setup, that does not react to the direct engine. That's very seldom. In most cases, its a control with settings, that needs the direct engine click.

- First thing to do is, record your script, using the direct engine.
- Test is slowly from the editor
- If you see that some clicks are not pressed, choose compatible clicks at these place

This is the way to do it. Here a short list with the most often used commands and a hint for the Engine:

```
MLE. - Direct Engine
MLI. - compatible Engine (faster then MLM.)
MLM. - compatible Engine (faster then MLC., more compatible
then MLI.)
MLC. - compatible Engine (Most compatible)

SDT. - direct Engine
RST. - direct Engine
SKP. - compatible Engine

SCI. - direct engine
CDD. - compatible Engine
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
BTC. - 0/1 - direct Engine, 3,4 compatible Engine (Details see
command)

TVI. / TVF. - direct Engine (depends on Options)
```

* There may be applications that defend actively against simulated mouse and keyboard input. In these cases. even the compatible engine may not work.

1.35.2 B. General Explanation

Starting Guide

General Explanation

Intention

This area explains what the command is good for.

Syntax

Command. [P1][|P2]

Parameter Explanation

Here you'll find an Explanation of the parameters, which are allowed or required for the explained command.

Some commands support two or more different syntaxes, so, those commands may have more than one parameter explanation after each syntax example. See below.

Some commands may take more than one kind of parameter, in such cases, there may be not a parameter explanation, but included examples, in the **Example** section.

```
P1 ... Px - Parameters 1 .. x

STR - String-Parameter (Any Binary is valid)
TXT - Text-Parameter (should be Text-Characters, numbers)
FILE - Filename with complete path
FOLD - Foldername with complete path
SCFN - Scriptfilename: with complete path if elsewhere,
filename only if its in ?path
VAR - Any valid Variablename can be given as parameter
LNG - 32 bit signed Integer
QINT- 64 bit signed Integer
INT - 64 bit signed Integer or 32 bit signed Integer
EXT- signed high precision Floating Point value
NUM - any numeric parameter (INT or EXT)
LAB - Label in current script.
ELAB - Label in other script.
TOS  - Top-of-Stack (see SCM.)
[optional] - Parameters in [] are optional
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'******************************************************
' In this area you will find "ready-to-run" Examples
'******************************************************
```

Remarks

Some commands have special remarks or extra explanations, in this area you will find comments which are general to the command, if the command explanation requires it.

Limitations:

If the command has Limitations, you should find them here.

Unlimited means that the total Memory usage may not exceed 2 GB (Gigabyte), including all Variables and Skriptcode.

The general Number of Parameters in one Line shall not exceed 60 (actual Limit).

See also:

Here you can find other commands which could be intresting for you. Related to the command or topic explained in the page.

© 2023 Theo Gottwald * https://www.smart-package.com

2. Components

2 2. Components

2.36 1. PreProcessor & EXE-Compiler

2.36.1 1.0 Pre-Processor

1.0 Smarty's Preprocessor **Previous** 290 **Top** 41 **Next** 248

Preprocessor-Directives

Smarty's PreProcessor

The Preprocessor is the first Step in Script Execution. During this step, the Code will be changed by certain rules, before any other execution is done.

Smarty's unique Preprocessor offers features like:

- define your own commands (`MACRO`'s)
- The Preprocessor will also read the INLINE-Data between `VDA. - VDE.` and bring them into a Form where the Script can be executed with maximum Speed.
- use parameters with your own commands
- return results from your own "Macros" inside variables
- Overload Macros using `GVT.` (get Variable Type)
- react on the number of Parameters given.
- use Macros inside Macros
- use `SAV.` and `SAV.Restore` to make all used Variables "Local".
- Use VBS and Powershell inside your Macro's. (See `VBS.` and `PWS.`)
- use unique-labels and variables in your `MACRO`'s
- include your personal subprograms with just one line of code, before the script runs using `#INC:`
- Influence the script-code before its being executed

*© 2023 Theo Gottwald * https://www.smart-package.com*

To enable these features, the preprocessor analyzes and changes the script immediately before script execution.
Therefore the Preprocessor is not really a part of script-execution, its rather a script preparation.

Below is a schematic diagram of the Script execution process.
As you can see, the Preprocessor takes its part as step number two.

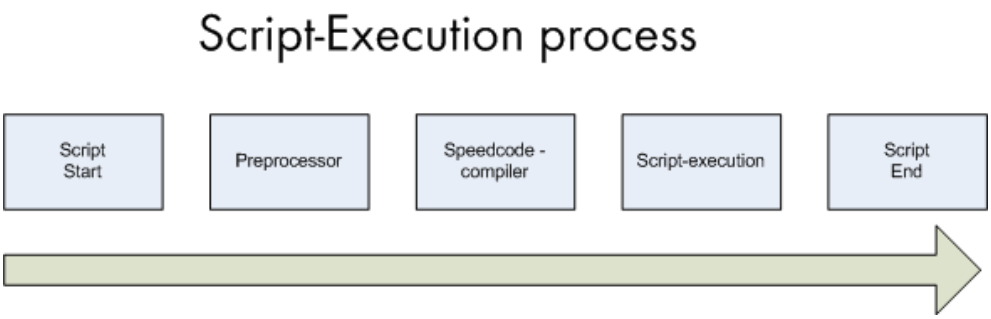
The preprocessor touches the script before execution. Therefore the execution stage will get the script that has already gone through the preprocessor.

PreProcessor commands generally start with a "#", followed by three letters. Please do not intermix PreProcessor-commands with Compiler-Commands. Compiler Commands are executed during compilation, and when the script is unpacked on the target machine.

Compiler-Commands generally start with a ' (Comment-Sign) to prevent them from being executed.

Preprocessor commands start with a "#".

Compiler-Directives start with " '#".



Sample-Macros see here: ! User-Macros 399

© 2023 Theo Gottwald * https://www.smart-package.com

2.36.2 1.1 #INC: - Pre-Processor File-Include

Preprocessor-Directives

#INC

Preprocessor File-Include

Intention

This Preprocessor-Directive will insert Code from a file at the Place where it occurs.
It can occur many times in the Skript and can even be used recursively.

#INC: is a preprocessor command, to include code-lines or complete files into your Scripts.
These can be your personal MACROS or variable definitions into your script. The inclusion of the file will be done immediately and on the lowest level.
The rest of the script will not see any difference between, if the file was included or if it had been pasted. It will be like the file plus the inclusions is one large file.

Normally, if you want to call a "SubScript" you would call `JNF.` at runtime. In that case you can use system local variables and the systen local stack. `#INC` is very different from that. It just mixes the the files into one file before they really get processed.

Assume that you have several MACRO packages that you want to load into your script, using `#INC:`. You can even nest as many `#INC:`'s to unlimited depth on your own risk.

What if each of the packages calls a main-package with your own, general definition?
How can you prevent, that a file with Macro-Definition (or any other) is included several times?

This can be done unsing the #ONCE ... #OEND 251 Option. This way you can be sure that any package with definition is just loaded once.

If you want to run your files as compiled Stand-Alone executable, make sure that all needed scriptfiles are being included into the executable package. For this you will need the compile-time command `'#INC:`. It looks similar but is something else!

Important note:
Do not intermix the Preprocessor-File-Include `#INC:` with the Compile time command `'#INC:`. The later will include files int othe executable package. While looking similar, these are two very different animal. The difference is the small " ' " comment operator. If its missing, we have the preprocessor-file include. If the comment-sign is there, its a compile.time command!

*© 2023 Theo Gottwald * https://www.smart-package.com*

To learn more about the compile time command '#INC: see
2.1.8 '#INC: - Include Files and Folders into the Executable 290

Hint: Use this command together with the 2.1.A #LIB: - User-Library Path 298 command. You can #INC: directly from the User-Library.

Also note that all ".mrt"-files that are included with the #INC: directive can be encrypted using the '#CRY: - directive.

Syntax:

#INC:P1

P1 - Filename including path to the file. If you want to run the script as Standalone "EXE" File, you should copy the file to the project folder, that is the folder where the script itself is.

Example:

For this example we need two files.The Main file, we want to execute/compile. And the Macro file that we want to include.

```
' Main-File

DBM.1
#INC:Macros.mrt
: §§VAL=5
' Here we check only the lower bound
%Check_Bounds §§VAL|6
PRT. First Result is §§VAL
MBX. Ready
ENR.

' This is the additional file,
' which is included.
'
' The Macro checks parameter 1 against
' parameter 2 as Lower Bound.
' if parameter 3 is available, parameter 1 will be
' checked against parameter 3 as upper bound
'
: %Check_Bounds 2
IVV.§§§01<§§§02
  : §§§01=§§§02
EIF.
#IF PARAMS>2
IVV.§§§01>§§§03
  : §§§01=§§§03
EIF.
#ELS
PRT.Nur ein Parameter
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
#EIF
PRT.Hallo
END%
```

Remarks:

All Commands starting with a "#" are Preprocessing Commands. These commands are used by the built-in preprocessor to change the code before execution. These commands will not be available in the code at runtime. These commands have no access to Variables and Runtime Resources. These commands will influence the code before it is actually starting.
When compiling an executable, the editor tries to include the filename after `#INC:` automatically into the package. If no path is given, "`?path\`" is assumed to be the location of the script file. Therefore its best practice to have the include-files in the same folder as the Main script file.

Limitations:
-

See also:

- : - MACRO-Definitions 253
- #ONCE / # OEND 251
- 2.1.A #LIB: - User-Library Path 298
- 2.1.8 '#INC: - Include Files and Folders into the Executable 290

© 2023 Theo Gottwald * https://www.smart-package.com

2.36.3 1.2 #ONCE / # OEND - Multiple Include Protection

Preprocessor-Directives

#ONCE / #OEND.

Include code-parts only once

Intention

All Commands starting with a "#" are Preprocessing Commands. These commands will influence the code before it is actually starting.These commands have no access to Variables and Runtime Resources, as they work in the Preprocessor, which is before Runtime.
The #ONCE and #OEND is a preprocessor command. The block between #ONCE and #OEND will not be read two times. There are two versions of the #ONCE command.

First version:
The #ONCE **without any parameters**. In this case the internal preprocessor uses the name of the actual loaded file as parameter. This will prevent the whole file from being loaded a second time. even if the block is somewhere inside the file.

Second version:
To just block a part of a code, use **#ONCE [parameter-string].** In this case the parameter string will be stored in an internal memory and compared to any further call to #ONCE.
If this string is found a second time, the whole enclosed Block is been removed before any further processing is done.
This way, you can prevent files which are included with #INC: from being loaded and processed multiple times.
For example if the files contain MACRO Definitions. You do not want them to be loaded and parsed several times. Even if they are called from multiple incclude files.

There is no internal space after #ONCE, **anything after the "#"** is taken as part of the string. You can use the **:** or many other signs for formatting, these will however be part of the string. Variables are not resolved after #ONCE because this is done at Preprocessing-time, not at runtime.

Syntax:

#ONCE [P1]

P1 - string which identifies the block as unique.

Example:

© 2023 Theo Gottwald * https://www.smart-package.com

```
'----------------------------------------
' Macro/#ONCE-Example 1
'----------------------------------------
' Minimum Number of parameters is set to zero
: %MyMacroA 0
#ONCE:ME
PRT.Number of Parameters:§§§00-Parameter=§§§01
#OEND
' Replace the MEX with ME to prevent the block from
' being processed.
#ONCE:MEX
PRT.Number of Parameters:§§§00-Parameter=§§§01
#OEND
END%

' Minimum Number of parameters is set to 1
: %MyMacroB 1
%MyMacroA Mytext
PRT.Number of Parameters:§§§00
END%

%MyMacroA Mytext

2.36.4 1.3 : - MACRO-Definitions

Preprocessor-Directives

MACRO. Definition

Macro definition

Intention

Define your own Commands!
Bundle them to build your personalized robot-language.
Use available commands and put them together to MACROs (to new commands).
Customize the scrip-language to your needs.

While not starting with a '#, this is an preprocessor command. Imagine that you can define your own commands. Save them in include files and call them in your scripts.

Macronames always start with a "%" (percentage sign, ASC 37). Before the script is executed, all MACROS are expanded to their content.

Macros can be used to make your own Instruction.
They can also be used to make your own "condition commands".
In this case, you may end up in the Editor with %IF_Something"
with a incorrect Formatting. Because Number of `IXX. / EXX.`
do not match.
To handle this, the SPRE-Editor now supports these two Pseudo-Instructions:

```
'EIF+
'EIF-
```

These will not influence the Script in any way, just correct the Formatting of the Script in the Editor.

See Example below.

```
VAN.$$NUA=1
%IF_OR $$NUA|$$NUA|$$NUA
'EIF+
  MBX.Was here
EIF.

DMP.1
MBX.1
ENR.
'=========================================================

: %IF_OR 1
SAV.$$M00
#IF PARAMS=1
CAL.$$M00=($$$01>0)
#EIF
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
#IF PARAMS=2
CAL.$$M00=(§§§01>0) OR (§§§02>0)
#EIF
#IF PARAMS=3
CAL.$$M00=(§§§01>0) OR (§§§02>0) OR (§§§03>0)
#EIF
#IF PARAMS=4
CAL.$$M00=(§§§01>0) OR (§§§02>0) OR (§§§03>0) OR (§§§04>0)
#EIF
IVV.$$M00>0
  #IF RECURS<0
EIF.
#EIF.
SAV.Restore
END%
```

Important:
We recommend that the Macro-Definitions are being placed at the End of the Script. As Macros are collected in a separate Pass, they can still be used inside the script. This way stepping through the script and testing will be easier, as you do not have always to go through the Macro-Definitions first.

Syntax

```
: %Macroname P1
[Macro Content]
...
END%
```

Let's see an very easy MACRO example:

```
: %PrintIt 1
  DBP.Hallo my dear §§§01
END%
```

Lets look at this in detail. The Line:

```
: %PrintIt 1
```

starts the MACRO definition and defines that there will be at least one parameter at runtime. Calling the MACRO with less parameters will lead you to an error:

"Macrodefinition contains less parameters as Macrocall"

Now if we call the Macro later in our script we must give the MACRO one parameter, for example a number or a text or a variable. Like this:

© 2023 Theo Gottwald * https://www.smart-package.com

```
%PrintIt Tomas
```

If we start the script, the Macro will be executed.
The DBP. command will write something like this in the Editor-Text-Area.

```
[10:22:14] [12] Hallo my dear Thomas
```

In the first bracket you can see the time when the Message was written. In the second bracket you will see the linenumber of the DBP.-command[769]. In our case its the linenumber of our MACRO.

Executing MACROs in Single step mode will make the Editor "stay on the MACRO line" until the MACRO is completely executed. You can use the DBM.-command[765].

```
DBM.2
```

will make you see every line that was executed inside the MACRO.

Macros make sense, if you need to call subprograms several times in a script.

Like this:

```
DBM.2

: %PrintIt 1
DBP.Hallo my dear §§§01
:MyDupLabel
END%

%PrintIt Thomas
%PrintIt Ralf

ENR.
```

Now imagine you call your Macro several times and it contains a label (Jump mark for GTO./ JMP. (=GOTO).

What would happen?
The Macro would expand the Label each time and we would get a Error message: *"Duplicate Label ignored."*

Similar problems could arise, if we used fixed variable names inside Macros, and these Macros would call themselves. Or would call other Macros that call these Macros.

To prevent these type of "duplication problems", the §§§95 to §§§99 preprocessor variables are provided. They will be expanded to a numeric value at preprocessing time.
This value has a defined format and will be increased by 1, each time a new MACRO Definition is been expanded. This way you can easily create unique labels and variable names.

© 2023 Theo Gottwald * https://www.smart-package.com

Let's see an example:

```
: %MoreClicks 1
' Get the parameter into a variable
VAR.$$V§§§97=§§§01
IVV.$$V§§§97=0
  JMP.Label§§§98
EIF.
FOR.$$X§§§97|1|$$V§§§97
 MLC.
NEX.
:Label§§§98
END%
```

If we call our Macro like this:

```
%MoreClicks 3
%MoreClicks 4
```

The source code line

```
VAR.$$V§§§97=§§§01
```

will expand to something like that for the first Macro call:

```
VAR.$$V01=3
```

and like this for the second Macro call:

```
VAR.$$V02=4
```

As we can see, the §§§01 contains the first given parameter. You can call a MACRO with more parameters then defined, but not with less. We could give more parameters to our MACROS like that:

```
%MoreClicks 3|hallo|99
```

They are separated with the pipe symbol. In this case the additional parameters will be in

```
§§§01 -> 3
§§§02 -> hallo
§§§03 -> 99
```

We can also check how many parameters have been given to our MACRO using the #IF ... #EIF - Decisions in Macros 262 option. The number of given parameters is available inside `the §§§00` also.

You can use the special-preprocessor variables §§§95 to §§§99 and the §§§00 to make Macro-unique Labels and temporary variables inside the Macros.

Macros can call themselves. They can call Macros that contain calls to themselves. They can be nested to any depth. This way you can use recursion to solve your problems. However, **the resolver does not check for unlimited nesting.**

© 2023 Theo Gottwald * https://www.smart-package.com

You can use the #IF ... #EIF - Decisions in Macros 262 #IF RECURS option to prevent unlimited Macro nesting, which will possibly lead to an memory error or stack overflow. Inside Macro-Definitions you can use these special variables:

```
- §§§95 - unique variable-counter variable, Format "000"
- §§§96 - unique variable-counter variable, Format "00"
- §§§97 - unique variable-counter variable, kein Format
- §§§98 - unique-Label counter-variable, kein Format
- §§§99 - actual recursion-depth at expansion time
- §§§00 - number of Parameters given to the Macro at call-
time
```

Macro-Parameter Substitution:

`§§§01` through `§§§90` will be substituted with the Macro parameters, which are given to the Macro at call-time. Macro-Parameter must be separated with | (Pipe-Symbol/ASC 124).

Important Note:
Macro Names are case-sensitive!
Using false written Macro-Names will not give an error-message!
These lines will just be ignored.

Parameter Explanation

Macroname - must start with %. Can be of any length. Can not contain spaces.

P1 - Number, defines the minimum number of parameters required for this definition

You can call a MACRO with more parameters but not with less.

2.36.5 1.4 #IF ... #EIF - Decisions in Macros

Preprocessor-Directives

#IF / #EIF

Two way decisions in Macros

Intention

All Commands starting with a "#" are Preprocessing Commands. The #IF commands can only be used inside Macros. See chapter MACRO-Definition 253.

These commands are used by the built-in preprocessor to change the code before execution. They will not be available in the code at runtime. These commands have no access to Variables and Runtime Resources. These commands will influence the code before it is actually starting.

These #IF Commands can be nested to unlimited Depth.

#IF is a special "**expansion-time evaluation**"

The following two **#IF ... #EIF** are supported:

```
#IF PARAMS[condition][number or formula in ()]
[code]
#ELS
[code]
#EIF
```

and

```
#IF RECURS[condition][number or formula in ()]
[code]
#ELS
[code]
#EIF
```

To influence Macro-Expansion at resolving-time. Use >,<,= or ! as condition. Please note that number must be any real number. Variables can not be taken at this place (except §§§00 and §§§99. While §§§98 can be used at this place, its expanded to a decimal number at this place. §§§97 can not be used at this place).

Inside Macro-Definitions you can use these special variables:

```
- §§§95 - unique variable-counter variable, Format "000"
- §§§96 - unique variable-counter variable, Format "00"
- §§§97 - unique variable-counter variable, kein Format
- §§§98 - unique-Label counter-variable, kein Format
- §§§99 - actual recursion-depth at expansion time
- §§§00 - number of Parameters given to the Macro at call-
time
```

© 2023 Theo Gottwald * https://www.smart-package.com

Macro-Parameter Substitution:

§§§01 through §§§90 will be substituted with the parameters, which are given to the Macro at call-time. Macro-Parameter must be separated with | (Pipe-Symbol/ASC 124).

Syntax:

```
#IF PARAMS[operator][value]
...
#EIF
```

Parameter Explanation:

Operator - can be any of: >,<,=, !
value - Number, will be compared to the number of parameters actually given to this Macro call. Based on result of the compare operation, the block is been added or removed from processing code.

```
#IF RECURS[operator][value]
...
#EIF
```

Parameter Explanation:

Operator - can be any of: >,<,=, !
value - Number, will be compared to the actual recursion depth inside macro expansion. Based on result of the compare operation, the block is been removed from processing code or not. Can be used to break recursive Macro calls at a specified depth.

Example:

```
'-------------------------------------------------------
' Macro-Example 1
' Please start "TestApp_01.exe" from the TestApp Folder
'-------------------------------------------------------

 #IF RECURS<5
  %Parameter §§§01
 #EIF
 END%

%Parameter 1
%Parameter 1|2
%Parameter 1|2|3

DMP.
MBX.1
END.
```

Remarks:

-

Limitations:

`#IF RECURSE` uses a Simple Algo. Internally it will check if the last resolved MACRO-NAME is equal to the currently resolved MACRO-NAME and if the MACRO-Definition contains the same Name in Code.
In this case it will increase the RECURSE-Counter.
This may fail under complex Conditions where multiple Macros are being called from within the same Macro. It will also fail, if a **Macro A** calls a **Macro B** that will call **Macro A** again.
We recommend to carefully examine, if `#IF RECURSE` does work in your case.
If not use an non-recursive algo.

Calling Macros from within Macros is supported. "Direct nesting" of `#IF PARAMS` is supported.
Below are two examples. Both will work as expected.

```
' Manually formatted code
' Nesting of #IF ...
: %Loc_Edit
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
#IF PARAMS=0
  GSB.Loc_Edit
#ELS
  #IF PARAMS=1
    GSB.Loc_Edit|§§§01
  #ELS
    #IF PARAMS>1
      MBX.More Params are not supported (§§§00)(§§§01)!
      END.
    #EIF
  #EIF
#EIF
END%
```

```
' Example 2, nested #IF
: %Loc_Edit
#IF PARAMS=0
  GSB.Loc_Edit
#ELS
  ' Nesting is currently NOT supported
  #IF PARAMS=1
    GSB.Loc_Edit|§§§01
  #ELS
    MBX.More Params are not supported!
    END.
  #EIF
  '--- The #ELS case will be included
#EIF
END%
```

Below is the same code in a serial way that.

```
: %Loc_Edit
#IF PARAMS=0
GSB.Loc_Edit
#EIF
#IF PARAMS=1
GSB.Loc_Edit|§§§01
#EIF
#IF PARAMS>1
MBX.More Params are not supported!
END.
#EIF
END%
```

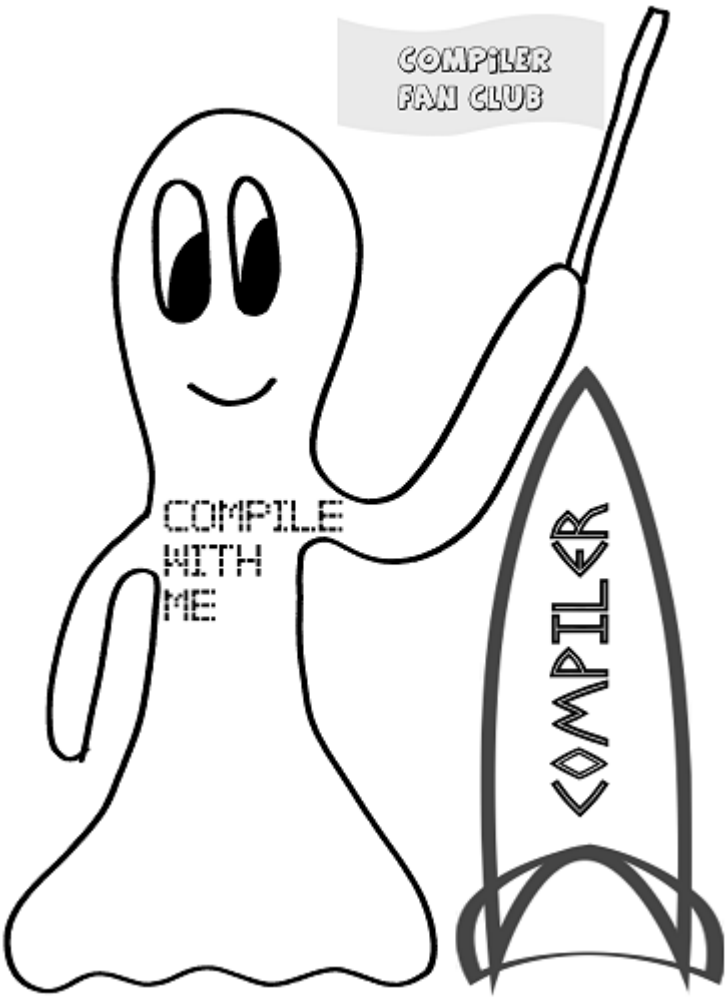
2.37 2. EXE-Compiler

2.37.1 2.0.0 Smarty's EXE-Compiler

Smarty's "Script to Executable" Compiler **Previous** 236 **Top** 41 **Next** 271

Compiler-Directives

Smarty's Script-Compiler



Smarty's script compiler allows you to **compile your script** into a small,
fast, standalone, executable.file.
To do this, just press the button "**compile**" in the Editor.

Smarty's script compiler **offers features** like:

- Compile your Script to Standalone Executable(-package)
- Add your Files to the package
- Add your Folders and Subfolders to the package using `'#INC:`
- Large Set of Special Instructions (see `'#SPI:`)
- utilizes Compression to remove data-redundancy
- utilizes Hashing, to verify the authenticity of your packages

*© 2023 Theo Gottwald * https://www.smart-package.com*

- has multiple Special Options, like:
- "'#SPI:SelfDel" (Executable can delete itself after running)
- and many more.

The generated executable are **completely Standalone**, they do **not** need any Runtime Files to be on the Target PC.

We call the process of the Package-Creation "compiling", as we compile the script-code into an Standalone Executable.

The Compilation process can be influences using a special sort of commands, called "Compiler Directives". These commands are not real commands, as they do not influence the script-behavior at runtime. They are used by the Editor, the Compiler and the "Runtime Environment" which is used to unpack your Data, when the Executable is been started.

Where is my compiled executable?

A short example for a "Compiler Directive" would be:

```
'#EXE:?desktop\MyExe.exe
```

Placing this line at the top of your script will change the name and path where the executable is been created. In that special case it would be created on your "user-desktop" and would use the filename "MyExe.exe".

If you omit any line with the Compiler Directive "'#EXE:" then the file is been created on the desktop. Note that in the script there may per default be a

```
'#EXE:?path
```

or something like that. In that case the executable is been created in the same folder, where the actual script-file was saved (that is "?path\").

How do i recognize a Compiler Directive?

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution)*.

The comment sign is important. Omitting or forgetting the comment sign, you will not get '#INC: but #INC: (no comment sign). Both are two different instructions.
#INC (no comment sign) is the Preprocessor-File-Include.

Compile-Time, that is, when the script is being compiled to an Standalone EXE-File. At ***Compile-Time*** these commands can change several behaviors.

There is another term, you should know and that is ***Unpack-Time***.
Unpack-Time is the time after the executable was started on the Target PC.

© 2023 Theo Gottwald * https://www.smart-package.com

It will then unpack all included data, together with some Runtime Files into the Temporary
Folder of the Target-PC..This happens at "**Unpack-Time**".

(User presses "Compile") (Executable is starting) (Script-Execution starts)
Compile-Time -> Unpack-Time -> Run-Time

All Options that influence the creation of compiled executable / packages are specified using
such Compiler Directives. Therefore they are saved with your script.

What is "?path\" ?

Be sure that you understand the concept of Sprecialfolders and "?path\" before you start to
include files or folders into your package. Normally you copy all files and/or folders that you
want to include with your package into the same folder, where your script file is been located.
This place is called "?path\".

During the Unpacking of your executable on the target system, Smarty will re-create the situation in "?path\" on the target system, in a temporary folder.
Therefore you address all files that are included in your script with "?path\". Because only then, they will be found on the target system.

"?path\" will always be evaluated at runtime to the path where the actual running script file is located. This way we have a relative path that can be used to find any inluded file or directory, as long as it is below "?path\".

What is "?exeloc\"?

Using the code sequence:

```
EXO.?path\
MBX.!
```

with an executable, will show you the content of the package. In case you add a "Setup.exe" File to your package, make sure that you also change the EXE. or EXX. calls to that file, in the script.

For example:

```
EXE.?exeloc\Setup.exe
```

must be changed to

```
EXE.?path\Setup.exe
```

to use the file that is inside the package, instead of a Setup that is in the same folder like the executable.

?exeloc\ will evaluate at runtime to the location where the executable itself resides.

© 2023 Theo Gottwald * https://www.smart-package.com

For example, if you have compiled a script to the file "MyScript.exe". And the location of "MyScript.exe" is on your desktop. Then `?exeloc\` will evaluate to the desktop-path at runtime.

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.2 2.1.1 '#RAU: - Run As User

Compiler-Directives

#RAU.

Run Executable as User

Intention

You can start a package in the context of another user. You have to provide the Login, password and domain (Login Information) for that user.
This command is processed by the editor and the compiler at compiletime. It is completely ignored while script execution. The Login informations are stored in an encrypted way in the package. They will be removed from the script that is finally compiled into the package. This way there is a maximum (while not perfect) level of security for your user-login information.

There are two versions of this command:

'#RAU:ask
A dialog will appear. In this dialog you can provide the user login information.

'#RAU:(Login)|(Password)|(Domain)
In this case you need to provide the user login information in the script file. Note that these will be removed from the script that is finally compiled into the package.

Syntax:

```
'#RAU:Login|Password|Domain
'#RAU:ask
```

Example:

```
'----------------------------------------
' '#RAU:ask
'----------------------------------------
' The following line will show a dialog to set the user Login
and password for the final package
'#RAU:ask
'
'MBX.!
END.

'----------------------------------------
' '#RAU:(Login)|(Password)|(Domain)
'----------------------------------------
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' The following line will make the package use this user('s
rights) to start the package
' You need to replace these with real account informations
'
'#RAU:MyLogin|MyPassword|MyDomain
'
'MBX.!
END.
```

Parameter Explanation:

-

Remarks:

-

Limitations:

'#RAU: does NOT cooperate with '#EXV: at this time. You can only use one of these in one compiled ex
In case you would need both, try using '#RAU: and then start another compiled executable using EXV.-C

See also:

- '#EXV: - Compiler-Directive 280
- Execution Commands and the Hidden Desktop 867
- EXV: -Execute via System 912

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.3 2.1.2 #AOS: - Choose valid OS for executable

Compiler-Directives

'#AOS: - Allowed OS

Used to prevent unpacking of a package under the wrong OS

Intention

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution)*. The '#AOS. takes place immediately after the Executable is been started on the Target PC.
It will check the OS on the Target PC against a list of valid OS'es that you can specify.

In case the OS-check fails and the actual OS does not match the List of allowed OS, per default an File "`SPR-Unpack-Error.txt`" is been created at the place where the executable was started.

The Executable-Unpack behavior that will occur, when an error happens or when the OS-check fail, can be set using the
`'#SPI:silent=0/1/2`
Compiler-Directive. For example:
`'#SPI:silent=0`
will make the Executable to show a Error-Message instead of the default behavior, that is to create an Error-Textfile.
Using
`'#SPI:silent=2`
will switch into complete silent mode. In case of an error, nothing will happen, the executable will just end itself.

'#AOS= Specify the allowed Operating System for the Package. You can use any of the following OS-Shortcuts. You can also use multiple of these shortcuts (left side), separated by comma.

```
Win95 - Windows 95
Win98 - Windows 98
WinMe - Windows Me
Win2k - Windows 2000
WinXP - Windows XP
WinVi - Windows Vista
Win7  - Windows 7
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
Win8  - Windows 8
Win9  - Windows 9  (expected a this time)

' and for Servers
WinS3  - Windows Server 2003
WinS8  - Windows Server 2008
WinS82 - Windows Server 2008 R2
WinS13 - Windows Server for Win8 (expected)
WinS14 - Windows Server for Win9 (expected)
```

You can add multiple "allowed OS" separated by comma, like this:

```
'#AOS:WinXP,Win2K,Win7
```

or you can use the ">" or the "<" (optional together with the "=") Operator to specify that any OS below or above a specified OS is valid. Like this:

```
'#AOS:=>Win2K
```

If you specify multiple OS, all of these are OR'ed, means ANY of the given OS is valid. For example:

```
'#AOS:>WinVi,<Win7
```

will include ALL possible OS'es, as if you would not have used the `'#AOS`:-directive.

You can use the following Operators with `#AOS:`

```
>  - OS must be newer then specified OS
=> - OS must be newer or equal then the specified
OS
>  - OS must be older then specified OS
=< - OS must be older or equal then the specified
OS
A-B - specify a valid Range of OS, including A
and B
```

You can only specify one `#AOS`: directive per Script.
You can add as many comma separated conditions to that instruction as you want.
This way you can exactly specify under which OS the packet should run or not,

To specify a Range of OS's, use the "-" Operator, like this:

```
'#AOS:WinXP-Win8,Win2k
```

In this case all OS between WinXP and Windows 8 are valid.

Syntax:

'#AOS:[>,<,=>,<=,OS-]OS[,OS]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation:

OS - a keyword out of the following. This will specify the allowed OS.

```
Win95 - Windows 95
Win98 - Windows 98
WinMe - Windows Me
Win2k - Windows 2000
WinXP - Windows XP
WinVi - Windows Vista
Win7  - Windows 7
Win8  - Windows 8
Win9  - Windows 9  (expected a this time)

' and for Servers
WinS3  - Windows Server 2003
WinS8  - Windows Server 2008
WinS82 - Windows Server 2008 R2
WinS13 - Windows Server for Win8 (expected)
WinS14 - Windows Server for Win9 (expected)
```

You can specify as man OS'es as you want, separated by a comma.
You can add one of these Operators below before the OS to select all newer or all older OS.

```
>  - OS must be newer then specified OS
=> - OS must be newer or equal then the specified
OS
>  - OS must be older then specified OS
=< - OS must be older or equal then the specified
OS
A-B - specify a valid Range of OS, including A
and B
```

You can only specify one `#AOS:` directive per Script.
You can add as many comma separated conditions to that instruction as you want.
This way you can exactly specify under which OS the packet should run or not,

To specify a Range of OS's, use the "-" Operator, like this:

```
'#AOS:WinXP-Win8,Win2k
```

In this case all OS between Windows XP and Windows 8 are valid.

Example:

```
'---------------------------------------
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Compile-Time Commands
'---------------------------------------
' Special Instructions
'#SPI:silent|0
'#AOS:>Win2k
EXO.?path\
MBX.!
END.
```

2.37.4 2.1.3 '#EXE: - Set Executable Path and Name

#EXE: - Specify Name and Path of the Executable Previous 273 Top 41 Next 321

Compiler-Directives

#EXE: - Executable Name

Used to specify the name and path of the executable that is to be created

Intention

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution).*

'#EXE:

The '#EXE: Compiler Directive is used to change File-Name or File-Path of the final Standalone EXE-File.

If there is no such Compiler Directive, the default path for any created executable file is on the actual user's Desktop. The filename for the generated executable is by default the filename of the Main-Script-File, with a ".exe" instead of the ".mrt".

For example, if you compile the script "InstallMe.mrt". Then the final executable will be on your desktop with the Name "InstallMe.exe". Unless you specify something else using "'#EXE:".

You can specify Specialfolders or just a File-Name. Here are some examples:

```
' If you specify this:
'#EXE:
' The compiler assumes that you mean:
'#EXE:?path\
' and will treat it like that.

Therefore, if you write:
'#EXE:?path\
or
'#EXE:?path
```

then your executable will have the default filename and will be created in the same folder, where you have saved your scriptfile.

```
' You can also write this:
' '#EXE:Peter.exe
```

In this case, your scriptfile will be created in "?path\" with the name "Peter.exe". If you prefer to have it on the desktop, write:

© 2023 Theo Gottwald * https://www.smart-package.com

```
'#EXE:?desktop\Peter.exe
```

In that case your executable will appear on the desktop.
If you just write:

```
'#EXE:Peter
```

your scriptfile will be created in "?path\" with the name "Peter.exe", as the ".exe" will automatically be added, if its missing.

Syntax:

'#EXE:[P1]

P1 - (***optional***) Name and or Path of the Executable-Package that should be created.

Example:

```
'----------------------------------------
' Compile-Time Commands
'----------------------------------------
'
' The following line will change the target path for
' the EXE-Compiler.
'#EXE:?path\
'
EXO.?path\
MBX.!
END.
```

Parameter Explanation:

-

Remarks:

I f no `'#EXE:` is given, the Targetfile is been created on the current User-Desktop. The Filename of the Executable will be the name of the Main-Script File, with ".exe" suffix.

Limitations:

-

2.37.5 2.1.4 '#EXV: - Execute on System Desktop

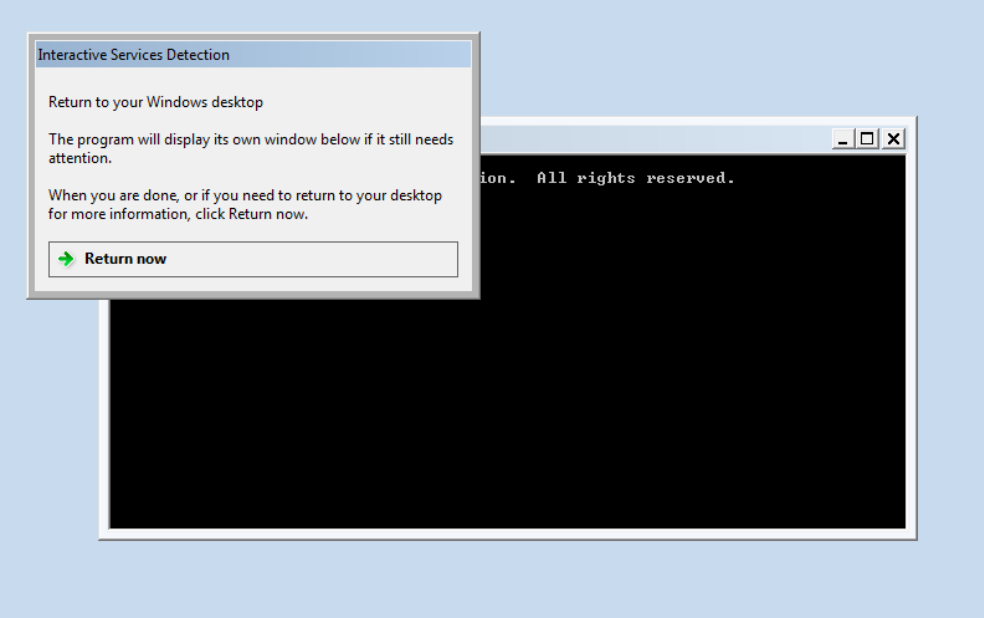
Compiler-Directives

#EXV: - Execute via System

Used to start the Automation on the Hidden System Desktop

Intention

This Compiler-Directive enables you, to start your compiled SPR-Skript on the "Hidden System Desktop".



Generally Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution).*

'#EXV:

The '#EXV: Compiler Directive is used to have the compiled executable start up on the "Hidden System Desktop 867".
For this it must be started with full Admin-Rights!

If there is no such Compiler Directive, the compiled Executable will start on the actual User Desktop.

To take a look on the Hidden System Desktop. follow the steps here 867.

© 2023 Theo Gottwald * https://www.smart-package.com

You do not need to specify an additional parameter to '#EXV.

Use the HDC.0 command to prevent your Clients from entering the Hidden Desktop.

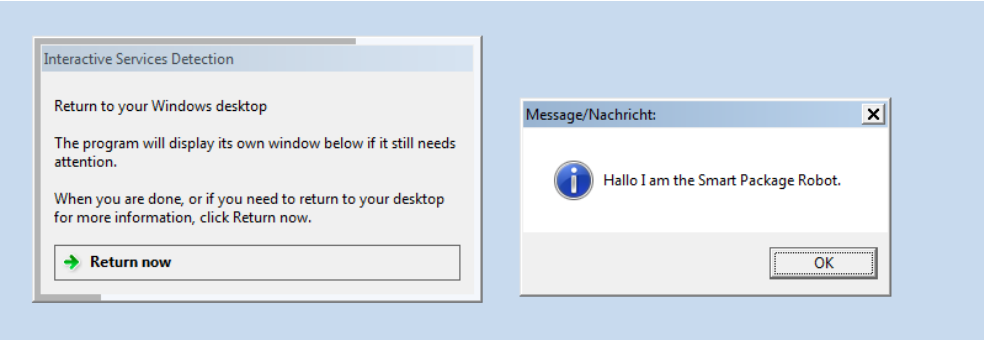
Syntax:

'#EXV:[P1]

P1 - (***optional***) Name that will be used internally. If you use several Skripts at the same time with '#EXV.
then this name should not be equal. Otherwise you can omit **P1**.

Example:

```
'----------------------------------------
' Compile-Time Commands
'----------------------------------------
'
' The following line will make the compiled
' executable start up on the Hidden System Desktop.
' It will only work if the Script has full admin-rights.
' To see the Message box, you need to switch to the System
Desktop.
'
'#EXV:Youdontseeme
'
MBX.I am the Smart Package Robot!
END.
```



Parameter Explanation:

-

Remarks:

Limitations:

'#EXV: does NOT cooperate with '#RAU: at this time. You can only use one of these in one compiled ex

© 2023 Theo Gottwald * https://www.smart-package.com

In case you would need both, try using `'#RAU:` and then start another compiled executable using `EXV.-C`

This Feature requires Windows Vista or higher.

2.37.6 2.1.5 '#HID: - Hidden Desktop Scripts

Compiler-Directives

#HID: - Execute compiled Script on private Desktop

Used to start the Automation on a private Desktop (Hidden Desktop)

Intention

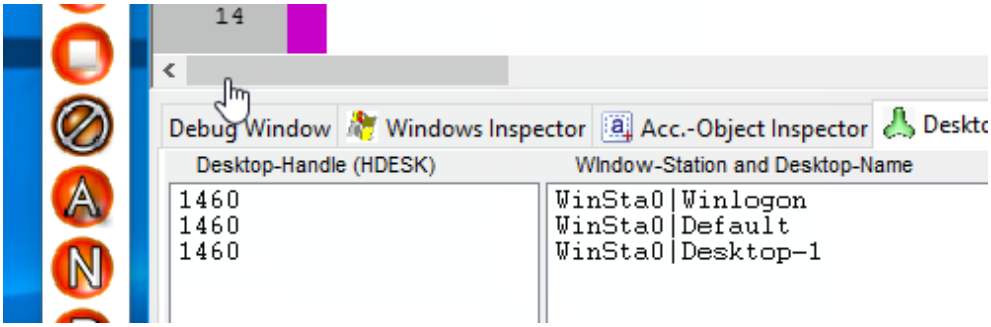
This Compiler-Directive enables you, to start your compiled SPR-Skript on a "Hidden Private Desktop".

To start SPR Scripts on a private Desktop, the Executable needs Admin-Rights.

The **'#HID:** Compiler Directive is used to have the compiled executable start up on the private Desktop.
For this it must be started with full Admin-Rights!

If you have created private Desktops, these will be displayed in the SPR-Editor, in the "Desktops-Inspector".
In this Example, you can see a Desktop that was created using:

```
'#HID:1
```



**If you specify a number after '"#HID:", the SPR will prefix ist with "Desktop-" and generate a new private Desktop
with the name "Desktop-1".**

If there is no such Compiler Directive, the compiled Executable will start on the actual User Desktop.

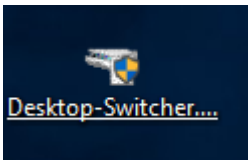
The following Sample-Script will generate a Messagebox on an private Desktop, and switch to this desktop.
Once you have confirmed the Messagebox, the SPR will close the private Desktop.

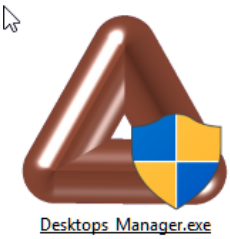
```
'#EXE:?path\
'#SPI:ForceWrite
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'#MAN:ra
'#HID:1|scn
MBX.!!
ENR.
```

Important:
To take a look on an private Desktop - for example to check for error-Messages - as well, as to
Switch back from an "private Desktop" to the "Default Desktop",
you may need to use the "Switch Desktop"-Tool that is provided together with this SPR-Release.





Also you will find the Tool "Desktops Manager.exe" in the Startmenu.

For more Information on "private Desktops" see here: PDC. - Private Desktop Commands 2658

Syntax:

'#HID:P1[|P2]

Parameter Explanation:

P1 - Number from 1-9 that will be used internally to create the private Desktop. The name of the new created private Desktop will be "Desktop-**P1**"
If you specify "`'#HID:1`", then the name of the new created private Desktop will be "Desktop-1".

You can use Numbers from 1 to 9 with `'#HID:`.
Using higher Numbers may work with Scripts, but these numbers may not work with the "Desktop-Switcher
If you really ever need higher numbers, you can switch to these Desktops using a SPR-Script that is compi

P2 - can be any or more of these letters (flags):
S - **s**witch to Desktop, using this flag, will make the Script to switch to the specified private Desktop.
N - **n**ew Desktop. Using this Flag will force the creation of a new private Desktop, rather then using an existing one.
C - **c**lose the Desktop when the Script ends.

© 2023 Theo Gottwald * https://www.smart-package.com

DANGER: Using the "c"-Flag will forcefully terminate all processes that are bound to the new created Desktop! Also note that this flag is currently experimental.

Before the new created Desktop can be closed, the Script switches to the new Desktop.
When the new Desktop has been closed, the Script switches to the Default desktop.

Example:

```
'----------------------------------------
' Compile-Time Commands
'----------------------------------------
'
' The following line will make the compiled
' executable start up on the private Desktop "Desktop-1".
' It will only work if the Script has full admin-rights.
' To see the Message box, you need to switch to the private
Desktop.
'
'#HID:1|c
'
MBX.I am the Smart Package Robot!
END.

'----------------------------------------
' Compile-Time Commands
'----------------------------------------
'
' The following line will make the compiled
' executable start up on the private Desktop "Desktop-2".
' It will only work if the Script has full admin-rights.
' The command will switch to the private Desktop.
' After you click the Messagebox, the private Desktop will be
removed.
'
'#HID:2|scn
'
MBX.I am the Smart Package Robot on Desk 2!
END.
```

Remarks:

'#HID: **does** work with '#RAU:.

Limitations:

This Feature may require Windows Vista or higher.
This feature needs Admin-Rights!
This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops.

© 2023 Theo Gottwald * https://www.smart-package.com

Using the "c"-Option may have unwanted effects on programs running on the Computer, also on otehr desktops.
For Limitations in the Windows-Explorer itself, not all Actions will be possible on "private Desktops".
Sometimes System-Windows - like the Start-Menu - will not open on the "private Desktop" but on the Default Desktop.

2.37.7 2.1.7 '#SPI: - Special Instructions

Compiler-Directives

'#SPI: - Special Instructions

Used to modify several compile- and unpack behavior

Intention

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution).*

Autoinclude
Another feature, "Auto-Include" will automatically include used script files into the compiled "Stand-Alone" package. Files are known if they are used in an JNF.-Command. Also the complete filename must be resolved at compiletime.

Syntax:

```
'#SPI:[spi-code][|Parameter]
```

Parameter Explanation:

`[spi-code]` - a keyword out of the following. This will specify the special instruction.

SPI-Instructions for Compile-Time:

- **forcewrite** - no parameter, will make the compiler to overwrite already existing executables with that name. If omitted, executables will not be overwritten, but numbered.
- **NoExe**- no parameter, will make the compiler to skip creation of the executable.

SPI-Instructions that influence Unpack-Time-Action:

- **SelfDel** - no parameter, will make the Final executable to kill itself after it was started.

© 2023 Theo Gottwald * https://www.smart-package.com

- **NoWait**- no parameter, will make the Final Executable to NOT wait for the script has been ended , and to NOT delete all temporary files.
- **Startfile=** - you can specify another scriptfile as starting point. Needs a starting file as a parameter. Normally this file resides in "?path\".
- **ProgressBox=** - numeric parameter, will make a Progressbox appear at Unpack-Time.
- **ProgressText1=** - Textual parameter. Use this Text as headline for the Progressbox.
- **ProgressText2=** - Textual parameter. Use this Text as textine for the Progressbox.
- **Mutex=** - (0/1/2) numerical parameter. Specifies the type of Mutex to use.
- **NoMutex** - no parameter, will make it possible to start the same executable multiple times. This is normally prevented using "Mutexes".
- **ShortTmp=** -(1/2) Numerical parameter. specifies the path to a temporary folder that is used instead of the default temp-folder. It makes sense, to also use the "**'#SPI:UTF**"-Option also with this.
  1 -> Drive from `?exeloc\`
  2 -> Drive from Windows-Folder
- **UTF** - no parameter. Specifies that a unique Temporary folder is been created inside the given Temporary folder, for the Runtime Environment.
- **TargetFolder=** - Textual parameter. specifies the path to a temporary folder that is used instead of the default temp-folder. Can use special folders. It makes sense, to also use the "**'#SPI:UTF**"-Option also with this.
- **silent**- numeric parameter, can be: 0,1 or 2.
  0 - display an error message in case of an error before RunTime.
  1 - (default mode) write a Textfile at the same location where the executable was started.
  2 - complete silent. Does not do anything in case of an error, just ends the process.
- **forceupdate** - no parameter, will make the compiler to overwrite already existing files that are in the way of files that are being unpacked. This flag is mostly needed if files are being unpacked outside "`?path\`".
- **DiskFree** - Numerical parameter that specifies the amount of free Diskspace in MB, that must be free on the target drive, to unpack the Executable.

Some Special Instructions are only for debugging purposes.
These are:

- **NoKill** - no parameter, will make the compiler to NOT delete the internal compilation files after the compilation.
- **TextOn** - do not compile an executable, but an textual file that can easily be sent via e-mail. Needs to be decoded before it can be used. This option is not yet available.

Example:

```
'----------------------------------------
' Special Instructions
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'----------------------------------------
' Special Instructions
'#SPI:ForceWrite
'#SPI:ForceUpdate
'#SPI:silent=0
'#SPI:NoExe
EXO.?path\
MBX.!
END.
```

Remarks:

-

Limitations:

-

See also:

- Specialfolders 345
- #ONCE / # OEND - Multiple Include Protection 251
- 1.6 #INC: - Pre-Processor File-Include 248

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.8 2.1.8 '#INC: - Include Files and Folders into the Executable

Compiler-Directives

'#INC: - Include Files & Folders

Used to add files and folders to your executable package

Intention

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution)*.

Compile-Time, that is, when the script is being compiled to an Standalone EXE-File. At ***Compile-Time*** these commands can change several behaviors.

'#INC:
The "#INC:" statement can be used to include Files or folders into the final EXE-Package

How do I include files or folders into the package?

Using the "\" Option with '#INC: will include the **folder but no subfolders**.

'#INC:myfolder\

Using the "*" with '#INC: will include the **folder and all subfolders.**

'#INC:myfolder*

This will include only the given file, which should be placed in the same folder as the script file (shortname for the script-file folder is **?path**).

'#INC:?path\myfile.txt

All of the above examples will only make sense if the specified files are within the project folder.
Now you can also include files from other places, outside the project folder.
For this the:

->

Operator can be used. Usage is like this:

© 2023 Theo Gottwald * https://www.smart-package.com

'#INC:?desktop\Infos.pdf->?path\

Anything on the right sider of the -> Operator is treated as a folder.
Therefore, you can not use the -> Operator to rename files.

For example:

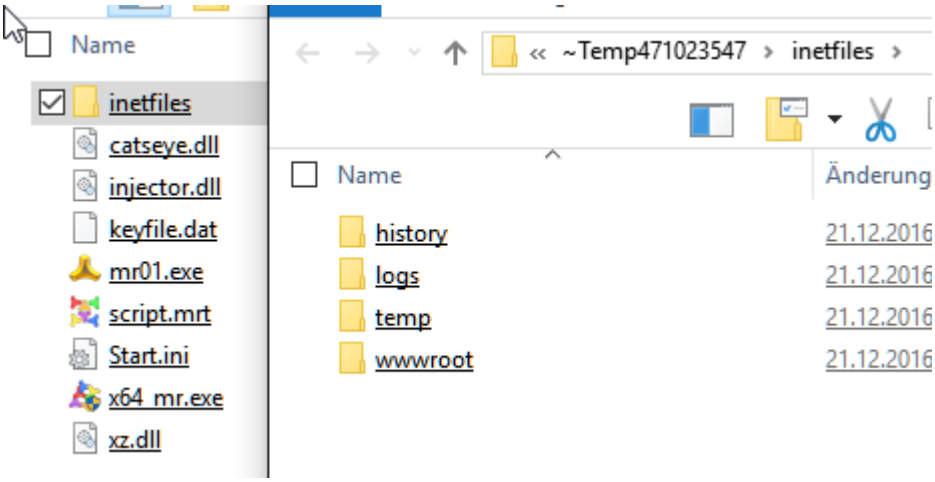
'#INC:?desktop\Infos.pdf->?path\XY.pdf

Will result in a Folder "XY.pdf" to be created. Insider the folder you will find then "Infos.pdf"-file.

You can use the -> Operator for files, and also for folders and sub-folders.

'#INC:c:\inetpub*->?path\inetfiles\

Will result in something like this, when the executable is unpacked.

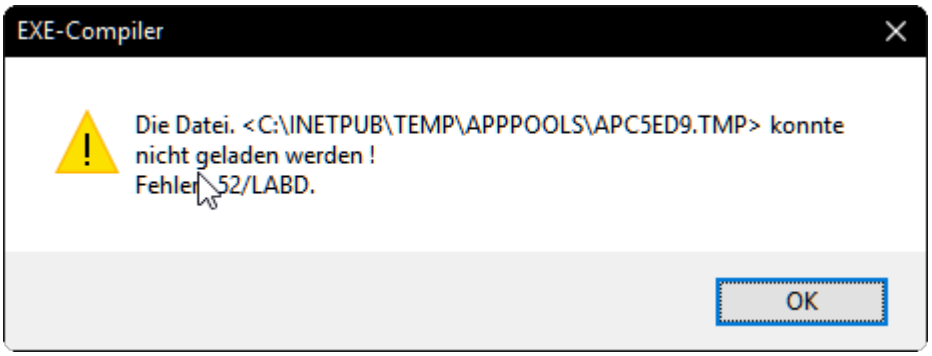


What happens if there are files that can not be included, because they are "Locked" by windows?

In this case the Compiler will bring up an error-message like this.

Detailed Description of Error-codes about files can be found online, here and on other places:
API-File Error-Codes

© 2023 Theo Gottwald * https://www.smart-package.com



Autoinclude:
Script-Files that are used with `JNF. JNJ.` or #INC: (Preprocessor File-Include) are automatically added to a executable package, if the path does not contain any variables.
Thats is, because the value of variables is undefined at compiletime. Specialfolders like `?path\` are ok, and will not block Autoinclude of Scriptfiles.

Will Include-Directives in Library files be found?

Yes, any "**.mrt**" file that is referenced with a "`JNF.`"-like command or included in the EXE, will be read completely and all include statements that are found will be evaluated.

This way, you can include selective Library files, using:

'#INC:?path\..\MyLib\Thisfile.mrt->?path\LibXXSPR\

Inside the Library file.Therefore in the calling Script you do not need to do anything else then to call the Script-file using `JNF.` or `#INC:`, if this is specified inside the Library-file.

Syntax:

'#INC:

Example:

```
'----------------------------------------
' Compile-Time Commands
'----------------------------------------
' The following line will include the specified folder and
all its subfolders into compiled EXE.
'#INC:C:\Files\*->?remote\
'
' More Examples follow
'#INC:C:\Files02\*
'#INC:?path\Install-Pack\*->?remote\install-Pack
'#INC:TabMdi.h.bak
'
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' The following line will change the target path for the EXE-
Compiler.
'#EXE:?desktop\
'
EXO.?path\
MBX.!
END.
```

Parameter Explanation:

-

Remarks:

Please note that the '#INC: and the #INC: (no comment sign) are two different instructions. #INC is the Preprocessor-File-Include.

Using the code sequence:

```
EXO.?path\
MBX.!
```

with an executable, will show you the content of the package. In case you add a "Setup.exe" File to your package, make sure that you also change the EXE. or EXX. calls to that file, in the script.

For example:

```
EXE.?exeloc\Setup.exe
```

must be changed to

```
EXE.?path\Setup.exe
```

to use the file that is inside the package, instead of a Setup that is in the same folder like the executable.
.

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.9 2.1.9 '#EXC: - Exclude Files or Dirs from Executable

Compiler-Directives

'#EXC: - Exclude from Package

Used to prevent files and folders from being packed into the executable.

Intention

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution).*

At *Compile-Time* these commands can change several behaviors. Compile-Time, that is, when the script is been compiled to an Standalone EXE-File

'#EXC:

The "'#EXC:" will exclude files or folders from the Package.

Important:
Use the `'#EXC:` - Directive **before any other directive** that may include files or folders. The `'#EXC:` will starting from the time it was read. Lines above the directive are not influenced.

The `'#EXC:` understands the File-Wildcards, these are:
* - match anything that follows
? - match to a single character, letter or number
- match to a numeric character (0-9)

Examples:
' The following lines will exclude files from the package.
```
'#EXC:Folder*.exe
'#EXC:Folder.e??
'#EXC:Folder*.*
'#EXC:*.bmp
```

' The following lines will exclude Dirs from the package.
```
'#EXC:mydir\
'#EXC:my*\
'#EXC:Sub Fol*\
'#EXC:Subfolder\Subfolder_??\
```

How do I exclude files or folders into the package?

Using the "\" at the end or inside the specified parameter, will exclude a **folder**.

© 2023 Theo Gottwald * https://www.smart-package.com

```
'#EXC:myfolder\
```

Just giving a name without a \ will exclude a File..

```
'#EXC:myfile.bmp
```

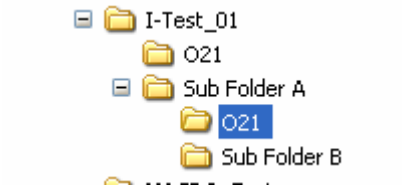
... or a group of files. You can use wildcards for this.

```
'#EXC:*.bmp
```

You can use special folders, and you can use wildcards. Excluding a folder will always exclude all subfolders and sub-files from this folder.

```
'#EXC:?path\reserve\
```

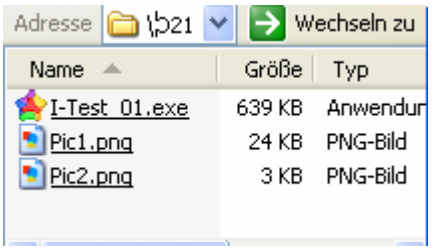
You can also give a path between folders, to exclude a specified folder, even if there are multiple folders with the same name on different locations.



```
'#EXC:*A\O21\
```

The given example above will exclude the folder O21 below the "Sub Folder A", but will not exclude the other O21 Folder in `?path\`.

Here is another example. Assume we have the folder "O21" in `?path\`.



Now we want to include the file "I-Test_01.exe" but wedo not want to include the PNG-Files. We can do it like that:

```
'#EXC:*.png
'#INC:?pfad\O21\*
```

This way, we include the whole folder excluding all *.PNG-Files.
Always remember that

Syntax:

`'#EXC:P1[*][?][#][\]`

© 2023 Theo Gottwald * https://www.smart-package.com

Example:

```
'----------------------------------------
' Compile-Time Commands
'----------------------------------------
'#SPI:ForceWrite
'#EXC:*.png
'#INC:?pfad\O21\*
'
' The following line will change the target path for the EXE-
Compiler.
'#EXE:?desktop\
'
EXO.?path\
MBX.!
END.
```

Parameter Explanation:

-

Remarks:

-

Limitations:

-

2.37.10 2.1.A #LIB: - User-Library Path

Compiler-Directives

#LIB: - User-Library Path

Used to automatically include User-Lib files and folders into the executable.

Intention

The `#LIB:`-Directive will enable you to include your personal Library-Script-Files into any of your Scripts easily.
To make this possible, the commands does a lot of things "under the hood".
What you need to provide is the "Library Path". That is the Path where your Library-Skript files are.
Then all you write is this:

```
#LIB:(Library-Path)\
```

For example:

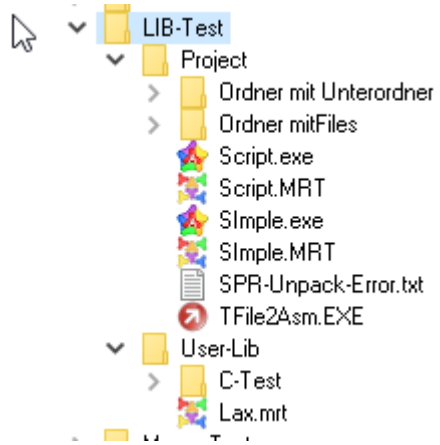
```
#LIB:X:\SPR-Library\
```

the folder can also be "relative to your Skript's Folder", using:

```
#LIB:?path\..\My-Library\
```

Here is a Sample that shows how to use the Directive:

#LIB:?path\..\User-Lib\



The "User-Lib" Folder can be anywhere, even on another drive. In this case its just at the same Level as `?path\` which is the Project Folder where the Skript itself is located. To make this possible, `'#LIB:` is a mixed Preprocessor- and Compiler Directive.
The `#LIB:` Command will therefore do a couple of things, during Compilation and during Preprocessing. These are:

*© 2023 Theo Gottwald * https://www.smart-package.com*

1. When starting a Script inside the Editor, it will also search Skripts inside the User-Lib Path.
   Example: `JNF.MyLibscript.mrt`
   will be executed if in ?path or in `?lib\`
2. The Special-Folder `?lib\` will be set to the Path that was specified behind the `#LIB:`-Directive.
   `JNF.`**`?lib\`**`MyLibscript.mrt`
   will be executed, if the file is in the Library-Path.
3. When compiling an EXE-File, the whole Folder "User-Lib" **and all Sub-Folders and files inside** will be compiled into the Folder:

?path\LibXXSPR\

This is the Path that `?lib\` will have when the Script runs in EXE-Mode (when the Script runs from a compiled Executable).
This way, the Library will be included and also deleted after Script execution.

How to Avoid to include always the whole library:
You can prevent the Compiler to generally include the whole library, by adding the `|N`
Doing so, you will have to manually add

```
'#INC:?path\..\User-Lib\WasMe.mrt->?path\LibXXSPR\
```

to your Script. You can simply add this Line into the Library file. It will look like this:

Main-Script:

```
#LIB:?path\..\User-Lib\|N
JNF.WasMe
```

Library file:

```
'#INC:?path\..\User-Lib\WasMe.mrt->?path\LibXXSPR\
MBX. Was me!
RET.
```

This way, you can just call your "Library Skript" using `JNF.Wasme`
and the Preprocessor will know that this shall be included into the Library during compilation.

You can use the `#LIB:` - Directive as well together with the
#INC: - Preprocessor-Directive. 290

Using this, you can add all used "Subroutines" to the bottom of your Script using a Single (or multiple)
`#INC:`(path and name of lib-file)

Example:

```
#INC:Subroutines.mrt
```

or

```
#INC:?lib\Subroutines.mrt
```

© 2023 Theo Gottwald * https://www.smart-package.com

Hint: To protect your Scripts and Library Scripts from being seen by unauthorized persons, you can use the '#CRY: - Directive.

Syntax:

#LIB:P1[|N]

Example:

```
'----------------------------------------
' Using the User-Library Command with #INC:
'----------------------------------------
'#SPI:ForceWrite
'#LIB:?pfad\..\User-Library\
'
#INC:MyLine.mrt
' This Subprogram will be included below with the #INC:
GSB.DoX

EXO.?path\
MBX.!
ENR.

' This will include your Subprograms
#INC:MySubs.mrt
END.

' MyLine.mrt must be in the Library-Folder and could look
like this:
'
MBX.I was here A!
'

' MySubs.mrt must be in the Library-Folder and could look
like this:
'
:DoX
MBX.I was here B!
RET.
'

   '----------------------------------------
' Using the User-Library Command with JNF.
'----------------------------------------
'#SPI:ForceWrite
'#LIB:?pfad\..\User-Library\
'
JNF.MySubs.mrt
EXO.?path\
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX.!
END.

' MySubs.mrt must be in the Library-Folder and could look
like this:
'
MBX.I was here!
' In this case we need the "ENR." Command to return to the
Main-Script.
ENR.
```

Parameter Explanation:

-

Remarks:

Preprocessor-Directives start with the Sequence: **#**
Because this is only important for the Preprocessor, the running script ignores these commands at ***Runtime*** *(at time of script execution)*.

Limitations:

-

See also:

- 2.1.8 '#INC: - Include Files and Folders into the Executable 290

- 1.1 #INC: - Pre-Processor File-Include 248
- 2.1.B #CRY: - enCrypt the Script 302

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.11 2.1.B #CRY: - enCrypt the Script

'#CRY: - User-Library Path Previous 295 Top 41 Next 310

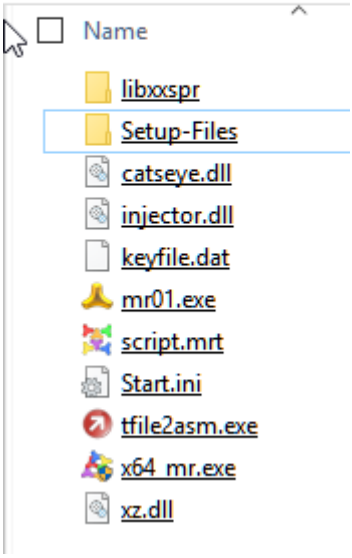
Compiler-Directives

#CRY: - Encrypt Scripts on Disc

Used to encrypt the Scripts that are stored on Disc to make them unreadable.

Intention

When you have a Script you will often compile it to an EXE-File. This EXE-File may be given to Clients or Customers.
Now when the EXE-File is been started, it will make a "Quick Install" in the Temp-Folder of the Client-PC.
It will unpack all the Scripts as well as included Setup-Files. Generally you can see this Project in the Temp-Folder as an
`~Temp(unique number)` somewhere. Here is an example:



Now somebody could "steal" your code-algorithm or included Passwords, by just opening the file inside the SPR-Editor, or even Notepad.
To make this very heavy (yet nothing is impossible in the world of hacking today) we have included the

`'#CRY:` - Directive
If you specify this anywhere in your code (can also be in a Library-File), ALL "`.mrt`"-Script-files will be encrypted.

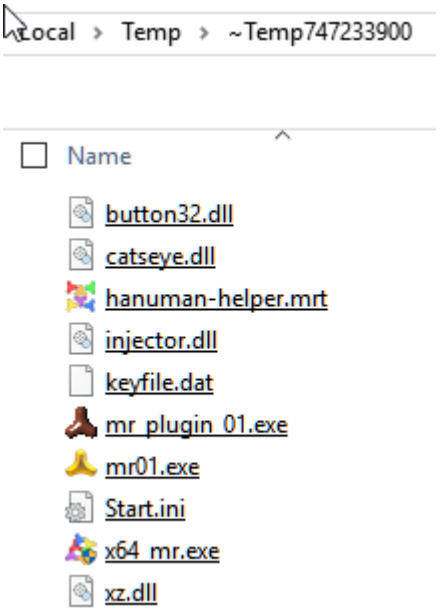
How can i check if my Scripts are really encrypted?

© 2023 Theo Gottwald * https://www.smart-package.com

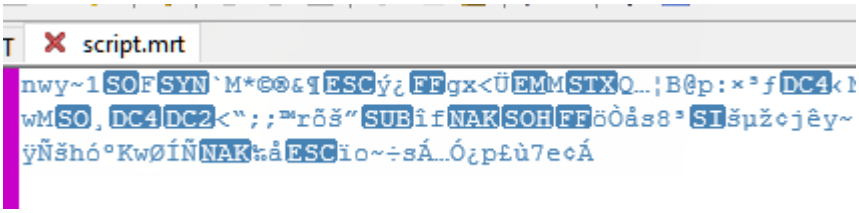
You can check if your Scripts are encrypted, by adding these statements at the Top of your code:

```
EXO.?path\
MBX.!
```

Now you compile the Script and Run the compiled EXE-File.
Once these commands are executed, the Script will open its folder, which may look similar like this:



Now just double click on the Script-File and load it into the Editor. You may see something like this:



If its completely unreadable then your Script is crypted. You will NOT be able to recognize ANY WORD that was in the Script before.

Now we are going to take a look on some encrypted Scripts to give you an impression of the Encryption.
We are going to use the following Script. This Script will "include" the small Script "X.mrt" via

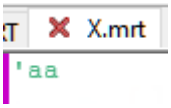
```
#INC:X.mrt
```

For Details on the Preprocessor-Include see here: 1.1 #INC: - Pre-Processor File-Include 248
Now this is the Main-Script:

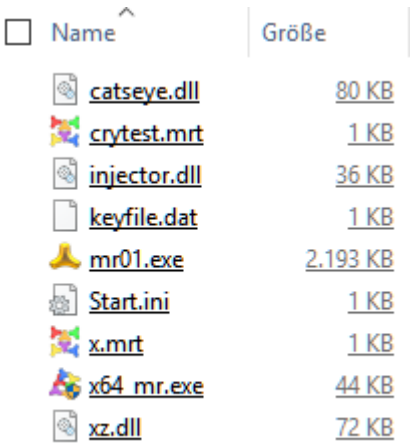
© 2023 Theo Gottwald * https://www.smart-package.com

```
'Creation·date:·12-2:
'====================
'#CRY:
'#EXE:?path\
'#SPI:ForceWrite
EXO.?path\
MBX.Ende
ENR.
'====================
#INC:X.mrt
```

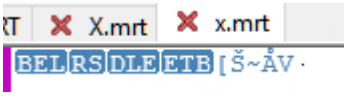
Here is the Original "X.mrt" in the Editor. As you can see its just 3 Bytes long.



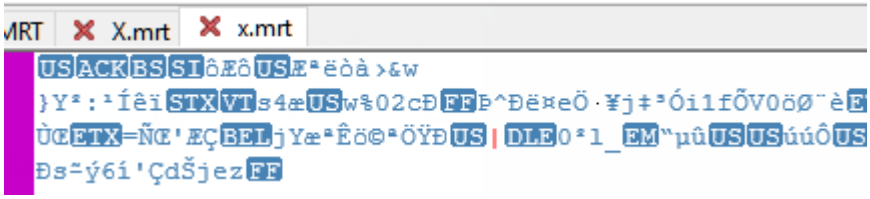
Now we compile the Script and start it. The Script will then open its temporary Folder and show us the unpacked Script-Files.



Now I am going to open the "`X.mrt`"-Script-File. It looks like this:



Ok, I will do the same again. NO CHANGE in the Code. Just take the same Script and compile it again.
Will it look equal? No, this time it looks quite different.



Ok, lets do it a third time. Compile ... and run. Open "X.mrt" in the Editor.

© 2023 Theo Gottwald * https://www.smart-package.com

Even the third time it looks totally different. Here are some Keypoints about the used Encryption-Scheme.
Now we will check something else.

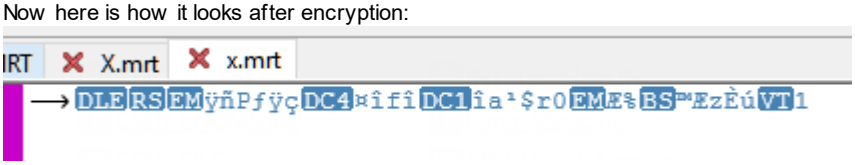
We will now use this file as "`X.mrt`". How will the encrypted version look?
The first thing we need to know is, that the "Original file" has a size of 4826 Byte.
See below.

© 2023 Theo Gottwald * https://www.smart-package.com

Crytest.MRT X.mrt

```
1  'aaaa
```

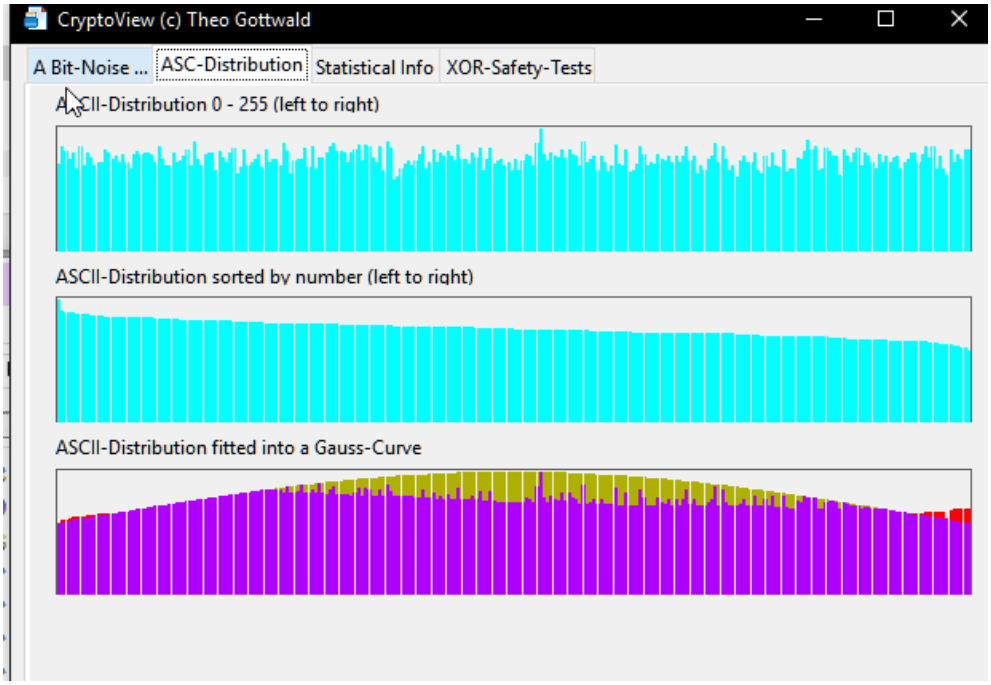
After Encryption the size of the file has reduced to 788 Byte.
From this example, you can see that the internal Algo will also remove redundancies before doing an Encryption.
Now here is how it looks after encryption:



You will not have any idea how it looked before, or even how long the original file was before.

Here are some Points about the internal Encryption Algo.
1.. Code is Compressed to reduce Redundancies
2. Code is Padded to fixed sizes.
Therefore, what you can see is that there are no valid conclusions about the original Code-Size.
3. Code is encrypted in an way that can mathematically not be reversed other then using the code that is inside the SPR it self..

YOU CAN TRUST the Encryption of the `'#CRY:` - Directive that it will definitely hide your Passwords very well.
Nothing that was readable in the Original Code will be readable in the Encrypted Code.



We added a improved Version of "CryptoView" to this SPR, and it will show you that any statistical Method of cracking the Script-Files is likely going to fail.

Having said this, there is no 100% Warranty that nobody will be able to find and extract the loaded Script in Memory or
use the built-in routines via Code-Hacking. However only Professionals with a lot of time and Know-How will be able to succeed in this.
And they need to have the SPR also.

Hint: You can use the `'#CRY:` - Directive together with the JNF.-Command as well as with the `#INC:` - Preprocessor-File-include.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax:

'#CRY:[P1]

P1 - Can only be a 0 or a 1. if omitted a "1" is used and this says that the code shall be encrypted.

Actually there is no way to encrypt only a few scripts. Using `'#CRY:` or `'#CRY:1` will always encrypt ALL SCRIPTS in a compiled package.

In the same way, if there is a `'#CRY:0` in the code, this will switch OFF Decryption for ALL Scripts.

If there are multiple such statements found, the LAST statement will be the one that counts.

Example:

```
'----------------------------------------
' Test if your Script is crypted
' compile this and run the EXE-File.
' then
'----------------------------------------
'#SPI:ForceWrite
'#EXE:
'#CRY:
'
EXO.?path\
MBX.!
END.
```

Parameter Explanation:

-

Remarks:

Preprocessor-Directives start with the Sequence: **#**
Because this is only important for the Preprocessor, the running script ignores these commands at ***Runtime*** *(at time of script execution)*.

Limitations:

How SAFE is the crypted Script-File and contained Passwords etc.?

About giving the file to somebody and say "please decrypt it" is mathematically impossible as we see it.
We have used protected ASM code therefore this is the maximum Level of safety.

However we see the following possible Safety problems:

1. Decryption is possible only when using the built in decryption subprograms that are contained somewhere in the Robot's internal code.
The only ways a potential Hacker could get the content of the Script-code is:

© 2023 Theo Gottwald * https://www.smart-package.com

a) To hack a program to get to its internal data is theoretically possible with any program out there,
And the SPR- even though there is some protection - can not make an exception to this.

b) If somebody can get hands on the SPR-Source code (buying the Company :-))
he may be able to decrypt Scripts.

2. If you need to make a compiled Script readable AND if you can proof that YOU are the valid Owner of the Script,
AND if you can pay some days of work-time, WE here at the SPR-Development can also make encrypted Scripts readable again.
For this we would need to compile a special version of the SPR which is actually nowhere available.

These are the the only ways we see, to get hands on the Script-Code. None of these will be easy or cheap.
We believe that, any statistical attack on the encrypted code will fail.

2.37.12 2.1.C '#AFT: - RUn AFTER Compile

Compiler-Directives

'#AFT: - Run Executable after Compile

Used to specify the name and path of an executable that is started immediately after Compile. It will become the name of the Executable as Commandline-Parameter.

Intention

```
'#AFT:?path\CopyStuff.exe
```

The `'#AFT:` Compiler Directive is used to start an Executable immediately after the Compilation of an executable is done.

There are two usage-modes:

1. You can start this way the created executable immediately after Compilation, Just write:

```
'#AFT:
```

2. You can start another Executable, in this case the complete path of the just created executable will be added as a commandline-parameter.

You can specify Specialfolders or just a File-Name.

```
'#AFT:Tester.exe
```

This is just the same as:

```
'#AFT:?path\Tester.exe
```

In both cases, the executable will be started like this:

```
(path)\Tester.exe (path and filename of created executable)
```

Below is an working Sample-Script.

Syntax:

```
'#AFT:[P1]
```

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - **N**ame and or Path of the Executable that should be started immediately after Compiling the program.
The program will be started with the Path and filename of the created executable as commandline-parameter.

'#AFT:Me
'#AFT:

In both cases, the executable that was just compiled will be immediately started without any commandline-Parameter.

Example:

```
'----------------------------------------
' Compile-Time Commands
'----------------------------------------
'
' The following line will start an Executable
' "Tester.exe" that must be located in ?path\
' that is the same folder where the Script is.
'
'#EXE:?path\
'#AFT:?path\Tester.exe
'
MBX.Thats me.
END.

'#EXE:?path\
'#SPI:ForceWrite

'----------------------------------------
' TESTER.REM
' Compile this Script to "Tester.exe"
' Then use it with "#AFT:
' and see what happens.
'----------------------------------------
'
' Commandline holen
$$FIL=$cmdexe$
IEF.$$FIL
  MBX. Die Datei $$FIL wurde kompiliert.
ELS.
  MBX. Kann $$FIL nicht finden.
EIF.
ENR.
```

Parameter Explanation:

-

Remarks:

2.37.13 2.2.1 '#ICO: - Choose own Icon

Compiler-Directives

'#ICO:

Changing the Icon for the final Executable

Intention

All Commands starting with a "'#" Sequence are Compiler Directives. They are executed at the time of compilation.
That is when you create an executable out of your script-file.

1. You can specify directly an Icon (.ico-File).
'**#ICO:** enables you to specify an ".ico" File for your executable.

Example:

```
'#ICO:?path\smiley.ico
' The following line is functionally exactly the same
'#ICO:smiley.ico
```

2. You can specify that NO ICON at all is used. This will decrease the size of your final executable.

'**#ICO:** enables you to specify that NO ICON shall be used.

Example:

```
'#ICO:-
or
'#ICO:No
```

3. You can specify an Folder with a Set of Icons..

'**#ICF:** enables you to specify an Folder with a set of Icons.
One of these Icons is automatically chosen, if you compile an Executable.
The type of specified "Manifest" decides also which Icon is been chosen.

Thje Icons in this folder must be named like this:

```
  "ST.ico" - This is the Standard Icon, its used if
no Manifest is specified
  "AI.ICO" - "As Invoker" Icon
  "HA.ICO" - "Highest available" Icon
  "RA.ico" - "require Administrator" Icon
  "UM.ico" - "User Manifest" Icon
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

4. You can specify an ".exe" or ".dll" File instead a ".ico" file. In this case the Icons from this file will be extracted to "?path\XIcons"
during compilation. The first available Icon will be used for the executable.
Generally this folder will not be deleted so you can see these Icons after Compilation is done.

```
 '#ICO:?path\Setup.exe
or
 '#ICO:?path\Icons.dll
```

Please note that Icons may be Protected Artwork and may under some circumstances not legally be used for own files.

Syntax:

```
'#ICO:[?path\]filename.ico
'#ICO:[?path\]filename.exe
'#ICO:[?path\]filename.dll
'#ICO:-

'#ICF:Iconfolder-Path\
```

Parameter Explanation:

-

Parameter Explanation:

-

Example:

-

Remarks:
If the Icons is not available, then the default Icon is used instead.
Please note that Icons may be Protected Artwork and may under some circumstances not legally be used for own files.

Limitations:

2.37.14 2.2.2 '#ICF: - Icon from Icon-Folder

Compiler-Directives

'#ICF:

Choosing the Icon for the final Executable from own "Icon Folder"

Intention

All Commands starting with a "'#" Sequence are Compiler Directives. They are executed at the time of compilation.
That is when you create an executable out of your script-file.

You can specify an Folder with a Set of Icons. If any of these Icons is not specified the default Icon is used instead.

'#ICF: enables you to specify an Folder with a set of Icons.
One of these Icons is automatically chosen, if you compile an Executable.
The type of specified "Manifest" decides also which of these Icon is been chosen.

The Icons in this folder must be named like this:

```
"ST.ico" - This is the Standard Icon,
           its used if no Manifest is specified
"AI.ICO" - "As Invoker" Icon
"HA.ICO" - "Highest available" Icon
"RA.ico" - "require Administrator" Icon
"UM.ico" - "User-Manifest" Icon
```

Syntax:

'#ICF:Iconfolder-Path\

Parameter Explanation:
-

Example:
-

Remarks:

*© 2023 Theo Gottwald * https://www.smart-package.com*

If any of these Icons is not specified the default Icon is used instead.
The Icon-Folder can only contain ".ico"-Files.
To extract Icons from ".exe" or ".dll"-files, use the " '#ICO:-Directive and then rename the Icons and use them here.

Limitations:

-

See also:

- 2.2.1 '#ICO: - Choose own Icon 313
- 2.2.3 '#ICS: / '#ICS: Icon-Set 318

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.15 2.2.3 '#ICS:- Icon from internal Icon-Set

Use Icon from internal "Icon-Set" Previous 253 Top 41 Next 361

Compiler-Directives

'#ICS:

There is a bunch of Icons already available inside the SPR. You can choose one of these Icons using the '#ICS:-Direktive.

Intention

All Commands starting with a "'#" Sequence are Compiler Directives. They are executed at the time of compilation. That is when you create an executable out of your script-file.

You can specify an Folder with a Set of Icons. If any of these Icons is not specified the default Icon is used instead.

'#ICS: enables you to specify an Folder with a set of Icons.
One of these Icons is automatically chosen, if you compile an Executable.
The type of specified "Manifest" decides also which of these Icon is been chosen.

The Icons in this folder must be named like this:

```
"ST.ico" - This is the Standard Icon,
           its used if no Manifest is specified
"AI.ICO" - "As Invoker" Icon
"HA.ICO" - "Highest available" Icon
"RA.ico" - "require Administrator" Icon
"UM.ico" - "User-Manifest" Icon
```

Syntax:

'#ICS:[Number][|N]

[Number] - a number in the range of 10 to the maximum number of available Icon-Sets. Currently this maximum Number is 66.
Numbers from 1 to 10 are reserved and repeat later Icons (doubles).
[|N] - "No Text". If this is specified, then always the "ST.ico" Icon is used, there will
be no letters on the Icon like "HA","UM" etc. No Matter what Manifest is used!

Parameter Explanation:

*© 2023 Theo Gottwald * https://www.smart-package.com*

The number of supplied icons may vary.
If you specify an invalid number, the standard Icon will be used.

Example:

```
    '#ICS:10|N
'#ICS:34
```

Remarks:
If any of these Icons is not specified the default Icon is used instead.
The Icon-Folder can only contain ".ico"-Files.
To extract Icons from ".exe" or ".dll"-files, use the " `'#ICO:`-Directive and then rename the Icons and use them here.

The following Icons can be accesse via the `'#ICS:`

2.37.16 2.3.0. '#MAN: - Manifest for Executable

'#MAN: - Specify a Manifest for the Executable Previous 277 Top 41 Next 287

Compiler-Directives

'#MAN:

Used to specify a manifest type for the executable that is to be created

Intention

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution).*

'#MAN:

The '#MAN: Compiler Directive is used to change the Manifest-Type of the final Standalone EXE-File. You can choose between:

- *asInvoker*
- *requireAdministrator*
- *highestavailable*
- *none*

alternative you can specify an own ".xml"-File with Path:

```
'#MAN:?path\User-Manifest.xml
```

For example:

```
'
' choose Manifest that shows that admin rights are required:
'#MAN:ra
or
'#MAN:requireAdmin
or
'#MAN:User-Manifest.xml
```

If you omit the `'#MAN:` - directive, per default "*asInvoker*" is used for the compiled Package. The internally used `MR01.exe` (Robot-Executable) does not have an own Manifest therefore.

Syntax:

'#MAN:[P1]

P1 - (***optional***) Manifest Type can be one of these:

© 2023 Theo Gottwald * https://www.smart-package.com

```
- ai,asInvoker
- ra,requireAdministrator
- ha,highestavailable
- -,none
```

or you can specify an ".xml"-Manifest File with complete path.
If you just specify the filename, ?path\ is taken as path.

```
'#MAN:User-Manifest.xml
```

Example:

```
'----------------------------------------
' Compiler Manifest
'----------------------------------------
'
'
' "requireAdmin" Manifest is used
'#MAN:ra
' or
'#MAN:requireAdmin

' No Manifest will be used
'#MAN:-
' or
'#MAN:None

' "highestavailable" Manifest is used
'#MAN:ha
' or
'#MAN:ra
'
'#MAN:User-Manifest.xml

END.
```

Manifest Explanation:

This is the Manifest that is basically used for the SPR.
The brown colored lines are internally changed to the value that is needed for "required execution level" and "UIAccess".

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<assembly manifestVersion="1.0" xmlns="urn:schemas-microsoft-com:asm.v1" xmlns:a

<assemblyIdentity type="win32" name="{decriptioA}" version="1.0.0.0" processorAr

<!-- Windows 8 -->
<supportedOS Id="{4a2f28e3-53b9-4441-ba9c-d69d4a4a6e38}"/>
</application>
</compatibility>

<asmv3:application>
<asmv3:windowsSettings xmlns="http://schemas.microsoft.com/SMI/2005/WindowsSetti
<dpiAware>true</dpiAware>
</asmv3:windowsSettings>
</asmv3:application>
</assembly>
```

Remarks:

The Icon of the Executable will show the Letter of the used Manifest, A, H or R.
In case you specify a "User-Manifest.xml", the Icon will show "U".

Internally this statement can be emulated using the '#CIL:-Directive:

```
'#CIL:Rempara|Manifest|(Number 0 to 3)
```

and in case a User-Manifest is used:

```
'#CIL:Rempara|Manipfad|(path)
```

Limitations:

-

See also:

- 2.3.1. '#MAU: - UI-Access for Manifest for Executable 325
- 2.4.0. '#VER: - Version-Informations 328

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.17 2.3.1. '#MAU: - UI-Access for Manifest for Executable

Compiler-Directives

'#MAU:

Used to specify a manifest type for the executable that is to be created

Intention

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution).*

'#MAU:

The '#MAU: Compiler Directive is used to change the Manifest-UIAccess of the final Standalone EXE-File.

It's needed for "assistive technology application" (for example helpdesk-applications).

You can choose between:

```
- 0 (default) - UI-Access is switched Off, switched to
"false"
- 1 - UI-Access is switched On, set to "true"
```

If you omit the Directive, the default value is : 0

For example:

```
'
' choose Manifest that shows that admin rights are required:
'#MAU:0
or
'#MAU:1
```

In the picture below you can see, how it looks in the final Manifest.

```
23  <security>
24  <requestedPrivileges> <requestedExecutionLevel
25  level="asInvoker"
26  uiAccess="false" ... />
27  </requestedPrivileges>
28  </security>
```

Important Note:
If you specify a User-Manifest, this directive will not change the manifest.
It will only work with the default- built in Manifest's.

© 2023 Theo Gottwald * https://www.smart-package.com

If you omit the '#MAU: - directive, per default "0" is used for the compiled Package.
For more Infos on the uiAccess-Parameter see here:

https://msdn.microsoft.com/en-us/library/windows/desktop/ee671610(v=vs.85).aspx

Syntax:

'#MAU:[P1]

P1 - Can only be 0 or 1, anything else will evaluate to zero.

Example:

```
'----------------------------------------
' Compiler Manifest
'----------------------------------------
'
'
' Switch UIAccess off
'#MAU:0

' Switch UIAccess on
'#MAU:1
'

END.
```

Manifest Explanation:

This is the Manifest that is basically used for the SPR.
The brown colored lines are internally changed to the value that is needed for "required execution level" and "UIAccess".

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<assembly manifestVersion="1.0" xmlns="urn:schemas-microsoft-com:asm.v1" xmlns:a

<assemblyIdentity type="win32" name="{decriptioA}" version="1.0.0.0" processorAr

<description>{decriptioB}</description>

<dependency> <dependentAssembly> <assemblyIdentity
type="win32" name="Microsoft.Windows.Common-Controls" version="6.0.0.0"
processorArchitecture="x86" publicKeyToken="6595b64144ccf1df" language="*"  />

</dependentAssembly> </dependency> <trustInfo xmlns="urn:schemas-microsoft-com:a

<security>
<requestedPrivileges> <requestedExecutionLevel

' The following two lines differ due to the Manifest settings
level="{levelio}"
uiAccess="{uiacio}" />
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
</requestedPrivileges> </security> </trustInfo>
<compatibility xmlns="urn:schemas-microsoft-com:compatibility.v1">
<application>

<!-- Windows 10 -->
<supportedOS Id="{8e0f7a12-bfb3-4fe8-b9a5-48fd50a15a9a}"/>
<!-- Windows 8.1 -->
<supportedOS Id="{1f676c76-80e1-4239-95bb-83d0f6d0da78}"/>
<!-- Windows Vista -->
<supportedOS Id="{e2011457-1546-43c5-a5fe-008deee3d3f0}"/>
<!-- Windows 7 -->

<!-- Windows 8 -->
<supportedOS Id="{4a2f28e3-53b9-4441-ba9c-d69d4a4a6e38}"/>
</application>
</compatibility>

<asmv3:application>
<asmv3:windowsSettings xmlns="http://schemas.microsoft.com/SMI/2005/WindowsSetti
<dpiAware>true</dpiAware>
</asmv3:windowsSettings>
</asmv3:application>
</assembly>
```

Remarks:

1. If needed, SPR-compiled EXE-Files can now be digitally signed with a certificate.

2. This command will internally evaluate to

```
'#CIL:Rempara|Manifest_UIAccess|0
'#CIL:Rempara|Manifest_UIAccess|1
```

Limitations:

-

See also:

- 2.3.0. '#MAN: - Manifest for Executable

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.18 2.4.0. '#VER: - Version-Informations

'#VER: - Specify custom Version-Informations Previous 277 Top 41 Next 287

Compiler-Directives

'#VER:

Used to specify custom version Information for the executable that is to be created.

Intention

Compiler-Directives start with the Sequence:

'#

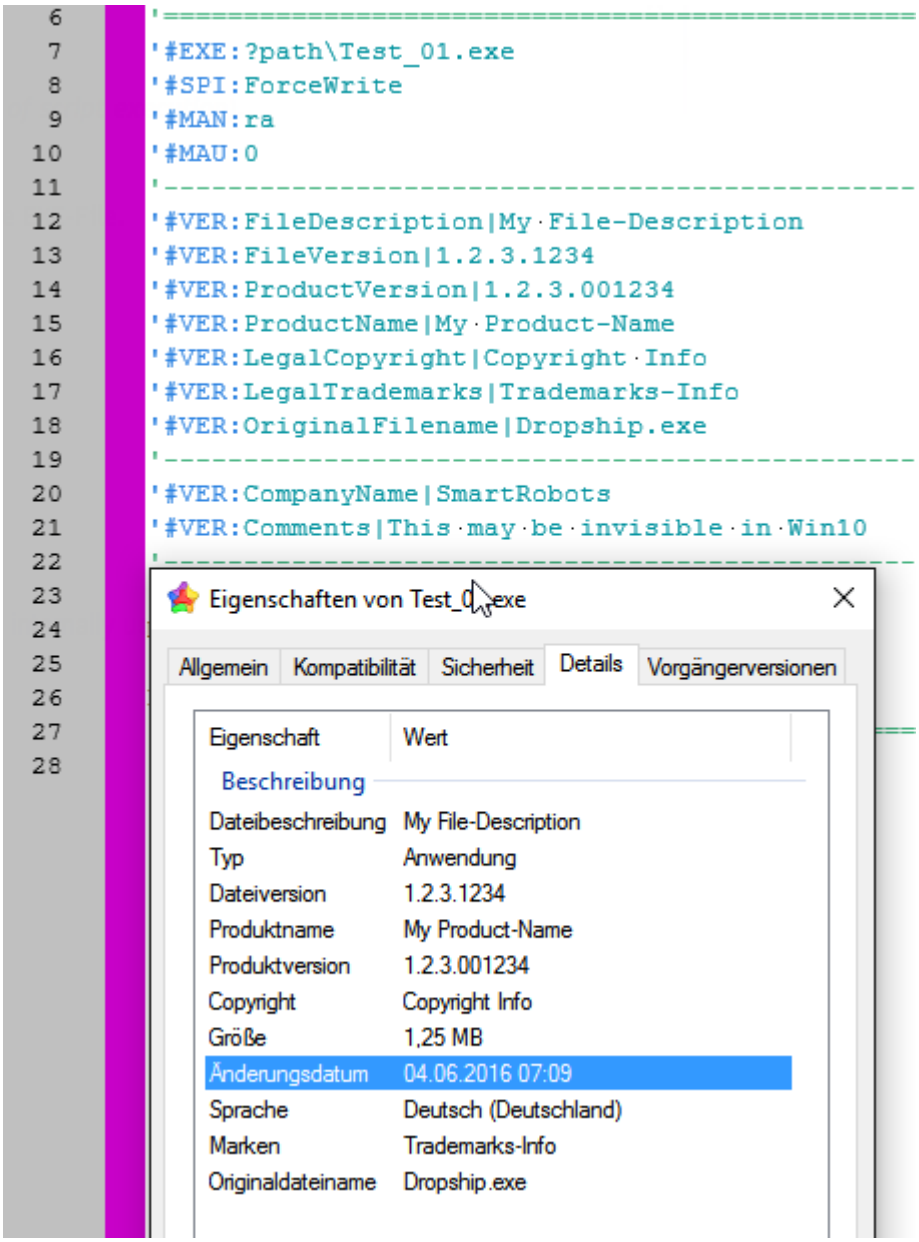
Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution)*.

'#VER:

The '#VER: Compiler Directive is used to change the Version Information of the final Standalone EXE-File.
Below is an example.

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax:

'#VER:P1|P2

P1 - One of the following Version-Information:

- *FileDescription*
- *FileVersion*
- *ProductName*
- *ProductVersion*
- *LegalCopyright*
- *LegalTrademarks*
- *OriginalFilename*

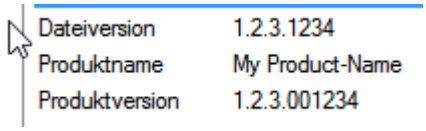
© 2023 Theo Gottwald * https://www.smart-package.com

- *CompanyName*
- *Comments*

P2 - Value for the Version-Information.
For *FileVersion and ProductVersion* there is a special rule: use only numbers and use three ".". For example:

```
'#VER:FileVersion|1.0.0.12
'#VER:ProductVersion|1.0.0.120
```

Also note, that the internal formatting of the last number is not equal between these two parameters.



Example:

```
'----------------------------------------
' Changed Version Informations
'----------------------------------------
'#VER:FileDescription|My File-Description
'#VER:FileVersion|1.2.3.1234
'#VER:ProductVersion|1.2.3.001234
'#VER:ProductName|My Product-Name
'#VER:LegalCopyright|Copyright Info
'#VER:LegalTrademarks|Trademarks-Info
'#VER:OriginalFilename|Dropship.exe
'-----------------------------------------------
'#VER:CompanyName|SmartRobots
'#VER:Comments|This may be invisible in Win10

END.
```

Parameter Explanation:

-

Remarks:

Internally uses:
`'#CIL:VersioninfoA|(P1)=(P2)`
There is also:
`'#CIL:VersioninfoB|(P1)=(P2)`
which is for an english set of File-Descriptions.

Limitations:

These two may not be visible under Windows 10.

```
'#VER:CompanyName|SmartRobots
'#VER:Comments|This may be invisible in Win10
```

© 2023 Theo Gottwald * https://www.smart-package.com

See also:

- 2.3.0. '#MAN: - Manifest for Executable 321

© 2023 Theo Gottwald * https://www.smart-package.com

2.37.19 2.5.0. '#CIL: - Direct Compiler Interface

'#CIL: - Specify custom Options for the Compiler Previous 277 Top 41 Next 287

Compiler-Directives

'#CIL:

Used to specify custom options for the executable that is to be created.

Intention

Compiler-Directives start with the Sequence:

'#

Which is a **comment-sign** on the left and then the **#.**

Because of the comment sign, the running script ignores these commands at ***Runtime*** *(at time of script execution).*

'#CIL:

The '#CIL: Compiler Directive is used to directly write Options to the Compiler. It's not needed for the "normal user". It enables advanced access to the Compiler-Internals.

For example:

'

If you omit the `'#MAN:` - directive, per default "*asInvoker*" is used for the compiled Package. The internally used `MR01.exe` (Robot-Executable) does not have an own Manifest therefore.

Syntax:

'#CIL:[P1]|[P2]|[P3]

P1 - Section: These can be one of the following values:

- `Rempara`
- `RemRun`
- `Remcust`
- `Resourcen`
- `VersioninfoA`
- `VersioninfoB`

P2 - Key: These must be the key-value. These values represent internal variables in the Compiler-/Compilation Process.

P3 - Value: This is the value that is been assigned to the Key **(P2).**

© 2023 Theo Gottwald * https://www.smart-package.com

Example:

```
'----------------------------------------
' Compiler Manifest
'

' This will set Version-info similar to "'#VER:" directive
'#CIL:VersioninfoA|ProductVersion|1.2.3.4

' This is equivalent to the '#ICO:
'#CIL:Rempara|Icon-Path=?path\Face1.ico
'#CIL:Rempara|Icon-Path=?path\Restuner.exe

END.
```

Parameter Explanation:

-

Remarks:
Please use this command only, if you know what you are doing.
Inputs from this command are in many cases not checked for validity and can prevent the script from compiling as it should..

Limitations:
-

2.38 3. System-Variable and Specialfolders

2.38.1 3.1 Systemvariables

Systemvariables Previous 389 Top 41 Next 341

MiniRobotLanguage (MRL)

Systemvariables

Intention

Systemvariables are replaced with the appropriate Content at runtime. They need to be written in lowercase.

Parameter Explanation

SYSVAR		Usage		ASCII
$crlf$	-	CR+LF	-	(13,10)
cr	-	Carriage Return	-	(13)
lf	-	Line Feed	-	(10)
sp	-	Space	-	(32)
tab	-	Horizontal Tab	-	(9)
nul	-	Null	-	(0)
sq	-	Singel Quote	-	(39)
dq	-	Double Quote	-	(34)
esc	-	Escape	-	(27)
eof	-	End-of-File	-	(26)
ff	-	Form Feed	-	(255)
vt	-	Vertical Tab	-	(11)
bs	-	Back Space	-	(8)
bel	-	Bell	-	(7)

Robot Command-Line

$cmdl$ - custom commandline (in EXE-Mode use $cmdexe$)

(Text-)Clipboard Content

cpb - Clipboard-Content (Text)

Current running Script

#linenum# - aktuelle Zeilennumber im Script
$script$ - actual Filename, currently running script.

© 2023 Theo Gottwald * https://www.smart-package.com

```
                Without Path.
#errnum#  - Code Number for Type of Error:
            0 - Unspecified Error. Details see Error-Message.
            1 - Syntax-Error,
            2 - Parameter-Nzmber,
            4 - Size-Error (to much or to few of something)

#errlin#   -    Linenumber where the last error has occurred.
$errtxt$   -    Error-Message, identical to what is shown in
the Messagebox.
                This one is available in Silent-Mode, where no
Messagebox appears.
```

Variables for use with the Stack's

```
$tos$   -       insert Top-of-stack
$dtos$  -       insert Top-of-stack (nodelete)
#tos#   -       Number of items on current stack
#stack# -       returns  1 if  GLOBAL Stack is selected
                         2 -if  LOCAL Stack is selected
```

Variables for time-measurement

```
$now$   -       (Local time) Exact Time,
                Format: 2006:01:30:16:29:17:0250
$utime$ -       (UTC/Universal Coordinated Time),
                Format: 2006:01:30:16:29:17:0250
$date$  -       Actual Date, Example:    01-01-2006
$time$  -       Actual Time, Example:    12:01:40
#date#  -       Date, Format: 01302006 for 30/01/2006
#time#  -       Time, Format: 173226 for 17:32:26
#timer# -       Timer, Format: 63220.625
#datetime#      Date and Time, Format: 01302006_172430
#dtime# -       Time, Format: 3348146124.41
#dsince#-       Time, since last call to #dtime# or #dsince#
#since# -       Time since last call to #since# or #time#
```

Process- and ThreadID and Window Handles

```
#pid#   -       Process-ID of the last program or window. Not
all execute-commands provide this.
                See help for EXS and other EXE-commands. Also
set by STW. and some other such Window-Commands.

#tid#   -       Thread-ID of the last program or window. Not
all execute-commands provide this.
                See help for EXS and other EXE-commands. Also
set by STW. and some other such Window-Commands.
                Prefer using the PID, as the TID is often not
set.

#cbw#   -       Handle of own Window
#cwh#   -       Debug Console Window-Handle
#hwn#   -       Handle, actual located window
```

© 2023 Theo Gottwald * https://www.smart-package.com

InterKOM

```
Note: the term "CUN" (Communication Unique Number) is the same
as
      the "InterKOM-Handle".

#cun#    -     CUN of the actual Robot, own InterKOK-Handle.
#ecun#   -     CUN of the actual Editor, if any
#fcun#   -     CUN of the Father-Process ("Father")
#bcun#   -     CUN of the last started Mini-Browser,
               it must have been started using the LBR.
Command.
#pcun#   -     CUN of the last started Parallel-Robot,
               using the PRR. Command.
```

Mini-Browser only

Note: these Systemvariables are only resolved if an Mini-Browser (MB**)** has been started from this robot, using the LBR.-command.
If you have multiple TAB's open in the same MB, some of these System-Variables react only on the actual selected TAB, while others are been set by any TAB that is loading at the same time.
You can use Parallel-Robots and multiple Instances of the MB to work with several Sites at the same time to overcome possible confusion when dealing with multiple sites at the same time.

```
#mb_prog#     -  0-100%, Loading Progress (Site-dependend)

#mb_state#    - 1/0 if actual selected TAB Browser Control
                is busy. 0 - ready, 1 - busy loading
                Result 99 if no state is available.
#mb_busy#     - 1/0 if MB overall is actually busy working
                1 - busy, 0 - ready, waiting for command
```

Generally the Browser-States occur one after the other when you load a WEB-Site. It may look like this for example:

```
[13:00:33] [12]  TAB: 0*269*SetSecureLockIcon*0*
[13:00:33] [12]  TAB: 0*102*StatusTextChange*Fertig*
[13:00:33] [12]  TAB: 0*108*ProgressChange*-1,10000*
[13:00:34] [12]  TAB: 0*104*DownloadComplete**
```

Using these System-Variables, you can either get them "One after the other" or you can only get the state that is "actual", at the time when you use the System-Variable.
Therefore you have two complete sets of system Variables.
One set wit "s" like "Serial" to get all states in order.
One set with "a" like "actual", to get only the state that is NOW.

© 2023 Theo Gottwald * https://www.smart-package.com

Note: the following SysVars contain all Browser Messages in serial order. To have them switch to the next message, use the #mb_nex# at any place.

#mb_time# - Time of last call to LBR., CBR.goto etc..
This is the time when you commanded to load a site in the MB.

#mb_since# - DTime since last call to LBR., CBR.goto.
Use to measure how long a site takes to load.

mb_sli - all Informations about the serial Event, in one System-Variable, separated by "*". Example:
TAB: 0*108*ProgressChange*-1,10000*
(Tab-Number)*(Event-Code)*(Event Name)*Additional Info)

#mb_stnr# - Number of the selected TAB for the serial message number starting from 0.

#mb_sevn# - Numeric Event Number for the serial Browser Event.

mb_sai - Additional Information for the serial Browser Event.
mb_stxt - State-Text Information for the serial Browser Event.

#mb_nex# - Use this to switch all "Serial MB-System-Variables" to the next serial Event. It will not evaluate to any value.

Note: the following SysVars contain all Browser Messages in actual order. This is the state of the Browser right when you use the SysVar. Using these Variables, states can be lost, if they are not more actual. You do not need to use #mb_nex# with these, because you get the actual state.

#mb_atnr# - Number of the selected TAB for the actual message number starting from 0.

#mb_aevn# - Numeric Event Number for the actual Browser Event.
mb_aai - Additional Information for the actual Browser Event.
mb_atxt - State-Text Information for the actual Browser Event.

mb_ali - all Informations about the actual Event, in one System-Variable, separated by "*". Example:
TAB: 0*108*ProgressChange*-1,10000*
(Tab-Number)*(Event-Code)*(Event Name)*Additional Info)

Note: All Errors will stay in these System-Variables until they are confirmed using the #mb_cerr# System-Variable. If there occur multiple errors, only the last error is stored. The last error
overwrites a previous error, whether it was confirmed with #mb_cerr# or not.

© 2023 Theo Gottwald * https://www.smart-package.com

```
#mb_err# - 0 or last MB-Error number from Mini-Browser.
           Could be for example: 2148270085
$mb_err$ - A short text that identifies the Error.
           For example: "INET_E_RESOURCE_NOT_FOUND"
$mb_ert$ - A textual description of the error.
           For example: "The server or proxy was not found."

#mb_cerr# - Will confirm the last Error and Reset the mb_er*
Systemvariables.

        A list with possible Errors can be found here:
        Internet Explorer Errors and here: HTTP-Status Codes
```

Mouse-Position

```
#mpx#    -       actual Mouse position X
#mpy#    -       actual Mouse position Y
#opx#    -       actual Mouse position X - Client-Coords.
#opy#    -       actual Mouse position Y - Client-Coords.
#ixp#,#iyp# -    Actual Point x,y (screen Coords)

#il#     -       actual Element, left side X (Sreenccords)
#it#     -       actual Element, upper side Y (Sreenccords)
#ir#     -       actual Element, right side X (Sreenccords)
#ib#     -       actual Element, bottom side y (Sreenccords)
#iw#     -       actual Element, width X
#ih#     -       actual Element, height Y
#icx#    -       actual Element, Centerpoint X
#icx#    -       actual Element, Centerpoint Y
```

Timeout-Flag

```
#tio#    -       Timeout-Flag
#til#    -       Timeout-Line-Number
```

Screen-/ Desktop Sizes

```
#ssx#,#ssy# -    Screen size X,Y
#wsx#,#wsy# -    Work-area-Size X,Y
#sbp#    -       Screen-bits per pixel (Colordepth)
```

FEX-Enumeration

```
#fex#    -       FEX - Elements left on the FEX-Stack
#fxd#    -       FEX - Nesting-Depth
```

There are some more for **compiled EXE's**

```
$exename$     - Name of the compiled EXE (Filename)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$starttime$    - time when EXE was started
$startdate$    - date when exe was started
$cmdexe$       - commandline given to the compiled EXE
$startscript$ - Name of script-file to start first
#exemode#      - if Script runs inside an EXE (1) or not (0)
#mutex1#       - was Script started from the same EXE before?
#mutex2#       - was a script of this name started from
                 anywhere before?

Hint: Timing functions like #time# and others internally use
                 the
      windows timer. This timer will be set to zero normally
                 around
      midnight. If your measurement will fall just into the
                 moment
      of the timer reset, the results may be wrong.
```

- 3.2 Standard-Search Pattern 341

© 2023 Theo Gottwald * https://www.smart-package.com

2.38.2 3.2 Standard-Search Pattern

MiniRobotLanguage (MRL)

Standard Search Pattern

Intention

Generally spoken, its mostly never needed to use the whole string for a text search. In most cases and with nearly all commands, a unique substring is all you need to describe an element.

Additionally you can use search patterns to describe elements. These patterns can be used in most commands, where you search for Text. Using the patterns, you can make your scripts recognize controls from multiple languages.

For example, when you open a WEB-Site and you want to check if the page is really available, you could use the following vommand:

```
' Wait 15 seconds until whether the term "Description" or
' the term "Media not visible" appears.
SAO.rnw|42|Description&OR:Media not visible|15
```

Parameter Explanation

Search Pattern	Shortform	Example
{&DOCAPS:}	{&00:}	{&DOCAPS:ExPE}
{&OR:}	{&01:}	{Text1&OR:Text2}
{&XOR:}	{&02:}	{Text1&XOR:Text2}
{&AND:}	{&03:}	{Text1&AND:Text2}
{&ANDTHEN:}	{&04:}	{Text1&ANDTHEN:Text2}
{&FUZZY:}	{&05:}	{{Text1}&FUZZY:[value]}
{&TOLERANT:}	{&06:}	{{Text1}&TOLERANT:[value]}
{&NOT:}	{&07:}	{&NOT:{Text1}}
{&EXACT:}	{&08:}	{&EXACT:Text1}
{&NOTEXT:}	{&09:}	{&NOTEXT:}
{&WILDC:}	{&0c:}	{&WILDC:Hallo??.*}

*© 2023 Theo Gottwald * https://www.smart-package.com*

{&t:}		
{&f:}		

{&DOCAPS:} = Activate Case-Sensitive

Normally all search patterns are not case sensitive. If you need case sensitivity, you can activate, the {**&DOCAPS:**}.

Text is: „Andreas is a human".

Searching {**&DOCAPS:**andreas} will not find the text.
Searching {**&DOCAPS:**Andreas} will find the text.

{&OR:} = OR

To perform a logical 'OR' of two options.
If either are true, then the result is true, otherwise it is false.
This is most often used to accept buttons in different languages.

Example:

AFT.**{yes&OR:ja&OR:Oui}**

will find any such element no matter if its english, german or french. There is no limit on how many values are used.

{&XOR:} = XOR

To perform a logical 'OR' of two values.
Only one can be true to get a true result. When both are true, the "XOR" result is false.

{&AND:} = AND

All the Words (conditions) must be true.

{&ANDTHEN:}

The Words must be in sequence one after the other with any number of chars between.

{&FUZZY:}

The Value must be given in numbers. 0 ... 100. It enables the found string to be slightly different from the original source. {&FUZZY:} calculates the "Edit-Distance" which tells how many wrong key-press would lead to this result.

For example:

If your window has the Title:
"Walkenhorsts Letter.doc - Microsoft Word"

© 2023 Theo Gottwald * https://www.smart-package.com

and you are using Matchstring: "{Microsaft&FUZZY:1}" then the result is true, because "Microsaft" is matching by 1 wrong character to "Microsoft".

{&TOLERANT:}

The Value must be given in 0% to 100%. It enables the found string to be slightly different from the original source. It uses a percentage Scale (0-100%). It usese percentage in different to Fuzzy.

{&NOT:}

The negotiation is true.
For example: The white light is not blue = TRUE

{&EXACT:}

When an expression should be exact the same you are looking for.
It is by default not case-sensitive.
For that you need to apply {&DOCAPS:} as well if needed.

{&EXACT:} will match the text only to true, if the text is equal.
This is important (for example) if you want to find a window "C:\Programme" while there is another one "C:\Programme\something".
Without {&EXACT:} you could match the wrong one.

{&NOTEXT:}

When you are looking for a window it has normally a name.
Some windows dont have names, so u can test it in your search by using the “&NOTEXT” pattern.

{&DOCAPS:&EXACT:Hallo&OR:{&notext:}}

{&WILDC:}

This arconym stands for “wildcard” and there are some symbols for different comparings between a source and a target string.

These are the expression_pattern:

? Use this if you don`t know any single character (all but no digit)
* Use this if you don`t know any characters, it can be zero or more.
# Use this if you don`t know any single digit (0-9)
[charlist] For complex search algorythem. Any single character in 'charlist'
[!charlist] Any single character not in 'charlist'

{&WILDC:Andrea*M[üä]ller*}" match "Andreas Müller

© 2023 Theo Gottwald * https://www.smart-package.com

{&t:}

Use this to tell „true" to your command, because its always true.
{&f:}

Use this to tell „false" to your command, because its always false.

Important: Standard-Search Pattern-terms must be written in UPPERCASE letters. Like:

&WILDC:

This i wrong:

&wildc:

This will also not work:

&WildC:

These patterns will only be recognized if they are written in big letters (uppercase).

Example:

```
{&DOCAPS:TheoGottwald&ANDTHEN:Internet}&OR:{&EXACT:Explorer}}

{&WILDC:Andrea*}" match "Andreas Müller

SCI.{&DOCAPS:ExPE}

STW.ct|#32770|Microsoft
&ANDTHEN:Word&ANDTHEN:2.29&ANDTHEN:.doc

STW.ct|afx:|Microsoft Word V.2.29 vom 23-01-97
&ANDTHEN:liste.doc

STW.ct|#32770|{Mikrosx&TOLERANT:4}&ANDTHEN{&NOT:word}
&ANDTHEN{&EXCEL&OR:Frontpage}

STW.ct|#32770|{Microsaft&TOLERANT:60}
```

© 2023 Theo Gottwald * https://www.smart-package.com

2.38.3 3.3 Specialfolders

MiniRobotLanguage (MRL)

Specialfolders

Intention

Specialfolders are also systemvariables.

- They are replaced on runtime with a real, physical folder-name.
- This folder name is evaluated at runtime on the target machine.

Specialfolders need to be written in small letters. Specialfolders need the "\" at the end of the name to be complete.

Parameter Explanation

```
Currently we support these OS-Specialfolders:

?wi\              - current windows-folder
?ws\              - windows\system32 - folder
?desktop\         - current user-desktop
?cdesktop\        - common desktop
?auto\            - current user-startmenu/autostart
?cauto\           - common startmenu/autostart
?fonts\           - (system) fonts folder
?startmen\        - current user startmenu
?cstarmen\        - common startmenu
?sendto\          - current user SendTo Folder
?progs\           - c:\programm files (x86) etc.
?temp\            - current user temporary folder
?startprog\       - current user\Startmenu\Programme\
?cstartprog\      - common \Startmenu\Programme\
?sysfolder(xx)    - get Specialfolder by code (see code below)
?appdata\         - C:\Documents and Settings\<username>\Application
Data\

And these Robot-specific folders:

?curdir\        - The current directory path
?path\          - The path to the Script itself
?pfad\          - The path to the Script itself (german)
?pattern\       - "?path\Pattern\" this is the default Path for
Search-Patterns in the Scriptfile.
```

© 2023 Theo Gottwald * https://www.smart-package.com

use '#INC:?path\Pattern* for including the Pattern into an Executable.
?exepath - The path to the Main Robot-Executable
?exepfad - The path to the Main Robot-Executable (german)
?mainpath - The path to the main-script file
?lib - **Path to the Library, see #LIB:**
This path is different depending
if in Editor or in EXE-Mode.
In EXE-Mode this Path will always be:
?path\LibXXSPR
From the Editor the Path will be what was specified with the #LIB: - Directive.

and only for compiled EXE's

?exeloc - Path of compiled EXE-Package

Under x64 OS (Vista, Win 7 and higher) you have:

?progs64 - c:\programm files\
?ws64 - c:\windows\System32\
?ws - c:\windows\SysWOW64\

And here are the Codes for ?sysfolder(xx):
Prefix with &H (hexadezimal).
Example: ?sysfolder(&H0A)\ -> Recycle Bin

00 - <desktop>
01 - Internet Explorer (icon on desktop)
02 - Start Menu\Programs
03 - My Computer\Control Panel
04 - My Computer\Printers
05 - My Documents
06 - <user name>\Favorites
07 - Start Menu\Programs\Startup
08 - <user name>\Recent
09 - <user name>\SendTo
0a - <desktop>\Recycle Bin
0b - <user name>\Start Menu
0d - "My Music" folder
0e - "My Videos" folder
10 - <user name>\Desktop
11 - My Computer
12 - Network Neighborhood
13 - <user name>\nethood
14 - windows\fonts
15 - Templates
16 - All Users\Start Menu
17 - All Users\Programs
18 - All Users\Startup
19 - All Users\Desktop
1a - <user name>\Application Data
1b - <user name>\PrintHood
1c - <user name>\Local Settings\Applicaiton Data (non roaming)
1d - non localized startup

© 2023 Theo Gottwald * https://www.smart-package.com

```
1e - non localized common startup
1f - COMMON FAVORITES
20 - INTERNET CACHE
21 - COOKIES
22 - HISTORY
23 - All Users\Application Data
24 - Windows-Directory
25 - System-Directory
26 - C:\Program Files
27 - C:\Program Files\My Pictures
28 - USERPROFILE
29 - x86 system directory on RISC
2a - x86 C:\Program Files on RISC
2b - C:\Program Files\Common
2c - x86 Program Files\Common on RISC
2d - All Users\Templates
2e - All Users\Documents
2f - All Users\Start Menu\Programs\Administrative Tools
30 - <user name>\Start Menu\Programs\Administrative Tools
31 - Network and Dial-up Connections
35 - All Users\My Music
36 - All Users\My Pictures
37 - All Users\My Video
38 - Resource Direcotry
39 - Localized Resource Direcotry
3a - All Users OEM specific apps
3b - USERPROFILE\Local Settings\Application Data\Microsoft\CD Burning
3c - unused
3d - Computers Near Me (computered from Workgroup membership)
8000 - combine with other numbers to force folder creation
```

Example

```
' See the Printout in the Text-Area of the Editor.
' The path to the Script itself

VAR.$$PFA=?path\
DBP.$$PFA

' User-Profile
VAR.$$PFA=?sysfolder(&H28)\
DBP.$$PFA

VAR.$$PFA=?mainpath\
DBP.$$PFA

VAR.$$PFA=?cstartmen\
DBP.$$PFA

VAR.$$PFA=?progs\
DBP.$$PFA

VAR.$$PFA=?cdesktop\
DBP.$$PFA

VAR.$$PFA=?ws\
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
DBP.$$PFA

VAR.$$PFA=?wi\
DBP.$$PFA

ENR.
```

2.38.4 3.4 System-Colors

MiniRobotLanguage (MRL)

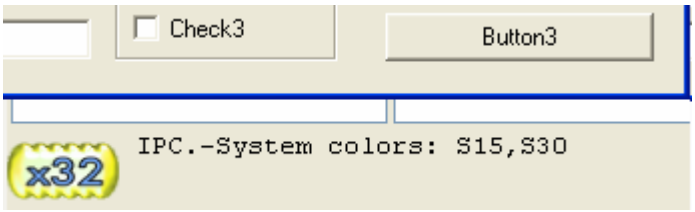
System-Colors

Intention

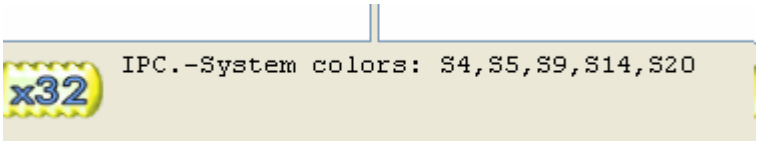
Normal colors values may differ on different target systems. This is because of changes in themes and graphics drivers and hardware.

To be able to use color values, you can use the "Windows System Colors" in many commands where Colors can be used.

System Colors are displayed in the Windows-Inspector, for the point which is currently below the mouse-cursor.



System-Colors may have the same values as other System-Colors on different systems. This is however a question of the design/theme that is used.
However, it is a fact that text is often black, as well as shadows.



You can use the CCV.-command to directly get the values of any System-Color.
Here is an example:

```
' Show value od System color S2
CCV.H|S2|$$HEX
DBP.$$HEX
ENR.
```

Systemcolor Definition (Color Type)

```
S0          - SCROLLBAR COLOR
S1          - BACKGROUND/DESKTOP COLOR
S2          - ACTIVE-CAPTION COLOR
S3          - INACTIVE-CAPTION COLOR
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
S4          - MENU COLOR, MSGBOX COLOR
S5          - WINDOW COLOR
S6          - WINDOW-FRAME COLOR
S7          - MENU-TEXT COLOR, MSGBOXTEXT COLOR
S8          - WINDOW-TEXT COLOR
S9          - CAPTION-TEXT COLOR
S10         - ACTIVEBORDER COLOR
S11         - INACTIVEBORDER COLOR
S12         - APPWORKSPACE COLOR
S13         - HIGHLIGHT COLOR
S14         - HIGHLIGHT-TEXT COLOR
S15         - BUTTON-FACE COLOR
S16         - BUTTON-SHADOW/3DSHADOW COLOR
S17         - GRAY-TEXT COLOR
S18         - BUTTON-TEXT COLOR
S19         - INACTIVE-CAPTION-TEXT COLOR
S20         - BUTTON-HIGHLIGHT COLOR

The following colors will not be available below Windows NT 4:

S21         - 3DDKSHADOW COLOR
S22         - 3DLIGHT COLOR
S23         - INFO-TEXT COLOR
S24         - INFO-BACKGROUND COLOR
S25         - not defined (&HB5B5B5 on XP here)

The following colors will not be available below Windows 2000:

S26         - HOTLIGHT COLOR
S27         - GRADIENT-ACTIVE-CAPTION COLOR
S28         - GRADIENT-INACTIVE-CAPTION COLOR
S29         - MENU-HILIGHT COLOR
S30         - MENUBAR
```

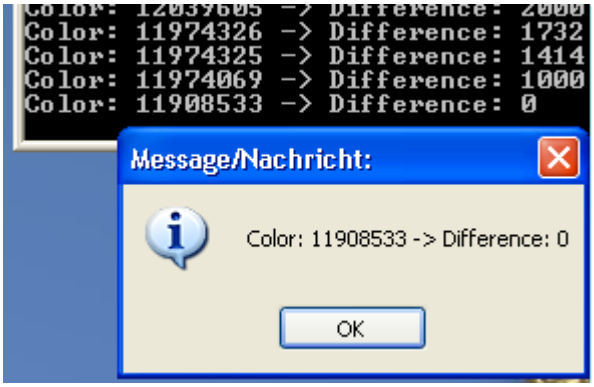
Example

```
'****************************
' Example 1
'****************************
' Brute Force Algo to guess undefined Systemcolor "S25"
' Needs quite a while to run, even as EXE.
'
$$COA=S25
$$COM=&HFFFFFF
FOR.$$COB|&HFFFFFF|0|-1
  CCD.$$COA|$$COB|$$COD
  IVV.$$COM>$$COD
    $$COM=$$COD
    $$COS=$$COB
    PRT.Color: $$COS -> Difference: $$COM
  EIF.
  JIZ.$$COD|out
NEX.
:out
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX.Color: $$COS -> Difference: $$COM
ENR.

Here is the output of the program on WinXP:
```



Remarks

When specifying Colors as hexadecimal values, prefer using this format:
`&H0FFFFFF.`
`   RRGGBB`
If you omit the "`&H0`" or just use the "`&H`" this may lead to strange results when the values is converted to decimal. The reason for this is::
`&HFFFF is -1 (conversion to signed number using "&H")`
while
`&H0FFFF is 65535 (conversion to unsigned number using "&H0")`
as expected.

Limitations:

-

2.38.5 3.5 Hexadezimal, Decimal and Binary and more

Hexadecimal and other numeric formats Previous 349 Top 41 Next 356

MiniRobotLanguage (MRL)

Hexadecimal & numeric formats

Intention

In normal life, we most often use only "decimal" numbers. In some situation it is easier to specify a number in "Hexadecimal" notation.For example when specifying a color-value.

Also as you may know, computers only work with binary data. BInary means it has only the two values 0 and 1 - it is **base 2**. Hexadecimal has all numbers you can see below, it is **base 16**.

It is easier to convert Binary to Hex and vice-verse compared to standard numbers (base 10). By grouping Binary numbers by 4, you can actually convert it directly to Hex, and vice versa. Here are all HEX-numbers and their binary conversion.

```
0 = 0000
1 = 0001
2 = 0010
3 = 0011
4 = 0100
5 = 0101
6 = 0110
7 = 0111
8 = 1000
9 = 1001
A = 1010
B = 1011
C = 1100
D = 1101
E = 1110
F = 1111

For example:
In short B0D3 (using the above table) converts to binary as
1011 0000 1101 0011

So if you write something like 1101001010010011, and group it
by four 1101 0010 1001 0011. Then use the table and you get
"D293".

The robot will understand Hexadezimal numbers if they are
prefixed with either "&H0" (unsigned numbers). Or "&H" (signed
numbers).

With base 10, you will need to compute it manually (for A0D3
see below)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
A = 10 * 16^3 (or 10 * 16 * 16 * 16) = 40960
0 = 0 * 16^2 (or 0 * 16 * 16) = 0
D = 13 * 16^1 (or 13 * 16) = 208
3 = 3 * 16^0 (or 3 * 1) = 3
```

then just add the results and get the decimal number, in this case `41171`.

You can use the `CCV`.-command to directly get the values of any System-Color.
Here is an example:

```
' Show value od System color S2
CCV.H|S2|$$HEX
DBP.$$HEX
ENR.

The CCV.-Command can also convert numbers into Hexadecimal
Color values:

' Show value od System color S2
$$NUM=12345368
CCV.H|$$NUM|$$HEX
DBP.$$HEX
ENR.
```

Details

You can use these numeric formats at many places in your scripts:

1. Decimal
You can just write a number, if the number has a fractional part, use the "." for example:

```
CAL.$$RES=4.5*9
```

Decimal numbers can be prefixed with a "-" sign to make them have a negative value.

2. Octal
You can use Octal numbers, if you prefix the number with "`&O`". Octal numbers will be converted to signed decimal values. For example:

```
CAL.$$RES=&10*9
' Result is 72 (dec)
```

Octal numbers are signed numbers and may not contain an fractional part.

3. Hexa-Decimal
You can use signed or unsigned Hexadecimal numbers. They may not have an fractional part. Be sure to choose the right Prefix! If you specify

```
&H(number) -> signed number conversion
&H0(number) -> unsigned number conversion
```

For example:

© 2023 Theo Gottwald * https://www.smart-package.com

```
CAL.$$RES=&HFFFF*9
DBP.$$RES
ENR.
' Result is -9

CAL.$$RES=&H0FFFF*9
DBP.$$RES
ENR.
' Result is 589815
```

To convert a decimal number to a Hexadecimal number, use
VTH. - Variable to Hexadecimal 2356

4. Binary
You can specify binary values as well. Prefix them with "&B". No fractional part can be used.
For example:

```
VAN.$NUM=&B01010011
DBP.$$NUM
' Result is 83

CAL.$$RES=&B10*9
DBP.$$RES
' Result is 18
```

To convert a decimal number to a BInary number, use
VTB. - Variable to Binary 2354

Numeric parameters and formulas

Wherever you have numeric (decimal-) parameters, you can also use a formula.
For example:

The command PAU. want a numeric parameter first. We could write:

```
' The script will Pause for 5 seconds
PAU.5
```

We can also use a variable here:

```
' The script will Pause for 5 seconds
: §§TIM=5
PAU.§§TIM
```

Now we can also use a formula here. The trick is, that we must put the formula into brackets (...).

```
' The script will Pause for 5 seconds
: §§TIM=1
PAU.(§§TIM*5)
```

© 2023 Theo Gottwald * https://www.smart-package.com

You can use formulas at most places where numeric parameters are valid. The formula can use all expressions that are valid for the CAL.-command also.

Remarks

Prefer using decimal numbers in formulas to prevent confusion. If you place the numbers inside variables, using the `VAN.` Command they are converted immediately to decimal numbers, which is the best way to go.
If you use the `VAR.` command instead, the numbers will be stored as text inside the variable.

Limitations:

-

2.38.6 3.6 Using Quadrant-Coordinates

MiniRobotLanguage (MRL)

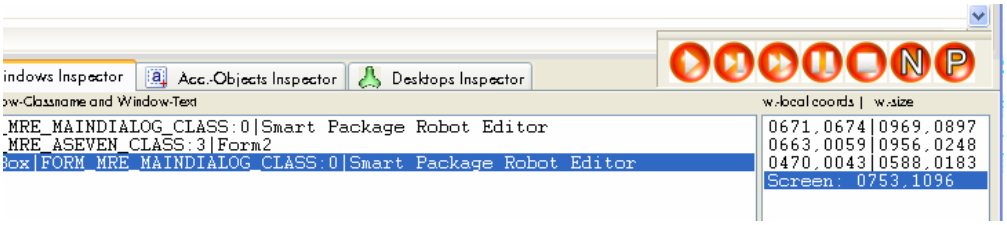
Quadrant-Coordinates

Intention

Normal Line or Rectangle (Rect-) Coordinates look like this:

```
x1,x2,y1,y2
```

Using these, you specify a (often) resolution dependent position on the screen.
Therefore they are generally screen-coordinates.



You can find out the screen coordinates where the mouse is, using the "windows Inspector". In this case it shows the values: `753,1096`
Example using Screen-Coordinates.

```
ILC.753,1096,900,1500|!&HFFFFFF|0|3
```

You can also specify Rect-Coordinates relative to the upper, left corner of the last window that you had located. These coordinates are called "Window coordinates".

You see them on the right side of each child-window in the "windows Inspector".
Example using "window coordinates":

```
ILC.w1,1,10,10|!&HFFFFFF|0|3
```

As an easier variant, you can use "Quadrants".

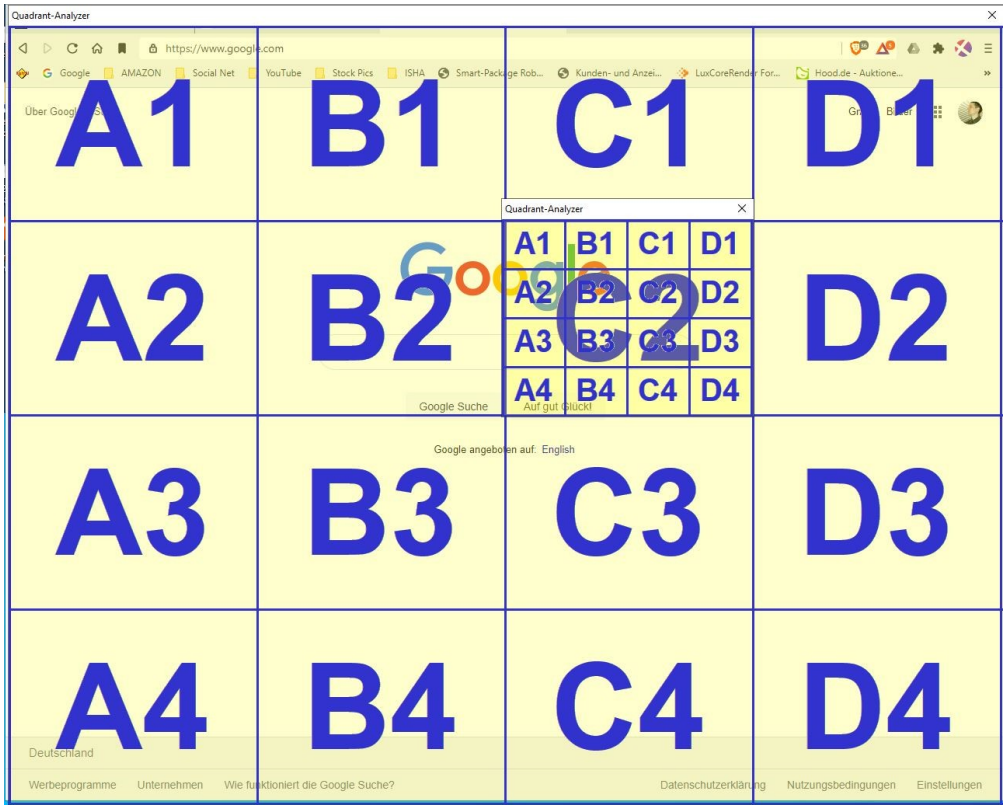
In short: **Quadrant-Coordinates are screen- and window-size independent.**
That is the advantage of using them. They are somehow similar numbered like the coordinates in a Spreadsheet.
Means that you may know the system already from your favorite Spreadsheet program.
It's the same system.

Using Quadrant- Coordinates, you specify the so called "Quadrant" that is

"`A1`" to "`D4`"

*© 2023 Theo Gottwald * https://www.smart-package.com*

Here is a Window showing its 16 Quadrants:



Notice that the Quadrant for Top-Windows may or may not contains the so called "non-Client Area", that is the Title-Bar and the complete windows-border.

In case you will wait for a change in this window, in Quadrant `{D4}` you would write:

```
STW.ct|#32770|Basic-NAV Matrix 01
RRA.{D4}
WRA.
DBP.Change happened!
ENR.
```

Be aware that even the window becoming "Active" or losing the Input-Focus will change the color of the window border and thus influence/change all outer Quadrants that are:
`A1-A4,C1,C4, D1-D4.`
Only `B2,B3,C2` and `C3` will not be changed if the window gets/loses Input Focus.

That is why you would normally locate a child-window or avoid using a Quadrant over the full window. More Details on this topic, see here:

1.8.1 The "Client" and the "Non-Client" Parts of a window 156

Here is an example:

```
  STW.ct|Chrome_WidgetWin_1|- Brave
  SWP.805,531|1076,1033|T

  IRC.t{B2}{A4,D4}@|&H0|45%|3
    DMP.6
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
    $$XPO=$tos$
    $$YPO=$tos$
    MMV.s|$$XPO,$$YPO

  EIF.
  MBX.!

  QFR.|{D1}{D1}|$$REC
  GRM.$$REC|$$MID
  MMV.$$MID

  MBX.!
  ENR.
```

As you can see the Quadrant is been calculated from the last located object, in this case from another Quadrant.

Quadrant coordinates are transformed to screen coordinates before they are used. Therefore moving a window that is inspected by `WRC.`, `WRA.` or such an command will make it be "changed".

Details

The regular Pixel-commands like `RRA./WLC./WRC./WRA.` etc. interpret Quadrants different from the "Analyze"-Command, that will be available in future versions.

If you give the `RRA.`-command this Parameter:

```
RRA.{A1,B2}
```

this will internally be calculated to a larger rectangle (-union) that will include all given rectangles in one large rectangle. In this case it will be an rectangle that includes `A1,A2,B1` and `B2`.
This is done, as these commands can only work with a single rectangle at one time, but not with multiple rectangles.

This treatment of Quadrants is different from using the (future) Analyze Command.
In the Analyze command you do include the Quadrants into "()" brackets, not into "{}" brackets, which is the first difference.

More important, When using the `ANA.`.-command, you can specify which types of controls should be included in the Quadrants-Mask for other commands.

When using a "Quadrant", all Controls or Buttons etc. can be:

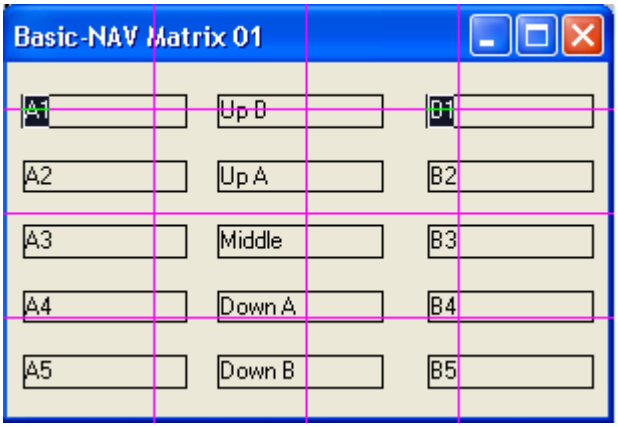
- completely inside a Quadrant (`f - full`)
- mostly inside a quadrant (middle-point is inside) (`m - middle point inside`)
- partly inside a Quadrant means that the control is inside but with less then half of the area. (`p - partly inside`)

Therefore acting on all Controls in a Quadrant, you will need to specify which controls to include or exclude. For example:

© 2023 Theo Gottwald * https://www.smart-package.com

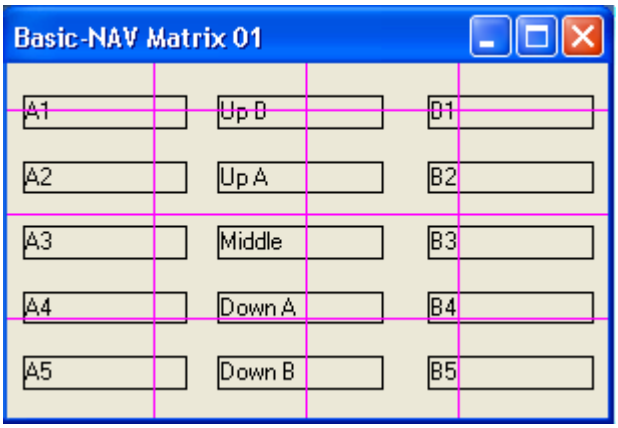
```
STW.ct|#32770|Basic-NAV Matrix 01
ANA.PD:8,TL:40,FL:48,MS:(A1,A3,p)
ENR.
```

Will act on all controls which touch the A1 or the A3 Quadrant:



```
STW.ct|#32770|Basic-NAV Matrix 01
ANA.PD:8,TL:40,FL:48,MS:(A1,A3,f)
ENR.
```

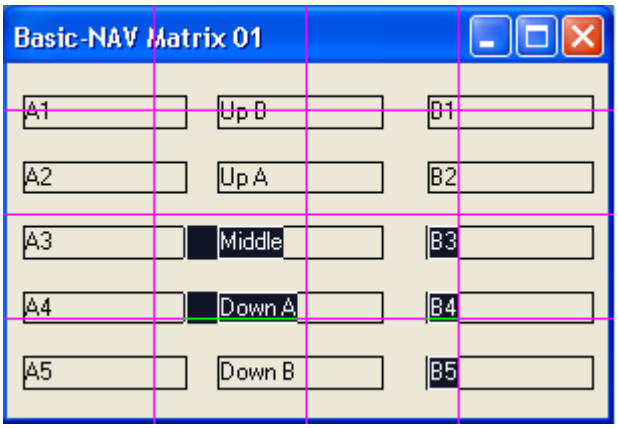
Will act only on all controls which are completely inside the A1 or the A3 Quadrant:
As there are no such controls, the result is this:



Here is a more complicated Example:

```
STW.ct|#32770|Basic-NAV Matrix 01
ANA.PD:8,TL:40,FL:48,MS:(C2,C3,D3,m)
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com



It will mark all controls that are more then half inside the given Quadrants.

2.39 4. Special features

2.39.1 4.1 : - Definiton-Command

MiniRobotLanguage (MRL)

Define Variable, MACRO or Label

Purpose:
This command can be used to define a **Variable**, **Macro** or a **Label**.

Define a variable

A **variable** is a placeholder for a numeric or string value.
A variable is replaced at runtime with the value behind.

Variables can be used to make your program more readable.
Also variables can save you a lot of typing work.
There are different ways to define a variable. Each of these have their own advantages and disadvantages.

If a variable name is used and there is no such variable defined, nothing will happen. It will be processed like normal text. The definition command makes a complete numeric and string resolution of the given values.

Using the definition command you can define and clear variables.

Example:

```
'This will clear the variable (set variable value to "empty"):
: $$ABC=

' This will assign a Value with complete Specialfolder 345-Processing
: $$ABC=Hallo
```

' This will assign the content of the Variable including the Variable-Type
' at this time there will be no Processing for Specialfolders etc. its just a COPY.

```
: $$ABC=$$CDE
```

Define a Label or Macro

A label is a jump-mark in the code. Program execution can jump to this mark, using the JMP or GSB, and other commands.

© 2023 Theo Gottwald * https://www.smart-package.com

A Macro is a user-defined command. It may contain several lines of code and parameters.
For Details on the MACRO option see the : - MACRO-Definitions 253.
For Details on variable-types see the VAR. 3562 - Command.

How does the robot know what you want?

The definiton of a Variable or a MACRO starts with a ": " (colon-blank).
A Label-Definiton may not contain a Blank! A label is defined like this:

```
:Here
```

Note that there can't be a blank after the colon - or it would be taken as the start of a Macro-Definition.

```
' This is a Label
:Label

' This is a MACRO:
: %Press 0
 MLE.
END%
```

' This will define a script-local **Variable**.

```
: $$BBB=99
```

' This will define a global **Variable**.

```
: $$BBB=99
```

For Information on Variables please see VAR. - Variable Set Value/Clear 3562.
For Information on Macros please look at : - MACRO-Definitions 253.

Syntax:

```
: [Variable]=[P1]
: [Macroname]
:LABEL
```

Example:

```
'This will clear the variable (set variable value to "empty"):
 : $$ABC=

' This will assign a Value without Specialfolder-Processing to
    a global variable
 : $$ABC=Hallo

' This will assign a Value with Specialfolder-Processing to a
    local variable
 : $$ABC=?path\hallo
```

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation:

-

Remarks:

Its important to understand that the VAR. 3562-**Command will resolve Special-Folders** and Special Variables, while the **":" Definition-Command** will do that and also try a numeric resolution if there is a formula on the value-side.

Limitations:

-

See also:

- : - MACRO-Definitions 253
- JMP. - Jump to Label 2189
- JSR. - Jump SubRoutine (Label) 2218
- VAR. - Variable Set Value/Clear 3562

© 2023 Theo Gottwald * https://www.smart-package.com

2.39.2 4.2 :on_Error - Label

MiniRobotLanguage (MRL)

:on_Error Label

on Error goto

Intention

`:on_Error` is a special Label. Its not a Label like any other!

If **`:on_Error`** is there, the script will jump there after an error and continue script execution there.

`:on_Error` does NOT prevent error messages, For this you have to use the USM.-command.

If `:on_Error` is really called, will also depend on the settings of an `USM.` -command.

Assume an error occurs and there is such a Label in a script. Then the robot will continue script execution in that line that is below that label.

The ":`on_Error`" Label does not prevent the Error-Message to be displayed, use the `USM.10` command for that.

See more details and examples on error-handling here: 1.B Error handling 224.

Syntax

```
:on_Error
```

Parameter Explanation

-

Example

```
'*********************************************
' USM. - Samples
'*********************************************

'Switch on silent Mode
USM.10
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Switch on Silent Mode with Error-Log file
USM.10|?pfad\MyLog.txt

' Clear ":on_Error" Retry Flag
USM.64

' Switch off Silent Mode
USM.0

END.

:on_Error
MBX. There was an Error
END.
'*********************************************
```

Remarks

Limitations:

-

2.39.3 4.3 Variables, global and local

MiniRobotLanguage (MRL)

Variables, GLOBAL and LOCAL

Intention

Variables are Symbols which contain numerical or string-data. When used in a script, the variable name is replaced with the variable content at runtime. The variable content can be defined, changed and cleared at runtime.

Global Variables are valid everywhere in a Script. Local Variables are used inside "Sub-Scripts" which are called with the JNF.-Command. Local variables contain their value until the script is left to the calling script. Then their content is lost.

If a script calls another script using JNF., the content of its local variables is preserved and automatically restored on return from the subscript.

Local variables are cleared when the Script returns to the Main-Script, using RTS. Local Variables and JNF. can be nested to unlimited depth.The Format for Variables is always:

§§xxx for script-local variables

$$xxx for global variables

Global variables keep their value anywhere in a script or subscript. Variables have a fixed length. Therefore we do not need any concatenation characters like in other scripting systems.

For xxx all letters or numbers as well as the "-" can be used.

There are few Variables which are reserved for Special Purposes which shall not be used for regular operations.

There are different Methods to assign values to variables.

- The : - Definiton-Command 361
- The VAR. - Variable Set Value/Clear 3562
- VAB. - Variable Binary 3544
- VAC. - Variable reCt 3546
- VAN. - Variable Numeric 3553
- VAO. - Variable Once 3556
- VAP: - Variable Point 3560
- VAS. - Variable with String 3564

*© 2023 Theo Gottwald * https://www.smart-package.com*

Only when using the VAR.- type Commands, Speical-Folders and System-Variables will be resolved! The Definition command does not resolve special folders.

Also Commands do return results directly into variables.

Syntax

$$xxx global Variable
§§xxx local Variable

Parameter Explanation

If the Parameter is omitted, the Variable is set to empty, which represents string with a of length 0, or a value of 0.

Example

```
' define global variable without Special-folders
: $$TXT=Hallo World

' define global variable with Special-folders and System-variable Resolution
VAR.$$FIL=?progs\FS Office\Myprog.exe
PRT.$$FIL
' Display a list with all global Variables
DMP.4

' define local variable with Special-folders and System-variable Resolution
VAR.§§FIL=?progs\FS Office\Myprog.exe
PRT.§§FIL
' Following clears variable §§NUM
: §§NUM=
' Display a list with all local Variables
DMP.5
```

Remarks

Global Variables are valid everywhere in a Script. Local Variables are used inside "Sub-Scripts" which are called with the JNF.-Command.
Such variables are cleared when the Script returns to the Main-Script, using RTS.
Local Variables and JNF. can be nested to unlimited depth.

Limitations:

How long can variables get? What is the maximum size? 100 MB ? 250, 500 MB ?

© 2023 Theo Gottwald * https://www.smart-package.com

It depends on the amount of unfragmented Memory that the robot can get from the OS.
Under normal circumstances variables can always exceed a size of 50 or 100 MB (MegaBytes) without problems. Once you clear the variable with
`VAR.$$XXX=`
the memory is safely returned to the OS. Of course this happens automatically when the script ends.

2.39.4 4.4 The global and local Stack

MiniRobotLanguage (MRL)

The Stack - global and Local

Intention

Why can you do with a stack?

The stack is a space where you can store hundreds of items. These items can be strings (text) or numeric items. Note that

Commands use it, too
Many commands leave their results on the stack. The stack organization can be customized to user needs.

Customize your stacks
First you can change the number of elements the stack can hold. Use the STV. - command for this.

Any stack can be organized as a **stack** (LIFO - Last-In-First-Out) or as a **que** (First-In-First-Out). The default Stack setting is LIFO. Use the STS. - command to switch the stack between LIFO and FIFO. Note that if a stack gets to many elements, some overflowing elements are automatically deleted. These overflowing elements are generally the oldest elements. In a LIFO stack the oldest element is the first element added, while in FIFO (Que), the last added elements added ist the "oldest".

Another setting is, if t he stack element is remove if you touch it. Normally a stack element it deleted immediately when you touch it. This way you get all stack elements one-by-one, just by using `$tos$` which is always the TOS (Top of Stack) in the actual selected stack. If you want to get the TOS without having it removed, use `$dtos$`.

What if i jump into a subprogram that also uses the stack?
You can anytime take the whole stack-content and put it into a variable, using the STV.-command. When you return from your subprogram, you can "restore" the complete stack from that variable using the STV.-command.

Use the script local stack
If you use Subscripts (scripts in separate files) you can take advantage of another feature.
Local and Global stacks. In fact, we have two stacks, a script-local stack and a global stack. The global stack is valid through the whole script execution. The local stack holds the same rules like the script local variables.

If a script calls another Subscript in another file, using the `JNF. command`. At this time the content of its local stack is preserved and automatically restored on return from the subscript. Thats the use of a local stack. To hold your script local data.

*© 2023 Theo Gottwald * https://www.smart-package.com*

However, the Local stack is cleared when the Script returns upwards to a Main-Script, from which it was called, using `JNF./RTS`. Its the same sytem like when using script local variables.

How do I select the actual stack/que?
To select which stack you want to work with, use the `STS.GLOB` or `STS.LOCA` command.
These will make the selected stack to the actual stack.

If you want to know which stack is currently the actual stack, use the **`#stack#`** systemvariable. It will return a number that shows you if the Local or the Global stack is currently selected as the actual stack.
#stack# -> 1 GLOBAL Stack is selected
#stack# -> 2 LOCAL Stack is selected

There are shortcuts to accessing the stack values inside your script.

§§000 to §§999
for directly accessing the local stack

$$000 to $$999
for directly accessing the global stack

§§000 - Top of Stack (TOS) local stack
$$000 - Top of Stack (TOS) global stack

The global stack keeps his content anywhere in a script or subscript.

There are different Methods to access the stack. First you can use the Stack-variables above to directly access the first 999 stack elements. Secondly you can use multiple stack-commands.

- PUS. - Push Parameter onto Stack/Que 3013
- PUV. PUsh variables on the User-Stack 3019
- POP. - POP Variable from Stack 3007
- POV. - POp Variables from User-Stack 3010
- STJ. - STack Job 3030
- STS. - Set STack Settings 3038
- STV. - Stack To/from Variable 3040

Most Commands may return results directly into stack-variables if you give these for the result.

Example

```
' Choose LOCAL Stack as Actual Stack
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
STS.LOCA
' Organize Stack as First-in-First-Out
STS.FIFO

' Put 10 Items on actual Stack
FOR.$$A01|1|10
  VAR.$$B00=Stackplace $$A01
  PUV.$$B00
NEX.

' Show all Items on Local Stack
DMP.5
MBX.Ready
ENR.
```

Remarks

The $$000 and §§000 refer to the TOS (Top of stack). See several example scripts in the examples folder.

Limitations:

Per default the maximum stack size limit is set to 25 Elements. This can be changed using the STS.SIZE command.
How long can stack-entry get? Can you strore a file in it?
What is the maximum size? 100 MB ? 250, 500 MB ?
It depends on the amount of unfragmented Memory that the robot can get from the OS.
Under normal circumstances any stack entry can always exceed a size of 50 or 100 MB (Megabyte) without problems. Once you clear the stack entry, in any way, the memory is safely returned to the OS. Of course this happens automatically when the script ends.

2.39.5 API-Error-Codes

MiniRobotLanguage (MRL)

API_ERROR_CODES

Error Codes

Intention

Normally you should not get this codes unless explicitly stated in this helpfile.

DOS-Error Code (1 - 26):

```
1 - Incorrect function call.
2 - The system cannot find the file specified.
3 - The system cannot find the path specified.
4 - The system cannot open the file. (too many open files)
5 - Access to that file was denied.
6 - The handle is invalid.
7 - The storage control blocks were destroyed.
8 - Not enough storage is available to process this command.
9 - The storage control block address is invalid.
10 - The environment is incorrect.
11 - The .EXE file is invalid (non-Win32 .EXE).
12 - The access code is invalid.
13 - The data is invalid.
14 - Not enough storage is available to complete this operation.
15 - The system cannot find the drive specified.
16 - The directory cannot be removed (current dir).
17 - The system cannot move the file to a different disk drive.
18 - There are no more files.
19 - The media is write protected.
20 - The system cannot find the device specified.
21 - The device is not ready.
22 - The device does not recognize the command.
23 - Data error (cyclic redundancy check).
24 - The program issued a command but the command length is
incorrect.
25 - The drive cannot locate a specific area or track on the disk.
26 - The specified disk or diskette cannot be accessed.
```

Error Codes

2.39.6 Regular Expressions

MiniRobotLanguage (MRL)

Regular_Expression

Regular Expressions in detail

Intention

Regular Expressions can be used with the GRE. and the GRR. Command.

Syntax

Details of "regular expressions" for the GRE. and the GRR. command

Parameter Explanation

. (period)
Matches any character, except the end-of-line.

^ (caret)
Matches the actual beginning-of-line position or the preceding line-delimiter character pair (ACII(13,10)), as taken from the start& character position. The line-delimiter characters themselves are not replaced. Also see [^] below for usage within a character class definition.

$ (dollar)
Matches the end-of-line position, which may be the either the first line-delimiter character pair (ACII(13,10)) that is encountered in the search to the right of the start position, or the actual end of the Mainstring, whichever occurs first. The line-delimiter characters themselves are not replaced.
| (stile)
Specifies alternation (the OR operator), so that an expression on either side can match. Precedence is from left-to-right, as encountered in the expression.

? (question mark)

*© 2023 Theo Gottwald * https://www.smart-package.com*

Specifies that zero or one match of the preceding sub-pattern is allowed. Cannot be used with a Tag.

+ (plus)
Specifies that one or more matches of the preceding sub-pattern are allowed. Cannot be used with a Tag.

*** (asterisk)**
Specifies that zero or more matches of the preceding sub-pattern are allowed. Cannot be used with a Tag.

Character classes

[ ] (square brackets)
Identifies a user-defined class of characters, any of which will match: [abc] will match a, b, or c. Only three special metacharacters are recognized within a class definition, the caret (^) for complemented characters, the hyphen (-) for a range of characters, or one of the following \ backslash escape sequences:
\\ \- \] \e \f \n \q \r \t \v \x##

Any other use of a backslash within a class definition yields an undefined operation that should be avoided.

[-] (hyphen)
The hyphen identifies a range of characters to match. For example, [a-f] will match a, b, c, d, e, or f.
Characters in an individual range must occur in the natural order as they appear in the character set. For example, [f-a] will match nothing.
Lists of characters, and one or more ranges of characters, may be intermixed in a single class definition. The start and end of a range may be specified by a literal character, or one of the \ backslash escape sequences:

\\ \- \] \e \f \n \q \r \t \v \x##
Any other use of a backslash within a class definition yields an undefined operation.
Multiple ranges in a class are valid. For example, [a-d2-5] matches a, b, c, d, 2, 3, 4, or 5.

When the hyphen is escaped, it is treated as a literal.
For example, [a\-c] is a list, not a range, and matches a, -, or c due to the \ backslash escape sequence.

[^] (caret)
When the caret appears as the first item in a class definition, it identifies a complemented class of characters, which will not match. For example, [^abc] matches any character except a, b, or c.
A range can also be specified for the complemented class.
For example, [^a-z] matches any character except a through z.

© 2023 Theo Gottwald * https://www.smart-package.com

A caret located in any position other than the first is treated as a literal character.

Tags/sub-patterns

( )(parentheses)
Parentheses are used to match a Tag, or sub-pattern, within the full search pattern, and remember the match. The matched sub-pattern can be retrieved later in the mask, or in a replace operation, with \01 through \99, based upon the left-to-right position of the opening parentheses.
Parentheses may also be used to force precedence of evaluation with the alternation operator. For example, "(Begin)|(End) File" would match either "BeginFile" or "EndFile", but without the Tag designations, "Begin|EndFile" would only match either "BeginndFile" or "BegiEndFile".

Note: Parentheses may not be used with ? + * as any match repetition could cause the tag value to be ambiguous. To match repeated expressions, use parentheses followed by \01*.

Escaped characters

\ (backslash).
The escape operator (single-character quote). The following character will be treated as a literal value rather than being interpreted as a special character. Note that the character following the backslash must actually be a special character, as follows:
\b
A word boundary. The start or end of a word, where a word is defined as one or more characters that include an alphabetic character (A-Z or a-z), a numeric character (0-9), and an underscore. For example, "abc_123" is considered a single word and "abc-123" is considered two words.

\c Case-sensitive search.
Without the \c operator, the default is to ignore case when matching. Unlike some other implementations of regular expressions, case-insensitivity is recognized in all operations, even a range of characters such as "[6-Z]". The
\c operator may appear at any position in the mask.
\e Escape character: ACII(27).
\f Formfeed character: ACII(12).
\n Linefeed (or newline) character: ACII(10).
\q Double-quote mark ("): ACII(34).
\q is included for ease of inclusion within a literal string. For example: "\qHello\q".
\r Carriage-return character: ACII(13).
\s Shortest match character:
The \s flag causes the shortest matching string to be returned, rather than the longest (the default). For example, when searching for the mask "abc.*abc" in "abcdabcabc", the default setting would return position 1 and length 10. With the \s switch set, it returns position 1 and length 7. This option may cause a slight increase in processing time. The \S flag must appear at the beginning of the mask string.

© 2023 Theo Gottwald * https://www.smart-package.com

\t Horizontal tab character: ACII(9).

\v Vertical tab character: ACII(11).

\x## Hex character code: Indicates that an ASCII code follows, given by two hexadecimal digits. For example, \xFF = ACII(255) (which is equivalent to ACII(255)). XX must be in the range 0 through 255.

\## Tag number: Evaluated as the characters matched by tag number ## (where ## is in the range 01 through 99, in decimal). Tags are implicitly numbered from 01 through 99, based upon the left-to-right position of the left parenthesis. "(…)w\01" would match "abcwabc" or "456w456". Tags cannot be forward-referenced - that is, if a reference is made to any Tag that is not yet defined, a non-match is presumed.

Example

```
DBM.2
PRT.Running!
PRT.#dtime#
: $$NUM=2
: $$MAN=please send an email to info@it-berater.org
: $$MAC=please send an email to info@it-berater.org
: $$MSK=([a-z0-9._/+-]+)(@[a-z0-9.-]+)
: $$REP=[E-Mail]
GRE.$$NUM,$$MAN,$$MSK
PRT.#dsince#
STS.DUMP
GRR.$$NUM,$$MAC,$$MSK,$$REP
PRT.$$MAC
STS.DUMP
PRT.$$000-$$001-$$002
STS.DUMP
STS.DUMP
DMP.
END.
```

Remarks

Limitations:

To maximize performance, avoid overuse of the *, + and ? metacharacters.

3. Script Language

3 3. Script Language

3.40 ! Smarty's Script language

MiniRobotLanguage (MRL)

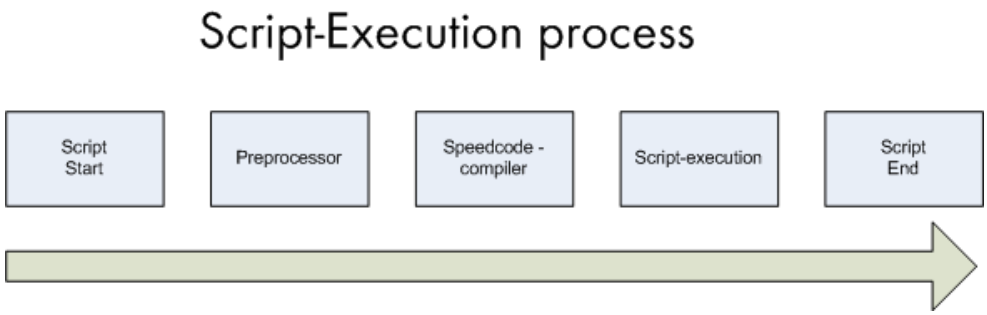
Smarty's Script language

The Script language is executed in stage 4 of the "Script-Execution process" (see picture below).

The Script language tells Smarty what to do. It will tell her to move the mouse around, to click on buttons. It will make her do key-presses for you and many more other things.

The Script language is the most important part for you to know.

If you know how to use the Script language, you will be able to get Smarty wake up and running!



Actually you can use 3 Sorts of Scripts:

1. SPR-Script
2. VBS. / JS - Script (See VBS. / VBE.)
3. Powershell-Script (See PWS. / PWE.)

Besides using the Commands, that are already defined for you, you can define own, new commands as ! User-Macros 399.

Sample-Script:

```
'#####################################################################
' Sicherheitspatch 4012212 installieren auf W7

3.41 ! User-Macros

3.41.1 ! User-Macros

MiniRobotLanguage (MRL)

Defining your own Commands: MACROS

Smarty's Script language can be extended using own Macros.

Besides using the Commands, that are already defined for you, you can define own, new commands.
You'll find this file also in the file "`Point_Convert-Lib.mrt`" in the User-Library Folder.

To use this Library in your Script you can copy the file into your Project folder and add the following Line at the end of your Script-Code (example):

```
#INC:Point_Convert-Lib.mrt
```

To make Using Macros more easy, use
2.1.A #LIB: - User-Library Path 298

and

1.1 #INC: - Pre-Processor File-Include 248

In this Chapter you will find examples of useful User-Macros that you can use to enhance your Scripts.

```
' Macro-Example:
' These Macros will implement a Time-FOR-Loop using Macros
' Please note the use of 'EIF- and 'EIF+ in the Macro for the Editor Formatting.
' This Loop will Loop from 08:09:59.000 to 08:10:01.000

$$TIA=08:09:59.000
$$TIB=08:10:01.000
'$$LOP=$$TIA
$$INC=00:00:00.010

%FOT $$TIA|$$TIB|$$INC
PRT.Looping: $$LOP
%NXT
```

3.41.2 Firefox

Sample Code

Firefox-Library

These Subprogrammes are just Samples that i use to Click inside Firefox*-Browser
.
*For Details and Download see here: Firefox-Browser.

To use these Macros in your Script you may need to change some german Texts to fit to your your favourite language and Browser Version.

```
'++++++
```

```
' This will locate FF and run it
' If the window is too large (1840,1644) change size in Library
VAR.$$PAX="$$LNK" $$PAR

3.41.3 Graphical Subprograms

Sample Code

Graphics-Library

These Macro-Commands can be used to do Pixel-Processing.

This Command will Scan a Line in an Image-Register until a specified Color is found.
The specification is the Color as RGB and the Minimum and/or Maximum Color-Difference.
The Command will return wether -1 (="no such color found") or the X-Position of the found color.

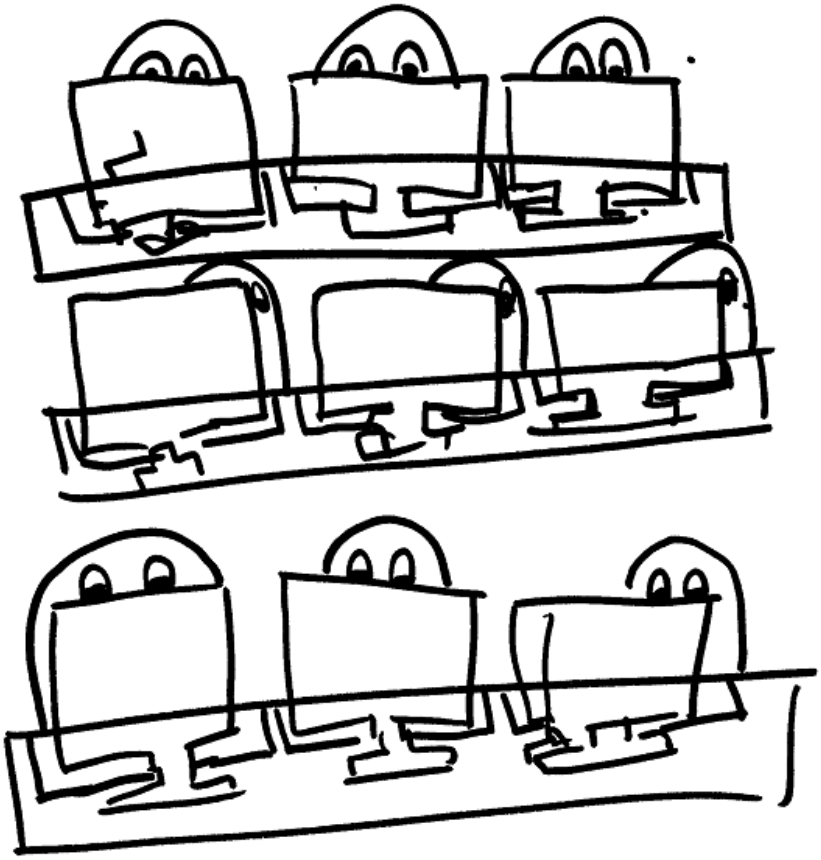
3.42 Background Operation

3.42.1 ! Smarty's Background Operations

MiniRobotLanguage (MRL)

Smarty's Parallel Robot Operations



Intention

What are Parallel-Robot Operations and Background Processing good for?

Take a look at the picture above. As you can see, many "Smarty's" work at the same time.
Having several "Smarty's" work at the same time can save you processing time.

Especially if you have a Multi-Core-CPU, then each of the Tasks uses his own CPU-Core and therefore makes perfect use of your hardware.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Using the Parallel-Robot feature, you can run a lot of things in the background. Some examples are:

- start large applications in the background
- check and handle complicated pop-up-windows in the background (prefer `DBC.`)
- split large scripts in smaller portions that run parallel
- use all cores of your computer (Multi-Core/CPU usage)
- have things done in shorter time

Is there a difference between a Parallel-Robot and a Background Operation?

Yes, there is a technical difference. A Parallel Robot will run as a new process with an own PID. It will be visible in the Windows Task Manager as a separate process.
A Background Operation starts as a so called "thread" and therefore has the same `PID`.
Background Operations are more efficient in terms of resources.
There is no problem to have 100, 200 or 400 and maybe more Background Operations running at the same time.
Parallel running robots need more system resources therefore you will not use so many under normal circumstances. The main difference is this:
A Background Operation is already defined and somehow "hard-wired". Therefore it will give you an Operation Result - or not.
A Parallel Robot is not hard-wired, it will do just what you want it to do. It will only give you an Operation Result, if you use the `PRS.`-command. We'll come back on this topic later.

How can i start a Parallel-Robot?

It's easy. Technically it is just a pair of `PRR.` and `PRE.` A short example could look like this:

```
PRR.
  ' Script that the parallel-robot will execute
  ' This is the necessary END for the Parallel robot
  END.
PRE.$$RET
' Here the Main-Robot continues with his script
' $$RET contains the window-handle of the Parallel-Robot
```

There are different sorts of Background-Jobs and Parallel Robots. For most of them, you can use the commands:

- `WRS.` - Wait until the Process has ended / is ready.
- `GRS.` - Get the Result of that Bavkground process, if there is any.
- `DRS.` - Drop the result of a Background-Operation.
- `IRS. / NRS.` - Check if an Result is waiting for you
- `JRS. / JNS.` - Jump if an Result is/not available
- `PRS.` - Set the Result of an Parallel-Robot Operation.

Can i receive an result from calculations inside parallel running Robots?

Yes - you can!

© 2023 Theo Gottwald * https://www.smart-package.com

Second answer: In case of an Parallel-Robot you have to sent it your self - of course. In case of other Background-Operations, (like `SMB.`) the command will sent the result of the operation by itself automatically.

You can receive a calculation Result from a Parallel-Robot, using the Ticket-Number and the commands `WRS. / GRS.` etc. See this example:

```
' We start the Parallel Robot
PRR.
  ' This is the Result the Parallel-Robot sends back to us.
  ' Note that we did not specify an ticket number in P1,
  ' because it will be sent to his "father-robot" in this
case.
  PRS.|Hallo!
  ENR.
PRE.
' This is the Stack after the Parobot was started
STS.DUMP
' We wait for the Parobot to end.
WRS.
' And get the calculation result
GRS.
' This is the Stack after the Parobot sent his result
STS.DUMP
MBX.!
ENR.
```

To see, how you get an Result from a Background-Operation, take a look at

SMB. - Send Mail Background 799

or

MPB. - Music Play Background

Can i receive an result from multiple parallel running Robots?

Yes, here is an example:

```
PRR.
  GUT.Please give Result for Robot 1
  PRS.|Result from Robot 1 is: $$000
  ENR.
PRE.
$$ROA=$$001
PRR.
  GUT.Please give Result for Robot 2
  PRS.|Result from Robot 2 is: $$000
  ENR.
PRE.
$$ROB=$$001
STS.DUMP
WRS.$$ROA,$$ROB
GRS.$$ROA
GRS.$$ROB
STS.DUMP
MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

You will need to put some text in the two input-boxes, when you run that example.

Important Note:

The parallel-robot will inherit all variables that the starting robot knows at the starting time.

In other words:
All variables and Stack-content will be available on the Parallel-Robot immediately. But from then each robot continues his work in his own address-space and with its own variables. Technically it looks like this:

```
$$MYA=1001
PRR.
  ' Script that the parallel-robot will execute
  ' This is the END for the Parallel robot
  MBX.$$MYA = 1001
  $$MYA=99
  END.
PRE.$$RET
' Here the Main-Robot continues with his script
' Result will be 1001
MBX.MYA
```

The Main Robot will not execute anything that is between the `PRR.` and the `PRE.`

And how do i know that the operation was finished and there is an Result available?

There are several ways to find that out. The easiest is to simply wait for the background Operation to finish, using the `WRS.`-command (Wait for Result). You can also use the `IRS. / NRS.` - Conditional statement.
And theoretically you could call `GRS.` and check the timeout-flag after that. If it was set, there was no such result available.

Important Note:
Any result behind an "ticket-number" is stored as long, until you drop it using `DRS.` You do not need to wait until the Operation is finished, to drop a result. If you do not need the result of an Operation, you can drop it immediately after you started the background-task. In this case, the robot will internally note that the result is been dropped and drop it immediately when it becomes available.

There is an exception:
Of course you only need to drop the Result of an Parallel-Robot (started with `PRR. / PRE.`) , if you use the `PRS,`-command to return a Result. If no Result is returned, it does not need to be dropped.

Use these commands together with any Background Operation or Parallel-Robot Operation:

- `GRS.` - Get Result of Operation
- `WRS.` - Wait until (one or more) Operation(s) is/are finished

© 2023 Theo Gottwald * https://www.smart-package.com

- DRS. - Drop Result of Operation if you do not need it.
- IRS. / NRS. Check if an Result is available
- JRS. / JNS. - Jump if an Result is/not available

Use this command:

- PRS. - Set the Result of an Parallel-Robot Operation.

only for Parallel Robots, to set the Operation Result..

Background Operation Example, using SMB.:

```
' Assume that a file "?path\MailConfig.dat"
' is available
SMP.
' It makes mostly sense with attachements
' SMP.attachment=?path\Send-Mail.zip
' Send the Mail, get the ticket number
SMB.
' If we do not specify a ticket number,
' WRS. will automatically remember the last ticket number
' and use it.
WRS.
' If we do not specify a ticket number,
' GRS. will automatically remember the last ticket number
' and use it.
GRS.
DBP.$$000
' If we do not specify a ticket number,
' DRS. will automatically remember the last ticket number
' and use it.
' DRS. free's the Memory location that was used to hold the
' Result of the background operation.
DRS.
ENR.
```

Limitations

The Parallel-Robot does NOT inherit the E-Mail Configuration for SMA./SMB. Remember that you can send E-Mails in the background using SMB. without explicit starting a Parallel Robots.

There are no limitations about Parallel-Robots starting other Parallel Robots, or Background-Tasks.

See also:

- PRR. - Parallel-Robot-Run 2642
- PRE. - Parallelrobot-Run-End 2638
- GRS. - Get Result 799

- SMB. Send Mail Background 799

© 2023 Theo Gottwald * https://www.smart-package.com

3.42.2 DRS. - Drop Result

MiniRobotLanguage (MRL)

DRS. - Drop Result

Drop Result from Background Operation

Intention

Using "Background Operations" means, that your Script execution can continue while the Robot is doing something in the background.

Some hardwired Background Operations store their Operation Results automatically when they are ready. If you do not need the Result, you should free that memory. This is, what the `DRS.` command is good for.

Any result behind an "ticket-number" is stored as long, until you drop it using `DRS.` You can apply the `DRS.` command immediately when you know the "Ticket Number" of the result.

You do not need to wait until the Operation is finished, to drop a result. If you do not need the result of an Operation, you can drop it immediately after you started the background-task. In this case, the robot will internally note that the result is been dropped and drop it immediately when it becomes available.

There is an exception:
Of course you only need to drop the Result of an Parallel-Robot (started with `PRR. / PRE.`) , if you use the `PRS,`-command to return a Result. If no Result is returned, it does not need to be dropped.

Use these commands together with Background Operations:

- `GRS.` - Get Result of Operation
- `WRS.` - Wait until (one or more) Operation(s) is/are finished
- `DRS.` - Drop Result of Operation if you do not need it.
- `IRS. / NRS.` Check if an Result is available
- `JRS. / JNS.` - Jump if an Result is/not available

to handle the result of the background mail-operation(s).

Example:

```
' Assume that a file "?path\MailConfig.dat"
' is available
SMP.
' It makes mostly sense with attachements

3.42.3 GRS. - Get Result

MiniRobotLanguage (MRL)

GRS. - Get Result

Get Result from Background Operation

Intention

Using "Background Operations" means, that your Script execution can continue while the Robot is doing something in the background.

How can I get the result of a background operation, if its running in the background?

The answer to this question is, that you get a "Ticket-Number", when you start the background operation. `SMB.` for example, will drop an "**ticket number**" on the TOS. Or, if **P2** is given, the ticket-number will be in the given variable.

Now you can get the result any time using the "**ticket number**" and the `GRS.`-command.
Just give `GRS.` the ticket-number, and in exchange you will get the result of the operation - when its already available.

And how do i know that the operation was finished and there is an Result available?

There are several ways to find that out. The easiest is to simply wait for the background Operation to finish, using the `WRS.`-command (Wait for Result). You can also use the `IRS. / NRS.` - Conditional statement.
And theoretically you could call `GRS.` and check the timeout-flag after that. If it was set, there was no such result available.

To wait for a background operation to be finished, the `WRS.`-command was made. It can also collect the Results of multiple background operations.

The system works like this:

1. Start a background operation and get a "ticket number"
2. keep the ticket number in a variable
3. do whatever you want ...
4. and call `WRS.` with that "ticket number" as parameter
5. `WRS.` will wait until the background Operation has finished
6. Call `GRS.` to get the result of the background operation

Important Note:
Any result behind an "ticket-number" is stored as long, until you drop it using `DRS.`
You do not need to wait until the Operation is finished, to drop a result. If you do not need the result of an Operation, you can drop it immediately after you started the

*© 2023 Theo Gottwald * https://www.smart-package.com*

background-task. In this case, the robot will internally note that the result is been dropped and drop it immediately when it becomes available.

There is an exception:
Of course you only need to drop the Result of an Parallel-Robot (started with `PRR. / PRE.`) , if you use the `PRS,`-command to return a Result. If no Result is returned, it does not need to be dropped.

Use these commands together with Background Operations:

- `GRS.` - Get Result of Operation
- `WRS.` - Wait until (one or more) Operation(s) is/are finished
- `DRS.` - Drop Result of Operation if you do not need it.
- `IRS. / NRS.` Check if an Result is available
- `JRS. / JNS.` - Jump if an Result is/not available

to handle the result of the background mail-operation(s).

Example:

```
' Assume that a file "?path\MailConfig.dat"
' is available
SMP.
' It makes mostly sense with attachements
' SMP.attachment=?path\Send-Mail.zip
' Send the Mail, get the ticket number
SMB.
' If we do not specify a ticket number,
' WRS. will automatically remember the last ticket number
' and use it.
WRS.
' If we do not specify a ticket number,
' GRS. will automatically remember the last ticket number
' and use it.
GRS.

3.42.4 IRS. / NRS. - If Result available

MiniRobotLanguage (MRL)

IRS. Conditional Statement

If Result available

Intention

Conditional Statement.

Test if a specified Parallel-Robot or Background Operation has released a Result. `IRS.` does not really check if the Operation is ongoing. It will just check if there is a Result from that "Ticket Number" available.

`IRS.` will accept only one "Ticket Number" to test for the result. If you want to wait for multiple running Background- or Parallel Robots to finish, use `WRS.`

`IRS.` will drop the Result of the Ticket on the Stack, if there is one. Therefore you do not need to call `GRS.`, just take the result from the Stack.

You should anyway call `DRS.` to Drop the Result, when you do not need it anymore.

`NRS.` is the negative Form of this statement.

Syntax

IRS.[P1] ... ELS. ... EIF.

Parameter Explanation

P1 - (optional) Is the "Ticket Number" of a running Parallel Robot or background Operation. It can be omitted then the last "Ticket Number" that was emitted is been taken.

`IRS.` can be nested to unlimited Depth, and they can also enclose Sub-Programm Calls or `FEX.` (Enumerations) to unlimited Depth.

Example

```
'**********************************
' IRS.-Sample
'**********************************
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```

3.42.5 WRS. - Wait for Result

MiniRobotLanguage (MRL)

WRS. - Wait for Result

Wait for Result from Background Operation

Intention

This command will wait until:
- a Background Operation / Parallel-Robot has ended
- there is an incoming Result from an Operation / Parallelrobot
  - using for example `PRS.`

When waiting for an "Result", the command will still react if the given process ends.

Using "Background Operations" means, that your Script execution goes on, while the Robot is doing something in the background.

To wait for a background operation to be finished, the `WRS.`-command was made.
It can also collect the Results of multiple background operations.

The system works like this:
1. Start a background operation and get a "ticket number"
2. keep the ticket number in a variable
3. do whatever you want ...
4. and call `WRS.` with that "ticket number" as parameter
5. `WRS.` will wait until the background Operation has finished
6. Call `GRS.` to get the result of the background operation

Hint: If you have just one background operation running, you do not need to specify an ticket number. The system always remembers the and uses the ticket number from the last background operation.

Example:

```
' Assume that a file "?path\MailConfig.dat"
' is available
SMP.
' It makes mostly sense with attachements
' SMP.attachment=?path\Send-Mail.zip
' Send the Mail, get the ticket number
SMB.
' If we do not specify a ticket number,
' WRS. will automatically remember the last ticket number
' and use it.
WRS.
' If we do not specify a ticket number,
' GRS. will automatically remember the last ticket number
' and use it.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
GRS.
DBP.$$000
' If we do not specify a ticket number,
' DRS. will automatically remember the last ticket number
' and use it.
' DRS. free's the Memory location that was used to hold the
' Result of the background operation.
DRS.
ENR.
```

How do i know that the operation was finished and there is an Result available?

As said, you can use `WRS.` And that is maybe the best version. Besides `WRS.` , there are several more ways to find that out.
The easiest is to simply wait for the background Operation to finish, using the `WRS.`-command (Wait for Result).
You can also use the `IRS. / NRS.` - Conditional statement.
And theoretically you could call `GRS.` and check the timeout-flag after that.
If the timeout-flag was set after a call to `GRS.` it was set, there was no result available.

How do i collect results from multiple parallel running robots/operations?

Here is an example:

```
PRR.
  GUT.Please give Result for Robot 1
  PRS.|Result from Robot 1 is: $$000
  ENR.
PRE.
$$ROA=$$001
PRR.
  GUT.Please give Result for Robot 2
  PRS.|Result from Robot 2 is: $$000
  ENR.
PRE.
$$ROB=$$001
STS.DUMP
WRS.$$ROA,$$ROB
GRS.$$ROA
GRS.$$ROB
STS.DUMP
MBX.!
ENR.
```

You will need to put some text in the two input-boxes, this text is the result from each of the two parallel robot operations.
As you can see, the `WRS.` will wait until both Results are available. And then present them to you.

Here is an Example that shows how you can wait for 5 Parallel Processes to end.
Click on the 5 Messageboxes and see what happens.

```
 VAO.$$TIB=
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
FOR.$$LOP|1|5
' Run 5 Robots
  PRR.0
    MBX.!
    END.
  PRE.$$TIC
  ' Collect the Tickets separated with ","
  $$TIB=$$TIB,$$TIC
NEX.
' Wait until they end
WRS.!$$TIB
ENR.
```

Syntax

WRS.[!][P1[,..Px]][|P2]

Parameter Explanation

! - **(optional)** if specified, the command will NOT react on an Result, but wait until the specified process has ended.

P1 – ***(optional)*** Variable that contains the "Ticket-Number" which leads to the Return code of the background job. If omitted, the last Background Operation will be taken.

P2 – ***(optional)*** Timeout-Value. If omitted no timeout is used.

Example

```
'**********************************
' SMB.-Sample

3.43 BIT. - Work with Bits

3.43.1 ! Smarty's BIT. - Operations

General comments on BIT. Commands Previous 2356 Top 41 Next 2361

MiniRobotLanguage (MRL)

BIT. Command

Get, Set Clear or Toggle Bits and make Logic Operations with Bits

Intention

Using Operations with Single Bits, you can do a lot of stuff.

You can find out if specified Bits are set or not. And you can also manipulate Bits to have then set or not.
This can be used to analyze results from other operations, or you can use it - for example - to make your own Encryption algo.
Before we take a look on the BIT-Options, lets take a look on the required Parameters.

Whatever you want to do with BITs, generally there are two ways to specify Parameters for the Bit-Operations.
You can specify a number "16" as "Text" then it has two Bytes length. Byte 1 is "1" and the second Byte is "6" - we call this "by value".
You can also use the ASC-Code "16" and then only use 1 Byte to store the number. We call this "as binary".

1. Specify Parameter as VALUE

```
' To specify the Parameter "as VALUE" we can just write it as a number, using the
' 9 is 1001 in Binary
VAN.$$P01=9
' We want extract Bit "1" which is "1" in Result
VAN.$$P02=1
BIT.Get|v$$P01|$$P02|$$RES
' We change the Result to a readable Value using the ASC.-Command. This will only
' The result will be "1" as CHR-value (Binary). To make it readable we use the AS
ASC.$$RES|$$ERG
MBX.Result is $$ERG
```

This will give the result: "1", because the first bit in "1001" (dez. 9) is a "1".
In both cases, we did not specify P4 (Size-Parameter) so the default size of 8-bit was used.

2. Specify Parameter as BINARY

```
' To specify the Parameter "as Binary" we use the CHR. Command if the Parameter
' 9 is 1001 in Binary
CHR.9|$$P01
```

 © 2023 Theo Gottwald * https://www.smart-package.com

```
  ' We want extract Bit "1" which is "1" in Result
  VAN.$$P02=1
  BIT.Get|b$$P01|$$P02|$$RES
  ' We change the Result to a readable Value using the ASC.-Command. This will onl
  ' The result will be "1" as CHR-value (Binary). To make it readable we use the A
  ASC.$$RES|$$ERG
  MBX.Result is $$ERG
```

3. Specify multi-Byte Parameters "as Binary" or "as Value"

```
' Use the "ToBin" or the "ToVal" Option to convert the Parameters
VAN.$$P01=9
' $$P02 will contain the result
BIT.ToBin|$$P01|$$P02|2
' $$P02 will contain the result
BIT.ToVal|$$P01|$$P02|2
```

4. Specify multi-Byte Parameters using the "Mask" Option.

IMPORTANT:

5. Using the 64-bit Options / Why are the 64-bit operations unusable?

While there is a 64-Bit Mask Option implemented, and also other 64-bit Operations, we found during testing that the
SPR is currently unable to show exact results in many cases.
The problem happens, if a 64-bit number will evaluate to a number in Exponential writing during variable resolution.
For example "6.144567 E+18".
In such case the result number will be enough precise for all "normal" calculations, but the real "Bits" inside can differ from the expected result.
As you do not know in which cases this rounding will happen, most 64-bit operations will be useless at this time.
The problem appears when the SPR looks what is inside of a numeric variable and replaces it with the number that is inside.
Currently this is an decimal number and decimal numbers are not 100% precise at all times. And this is when the problem appears.
As an alternative, we have evaluated to change the variables of the SPR to NOT output decimal numbers but Hexadecimal numbers like **&HAAAAAAAAAAAAAAAAFFFFFFFFFFFFFFFF**, in such case the output would be unreadable for most people.
So we have not done this, instead 64-bit operations with bits are there but you should currently not use them because the results may be wrong.

For details on how to prefix Hexadecimal, Octal or Binary numbers, see
3.5 Hexadezimal, Decimal and Binary and more 352

Syntax

BIT.P1[|P2][|P3][|P4]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - Subcommand

P2 - Input Parameter

P3 -- Px Parameter depending on the Subcommand

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAN.$$LEA=1
VAN.$$P01=67
VAN.$$P02=2
BIT.Show|v$$P01|$$ERA|$$LEA
BIT.Toggle|$$P01|$$P02|$$P03|$$LEA
BIT.Show|v$$P03|$$ERC|$$LEA
MBX.$$P01 Toggle $$P02 is $$P03$crlf$Bin: $$ERA Toogle $$P02 -
> $$ERC
BIT.Toggle|$$P03|$$P02|$$P04|$$LEA
BIT.Show|v$$P04|$$ERD|$$LEA
MBX.$$P03 Toggle $$P02 is $$P04$crlf$Bin: $$ERC Toogle $$P02 -
> $$ERD
ENR.
```

Remarks

Please always use the proper prefix for non-decimal numbers.
More details on this, see here:
3.5 Hexadezimal, Decimal and Binary and more 352

Limitations:

Why are the 64-bit operations unusable and give wrong results?

While there is a 64-Bit Mask (8-Byte Option) implemented, and also other 64-bit Operations, we found during testing that the
SPR is currently unable to show exact results in many cases.
The problem happens, if a 64-bit number will evaluate to a number in Exponential writing during variable resolution.
For example "6.144567 E+18".
In such case the result number will be enough precise for all "normal" calculations, but the real "Bits" inside can differ from the expected result.
As you do not know in which cases this rounding will happen, most 64-bit operations will be useless at this time.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

BIT.16to32|[b/v]P1|[b/v]P2[|P3]

Parameter Explanation

P1 **-** Variable containing a 16 bit numeric value.
You can define with a prefix of "v" for value and "b" for "binary" which format the value is.
If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable containing a 16 bit numeric value.
You can define with a prefix of "v" for value and "b" for "binary" which format the value is.
If the prefix is omitted, "v" is the default setting for P1.

P3 - optional,Variable for result. If you use "-" the result is placed on the TOS. Also here you can specify [b/v] for the format of the result.
If you do not specify anything the result is "value"-Format.

Example

```

3.43.5 BIT.8to16 - concatenate 2 Bytes to 16 Bit Word

MiniRobotLanguage (MRL)

BIT.8to16

concatenate 2 Bytes to 16 Bit Word

Intention

Concatenate two 8-Bit variables into one 16-Bit Variable.

The parameters **P1** and **P2** can be given as value or as "binary".
The result is a 32-bit variable. You can choose whether **P3** will be "as value" or "as binary". If you do not specify whether "b" or "v" the result will take the format of **P1**.
Please see ! Smarty's BIT. - Operations 441

You can define for all 3 Parameters if they should be in "Value" or "Binary Format.

```
VAN.$$LEA=2
VAN.$$P01=&HAA
VAN.$$P02=&HFF
BIT.8to16|$$P01|$$P02|$$P03
MBX. $$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$ERA
ENR.
```

Syntax

BIT.8to16|[b/v]P1|[b/v]P2[|[b/v]P3]

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 - Variable containing a 8 bit numeric value.
You can define with a prefix of "v" for value and "b" for "binary" which format the value is.
If the prefix is omitted, "v" is the default setting for P1.

P2 - Variable containing a 8 bit numeric value.
You can define with a prefix of "v" for value and "b" for "binary" which format the value is.
If the prefix is omitted, "v" is the default setting for P1.

P3 - optional,Variable for 16 bit result. If you use "-" the result is placed on the TOS. Also here you can specify [b/v] for the format of the result.
You can choose whether P3 will be "as value" or "as binary". If you do not specify whether "b" or "v" the result will take the format of **P1**.

3.43.6 BIT.AND - Use logical AND with Bits

MiniRobotLanguage (MRL)

BIT.AND

Use logical AND with Bits

Intention

AND returns TRUE (non-zero) if (and only if) the Bits in P1 AND P2 are "1".
Therefore AND masks clear selected bits of P1 without affecting the other bits.
For example, to clear the most-significant (leftmost) 2 bits in the integer value &H9700, AND it with &H3FFF.
That is, the mask contains all 1s, except for the bit positions you want to force to 0:

The parameters **P1** and **P2** can be given as value or as "binary".
You can choose whether **P3** will be "as value" or "as binary". If you do not specify whether "b" or "v" the result will take the format of **P1**.
Using **P4** you can decide how many Bytes the result should have, 8, 16 or 32 bit.

Please see ! Smarty's BIT. - Operations 441

```
VAN.$$LEA=1
VAN.$$P01=&H1
VAN.$$P02=129
BIT.AND|$$P01|$$P02|$$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$P01 AND $$P02 is $$P03$crlf$Bin: $$ERA
ENR.
```

Syntax

```
BIT.AND|[b/v]P1|[b/v]P2[|P3][|P4]
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for P2.

P3 - optional,Variable for result. You can define with a prefix of "v" for value and "b" for "binary" the format of the result. If the prefix is omitted the result will have the format of **P1**.
If the P3 is "-" then result is placed on the TOS.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAN.$$LEA=1
VAN.$$P01=&H1
VAN.$$P02=129
BIT.AND|$$P01|$$P02|$$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$P01 AND $$P02 is $$P03$crlf$Bin: $$ERA
ENR.
```

Remarks

-

Limitations:

When using the "|8" Parameter, the lower 4 bits are possibly wrong. This is not a bug its due to the way variables are stored internally.
Therefore we recommend to not use this option.

3.43.7 BIT.Clear - Set Bit to 0

MiniRobotLanguage (MRL)

BIT.Clear

Set Bit to 0

Intention

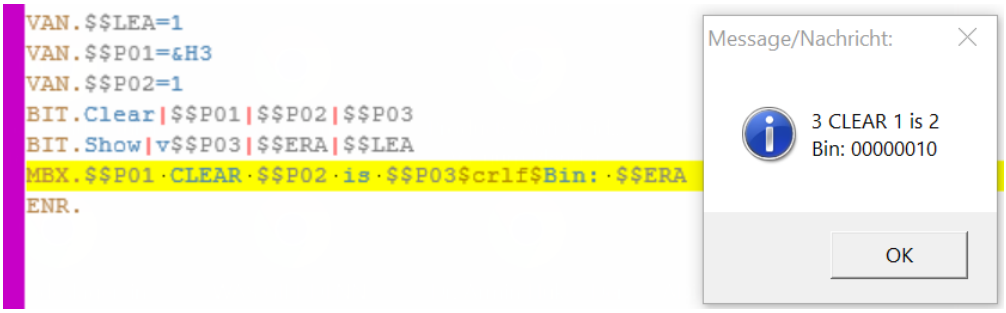
CLEAR will set a defined Bit in **P1** to "0".

For example, if you have the number "3" and you set Bit 1 to "0" the result will be "2".

The parameters **P1** and **P2** can be given as value or as "binary".
You can choose whether **P3** will be "as value" or "as binary". If you do not specify whether "b" or "v" the result will take the format of **P1**.
Using **P4** you can decide how many Bytes the result should have, 8, 16 or 32 bit.

Please see ! Smarty's BIT. - Operations 441

```
VAN.$$LEA=1
VAN.$$P01=&H3
VAN.$$P02=1
BIT.Clear|$$P01|$$P02|$$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$P01 CLEAR $$P02 is $$P03$crlf$Bin: $$ERA
ENR.
```



Syntax

BIT.CLEAR|[b/v]P1|[b/v]P2[|[b/v]P3][|P4]

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable containing a value or binary number. **P2** is the number of the Bit to Clear.Counting is 1-based and bit 1 has the value 1, Bit 8 would be 128 for example.
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for P2.

P3 - optional,Variable for result. You can define with a prefix of "v" for value and "b" for "binary" the format of the result. If the prefix is omitted the result will have the format of **P1**.
If the P3 is "-" then result is placed on the TOS.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAN.$$LEA=1
VAN.$$P01=&H3
VAN.$$P02=1
BIT.Clear|$$P01|$$P02|$$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$P01 CLEAR $$P02 is $$P03$crlf$Bin: $$ERA
ENR.
```

Remarks

-

Limitations:

When using the "|8" Parameter, the lower 4 bits are possibly wrong. This is not a bug its due to the way variables are stored internally.
Therefore we recommend to not use this option.

3.43.8 BIT.Get - check if Bit is set

MiniRobotLanguage (MRL)

BIT.Get - check if Bit is set

Check if bit is set

Intention

Check if a specified Bit is set or cleared.

The parameters **P1** and **P2** can be given as value or as "binary".
The result is always "0" or "1" as a value. Please see ! Smarty's BIT. - Operations 441

These two example below will check if Bit Nr.1 is set in the binary number "9" which is "1001".
Therefore the result will be a "1" in both Samples.

```
' Using a binary Number as Input
CHR.9|$$P01
VAN.$$P02=1
BIT.Get|b$$P01|$$P02|$$RES
MBX.$$RES

' Using a vale/numeric Number as Input
VAN.$$P01=9
VAN.$$P02=1
BIT.Get|$$P01|$$P02|$$RES
MBX.$$RES
```

Syntax

BIT.Get|[b/v]P1|[b/v]P2|P3[|P4]

Parameter Explanation

P1 - Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 - Variable containing a value or binary number for the bit to get. Depending on **P4** this number can be 1 to 8, 1 to 16 or

*© 2023 Theo Gottwald * https://www.smart-package.com*

1 to 32. Unless "b" is prefixed the default type for **P2** is "value".

P3 - Variable for result or "-". The result will always be numeric/value and can only be 1 or 0.
If omitted the result is placed on the TOS. Also here you can specify [b/v] for the format of the result. If you do not specify anything the result is "value"-Format.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAN.$$P01=9
VAN.$$P02=4
VAN.$$SOL=1
BIT.Get|v$$P01|$$P02|$$ERG
MBX.$$ERG
END.
```

Remarks

-

Limitations:

When using the "|8" Parameter, the lower 4 bits are possibly wrong. This is not a bug its due to the way variables are stored internally.
Therefore we recommend to not use this option.

3.43.9 BIT.LShift - Shift Bits to Left, insert 0

MiniRobotLanguage (MRL)

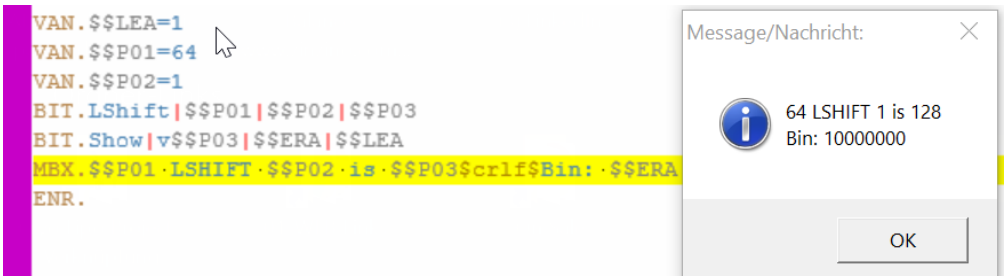
BIT.LShift - Shift Bits to Left, insert 0

Shift Bits to the Left side, insert 0 at the right side

Intention

LSHIFT shifts all the bits in **P1** inserting a "0" at the right side. In general a LShift equals an Integer multiplication by 2.
The parameters **P1** and **P2** can be given as value or as "binary".
You can choose whether **P3** will be "as value" or "as binary". If you do not specify whether "b" or "v" the result will take the format of **P1**.
Using **P4** you can decide how many Bytes the result should have, 8, 16 or 32 bit and also how many bits are shifted.
Please see ! Smarty's BIT. - Operations 441

```
VAN.$$LEA=1
VAN.$$P01=64
VAN.$$P02=1
BIT.LShift|$$P01|$$P02|$$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$P01 LSHIFT $$P02 is $$P03$crlf$Bin: $$ERA
ENR.
```



Syntax

BIT.LShift|[b/v]P1|[b/v]P2[|[b/v]P3][|P4]

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
This number contains the Bits "to be shifted".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable containing a value or binary number. This number is the amount of bits to "Shift Left".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for P2.

P3 - optional,Variable for result. You can define with a prefix of "v" for value and "b" for "binary" the format of the result. If the prefix is omitted the result will have the format of **P1**. If the P3 is "-" then result is placed on the TOS.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAN.$$LEA=1
VAN.$$P01=64
VAN.$$P02=1
BIT.LShift|$$P01|$$P02|$$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$P01 LSHIFT $$P02 is $$P03$crlf$Bin: $$ERA
ENR.
```

Remarks

-

Limitations:

When using the "|8" Parameter, the lower 4 bits are possibly wrong. This is not a bug its due to the way variables are stored internally.
Therefore we recommend to not use this option.

3.43.10 BIT.NOT - Use logical NOT with Bits

MiniRobotLanguage (MRL)

BIT.NOT - Use logical NOT with Bits

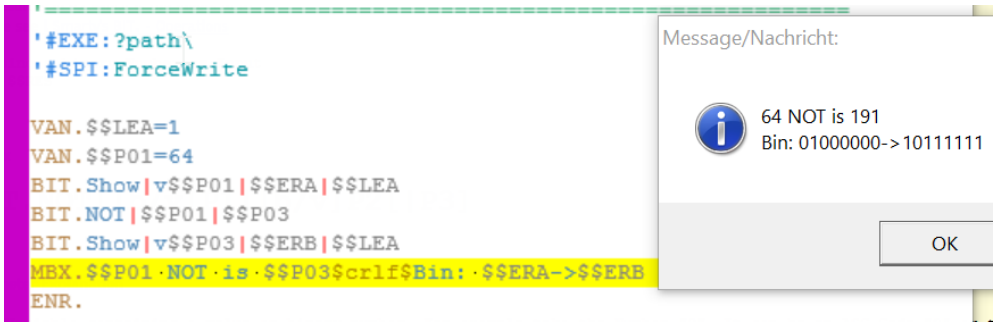
Invert Bits

Intention

NOT generally inverts bit, it makes a 0 to a 1 and makes a 1 to a 0.

The parameters **P1** can be given as value or as "binary".
The result is in **P2** which is the invers of P1.
Please see ! Smarty's BIT. - Operations 441

```
VAN.$$LEA=1
VAN.$$P01=64
BIT.Show|v$$P01|$$ERA|$$LEA
BIT.NOT|$$P01|$$P03
BIT.Show|v$$P03|$$ERB|$$LEA
MBX.$$P01 NOT is $$P03$crlf$Bin: $$ERA->$$ERB
ENR.
```



Syntax

BIT.NOT|[b/v]P1|[b/v]P2[|P3]

Parameter Explanation

P1 - Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 - P2 - Variable for result or"-". If P2 is not a variable, the result is placed on the TOS.
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for P2.
Also here you can specify [b/v] for the format of the result. If you do not specify anything the result is "value"-Format.

P3 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.

1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```

3.43.11 BIT.OR - Use logical OR with Bits

MiniRobotLanguage (MRL)

BIT.OR - Use logical OR with Bits

Use logical OR with Bits

Intention

OR returns TRUE (non-zero) if any of the Bits in P1 AND P2 are "1".
Therefore OR will make sure that the given bits are set to 1.

The parameters **P1** and **P2** can be given as value or as "binary".
You can choose whether **P3** will be "as value" or "as binary". If you do not specify whether "b" or "v" the result will take the format of **P1**.
Using **P4** you can decide how many Bytes the result should have, 8, 16 or 32 bit.

Please see ! Smarty's BIT. - Operations 441

```

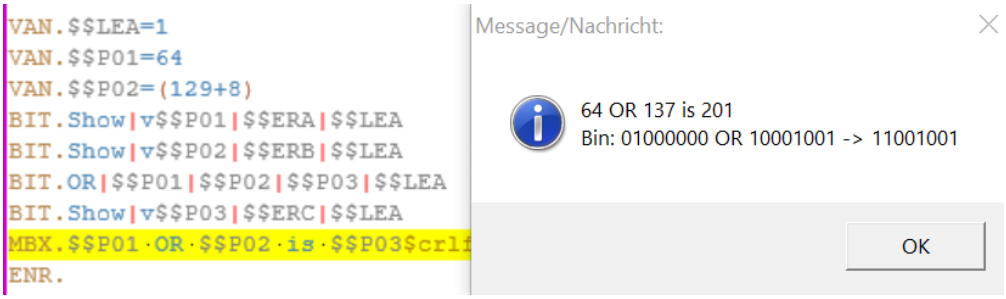
MBX.$$P01 OR $$P02 is $$P03$crlf$Bin: $$ERA OR $$ERB -> $$ERC
ENR.
```



Syntax

 *© 2023 Theo Gottwald * https://www.smart-package.com*

BIT.OR|[b/v]P1|[b/v]P2[|[b/v]P3][|P4]

Parameter Explanation

P1 - Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 - Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for P2.

P3 - optional,Variable for result. You can define with a prefix of "v" for value and "b" for "binary" the format of the result. If the prefix is omitted the result will have the format of **P1**.
If the P3 is "-" then result is placed on the TOS.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```

```

Syntax

BIT.RotateRight|[b/v]P1|[b/v]P2[|[b/v]P3][|P4]

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
This number contains the Bits "to be shifted".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable containing a value or binary number. This number is the amount of bits to "RotateRight".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for P2.

P3 - optional,Variable for result. You can define with a prefix of "v" for value and "b" for "binary" the format of the result. If the prefix is omitted the result will have the format of **P1**. If the P3 is "-" then result is placed on the TOS.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```

3.43.14 BIT.RShift - Shift Bits to Right, insert 0

MiniRobotLanguage (MRL)

BIT.RShift - Shift Bits to Right, insert 0

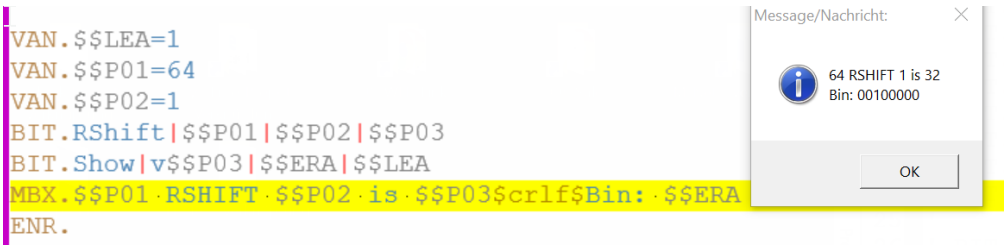
Shift Bits to the Right side, insert 0 at the right side

Intention

RSHIFT shifts all the bits in **P1** inserting a "0" at the left side. In general a RShift equals an Integer division by 2.

The parameters **P1** and **P2** can be given as value or as "binary".
You can choose whether **P3** will be "as value" or "as binary". If you do not specify whether "b" or "v" the result will take the format of **P1**.
Using **P4** you can decide how many Bytes the result should have, 8, 16 or 32 bit and also how many bits are shifted.
Please see ! Smarty's BIT. - Operations 441

```
VAN.$$LEA=1
VAN.$$P01=64
VAN.$$P02=1
BIT.RShift|$$P01|$$P02|$$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$P01 RSHIFT $$P02 is $$P03$crlf$Bin: $$ERA
ENR.
```



Syntax

BIT.RShift|[b/v]P1|[b/v]P2[|[b/v]P3][|P4]

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 - Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
This number contains the Bits "to be shifted".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 - Variable containing a value or binary number. This number is the amount of bits to "Shift Right".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for P2.

P3 - optional,Variable for result. You can define with a prefix of "v" for value and "b" for "binary" the format of the result.
If the prefix is omitted the result will have the format of **P1**. If the P3 is "-" then result is placed on the TOS.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAN.$$LEA=1
VAN.$$P01=64
VAN.$$P02=1
BIT.RShift|$$P01|$$P02|$$P03
BIT.Show|v$$P03|$$ERA|$$LEA
MBX.$$P01 RSHIFT $$P02 is $$P03$crlf$Bin: $$ERA
ENR.
```

Remarks

-

Limitations:

When using the "|8" Parameter, the lower 4 bits are possibly wrong. This is not a bug its due to the way variables are stored internally.
Therefore we recommend to not use this option.

```

Syntax

BIT.Set|[b/v]P1|[b/v]P2|[b/v]P3[|P4]

Parameter Explanation

*© 2023 Theo Gottwald * https://www.smart-package.com*

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable containing a value or binary number for the bit to set. Depending on **P4** this number can be 1 to 8, 1 to 16 or 1 to 32. Unless "b" is prefixed the default type for **P2** is "value".

P3 **-** Variable for result or "-". The result will always be numeric/value and can only be 1 or 0.
If omitted the result is placed on the TOS. Also here you can specify [b/v] for the format of the result. If you do not specify anything the result is "value"-Format.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************

3.43.16 BIT.Show - Show Bits in Binary-Numbers

MiniRobotLanguage (MRL)

BIT.SHOW - Show binary Bits

Show Bits

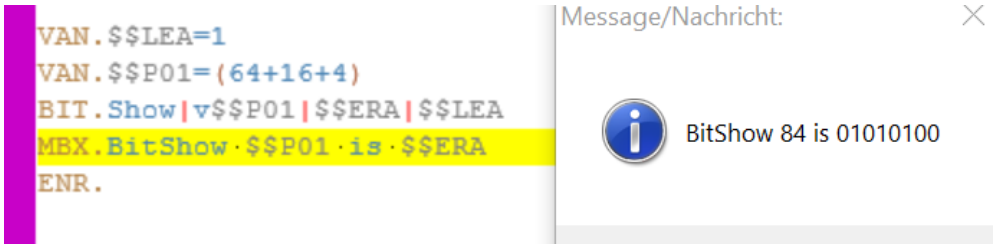
Intention

SHOW will convert a Number into Binary format.

The parameters **P1** can be given as value or as "binary".
The result is in **P2** which is the binary version of P1 "as Text".

Please see ! Smarty's BIT. - Operations 441

```
VAN.$$LEA=1
VAN.$$P01=(64+16+4)
BIT.Show|v$$P01|$$ERA|$$LEA
MBX.BitShow $$P01 is $$ERA
ENR.
```



Syntax

BIT.SHOW|[b/v]P1|P2[|P3]

Parameter Explanation

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".

You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 - Variable for result or "-". You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for P2.
    If omitted the result is placed on the TOS. Also here you can specify [b/v] for the format of the result. If you do not specify anything the result is "value"-Format.

P3 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
     1 - 8 Bits
     2 - 16 Bits
     4 - 32 Bits

     Do not use the "8" Option. See Limitations below.

Example

```

3.43.18 BIT.ToBin - change Parameter to Binary-Format

MiniRobotLanguage (MRL)

BIT.ToBin - Convert Parameter from "Value" to "Binary"

Convert Parameter to "Binary"

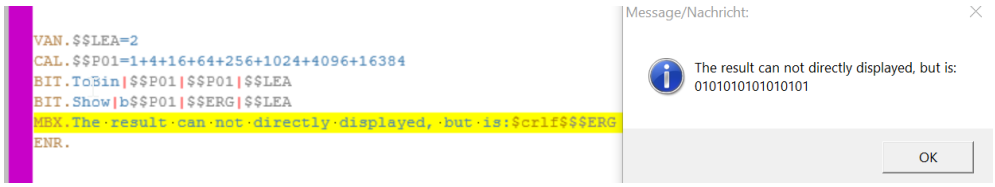
Intention

Generally there are two types od Parameters, these are "as value" and "as binary".

Whatever you want to do with BITs, generally there are two ways to specify Parameters for the Bit-Operations.
You can specify a number "16" as "Text" then it has two Bytes length. Byte 1 is "1" and the second Byte is "6" - we call this "by value".
You can also use the ASC-Code "16" and then only use 1 Byte to store the number. We call this "as binary".
More explanation is below under Remarks and see ! Smarty's BIT. - Operations 441

The parameters **P1** is the "Input" and it is "as Value".
The result is in **P2** which is the "as binary" of **P1**.

```
VAN.$$LEA=2
CAL.$$P01=1+4+16+64+256+1024+4096+16384
BIT.ToBin|$$P01|$$P01|$$LEA
BIT.Show|b$$P01|$$ERG|$$LEA
MBX.The result can not directly displayed, but is:$crlf$$$ERG
ENR.
```



Syntax

BIT.ToBin|[b/v]P1|P2[|P3]

Parameter Explanation

 *© 2023 Theo Gottwald * https://www.smart-package.com*

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable for result or"-". If **P2** is not a variable, the result is placed on the TOS.

P3 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAN.$$LEA=2
CAL.$$P01=1+4+16+64+256+1024+4096+16384
BIT.ToBin|$$P01|$$P01|$$LEA
BIT.Show|b$$P01|$$ERG|$$LEA
MBX.The result can not directly displayed, but is:$crlf$$$ERG
ENR.
```

Remarks

Whatever you want to do with BITs, generally there are two ways to specify Parameters for the Bit-Operations.
You can specify a number "16" as "Text" then it has two Bytes length. Byte 1 is "1" and the second Byte is "6" - we call this "by value".
You can also use the ASC-Code "16" and then only use 1 Byte to store the number. We call this "as binary".

1. Specify Parameter as VALUE

```
' To specify the Parameter "as VALUE" we can just write it as a number, using the
' 9 is 1001 in Binary
VAN.$$P01=9
' We want extract Bit "1" which is "1" in Result
VAN.$$P02=1
BIT.Get|v$$P01|$$P02|$$RES
' We change the Result to a readable Value using the ASC.-Command. This will only
' The result will be "1" as CHR-value (Binary). To make it readable we use the AS
ASC.$$RES|$$ERG
MBX.Result is $$ERG
```

This will give the result: "1", because the first bit in "1001" (dez. 9) is a "1".

© 2023 Theo Gottwald * https://www.smart-package.com

In both cases, we did not specify P4 (Size-Parameter) so the default size of 8-bit was used.

2. Specify Parameter as BINARY

```
' To specify the Parameter "as Binary" we use the CHR. Command if the Parameter i
' 9 is 1001 in Binary
CHR.9|$$P01
' We want extract Bit "1" which is "1" in Result
VAN.$$P02=1
BIT.Get|b$$P01|$$P02|$$RES
' We change the Result to a readable Value using the ASC.-Command. This will only
' The result will be "1" as CHR-value (Binary). To make it readable we use the AS
ASC.$$RES|$$ERG
MBX.Result is $$ERG
```

3. Specify multi-Byte Parameters "as Binary" or "as Value"

```
' Use the "ToBin" or the "ToVal" Option to convert the Parameters
VAN.$$P01=9
' $$P02 will contain the result
BIT.ToBin|$$P01|$$P02|2
' $$P02 will contain the result
BIT.ToVal|$$P01|$$P02|2
```

Limitations:

When using the "|8" Parameter, the lower 4 bits are possibly wrong. This is not a bug its due to the way variables are stored internally.

Therefore we recommend to not use this option.

3.43.19 BIT.Toggle - Switch Bit

MiniRobotLanguage (MRL)

BIT.Toggle - Switch Bit

Change state of a bit from "0" to "1" or from "1" to "0"

Intention

`BIT.Toggle` will check if a bit is currently "1" or "0" first, and then switch it over.
Its somehow like a light-switch. If you click it, it will make the light "ON" or "OFF" depending on how it w

The parameters **P1** and **P2** can be given as value or as "binary".
Please see ! Smarty's BIT. - Operations 441 for details on this topic.

```

Syntax

BIT.Toggle|[b/v]P1|[b/v]P2|P3[|P4]

Parameter Explanation

*© 2023 Theo Gottwald * https://www.smart-package.com*

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable containing a value or binary number for the bit to Toggle. Depending on **P4** this number can be 1 to 8, 1 to 16 or 1 to 32. Unless "b" is prefixed the default type for **P2** is "value".

P3 - optional,Variable for result or "-". The result will always be numeric/value and can only be 1 or 0.
If omitted the result is placed on the TOS. Also here you can specify [b/v] for the format of the result. If you do not specify anything the result is "value"-Format.

P4 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************

BIT.Show|v$$P04|$$ERD|$$LEA
MBX.$$P03 Toggle $$P02 is $$P04$crlf$Bin: $$ERC Toogle $$P02 -
> $$ERD
ENR.
```

Remarks

-

Limitations:

When using the "|8" Parameter, the lower 4 bits are possibly wrong. This is not a bug its due to the way variables are stored internally.

© 2023 Theo Gottwald * https://www.smart-package.com

Therefore we recommend to not use this option.

3.43.20 BIT.ToVal - change Parameter to Value-Format

BIT.ToVal - change Parameter to Value-Format Previous 2350 Top 41 Next 2354

MiniRobotLanguage (MRL)

BIT.ToVal - Convert Parameter from "Binary" to "Value"

Convert Parameter to "Value"

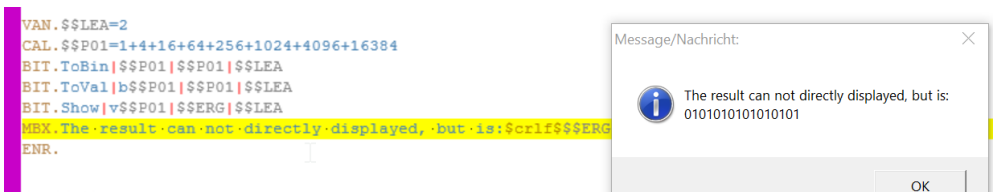
Intention

Generally there are two types od Parameters, these are "as value" and "as binary".

Whatever you want to do with BITs, generally there are two ways to specify Parameters for the Bit-Operations.
You can specify a number "16" as "Text" then it has two Bytes length. Byte 1 is "1" and the second Byte is "6" - we call this "by value".
You can also use the ASC-Code "16" and then only use 1 Byte to store the number. We call this "as binary".
More explanation is below under Remarks and see ! Smarty's BIT. - Operations 441

The parameters **P1** is the "Input" and it is "as Value".
The result is in **P2** which is the "as binary" of **P1**.

```
VAN.$$LEA=2
CAL.$$P01=1+4+16+64+256+1024+4096+16384
BIT.ToBin|$$P01|$$P01|$$LEA
BIT.ToVal|b$$P01|$$P01|$$LEA
BIT.Show|v$$P01|$$ERG|$$LEA
MBX.The result can not directly displayed, but is:$crlf$$$ERG
ENR.
```



Syntax

BIT.ToVal|[b/v]P1|P2[|P3]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **-** Variable containing a value or binary number. For example take the Number "9". It can be an ASC-Code "9" or the numeric number "9".
You can define this with a prefix of "v" for value and "b" for "binary". If the prefix is omitted, "v" is the default setting for **P1**.

P2 **-** Variable for result or"-". If **P2** is not a variable, the result is placed on the TOS.

P3 - optional, can be 1,2 or 4. Number of Bytes that are used internally. The number of Bits is the number of Bytes times 8.
1 - 8 Bits
2 - 16 Bits
4 - 32 Bits

Do not use the "8" Option. See Limitations below.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAN.$$LEA=2
CAL.$$P01=1+4+16+64+256+1024+4096+16384
BIT.ToBin|$$P01|$$P01|$$LEA
BIT.ToVal|b$$P01|$$P01|$$LEA
BIT.Show|v$$P01|$$ERG|$$LEA
MBX.The result can not directly displayed, but is:$crlf$$$ERG
ENR.
```

Remarks

Whatever you want to do with BITs, generally there are two ways to specify Parameters for the Bit-Operations.
You can specify a number "16" as "Text" then it has two Bytes length. Byte 1 is "1" and the second Byte is "6" - we call this "by value".
You can also use the ASC-Code "16" and then only use 1 Byte to store the number. We call this "as binary".

1. Specify Parameter as VALUE

```
' To specify the Parameter "as VALUE" we can just write it as a number, using the
' 9 is 1001 in Binary
VAN.$$P01=9
' We want extract Bit "1" which is "1" in Result
VAN.$$P02=1
BIT.Get|v$$P01|$$P02|$$RES
' We change the Result to a readable Value using the ASC.-Command. This will only
' The result will be "1" as CHR-value (Binary). To make it readable we use the AS
ASC.$$RES|$$ERG
MBX.Result is $$ERG
```

© 2023 Theo Gottwald * https://www.smart-package.com

This will give the result: "1", because the first bit in "1001" (dez. 9) is a "1".
In both cases, we did not specify P4 (Size-Parameter) so the default size of 8-bit was used.

2. Specify Parameter as BINARY

```
' To specify the Parameter "as Binary" we use the CHR. Command if the Parameter i
' 9 is 1001 in Binary
CHR.9|$$P01
' We want extract Bit "1" which is "1" in Result
VAN.$$P02=1
BIT.Get|b$$P01|$$P02|$$RES
' We change the Result to a readable Value using the ASC.-Command. This will only
' The result will be "1" as CHR-value (Binary). To make it readable we use the AS
ASC.$$RES|$$ERG
MBX.Result is $$ERG
```

3. Specify multi-Byte Parameters "as Binary" or "as Value"

```
' Use the "ToBin" or the "ToVal" Option to convert the Parameters
VAN.$$P01=9
' $$P02 will contain the result
BIT.ToBin|$$P01|$$P02|2
' $$P02 will contain the result
BIT.ToVal|$$P01|$$P02|2
```

Limitations:

When using the "|8" Parameter, the lower 4 bits are possibly wrong. This is not a bug its due to the way variables are stored internally.

Therefore we recommend to not use this option.

3.43.21 BIT.XOR - Use logical XOR with Bits

MiniRobotLanguage (MRL)

BIT.XOR

Use logical XOR with Bits

Intention

XOR returns TRUE (non-zero) if (and only if) the Bits in P1 AND P2 are uneqal. Its a reversable operation and therefore the number one operation in data-encryption and decryption.

The parameters **P1** and **P2** can be given as value or as "binary".
You can choose whether **P3** will be "as value" or "as binary". If you do not specify whether "b" or "v" the result will take the format of **P1**.
Using **P4** you can decide how many Bytes the result should have, 8, 16 or 32 bit.

Please see ! Smarty's BIT. - Operations 441

```
VAN.$$LEA=1
VAN.$$P01=73

3.44 Browser and Office (Acc.-Engine)

3.44.1 OFC. - Office-Commands

3.44.1.1 MS-Excel Scripting

3.44.1.1.1 !Excel-Scripting

MiniRobotLanguage (MRL)

OFC.Excel|Commands

Control MS-Excel worksheet via the SPR

Intention

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
There is one exception that is the "EXIST" Command. It will always execute and return whether a "1" or a "0" (Excel is installed -> 1, Excel is not installe-> 0) on the TOS.

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.

Hint:

1. Due to the nature of the underlying Excel-Scripting System it may not work to repeat tasks of opening and closing Excel hundreds of times. If such issues appear a reboot may be needed.
We have not tested this until now.

2. You may need to replace in german systems the "." with a "," in numbers that have been read. Because excel may read the numbers with ".".
For example "3.141"<>"3,131".
To replace it use:
`RPL.$$RES|.|,`

Syntax:

OFC.Excel|Subcommand and Data

Parameter Explanation:

Subcommands:

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
EXIST - Test if Excel is properly installed
OPEN - Open a existing Excel-File
CLOSE - Close an Excel-File that was opened using OPEN
SAVE - Save changes
SAVEAS - Save changes under another filename
SHEET_ACTIVATE - Activate another Sheep by Name/Number
SHEET_SETNAME - Set a new Name for a Sheep
SHEET_GETNAME - Get the name of a Sheet
FULLSCREEN - Make Excel Fullscreen
VISIBLE - Switch between visible/Invisible Mode
PAGE_UPDOWN - Scroll Page Up or down
SCROLL_UPDOWN - Scroll Up or down
SCROLL_LEFTRIGHT - Scroll Left or right
NUMBER_TO_LETTER - Convert a number to a letter
GET_CELL_???_BY_COORD - Get contents of a Cell by X and Y
Coordinates
GET_CELL_???_BY_RANGE - Get contents of a Cell by Range
"A1:A2".
FORMULA - Set a Cell Content
GET FORMULA - Get Formula from a Cell
LASTROW - Get the last used Row
LASTCOLUMN - Get the last used Column
EXCEL_GETTOPWIN - Get the Excel TopWindow-Handle
CALCULATE - Make Excel Calculate the sheet
SET_SIZE - Set Size of the Excel-Window
SET_POS - Set Position of the Excel-Window

' These SET Commands tell Excel how to load and save a Sheet
' for example using a Password or not.
SET UpdateLinks ON","SET UL ON"
SET UpdateLinks OFF","SET UL OFF"
SET FORMAT","SET FMT"

3.44.1.1.3 CLOSE

MiniRobotLanguage (MRL)

OFC.Excel|CLOSE

CLOSE MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
To Close your Excel-Instance, use the CLOSE Subcommand.
There is one Parameter, that will force Excel to close whether there are Error-Messages like "File not saved" etc. or not.
Set the Force Flag to "1" if you want to close Excel anyway.

The CLOSE Subcommand will only Close Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|CLOSE[|P1]

Parameter Explanation:

P1 - 0/1 - FORCE Flag suppress Error-Messages and force Excel to close

Example:

```
' Excel CLOSE Example
VAR.$$PFA=?path\Test.xls
OFC.excel|OPEN||0|1
DMP.6
OFC.excel|CLOSE|1
DMP.6
MBX.!
END.
```

Remarks:

To Close your Excel-Instance, use the CLOSE Subcommand.
However, its not necessary to close an Excel File, if you want to leave it open, even after the SPR exits.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The CLOSE Subcommand will only Close Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

© 2023 Theo Gottwald * https://www.smart-package.com

3.44.1.1.4 EXIST

MiniRobotLanguage (MRL)

OFC.Excel|EXIST

Verify if MS-Excel is installed and functional

Intention

Normally all SPR commands for use with "MS Excel" need an valid Installation of MS-Office Excel.
There is one exception that is the "EXIST" Command. This command will always execute and return whether a "1" or a "0" on the TOS.

Excel is installed -> 1
Excel is not installed -> 0

This command will internally check the Registry if the Entry for Excel is set properly.
Secondly this command will check if the SPR can access the Excel internal Interfaces.
Only if all of this works, then the command will return "1" on TOS.
Else the command wil lreturn a "0" on TOS.

Syntax:

OFC.Excel|EXIST

Parameter Explanation:

-

Example:

```
' Check if MS-Excel is installed and functional
OFC.excel|Exist
DBP.$$000
ENR.
```

Remarks:

This command is automatically executed one time when the SPR starts and the first `OFC.EXCEL` command is executed.
For this reason, the first call to a Excel command may take a second longer then succeeding commands.
The result is internally remembered for Speed reasons.
So all further calls to `OFC.EXCEL` may fail if Excel was not working on first attempt.

© 2023 Theo Gottwald * https://www.smart-package.com

Unless you call this command, which will do the check again and then set the internal values new.

Limitations:

-

See also:

- !Excel-Scripting 508
- Excel_Open 536
- Excel_Close 516

© 2023 Theo Gottwald * https://www.smart-package.com

3.44.1.1.5 FORMULA GET

MiniRobotLanguage (MRL)

OFC.Excel|FORMULA GET

Read a Formula or any value from a Cell in an MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.Also you need to activate the sheet first using:

```
' Activate by Number
OFC.excel|SHEET_Activate|1
```

The Formula Command will read any sort of Text or Formula or numbers from the given Range of Cells.
For this you can use **P3** to specify the way how the Cell-Content is interpreted.

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

```
OFC.Excel|FORMULA|P1|P2[|P3]
OFC.Excel|FORMULA GET|P1|P2[|P3]
```

Parameter Explanation:

```
OFC.excel|Formula|$$RAN|$$RESUL-VAR[|numeric Paste Method]
```

P1 - RANGE, A1:A1 oder A1:B400 specifies the coordinates of the cells to be written to.
P2 - (opt.) Variable for result. If missing, invalid or it's "-" then TOS is used.
P3 - (opt./numeric) 0-8 Read Method, technically the way how Excel should interpret the Cell value/text

```
     0 - use "Cells.Formula" (default)
     1 - use "Cells.Value"
     2 - use "Cells.Value2"
     3 - use "Cells.FormualArray"
     4 - use "Cells.FormulaLabel"
     5 - use "Cells.FormulaHidden" (Get Cell Property)
     6 - use "Cells.FormulaLocal"
     7 - use "Cells.FormulaR1C1"
     8 - use "Cells.FormulaR1C1Local"
     9 - use "Cells.Numberformat" (Get Format of the specified Range)
```

Example:

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Excel FORMULA Example
OFC.excel|OPEN||0|1
DBP.---------------
' Activate by name
OFC.excel|SHEET_Activate|2
OFC.excel|Formula Set|A1:B3|25|1
OFC.excel|Formula Set|A2:C2|=+A1*2
OFC.excel|Formula Set|A3:C3|=+A1*2|6
OFC.excel|Formula Set|A4:C4|=+A1*2|8

OFC.excel|Formula Get|A2:A2|0|$$RES
OFC.excel|Formula Get|A2:A2|1|$$VAL
DBP.Formula at A2: $$RES
DBP.Value at A2: $$VAL

MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:

Some of the **P3** Parameters may not make sense (Hidden?) there may be changes in the future.

We replace in german systems the "." with a "," in numbers that have been read.

```
RPL.$$RES|.|,
```

Limitations:

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The FORMULA GET Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.44.1.1.6 FORMULA SET

MiniRobotLanguage (MRL)

OFC.Excel|FORMULA SET

Write a Formula to a Cell in an MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
Also you need to activate the sheet first using:

```
' Activate by Number
OFC.excel|SHEET_Activate|1
```

The Formula Command will write any sort of Text or Formula or numbers into the given Range of Cells.
For this you can use **P3** to specify the way how the Text is written into the Sheet.

The Command with the Parameter "9" can be used to set the Format (Numeric, General, Text etc.) of a Cell or a Range of Cells.

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|FORMULA|P1|P2[|P3]
OFC.Excel|FORMULA SET|P1|P2[|P3]

Parameter Explanation:

OFC.excel|Formula|$$RAN|$$FOR[| Paste Method]

P1 - RANGE, A1:A1 oder A1:B400 specifies the coordinates of the cells to be written to.
P2 - Text, this text is written in the cells. Delimiter can be used (P3).
P3 - (opt./numeric) 0-8 Paste Method, technically the way how Excel should interpret the written Text

```
     0 - use "Cells.Formula" (default)
     1 - use "Cells.Value"
     2 - use "Cells.Value2"
     3 - use "Cells.FormualArray"
     4 - use "Cells.FormulaLabel"
     5 - use "Cells.FormulaHidden" (Set Cell Property)
     6 - use "Cells.FormulaLocal"
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
     7 - use "Cells.FormulaR1C1"
     8 - use "Cells.FormulaR1C1Local"
     9 - use "Cells.Numberformat" -> This can be use to change
the Cell-Format to Text or numeric etc.
```

Example:

```
' Excel FORMULA Example
OFC.excel|OPEN||0|1
OFC.excel|SHEET_Activate|2
FOR.$$LOP|0|8
  OFC.excel|FORMULA|B$$LOP:B$$LOP|=+A1*2|$$LOP
NEX.

DMP.6
MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:

Some of the **P3** Parameters may not make sense (Hidden?) there may be changes in the future..

Limitations:

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The FORMULA Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

3.44.1.1.7 GET_CELL...BY COORD

MiniRobotLanguage (MRL)

OFC.Excel|GET_CELL_???_BY_COORD

Read a Cell in an MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
Also you need to activate the sheet first using:

```
' Activate by Number
OFC.excel|SHEET_Activate|1
```

There are 3 versions og the Subcommand:

1. To read Simple numbers:
OFC.Excel|GET_CELL_NUM_BY_COORD|P1|P2[|P3]

2. To read Text
OFC.Excel|GET_CELL_TEXT_BY_COORD|P1|P2[|P3]

3. This will read the Cell as both Numbers and Text. And return the (longer) result that looks more valid.
OFC.Excel|GET_CELL_ANY_BY_COORD|P1|P2[|P3]

The GET_CELL ... BY_COORD Commands will read Text and Numbers from the Sheet. It may not read Formulas there.
Use the GET FORMULA-Command for that.
To specify which Cell to read, this Subcommand uses X- and Y-Coordinates, starting in the upper right Corner of the Sheet with (1,1).
If you prefer to use a RANGE like: "`A1:A1`" then use the `GET_CELL_???_BY_RANGE` Group of Commands.

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|GET_CELL_TEXT_BY_COORD|P1|P2[|P3]
OFC.Excel|GET_CELL_NUM_BY_COORD|P1|P2[|P3]

© 2023 Theo Gottwald * https://www.smart-package.com

OFC.Excel|GET_CELL_ANY_BY_COORD|P1|P2[|P3]

Parameter Explanation:

P1 - X-Coordinate, starting with "1" in the Upper,left corner of the sheet, specifies the X-coordinates of the cells to be written to.
P2 - Y-Coordinate, starting with "1" in the Upper,left corner of the sheet, specifies the Y-coordinates of the cells to be written to.
P3 - (optional, Variable or "-") contains the variable that will receive the Cell-Content.
If a Cell has String Content, "GET_NUM" will return "0". If P3 is missing then the result will be placed on TOS.
If a Cell has numeric Content then "GET_TEXT" will not return a result. Use "GET_ANY" to have an internal check which one to use.

Example:

```
' Excel GET_CELL Example
OFC.excel|OPEN||0|1
DBP.---------------
' Activate by name
OFC.excel|SHEET_Activate|2
OFC.excel|write|A1:A1|54
OFC.excel|write|A2:A2|Hallo

DBP. Text
OFC.excel|GET_CELL_TEXT_BY_RANGE|A1:A1|$$REA
OFC.excel|GET_CELL_TEXT_BY_RANGE|A2:A2|$$REB
DBP.$$REA-$$REB

DBP. Num
OFC.excel|GET_CELL_NUM_BY_RANGE|A1:A1|$$REA
OFC.excel|GET_CELL_NUM_BY_RANGE|A2:A2|$$REB

OFC.excel|GET_CELL_TEXT_BY_COORD|1|1|$$REA
OFC.excel|GET_CELL_TEXT_BY_COORD|1|2|$$REB
DBP.$$REA-$$REB

DBP.Num
OFC.excel|GET_CELL_NUM_BY_COORD|1|1|$$REA
OFC.excel|GET_CELL_NUM_BY_COORD|1|2|$$REB
DBP.$$REA-$$REB
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
DBP. ANY
OFC.excel|GET_CELL_ANY_BY_COORD|1|1|$$REA
OFC.excel|GET_CELL_ANY_BY_COORD|1|2|$$REB
DBP.$$REA-$$REB
MBX.$$REA-$$REB

DMP.6
MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:
To Close your Excel-Instance, use the CLOSE Subcommand.
However, its not necessary to close an Excel File, if you want to leave it open, even after the SPR exits.

Limitations:
The GET_CELL ... BY_COORD Commands will read Text and Numbers from the Sheet. It may not read Formulas there.
Use the GET FORMULA-Command for that.

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The GET_CELL ... BY_COORD Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

3.44.1.1.8 GET_CELL...BY RANGE

MiniRobotLanguage (MRL)

OFC.Excel|GET_CELL_???_BY_RANGE

Read a Cell in an MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
Also you need to activate the sheet first using:

```
' Activate by Number
OFC.excel|SHEET_Activate|1
```

There are 3 versions og the Subcommand:

1. To read Simple numbers:
OFC.Excel|GET_CELL_NUM_BY_RANGE|P1[|P2]

2. To read Text
OFC.Excel|GET_CELL_TEXT_BY_RANGE|P1[|P2]

3. This will read the Cell as both Numbers and Text. And return the (longer) result that looks more valid.
OFC.Excel|GET_CELL_ANY_BY_RANGE|P1[|P2]

The GET_CELL ... BY_RANGE Commands will read Text and Numbers from the Sheet. It may not read Formulas there.
Use the GET FORMULA-Command for that.

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|GET_CELL_TEXT_BY_RANGE|P1[|P2]
OFC.Excel|GET_CELL_NUM_BY_RANGE|P1[|P2]
OFC.Excel|GET_CELL_ANY_BY_RANGE|P1[|P2]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation:

P1 - RANGE, A1:A1 oder A1:B400 specifies the coordinates of the cells to be written to.
P2 - (optional, Variable or "-") contains the variable that will receive the Cell-Content.
If a Cell has String Content, "GET_NUM" will return "0". If P3 is missing then the result will be placed on TOS.
If a Cell has numeric Content then "GET_TEXT" will not return a result. Use "GET_ANY" to have an internal check which one to use.

Example:

```
' Excel GET_CELL Example
OFC.excel|OPEN||0|1
DBP.---------------
' Activate by name
OFC.excel|SHEET_Activate|2

3.44.1.1.9 LASTROW / LASTCOLUMN

MiniRobotLanguage (MRL)

OFC.Excel|LastRow/LastColumn

Find out how much Rows/Columns are used in an MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
Also you need to activate the sheet first using:

```
' Activate by Number
OFC.excel|SHEET_Activate|1
```

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

```
OFC.Excel|LastRow[|P1][|P2]
OFC.Excel|LastColumn[|P1][|P2]
```

Parameter Explanation:

P1 - (optional, Variable or "-") contains the variable that will receive the Result. The first Row/Column is "1" (1-based).
P2 - (optional, numeric) - Specify the Row(Column) number which is used to count the number of used Cells.
If sheets are not rectangular, means the headline is possibly larger then the rest of the sheet, you can specify where (in which row/column) to count.

Example:

```
' Excel LASTROW Example
OFC.excel|OPEN||0|1
DBP.---------------
' Activate by name
OFC.excel|SHEET_Activate|2
OFC.excel|write|A1:D1|54
OFC.excel|write|A2:C8|Hallo
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
OFC.Excel|LastRow|$$REA
OFC.Excel|LastColumn|$$REB

MBX.Last used Column $$REA $crlf$ Last used Row: $$REB

OFC.Excel|LastRow|$$REA|1
OFC.Excel|LastColumn|$$REB|1

MBX.Measured in Row 1 Last used Column $$REA $crlf$ Last used
Row: $$REB

DMP.6
MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:

-

Limitations:

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The `LASTROW/LASTCOLUMN` Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

3.44.1.1.10 LETTER_TO_NUMBER

MiniRobotLanguage (MRL)

OFC.Excel|LETTER_TO_NUMBER

Convert a numeric value int othe Alphabetic value of the Excel X-Axis

Intention

This command does not need Excel to be opened. It is a pure mathematical operation.
It will convert a pure Excel-X-Axis "Letter-Number" to a numeric representation.
It is the logical opposite from the "NUMBER_TO_LETTER" command.

```
   ' Convert "DD" to "99"
OFC.Excel|LETTER_TO_NUMBER|DD|$$RES
DBP.$$RES
```

Syntax:

OFC.Excel|LETTER_TO_NUMBER|P1[|P2]

Parameter Explanation:

P1 - (numeric) value that specifies the excel representation of a Cell on the X-Axis starting with "A".
P2 - (optional/Variable) Variable that will receive the numeric result of the operation. If omitted, TOS is used.

Example:

```
' Excel NUMBER_TO_LETTER Example
OFC.excel|OPEN||0|1

OFC.Excel|LETTER_TO_NUMBER|ZZZ|$$RES
DBP.$$RES
OFC.Excel|NUMBER_TO_LETTER|$$RES|$$LET
DBP.$$LET
MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks:
-

Limitations:
These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
Will work on a large range of numbers at least from "A" to "ZZZZZZZ" (equals 236852010). Which is more then any Excel will possibly provide in the near future.

See also:

- !Excel-Scripting 508

© 2023 Theo Gottwald * https://www.smart-package.com

3.44.1.1.11 NUMBER_TO_LETTER

MiniRobotLanguage (MRL)

OFC.Excel|NUMBER_TO_LETTER

Convert a numeric value int othe Alphabetic value of the Excel X-Axis

Intention

This command does not need Excel to be opened. It is a pure mathematical operation.
It will convert a pure numberical count to the Excel-X-Axis "Letter-Number".
This way you can more easily iterate through all fields and still use the "RANGE" Parameter in other commands.

```
   ' Convert "99" to "DU"
OFC.excel|NUMBER_TO_LETTER|$$NUM|$$RES
   MBX.$$RES
```

Syntax:

OFC.Excel|NUMBER_TO_LETTER|P1[|P2]

Parameter Explanation:

P1 - (numeric) value that specifies the numeric representation of a Cell on teh X-Axis starting with "1".
P2 - (optional/Variable) Variable that will receive the result of the operation. If omitted, TOS is used.

Example:

```
' Excel NUMBER_TO_LETTER Example
OFC.excel|OPEN||0|1
DBP.---------------
' Activate by name
OFC.excel|SHEET_Activate|2
OFC.excel|write|A9:DU9|54
OFC.excel|write|A6:CU9|Hallo

OFC.Excel|LastRow|$$REA
OFC.Excel|LastColumn|$$REB

OFC.Excel|NUMBER_TO_LETTER|$$REB|$$REB
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX.Last used Column $$REA $crlf$ Last used Row: $$REB

DMP.6
MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:
-

Limitations:
These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
Will work from "A" to "ZZZZZZ" (equals 321272406).

See also:

3.44.1.1.12 OPEN

MiniRobotLanguage (MRL)

OFC.Excel|OPEN

OPEN or CREATE NEW MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
There are two parameters which can be changed to have Excel open in FULL-SCREEN Mode, or to open an invisible Instance.
If the command succeeds, it will drop an "1" on the TOS.

To Close your Excel-Instance, use the CLOSE Subcommand.

To Open an Instance of Excel, which does not load any worksheet, use:

```
OFC.excel|OPEN||0|1
```

Syntax:

OFC.Excel|OPEN|P1[|P2][|P3]

Parameter Explanation:

P1 - (optional) Filename of the XLS-File to open, can be any file that Excel can open.
P2 - (optional) 0/1 Fullscreen or Normal Window
P3 - (optional) 0/1 Visibility - if this is "0" then Excel will open invisible.

Example:

```
' Excel OPEN Example
VAR.$$PFA=?path\Test.xls
OFC.excel|OPEN|$$PFA|0|1
' Activate by name
OFC.excel|SHEET_Activate|2
OFC.excel|WRITE|A3:A4|44
OFC.excel|CLOSE|1
END.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks:
To Close your Excel-Instance, use the CLOSE Subcommand.
However, its not necessary to close an Excel File, if you want to leave it open, even after the SPR exits.

Limitations:
These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.

3.44.1.1.13 PAGE_UPDOWN

MiniRobotLanguage (MRL)

OFC.Excel|PAGE_UPDOWN

SCROLL MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
Use the PAGE_UPDOWN Subcommand to scroll your Sheet by one or more full page(s) up or down.

Parameter **P1** specifies how many pages to scroll up (negative parameter) or down (positive parameter).

```
' Scroll down 2 Pages
OFC.excel|PAGE_UPDOWN|2

' Scroll up 2 Pages
OFC.excel|PAGE_UPDOWN|-2
```

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|PAGE_UPDOWN|P1

Parameter Explanation:

P1 - (numeric) - Negative or positive number of pages to scroll up (negative) or down (positive)

Example:

```
' Excel PAGE-SCROLL UP/DOWN Example
OFC.excel|OPEN||0|1
' Activate by name
OFC.excel|SHEET_Activate|2
FOR.$$LOP|1|199
  CAL.$$LOA=$$LOP+1
  OFC.excel|WRITE|A$$LOP:A$$LOP|$$LOP
  OFC.excel|FORMULA SET|B$$LOP:XX$$LOP|=A$$LOP*78+$$LOP|0
NEX.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
FOR.$$LOP|1|90
  ' Scroll down
  OFC.excel|PAGE_UPDOWN|2
  PAU.1
  ' Scroll up
  OFC.excel|PAGE_UPDOWN|-2
  PAU.1
NEX.

MBX.!
'PAU.4
'OFC.excel|SAVE|1
OFC.excel|CLOSE|1
END.
```

Remarks:

You can not scroll much more down then there are lines in your Spreadsheed.

Limitations:

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The `PAGE_UPDOWN` Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

3.44.1.1.14 SAVE

MiniRobotLanguage (MRL)

OFC.Excel|SAVE

SAVE MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
To SAVE your Excel-Worksheet, use the SAVE Subcommand.
There is one Parameter, that will force Excel to suppress any Error-Messages like "File exists" etc.
Set the Force Flag to "1" if you want Excel to Save your Files anyway (if possible with the given name and path).

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|SAVE[|P1]

Parameter Explanation:

P1 - 0/1 - FORCE Flag suppress Error-Messages and force Excel to SAVE even if the file already exists

Example:

```
' Excel SAVE Example
VAR.$$PFA=?path\Test5.xls

' Open New empty Sheet
OFC.excel|OPEN||0|1

' Activate by name
OFC.excel|SHEET_Activate|2

' Save as Filename
OFC.excel|SAVEAS|$$PFA
MBX.!

' Write some numbers into Sheet
OFC.excel|FORMULA|A1:B10|2

' SAVE
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
OFC.excel|SAVE

' Show Stack
DMP.6

MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:
To Close your Excel-Instance, use the CLOSE Subcommand.
However, its not necessary to close an Excel File, if you want to leave it open, even after the SPR exits.

Limitations:
These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The SAVE Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

3.44.1.1.15 SAVEAS

MiniRobotLanguage (MRL)

OFC.Excel|SAVEAS

SAVE MS-Excel worksheet via the SPR using a Filename

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
To SAVE your Excel-Worksheet, use the SAVEAS Subcommand.
There is one Parameter, that will force Excel to suppress any Error-Messages like "File exists" etc.
Set the Force Flag to "1" if you want Excel to Save your Files anyway (if possible with the given name and path).

You can use the "SET" Commands to save with a Password and for other Options.

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|SAVEAS[|P1][|P2][|P3][|P4]

Parameter Explanation:

Filename$, Filetype&,Quite& (1-keine Alerts/0-Alerts),Create_Backup& (1/0)

P1 - (Text) Filenpath&Filename
P2 - (opt,numeric) - Fileformat - leave zero to use Standard "xlTextWindows" alternative numbers see below in "Remarks" Section. (default 0)
P3 - (opt,0/1) - FORCE Flag suppress Error-Messages and force Excel to SAVEAS even if the file already exists
P4 - (opt,0/1) - Generate Backup on Save (default 0)

Example:

```
' Excel SAVEAS Example
VAR.$$PFA=?path\Test5.xls

' Open New empty Sheet
OFC.excel|OPEN||0|1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Activate by name
OFC.excel|SHEET_Activate|2

' Save as Filename
OFC.excel|SAVEAS|$$PFA
MBX.!

' Write some numbers into Sheet
OFC.excel|FORMULA|A1:B10|2

' SAVE
OFC.excel|SAVE

' Show Stack
DMP.6

MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:

You can use the "SET" Commands to save with a Password and for other Options.

```
    XlFileFormat - please use the numbers on the right side:
     xlAddIn                                                = 18          ' &H00000
     xlCSV                                                  = 6           ' &H00000
     xlCSVMac                                               = 22          ' &H00000
     xlCSVMSDOS                                             = 24          ' &H00000
     xlCSVWindows                                           = 23          ' &H00000
     xlDBF2                                                 = 7           ' &H00000
     xlDBF3                                                 = 8           ' &H00000
     xlDBF4                                                 = 11          ' &H00000
     xlDIF                                                  = 9           ' &H00000
     xlExcel2                                               = 16          ' &H00000
     xlExcel2FarEast                                        = 27          ' &H00000
     xlExcel3                                               = 29          ' &H00000
     xlExcel4                                               = 33          ' &H00000
     xlExcel5                                               = 39          ' &H00000
     xlExcel7                                               = 39          ' &H00000
     xlExcel9795                                            = 43          ' &H00000
     xlExcel4Workbook                                       = 35          ' &H00000
     xlIntlAddIn                                            = 26          ' &H00000
     xlIntlMacro                                            = 25          ' &H00000
     xlWorkbookNormal                                       = -4143       ' &HFFFFF
     xlSYLK                                                 = 2           ' &H00000
     xlTemplate                                             = 17          ' &H00000

3.44.1.1.16 SCROLL_LEFTRIGHT

MiniRobotLanguage (MRL)

OFC.Excel|SCROLL_LEFTRIGHT

SCROLL MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
Also you need to activate the sheet first using:

```
' Activate by Number
OFC.excel|SHEET_Activate|1
```

Use the SCROLL_LEFTRIGHT Subcommand to scroll your Sheet by one or more cell(s) left or right.

Parameter **P1** specifies how many cells to scroll left (negative parameter) or right (positive parameter).

```
'Scroll 2 Cells to the right
OFC.excel|SCROLL_LEFTRIGHT|2

'Scroll 2 Cells to the left
OFC.excel|SCROLL_LEFTRIGHT|-2
```

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|SCROLL_LEFTRIGHT|P1

Parameter Explanation:

P1 - 0/1 - FORCE Flag suppress Error-Messages and force Excel to close

Example:

```
' Excel SCROLL UP/DOWN Example
OFC.excel|OPEN||0|1
' Activate by name
OFC.excel|SHEET_Activate|2
FOR.$$LOP|1|199
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  CAL.$$LOA=$$LOP+1
  OFC.excel|WRITE|A$$LOP:A$$LOP|$$LOP
  OFC.excel|FORMULA SET|B$$LOP:XX$$LOP|=A$$LOP*78+$$LOP|0
NEX.

FOR.$$LOP|1|90
  'Scroll 2 Cells to the right
  OFC.excel|SCROLL_LEFTRIGHT|2
  PAU.1
  'Scroll 2 Cells to the left
  OFC.excel|SCROLL_LEFTRIGHT|-2
  PAU.1
NEX.

MBX.!
'PAU.4
'OFC.excel|SAVE|1
OFC.excel|CLOSE|1
END.
```

Remarks:

You may not be able to scroll more to the right then there are used Cells in your sheet!

Limitations:

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The `SCROLL_LEFTRIGHT` Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

3.44.1.1.17 SCROLL_UPDOWN

MiniRobotLanguage (MRL)

OFC.Excel|SCROLL_UPDOWN

SCROLL MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
Use the SCROLL_UPDOWN Subcommand to scroll your Sheet by one or more line(s) up or down.

Parameter **P1** specifies how many lines to scroll up (negative parameter) or down (positive parameter).

```
' Scroll 2 Lines down
OFC.excel|SCROLL_UPDOWN|2

'Scroll 2 Lines up
 OFC.excel|SCROLL_UPDOWN|-2
```

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|SCROLL_UPDOWN|P1

Parameter Explanation:

P1 - 0/1 - FORCE Flag suppress Error-Messages and force Excel to close

Example:

```
' Excel SCROLL UP/DOWN Example
OFC.excel|OPEN||0|1
' Activate by name
OFC.excel|SHEET_Activate|2
FOR.$$LOP|1|199
  CAL.$$LOA=$$LOP+1
  OFC.excel|WRITE|A$$LOP:A$$LOP|$$LOP
  OFC.excel|FORMULA SET|B$$LOP:XX$$LOP|=A$$LOP*78+$$LOP|0
NEX.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
FOR.$$LOP|1|90
' Scroll 2 Lines down
  OFC.excel|SCROLL_UPDOWN|2
  PAU.1
  'Scroll 2 Lines up
  OFC.excel|SCROLL_UPDOWN|-2
  PAU.1
NEX.

MBX.!
'PAU.4
'OFC.excel|SAVE|1
OFC.excel|CLOSE|1
END.
```

Remarks:

To Close your Excel-Instance, use the CLOSE Subcommand.
However, its not necessary to close an Excel File, if you want to leave it open, even after the SPR exits.

Limitations:

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The `PAGE_UPDOWN` Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

3.44.1.1.18 SENDKEY

MiniRobotLanguage (MRL)

OFC.Excel|SENDKEY

Write to a Cell in an MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.

The Sendkey Subcommand will be useful to navigate inside Excel. To find the right keys to send, go into Excel manually and pres the ALT-key.

```
' Open the File-Menu
OFC.Excel|SENDKEY|"%d"
' Choose new Page
OFC.Excel|SENDKEY|"%n"

' Write "Hallo"
OFC.Excel|SENDKEY|Hallo
```

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|SENDKEY|P1

Parameter Explanation:

P1 - Characters to send. Besides normal Letters there are several special characters.

```
' Excel WRITE Example
OFC.excel|OPEN||0|1
' Activate by name
OFC.excel|SHEET_Activate|2
' Write "Hallo"
OFC.Excel|SENDKEY|Hallo
' Open the File-Menu
OFC.Excel|SENDKEY|"%d"
' Choose new Page
OFC.Excel|SENDKEY|"%n"
MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:

Not all Character-Kombinations make sense using SENDKEY. You can use the Standard SPR Keyboard Simulation Features also, but the Chance that Keys get lost are minimized if you use this Sendkey-Version, as it internally checks that no further Key is send until the Key before has been processed.

Limitations:

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The SENDKEY Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

3.44.1.1.19 WRITE

MiniRobotLanguage (MRL)

OFC.Excel|WRITE

Write to a Cell in an MS-Excel worksheet via the SPR

Intention

Generally you will need to OPEN a Excel-Instance first, this is done using the "OPEN" Subcommand.
To SAVE your Excel-Worksheet, use the SAVE Subcommand.
There is one Parameter, that will force Excel to suppress any Error-Messages like "File exists" etc.
Set the Force Flag to "1" if you want Excel to Save your Files anyway (if possible with the given name and path).

The WRITE Command wiill just put Text and Numbers into the Sheet. It will not place Formulas there.
Use the FORMULA-Command for that.

The Command will drop an "1" on the TOS if it was successful, otherwise a "0".

Syntax:

OFC.Excel|WRITE|P1|P2[|P3]

Parameter Explanation:

P1 - RANGE, A1:A1 oder A1:B400 specifies the coordinates of the cells to be written to.
P2 - Text, this text is written in the cells. Delimiter can be used (P3).
P3 - (opt./numeric) 0/1/2/3 - Which delimiters are evaluated.
0 - no delimiters are evaluated, just write one Cell
1 - use Row-Delimiter (default = ",")
2 - use Column-Delimiter (default = ";")

Example:

```
' Excel WRITE Example
OFC.excel|OPEN||0|1
' Activate by name
OFC.excel|SHEET_Activate|2
OFC.excel|WRITE|B1:F8|23,44;+A1*2,=+A2*2|1
OFC.excel|WRITE|B9:F9|55,-6;8,+A2*2|2
OFC.excel|WRITE|B12:e19|55,-6;8,+A2*2|1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
DMP.6
MBX.Click to Close
OFC.excel|CLOSE|1
END.
```

Remarks:
To Close your Excel-Instance, use the CLOSE Subcommand.
However, its not necessary to close an Excel File, if you want to leave it open, even after the SPR exits.

Limitations:
The WRITE Command will just put Text and Numbers into the Sheet. It will not place Formulas there.
Use the FORMULA-Command for that.

These commands need an valid Installation of MS-Office Excel. It will check if MS Excel is properly installed, and if not just do nothing.
The WRITE Subcommand will only work with Excel-Instances that have previously been opened with the OPEN Subcommand of the same Robot-Instance.
If the command succeeds, it will drop an "1" on the TOS.

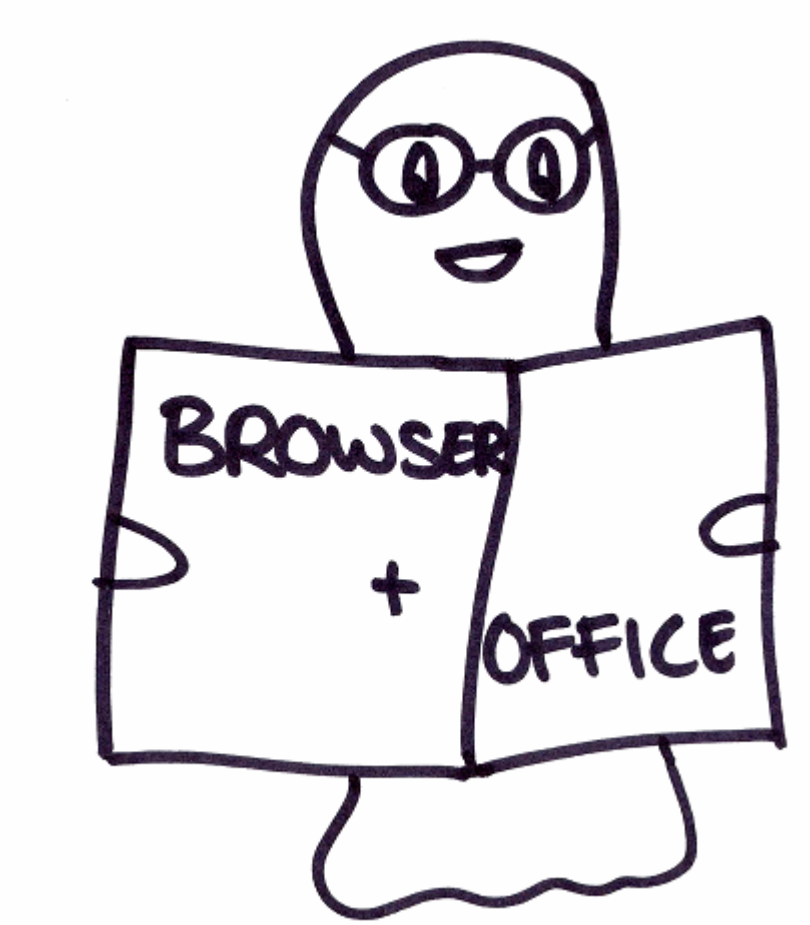
3.44.2 ! Smarty's Browser and Office Commands

Smarty's Browser and Office Commands



The Mini-Browser

The Mini-Browser is a Component of the SPR System. Internally it uses a Internet Explorer Control to display all the WEB-Sites in the same way as a Standard Internet Explorer would do. Technically the Internet Explorer Control is on any Windows Computer, no matter if the Internet Explorer itself is installed or not.

Using this Standard Internet Explorer Technology, the Mini-Browser (MB) is perfectly compatible with all the Commands `SAO.`, `AGR.` `etc.`
The `AGR.` Command will even Scroll the MB in the same way as if it would be an Standard Internet Explorer.

Why an own Browser?

*© 2023 Theo Gottwald * https://www.smart-package.com*

One important advantage is, that you are not so much dependent on the Browser that is installed on the target system. When you compile an executable, then **the Mini-Browser is been included in the package** and will be available on the target system.
This makes the target situation equal to the recording situation.

Secondly the MB opens its heartbeats to you. Using the supplied Systemvariables 334 and commands that are specifically for the MB, you can "hear" any event that occurs while loading a WEB- or Intranet Site. And of course you will know when its completely loaded and ready to take action.
And you can check if there have been any errors. In that later case, you will also know, exactly which error has happened.

What is it good for?

This gives you a new level of control over WEB-based automations.
No matter if you want to register a specific software package, or if you want to test the availability of your company WEB-Site.
The new MB will help you to get the Job done in a fraction of the time, that you would have needed without it.

How do I start the Mini-Browser (MB) ?

The Mini-Browser should be started using the `LBR.`-command to take full advantage of all its features.

Using the `LBR.`-Command you can immediately give all these needed Information like

- Size and Position
- Starting Page
- Survive when Robot/Script ends? Or close in this case?

to the MB directly on Startup.

As you can see in the picture below, the MB is optimized for cisual automation.
It does not only have the normal "Status Line", but also has another Events-Static, at the Top of the window. Using these, you can perfectly control its actions within a script.
Even without using any of the special features that are available.

Having said this, you can start the MB just like any other browser, using a Commandline:

```
EXE.SPR-Browser.exe www.fa2.de
MBX.Ready
ENR.
```

This way you can only give one hyperlink and no other parameters.

Can I "connect" my Script to a MB that was already running?

To use all the features, the MB must be connected with the Robot-Script.
This is automatically done, when you use the `LBR.`-Command to start the MB.

© 2023 Theo Gottwald * https://www.smart-package.com

If the MB is already running, you can "connect" your Script to that MB.
This is useful, when the MB is been started from other tools or programs.

```
' Connect to a running MB usign
' LBR.connect

EXE.SPR-Browser.exe www.fa2.de
' First locate the MB you want to connect
STW.t|SPR Mini
' Or get its CUN
GIK.cfh.||$$BCU
' THen use LBR. to connect to the desired MB
LBR.connect|$$BCU
' Here is check if it worked
DOL.
  DBP.$mb_ert$
  DBP.#mb_busy#-#mb_prog#
OOP.(0)
MBX.Ready
ENR.
```

How do i register a browser as the default browser?

You can register the MB temporarily or permanent as the default browser.
This may also be needed, when you have a program that automatically starts a browser.
If you register the MB as Default Browser, you can more easy use it for browsing the WEB.

These are the registry keys you need to change to set the default browser:

```
HKEY_CLASSES_ROOT\http\shell\open\command
HKEY_CLASSES_ROOT\https\shell\open\command
```

You can just write the path of the desired browser into this Reg-Key.

© 2023 Theo Gottwald * https://www.smart-package.com

A Screenshot of the Mini-Browser.

© 2023 Theo Gottwald * https://www.smart-package.com

3.44.3 AFT. / AFF.. - Acc.- Find Text

AFT. / AFF. - Acc.- Find Text (Sear Previous 554 Top 41 Next 564

MiniRobotLanguage (MRL)

AFT. Command

Accessibility Find Text

AFF. Command

Accessibility Find Fast

Intention

These commands will search for a specified text in the given window. It was designed for most easy usage. You search a text?
`AFT./ AFF.` will search that text in that window.
`AFT./ AFF.` was made for easy usage. Just give the text to search for. Like in this example.
The only difference between `AFT.` and `AFF.` is, that `AFF.` uses multiple CPU-Cores. This may lead to a SpeedUp under circumstances when AFT. is too slow.
If AFT. is fast enough, use AFT. because in this case AFF. may be slower then. If AFT, is too slow, try AFF. instead.

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
AFT.|google&ANDTHEN:nwshp
MMV.
ENR.
```

You can specify a role-parameter, if you want. Like below.

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
AFT.40,43|google&ANDTHEN:nwshp
MMV.
ENR.
```

But maybe you don't want in most cases, if your text is unique. If you want to click immediately on the found object, `AFT.` understands all "Inline Role-Parameters" (Subcommands) like `AGR`.

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
' This will immediately click the link.
AFT.!MOS.|google&ANDTHEN:nwshp
ENR.
```

If the target application is an Internet explorer, `AFT.` will scroll to bring the located object into the visible area.

© 2023 Theo Gottwald * https://www.smart-package.com

Technically AFT. localizes a specified Acc.-Object in a Child-Window or Top-Window and sets the actual point into the object center. It's similar to AGR. but it does not separate the value and the name parameter. They are both treated as "Text".

Additionally you can specify a number, if there are multiple objects that fit your textual description, and you prefer to not take the first one. If you omit the number the default is 1. Means that you will get the first object that fits your description.

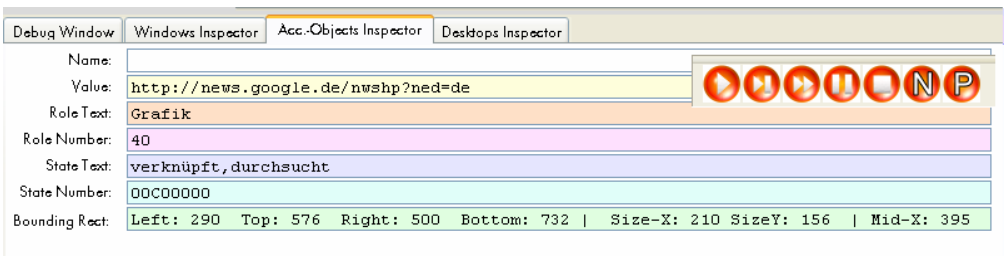
AFT. supports the use of so called "Role-Parameter". These are Inline-Subcommands which get executed only if the object could be found. Here is an example:

```
' The "Inline MOS." will select the Link in the IE
AFT.!MOS.|google&ANDTHEN:nwshp
```

For a complete list of all "Role-Parameters" see below.

You can see Acc-Objects in the Acc.-Inspector.Let us see an example from a WEB-Site in the Internet Explorer:

In the picture below you will see the resulting Display in the Acc.-Inspector.



The most important parameters for AFT. are:
"**text**" and "**role**". In most cases you can even ignore the role parameter and just use "text".

Now we'll take the above picture from the Acc.-Analyzer, and make the code for it.

Using AFT. we do best locate a Top- and a child-window. Like this:

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
SCW.ct|Shell DocObject View|{&NOTEXT:}
AFT.40|google&ANDTHEN:nwshp
MMV.
ENR.
```

In some cases this may not be possible, or will not work. Then we can use `AFT.` just on the Top-Window:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
AFT.40|google&ANDTHEN:nwshp
MMV.
ENR.
```

Which may be a bit slower in execution times, depending on the overall complexity of the WEB-/Office program.

Hints:
It is important, that you localize a window before using `AFT.`

`Unlike SAO., AFT.` does not use the 1.4. The Prototype Parameter System 73.

`AFT.` supports 3.2 Standard-Search Pattern 341 and they can help you to better define the things you look for. See example above "`google&ANDTHEN:nwshp`".

Please note that `AFT.` can be quite slow when being used on complex applications and slow Computers.

Use the Acc.-Inspector in the Editor to get the necessary parameter data.

`AFF.`

We have implemented an (undocumented) experimental) version of `AFT.`, called `AFF.` Unlike `AFT.`, `AFF.` uses multilpe CPU-cores to speed things up. It will not scroll the `IE`, and the "Nr." parameter may not work as expected (which is due to the fact that we can not predict, which core finds what element first). It may however be faster in complex cases then `AFT.` `AFF.` is experimental, Use it with caution.

Syntax

AFT.[P1][|P2...|Px]
AFF.[P1][|P2...|Px]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - (optional)* Role, and Role-Parameter,** a numeric value as you it in the Acc.-Inspector, when you are over the element with the mouse. ***You can specify additional "Subcommands" after the Role-Parameter* (See below), separated by a "!". Example:

```
AFT.40!WII.MLE.|google&ANDTHEN:nwshp
```

P2 - (optional)* Text**, a string / text as you it in the Acc.-Inspector, when you are over the element with the mouse. ***"Text" can be the "Value" as well as the "Name".

***P3 - (optional)* Number** of the element. There may be multiple elements that fit your description. In that case you can choose which one you want using this parameter. You need to try which number you need to locate the element of your choice.

***P4 - (optional)* Flags.** A numeric value that is a combination of the below numbers.

```
1 - only Objects,
2 - only Simple Elements
4 - display debug info while searching.
```

```
while all parameters are marked as "optional", you need to
specify some of them. An empty AGR. does not make any sense.
```

*Role-Parameter:

You can specify multiple Roles, they must be separated by ",".
Any of these will be valid.

If you specify a "#" before the Role-Parameter, it will mean "Role-Group" and specifies any of the following:
0: unknown
1: User-bedienbare Controls
2: Panels, Client und Background
4: Borders etc.
8: Window-Controls (Titlebar, Minimize etc.)
16: Scrollbars
32: Spezial, Cursor, Sound etc.
These inline-commands can be specified together with the role-parameter, separated by a "!". You can specify as man of them as you wish. They will only get executed, in case of an element is found:

```
"TAF" - "a" ' Take Focus
"TAS" - "b" ' Take Selection
"ESE" - "c" ' Ext. Select
"ASE" - "d" ' Add to Selection
"RSE" - "e" ' Remove Selection
"SSE" - "f" ' Strong Select
"SHC" - "g" ' Shift-Click
"CCS" - "h" ' ctrl-click - select
"CSE" - "i" ' ctrl-click cancel selection
"MER" - "j" ' MER at Pos.
"MSE" - "k" ' do Multiselect
"MOS" - "m" ' Mouseless Operation Select
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
"DMO" - "n" ' Double Mouseless Operation Select
"MLI" - "o" ' MLI at place
"DMR" - "p" ' Double Mouseless Operation Select with rest
"MPO" - "q" ' Mousepointer Position Set
"MSO" - "r" ' Mouse Operation
"MDO" - "s" ' Mouse Double Operation
"WIN" - "t" ' Set Wait-Input Idle- Time to infinte
"MDC" - "u" ' MDC at place
"MRC" - "v" ' MRC at place
"WII" - "w" ' Wait-for-Input-Idle (max. 5 Seconds)
"MLE" - "x" ' MLE.
"SMP" - "y" ' Set Mousepos Mode
"BTP" - "z" ' Set Left-ControlPosition like for Checkmark
"BTC" - "0" ' check State before click and click
              if actually state=0 (check it)
"BTS" - "1" ' check State before click and click if actually
              state=1 (uncheck it)
```

Example

```
' This Example will find an item in the Internet Explorer
' on a WEB-Site
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
SCW.ct|Shell DocObject View|{&NOTEXT:}
AGR.40||google&ANDTHEN:nwshp|1|64
MMV.
ENR.
```

Remarks

-

Limitations:

This command can be slow on complex applications.

AGR. / AGF. - Acc.-Get Rect (Search Acc.-Object) Previous 558 Top 41 Next 570

MiniRobotLanguage (MRL)

AGR. Command

Search Accessible Object

AGF. Command

Search Accessible Object Fast

Intention

This command localizes a specified Acc.-Object in a Child-Window or Top-Window and sets the actual point into the object center.
It's similar to `SAO.` but it does not use the 1.4. The Prototype Parameter System 73 for its parameters. Therefore it has only the basic options, but may be easier to use.

AGR. is using just one CPU-Core and therefore the order in which you find Objects is clearly defined.
AGF. uses multiple CPU-Cores, this makes it faster on large search operations, but does not allow you to specify the order in which objects are returned.
As we can not know which CPU finds which Object first.

```
012 0000000000332592 0001 STW.ct|IEFrame|Theo Gottwald
013 0000000009320706 0001 AGR.40||findip

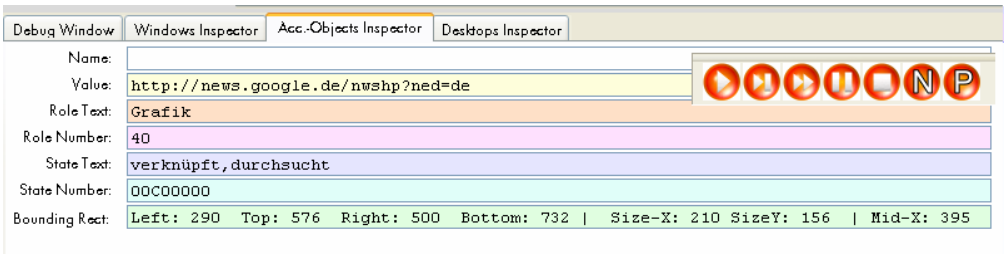
019 0000000000000000 0000 MBX.1
020 0000000000000000 0000 ENR.
```

You can see Acc-Objects in the Acc.-Inspector.Let us see an example from a WEB-Site in the Internet Explorer:

© 2023 Theo Gottwald * https://www.smart-package.com

In the picture below you will see the resulting Display in the Acc.-Inspector.



The most important parameters for AGR. are:
"**name**", "**role**" and "**value**". In most cases you can ignore the other parameters.

Now we'll take the above picture from the Acc.-Analyzer, and make the code for it.

Using AGR. we do best locate a Top- and a child-window. Like this:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
SCW.ct|Shell DocObject View|{&NOTEXT:}
AGR.40||google&ANDTHEN:nwshp
MMV.
ENR.
```

In some cases this may not be possible, or will not work. Then we can use AGR just on the Top-Window:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
AGR.40||google&ANDTHEN:nwshp
MMV.
ENR.
```

Which may be a bit slower in execution times, depending on the overall complexity of the WEB-/Office program.

© 2023 Theo Gottwald * https://www.smart-package.com

If the target application is an Internet explorer, AGR. will scroll to bring the located object into the visible area.

AGR. supports the use of so called "Role-Parameter". These are Inline-Subcommands which get executed only if the object could be found. Here is an example:

```
' The "Inline MOS." will select the Link in the IE
AGR.40!MOS.||google&ANDTHEN:nwshp
```

For a complete list of all "Role-Parameters" see below.

Hints:
It is important, that you localize a window before using AGR.

Unlike SAO., AGR. does not use the 1.4. The Prototype Parameter System 73.

AGR. supports 3.2 Standard-Search Pattern 341 and they can help you to better define the things you look for. See example above "google&ANDTHEN:nwshp".

Please note that AGR. can be quite slow when being used on complex applications and slow Computers.

Use the Acc.-Inspector in the Editor to get the necessary parameter data.

If you use the AGR.-Command for a**utomated Installations**, like for Office 2007 or Office 2010, its absolutely necessary that you specify the **Flag 19.**
Otherwise the AGR. Command will localize invisible elements and the installation will not work as expected.

Syntax

```
AGR.[P1][|P2...|Px]
AGF.[P1][|P2...|Px]
```

Parameter Explanation

P1 - (optional)* Role, and Role-Parameter,** a numeric value as you it in the Acc.-Inspector, when you are over the element with the mouse. ***You can specify additional "Subcommands" after the Role-Parameter* (See below), separated by a "!". Example:

```
AGR.40!WII.MLE.||google&ANDTHEN:nwshp
```

***P2 - (optional)* Name**, a string / text as you it in the Acc.-Inspector, when you are over the element with the mouse.

***P3 - (optional)* Value,** a string / text as you it in the Acc.-Inspector, when you are over the element with the mouse.

© 2023 Theo Gottwald * https://www.smart-package.com

***P4 - (optional)* Number** of the element. There may be multiple elements that fit your description. In that case you can choose which one you want using this parameter. You need to try which number you need to locate the element of your choice.

***P5 - (optional)* Flags.** A numeric value that is a combination of the below numbers.

1 - only Objects,
2 - only Simple Elements
4 - display debug info while searching.
8 - if set, then elements with the %STATE_SYSTEM_INVISIBLE will also be found.
16 - if set, then elements with the %STATE_SYSTEM_INVISIBLE or the %STATE_SYSTEM_UNAVAILABLE will also be found. Needed for Setup automation, like MS-Office 2007 or 2010.
32 - NoScroll-Flag. Using this Flag, you can permit AGR to scroll in the Internet Explorer.

while all parameters are marked as "optional", you need to specify some of them. An empty AGR. does not make any sense.

***P6 - (optional)* Waiting Time.** if given, AGR. will wait the specified amount of time if that specified Object will appear. Needed to wait for WEB-Sites or in Setup Scripts.

***P7 - (optional)* On NOT Found Jump to.** if given, AGR. will jump to the specified Label, if that specified Object is not found in the specified time.

***Role-Parameter:**

You can specify multiple Roles, they must be separated by ",".
Any of these will be valid.

If you specify a "#" before the Role-Parameter, it will mean "Role-Group" and specifies any of the following:
0: unknown
1: User-bedienbare Controls
2: Panels, Client und Background
4: Borders etc.
8: Window-Controls (Titlebar, Minimize etc.)
16: Scrollbars
32: Spezial, Cursor, Sound etc.

These inline-commands can be specified together with the role-parameter, separated by a "!". You can specify as man of them as you wish. They will only get executed, in case of an element is found:

```
"TAF" - "a" ' Take Focus
"TAS" - "b" ' Take Selection
"ESE" - "c" ' Ext. Select
"ASE" - "d" ' Add to Selection
"RSE" - "e" ' Remove Selection
"SSE" - "f" ' Strong Select
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
 "SHC" - "g" ' Shift-Click
 "CCS" - "h" ' ctrl-click - select
 "CSE" - "i" ' ctrl-click cancel selection
 "MER" - "j" ' MER at Pos.
 "MSE" - "k" ' do Multiselect
 "MOS" - "m" ' Mouseless Operation Select
 "DMO" - "n" ' Double Mouseless Operation Select
 "MLI" - "o" ' MLI at place
 "DMR" - "p" ' Double Mouseless Operation Select with rest
 "MPO" - "q" ' Mousepointer Position Set
 "MSO" - "r" ' Mouse Operation
 "MDO" - "s" ' Mouse Double Operation
 "WIN" - "t" ' Set Wait-Input Idle- Time to infinte
 "MDC" - "u" ' MDC at place
 "MRC" - "v" ' MRC at place
 "WII" - "w" ' Wait-for-Input-Idle (max. 5 Seconds)
 "MLE" - "x" ' MLE.
 "SMP" - "y" ' Set Mousepos Mode
 "BTP" - "z" ' Set Left-ControlPosition like for Checkmark

 "BTS" - "1" ' check State before click and click if actually
               state=1 (uncheck it)
```

Example

```
' This Example will find an item in the Internet Explorer
' on a WEB-Site
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
SCW.ct|Shell DocObject View|{&NOTEXT:}
AGR.40||google&ANDTHEN:nwshp|1|64
MMV.
ENR.
```

Remarks

-

Limitations:

This command can be slow on complex applications. In such case use AGF. insteead of AGR.
You can not use this command to wait for a WEB-Site to be opened as it tries to analyze internal structures that are going to be rebuild in the WEB-Site.
Using this commands on WEB-Sites that do just load/rebuild internal structures may lead to all sorts of crashes.
Using the command on a WEB-Site that is going to be opened, may therefore result in a unrecoverable crash of the robot program.

3.44.5 AMS. - Acc.-Multi Scan

AMS. - Acc.- Multi Scan (Visual Acc.-Object Scan) Previous 564 Top 41 Next 582

MiniRobotLanguage (MRL)

AMS. Command

Scan for Accesible Object

Intention

This command localizes a specified Acc.-Object in a Child-Window or Top-Window and sets the actual point into the object center.

Unlike `SAO.,AFT.,AGR.` etc. `AMS.` uses a scanning technique instead of a search technique.
Therefore `AMS.` can find Acc.-Objects that can not be found using any other command. Technically the `AMS.` does the same, like when you use the Acc.-Inspector from the Editor, and drive through the window, scanning for a object.
Therefore only Objects that are currently visible and on Top can be scanned/searched using `AMS.`.

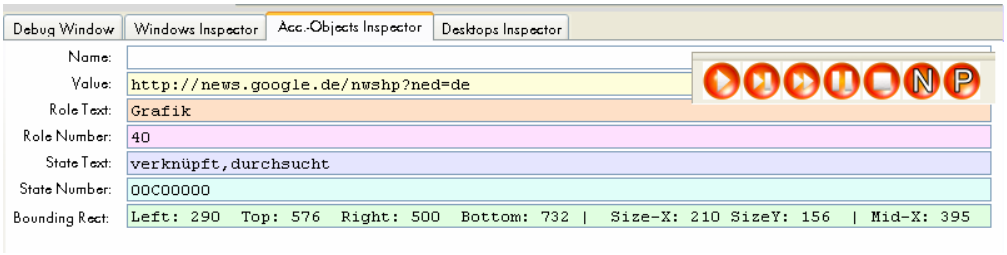
You can see Acc-Objects in the Acc.-Inspector. If you see Acc.-Objects in teh Acc.-Inspector, but you can not localize them with any of the search commands, then `AMS.` can get them for you. This is where `AMS.` can be used.

`AMS.` uses multiple CPU-Cores at the same time to speed things up. Therefore the time, `AMS.` needs to locate an object depends heavily on the size of the window, and as well on the number and speed of the CPU cores.

Let us see an example from a WEB-Site in the Internet Explorer:

In the picture below you will see the resulting Display in the Acc.-Inspector.

© 2023 Theo Gottwald * https://www.smart-package.com



The most important parameters for AMS. are:
"**name**", "**role**" and "**value**" and we also have "**Step**". In most cases you can ignore the other parameters.

Now we'll take the above picture from the Acc.-Analyzer, and make the code for it.

Using AMS. we do best locate a Top- and a child-window. Like this:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet Explorer
SCW.ct|Shell DocObject View|{&NOTEXT:}
AMS.40||google&ANDTHEN:nwshp
MMV.
ENR.
```

In some cases this may not be possible, or will not work. Then we can use AGR just on the Top-Window:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet Explorer
AMS.40||google&ANDTHEN:nwshp|1|25
MMV.
ENR.
```

Which may be a bit slower in execution times, depending on the overall complexity of the WEB-/Office program.

If the target application is an Internet explorer, AMS. will not scroll to bring the located object into the visible area. It will not find any element that is not completely visible for scanning. Therefore use the SWP. command, to make sure that the window has a sufficient size.

AMS. will never work behind a cover, like the cover that can be created using the UCV. command.

AMS. supports the use of so called "Role-Parameter". These are Inline-Subcommands which get executed only if the object could be found. Here is an example:

```
' The "Inline MOS." will select the Link in the IE
AMS.40!MOS.||google&ANDTHEN:nwshp
```

For a complete list of all "Role-Parameters" see below.

Hints:
It is important, that you localize a window before using AMS.

© 2023 Theo Gottwald * https://www.smart-package.com

Unlike SAO., the AMS. command does not use the 1.4. The Prototype Parameter System 73.

AMS. supports 3.2 Standard-Search Pattern 341 and they can help you to better define the things you look for. See example above "google&ANDTHEN:nwshp".

Please note that AMS. can be quite slow when being used on large windows and with slow Computers. AMS. will speed up with multiple CPU cores, the more the better.

Use the Acc.-Inspector in the Editor to get the necessary parameter data.

Syntax

AMS.[P1][|P2...|Px]

Parameter Explanation

P1 - (optional)* Role, and Role-Parameter,** a numeric value as you it in the Acc.-Inspector, when you are over the element with the mouse. ***You can specify additional "Subcommands" after the Role-Parameter* (See below), separated by a "!". Example:

```
AMS.40!WII.MLE.||google&ANDTHEN:nwshp
```

***P2 - (optional)* Name**, a string / text as you it in the Acc.-Inspector, when you are over the element with the mouse.

***P3 - (optional)* Value,** a string / text as you it in the Acc.-Inspector, when you are over the element with the mouse.

***P4 - (optional)* Number** of the element. There may be multiple elements that fit your description. In that case you can choose which one you want using this parameter. You need to try which number you need to locate the element of your choice.

***P5 - (optional)* Step.** A numeric value that is the raster-size, of the scanning-net. The higher this parameter, the faster AMS. will work. Imagine the Step parameter like the size of the holes in a fisher net. The larger the holes, the bigger the fishes have to be, to be caught. The default value is 5. A good number would be, a bit less then the half size of the element you are looking for, in pixels.

While all parameters are marked as "optional", you need to specify some of them. An empty AGR. does not make any sense.

***Role-Parameter:**
These inline-commands can be specified together with the role-parameter, separated by a "!". You can specify as man of them as you wish. They will only get executed, in case of an element is found:

```
"TAF" - "a" ' Take Focus
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
"TAS" - "b" ' Take Selection
"ESE" - "c" ' Ext. Select
"ASE" - "d" ' Add to Selection
"RSE" - "e" ' Remove Selection
"SSE" - "f" ' Strong Select
"SHC" - "g" ' Shift-Click
"CCS" - "h" ' ctrl-click - select
"CSE" - "i" ' ctrl-click cancel selection
"MER" - "j" ' MER at Pos.
"MSE" - "k" ' do Multiselect
"MOS" - "m" ' Mouseless Operation Select
"DMO" - "n" ' Double Mouseless Operation Select
"MLI" - "o" ' MLI at place
"DMR" - "p" ' Double Mouseless Operation Select with rest
"MPO" - "q" ' Mousepointer Position Set
"MSO" - "r" ' Mouse Operation
"MDO" - "s" ' Mouse Double Operation
"WIN" - "t" ' Set Wait-Input Idle- Time to infinte
"MDC" - "u" ' MDC at place
"MRC" - "v" ' MRC at place
"WII" - "w" ' Wait-for-Input-Idle (max. 5 Seconds)
"MLE" - "x" ' MLE.
"SMP" - "y" ' Set Mousepos Mode
"BTP" - "z" ' Set Left-ControlPosition like for Checkmark
"BTC" - "0" ' check State before click and click
              if actually state=0 (check it)
"BTS" - "1" ' check State before click and click if actually
              state=1 (uncheck it)
```

P6 **-** ***(optional)*** **Waiting Time.** if given, AGR. will wait the specified amount of time if that specified Object will appear. Needed to wait for WEB-Sites or in Setup Scripts.

P7 **-** ***(optional)*** **On NOT Found Jump to.** if given, AGR. will jump to the specified Label, if that specified Object is not found in the specified time.

Example

```
' Example comparing AVF. with AMS
'
STW.ct|IEFrame|Theo Gottwald
AVF.40||ing-diba|1|70
MMV.
AMS.40||ing-diba|1|70
MMV.
DMP.1
MBX.1
ENR.

' Choosing a raster size of 40 is possible for long elements
' and will speed up search significantly
'
STW.ct|IEFrame|theo&ANDTHEN: - Windows Internet Explorer
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
AMS.40||focus|1|40
MMV.
ENR.
```

Remarks

This command will speed up with a growing number of CPU-Cores.

Limitations:

This command can be slow on large windows.

3.44.6 AVF. - Accesibility Visual Find

AVF. - Acc.- Visual Find (Visual Acc.-Object Scan) Previous 564 Top 41 Next 582

MiniRobotLanguage (MRL)

AVF. Command

Scan for Accesible Object

Intention

This command localizes a specified Acc.-Object in a Child-Window or Top-Window and sets the actual point into the object center.

Unlike `SAO.,AFT.,AGR.` etc. `AVS.` uses a scanning technique instead of a search technique.
Therefore `AVF.` can find Acc.-Objects that can not be found using any other command. Technically the `AVF.`
does the same, like when you use the Acc.-Inspector from the Editor, and drive through the window, scanning for a object.

Therefore only Objects that are currently visible and on Top can be scanned/searched using `AVF.`
You can see Acc-Objects in the Acc.-Inspector. If you see Acc.-Objects in the Acc.-Inspector,
but you can not localize them with any of the search commands, then `AMS.` or `AVF.` can get them for you. This is where `AMS.` and `AVF.` can be used.

`AVF.` uses multiple CPU-Cores at the same time to speed things up.
Therefore the time, `AVF.` needs to locate an object depends heavily on the size of the window, and as well on the number and speed of the CPU cores.

AMS. and AVF. use different internal Implementation. Also AVF. leaves other information on the TOS.
In terms of Speed both are similar fast.

```
010 0000000018315666 0001 STW.ct|#32770|PB/Win IDE 10.04 beta build
011 0000000009056948 0001 SCW.nict|1|302|ToolbarWindow32|{&NOTEXT:}
012 0000000024558055 0001 AVF.43|Print
013 0000000026442359 0001 AMS.43|Print
014 0000000029818745 0001 MMV.
015 0000000000000000 0001 DMP.1
016 0000000000000000 0000 MBX.1
```

In this Sample AVS. is a bit faster

© 2023 Theo Gottwald * https://www.smart-package.com

```
012 0000000000225522 0001 STW.ct|IEFrame|Theo Gottwald
013 0000000515178748 0001 AVF.40||ing-diba
014 0000000029706078 0001 MMV.
015 0000000479818740 0001 AMS.40||ing-diba
016 0000000012501280 0001 MMV.
017 0000000000000000 0001 DMP.1
018 0000000000000000 0000 MBX.1
019 0000000000000000 0000 ENR.
```

In this Sample AMS. is faster

Here are some Speed Considerations:
First we use a step of 7 (Default)

```
012 0000000000700386 0001 STW.ct|IEFrame|Theo Gottwald
013 0000000554899556 0001 AVF.40||ing-diba|1|7
014 0000000029917839 0001 MMV.
015 0000000887212953 0001 AMS.40||ing-diba|1|7
016 0000000029778553 0001 MMV.
017 0000000000000000 0001 DMP.1
018 0000000000000000 0000 MBX.1
019 0000000000000000 0000 ENR.
```

Here we use a Step-Value of 7

Second we use a step of 70: Note that AVF. will internally scale down if it does not find anything until the Step-Value is smaller then 4.

```
012 0000000000208610 0001 STW.ct|IEFrame|Theo Gottwald
013 0000000027980512 0001 AVF.40||ing-diba|1|70
014 0000000012524153 0001 MMV.
015 0000000128987777 0001 AMS.40||ing-diba|1|70
016 0000000029821614 0001 MMV.
017 0000000000000000 0001 DMP.1
018 0000000000000000 0000 MBX.1
019 0000000000000000 0000 ENR.
```

Here we use a Step-Value of 70 which is significantly faster.

Let us see an example from a WEB-Site in the Internet Explorer:

*© 2023 Theo Gottwald * https://www.smart-package.com*

In the second picture above you see the resulting Display in the Acc.-Inspector.

The most important parameters for AVF. are:
"**name**", "**role**" and "**value**" and we also have "**Step**".
Now we'll take the above picture from the Acc.-Analyzer, and make the code for it.

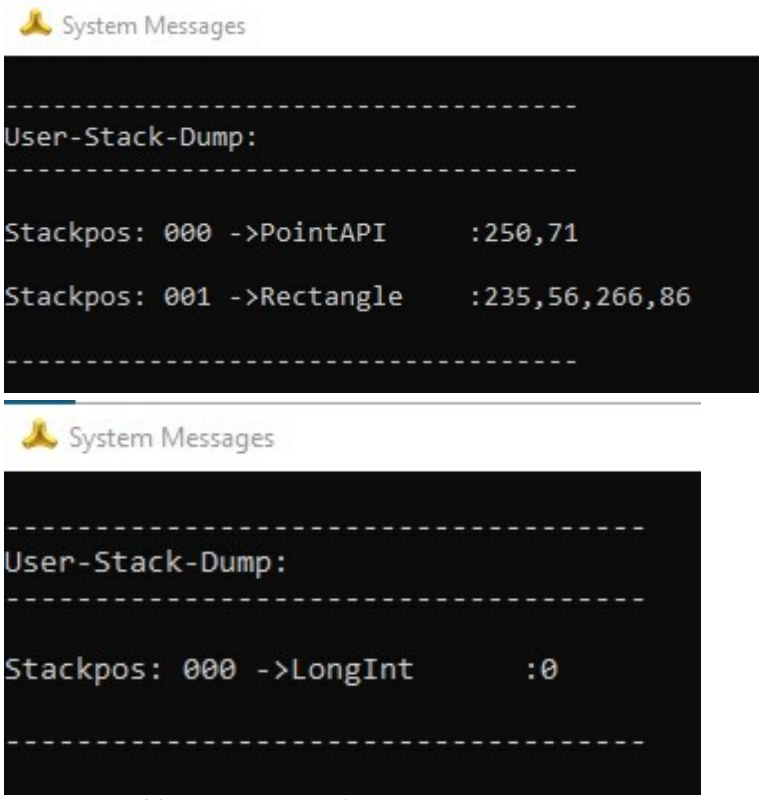
Using AVF. we do best locate a Top- and a child-window. Like this:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
SCW.ct|Shell DocObject View|{&NOTEXT:}
AVF.40||google&ANDTHEN:nwshp
MMV.
ENR.
```

In some cases this may not be possible, or will not work. Then we can use AGR just on the Top-Window:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
AMS.40||google&ANDTHEN:nwshp|1|25
MMV.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com



This is the TOS when we have found something.
This is the TOS when we did not find anything.

Which may be a bit slower in execution times, depending on the overall complexity of the WEB-/Office program.

If the target application is an Internet explorer, `AMS.` will not scroll to bring the located object into the visible area. It will not find any element that is not completely visible for scanning. Therefore use the `SWP.` command, to make sure that the window has a sufficient size.

Use `AVF.` with a larger Step value, for example the Size of the object. It will automatically scale down internally if it does not find anything.
This is the major difference to `AMS.`

`AVF.` will never work behind a cover, like the cover that can be created using the `UCV.` command.

`AVF.` supports the use of so called "Role-Parameter". These are Inline-Subcommands which get executed only if the object could be found. Here is an example:

```
' The "Inline MOS." will select the Link in the IE
AVF.40!MOS.||google&ANDTHEN:nwshp
```

For a complete list of all "Role-Parameters" see below.

Hints:
It is important, that you localize a window before using `AVF.`
Unlike `SAO.`, the `AVF.` command does not use the 1.4. The Prototype Parameter System 73.

 © 2023 Theo Gottwald * https://www.smart-package.com

AVF. supports 3.2 Standard-Search Pattern 341 and they can help you to better define the things you look for. See example above "google&ANDTHEN:nwshp". Please note that AVF. can be quite slow when used on large windows and with slow Computers. AVF. will speed up with multiple CPU cores, the more the better.

Keep your Target-Window as small as possible when using AVF. or AMS.

Use the Acc.-Inspector in the Editor to get the necessary parameter data.

Syntax

AVF.[P1][|P2...|Px]

Parameter Explanation

P1 - (optional)* Role, and Role-Parameter,** a numeric value as you it in the Acc.-Inspector, when you are over the element with the mouse. ***You can specify additional "Subcommands" after the Role-Parameter* (See below), separated by a "!". Example:

```
AMS.40!WII.MLE.||google&ANDTHEN:nwshp
```

***P2 - (optional)* Name,** a string / text as you it in the Acc.-Inspector, when you are over the element with the mouse.

***P3 - (optional)* Value,** a string / text as you it in the Acc.-Inspector, when you are over the element with the mouse.

***P4 - (optional)* Number** of the element. There may be multiple elements that fit your description. In that case you can choose which one you want using this parameter. You need to try which number you need to locate the element of your choice.

***P5 - (optional) Pixel*-Step.** A numeric value that is the raster-size, of the scanning-net. The higher this parameter, the faster AVF. will work.

Imagine the Step parameter like the size of the holes in a fisher net. The larger the holes, the bigger the fishes have to be, to be caught.

The default value is 5. A good number would be, a bit less then the half size of the element you are looking for, in pixels.

Special when using AVF:
Use AVF. with a larger Step value, for example the Size of the object. It will automatically scale down internally if it does not find anything.
This is the major difference to AMS. Technically AVF: will run with the given large Step-Value and if it did not find anything it will run again with the step value of half the size until the step values is below 3.

If the Object can not be found this may take a while, even a Minute. If you do not want that use AMS. instead.

***Role-Parameter:**

© 2023 Theo Gottwald * https://www.smart-package.com

These inline-commands can be specified together with the role-parameter, separated by a "!". You can specify as man of them as you wish. They will only get executed, in case of an element is found:

```
"TAF" - "a" ' Take Focus
"TAS" - "b" ' Take Selection
"ESE" - "c" ' Ext. Select
"ASE" - "d" ' Add to Selection
"RSE" - "e" ' Remove Selection
"SSE" - "f" ' Strong Select
"SHC" - "g" ' Shift-Click
"CCS" - "h" ' ctrl-click - select
"CSE" - "i" ' ctrl-click cancel selection
"MER" - "j" ' MER at Pos.
"MSE" - "k" ' do Multiselect
"MOS" - "m" ' Mouseless Operation Select
"DMO" - "n" ' Double Mouseless Operation Select
"MLI" - "o" ' MLI at place
"DMR" - "p" ' Double Mouseless Operation Select with rest
"MPO" - "q" ' Mousepointer Position Set
"MSO" - "r" ' Mouse Operation
"MDO" - "s" ' Mouse Double Operation
"WIN" - "t" ' Set Wait-Input Idle- Time to infinte
"MDC" - "u" ' MDC at place
"MRC" - "v" ' MRC at place
"WII" - "w" ' Wait-for-Input-Idle (max. 5 Seconds)
"MLE" - "x" ' MLE.
"SMP" - "y" ' Set Mousepos Mode
"BTP" - "z" ' Set Left-ControlPosition like for Checkmark
"BTC" - "0" ' check State before click and click
              if actually state=0 (check it)
"BTS" - "1" ' check State before click and click if actually
              state=1 (uncheck it)
```

***P6 - (optional)* Waiting Time.** if given, AGR. will wait the specified amount of time if that specified Object will appear. Needed to wait for WEB-Sites or in Setup Scripts.

***P7 - (optional)* On NOT Found Jump to.** if given, AGR. will jump to the specified Label, if that specified Object is not found in the specified time.

Example

```
' This Example will find an item in the Internet Explorer
' on a WEB-Site and select that item mouse-less.
STW.ct|IEFrame|theo&ANDTHEN: - Windows Internet Explorer
AMS.40!MOS.||focus
ENR.

' Choosing a raster size of 40 is possible for long elements
' and will speed up search significantly
'
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.ct|IEFrame|theo&ANDTHEN: - Windows Internet Explorer
AMS.40||focus|1|40
MMV.
ENR.
```

Remarks

This is one of the Slowest commands, therefore keep the size of the target-window as small as possible.
Increase P4 to half the size of the Object that you want to search, this will speed up the command significantly.

This command will also speed up with a growing number of CPU-Cores.
If possible use the new Pattern-Search Commands or AGR. instead of these Commands.
In a Target Window 576x1090 i received scanning times of up to 17 Seconds.

Limitations:

This command can be slow on large windows.

3.44.7 CBR. - Control Browser

MiniRobotLanguage (MRL)

CBR. Command

Send or receive Data from/to the Mini-Browser

Intention

Using `CBR.` you can control the Mini-Browser (=*MB*). For this to work, the *MB* must have been started using the `LBR.` command. This ensures that there is a technical connection between the Script and the MB.

`CBR.` can switch or close sites in the MB. It can even give you the HTML or Text that is currently on the WEB-Site.

For more details on the Mini-Browser (MB) 554 see there.

One special usage for `CBR.` is
`CBR.errclear`

Any error tha occurs while loading a site will stay until it is "confirmed" from the script. This is to make sure that you have seen that error.
`CBR.errclear`
Will clear the internal Error variables. Note that in case of successive Errors, the last will overwrite any previous Error, no matter if that one was confirmed or not.

Please see the 3.1 Systemvariables 334 for more Information on Errorhandling with the MB.

`CBR.` is a multi-purpose command that includes multiple possible subcommands. Usage is simple:

```
' Start the Mini-Browser
LBR.Size=1024,980|Pos=0,0|svf=0|Site=www.it-berater.org
' Wait until the Starting Site is loaded,
' please look at the Logo on the site, left upper corner.
' The loading will not be "done" until it has been
' completely aninmated!
WBR.
' Use CBR to open a new site also
CBR.new|www.fa2.de
' Wait until that site is loaded
WBR.
' Select the first TAB
CBR.select|1
' Switch the selected TAB to this site
CBR.Goto|www.smart-package.com
WBR.
' Wait 5 seconds
PAU.5
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Select the second TAB
CBR.select|2
' Cose it
CBR.Close
WBR.
MBX.Ready
' then the SPR-Browser will close
' because we started it with "svf=0"
ENR.
```

Syntax

CBR.P1[|P2]

Parameter Explanation

P1 – `Subcommand`, the following Subcommands are currently supported. Note that for all of the subcommands there is a long form that is better readable, as well as a short form, that can be used to write faster.

- `"New"` - open a new TAB in the MB
  ```
  CBR.New[|page to load]
  CBR.New
  CBR.New|about:blank
  CBR.New|www.fa2.de$crlf$www.c10.de
  CBR.New|$$TXT
  ```

- `"Close","Cl."` - Close the active TAB
  or close a TAB using a numeric Index (1..X)
  ```
  CBR.Close
  CBR.Close|(number)
  CBR.Close|2
  CBR.Close|$$NUM
  ```

- `"TClose","tc."` - Close a TAB using a pattern
  ```
  CBR.TClose|$$PAT
  CBR.TClose|Theo$OR:Site
  ```

- `"Select","s."` - Select a TAB using a number (1..X)
  ```
  CBR.Select|$$NUM
  CBR.Select|3
  ```

- `"TSelect","ts."` - Select a TAB using a pattern
  ```
  CBR.TSelect|$$PAT
  CBR.ts.|Theo$OR:Site
  ```

- `"Exit","ex."` - Exit MiniBrowser
  ```
  CBR.Exit
  CBR.ex.
  ```

- `"Goto","gt."` - Goto this site ...

© 2023 Theo Gottwald * https://www.smart-package.com

```
CBR.Goto|$$SIT
CBR.gt.|www.fa2.de
```

- "ErrClear","er." - Confirm / Clear Error
```
CBR.ErrClear
CBR.ErrClear
```

- "gback","gb." - Press Back Button (1 or more times)
```
' Press "Back" 2 times
CBR.gback|2
' Press "Back" 1 time
CBR.gback
```

- "gforward","gf." - Press Forward Button (1 or more times)
```
' Press "Forward" 2 times
CBR.gforward|2
' Press "Back" 1 time
CBR.gf.
```

- "GHome","gh." - Load Default page
```
CBR.GHome
CBR.gh.
```

- "gsearch","gs." - Load Search Site
```
CBR.gsearch
CBR.gs.
```

- "refresh","rf." - Load actual Site again/refresh Site
```
CBR.refresh
' refresh 2 times
CBR.rf.|2
```

- "silent","si." - Set/Reset IE-Silent Mode
```
CBR.silent|1
CBR.si.|0
```

- "SetFocus","sf." - SetFocus on current Tab or numeric TAB
```
' SetFocus on TAB 1
CBR.SetFocus|1
' SetFocus on current TAB
CBR.sf.
```

- "iHTML","ih." - Get Site HTML
```
' Get Site HTML into Variable
CBR.iHTML|$$HTM
' Get HTML on TOS
CBR.ih.
```

- "iText","it." - Get Site Text
```
' Get Site Text into Variable
CBR.iText|$$TXT
' Get Text on TOS
CBR.it.
```

- "GetZoom","gz." - Get Site Zoom-Factor (10-1000)

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Get Site Zoom into Variable
CBR.GetZoom|$$TXT
```

- "SetZoom","sz." - Set Site Zoom-Factor (10-1000)
```
' Set Site Zoom
CBR.sz.|200
' Formulas are allowed
CBR.sz.|(10*$$TXT)
```

- "getwindow","gw." - Locate selected TAB Browser-Control
This will locate the Browser Control like if you would have used SCW.
```
' Locate Control and put Control Handle into $$TXT
CBR.getwindow|$$TXT
' Locate Control and place Control Handle on TOS
CBR.it.
```

- "ScrollTo","st." - Scroll to defined Position
```
CBR.ScrollTo|45,344
' Formulas in () are allowed
CBR.ScrollTo|(45+$$NUM),(344-$$IXX)
```

- "XScroll","xp." - Get actual X-Scrolling Position
```
' Get X-Pos. into Variable
CBR.xp.|$$TXT
```

- "YScroll","yp." - Get actual Y-Scrolling Position
```
' Get Y-Pos. into Variable
CBR.yp.|$$TXT
```

- "XSize","xs." - Get actual X-Scrolling Size
```
' Get X-Size. into Variable
CBR.xs.|$$TXT
```

- "YSize","ys." - Get actual Y-Scrolling Size
```
' Get Y-Size. into Variable
CBR.ys.|$$TXT
```

- "Scroll","sc." - Scroll Browser
```
' Scroll PageDown 4 times
CBR.Scroll|pageDown,4
' Scroll 1 time PageUp
CBR.Scroll|scrollbarPageUp
```

The "Scroll" Subcommand has additional options. With some of these, you can give an additional numeric parameter that specifies how often you want to to the specified action.

- "scrollbarDown","Down" – scroll down, like a click on the Scrolldown Button
```
' Press "Scrolldown" 1 time
CBR.Scroll|scrollbarDown,1
```

- "scrollbarUp","Up" – scroll Up, like a click on the Scroll-Left Button
```
' Press "scrollbarUp" 2 times
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  CBR.Scroll|scrollbarUp,2
```

- "scrollbarLeft","left" - scroll left, like a click on the Scroll-Left Button

```
' Press "scrollbarLeft" 2 times
  CBR.Scroll|scrollbarLeft,2
```

- "scrollbarRight","Right" - scroll right, like a click on the Scroll-Right Button

```
' Press "scrollbarRight" 2 times
  CBR.Scroll|scrollbarRight,2
```

- "scrollbarPageDown" - scroll full page down

```
' Press "scrollbarPageDown" 1 times
  CBR.Scroll|scrollbarPageDown,1
```

- "scrollbarPageUp" - scroll full page Up

```
' Press "scrollbarPageUp" 2 times
  CBR.Scroll|scrollbarPageUp,2
```

- "scrollbarPageRight" - scroll full page to right

```
' Press "scrollbarPageRight" 2 times
  CBR.Scroll|scrollbarPageRight,2
```

- "scrollbarPageLeft" - scroll full page to left

```
' Press "scrollbarPageLeft" 2 times
  CBR.Scroll|scrollbarPageLeft,2
```

Depending on the chosen Subcommand the further Parameters **P2** to **P4** differ and may be needed or not.

P2 - (optional) Depending on the chosen Subcommand this Parameter may be needed or not.

Example

```
'************************************
' CBR. Sample Locate WEB-Elements
' and compute Link
'************************************

Remarks

At nearly all places, where you need numerical parameters, you can also use Formulas in (). Even if it is not explicitly stated in the description.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

The two Scroll-commands (ScrollTo/Scroll) depend to some degree on the used WEB-Environment/IE-Control. However one of them should work in any environment. In most circumstances both should work.

© 2023 Theo Gottwald * https://www.smart-package.com

3.44.8 GAI. - Get-Acc-Information

MiniRobotLanguage (MRL)

GAI. Command

Get accessible information

Intention

This command read information from the actual selected point/object. This can be for example a text in a window or browser or office-program.

Technically it reads accessible information from the Screen Objects at the **Actual Point**.
It can be the state of a element, or its size (location).
It will also return the position of the actual point if the prototype "**p**" is specified.

`GAI.` is slower then `CFW` but it may return more Details and can read also where `CFW.` might not.

Internally `GAI.` calls MAP 2483. which makes an separate call to MMV - Mouse MoVe 2466., MPO. - Mouse-POsition move. or MAP - Move Active Point 2483. obsolete.

In the easiest form, `GAI.` will read texts from a screen-position onto `TOS`.
In this example we read text from the Internet Explorer.

```
' In this case we had the page www.fa2.de open
' in the internet explorer. Change the window-title:
STW.t|internet
' and the SAO.-parameter to your needs
' SAO. locates a point in the IE window
SAO.nvw|google|http|40
' GAI. reads that point's texts
GAI.
' Now we gave the results on the stack
STS.DUMP
```

Now we find the results from `GAI.` on the TOS. Here:

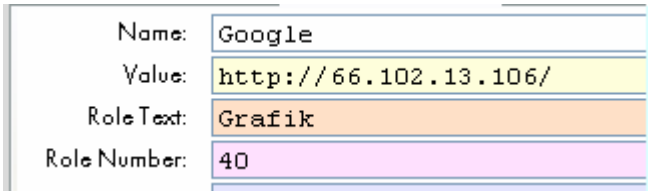
```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->String        :Google
Stackpos: 001 ->String        :http://66.102.13.106/

-----------------------------------
```

These are the same values, that you can see in the windows-inspector in the editor, when the mouse is exactly at that place.

© 2023 Theo Gottwald * https://www.smart-package.com



Next, you can use GAI. with parameters to get the values directly into variables.

Syntax

GAI.P1|P2[|P3]...[|PX]

Parameter Explanation

```
Px - (optional) l,n,p,r,s,v -  output-prototypes
      Output variables according to prototype(s)

 l - Get Item Location, this will result in a RECT with the
     item-Coordinates
 n - Get the Item Name. Text result.
 p - Position, this will return the (x,y) from the Actual
Point-
     Position which was used for the Operation. You get a
     point-variable-result.
 r - Get Element "Role".  Numeric result.
 s - Get Element State. Numeric result.
 v - Get Element Value. Text (or numeric) result.
```

Example

```
'******************************************************
' Example 1 GAI.

3.44.9 IBR. / NBR. - If Browser

IBR./NBR. - If Browser, Not If Browser Previous 591 Top 41 Next 599

MiniRobotLanguage (MRL)

IBR. Conditional Statement

If Browser Event/ Site loaded

Intention

Using `IBR.` you can check until a Site had been completely loaded in the Mini-Browser (=MB). `IBR.` can also be used to check for several Browser Events or Errors.

For more details on the Mini-Browser (MB) 554 see there.

`IBR.` is a multi-purpose command that includes multiple possible subcommands. Like with all conditional statements, `IBR.` is used like this:

```
IBR.(parameter)
   ...(this is executed if the condition evaluates to True)
ELS.
   ...(this is executed if the condition evaluates to False
EIF.)
```

Here is an example:

```
LBR.Size=1024,980|Pos=0,0|svf=0|site=www.fa33.de
WBR.
IBR.Err.=2148270085
  MBX.Browser reported Error
  DBP. Err-Code: #mb_err#
  CBR.errclear
  CBR.exit
ELS.
  MBX.Browser ended regularly
EIF.
ENR.
```

Below you will see more examples on how to check for Errors and loading Progress.

`NBR.` is the negative form of `IBR.`

Syntax

IBR.[P1]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

[!] – If you prefix the Subcommand **P1** with a "**!**" then the Logic is negated and the given
condition is true, if its originally false.

P1 – `Subcommand`, the following Subcommands are currently supported:

- `IBR. without any options is the same as IBR.all`
  `IBR.`
- `"All"` - wait until MB is ready with all Jobs
  `IBR.all`
- "Page" - Wait until the actual Page has been loaded
  `IBR.Page`
- "Job" - Wait until the actual Job is done
  `IBR.Job`

The following Subcommands support Comparisons **!,=,>,<**
If you prefix these Subcommands with a "**q**" they will "confirm" any Error like if you had been using the command:

```
CBR.errclear
```

If you omit the `"q"` you will need to manually call

```
CBR.errclear
```

to clear internal Error Variables, and make them ready for the next Event.

- `"Progress","Pro."` - Compare actual loading Progress (0-100%)
  `IBR.Progress=`*`progress value`*
  `IBR.Progress>0`
  `IBR.Progress<19`
  `IBR.Progress<19`

- `"Error","Err."` - Compare actual loading Error State
  `IBR.Err.=0`
  `IBR.Error>0`
  `IBR.Error=0`
  `IBR.Error!200`

- `"State","Sta."` - Compare actual loading Error State as textual pattern 341
  For this textual compare the sign is been ignored.
  `IBR.Sta.=HTTP&AND:Error`
  `IBR.State=HTTPS&OR:Error`
  `IBR.qState=HTTPS&OR:Error`

© 2023 Theo Gottwald * https://www.smart-package.com

- "Description","Des." - Compare loading State as textual pattern[341]
  For this textual compare the sign is been ignored.
  IBR.Des.=HTTP&AND:Error
  IBR.description=HTTPS&OR:Error
  IBR.qDescription=HTTPS&OR:Error

cond - IBR. supports the following conditions:

! - NOT

= - Is Equal to

> - Larger then

< - Smaller then

Hint: Combined Operators like "**>=**" are not supported. In this case, just use ! and "<"
and switch the operators. Because **A>=B** is the same as **NOT B<A**.

Example

```
'##############################
' Sample 2
'##############################
LBR.Size=1024,980|Pos=0,0|svf=0|site=www.fa33.de

3.44.10 LAP. - Locate at Point

MiniRobotLanguage (MRL)

LAP. Command

Locate any Object/Window at a specified coordinate

Intention

This command will locate a Top- or Child-Window and possibly an "Accessible Object" (~ Browser/Office Object that is not a window) that is at the given Coordinate. Depending on the specified parameters, you do not need to locate any Top-Window prior using this command.

Most often, this command may be used together with `GMP. (Get Mouse Position)` to interact with the object, where the user has placed his mouse-pointer.

The LAP.-command can be used to locate a Top- or Child-Window as well as to locate another non-window (Acc.-)Object.

Syntax

LAP.[P1][|P2,P3]

Parameter Explanation

P1 - (optional) Prototypes, can be one of these:

- ***s*** **-** screen coordinates are specified
- ***o*** **-** ***(Acc-) Object*** coordinates are specified
- ***r*** **-** Coordinates are specified relativ to active point
- ***w*** **-** ***Window*** coordinates are specified
- ***m*** **-** *Use Mouse Coordinates and add specified coordinates in this case Coordinates can be omitted.*

you can add these two prototypes as second prototype:

- **l** **-** Use given coordinates and make left-shift
- **n** **-** Do NOT locate an Acc.-Object - just locate the window.

Example:

```
LAP.sn|44,56
LAP.ml|109,12
```

P2, P3 **-** ***(optional)*** - X- and Y-Coordinates in the Coordinate System that is specified using the above prototypes.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
' Run this script in the Editor, drive with the Mouse on
' an object within the first PAU. command.
' then wait until the LAP. command was executed.
' Now drive the mouse away.
' After 3 seconds the mouse will return to the center-point of
' the Object that was under the mouse while LAP. was called.
' Note that this worked without any need for previous STW.
'
PAU.2
GMP.ms|$$XPO|$$YPO
DBP.$$XPO-$$YPO
LAP.s|$$XPO,$$YPO
PAU.3
MMV.
:Lab_nocon
ENR.
```

Remarks

-

Limitations:

Using invalid coordinates with LAP. may result in strange errors.

3.44.11 LBR. - Launch (Mini-)Browser

MiniRobotLanguage (MRL)

LBR. Command

Launch (Mini-)Browser

Intention

This command is used to start the Mini-Browser (=*MB*). It can also connect to a MB that is already running.

If you use `LBR.` to start a new MB then you can specify startup-parameters when using `LBR.` to start the *MB*.

These include:
- the window position
- the window size
- the WEB-/Intranet-Sites to load at startup
- if the MB should automatically close at script-end or not (svf="survive father")

These features are only available when starting the MB using the `LBR.`-command.

To start the MB, a simple

```
LBR.
```

is all you need. If you want to specify that a site should be loaded immediately after startup, use:

```
LBR.site=http://www.smart-package.com
```

You can specify multiple sites in the same way:

```
LBR.site=http://www.smart-package.com|site=www.fa2.de
```

This will do the same:

```
LBR.site=http://www.smart-package.com$crlf$www.fa2.de
```

Then all these sites will be opened in the MB, one after the other.

Hint: To wait until the sites have been opened, use the command `WBR.`

You can specify a window size and position and other startup parameters, for the starting Browser-window.Like this:

```
' We put the Sites into a variable to have a shorter line
length
' for this example.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
$$SIT=Site=www.fa2.de|site=www.it-
berater.org$crlf$www.facebook.com
LBR.Size=1024,980|Pos=0,0|svf=0|$$SIT
```

If `LBR.` is used in your scripts, in any way, then the EXE-Compiler will automatically include the needed Executable "SPR-Browser.exe" into the final EXE-Package. This way it can be used on any Client-PC in a consistent way.

Alternatively you can start the MB using any "`EXE.`"-command, or have the MB been started by other applications as the registered browser.
In this case you need to take yourself care that the MB is available on the target system, and if needed, is registered as the default browser.

In this case, you can use `LBR.` to connect to an already running MB, no matter how it was started. For more Information about the term *CUN*, see ! Smarty's InterKOM Technology 2116.

Example:

```
' $$BCU holds the CUN of the MB
' That we want to connect to
LBR.connect|$$BCU
```

Hint:

For yet unknown reasons, the Mini-Browser may in seldom cases crash immediately after starting. To make sure the MB is running properly, you can use this script:

```
' Button-Text must be changed for other then german language.
DBC.a|§§A00|SPR-Browser|&Programm schließen|||2|#32770
DBC.a|§§A01|SPR-Browser|Abbrechen|||2|#32770

$$URL=www.bitcoin.fa2.de
:retry
LBR.site=$$URL|Size=1024,980|Pos=2820,0|svf=0
' Here comes the trick, we first get the Window handle
' that is zero in case of a crash
CBR.gw.
HTV.$$WND
IVV.$$WND=0
  ' Now we shoot the MB
  KPN.SPR-Browser.exe
  PAU.200|ms
  GTO.retry
EIF.
```

For more details on the Mini-Browser (MB) 554 see there.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

LBR.[P1][|P2...|Px]

Parameter Explanation

P1...Px **- *(optional)*** If no Parameter is given, MB will launch with its default site. that is: "about:blank". Otherwise you can specify the following startup-parameters:

"connect=" - this Subcommand is special, because it can not be combined with any other Subcommand.
It does not start a new MB, but tries to connect the Script to an existing MB,
which CUN is in the given Variable.
If CUN is zero, it tries to get the CUN of the last localized Window.
Example:

```
LBR.connect=$$BCU
```

"size=" - this Subcommand can be used to give the new starting MB a defined Window-Size. Example:

```
LBR.Size=1024,800
```

You can just omit coordinates, then they will be replaced with default coordinates.

"Pos=" - this Subcommand can be used to give the new starting MB a defined Window-Position. While you can give screen coordinates as parameters, you can also write this:

```
' Center the MB
LBR.Pos=mid

' Place the MB at the given Coords
LBR.Pos=1200,900
```

You can just omit coordinates, then they will be replaced with default coordinates.

"Svf=" - this Subcommand means "Survive Father". It can be used to define a behavior for the new starting MB. If set to "0" then the MB will automatically close, when the robot / script ends.
If set to"1", then the MB will survive the "end of script". Example:

```
LBR.Svf=1
```

"Site=" - this Subcommand defines the sites that will be opened, immediately when the MB starts up.
You can give multiple "SIte=..." Subcommands. Also you can give a variable,

© 2023 Theo Gottwald * https://www.smart-package.com

in which the names of the sites to be opened are delimited by `$crlf$`.
Example:
`LBR.Site=www.fa2.de`
`LBR.Site=www.fa2.de|site=www.it-berater.org`

Example:

```
LBR.Size=1024,800|Pos=40,0|svf=0|Site=www.fa2.de
```

Example

```
'*********************************************
' LBR. - Sample

3.44.12 NAV - NAVigate to Object

3.44.12.1 ! NAV. - NAVigate in Dialog

NAV - Navigate in Dialog

Previous 601 Top 41 Next 612

MiniRobotLanguage (MRL)

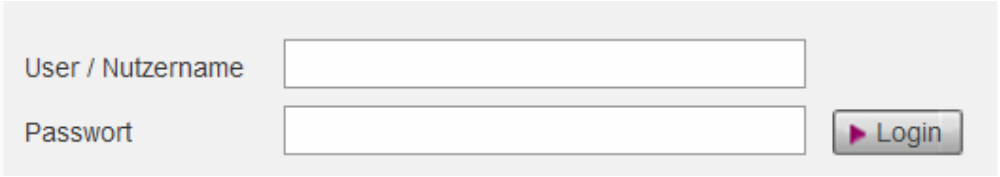
NAV. Command

Navigate in Dialog

Intention

This command locates screen-elements relative to another element. It is used most often in WEB-based GUI's (GUI = Graphical User Interface). But it can also be used in typical windows-based GUIs.

It is used to locate elements that can hardly be located in conventional, direct way. Here is an example. Take a look on the two textboxes inside the Internet Explorer (see picture below).



Why are these textboxes hard to locate?
Normally we locate an element by describing it to the robot. We say "Look for an element with the Name XY". As you see, these textboxes are empty. They may not have a valid name or a value parameter.
Then the only chance we have to grab such nameless boxes, would be, by using the role-parameter. Still there is a risk that if there are many elements with the same role, on a more or less dynamic WEB-Site (changes may happen), that we would locate not the right element.

Here is when the `NAV.` command takes is place. NAV. takes a special property to describe an element. NAV. looks "Where is it? How far is it from another element? "

Using `NAV.` we do like this:

1. Locate the window
2. locate an object we can safely locate, near the object we want to locate finally
3. use `NAV.` to navigate from the Object we have to the Object we want.

In this case we would like to locate the Textbox.We do like this:

1. Locate the window

```
STW.ct|IEFrame|Login - Windows Internet Explorer
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SCW.ct|Internet Explorer_Server|{&NOTEXT:}
```

2. Locate an object that we can describe
```
SAO.rn|42|User / Nutzername
```

3. NAV.igate to the Object that we really want
```
NAV.R|r
```

Here is the complete sample script:

```
STW.ct|IEFrame|Login - Windows Internet Explorer
SCW.ct|Internet Explorer_Server|{&NOTEXT:}
SAO.rn|42|User / Nutzername
NAV.R|r
MMV.
```

How does it work?
Let me tell you that NAV. is technically the most complex command we have built into the robot. Therefore you may need some time to understand its usage and all of its features.

This command localizes a specified Object in a Child-Window or Top-Window and sets the actual point into its center.
Please note that you need to localize a Element before, using SAO 625. Please note that NAV 606 can be quite slow when being used on complex applications and slow Computers.

For example, an Login Page in the Internet Explorer:
After you localized an unique Element (for Example the Text "Login") using SAO 625.

```
STW.c|ieframe
SAO.n|Login
```

You want to locate the empty Textbox at the Left side from that, to type the Login-Name in there. While it may be at the left side of the Text, the Center-Point of the Element is likely to be below of the one which is actually selected. Therefore we use a NAV 606.-Direction of "LD" (Left or Down).
If you want - for example in a Toolbar - to localize an equal element which is exactly right or down to a unique, already located element, you can use only one of these: "R" or "D".

The **8 possible Directions** are:
- (**A**)ll (All 4 directions)
- (**L**)eft
- (**R**)ight
- (**U**)p
- (**D**)own

and all **4 possible Combinations** of them.
Additionally there are:
- **LA** (Left-All) as a short replacement for: LUD
- **RA** (Right-All) as a short replacement for: RUD
- **UA** (Up-All) as a short replacement for: ULR
- **DA** (Down-All) as a short replacement for: DLR

© 2023 Theo Gottwald * https://www.smart-package.com

You can also use the "N" to jump to the next Element. Example:

```
STW.c|ieframe
SAO.n|Login
NAV.RN|DR|4
```

This one would jump to the 4'th next Element on the Down/Right Side. The 4'th next is the Element which Center-Point (!) is the 4'th next on that side.

Using NAV606., you can easily NAVIGATE to any Element in a Browser Window, by first using SAO625. to get an unique Element. Then secondly use NAV606. to get where you want.

To see which Element has which Number/Distance use A- with Parameter 8:

```
STW.c|ieframe
SAO.n|Login
NAV.RNA|DR|4|11
```

To get the nearest Element just use:

```
STW.c|ieframe
SAO.n|Login
NAV.q|edit
```

or to get the 3rd nearest Element which is a "edit-control" use

```
 STW.t|Basic
 SAO.n|Up
 MPO.
 NAV.Nq|3|edit
 MMV.
 END.
```

Most important with using NAV606. is:

- the Concept of the **8- Directions**,
- the Element **borderline**
- the distance between two element borders and
- the Element-**Center-Point** and
- the **distance** between two Elements Center-Points

Hint:

1. When you note that an Object that is there, is not found, you possibly need to use the "**u**" Options.

2. In regular Mode, NAV. will calculate the distance between elements from borderline to borderline.

3. When you reach the wrong Object, try using the "**g**" Prototoype and the Number "**&H8000**". This will exclude invisible targets.

```
SAO.grnvo|&H8000|42|×|adpubcomb&ANDTHEN:#close|nowin
```

© 2023 Theo Gottwald * https://www.smart-package.com

4. You can `NAV.`igate from any Object to another Object. This includes Objects that have been found using the `NAV.` command. You can use as many `NAV.` commands as you want.

```
NAV.uRKrn|LA|$$NAM|42|Date Qualified
NAV.uRKrn|d|$$NAM|42|:
```

Syntax:

NAV.[prototypes|][Data|...]

Parameter Explanation:

Prototype-Field:

```
A - (n) search only Elements of Group: X (0.1.2.3)
     0 = default (is internally change to 3)
     these values can be added:
     1 - only Objects,
     2 - only Simple Elements add
     4 - display Objects while searching.
     8 - paint Elements,
     16 - selective debug info (only found matches).

B - (var) Variable will contain the actual
     Acc-Object-Handle (LPAcc)
C - (var) Variable will contain the Object-Rectangle
D - (n) maximum Search-Depth
E - (-) close Acc-Object-Handle (LPAcc) after Operation
F - (var) Variable will contain the window handle of the
    localized object
G - (-) Start Search at the Top-Object.
H - (n) Handle (Input Window-Handle) instead of last
    Acc-Object-Handle (LPAcc). Counterpart to "L"
K - (var) Variable, set to 0/1 to indicate if the Object
    could be localized.
L - Input-Values Acc-Object-Handle (LPAcc), counterpart to "H"
M - Variable with Object Middlepoint.
N - (v) Number of the Object to search for.
    1st fitting, 2nd, 3rd ... etc.)
P - (-) switch from Border- (default) to Middlepoint-Distance
R - (s) DiRection in which to search (up, down etc.). Give
     direction in big letters, U,D,L,R, A and Combinations of
     two letters.
T - (-) Start Search from the Top-Window.
U - (n) minimale Suchtiefe
    If H and L are not explicitly specified, the actual window
    and option H is choosen.
V - (n) Role-group (1 - Control, 2 - Background)
a - (s) defaultAction (string)
b - (n) helptopic-id
c - (n) child-id
d - (s) Description (s)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
e - (n) state AND (these states must be set, there can be
    others set as well)
f - (s) helpfile (string)
g - (n) state (these states must NOT be set, others may be
set)
h - (n) window-handle from Acc-Object-Handle (LPAcc)
i - (n) "iac"-tree-depth
j - (s) help-string
k - (s) keybrd shortcut

m - (s) helptopic
n - (s) name   (s)
o - (l) On not found goto Label.
p - (n) PID
q - (s) window-class
r - (n) role (v)
s - (n) state (v) muss exact stimmen
t - (v) TID
u - (-) invisible auch enumerieren (ist unabhängig vom state)
v - (s) value (s)
w - (n.fp) Waiting-Time to wait for appearance of the Element
x - (v) Number in Tree-Level
y - (-) must be linked
z - (-) search only depth of last found SAO.-Object
```

Example:

```
' Simple NAV-Example
 STW.t|Basic
 SAO.n|Up
 MPO.
 NAV.R|D
 MMV.
 NAV.R|D
 MMV.
 NAV.R|RD
 MMV.
 NAV.R|U
 MMV.
MBX.!
END.

' This Example will find a text in the Browser
' and move the Mouse to the control below.
'
DBM.2
JNF.Move-Console.txt

: §§TXT=Google-Suchen

STW.t|Google&AND:Explorer
MPO.

SAO.n|bilder
MMV.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PAU.1
' Navigate to the first Element in the "down-right" direction
' Display (A/1) Elements inverse and with distance-numbers.
' Use only Group 1 Elements ( V/1 - recommended).
NAV.RNAV|DR|1|11|1
MMV.

MBX.!
END.
```

Remarks:

Please always use E if you do not need the Object for further `NAV./SAO`-Commands. Otherwise small amounts of Memory may not be free'd by the system.

When you note that an Object that is there, is not found, you possibly need to use the "**u**" Options.

You can specify multiple Roles, they must be separated by ",".
Any of these will be valid.

If you specify a "#" before the Role-Parameter, it will mean "Role-Group" and specifies any of the following:
0: unknown
1: User-bedienbare Controls
2: Panels, Client und Background
4: Borders etc.
8: Window-Controls (Titlebar, Minimize etc.)
16: Scrollbars
32: Spezial, Cursor, Sound etc.

Limitations:

This command can be slow on complex applications.
Wrong usage may lead to steadily decreasing memory.
You can currently not navigate more far then 20 Elements away from an element.

Using this commands on WEB-Sites that do just load/rebuild internal structures may lead to all sorts of crashes.

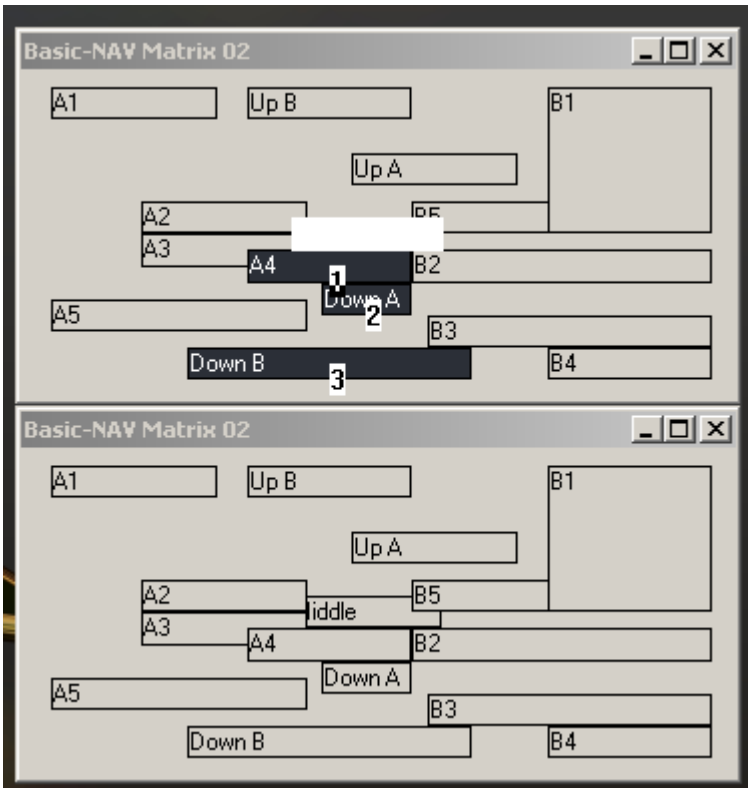
3.44.12.2 NAV - "Down"

NAV - "Down"

The following two Picture shows a NAV.R|D (Down) from the Element in the Center (white Rectangle), the numbers demonstrate the Order of the Elements if the Prototype "N" would be used.

You can see, that only those Elements are treated as "Down", where the Center-Point is between the left and right border of the Reference-Object.



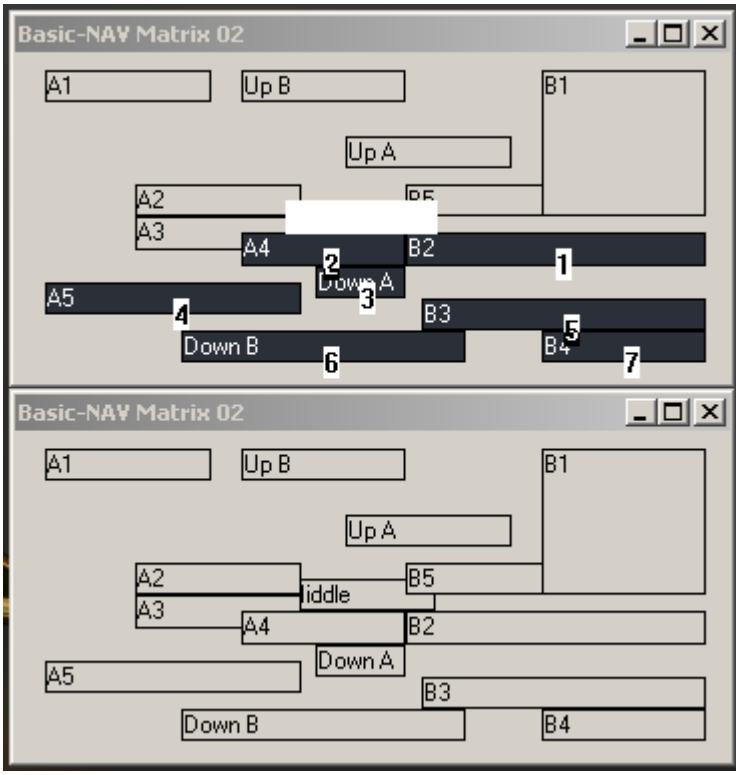
© 2023 Theo Gottwald * https://www.smart-package.com

3.44.12.3 NAV - "DownAll"

NAV - DownAll

The following two Picture shows a NAV.R|DA (DownAll) from the Element in the Center (white Rectangle), the numbers demonstrate the Order of the Elements if the Prototype "N" would be used.

Elements which overlap the reference Object are sorted by an independent scheme, which may lead to effects like A3, which is been treated as "Left", not "down" because its center-point is higher then lower border from Reference-Object.



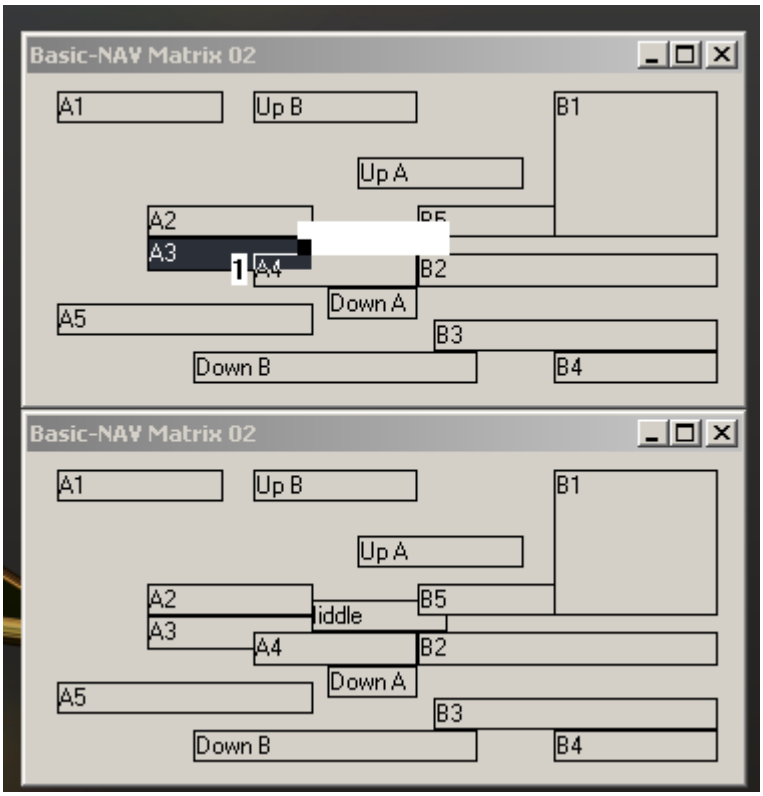
© 2023 Theo Gottwald * https://www.smart-package.com

3.44.12.4 NAV - "Left"

NAV - "Left"

The following two Picture shows a NAV.R|L (Left) from the Element in the Center (white Rectangle), the numbers demonstrate the Order of the Elements if the Prototype "N" would be used.

In this example, A3 is the only "pure Left" object.
All other objects are "Left-Up" or "Left-Down".



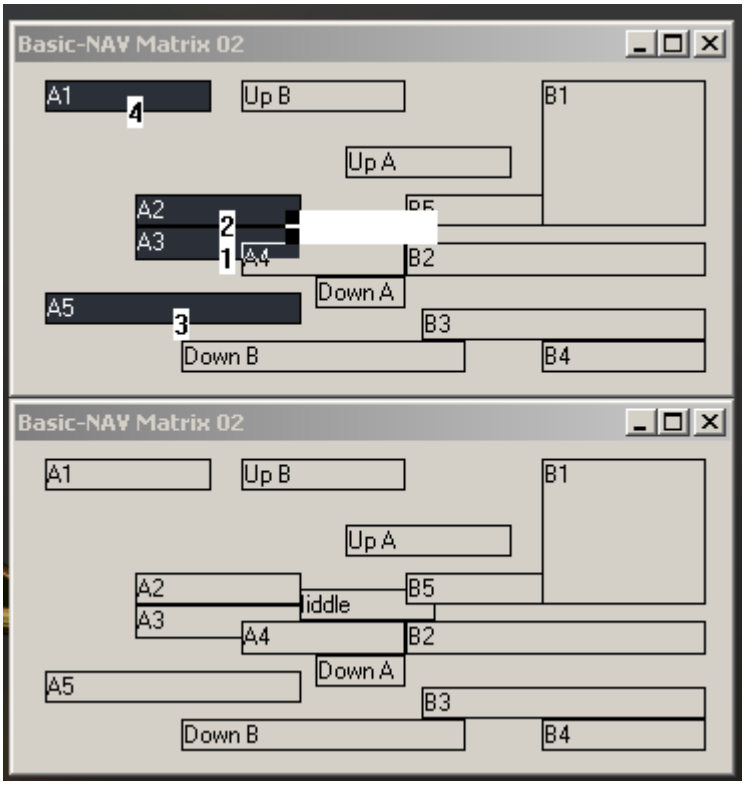
© 2023 Theo Gottwald * https://www.smart-package.com

3.44.12.5 NAV - "LeftAll"

NAV - "LeftAll"

The following two Picture shows a NAV.R|LA (LeftAll) from the Element in the Center (white Rectangle), the numbers demonstrate the Order of the Elements if the Prototype "N" would be used.

Please note that the field "Down B" is not taken as "Left from" because its Center-Point is right from the Left Border of the Reference-Object (white Rectangle).



© 2023 Theo Gottwald * https://www.smart-package.com

3.44.12.6 NAV - "Right"

NAV - "Right"

The following two Picture shows a NAV.R|UA (UpAll) from the Element in the Center (white Rectangle), the numbers demonstrate the Order of the Elements if the Prototype "N" would be used.

In this special case, there is only one Element recognized as "right".
All other elements are "Right Up" or "Right Down".

3.44.14 SAO. - Search Accessible Object

MiniRobotLanguage (MRL)

SAO. Command

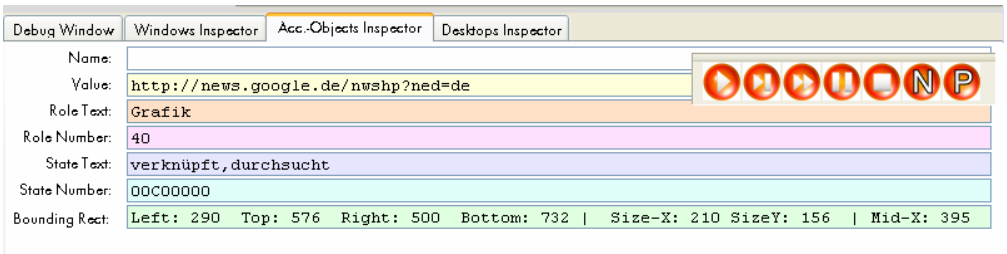
Search Accesible Object

Intention

This command localizes a specified Acc.-Object in a Child-Window or Top-Window and sets the actual point into the object center.

You can see Acc-Objects in the Acc.-Inspector.Let us see an example from a WEB-Site in the Internet Explorer:

In the picture below you will see the resulting Display in the Acc.-Inspector.



The most important parameters for SAO. are:
"**name**", "**role**" and "**value**". In most cases you can ignore the other parameters.

Now we'll take the above picture from the Acc.-Analyzer, and make the code for it.

© 2023 Theo Gottwald * https://www.smart-package.com

Using SAO. we do best locate a Top- and a child-window. Like this:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
SCW.ct|Shell DocObject View|{&NOTEXT:}
SAO.rv|40|google&ANDTHEN:nwshp
MMV.
ENR.
```

In some cases this may not be possible, or will not work. Then we can use SAO. just on the Top-Window:

```
STW.ct|IEFrame|Theo Gottwald&ANDTHEN: - Windows Internet
Explorer
SAO.rv|40|google&ANDTHEN:nwshp
MMV.
ENR.
```

Which may be a bit slower in execution times, depending on the overall complexity of the WEB-/Office program.

Hints:
It is important, that you localize a window before using SAO.

Unlike AGR., SAO. uses the 1.4. The Prototype Parameter System 73. Before using SAO. please read that chapter in the help.

SAO. supports 3.2 Standard-Search Pattern 341 and they can help you to better define the things you look for. See example above "google&ANDTHEN:nwshp".

Please note that SAO can be quite slow when being used on complex applications and slow Computers.

Use the Acc.-Inspector in the Editor to get the necessary parameter data.

Hint:

1. When you note that an Object that is there, is not found, you possibly need to use the "**u**" Options.

2. When you reach the wrong Object, try using the "**g**" Prototoype and the Number "**&H8000**". This will exclude invisible targets.

```
SAO.grnvo|&H8000|42|×|adpubcomb&ANDTHEN:#close|nowin
```

3. If you can not safely locate a Object directly, use the NAV. Command to navigate to the Object.

Syntax

SAO.P1[|P2...|Px]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** Prototypes

```
A - (n) search only Elements of Group: X (0.1.2.3)
     0 = default (is internally change to 3)
     these values can be added:
     1 - only Objects,
     2 - only Simple Elements add
     4 - display Objects while searching.
     8 - paint Elements,
     16 - selective debug info (only found matches).

B - (var) Variable will contain the actual
     Acc-Object-Handle (LPAcc)
C - (var) Variable will contain the Object-Rectangle
D - (n) maximum Search-Depth
E - (-) close Acc-Object-Handle (LPAcc) after Operation
F - (var) Variable will contain the window handle of the
    localized object
G - (-) Start Search at the Top-Object.
H - (n) Handle (Input Window-Handle) instead of last
    Acc-Object-Handle (LPAcc). Counterpart to "L"
K - (var) Variable, set to 0/1 to indicate if the Object
    could be localized.
L - Input-Values Acc-Object-Handle (LPAcc), counterpart to "H"
M - Variable with Object Middlepoint.
N - (v) Number of the Object to search for.
    1st fitting, 2nd, 3rd ... etc.)
T - (-) Start Search from the Top-Window.
U - (n) minimale Suchtiefe
    If H and L are not explicitly specified, the actual window
    and option H is choosen.
V - (n) Role-group (1 - Control, 2 - Background)
a - (s) defaultAction (string)
b - (n) helptopic-id
c - (n) child-id
d - (s) Description (s)
e - (n) state AND (these states must be set, there can be
    others set as well)
f - (s) helpfile (string)
g - (n) state (these states must NOT be set, others may be
set)
h - (n) window-handle from Acc-Object-Handle (LPAcc)
i - (n) "iac"-tree-depth
j - (s) help-string
k - (s) keybrd shortcut

m - (s) helptopic
n - (s) name   (s)
o - (l) On not found goto Label.
p - (n) PID
q - (s) window-class
r - (n) role (v)
s - (n) states (v) must match exactly
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
t - (v) TID
u - (-) include invisible objects (is state independent)
v - (s) value (s)
w - (n.fp) Waiting-Time to wait for appearance of the Element
x - (v) Number in Tree-Level
y - (-) must be linked
```

P2-Px

```
- Data(s)
```

Example

```
' This Example will find an item in the XP-Quickstart
' and move the Mouse there
VAR.$$NAM=Internet
STW.c|shell_traywnd
SAO.nKAN|$$NAM|$$ERG|3|2
PRT.Item was found (0-NO, 1 -YES)$crlf$ Answer =$$ERG
MMV.
DMP.
```

Remarks

Please use the prototype E if you do not need the Object for further `SAO./NAV.-` Commands. Otherwise small amounts of Memory may not be free'd by the system.

You can not use this command to wait for a WEB-Site to be opened.
Using the command on a WEB-Site that is going to be opened, may result in a unrecoverable crash of the robot program.

You can specify multiple Roles, they must be separated by ",".
Any of these will be valid.

If you specify a "#" before the Role-Parameter, it will mean "Role-Group" and specifies any of the following:
0: unknown
1: User-bedienbare Controls
2: Panels, Client und Background
4: Borders etc.
8: Window-Controls (Titlebar, Minimize etc.)
16: Scrollbars
32: Spezial, Cursor, Sound etc.

Limitations:

This command can be slow on complex applications.
Wrong usage may lead to steadily decreasing memory.
Using this commands on WEB-Sites that do just load/rebuild internal structures may lead to all sorts of crashes.

3.44.15 WBR. - Wait Browser

MiniRobotLanguage (MRL)

WBR. Command

Wait for Browser Event/ Site loaded

Intention

Using `WBR.` you can wait until a Site had been completely loaded in the Mini-Browser (=MB). `WBR.` can also be used to wait for Browser Events.

For more details on the Mini-Browser (MB) 554 see there.

`WBR.` is a multi-purpose command that includes multiple possible subcommands.
`WBR.` supports a set of typical "Wait" Subcommands that do not have further parameters,
as well of a second set that is used to check Error states.

Usage is simple. To just wait until a WEB-Site is loaded, write:

```
WBR.
```

Below you will see more examples on how to check for Errors and loading Progress.

Syntax

WBR.[P1][|[!]P2]

Parameter Explanation

[!] – If you prefix the time-value **P2** with a "**!**" then the Logic is negated and the given
condition is true, if its false.

P1 – `Subcommand`, the following Subcommands are currently supported:

- `WBR.`
  `WBR. without any options is the same as WBR.all`

- `"All"` - wait until MB is ready with all Jobs
  `WBR.all`
  `WBR.all`
  `WBR.all[|[!]max time]`

*© 2023 Theo Gottwald * https://www.smart-package.com*

- "Page" - Wait until the actual Page has been loaded
  ```
  WBR.Page[|[!]max time]
  WBR.Page
  ```

- "Job" - Wait until the actual Job is done
  ```
  WBR.Job[|[!]max time]
  WBR.Job
  ```

The following Subcommands support Comparisons **!,=,>,<**
If you prefix these Subcommands with a "**q**" they will "confirm" any Error like if you had been using the command:

```
CBR.errclear
```

If you omit the "q" you will need to manually call

```
CBR.errclear
```

to clear internal Error Variables, and make them ready for the next Event.

- "Progress","Pro." - Compare actual loading Progress (0-100%)
  ```
  WBR.Progress=progress value[|[!]max time]
  WBR.Progress>0|120
  WBR.Progress<19|60
  WBR.Progress<19|!60
  ```

- "Error","Err." - Compare actual loading Error State
  ```
  WBR.Err.=0[|[!]max time]
  WBR.Error>0|120
  WBR.Error=0|!120
  WBR.Error!200|66
  ```

- "State","Sta." - Compare actual loading Error State as textual pattern 341
  For this textual compare the sign is been ignored.
  ```
  WBR.Sta.=HTTP&AND:Error|55
  WBR.State=HTTPS&OR:Error|!251
  WBR.qState=HTTPS&OR:Error|!251
  ```

- "Description","Des." - Compare loading State as textual pattern 341
  For this textual compare the sign is been ignored.
  ```
  WBR.Des.=HTTP&AND:Error|55
  WBR.description=HTTPS&OR:Error|!251
  WBR.qDescription=HTTPS&OR:Error|!203
  ```

Depending on the chosen Subcommand the further Parameters **P3** to **P4** differ and may be
needed or not.
If you prefix the Subcommand or the max-time value with a "**!**" this will negate the logic of the command. If you prefix both, the logic will be unchanged.

© 2023 Theo Gottwald * https://www.smart-package.com

P2 - **`[optional] Time-Value`** If given, this is the maximum time to wait for the condition to be true. If missing, the command will wait "endless". If the condition does not become true, then the command will set the timeout-flag and just continue with the script. You can check the timeout-flag to immediately after this command, to see if an timeout has occurred.

cond - WBR. supports the following conditions:

! - NOT

= - Is Equal to

> - Larger then

< - Smaller then

Hint: Combined Operators like "**>=**" are not supported. In this case, just use ! and "<" and switch the operators. Because **A>=B** is the same as **NOT B<A**.

Example

```
' This example uses WBR. to wait until a Site is been loaded.
'
LBR.Size=1024,980|Pos=0,0|svf=0|site=www.fa2.de
WBR.
CBR.gw.
FOR.$$NUM|1|40
  AGR.40|||$$NUM
  GAI.v|$$LNK
  DBP.Der hinterlegte Link:$crlf$$$LNK
  MMV.
NEX.
MBX.Browser exit
CBR.exit
ENR.

' Example on how to track Site-loading Errors
'
LBR.Size=1024,980|Pos=0,0|svf=0|site=www.fa33.de
WBR.
DBP. Descr.: $mb_ert$
DBP. Err-Code: #mb_err#
DBP. Err.-Name: $mb_err$
MBX.Browser exit
CBR.exit
ENR.

Output:
[10:15:00] [12]  Descr.: The server or proxy was not found.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
[10:15:00] [13]  Err-Code: 2148270085
[10:15:00] [14]  Err.-Name: INET_E_RESOURCE_NOT_FOUND

' Example, if we wait for an specific Error to happen
'
LBR.Size=1024,980|Pos=0,0|svf=0|site=www.fa33.de
' This will wait forever until the site is "Not found".
'
WBR.qDes.=was not found
' Because WBR.Des. will confirm the Error,
' you will get a state 0 (no error) here:
DBP. Descr.: $mb_ert$
'DBP. Err-Code: #mb_err#
'DBP. Err.-Name: $mb_err$
'MBX.Browser exit
CBR.exit
ENR.

' Example, if we wait for an specific Error to happen
' In this case the Error-Number is 2148270085
'
LBR.Size=1024,980|Pos=0,0|svf=0|site=www.fa33.de
WBR.Err.=2148270085
DBP. Err-Code: #mb_err#
CBR.exit
ENR.
```

Remarks

There are multiple examples on using the Mini-Browser within the supplied Sample Scripts. A list with possible Errors can be found here:
Internet Explorer Errors and here: HTTP-Status Codes

3.45 Control specific operations

3.45.1 BTC. - Button-Check

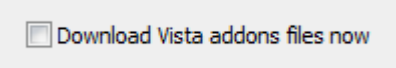
MiniRobotLanguage (MRL)

BTC. Command

Button Check

Intention

Check Radio-Buttons or Checkmarks, which have been previously located by SCW. or other commands like SAO.



This could be a 1.9.1.4 Checkmark Control 184.

```
' To check a checkmark, use
BTC.1

' To uncheck a checkmark, use
BTC.0
```

These commands use the MLE.-command (direct-engine). If the just do not work, you can make the command to use the MLI. (compatible engine) by adding a 3 to that number.

```
' To check a checkmark, (compatible engine) use
BTC.4

' To uncheck a checkmark, (compatible engine) use
BTC.3
```

You can make the command to use the MLC.-command (compatible engine) by adding a 6 to that number.

```
' To check a checkmark, (compatible engine) with Mouse use
BTC.6

' To uncheck a checkmark, (compatible engine) with Mouse use
BTC.7
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

BTC.P1

Parameter Explanation

P1 - Numeric parameter, represents the target-status of the option button.

```
0,3 or 6 - Uncheck
1,4 or 7 - Check
2,5 or 8 - Set to "indeterminate" (3-State checkmarks Only)
```

Example

```
' This Example will check a checkmark and uncheck it.
' Please note that you need to have such a window.
DBM.2
STW.t|sample
SCW.ct|button|check1
' check the checkmark
BTC.1
' uncheck the checkmark
BTC.0

DMP.
END.
```

Remarks

For Treeview-Checkmarks use the **TVI.** or **TVF.**-command with the "**d**" or "**b**"-Flag.

Limitations:

Works only in standard Controls. Does not work in "Ownerdrawn" or Java Checkmarks. May work or not in in Browser and Office. Use Mouse-Clicks (MLC. MOS.etc.) in use-cases.
"Intermediate state" may not in for all programs work as expected. Use normal Mouse-Clicks (MLE., MLI. etc.) in such cases.

3.45.2 CDD. - Combo Drop Down

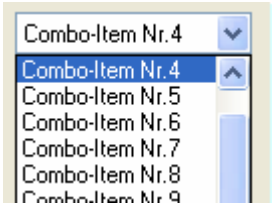
MiniRobotLanguage (MRL)

CDD. Command

Combobox open/close

Intention

A Dropdown-List Control that includes Here is a Picture of a Combobox/Dropdown with item Nr.4 selected.



A Dropdown-control, often also contains a builtin

This command is an add-on to the SCI.-command to make it a compatible engine command (see: 1.C Direct Engine and Compatible Engine 231) command.

In very few cases, SCI. 657 will visually set the Combobox to the right value, but the program will not have accepted it. In these cases, just add a CDD. after the SCI. This will make the Combobox accept the value.

Syntax

```
CDD.[P1]
```

Parameter Explanation

P1 - (optional) 0 or 1, if omitted, the Combobox will be opened and closed after 150 milliseconds.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
 ' Selects the 1-based Index-Item Nr.34
  SCI.34|N
' open and close the Combobox
  CDD.

 ' Selects the Entry which contains "Hallo"
  SCI.Hallo -> Textangabe
CDD.0
PAU.1
CDD.1
```

3.45.4 GCI. - Get-Combo-Item

MiniRobotLanguage (MRL)

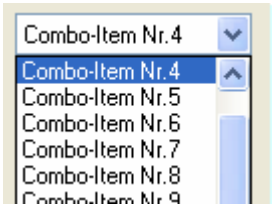
GCI. Command

Get Combo Item

Intention

The `GCI.`-Command can be used to return the Combo-Box-Items.

Here is a Picture of a Combobox with item Nr.4 selected.



It is important, that you first locate a Combobox 162. To do this, You can use SCW. 3738 as well as SAO 625..

In our Test-Application this would look like:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nc|3|ComboBox
```

Once this is done, the computer knows which Combobox you want to analyze. So we can start using `GCI.` The simplest way of operation is, if you just write:

```
GCI.
```

In this case you will find the actual selected Combo-Item (see below) on the TOS:

© 2023 Theo Gottwald * https://www.smart-package.com

The `TOS` contains the 1-based Index number of the actual selected item. Below the TOS is the text of the selected Combo-Item.

The `GCI.`-command has multiple Modes of operation. To switch between them, the command knows a number of prototypes, see below.

Lets start with the c - prototype. **C** like **C**ount. Using this prototype you can simply find out how many items the Combobox has.

There are two modes of operation using this prototype:

```
'This will just place the number of Combo-Items on the TOS.
GCI.c
```

```
' This will store the result in the given variable instead on
TOS.
GCI.c|$$NUM
```

As you can see the only difference is, that the result is once on the Stack, and once in a given variable. This will be the same with most of the following operation modes.

Using the **s** - like **s**elected prototype, you can find out which Combo-Item is currently selected. As the returned index is 1 - based, a return value of zero means that currently there is no Item selected. The modes of operation for the "**s**"-prototype are:

```
GCI.
GCI.s
GCI.s|$$TXT
GCI.s||$$NUM
GCI.s|$$TXT|$$NUM
```

 © 2023 Theo Gottwald * https://www.smart-package.com

The only difference is, which result is been placed on the TOS and which is placed inside variables. $$TXT[366] hereby is the Text of the selected Combo-Item, while `$$NUM` is the 1-based Index of it.

Using the **t** - like **t**ext prototype, you can get the Text of an Combo-Item from an 1-based Item-Index. The details from where the numeric index is taken, and where the result is been place, are straightforward.

```
' Take number from TOS, place result on TOS
GCI.t

' Take number from $$NUM, place result on TOS
GCI.t|$$NUM

' Take number from $$NUM, place result in $$TXT
GCI.t|$$NUM|$$TXT
```

Using the **n** - like **n**umeric prototype, you can find out the numeric, 1-based Index of an Combo-Item. The string you specify can contain 3.2 Standard-Search Pattern[341].

```
' Will get the search string from TOS, and place result on TOS
GCI.n

' Search string from $$TXT, result on TOS
GCI.n|$$TXT

' Search string from $$TXT, choose result number $$NUM
' place result on TOS
GCI.n|$$TXT|$$NUM ' resultat number in $$NUM

' Search string from $$TXT, choose result number $$NUM
' place result in variable $$RES
GCI.n|$$TXT|$$NUM|$$RES
```

Using the **f** - like **f**ind prototype, you can find a Combo-Item using 3.2 Standard-Search Pattern[341].

```
' Will get the search string from TOS, and place result on TOS
GCI.f

' Search string from $$TXT, result on TOS
GCN.f|$$TXT

' Search string from $$TXT, choose result number $$NUM
' place result on TOS
GCN.f|$$TXT|$$NUM

' Search string from $$TXT, choose result number $$NUM
' place result in variable $$RES
GCN.f|$$TXT|$$NUM|$$RES
```

© 2023 Theo Gottwald * https://www.smart-package.com

Using the **a** - like **a**ll prototype, you can

```
' Concatenates all Combo-Items using $crlf$ as delimiter.
' Result is been placed on TOS.
GCI.a

' Concatenates all Combo-Items using $$DEM as delimiter.
' Result is been placed on TOS.
GCI.a|$$DEM

' Concatenates all Combo-Items using $$DEM as delimiter.
' Result is been placed in $$RES
GCI.a|$$SDEM|$$RES
```

If the delimiter expression is a null (zero-length) string, no separators are inserted between the string sections.

If the delimiter expression is the following 3-byte value of "," a leading and trailing double-quote is added to each string section.

Syntax

GCI.[P1][|P2][|P3]

Parameter Explanation

The details of the parameter depend on the used prototype.

P1 - (optional) prototype, selects the kind of operation, if omitted "s" is used. The following prototypes are supported:

```
c - count Combo-items
s - selected Combo-Item (get selected)
t - text of Combo Item
n - numeric, get 1-based Index of Combo-Item
f - find, find a Combo-Item based on a Text using Patterns
a - all, fill a variable with all Combo-Items, possibly with a
    delimiter of your choice.
```

P2 - (optional) VAR to store results, STRING or number.
P3 - (optional) VAR to store results.
P4 - (optional) VAR to store results.

Example

```
'************************************************
' GCI- Sample #1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Get actual selected Item

```

Remarks

-

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

There may be non-Standard Comboboxes out there, where this command may not work as expected. If that happens, its not a bug, its just that the developer of that Application made his Combobox too far away from Common-Control-Standards. Please note that this command does generally not support Comboboxes in Browser- or Java-Applications.

Also this command may currently not work with all x64 applications.

3.45.5 LBE. - ListBox Entry

MiniRobotLanguage (MRL)

LBE. Command

Listbox Entry

Intention

This command is used to select an item in a Listbox Control. It is also used to check checkmarks in Listbox controls "Listbox Checkmark".

There are several modes of operation. In the simplest mode, `LBE.` gets just one parameter. And that is the entry to locate. You can specify 3.2 Standard-Search Pattern 341.
And you can use variables for any of the parameters.

```
LBE.Entry-Name
```

If there are multiple equal named Entries, you can additionally specify a number.

```
LBE.Entry-Name|number or formula in ()
' Looks like
LBE.Entry Nr.|5
```

If there is a checkmark that needs to be checked, you can specify an third parameter:

```
' without the number parameter (default is 1)
LBE.Entry Nr.||1
' or if you need the number parameter P2 also:
LBE.Entry Nr.|2|1
```

Syntax

LBE.P1|P2[|P3]

Parameter Explanation

P1 – Entry name. Can use 3.2 Standard-Search Pattern 341

P2 – ***(optional)*** number of fitting entry (1- first, 2 - second etc.).
if omitted, default value is 1

*© 2023 Theo Gottwald * https://www.smart-package.com*

P3 **-** ***(optional)*** value for internal "Buttoncheck" (Listbox-Checkmarks).

These are:
0 - uncheck checkmark (direct engine 231)
1 - check checkmark (direct engine)
2 - uncheck checkmark (compatible engine 231)
3 - check checkmark (compatible engine)

Example

```
'*****************************************
' Demo for LBE.
'*****************************************
LBE.Entry Nr.
LBE.Entry Nr.||1
LBE.Entry Nr.||(1-$$VAL)
LBE.Entry Nr.|($$NUM-1)|1

END.
```

Remarks

Works with x32 and also with x64 Listbox-Controls.

Limitations:

This command is generally for use with **Listbox Controls**. A good hint is, when the Acc.-Inspector shows a **role** of: **34,36 or 44**. In these cases you can try using the `LBE.` command. There may be controls out there that do not react on this command. This is not a bug, but a result of the "Inner living" of that specific control.

3.45.6 LVI. - Listview Command

MiniRobotLanguage (MRL)

LVI. Command

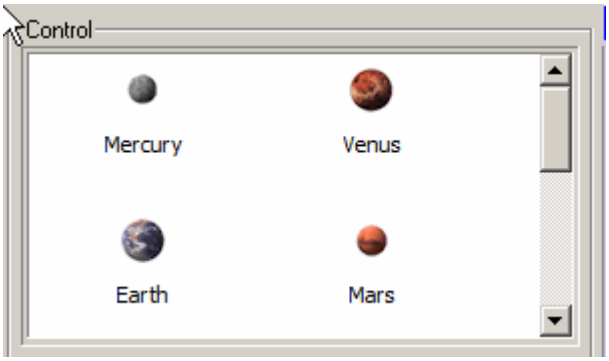
ListView32 Command

Intention

These command will select a Listview item. A Listview is a special type of control and may look like this (Listview in Report-Mode):

Column #1	Column #2	Column #3
Row #001 Item #01	Row #001 Item #02	Row #001 Item #03
Row #002 Item #01	Row #002 Item #02	Row #002 Item #03
Row #003 Item #01	Row #003 Item #02	Row #003 Item #03
Row #004 Item #01	Row #004 Item #02	Row #004 Item #03
Row #005 Item #01	Row #005 Item #02	Row #005 Item #03
Row #006 Item #01	Row #006 Item #02	Row #006 Item #03
Row #007 Item #01	Row #007 Item #02	Row #007 Item #03
Row #008 Item #01	Row #008 Item #02	Row #008 Item #03

Listviews that are not in Report-Mode may show Icons for the elements they contain:



The desktop is also a Listview Control, and it shows Icons.
Therefore the LVI.-Command can also be applied on the Windows Desktop.

Using LVI. you can locate Items in a Listview by their numeric position, or using a textual description. If you use a textual description, 3.2 Standard-Search Pattern 341 can be used.

Depending on the SubCommand, `LVI.` has multiple purposes.

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

LVI.P1[.OPT][...|Px]

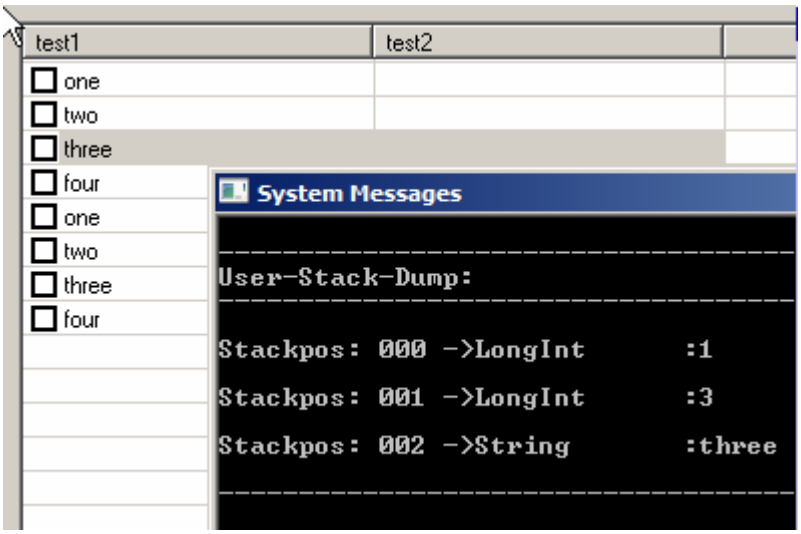
The Syntax depends on the used Subcommands:

Parameter Explanation

P1 – Subcommand, is one of the following Subcommands:

Find a Listview Item by name, locate center of text area (and navigate)
"ftbn","find text by name"
This Subcommand finds a Listview Item using a Substring of the Text that it contains.
3.2 Standard-Search Pattern can be used.
The item will be located, you will find Information about the item on the TOS.

```
' Using this example, the TOS looksl ike this:
LVI.ftbn.unc|thre
```



```
LVI.ftbn|P2|P3|P4|P5

P2 - Text textual Pattern you want to search for
P3 - (optional) Number of occurrence
P4 - (optional) Navigate X by Steps
P5 - (optional) Navigate Y by Steps
```

using P4 and P5, you can find a specified Item and then navigate from there in X- or Y-direction to another item.

Examples:

```
LVI.ftbn|Earth
LVI.ftbn|Ear&OR:Mar
LVI.ftbn.mlm|Earth
LVI.ftbn|Earth||1
```

© 2023 Theo Gottwald * https://www.smart-package.com

Find a Listview Item by name, locate Icon area (and navigate)

"fibn","find icon by name"

This Subcommand finds a Listview Item using a Substring of the Text that it contains.

It will locate the Icon Area to the left instead of the Text-Area.

3.2 Standard-Search Pattern 341 can be used.

The item will be located, you will find Information about the item on the TOS.

```
LVI.fibn|P2|P3|P4|P5

 P2 - Text textual Pattern you want to search for
 P3 - (optional) Number of occurrence
 P4 - (optional) Navigate X by Steps
 P5 - (optional) Navigate Y by Steps
```

using P4 and P5, you can find a specified Item and then navigate from there in X- or Y-direction to another item.

Examples:

```
LVI.fibn|Earth
LVI.fibn|Ear&OR:Mar
LVI.fibn.mlm|Earth
LVI.fibn.chk|Earth
LVI.fibn|Earth||1
```

Find a Listview Item by number

"fbn","find by number"

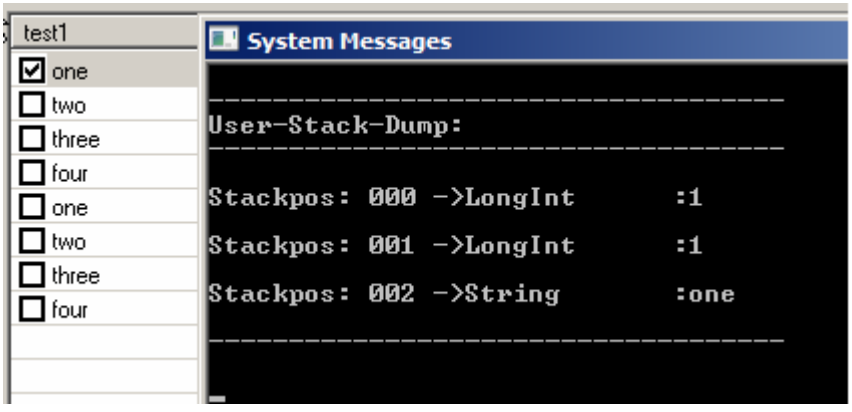
This Subcommand finds a Listview Item using numerical coordinates.

You can specify an X- (Row) and an Y- (Column).

Both numbers are 1-based.

The item will be located, you will find Information about the item on the TOS.

```
000  Column-Number or zero
001  Row-Number, 1- based
002 Name if item that was found
```



Examples:

```
' Locate 4'th item in a single column LV
LVI.fbn|4
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
      ' Locate 4'th item in the second row of a multi-column
LV
      LVI.fbn|4|2
      ' Locate the first item and check the checkmark
      LVI.fbn.chk|1
```

Get number of Items, number of columns, Listview-Style number and Unicode Information

```
   "gin","get info"
```

This `Subcommand` will retrieve needed informations about the Listview. You can omit
parameters that you do not need. In that case these values are placed on the TOS.

```
 LVI.get info|P2|P3|$$STL|$$UNI
```

The first Variable **P2** receives the number of Lines thats in the Listview (Line-Count).
Variable **P3** receives the number of Columns if the Listview has more then one.
Variable **P4** receives the Listview Style value. This is for advanced use only.
Variable **P5** receives 0 or 1 if the Listview is a Unicode Control (1) or an ANSI Control (0).
There is a Unicode conversion built in. Some Listviews are marked as Unicode and are
not used as such, in this case you may get "??????" as textual result.
You can then use the "Force Unicode" Subcommand to set this Flag to 0 and make the
Control readable.

```
   LVI.get info|$$TAY|$$TAX|$$STL|$$UNI
```

Set the text of the selected item to another text / change text

```
"sit","set item text"
```

You can change the text of an item using this command.

```
   LVI.sit|TY|TX|Text
```

Unselect all Items in the Listview

```
   "usa","unselect all items"
```

This will unselect all selected items in the Listview.
Depending on the Listview, some Listviews may not support this command.

Select all Items in the Listview

```
   "sai","select all items"
```

This will select all items in the Listview.
Depending on the Listview, some Listviews may not support this command.

© 2023 Theo Gottwald * https://www.smart-package.com

Cancel Edit Mode

```
"nedi","cancel edit label"
```

Set the Unicode Flag of the Listview

```
"funi","force unicode"
```

You can set the unicode flag of the Listview to 0 or to 1.
This will influence the way that the text is internally interpreted, at least under x32.
Sometimes Controls are marked as Unicode but are not used as that.
In that case you may receive textual results like ?????? ??? and nothing is found.
If so, set the unicode flag to zero using this command before using other LVI. commands.

Fake Unicode processing

```
"fauni","fake unicode"
```

This will influence the way that the text is internally interpreted, at least under x32.
It will not physically change the Unicode flag inside the Control.
It will only change the way, all further LVI.-Commands process the Text.
This currently has only an effect under x32 Applications.

`.OPT` - You can add one or more of these Options to any of the Subcommands.
Then the selected Options will be used on the Target-Listview-Item.
Possible Options are:

```
.lbo - Move Actual Point to Left Border for all later commands
.rbo - Move Actual Point to Right Border for all later
commands
.foc - focus item
.sel - select item
.chk - check a checkamrk on that item
.unc - uncheck a checkamrk on that item
.vse - Enshure visible + select Item
.usa - unselect all items
.ndi - cancel Item-Text editing
.edi - Start Item-Text Editing
.upd - Update/Redraw Listview Control
.uns - unselect this item
.del - delete Item from Listview
.wii - Wait for Input Idle
```

The following Options are not available as **`.OPT`** under x64.
Just use the normal SPR Commands (`MLE.`,`MLM.` etc. instead).
Also note that these clicks always hit the item-Center, even if you have specified `.lbo` or `.rbo`.

```
.mle - Direct Engine Click
.mli - do a compatible Click
.mdc - do a Double Click
.mlm - do a MLM-Click
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
.clr - do not do any selection, this will clear all other .OPT
Flags
```

Example

```
'*********************************************
' LVI.-Sample
'*********************************************
' If no such item as specified is found,
' the timeout-flag is neen set.
' You can check that using the ITO-Query.
'
STW.ct|#32770|item
SCW.nc|1|SysListView32
LVI.ftbn.unc|threx
ITO.
  MBX.No such item was found
EIF.
MMV.
STS.DUMP
MBX.!
ENR.

'*********************************************
```

Remarks

On the stack, you can find the name of the selected element.
This useful, if it was selected using a Pattern.

The command has internally a different path for x32 and x64 applications.
Some features may not do exactly the same under x64 and x32.
Also some features may not work under both types of OS.

Limitations:

Some features may not work under x64, in th3e same way as they do under x32.

© 2023 Theo Gottwald * https://www.smart-package.com

3.45.7 SCI. - Set-Combo-Item

MiniRobotLanguage (MRL)

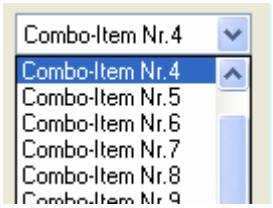
SCI. Command

Select Combo Item

Intention

With this command you directly select a specified combo box entry.
You can specify the entry to select, by its name, 1 based index or position.

Here is a Picture of a Combobox with item Nr.4 selected.



It is important, that you first locate a Combobox 162. To do this, You can use SCW. 3738 as well as SAO 625..

In our Test-Application this would look like:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nc|3|ComboBox
```

Once this is done, the computer knows in which Combobox you want to select an item.
When choosing an item "by text", you can use 3.2 Standard-Search Pattern 341 or just give a unique part of the text you want to select.

```
SCI.Item-Nr.7
```

As alternative, you can select an item by its 1-based item-index. If you count the items from top to bottom, the most upper item has Nr.1, the next is Nr.2 ... until you reach the bottom item. For this you would write:

```
SCI.7|N
```

Which would select the same item as before. In case you want to make sure that **P1** is a text item (part of), you can use the **T**(ext) instead of the **N**(umeric).

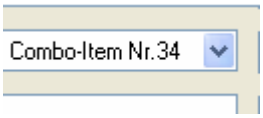
```
SCI.Item-Nr.7|T
```

© 2023 Theo Gottwald * https://www.smart-package.com

And in this case you also have the chance to add a item-number. For example in our Testapplication the script::

```
STW.ct|PBWindowClass:0|TestApp
SCW.nc|1|ComboBox
SCI.4|T|3
```

will make this item to be selected, as it is the third item that contains a "4".



Hint:
In case the `SCI.` will change the Combo-Item only visually, but not really, you can use a script like this below.

```
STW.ct|FORM_DIFF-TOOL_MAINDLG_CLASS:0|Robo-Diff
SCW.nct|1|FORM_DIFF-TOOL_REGOPTION_CLASS:3|Registry-Options
SCW.nic|1|1001|ComboBox
' Instead of SCI. we click on the Combobox to open it
MLE.
' Now we get the Combolbox
STW.Ac|combolbox
' Here we do the selection
AFT.34!MLI|HKEY_CURRENT_USER\Test
```

Here is another example:

Instead of
```
'SCI.MSK_ws.png
```

you write something like:

```
' Klick on the Combobox to open it
STW.ct|#32770|Berechnung
SCW.nict|1|83|ComboBox
MLI.

' Treat it like a Menu and click on the Item
STW.Ac|Combolbox
' Possible Commands are: SCI. | CDD.
AFT.34!MLI.|MSK_ws.png
```

Syntax

SCI.[P1][|P2][|P3]

Parameter Explanation

P1 - A value like a number a text or variable

© 2023 Theo Gottwald * https://www.smart-package.com

P2 - (optional) N tells the command that P1 is a numeric value for index access
T tells the command that P1 is a text value. The default when P2 is missing.

P3 - (optional) Numeric value, fitting item number, in case there are multiple equal named items.

Example

```
' Selects the 1-based Index-Item Nr.34
SCI.34|N

' Selects the Entry which contains "Hallo"
SCI.Hallo -> Textangabe

' Selects the 3.rd Entry which contains "Hallo"
SCI.Hallo|T|3
CDD.
```

Remarks

SCI. is a direct engine command 231. In few cases where it might select the right item, but the application does not react on it, use CDD. additionally to open and close the Dropdown.This will often solve the problem.

Limitations:

3.45.8 SMH. - Set Menu Hook

MiniRobotLanguage (MRL)

SMH. Command

Set Menu Hook

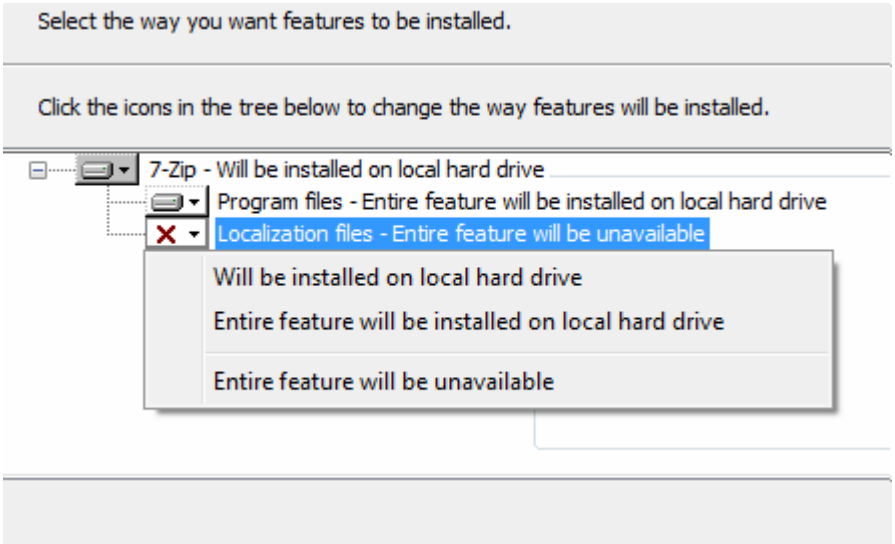
Intention

These command will click a menu item in a popup-menu.

You can specify the menu item by text (also use 3.2 Standard-Search Pattern 341 = or you can xpecify the menu item by number.

Additionally you can choose which action is been made with the located menu-item.

You can also use SMH. with customizing-Treeviews in MSI-Setup's. 215 It will click in the upcoming Menü and select the item of your choice. Here is an example:



Here is an example that will paste something into a textbox in our Testapplication.

```
' Select the TestApp
STW.ct|PBWindowClass:0|TestApp

' Select the Textbox
SCW.nc|3|edit

' Tell Hook that soon a Menu will pop up, he should click
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Einfügen (engl. "Paste")
SMH.Einfügen

' Now we move the Mouse to the Textbox and click the right
Mousebutton
MRC.

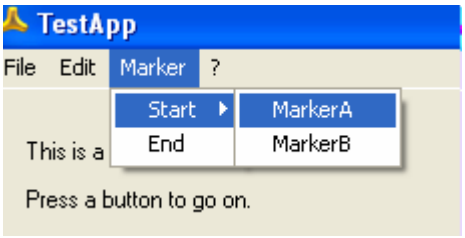
' This Pause is needed, because if the script ends, the SMH.
' will also end, before the Menu is been clicked!
PAU.2

ENR.
```

In case you have a deep-menu, you may combine `SMH.` with `SAO.`

```
STW.ct|PBWindowClass:0|TestApp
SAO.rn|12|Marker
SMH.Start
MOS.

STW.ActE|#32768|{&NOTEXT:}
SAO.rn|12|MarkerA
MOS.
PAU.1
```



Syntax

SMH.P1|P2

Parameter Explanation

```
P1 - action you want

    c = use mouse click by using COMPATIBLE-ENGINE
    d = use mouse click (MLE) by using DIRECTENGINE
    e = use mouseless Mouseaction (the default) by using
ENGINE8
    p = no further action, set only the point on the actual
entry

    a = search menu item by by number (count separators)
    m = search menu item by number (do not count seperators)
    t = search menu item by text
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
    i = mouse jump to point
    v = mouse move to point
```

P2 - Argument to P1. It can be text or number.

Example

```
STW.t|sample ap
SMH.i|Submen&ANDTHEN:8
SAO.rn|12|edit
MLI.

3.45.9 TVF. - Tree View Find

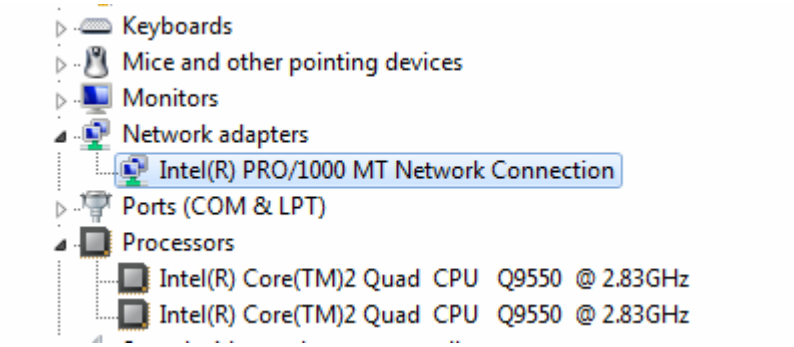
MiniRobotLanguage (MRL)

TVF. Command

Tree View Found

Intention

These command will select a treeview item. A treeview is a special type of control and may look like this:



Please see here for more details and examples about TVF.and treeviews. 202

Here are some more hints:

```
' Locate the first fitting element
TVF.Intel(R) Core||1

' Locate the second fitting element
TVF.Intel(R) Core||2
```

For P1 a 3.2 Standard-Search Pattern 341 can be used.

```
TVF. uses the direct engine for most flags.

' Here is an example that will uncheck an treeview-checkmark
STW.ct|#32770|Main
SCW.nct|1|SysTreeView32|SysTreeView32_1
TVF.Item8|d
```

There are two commands to work with treeviews.

```
TVI. -  uses a path to the item and uses wildcard-patterns
TVF. - uses 3.2 Standard-Search Pattern
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

TVF.P1[|P2][|P3]

Parameter Explanation

Searchargument

P1 - item name can use 3.2 Standard-Search Pattern 341

P2 - ***(optional)*** flags

Flags

n - avoid first regular "Enshure visible" for item
c - collapse the tree before going on
e - expand the tree
v - do a second "Enshure visible"
w - do a "Wait for Input Idle" with max time 5 seconds.
l - locate checkbox/Install-Box on the left, no click
a - Algo 2 to find a checkbox/Install-Box on the left side of the tree-item
i - "install" - opens the the selected MSI-Tree-menu

b - Check checkmark Item in a Treeview (direct engine)
d - UnCheck Checkmark Item in a Treeview (direct engine)

s - Select, select the treeview Item (direct engine)
m - Klick with MLE. on tree-item (direct engine)
o - click using compatible engine (MLI.)

You can combine all Flags, but not all combinations are useful. Also note that the order of the flags may influence the result. Generally the flags are processed from left to right.

P3 - ***(optional)*** number, if omitted, default number is 1.

Example

```
'***********************************************
' TVF.-Sample
'***********************************************

STW.ct|MMCMainFrame|Geräte
SCW.c|systreeview32

TVF.Bluetooth

TVF.&DOCAPS:&EXACT:HP Integrated Bluetooth module
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
TVF.:&EXACT:HP Integrated Bluetooth module

TVF.Bluetooth||3
MMV.

'*********************************************
```

Remarks

On the stack, you can find the name of the selected element .
It's only the name of the element, not the full path to the element, like in `TVI.`.
The command has internally a different path for x32 and x64 applications.

Limitations:

-

See also:

- TVI. - Tree View Invisible 668
- GBC. - Get-Button-Check 640
- BTC. - Button-Check 635

© 2023 Theo Gottwald * https://www.smart-package.com

3.45.10 TVI. - Tree View Item

MiniRobotLanguage (MRL)

TVI. Command

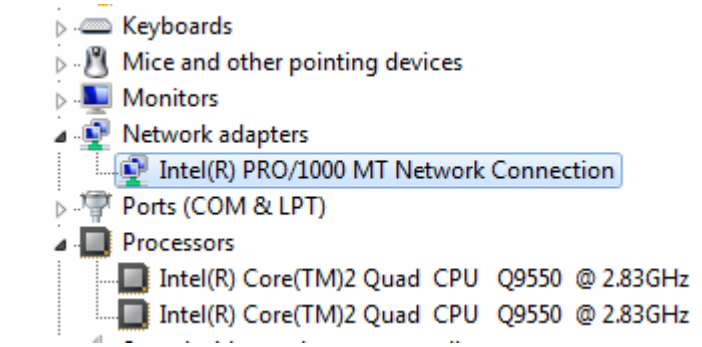
Tree View Item

Intention

These command selects an treeview Item. If necessary you can expand or collapse branches in treeviews. You can check checkmarks in treeviews. And you can open Menus in treevies, for example in MSI-Installations.

This command uses a special technology to also support x64 applications. However the results may be slower and slightly differ from the behavior in normal x32 applications.

A treeview is a special type of control and may look like this:



Please see here for more details and examples about TVI.and treeviews. 202

Example TVI.:

```
TVI.*\Tast*\*102*|e

' This uses a number to get the 3rd fitting element
TVI.*\Tast*\*102*|e|3
```

TVI. uses the direct engine for most flags.

There are two commands to work with treeviews.

```
TVI. - uses a path to the item and uses wildcard-patterns
TVF. - uses 3.2 Standard-Search Pattern 341
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

TVI.P1[|P2][|P3]

Parameter Explanation

P1 - item path and name can contain wildcards ? and *

P2 - ***(optional)*** flags

Flags

n - avoid first regular "Enshure visible" for item
c - collapse the tree before going on
e - expand the tree
v - do a second "Enshure visible"
w - do a "Wait for Input Idle" with max time 5 seconds.
l - locate checkbox/Install-Box on the left, no click
a - Algo 2 to find a checkbox/Install-Box on the left side of the tree-item
i - "install" - opens the the selected MSI-Tree-menu

b - Check checkmark Item in a Treeview (direct engine)
d - UnCheck Checkmark Item in a Treeview (direct engine)

s - Select, select the treeview Item (direct engine)
m - Klick with MLE. on tree-item (direct engine)
o - click using compatible engine (MLI.)

You can combine all Flags, but not all combinations are useful. Also note that the order of the flags may influence the result. Generally the flags are processed from left to right.

P3 - ***(optional)*** number, if omitted, default number is 1.

You have to specify the path to the destination item. You can use wildcards like '?' or '*' anywhere in the path.

```
' Example
TVI.*\Tast*\*102*
```

```
' Example, choose second fitting item
TVI.*\Core*||2
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'************************************************
' TVI.-Sample
'************************************************

STW.ct|MMCMainFrame|Geräte
SCW.c|systreeview32
TVI.*\Tast*\*102*
MMV.
POP.$$TXT
CLP.t|$$TXT
PRT.$$TXT
MBX.!

'************************************************
```

Remarks

On the stack, you can find the name of the element (the full path).
The command has internally a different path for x32 and x64 applications.

Limitations:

-

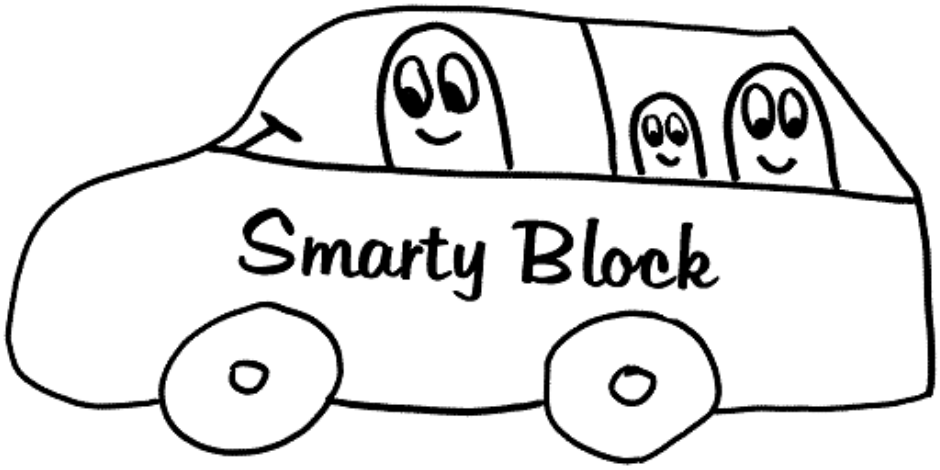
3.46 Data-Block Commands

3.46.1 ! Smarty's Data-Block Commands

Smarty's Data-Block Commands

Data Blocks are sort of Array-Command.
While a normal Array can only hold Numbers, a Smarty Data-Block can hold any Item, even another Data Block.



More Info and example to Data blocks, see here:

1.5.1.5. Organizing data items in blocks 117

© 2023 Theo Gottwald * https://www.smart-package.com

3.46.2 CNB. - Create New Block

MiniRobotLanguage (MRL)

CNB. Command

Create New Block

Intention

What is a "data-block" ?
A data-block is a compound variable. A variable that contains multiple independent variables inside.

How do i create a data-block?
Use CNB. to create a new data-block container.

More on the CNB.-command:
This command is used to create a new data-block. Using data-blocks, any variable can be used to store multiple data items.

Using `CNB.` you can create a data item out of up to 20 data items **in one step**.

```
' Create a block with 3 elements
CNB.$$BLO|3|Element 1|Element 2|Element 3

' retrieve element Nr.1 into $$RES
GBE.$$BLO|1|$$RES

' Debug-Print the element in the editor
DBP.$$RES
ENR.
```

If you want to **haven more then 20 data-items** in the block, you need to create the block first, and add the items in a second step. Like this:

```
CNB.$$BLO|30
FOR.$$CNT|1|30
  VAR.$$ELE=Data-Item $$CNT
  SBE.$$BLO|$$CNT|$$ELE
NEX.
' Now see if they are really in there
FOR.$$CNT|1|30
  GBE.$$BLO|$$CNT|$$ELE
  DBP. ELement $$CNT=>$$ELE
NEX.
ENR.
```

There is no need to know perfectly how many block you will have at the end.
You can at any time extend (increase) the number of items in a data-block, without any items in that data-block being lost.

© 2023 Theo Gottwald * https://www.smart-package.com

Extending a data-block is done using `SIB.` or `SBE.`

For more details on 1.5.1.5. Organizing data items in blocks 117 see there.

Syntax

CNB.P1|P2[|P3]...[|PX]

Parameter Explanation

CNB.P1|P2

In this case **P1** is taken as Block-variable, **P2** is the number of the blocks to create. After creation, all blocks are there, while empty.

CNB.P1|P2[|P3 ... Px]

In this case **P1** is taken as Block-variable, **P2** is the number of the blocks to create. All further variables fill the blocks starting at block Nr. 1. This way you can create and define small blocks in one strike.

Example

```
'*********************************************
' GBE./CNB. - Sample
' Small block created in one strike
' with only 3 items
'*********************************************
CNB.$$BLO|3|Element 1|Element 2|Element 3
FOR.$$CNT|0|2
  GBE.$$BLO|($$CNT+1)|$$RES
  DBP.Element $$CNT is $$RES
NEX.
ENR.

'*********************************************
' SBE./CNB. - Sample 2
' Larger Block with >20 Items
'*********************************************
CNB.$$BLO|30
FOR.$$CNT|1|30
  VAR.$$ELE=Data-Item $$CNT
  SBE.$$BLO|$$CNT|$$ELE
NEX.
' Now see if they are really in there
FOR.$$CNT|1|30
  GBE.$$BLO|$$CNT|$$ELE
  DBP. ELement $$CNT=>$$ELE
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
NEX.
ENR.
```

Remarks

Blocks are internally checked for authenticity. This is done to prevent hard to track error.
If you change bytes or the length of a block variable externally, the block will not be unpacked anymore.
Data blocks can contain all 256 ASC Characters (even binary files) and are binary-compatible. Therefore whether special folders nor system variables are resolved inside blocks. Variables are resolved one time.

Limitations:

There is no explicit limit on data-items per block. However timing considerations may set you a limit at around 10000 Items, depending on your available hardware. For a larger number of non-binary items, Member-Operations, using `SBD.` `FEM.` and `SBM.` may be significantly faster.

3.46.3 GBE. - Get Block Element

MiniRobotLanguage (MRL)

GBE. Command

Get Block Element

Intention

This command can be used to retrieve a specified element from an block (another word for a data-array). A block can be created using the `CNB.` - command.

There are two Modes of operation for `GBE.`:
First, you can write:

```
CNB.$$BLO|3|Element 1|Element 2|Element 3
' Result is been place on the TOS
GBN.$$BLO|1
DBP.$$000
ENR.
```

Second you can do this:

```
CNB.$$BLO|3|Element 1|Element 2|Element 3
' Result is in $$RES
GBN.$$BLO|$$NUM|$$RES
DBP.$$RES
ENR.
```

For more details on 1.5.1.5. Organizing data items in blocks 117 see there.

Syntax

GBE.P1|P2[|P3]

Parameter Explanation

GBE.P1|P2

In this case **P1** is taken as Block-variable. **P2** is the number of the element to retrieve. The result is placed on TOS.

GBE.P1|P2|P3

In this case **P1** is taken as Block-variable, **P2** is the number of the element to retrieve.
P3 is the variable that will hold the result.

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'*******************************************
' GBE./CNB. - Sample
'*******************************************
CNB.$$BLO|3|Element 1|Element 2|Element 3
GBN.$$BLO|$$RES
FOR.$$CNT|1|$$BLO
  GBE.$$BLO|$$CNT|$$RES
  DBP.Element $$CNT is $$RES
NEX.
ENR.
```

Remarks

Blocks are internally checked for authenticity. This is done to prevent hard to track error.
If you change bytes or the length of a block variable externally, the block will not be unpacked anymore.

Data blocks can contain all 256 ASC Characters (even binary files) and are binary-compatible. Therefore whether special folders nor system variables are resolved inside blocks. Variables are resolved one time.

Limitations:

There is no explicit limit on data-items per block. However timing considerations may set you a limit at around 10000 Items, depending on your available hardware. For a larger number of non-binary items, Member-Operations, using `SBD.` `FEM.` and `SBM.` may be significantly faster.

3.46.4 GBN. - Get Block Number

MiniRobotLanguage (MRL)

GBN. Command

Get Block Elements Count

Intention

How many independent data-items are in a given data-block?
`GBN.` will tell you the answer to this question..

`GBN.` can be used to retrieve the number of elements in an block (another word for a data-array). A block can be created using the `CNB.` - command.

There are two Modes of operation for `GBE.`:
First, you can write:

```
CNB.$$BLO|3|Element 1|Element 2|Element 3
GBN.$$BLO
DBP.$$000
ENR.
```

Second you can do this:

```
CNB.$$BLO|3|Element 1|Element 2|Element 3
GBN.$$BLO|$$RES
DBP.$$RES
ENR.
```

In this case the result will be in a variable, instead of on `TOS`.

For more details on 1.5.1.5. Organizing data items in blocks 117 see there.

Syntax

GBN.P1[|P2]

Parameter Explanation

GBN.P1

In this case **P1** is taken as Block-variable. The result (number of blocks in that variable) is placed on TOS.

GBN.P1|P2

© 2023 Theo Gottwald * https://www.smart-package.com

In this case **P1** is taken as Block-variable, **P2** is the variable that will hold the result.

Example

```
'*******************************************
' GBE./CNB. - Sample
'*******************************************
CNB.$$BLO|3|Element 1|Element 2|Element 3
GBN.$$BLO|$$RES
FOR.$$CNT|1|$$RES
  GBE.$$BLO|$$CNT|$$ELE
  DBP.Element $$CNT is $$ELE
NEX.
ENR.
```

Remarks

Blocks are internally checked for authenticity. This is done to prevent hard to track error.
If you change bytes or the length of a block variable externally, the block will not be unpacked anymore.

Data blocks can contain all 256 ASC Characters (even binary files) and are binary-compatible. Therefore whether special folders nor system variables are resolved inside blocks. Variables are resolved one time.

Limitations:

There is no explicit limit on data-items per block. However timing considerations may set you a limit at around 10000 Items, depending on your available hardware. For a larger number of non-binary items, Member-Operations, using `SBD.` `FEM.` and `SBM.` may be significantly faster.

3.46.5 GFB. - Get-From-Block

MiniRobotLanguage (MRL)

GFB. Command

Get from Block

Intention

This command can be used to get several elements of an data-block in one strike. It saves you a bit typing compared to `GBE.`

When using `GFB.` there is no need to specify the Block-Variable. GFB. will automatically remember and use the last used block variable. Also the index (the first element number) is fix - the first parameter will retrieve element 1.

A short example, using `GFB.` and `SIB.` is:

```
CNB.$$BLO|6
SIB.Element 01|Element 02|Element 03
GFB.$$EL1|$$EL2|$$EL3
DBP.$$EL1$crlf$$$EL2$crlf$$$EL3
ENR.
```

Syntax

GFB.P1[|P2][|P3][|P4]..[|PX]

Parameter Explanation

P1- variable, `will hold first block element`

P2 ... Px (optional) `more variables, they will get all successive Block-Elements.`

Example

```
'*********************************************
' GFB./ SIB. - Sample
'*********************************************
CNB.$$BLO|6
SIB.Element 01|Element 02|Element 03
GFB.$$EL1|$$EL2|$$EL3
DBP.$$EL1$crlf$$$EL2$crlf$$$EL3
```

© 2023 Theo Gottwald * https://www.smart-package.com

ENR.

Remarks

Blocks are internally checked for authenticity. This is done to prevent hard to track error.
If you change bytes or the length of a block variable externally, the block will not be unpacked anymore.

Data blocks can contain all 256 ASC Characters (even binary files) and are binary-compatible. Therefore whether special folders nor system variables are resolved inside blocks. Variables are resolved one time.

Limitations:

There is no explicit limit on data-items per block. However timing considerations may set you a limit at around 10000 Items, depending on your available hardware. For a larger number of non-binary items, Member-Operations, using SBD. FEM. and SBM. may be significantly faster.

3.46.6 SBE. - Set Block Element

SBE. - Set Block Element **Previous** 680 **Top** 41 **Next** 685

MiniRobotLanguage (MRL)

SBE. Command

Set Block Element

Intention

This command can be used to Set individual elements of an data-block.

Using `SBE.` you can selectively Set individual data-items to an value you like.

Usage of `GBE.` is simple, see this example:

```
' Create a block with 3 elements
CNB.$$BLO|3|Element 1|Element 2|Element 3

' retrieve element Nr.1 into $$RES
GBE.$$BLO|1|$$RES

' Debug-Print the element in the editor
DBP.$$RES
ENR.
```

For more details on 1.5.1.5. Organizing data items in blocks 117 see there.

Syntax

SBE.P1|P2[|P3]

Parameter Explanation

SBE.P1|P2

In this case **P1** is taken as Block-variable, **P2** is the number of the block-element (1-based) to get whatever is on **TOS**. If TOS evaluates empty, the element will be set to empty.

P2 - If **P2** is higher then the actual number of blocks in data-block **P1**, then the data-block is automatically extended to that number of blocks.

SBE.P1|P2|P3

In this case **P1** is taken as Block-variable. **P2** is the number of the block-element (1-based) which is going to be filled with the content from variable **P3**.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'*******************************************
' SBE./CNB. - Sample
'*******************************************
CNB.$$BLO|6000
FOR.$$CNT|1|6000
  VAR.$$ELE=Data-Item $$CNT
  SBE.$$BLO|$$CNT|$$ELE
NEX.
' Now see if they are really in there
FOR.$$CNT|1|6000
  GBE.$$BLO|$$CNT|$$ELE
  PRT. ELement $$CNT=>$$ELE
NEX.
ENR.
```

Remarks

Blocks are internally checked for authenticity. This is done to prevent hard to track error.
If you change bytes or the length of a block variable externally, the block will not be unpacked anymore.

Data blocks can contain all 256 ASC Characters (even binary files) and are binary-compatible. Therefore whether special folders nor system variables are resolved inside blocks. Variables are resolved one time.

Limitations:

There is no explicit limit on data-items per block. However timing considerations may set you a limit at around 10000 Items, depending on your available hardware. For a larger number of non-binary items, Member-Operations, using `SBD.` `FEM.` and `SBM.` may be significantly faster.

3.46.7 SIB. - Set-In-Block

MiniRobotLanguage (MRL)

SIB. Command

Set In Block

Intention

This command can be used to set successive elements of an data-block to values in one strike. It saves you a bit typing compared to `SBE.`

When using `SIB.` there is no need to specify the Block-Variable. `SIB.` will automatically remember and use the last used block variable. Also the index (the first element number) is fix - the first parameter will set element 1.

A short example, using `GFB.` and `SIB.` is:

```
CNB.$$BLO|6
SIB.Element 01|Element 02|Element 03
GFB.$$EL1|$$EL2|$$EL3
DBP.$$EL1$crlf$$$EL2$crlf$$$EL3
ENR.
```

`SIB.` will not create a new block, use `CNB.` for this purpose.

Syntax

SIB.P1[|P2][|P3]...[|PX]

Parameter Explanation

P1- content, `the first block element will be set to this value`

P2 ... Px (optional) `more variables, they will set all successive Block-Elements to these values.`

If the number of parameters is higher then the actual number of blocks in the data-block, then the data-block is automatically extended (blocks are added) to match that number of blocks.

Example

```
'*********************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' GFB./ SIB. - Sample
'*******************************************
CNB.$$BLO|6
SIB.Element 01|Element 02|Element 03
GFB.$$EL1|$$EL2|$$EL3
DBP.$$EL1$crlf$$$EL2$crlf$$$EL3
ENR.

'*******************************************
' GFB./ SIB. - Sample
'*******************************************
CNB.$$BLO|1
SIB.Hallo|Thomas|Lange
GBN.$$BLO|$$RES
'GBE.$$BLO|3|$$E01
DBP.Blo hat $$RES Elemente
GFB.$$E01|$$E02|$$E03
DBP.$$E01- $$E02 - $$E03
MBX.Blo hat $$RES Elemente
ENR.
```

Remarks

Blocks are internally checked for authenticity. This is done to prevent hard to track error.
If you change bytes or the length of a block variable externally, the block will not be unpacked anymore.

Data blocks can contain all 256 ASC Characters (even binary files) and are binary-compatible. Therefore whether special folders nor system variables are resolved inside blocks. Variables are resolved one time.

Limitations:

There is no explicit limit on data-items per block. However timing considerations may set you a limit at around 10000 Items, depending on your available hardware. For a larger number of non-binary items, Member-Operations, using `SBD.` `FEM.` and `SBM.` may be significantly faster.

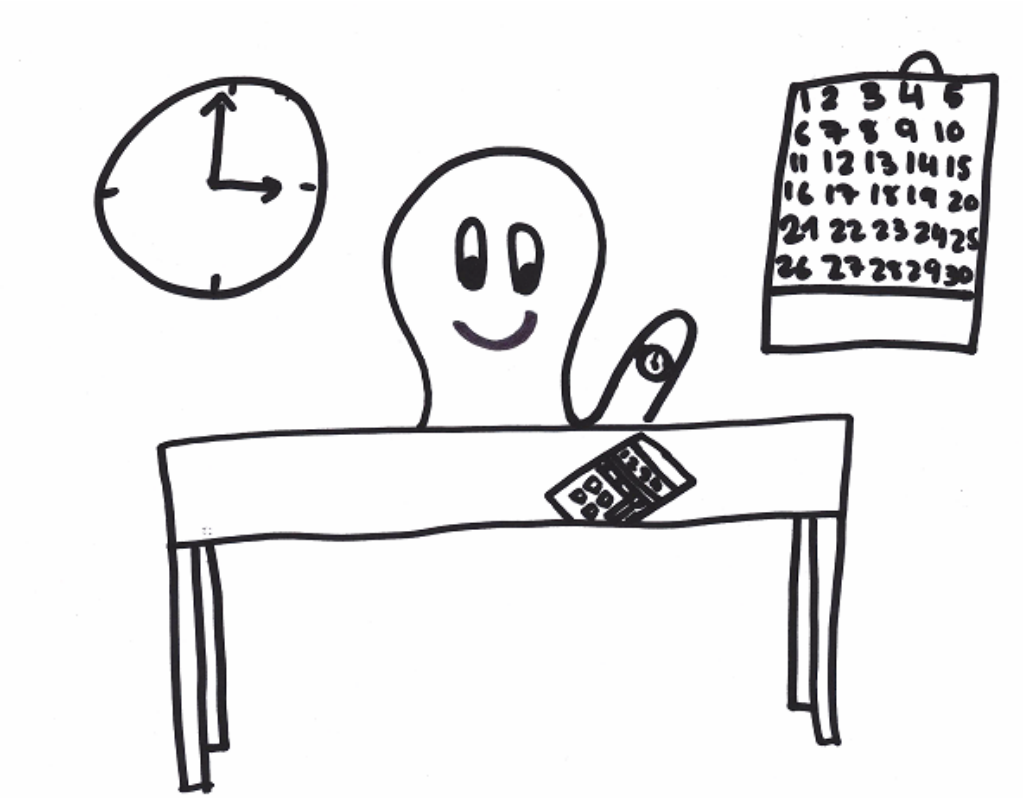
Smarty's Date and Time Calculations



*© 2023 Theo Gottwald * https://www.smart-package.com*

3.47.2 DAT. - Date and Time Information (System independent)

DAT. - Date to Value Previous 688 Top 41 Next 693

MiniRobotLanguage (MRL)

DAT. Command

Date and Time Informations

Intention

This command returns date and time information.

Most of them are system-independent. No matter in which country the script will run, you will get exactly the same formatted time/date information.

There are several different Information you can retrieve using `DAT.`

For this you call the `DAT.`-command and specify an number from 0 to 10.
Here is a list of the numbers, and what they return.

```
DAT.0 ->Samstag<-
DAT.1 ->Februar<-
DAT.2 ->25<-
DAT.3 ->2012<-
DAT.4 ->11:28:16<-
DAT.5 ->11:28:16:406<-
DAT.6 ->6<- (DAY-Nr. of the WEEK)
DAT.7 ->25.02.2012<-
DAT.8 ->Saturday<- (DAYNAME)
DAT.9 ->SA<-     (DAYNAME-2 Letter)
DAT.10 -> 11:28<- (hh::MM)
DAT.11 ->2<-    (Month number)
DAT.12 ->02<-    (Month number with "0"-Prefix Format)
DAT.13 ->2020_12_01<-    (YYYY_MM_DD)
DAT.14 ->2020.12.01<-    (YYYY.MM.DD)
DAT.15 ->2020-12-01<-    (YYYY-MM-DD)
DAT.16 ->01_12_2020<-    (DD_MM_YYYY)
DAT.17 ->01122020<-    (DDMMYYYY)
DAT.18 ->20201201<-    (YYYYMMDD)
DAT.19 ->01<-    (DD)
```

For example:

```
DAT.10|$$RES
DBV.$$RES
ENR.
```

You can also use the same variable for source and target:

```
$$RES=10
DAT.$$RES
```

© 2023 Theo Gottwald * https://www.smart-package.com

DBV.$$RES
ENR.

Syntax

DAT.[P1][|P2]

Parameter Explanation

P1 - ***(optional)*** If omitted or empty, the actual time is returned. The result will be placed on the TOS. If you specify an variable in **P1**, and **P2** is omitted, then the result will be placed in that variable **P1**.

These are the numbers you can specify as **P1, and what they return:**

```
 ' Returns the Dayname in computer local language
 DAT.0 ->Samstag<-

' Returns the  Monthname in computer local language
 DAT.1 ->Februar<-

 ' Returns the Daynumber in the month
 DAT.2 ->25<-

 ' Returns the actual year
 DAT.3 ->2012<-

 ' Returns the actual time in fixed format.
 DAT.4 ->11:28:16<-

 ' Returns the actual time in fixed format incl. ms.
 DAT.5 ->11:28:16:406<-

 ' Returns the day of the week, numeric
 DAT.6 ->6<-

 ' Returns the actual date in fixed format
 DAT.7 ->25.02.2012<-

 ' Returns todays day in english
 DAT.8 ->Saturday<-

 ' Returns first two letters of todays day (engl.)
 DAT.9 ->SA<-

 ' Returns how many days this actual month has
 DAT.10->11:28<-
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Returns the Month-Number
 DAT.11 ->2<-     (Month number)

' Returns the Month number in 2-Prefix "00"
 DAT.12 ->02<-     (Month number with "0"-Prefix Format)

' Returns the Date (YYYY_MM_DD)
 DAT.13 ->2020_12_01<-

' Returns the Date  (YYYY.MM.DD)
 DAT.14 ->2020.12.01<-

' Returns the Date   (YYYY-MM-DD)
 DAT.15 ->2020-12-01<-

' Returns the Date  (DD_MM_YYYY)
 DAT.16 ->01_12_2020<-

' Returns the Date (DDMMYYYY)
 DAT.17 ->01122020<-

' Returns the Date  (YYYYMMDD)
 DAT.18 ->20201201<-

' Returns the Day-number in Month in "00"-Format
 DAT.19 ->01<-     (DD)
```

P2 - ***(optional)*** If specified, this variable will be used for the resulting value. If omitted, and P1 is a variable, P1 will be used. Else the result will be placed on TOS.

Example

```
'*******************************************
' DAT. - Sample
'*******************************************
'
FOR.$$CNT|0|10
  DAT.$$CNT|$$RES
  DBP.DAT.$$CNT->$$RES<-
NEX.
ENR.
DAT.10
DBV.$$000
ENR.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

-

Limitations:

All Date-calculations should be accurate up to a Millisecond at least back until 1601.

3.47.3 DTC. - Date and Time Calculation

MiniRobotLanguage (MRL)

DTC. Command

Date- and Time Calculations

Intention

What is the difference between date and time?
A date is this: `"23.05.2014"`.
A time is this: `"15:12:45"`.

What does DTC. do?

- delivers you Date in any format you want.
- delivers you Time in any format you want.
- allows you to add or
- to subtract from date or time

`DTC.` can give you the current date, or current time.
It can also reformat the current date or time for you into any format you want.

It can do any date-/time calculation for you. And also mix date and time calculations. For example:

- What do i get, if i add 5000 seconds and 403 days to the 12.12.2013, 9:12:53 ?
- What date was 12316 seconds before the 01.01.2014?
- What time will be in 5 hours and 15 Minutes from now?

These are just examples, to show the flexibility of `DTC.` Any of these and many more questions can quickly be solved using `DTC.`

In short: Its a complete all-in-one solution for date/time calculations and re-formatting of the result into the format that you like.
When you need to deal with dates or with time, this is the command that may help you.

And after all, we have tried hard to make all this as easy as possible, for you.

Generally the `DTC.` command has two modes of operation:

- formatting date and/or time (2 Parameters)
- formatting *and* calculation (3 Parameters)

To give you a quick overview, look at the general use of the 2 or 3 parameters:

P1 - is the variable for the source date and it will also receive the result after all
P2 - is the mask for the format of the result
P3 - is the parameter for adding and subtracting to the date/time

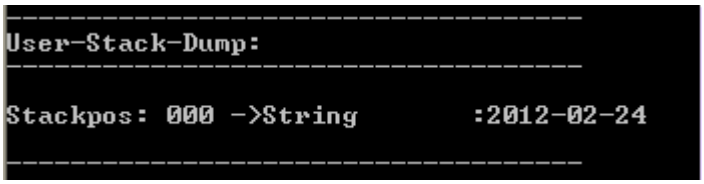
*© 2023 Theo Gottwald * https://www.smart-package.com*

Note that there are exceptions from this general rules, see the details below in the section "Parameter".

Let us first start with an simple example. We have given the term "now" in **P1**, this shows that we want to get the current date/time. Then this script:

```
DTC.now|yyyy-mm-dd
STS.DUMP
```

Will put the date, formatted like we want it, on the TOS 104,
The TOS is used, if we do not specify a variable in **P1**.



Next, let us use a variable for **P1**, then we will get the return value in that variable. Anyway we want to use the term "now" also, to get the actual date.

```
: $$TIM=now
DTC.$$TIM|dd
MBX.$$TIM
```

In the same way you can get any date or time component into the variable.
What date is in 90 days from today?

```
: $$TIM=now
DTC.$$TIM|dd|AD:90
MBX.$$TIM
```

Next lets take a look at time calculations. We can get the actual time in the same way:

```
: $$TIM=now
DTC.$$TIM|hh:nn
MBX.$$TIM
```

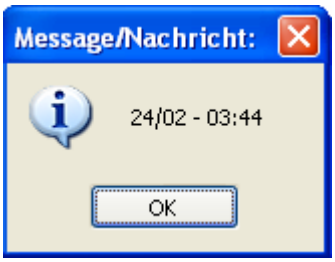
And of course we can add and subtract from that also.
What time was 29000 seconds before now?

```
: $$TIM=now
DTC.$$TIM|hh:nn|SS:29000
MBX.$$TIM
```

Sure, this was on another day, lets see which day. We will just need to tweak the format-parameter a bit. Like this:

```
: $$TIM=now
DTC.$$TIM|dd/mm - hh:nn|SS:29000
MBX.$$TIM
```

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

DTC.P1|P2[|P3]...[|PX]

Parameter Explanation

P1 - (can be empty) Variable with base-time and or base-date, or can contain the "now", or can be empty.
If the term "now" is specified, or **P1** evaluates to empty, current date and time is taken as base-time for further formatting and calculations.
If variable is given in **P1**, the result is placed in the variable else the result is placed on TOS.

P2 - Output-Mask. Mask that contains the letters below. These will be replaced with the values of the date/time-result. You can specify the following letters in the output-mask:

y - Year
m - Month
d - Day
h - Hours
n - Minutes
s - Seconds
t - Milliseconds

Example: the mask "dd-mm" will be replaced with "12-03" if the date was the 12.03.XXXX. Time works in the same way. You can specify a mask that contains time and date:

DTC.now|yyyy-mm-dd,hh:nn

If you specify less characters then the original value needs, for example: "yy" instead of "yyyy", then you will get the numbers from the right side, in this case "15", if the result year is 2015.
A mask of "mm-yy" could be for example "03-15" in the march 2015.

© 2023 Theo Gottwald * https://www.smart-package.com

P3 - (optional) - Add / Subtract Parameter. If you want to add or subtract time to/from the base-time, then you can do that using **P3**. Here you specify the amount of time that should be added or subtracted. Generally all Options are made of two uppercase letters. The first letter specifies what to do:

```
A - Add something to the base-time/date
S - Subtract something from the base-time/date
N - Set the value of the base-time/date to this number before
    addition/subtraction.

The second letter specifies the time/date parameter that is
going to be changed. The used letters are the same like in the
list above: Y- Year, until ... T - Milliseconds.

You can use any combination of the following options:

NY:(number) ' Set Years
AY:(number) ' Add Years
SY:(number) ' Subtract Years

NM:(number) ' Set Month
AM:(number) ' Add Month
SM:(number) ' Subtract Month

ND:(number) ' Set days
AD:(number) ' Add days
SD:(number) ' Subtract days

NH:(number) ' Set hours
AH:(number) ' Add hours
SH:(number) ' Subtract hours

NN:(number) ' Set Minutes
AN:(number) ' Add Minutes
SN:(number) ' Subtract Minutes

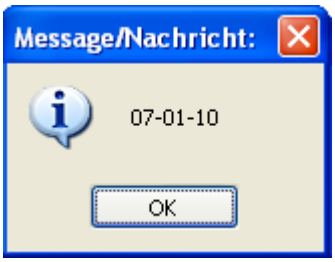
NS:(number) ' Set Seconds
AS:(number) ' Add Seconds
SS:(number) ' Subtract Seconds

NT:(number) ' Set Milliseconds
AT:(number) ' Add Milliseconds
ST:(number) ' Subtract Milliseconds
```

For example, your base-time is the 01.01.2010 and you add 1222 Minutes (thats 20 hrs.) and 5 days, you will write:

```
: $$TIM=01.01.2010
' Additions and Subtractions get separated by a comma
DTC.$$TIM|dd-mm-yy|AN:1222,AD:5
MBX.$$TIM
```

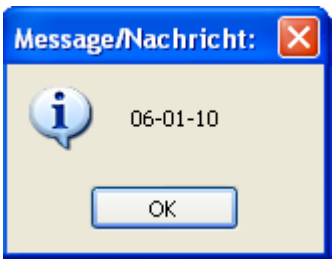
© 2023 Theo Gottwald * https://www.smart-package.com



All parameters that are not specified, are replaced with current time! In this case, the base-time is the current time when the script runs. To be more exact we would therefore need to also specify a base-time:

```
: $$TIM=01.01.2010,01:00
DTC.$$TIM|dd-mm-yy|AN:1222,AD:5
MBX.$$TIM
```

and the result will be:



You can specify as many Additions and subtractions as you want. Separate them with a comma.

Example

```
'*********************************************
' DTC. - Sample
' Add 1222 Minutes and 5 Days
' to the time in $$TIM
'
'*********************************************
: $$TIM=01.01.2010,01:00
DTC.$$TIM|dd-mm-yy|AN:1222,AD:5
MBX.$$TIM
ENR.

'*********************************************
' DTC. - Sample
' What date was 149385 days earlier?
'*********************************************
: $$TIM=now
DTC.$$TIM|dd-mm-yyyy|SD:149385
MBX.$$TIM
```

3.47.4 IAT. / NAT. - If After Timestamp

MiniRobotLanguage (MRL)

IAT. / NAT. Conditional Statement

If After Timestamp / If NOT After Timestamp

Intention

What is a TimestamP
A Timestamp is a Time-Value in the Format: `HH:MM:SS` or
`HH:MM:SS.mmm`

Using the TCA. and these other Time-Stamp Commands you can work with Timestamps.

IAT. will need two timestamps as Parameter. It will then compare both Timestamps and decide
if Timestamp **P1** is AFTER Timestamp **P2**.
If Timestamp **P1** is equal to Timestamp **P2** then the time **P1** is **NOT** After **P2**.
If you specify an `@` Sign in front of **P1** then the statement will evaluate if **P1 = P2** means If Timestamp 1 is equal to Timestamp 2 instead.
In case of an error, the `IAT.` will by default evaluate to true, but will raise an error on TOS.

Hint: `$time$` will return a timestamp like: `12:01:40`
If one or both Parameters include `".000"` Microseconds, then these will also be evaluated.
If Microseconds are missing, they will be ignored.

The negative Form of this statement is `NAT`.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
$$TIA=10:46:24
$$TIB=10:46:29

IAT.$$TIB|$$TIA
DBP. $$TIB is AFTER $$TIA
ELS.
DBP. $$TIB is NOT AFTER $$TIA
EIF.
```

```
[11:08:26] Done.
[11:08:27] 10:46:29 is AFTER 10:46:24
```

```
$$TIA=10:47:24
$$TIB=10:48:29

IAT.$$TIA|$$TIB
DBP. $$TIA is AFTER $$TIB
ELS.
DBP. $$TIA is NOT AFTER $$TIB
EIF.
```

```
[11:22:00] 10:47:24 is NOT AFTER 10:48:29
```

Here is the special Mode that uses the @ Operator.

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$TIA=@11:45:59
$$TIB=11:45:59

IAT.$$TIA|$$TIB
DBP. $$TIA is $$TIB
ELS.
DBP. $$TIA is NOT $$TIB
EIF.
```

```
[11:53:30] @11:45:59 is 11:45:59
```

And the other case:

```
$$TIA=@11:45:59
$$TIB=11:45:49

IAT.$$TIA|$$TIB
DBP. $$TIA is $$TIB
ELS.
DBP. $$TIA is NOT $$TIB
EIF.
```

```
[11:55:44] @11:45:59 is NOT 11:45:49
```

Syntax

```
IAT.[@]P1|P2 ... ELS. ... EIF.
NAT.[@]P1|P2 ... ELS. ... EIF.
```

Parameter Explanation

P1 – Timestamp 1 that needs to be AFTER **P2** for this to evaluate to TRUE.

© 2023 Theo Gottwald * https://www.smart-package.com

If you specify an @ Sign in front of **P1** then the statement will evaluate if **P1 = P2** means If Timestamp 1
is equal to Timestamp 2 instead.

P2 – Timestamp 2

Example

3.47.5 IBT. / NBT. - If Before Timestamp

MiniRobotLanguage (MRL)

IBT. / NBT. Conditional Statement

If Before Timestamp / If NOT Before Timestamp

Intention

What is a TimestamP
A Timestamp is a Time-Value in the Format: `HH:MM:SS` or `HH:MM:SS.mmm`

Using the TCA. and these other Time-Stamp Commands you can work with Timestamps.

IBT. will need two timestamps as Parameter. It will then compare both Timestamps and decide
if Timestamp **P1** is BEFORE Timestamp **P2**.
If Timestamp **P1** is equal to Timestamp **P2** then the time **P1** is **NOT** BEFORE **P2**.
If you specify an `@` Sign in front of **P1** then the statement will evaluate if **P1 = P2** means If Timestamp 1 is equal to Timestamp 2 instead.

In case of an error, the `IBT.` will by default evaluate to true, but will raise an error on TOS.

Hint: `$time$` will return a timestamp like: `12:01:40`
If one or both Parameters include `".000"` Microseconds, then these will also be evaluated.
If Microseconds are missing, they will be ignored.

The negative Form of this statement is NBT.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
$$TIA=10:47:24

3.47.6 IDC. / NDC. - If Date Condition

MiniRobotLanguage (MRL)

IDC. Conditional Statement

If Date Condition

Intention

Conditional Statement. Test multiple conditions about the current date or time.
You can test:

- if the current date is before or after a specified date.
- if the current time is before or after a specified time.
- if we have a specified date or time.
- if a specified year is a leap year

Let us start with this:

```
' Get Leap Years between 1997 and 2012
FOR.$$CNT|1997|2012
' This will do the magic
  IDC.is_lj|$$CNT
    DBP.$$CNT is a leap year!
  EIF.
NEX.
ENR.
```

You can test if we have a given date:

```
: $$HRR=23.2.2012
IDC.date_equal|$$HRR
  DBV.Yes, we have the $$HRR
ELS.
  DBV.No, its not the $$HRR
EIF.
ENR.
```

You can test if a given number is the current year:

```
: $$CNT=2012
IDC.is_year|$$CNT
    DBP.$$CNT is the current year!
EIF.
```

In the same way you can check the month, day, hour, minute, second.

If you need to check if the current date is before or after a given date, its as easy as before:

© 2023 Theo Gottwald * https://www.smart-package.com

```
' This is the date, we check
: $$CNT=26.02.2012
' and this will do the magic
IDC.date_after|$$CNT
  DBP.$$CNT is after current time!
EIF.
IDC.date_before|$$CNT
  DBP.$$CNT is before current time!
EIF.
```

Note that you need to give a complete date with all parts, in the order `DD-MM-YYYY` for this to work. This is not the case when we do the same with times. With time we have more options. You can find out, if a given time is before or after the actual time (now).

When you specify a time, you can choose, what time you want to specify:

- the hour
- the hour and the Minute
- the hour and the minute and seconds
- the hour and the minute, seconds and milliseconds

This way you can check if its before or after 12 o'clock or you can check if its before or after 12:37:29. Just specify what you want to have. Generally the command looks like this:

```
: $$CNT=08:36
' check if time is yet to come
IDC.time_after|$$CNT

' Check for past time
IDC.time_before|$$CNT

' Check if time is now
IDC.time_equal|$$CNT
```

Here is an complete running example .

```
' Change the time (next line) to any time you want
: $$CNT=17:36:59

IDC.time_after|$$CNT
  DBP.$$CNT is after current time!
EIF.

IDC.time_equal|$$CNT
  DBP.$$CNT is current time!
EIF.

IDC.time_before|$$CNT
  DBP.$$CNT is before current time!
EIF.
ENR.
```

`IDC.` can also be used to directly test components of date and time.
Let us start with the date. We want to know if its currently 2012.

© 2023 Theo Gottwald * https://www.smart-package.com

```
: $$YEA=2012
IDC.is_year|$$YEA
  DBV.Yes, we have $$YEA
ELS.
  DBV.No, its not $$YEA
EIF.
ENR.
```

You can test in the same way the actual month or day, see examples below.

```
'  Test the month
: $$MON=3
IDC.is_month|$$MON
  DBV.Yes, we have $$MON
ELS.
  DBV.No, its not $$MON
EIF.
ENR.

'  Test the actual day, if its the 24 th
: $$DAY=24
IDC.is_day|$$DAY
  DBV.Yes, we have $$DAY
ELS.
  DBV.No, its not $$DAY
EIF.
ENR.
```

Also the same will work with time. You can test the hour or minutes or even the seconds.
In just the same way. Here is an example:

```
' Test if we have 19:xx o'clock
: $$HRR=19
IDC.is_hour|$$HRR
  DBV.Yes, we have $$HRR
ELS.
  DBV.No, its not $$HRR
EIF.
ENR.
```

Hint:
`IDC.` will internally verify the date- and the time format when you use the `date_after,date_before,time_after,time_after` options. However the order of the parameters will not be touched. You need to specify all dates like this:`DD-MM-YYYY` and all times like this: `HH:MM:SS or HH:MM:SS:MS`.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

IDC.P1[|P2][,P3] … ELS. … EIF.

Parameter Explanation

P1 **-** prototype

Prototype can be omitted or any of:
- "is_leap_year" - test if the actual/specified year is a leap year or not.
- "is_year" - test if the given year matches the actual date (now).
- "is_month" - test if the given year matches the actual date (today).
- "is_day" - test if the given year matches the actual date (today).
- "is_hour" - test if the given number matches the actual time (now).
- "is_minute" - test if the number matches the actual time (now).
- "is_second" - test if the given number matches the actual time (now).
- "time_after" - test if specified time is after actual time.
- "time_before" - check if specified time is in the past
- "time_equal" - check if specified time is right now
- "date_after" - test if specified date is after actual date
- "date_before" - check if specified date is in the past
- "date_equal" - check if specified date is today

P2 **-** (optional) - The usage of **P2** and **P3** depends on the prototype **P1**

Important:: If you specify a Year below 100, for example 23.02.12, the time-logic will add 2000 to it. Therefore the 30.03.12 will be internally treated like the 30.03.2012. We have made this addition, because we believe that the chances that somebody wants to make calculations with the Year 0 are lower, then the chance that somebody will forget the first two number for the actual date. Here is an example:

```
'  this date will be treated as 24.02.2012
: $$HRR=24.2.12
IDC.date_after|$$HRR
  DBV.Yes, the $$HRR is in the future
ELS.
  DBV.No, the $$HRR is not after today
EIF.
ENR.
```

Example

```
'**********************************
' IDC.-Sample (Leap Year)
'**********************************
'
' Get Leap Years between 1997 and 2012
FOR.$$CNT|1997|2012

3.47.7 TCA. - Time Calculation

MiniRobotLanguage (MRL)

TCA. Command

Time Calculation

Intention

Using TCA. you can easily work with Times in this Standard-Format:

HH:MM:SS.ddd

Hereby the
- **HH** is Hours (0 to 99 - sometimes not limited to 12 or 24)
- **MM** is the Minutes limited 59
- **SS** is the Seconds limited 59
- **ddd** is the Milliseconds limited to 999

The Format of the Milliseconds is internally rounded to 3 places by prefixing zeroes.
If you specify `00:00:23` this will be treated as `00:00:00.023`
If you specify `00:00:00.023` this will be treated as `00:00:00.023`

If the addition of any of the values goes beyond their limit, the Carry is added to the next higher Parameter.

Example

-

Remarks

-

Limitations:

3.47.7.1 TCA.Add

MiniRobotLanguage (MRL)

TCA.Add - Command

Add 2 Timestamps

Intention

Using TCA. you can easily add Timestamps in this Standard-Format:

HH:MM:SS.ddd

Hereby the
- **HH** is Hours (0 to 99 - not limited to 12 or 24)
- **MM** is the Minutes limited 59
- **SS** is the Seconds limited 59
- **ddd** is the Milliseconds limited to 999

The Format of the Milliseconds is internally rounded to 3 places by prefixing zeroes.
If you specify `00:00:23` this will be treated as `00:00:00.023`
If you specify `00:00:00.023` this will be treated as `00:00:00.023`

If the addition of any of the values goes beyond their limit, the Carry is added to the next higher Parameter.

Sample: Add (Add Timestamps)

```
' Technically the robot works with 08:09:59:098
$$LAA=08:14:59.98
' Technically the robot works with 12:00:00:002
$$LAB=12:59:5.2
TCA.Add|$$LAA|$$LAB|$$LAC
' Result is  21:14:04:100
MBX.$$LAC
ENR.
```

Syntax

TCA.Add|P1|P2[|P3]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 – Timestamp A
P2 – Timestamp B
P3 – Variable for Result Timestamp. If omitted the result is placed on **TOS**.

Example

```
'*********************************************
' TCA. - Sample
'*********************************************
'
$$LAA=08:11:12.124
$$LAB=12:11:12.123
$$ERG=20:22:24.247
$$MSG=Teste TCA. 1
TCA.Add|$$LAA|$$LAB|$$LAC
NAT.@$$LAC|$$ERG
  MBX.Result is wrong.
ELS.
  MBX.Result is $$ERG
EIF.

3.47.7.2 TCA.Between

MiniRobotLanguage (MRL)

TCA.Betweeen - Command

Get Time between 2 Timestamps

Intention

With TCA.Between you can get the exact time between two timestamps in this standard format:

HH:MM:SS.ddd

Hereby the
- **HH** is Hours (0 to 99 - not limited to 12 or 24)
- **MM** is the Minutes limited 59
- **SS** is the Seconds limited 59
- **ddd** is the Milliseconds limited to 999

The Format of the Milliseconds is internally rounded to 3 places by prefixing zeroes.
If you specify `00:00:23` this will be treated as `00:00:00.023`
If you specify `00:00:00.23` this will be treated as `00:00:00.023`

The result will be the same if the second parameter P2 is larger (later) than P1 or earlier.

Sample: Between (Get Timestamp between 2 Timestamps)

```
' Simple Example
$$LAA=00:00:00.000
' Technically the robot works with 12:00:00:002
$$LAB=12:00:00.2
TCA.Bet|$$LAA|$$LAB|$$LAC
' Result is  06:00:00:001
MBX.$$LAC
ENR.

' Difficult Example
$$LAA=23:59:36.740
$$LAB=12:00:00.212
TCA.Bet|$$LAA|$$LAB|$$LAC
' Result is  17:59:58:476
MBX.$$LAC
ENR.

' Simpler Example
$$LAA=10:00:00.000
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
$$LAB=20:20:10.500
TCA.Bet|$$LAA|$$LAB|$$LAC
' Result is  15:10:05:250
MBX.$$LAC
ENR.
```

Syntax

TCA.Bet|P1|P2[|P3]
TCA.Between|P1|P2[|P3]

Parameter Explanation

P1 – Timestamp A
P2 – Timestamp B
P3 – Variable for Result Timestamp. If omitted the result is placed on **TOS**.

Example

```
'*********************************************
' TCA. - Sample
'*********************************************
'
$$LAA=03:11:11.111
$$LAB=05:55:55.555

3.47.7.3 TCA.Diff

MiniRobotLanguage (MRL)

TCA.Diff - Command

Subtracts 2 Timestamps

Intention

Using TCA.Diff you can easily Subtracts Timestamps in this Standard-Format:

HH:MM:SS.ddd

Hereby the
- **HH** is Hours (0 to 99 - not limited to 12 or 24)
- **MM** is the Minutes limited 59
- **SS** is the Seconds limited 59
- **ddd** is the Milliseconds limited to 999

The Format of the Milliseconds is internally rounded to 3 places by prefixing zeroes.
If you specify `00:00:23` this will be treated as `00:00:00.023`
If you specify `00:00:00.023` this will be treated as `00:00:00.023`

If the result of any of the values goes beyond their limit, the Carry is added to the next higher Parameter.
If the result is smaller then P1, the result will roll over to the previous time.

Sample: Diff (Add Timestamps)

```
' Here P1 is smaller then P2, therefore the result will roll over
$$LAA=01:24:12.001
$$LAB=02:50:13.002
$$ERG=22:33:58:999
$$MSG=Teste TCA. 4
TCA.Dif|$$LAA|$$LAB|$$LAC
MBX.$$LAC
NAT.@$$LAC|$$ERG

$$ERG=01:26:01:001
$$MSG=Teste TCA. 4
TCA.Dif|$$LAA|$$LAB|$$LAC
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  MBX.$$LAC
  NAT.@$$LAC|$$ERG
    GTO.Lab_failed
  EIF.
  ENR.
```

Syntax

TCA.Diff|P1|P2[|P3]
TCA.Dif|P1|P2[|P3]

Parameter Explanation

P1 – Timestamp A
P2 – Timestamp B
P3 – Variable for Result Timestamp. If omitted the result is placed on **TOS**.

Example

```
'*********************************************
' TCA.Dif - Sample
'*********************************************
'
$$LAA=08:11:12.124
$$LAB=12:11:12.123
$$ERG=20:00:00.001
$$MSG=Teste TCA. 1
TCA.Dif|$$LAA|$$LAB|$$LAC
NAT.@$$LAC|$$ERG
  MBX.Result is wrong.
ELS.
  MBX.Result is $$ERG
EIF.
ENR.
```

Remarks

3.47.7.4 TCA.Divide

MiniRobotLanguage (MRL)

TCA.Divide - Command

Divide a Timestamp

Intention

Using TCA.Div you can easily divide Timestamps in this Standard-Format:

HH:MM:SS.ddd

Hereby the
- **HH** is Hours (0 to 99 - not limited to 12 or 24)
- **MM** is the Minutes limited 59
- **SS** is the Seconds limited 59
- **ddd** is the Milliseconds limited to 999

The Format of the Milliseconds is internally rounded to 3 places by prefixing zeroes.
If you specify `00:00:23` this will be treated as `00:00:00.023`
If you specify `00:00:00.023` this will be treated as `00:00:00.023`

If any of the values goes beyond their limit, the Carry is added to the next higher Parameter.
The Division is always an Integer Division, means if **P2** is "2.5" then the Robot will use a "2".

The Hours are hereby not limited to 23 because this way you can also calculate working times.

Sample: Div (Divide Timestamps)

```
$$LAA=30:14:12.900
$$LAB=2
TCA.Div|$$LAA|$$LAB|$$LAC
' Result is  15:07:06.450
MBX.$$LAC
ENR.

' Lets say the total amount of time to do the Job would be 45 Hours
' And you can use 5 Computers for it.
$$LAA=45:01:4.100
$$LAB=5
TCA.Div|$$LAA|$$LAB|$$LAC
' Result is  09:00:12.820
DBP.$$LAC
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

TCA.Divide|P1|P2[|P3]
TCA.Div|P1|P2[|P3]

Parameter Explanation

P1 – Timestamp A
P2 – Timestamp B
P3 – Variable for Result Timestamp. If omitted the result is placed on **TOS**.

Example

```
'*********************************************
' TCA.Div - Sample
'*********************************************
'
$$LAA=08:11:12.124
$$LAB=12
$$ERG=20:22:24.247
$$MSG=Teste TCA. 1
TCA.Div|$$LAA|$$LAB|$$LAC
' Result is 00:40:56.010
NAT.@$$LAC|$$ERG
  MBX.Result is wrong.
ELS.
  MBX.Result is $$ERG
EIF.
ENR.
```

Remarks

-

Limitations:

Its a Integer Division. You can not divide using FP Numbers like "3.5".

3.47.7.5 TCA.GetPart

MiniRobotLanguage (MRL)

TCA.GetPart

Get a part of a Timestamp

Intention

Using `TCA.GetPart` you can easily just get a defined Part of the Timestamp.
This is similar to `TCA.Split`, but here you can define the Parts you want and also the Output Format.

For this you need to use the following Placeholder which will be replaced by the values during the process.

H:M:S.x

Hereby the
- H is Hours (0 to 23)
- M is the Minutes limited 59
- S is the Seconds limited 59
- x is the Milliseconds limited to 9999

The Format of the Milliseconds is internally rounded to 4 places by prefixing zeroes.
If you specify `00:00:23` this will be treated as `00:00:00.0023`
If you specify `00:00:00.023` this will be treated as `00:00:00.0230`

Sample: GetPart (Add Timestamps)

```
' Get Hour only
$$LAA=25:09:03.001
$$LAB=H
TCA.Get|$$LAA|$$LAB|$$LAC
DBP.$$LAC
' Result is here "01" due to the fact that the System will automatically detect
' Over 23:00 and then calculate the difference which is "01"

' Get Minutes only
$$LAA=03:19:23.01
$$LAB=M
TCA.Get|$$LAA|$$LAB|$$LAC
DBP.$$LAC
' Result is "19"

' Get Microseconds only
$$LAA=03:19:23.0199
$$LAB=X
TCA.Get|$$LAA|$$LAB|$$LAC
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
DBP.$$LAC
' Result is "019"

' Get Hours:Minutes.Microseconds with Overflow
$$LAA=25:79:03.001
$$LAB=H:M.x
TCA.Get|$$LAA|$$LAB|$$LAC
DBP.$$LAC
' Result is "01:19.001" due to Overflow calculations for the "25"->"01" and the

' Get Hours:Minutes.Microseconds, notice the Microseconds are filled to the Left
$$LAA=23:59:03.98
$$LAB=H:M.x
TCA.Get|$$LAA|$$LAB|$$LAC
DBP.$$LAC
' Result is "23:59.098"

' Get Hours:Minutes.Microseconds
$$LAA=08:09:59.098
$$LAB=H:M.X
TCA.Get|$$LAA|$$LAB|$$LAC
DBP.$$LAC
ENR.
' Result is "08:09.098"
```

Syntax

TCA.GetPart|P1|P2[|P3]
TCA.Get|P1|P2[|P3]

Parameter Explanation

P1 – Timestamp `like 08:39:40.123`
If Microseconds are not 3 digits, they will be filled with "0" from left. `side.`

P2 – Format of Output, `"H:M:S.x" -> Complete Timestamp`
`"H" -> Return only Hours`
`"S" -> Return only Seconds etc.`

P3 – ***(Optional)*** Variable for result. If missing, Result is stored in Variable P1.

Example

```
'*********************************************
' TCA.Get - Sample
'*********************************************
  ' Get Hours:Minutes.Microseconds
  $$LAA=08:09:59.098
  $$LAB=H:M.X
  TCA.Get|$$LAA|$$LAB|$$LAC
  DBP.$$LAC
  ' Result is "23:59:098"
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

3.47.7.6 TCA.Make

MiniRobotLanguage (MRL)

TCA.Make - Command

Make 2 Timestamps

Intention

Using TCA.Make you can easily create a Timestamp in this Standard-Format:

HH:MM:SS.ddd

Hereby the
- **HH** is Hours (0 to 99 - not limited to 12 or 24)
- **MM** is the Minutes limited 59
- **SS** is the Seconds limited 59
- **ddd** is the Milliseconds limited to 999

The Format of the Milliseconds is internally rounded to 3 places by prefixing zeroes.
If you specify `00:00:23` this will be treated as `00:00:00.023`
If you specify `00:00:00.023` this will be treated as `00:00:00.023`

If the Makeition of any of the values goes beyond their limit, the Carry is Makeed to the next higher Parameter.

Sample: Make (Make Timestamps)

```
$$LAF=
$$LAB=14
$$LAC=40
$$LAD=21
$$LAE=999
$$MSG=Teste TCA.MAKE
TCA.Make|$$LAF|$$LAB|$$LAC|$$LAD|$$LAE
' Result is "14:40:21.999"
ENR.
```

Syntax

TCA.Make|P1|P2[|P3]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 – Variable for Result Timestamp.
P2 – Hours-Value
P3 – Minutes Value
P4 – Seconds-Value
P6 – ***(optional)*** Miliseconds Value

Example

```
'*******************************************
' TCA.MAKE - Sample with Rollover
' If the given values are too high, the command will
autoamtically
' Roll over to the next allowed Timestamp.
'*******************************************
'
$$LAF=
$$LAB=24
$$LAC=69
$$LAD=81
$$LAE=999
$$MSG=Teste TCA.MAKE
TCA.Make|$$LAF|$$LAB|$$LAC|$$LAD|$$LAE
$$ERG=01:10:21.999
JIS.$$LAF!$$ERG|Lab_failed
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.47.7.7 TCA.Overflow

MiniRobotLanguage (MRL)

TCA.Overflow - Command

Calculate Numbers Overflow

Intention

Using TCA.Overflow you can calculate an numeric Overflow.

Question:
What time is it in 81 Hours, if its 12:00 now?

```
' This is the Time (21:00) and the hours we want go into the future (81)
CAL.$$LAB=81+21
' This is the Overflow Number, its 23 for hours
$$LAC=23
$$MSG=Teste TCA.Ovl 2
TCA.Ovl|$$LAB|$$LAC|$$LAD
' Result is "10"
DBP.$$LAD
ENR.
```

Sample: Overflow (Overflow Timestamps)

```
' This is the current Minutes (:22) and the Minutes we
' want go into the future (281)
CAL.$$LAB=281+22
' This is the Overflow Number, its 59 for Minutes
$$LAC=59
TCA.Ovl|$$LAB|$$LAC|$$LAD
' Result is "08"
DBP.$$LAD
ENR.
```

Syntax

TCA.Overflow|P1|P2[|P3]

Parameter Explanation

P1 - Numeric value (Integer)
P2 - Overflow Value (Integer)

*© 2023 Theo Gottwald * https://www.smart-package.com*

P3 – Variable for Result. I omitted, the Result is placed on **TOS**.

Example

```
'*******************************************
' TCA.Overflow - Sample with Rollover
' If the given values are too high, the command will
autoamtically
' Roll over to the next allowed Timestamp.
'*******************************************
'
$$LAF=
$$LAB=24
$$LAC=69
$$LAD=81
$$LAE=999
$$MSG=Teste TCA.Overflow
TCA.Overflow|$$LAF|$$LAB|$$LAC|$$LAD|$$LAE
$$ERG=01:10:21.999
JIS.$$LAF!$$ERG|Lab_failed
```

Remarks

-

Limitations:

-

See also:

- 1.5.1.3. Using Variables 92
- DAT. - Date and Time Information (System independent) 689

© 2023 Theo Gottwald * https://www.smart-package.com

3.47.7.8 TCA.Split

MiniRobotLanguage (MRL)

TCA.Split - Command

Split Timestamp into its Components

Intention

Using TCA.Split you can easily split a Timestamp in all Components:

HH:MM:SS.ddd

Hereby the
- **HH** is Hours (0 to 99 - not limited to 12 or 24)
- **MM** is the Minutes limited 59
- **SS** is the Seconds limited 59
- **ddd** is the Milliseconds limited to 999

The Format of the Milliseconds is internally rounded to 3 places by prefixing zeroes.
If you specify `00:00:23` this will be treated as `00:00:00.023`
If you specify `00:00:00.023` this will be treated as `00:00:00.023`

Sample: Split (Split Timestamps)

```
$$LAA=01:24:12.14
TCA.Split|$$LAA|$$LAB|$$LAC|$$LAD|$$LAE
DBP.$$LAB#$$LAC#$$LAD#$$LAE
' Result is "01#24#12#014"
ENR.
```

Syntax

TCA.Split|P1|P2|P3|P4|P5|P6
TCA.Spl|P1|P2|P3|P4|P5|P6

Parameter Explanation

P1 – Variable for original Timestamp
P2 – Variable for Hours-Value
P3 – Variable for Minutes Value
P4 – Variable for Seconds-Value

*© 2023 Theo Gottwald * https://www.smart-package.com*

P6 – Variable for Miliseconds Value

Any Parameter **P2** to **P6** can be omitted or replaced with a "-", in which case this value is been placed on **TOS**.

Example

```
'*********************************************
' TCA.Split - Sample
'*********************************************
'
$$LAA=01:24:12.14
TCA.Split|$$LAA|$$LAB|$$LAC|$$LAD|$$LAE
DBP.$$LAB#$$LAC#$$LAD#$$LAE
TCA.Make|$$LAF|$$LAB|$$LAC|$$LAD|$$LAE
DBP. Result is: $$LAF
ENR.
```

Remarks

-

Limitations:

-

See also:

- 1.5.1.3. Using Variables 92
- DAT. - Date and Time Information (System independent) 689
- VTT. - Value to Time 760
- TTV. - Time to Value 751
- VTD. - Value to Date 756
- DTC. - Date and Time Calculation 693
- VTF. - Verify Time Format 742
- VDF. - Verify Date Format 739
- IDC. / NDC. - If Date Command 709
- CAL. - mathematical CALculation 2315
- CAX. - Calculate Extended 2320

© 2023 Theo Gottwald * https://www.smart-package.com

3.47.8 VDF. - Verify Date Format

MiniRobotLanguage (MRL)

VDF. Command

Verify Date Format

Intention

What is a date?

A date is this: "01.01.2010". It can also be "1.1.10".
A US-formatted Date like "2022/12/31" will be converted to the European Date that can be used with these functions here.

What does VDF do?
VDF. will check that you have to do with a valid date. For example:
"39.13.2013" looks like it would be would be the right date format.
But its not a valid date.
There are no 39 days in a month. And you can't have a 13 th month in a year.
Year-numbers can go from 100 to 9999. Years below 100 get a 2000 added.
If you specify "01.01.13" it will become "01.01.2013".

Let us see what VDF. will do in such a cases.

```
$$TIM=23/45/12
VDF.$$TIM
ITO.
  DBV.Timeout Flag: $$TIM
ELS.
  DBV.$$TIM
EIF.
' Timeout Flag: 23-12-2012
```

As you can see here, in case that it did any changes in the supplied date, it will also set the "Timeout Flag". This way you know that VDF. has changed something in the date-format.

This does not necessarily mean that your date was wrong. It just means "it was changed". See this example::

```
$$TIM=01/01/2012
VDF.$$TIM
ITO.
  DBV.Timeout Flag: $$TIM
ELS.
  DBV.$$TIM
EIF.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

VDF. does not really check, if your actual month has exactly a 31th day. It will generally check the date-range. It will check that any month will not have more the 31 days, and that any year will have 1 to 12 month.

If you just write VDF. you will get this output:on TOS:

```
00-00-0000
```

Which is the mask for the date. You can use this date immediately in DTC.

Syntax

VDF.P1[|P2]

Parameter Explanation

P1 - Variable or number that should be verified.
If you specify an variable in P1, and P2 is omitted, then the result will be placed in that variable P1.

P2 - (optional) If specified, this variable will be used for the resulting value.

Example

```
'*********************************************
' VDF. - Sample
'*********************************************
'
$$TIM=23/45/12
VDF.$$TIM
ITO.
  DBV.Timeout Flag: $$TIM
ELS.
  DBV.$$TIM
EIF.
' Timeout Flag: 23-12-2012
ENR.
```

Remarks

Year-numbers can go from 100 to 9999. Years below 100 get a 2000 added.
If you specify "01.01.13" it will become "01.01.2013".

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.47.9 VTF. - Verify Time Format

MiniRobotLanguage (MRL)

VTF. Command

Verify Time Format

Intention

What is a time?
A time is this: "08:37". A time is also this ""08:37:15", which includes seconds. While this "08:37:15:2544" is also a valid time and include Milliseconds.

What does VTF do?
VTF. will check that you have to do with valid times. For example:
"29:65:99" looks like it would be would be the right time format.
But its not. There are no 29 hours on each day. And you can't have 99 seconds in a minute.

Let us see what VTF. will do in such a case.

```
$$TIM=25:65:-2
VTF.$$TIM
DBV.$$TIM
ENR.
' Output is 23:29:02
```

It will do a little bit more then that. In case that it did any changes in the supplied date, it will also set the "Timeout Flag". This way you know that VTF. changed something in the time-format. This does not necessarily mean that your time was wrong. It just means "it was changed". See here:

```
$$TIM=25:65:-2
VTF.$$TIM
ITO.
  DBV.Timeout Flag: $$TIM
ELS.
  DBV.$$TIM
EIF.
ENR.
' Timeout-Flag was set
' Result is 23:59:02
```

Here the timeout flag will not be set:

```
$$TIM=23:59:00
VTF.$$TIM
ITO.
  DBV.Timeout Flag: $$TIM
ELS.
  DBV.$$TIM
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EIF.
```

And the following code will set the timeout flag, because the time was changed.

```
$$TIM=23:59
VTF.$$TIM
ITO.
  DBV.Timeout Flag: $$TIM
ELS.
  DBV.$$TIM
EIF.
```

Here is another example, what its good for:

```
$$TIM=23/45/00
VTF.$$TIM
' Result is 23:45:00
```

Syntax

VTF.P1[|P2]

Parameter Explanation

P1 - Variable or number that should be verified.
If you specify an variable in P1, and P2 is omitted, then the result will be placed in that variable P1.

P2 - ***(optional)*** If specified, this variable will be used for the resulting value.

Example

```
'*********************************************
' VTF. - Sample
'*********************************************
'
$$TIM=23:59
VTF.$$TIM
ITO.
  DBV.Timeout Flag: $$TIM
ELS.
  DBV.$$TIM
EIF.
ENR.
```

3.47.10 Time to Value Commands

Using these Commands, you can convert Date and Time to numbers and do simple Mathematics with these numbers.

Using `DTV.` you can convert a date to the equivalent number of days since January 1601.
Now you can do any sort of math using this number. When you're done, just use VTD. to convert the result back into a valid date! This way calculations with days get very easy.

`TTV.` delivers you the "**number of seconds since midnight**" for a specified time. It will tell you "How many seconds old your day is. You can also do Mathematics using this number and convert it back.

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.47.10.1 DTV. - Date to Value

MiniRobotLanguage (MRL)

DTV. Command

Date to Value

Intention

Using DTV. you can convert a date to the equivalent number of days since January 1601.
Now you can do any sort of math using this number. When you're done, just use VTD. to convert the result back into a valid date! This way calculations with days get very easy.

Example:

```
VTD.1|$$RES
MBX.$$RES
' Will return "01-91-1601"

DTV.01.01.1601|$$RES
MBX.$$RES
' Will return "1"

' Using "Now" the current Date is used.
DTV.now|$$RES
VTD.$$RES|$$RES
MBX.$$RES
```

What is the difference between date and value?
A date is this: "01.01.2010".
A value is this: "149386". This the number of days that have passed, since January 1601.

What does DTV. do?
DTV. delivers you the value for a date. That is the number of the given day, counted from January 1601, one for each day.
For example, you will get a "149385" as value for the "01.01.2010" and a "149386" as value for the "02.01.2010", which is one day later.

What do i do with these values?
Values that represent a date, are more easy to handle. Store them in files, do calculations with them. A date is just a number with DTV. Of course you can also add or subtract days from this value.

Can i convert that number back to a date?
Yes, finally you can convert that value back to a valid date using VTD. (Value to Date).

© 2023 Theo Gottwald * https://www.smart-package.com

One thing to know is, that if you specify the term "now" instead of a date, then the current date will be used. The same will happen, if you omit **P1** or if you leave **P1** empty.

Usage is simple:

```
DTV.
STS.DUMP
MBX.!
```

```
------------------------------------
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->LongInt      :150169

------------------------------------
```

which is today's value on TOS.

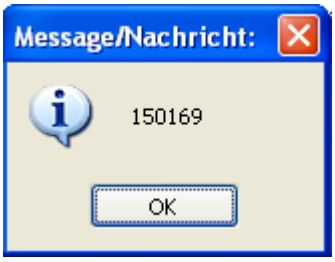
If we provide **P1**, the variable will be used as Source and Target, if its a variable.
Like this:

```
$$TIM=now
DTV.$$TIM
MBX.$$TIM
```

will deliver this result:below (left picture). If you leave away the first line and just write:

```
DTV.$$TIM
MBX.$$TIM
```

you will get a zero, like in the second picture. Why this?



The reason is, that undefined variables will not be resolved. In that case the script tries to get the "date-value" for `$$TIM` which is zero, like it is zero for any invalid (non-date) string..

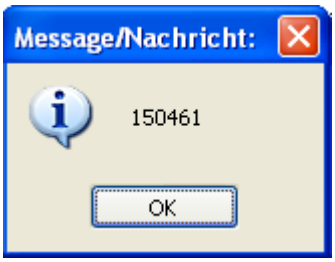
```
' This will work as expected and return the value for "Now"
$$TIM=
DTV.|$$TIM
MBX.$$TIM

' This will do just the same (P1 = empty)
DTV.|$$TIM
MBX.$$TIM
```

Now we will get a value for another date, let us take the `12.12.2012`.
Like this:

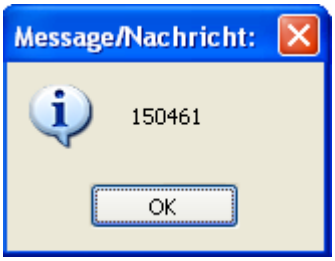
© 2023 Theo Gottwald * https://www.smart-package.com

```
 DTV.12.12.2012|$$TIM
MBX.$$TIM
```



Of course we can use variables. Here is an example:

```
$$DAT=12.12.2012
DTV.$$DAT|$$TIM
MBX.$$TIM
```



It works. The result is in the second variable `$$TIM`.

Important:
You need to specify the date in the format "`dd.mm.yyyy`". Giving a useless input you will get:
a) If there are no numbers contained, Result is "0"
b)If there are numbers contained, you will get a date based on the 01.01.2001 as result. For example:

```
$$DAT=Anton
DTV.$$DAT|$$TIM
MBX.$$TIM
'Result is "0"

$$DAT=Anton6
DTV.$$DAT|$$TIM
MBX.$$TIM
'Result is "06.01.2001"
```

Syntax

DTV.[P1][|P2]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - ***(can be omitted or empty)*** If omitted or empty, the actual time (Now) is used. The result will be placed on the TOS. The same will happen, if the term now is given, no matter if in an variable or direct. If you specify an variable in P1, and P2 is omitted, then the result will be placed in that variable.

P2 - ***(optional)*** If specified, this variable will be used for the resulting value.

Example

```
'*********************************************
' DTV. - Sample
'*********************************************
'
$$TIA=01.01.2010
$$TIB=02.01.2010
DTV.$$TIA
DTV.$$TIB
CAL.$$RES=($$TIB-$$TIA)
DBP.$$RES, $$TIB,$$TIA
ENR.

'*********************************************
' DTV. - Sample
'*********************************************
'
$$DAT=12.12.2012
DTV.$$DAT|$$TIM
MBX.$$TIM

'*********************************************
' DTV. - Sample
' Convert Date to Number, Add 1 day and convert
' Number back to Date
'*********************************************
'
$$DAT=12.12.2012
DTV.$$DAT|$$TIM
VIC.$$TIM
VTD.$$TIM
MBX.$$TIM
' Result is 13.12.2012
ENR.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

-

Limitations:

All Date-calculations should be accurate up to a Millisecond at least back until 1601.
You can not specify Dates before the 01-01-1601. Doing so will always return "0".

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.47.10.2 TTV. - Time to Value

MiniRobotLanguage (MRL)

TTV. Command

Time to Value

Intention

What is the difference between time and value?
A time is this: "08:37". A time is also this ""08:37:15", which includes seconds. While this "08:37:15:2544" is also a valid time, we don't need Milliseconds here because TTV. does only work down to seconds. A value is this: "31006" which is about "07:36".

What does TTV. do?
TTV. delivers you the "**number of seconds since midnight**" for a specified time. It will tell you "How many seconds old your day is.

For example, you will get a "31151" as value for the "07:39:" and a "149386" as value for the "02.01.2010", which is one day later.

What do i do with these values?
Values that represent a time, are more easy to handle. Store them in files, do calculations with them. A time is just a number with DTV. Of course you can also add or subtract seconds to / from this value.

Can i convert that number back to a time?
Yes, finally you can convert that value back to a valid date using VTT. (Value to Time).

One thing to know is, that if you specify the term "**now**" instead of a date, then the current time will be used. The same will happen, if you omit **P1** or if you leave **P1** empty.

Usage is simple:

```
TTV.
STS.DUMP
MBX.!
```

```
-------------------------------------
User-Stack-Dump:
-------------------------------------

Stackpos: 000 ->LongInt      :30922

-------------------------------------
```

which is actual time (in seconds after midnight) as a value on TOS.

If we provide **P1**, the variable will be used as Source and Target, if its a variable.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Like this:

```
$$TIM=now
TTV.$$TIM
MBX.$$TIM
```

will deliver this result:below (left picture). If you leave away the first line and just write:

```
TTV.$$TIM
MBX.$$TIM
```

you will get a zero, like in the second picture. Why this?

The reason is, that undefined variables will not be resolved. In that case the script tries to get the "date-value" for `$$TIM` which is zero, like it is zero for any invalid (non-time) string..

```
' This will work as expected and return the value for "Now"
$$TIM=
TTV.|$$TIM
MBX.$$TIM

' This will do just the same (P1 = empty)
TTV.|$$TIM
MBX.$$TIM
```

Now we will get a value for another time. But what if we have times without the seconds?
Let us try:

```
' We specify only the hours
TTV.10|$$TIM
DBV.$$TIM
' Result is 36000

' We specify Hours and Minutes
TTV.10:00|$$TIM
DBV.$$TIM
' Result is 36000

' We specify the complete time
TTV.10:00:00|$$TIM
DBV.$$TIM
' Result is 36000

' We specify even Milliseconds
TTV.10:00:00:0000|$$TIM
DBV.$$TIM
```

© 2023 Theo Gottwald * https://www.smart-package.com

As you can see in this example, the result is always the same. Missing time-informations are being treated as zero. If you omit minutes or seconds, they are zero'ed.
The Milliseconds do not play a role here and are simply ignored.

Of course we can use variables. Here is an example:

```
$$TIA=10
TTV.$$TIA|$$TIM
DBV.$$TIM
```

It works. The result is 36000 as expected.

```
' Get the time-value into variable $$TIA
$$TIA=10:00:30
TTV.$$TIA|$$TIM

' Subtract 156 Seconds
CAL.$$TIM=$$TIM-156
VTT.$$TIM|$$TIA

' Print it in the editor
DBV.$$TIA
ENR.
```

Important:
You do need to specify the time in the format "`hh:mm:ss`", but you can leave parts away from the right side. You can not leave away the **hh**-part.

Syntax

TTV.[P1][|P2]

Parameter Explanation

P1 - ***(can be omitted or empty)*** If omitted or empty, the actual time (Now) is used. The result will be placed on the TOS. The same will happen, if the term now is given, no matter if in an variable or direct. If you specify an variable in P1, and P2 is omitted, then the result will be placed in that variable.

P2 - ***(optional)*** If specified, this variable will be used for the resulting value.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*********************************************
' TTV. - Sample
'*********************************************
'
TTV.
DBV.$$000
PAU.1
TTV.
VTT.$$000
DBV.$$000
ENR.

'*********************************************
' TTV. - Sample
'*********************************************
'
TTV.now|$$TIM
DBV.$$TIM
VTT.$$TIM
DBV.$$TIM
ENR.

'*********************************************
' TTV. - Sample
'*********************************************
'
TTV.now
VTT.$$000
DBV.$$000
ENR.

'*********************************************
' TTV. - Sample
'*********************************************
'
TTV.10:00:00|$$TIM
DBV.$$TIM
' Result is 36000
```

Remarks

-

Limitations:

These time-calculations depend on th current system time. If your system time is wrongly set, the command may also deliver the wrong time.

3.47.10.3 VTD. - Value to Date

MiniRobotLanguage (MRL)

VTD. Command

Value to Date

Intention

Using `DTV.` you can convert a date to the equivalent number of days since January 1601.
Now you can do any sort of math using this number. When you're done, just use `VTD.` to convert the result back into a valid date!
This way calculations with days get as easy as adding or subtracting numbers.

Example:

```
VTD.1|$$RES
MBX.$$RES
' Will return "01-91-1601"

DTV.01.01.1601|$$RES
MBX.$$RES
' Will return "1"
```

What is the difference between a date and a value?
A date is this: `"01.01.2010"`.
A value is this: `"149386"`.

What does VTD. do?
`VTD.` is the counterpart to `DTV.` It will convert a value back to a date.
`DTV.` delivers you the value for a date. That is the number of the given day, counted from January 1601, one for each day.

For example, you will get a `"149385"` as value for the `"01.01.2010"` and a `"149386"` as value for the `"02.01.2010"`, which is one day later.

What do i do with these values?
Values that represent a date, are more easy to handle. Store them in files, do calculations with them. A date is just a number with `DTV.` Of course you can also add or subtract days from this value.

Can i convert that number back to a date?
Yes, finally you can convert that value back to a valid date using `VTD.` (Value to Date).

See DTV. - Date to Value 746 on how to convert a date into a corresponding number.

Once you have such a number, `VTD.` will convert it back to a date. If you want to change the format of the given date, use `DTC.`

*© 2023 Theo Gottwald * https://www.smart-package.com*

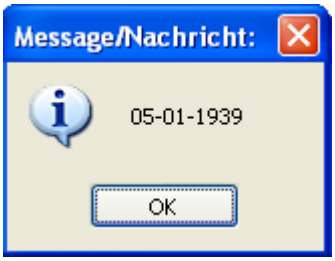
Here is an example, how
- a date is been converted into a number
- one day is added
- and then the number is converted back to the date..

```
$$DAT=12.12.2012
DTV.$$DAT|$$TIM
VIC.$$TIM
VTD.$$TIM
MBX.$$TIM
ENR.

' This example uses a given date-number "123456!
$$TIM=123456
VTD.$$TIM
MBX.$$TIM
```

Which will evaluate to the below result (picture below).
Of course you can also use 2 variables, in that case you get the same result.

```
$$TIM=123456
VTD.$$TIM|$$RES
MBX.$$RES
ENR.
```



Important:
You can use this date immediately for DTC. to convert it to any format you like.
Like this:

```
$$TIM=123456
VTD.$$TIM|$$RES
' change the date-format to anything you want.
DTC.$$RES|mm/dd/yy
MBX.$$RES
ENR.
```

Syntax

VTD.P1[|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - Variable or number that should be converted to a date.
If you specify an variable in P1, and P2 is omitted, then the result will be placed in that variable P1.

P2 - (optional) If specified, this variable will be used for the resulting value.

Example

```
'*********************************************
' VTD. - Sample
'*********************************************
'
$$TIM=123456
VTD.$$TIM|$$RES
DTC.$$RES|dd+mm+yy
MBX.$$RES
ENR.
```

Remarks

-

Limitations:

All Date-calculations should be accurate up to a Millisecond back until 1601.
You can not specify negative values, therefore earlier dates then 1601 can not be calculated using `VTD./DTV.`.

See also:

- 1.5.1.3. Using Variables 92

© 2023 Theo Gottwald * https://www.smart-package.com

3.47.10.4 VTT. - Value to Time

MiniRobotLanguage (MRL)

VTT. Command

Value to Time

Intention

What is the difference between time and value?
A time is this: "08:37". A time is also this ""08:37:15", which includes seconds. While this "08:37:15:2544" is also a valid time, we don't need Milliseconds here because TTV. does only work down to seconds. A value is this: "31006" which is about "07:36".

What does VTT. do?
VTT. is the counterpart to TTV. It will convert a value back to a Time.
TTV. delivers you the "**number of seconds since midnight**" for a specified time. It will tell you "How many seconds old your day is. And VTT. takes that number and converts it back.
For example, you will get a "36000" as value for the 10:00:00" and a "36001" as value for the "10:00:01", which is one second later.

What do i do with these values?
Values that represent a time, are more easy to handle. Store them in files, do calculations with them. A time is just a number of seconds with TTV. Of course you can also add or subtract seconds from this value. Here is an example:

```
' Get the time-value into variable $$TIA
$$TIA=10:00:30
TTV.$$TIA|$$TIM

' Subtract 30 Seconds
CAL.$$TIM=$$TIM-30
VTT.$$TIM|$$TIA

' Print it in the editor
DBV.$$TIA
ENR.
```

See TTV. - Time to Value 751 for additional samples and explanations on this topic.
See DTC. - Date and Time Calculation 693 for formatting and calculation with times and dates.
See also FMT. - Format Numeric Output 3107 for formatted numeric output.

Important:
You can use this time immediately for DTC. to convert it to any format you like.
Like this:

```
$$TIM=36000
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VTT.$$TIM|$$RES
' change the date-format to anything you want.
DTC.$$RES|hh/nn
DBV.$$RES
ENR.
' Output is 10/00
```

Syntax

VTT.P1[|P2]

Parameter Explanation

P1 - Variable or number that should be converted to a time.
If you specify an variable in P1, and P2 is omitted, then the result will be placed in that variable P1.

P2 - (optional) If specified, this variable will be used for the resulting value.

Example

```
'*********************************************
' VTT. - Sample
'*********************************************
'
$$TIA=10:00:30
TTV.$$TIA|$$TIM
' Subtract 30 Seconds
CAL.$$TIM=$$TIM-30
VTT.$$TIM|$$TIA
DBV.$$TIA
ENR.
```

Remarks

-

Limitations:

These time-calculations depend on th current system time. If your system time is wrongly set, the command may also deliver the wrong time.

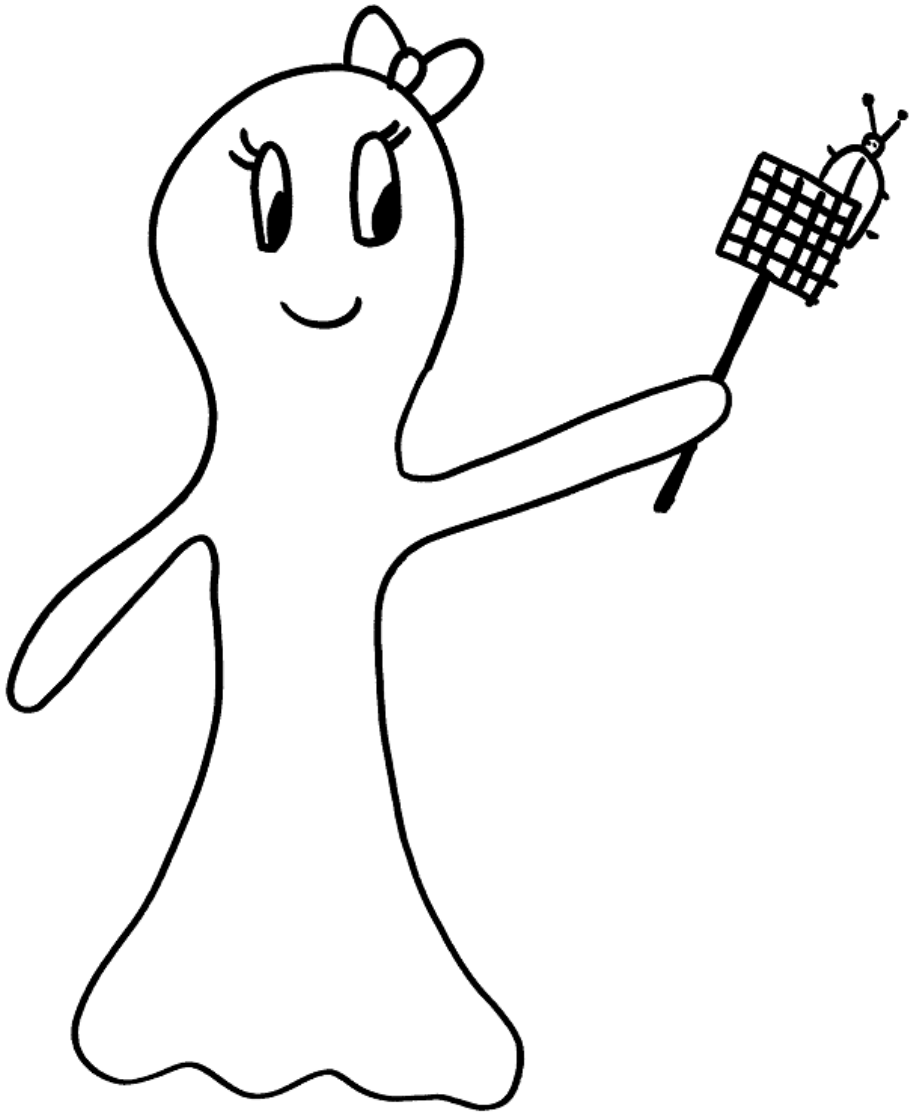
3.48 Debugging - Commands

3.48.1 ! Smarty's Debugging Commands

Smarty's Debugging Commands **Previous** 760 **Top** 41 **Next** 765

Smarty's Debugging Commands

These Commands are helpful not only in Debugging, they can also be used to slow down Script Execution whenever the target GUI can not handle the Robots Speed. And thats often the case.



Your script does not do what you want?

*© 2023 Theo Gottwald * https://www.smart-package.com*

It does not work as expected?

In this case "debugging" is your next step.

In this chapter you find all the commands that you need to trace your script and find out what's wrong.

© 2023 Theo Gottwald * https://www.smart-package.com

3.48.2 DBM. - DeBugMode

MiniRobotLanguage (MRL)

DBM. Command

Debug Mode

Intention

The `DBM.`-Command enables different options for Debugging.

`DBM.1` opens a separate Window with Single-Step option.

`DBM.2` prints the actual Command into a Debug-Console-Window.

`DBM.4` prints all Browser-Events that come from the Mini-Browser, if it was launched using `LBR.`

`DBM.32` enables additional Infos.

Syntax

DBM.P1

Parameter Explanation

```
P1 -  0 = Mode off
      1 = Mode on, messages in debug-window of the editor
      2 = Mode on, messages in Concole-window
      4 = Show Browser Events, while loading a WEB-Site
           MiniBrowser only, and must be started using LBR.
     32 = Mode on, Additional infos mostly for internal use.

Debugmode 32 prints every executed Line in the Debug-Window
together with following informations:

001   000000782162   0001 DBM.1

1. Linenumber
2. used CPU-Time
3. Times the Line was executed
4. Command
```

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
' DBM.-Demo
'**********************************
DBM.2
PRT.This is a text to display something
:over
MBX.Halt to read output
'**********************************
```

Remarks

With the `USM.` Command you can redirect the ouput of `DBM.`-Mode2 into an separate Log-file.

Limitations:

-

- DMP. - Dump internat Informations 775

© 2023 Theo Gottwald * https://www.smart-package.com

3.48.3 DBO. - Debug Raw Output

MiniRobotLanguage (MRL)

DBO. Command

Debug Raw Output

Intention

This command is used to print debug variables in the debug-window of the editor.
Unlike DBP - Debug Print 769, specialfolders 345 and systemvariables 334 will not be resolved.
Unlike DBV. - Debug Print Variable 771 variables will also not be resolved.
The output will be completely and exactly what you write.

`DBO.` will be ignored, if the script is not running from within the editor. This way, Debug-Messages will not be see from an compiled executable.

```
VAB.$$NAM=Rainer
VAB.$$TXT=$$NAM
DBO.$$TXT
ENR.
' Output is "$$TXT"
```

Syntax

DBO.P1

Parameter Explanation

P1 - Any text or variables you want to print in the Editor-Debug-Window.

Example

```
'*****************************************************
' EXAMPLE : DBO.
' Run from the Editor!
'*****************************************************
: $$TXT=?path\Logfile.log $$TXT
DBO. My variable is: $$TXT
ENR.
MBX.Ready
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'******************************************************
```

Remarks

-

Limitations:

-

- **DBP - Debug Print** 769
- **DBO. - Debug Raw Output** 767
- DBM. - DeBugMode 765
- SAY. - Say something 2048
- DIP. - Delayed Instruction Processing 773
- USM - Use silent Mode 786
- DMP. - Dump internat Informations 775

© 2023 Theo Gottwald * https://www.smart-package.com

3.48.4 DBP. - Debug Print

MiniRobotLanguage (MRL)

DBP. Command

Debug Print

Intention

This command is used to print debug information in the debug-window of the editor. `DBP.` will be ignored, if the script is not running from within the editor. This way, Debug-Messages will not be see from an compiled executable.

```
DBP. Hallo World!
```

`DBP.` will resolve systemvariables and specialfolders, which could be an unwanted feature for debugging. If you do not want that, use DBV. - Debug Print Variable 771.

Syntax

DBP.P1

Parameter Explanation

P1 - `Any text or variables you want to print in the Editor-Debug-Window.`

Example

```
'*****************************************************
' EXAMPLE : DBP.
' Run from the Editor!
'*****************************************************
DBP.Hallo

3.48.5 DBV. - Debug Print Variable

MiniRobotLanguage (MRL)

DBV. Command

Debug Print Variable

Intention

This command is used to print debug variables in the debug-window of the editor. Unlike DBP - Debug Print 769, specialfolders 345 and systemvariables 334 will not be resolved.

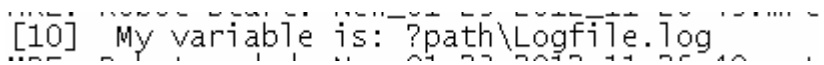
`DBV.` will be ignored, if the script is not running from within the editor. This way, Debug-Messages will not be see from an compiled executable.

Here is a good example what `DBV.` is useful for. You want to know what is the content of this variable. But the content should not be resolved, just be displayed. This is where `DBV.` takes place.

```
VAB.$$NAM=Rainer
VAB.$$TXT=$$NAM
DBV.$$TXT
ENR.
' Output is "$$NAM"

' Special folders are not resolved
: $$TXT=?path\Logfile.log
DBV. My variable is: $$TXT
```

You will get this output:



Syntax

DBV.P1

Parameter Explanation

P1 - Any text or variables you want to print in the Editor-Debug-Window.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'*****************************************************
' EXAMPLE : DBV.
' Run from the Editor!
'*****************************************************
: $$TXT=?path\Logfile.log $$TXT
DBV. My variable is: $$TXT
ENR.
MBX.Ready
'*****************************************************
```

3.48.6 DIP. - Delayed Instruction Processing

MiniRobotLanguage (MRL)

DIP. Command

Delayed Instruction Processing

Intention

These command is used to slow down script execution. The robot will pause after each line for the given amount of time in milliseconds (ms).

`DIP.200` is a common used value.

You can switch off the slow-down with:

```
DIP.0
```

or simply

```
DIP.
```

These will make the script run with full speed. DIP. is used to slow down the whole script or parts of a script. If you experience problems running a script as executable (compiled script), while the script has worked fine from the Editor, try a DIP.250.

Generally we recommend to design scripts in a way that they run at full speed. However for debugging use, DIP. is a good choice.

Syntax

DIP.[number]

Parameter Explanation

P1 - (optional) `NUM/VAR`

```
   the given number is the amount of time in msec
(Milliseconds =
   1/1000 th of a second), that the Script waits between the
commands.
   This way the script execution is slowed down.
```

Example

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
'************************************************
' DIP. - Sample
'************************************************

'Switch on Slow Mode
DIP.450

' Switch off Slow Mode
DIP.

'************************************************
```

3.48.7 DMP. - Dump internat Informations

MiniRobotLanguage (MRL)

DMP. Command

Dump internal informations

Intention

This command makes internal structures like the stack or the speed-table visible to the user.
You can see all variables 366, the stack 369. Or you can get the information on how fast single lines have been processed (speed table 80).

1. DMP.1 - Show Speed-Table

Using `DMP.1` to get a "Speed Table", you can get a lot of **information for debugging**.

In the very left column, you can see the line-number.
In the second column, you can see the Number of "Ticks" that this line needed to execute. My current i7 CPU can make 16.000.000 Ticks in one seconds. On your computer this may differ.
The third row shows you how often this line has been executed.
You will also see all Macros expanded in this DMP.1-View.
Also you see here that the SPR will jump over a lot of Comment-Lins, thats why they did not use any time. Therefore the (automatic) Jump-Instruction in Line 001 needs 130 Ticks.

```
-----------------------------------
Speed-Dump:
-----------------------------------
001 0000000000000130 0001
002 0000000000000000 0000
003 0000000000000000 0000
004 0000000000000000 0000
005 0000000000000000 0000
006 0000000000000000 0000
007 0000000000000000 0000
008 0000000000000000 0000
009 0000000000000000 0000
010 0000000000104023 0001 STW.ct|Chrome_WidgetWin_1|- Brave
011 0000000000549567 0001 ANA.Snap|0
012 0000000001272838 0001 ANA.Save|0|?path\Before.png
013 0000000050642061 0001 ANA.bw|0|460
014 0000000000482603 0001 ANA.Save|0|?path\After.png
015 0000000000000000 0001 DMP.1
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

DMP.[P1][|P2|P3]

Parameter Explanation

P1 - Select which table or stack you want to see.
  1 or "Speed"   - Speed-Table
  2 or "Global Var"   - Global Variables Table
  3 or "Local Var"   - Local Variables Table
  4 or "Global Stack" - Global User-Stack
  5 or "Local Stack"   - Local User-Stack
  6 or "Current Stack" - dump actual selected stack

P2 - (optional) Lower value of the displayed range

P3 - (optional) Upper value of the displayed range

If no argument is given the whole table is shown.

Important: Currently the Stack-Dump will NOT Show Floating-Point Variables
correctly due to the used Formatting. To check these, use:

```
POP.$$TST
MBX.$$TST
```

Example

```
'***********************************
' it will show Speedtable entry 4 to 6
DMP.1|4|6
' or
DMP.Speed|4|6

:over
MBX.Halt to read output
'***********************************

'***********************************
' This example shows the Speed-Dump of the script
' Put this command at the end of your script.
DMP.
:over
MBX.Halt to read output
'***********************************
```

3.48.8 GRI. - Get Run Information

MiniRobotLanguage (MRL)

GRI. Command

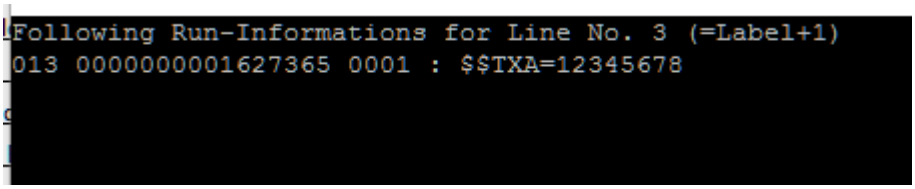
Get Run Information

Intention

Get internal Information on how long a single line needed to be processed by the CPU.

```
' GRI - Example 1 using Label-Reference
:Label
: $$TXA=12345678
GRI.:Label|1
PRT.Following Run-Informations for Line No. 3 (=Label+1)
PRT.$$000
MBX.!
END.

' This Example uses a Variable for the GRI.-Result
:Label
: $$TXA=12345678
GRI.:Label|1|$$RES
PRT.Following Run-Informations for Line No. 3 (=Label+1)
PRT.$$RES
MBX.!
END.
```



Syntax

GRI.[P1][|P2][|P3]

Parameter Explanation

P1 - `Line-Number or Label` (can be inside a variable, too).
P2 - ***(optional)*** `NUM` - Increment, is added to the Line-Number/Label **P1**.
P3 - ***(optional)*** ***VAR*** - Variable for Result, if omitted the Result goes to the TOS.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P1 or **P2** can be inside a variable.

Example

```
'-----------------------------------------------------------
' GRI - Example
'-----------------------------------------------------------
: $$TXA=12345678
: $$TXB=2

3.48.9 PAU. - Pause

MiniRobotLanguage (MRL)

PAU. Command

Pause

Intention

Pauses Script execution for a given amount of time. Give CPU-time back to the windows system. Possible use cases are:

- At some places the script may execute too fast, then you may want to slow it down.
- if you make a so called "endless loop", it makes sense to give some computing power back to the system.

In both cases you can use the `PAU.` Instruction. Usage is as easy as possible. Just write:

```
' pause for 1 second
PAU.1
```

When the script comes to that place it will just wait for 1 second. Behind the curtains, it will leave the CPU to other processes for the given amount of time.

1 second can be a lot of time, but its up to you, how long you want the script to **PAU.**
You can make it wait for 5 hr like this:

```
PAU.5|hr
```

or even let it wait for a Year (in seconds):

```
'  This is 6 hrs in milliseconds
PAU.21600000|ms
' this is also 6 hrs., in minutes
PAU.360|min
' and this is 6 hrs. in secons
PAU.21600|s
```

but normally you would write it like this:

```
PAU. 6|hr
```

You can use smaller times, starting up with 1 ms.

```
' This will wait for a tenth of a second
PAU.0.01
' this is the same
PAU.100|ms
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

You can choose values down to 1 ms, there are no half or zero milliseconds.

Syntax

PAU.[P1][|P2]

Parameter Explanation

P1 - Time to pause

P2 - ***(optional)*** Time unit (default is seconds)
Possible values are:

- hr = hour
- min = minute
- sec = seconds (default when P2 is missing)
- ms = milliseconds

Example

```
'****************************************
' Sample: PAU
' AWT at 2011-07-30
'****************************************

' pause in length of 1 second
PAU.1

' pause in lenght of half second
PAU. 0.5

'pause in length of 1 hour
PAU. 1|hr

'pause in length of 2 minutes
PAU. 2|MIN

' Example using a variable
$$PAU=0.25
PAU.$$PAU
```

Remarks

PAU. will only PAUSE the script at one place. If you want the whole script to be slowed down, use DIP. - Delayed Instruction Processing 773. The robot is able to receive messages while in PAU. Mode.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

The internal time calculations are done with 32 bits of Precision in ms. You can choose values down to 1 ms, there are no half or zero milliseconds. There is no upper limit you should be able to run against.

See also:

- DIP. - Delayed Instruction Processing 773
- 1.B Error handling 224

© 2023 Theo Gottwald * https://www.smart-package.com

3.48.10 USM. - Use silent Mode

MiniRobotLanguage (MRL)

USM. - prevent error messages

Use Silent Mode * prevent and redirect error messages

Intention

These command is used to tell the robot what to do in case of errors. Its mostly used to prevent errors popping up on client computers. Use it together with the Label 2.2 :on_Error - Label 364.

For more details on Error handling see: 1.B Error handling 224.

Syntax

USM.[P1][|P2]

Parameter Explanation

P1 -(optional) numeric parameter, if omitted, 32 is the default value

```
  0 - immediately end the script, no error handling.
      Can not be combined with other flags.
      :on_Error Label will be ignored!

  1 - just Beep on error, no error message,
       add +4 to make script continue running

  2 - redirect all console Messages to a file,
      use this together with Flag 8 to log all errors in a
file

  4 - ignore error-line and continue script execution,
        if possible. :on_Error Label will be ignored! Has
priority
       over additional options, like 32 (pressing CANCEL).

   8 - Redirect Error-Message to Console window,
       use this together with Flag 2 to log all errors in a
file

   16 -  Show error-message for ~ 50 Seconds, then kill
Message
         and End Script.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
   32 - Normal / default-Mode:
        Show Messagebox with "Retry/Cancel". If user presses
        "Retry", Error line will be skipped, like in Option 4.

  64 - Clear ":on_Error" Stop-Flag. See remark below for this
       special option.

  P2 - Path of the Error-Log file. If omitted:
       In case the script runs from Editor, ?path\MR_Error.log
       else, ?cdesktop\MR_Error.log is used.
```

Example

```
'*********************************************
' USM. - Samples
'*********************************************

'Switch on silent Mode
USM.10

' Switch on Silent Mode with Error-Log file
USM.10|?pfad\MyLog.txt

' Clear ":on_Error" Retry Flag
USM.64

' Switch off Silent Mode
USM.0

END.
:on_Error
MBX. There was an Error

'**********************************
' USM.-Demo
'**********************************
'
USM.10|?desktop\MR_Error.log
STW.tw|Nix|0

MBX.Ready

'-------------------------------------------------------------
ENR.

:on_Error
: $$ERF=?exepath\MR_Error.log
MBX.$$ERF
IEF.$$ERF
  COP.$$ERF|?cdesktop\MR_Error.log
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX. AN error happened!
ENR.
```

Remarks

Remark to Option "64":
In case there is a Label ":on_Error" somewhere in the script,
the robot will jump there in case of an error.
To prevent a circular reference, if the error is in the part after ":on_Error", there is an internal safety-flag that will prevent the "on_Error" to be called a second time.
This flag can be cleared to (retry aomething) using USM.64

`USM.0` does not do any defined action in case of error. The script will just end. However it will not even run into the `:on_Error Label`.

`USM.2` will redirect all console output to the error-log file. This includes all output from any command that writes to the console.

ParallelRobots (`PRR. - PRE.`) do actually not run in he Editor and may use the `?cdesktop\MR_Error.log Log-Path`
even, if the Main-Script runs in the Editor.

Limitations:

-

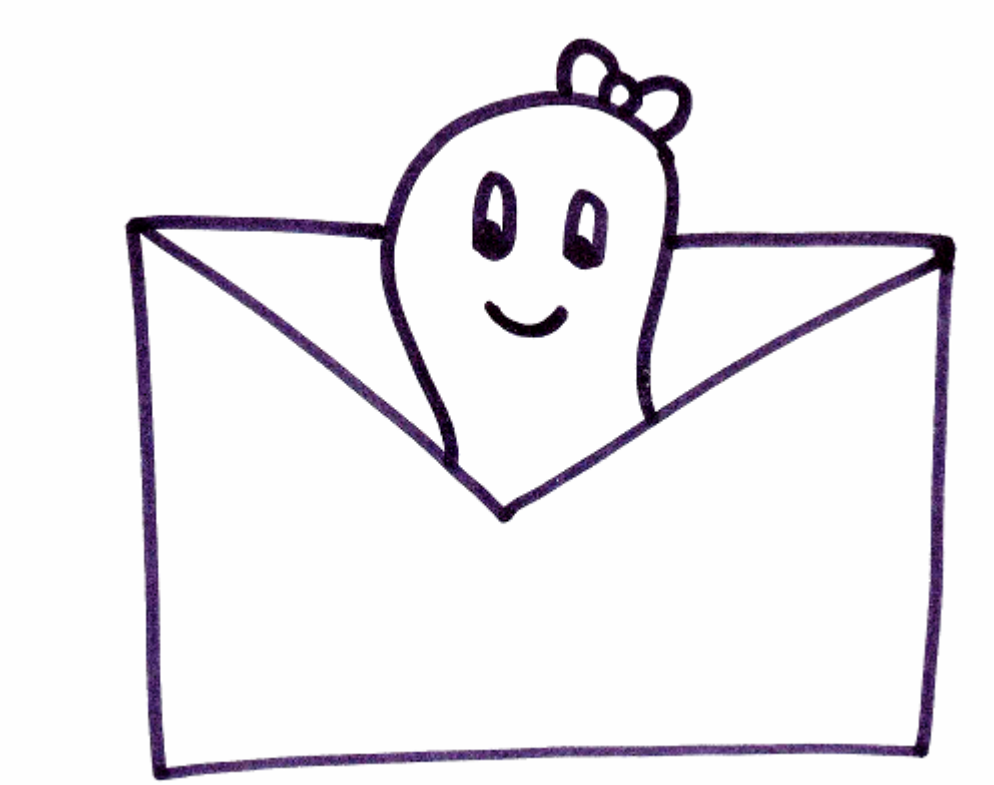
3.49 E-Mail Commands

3.49.1 ! Smarty's Send-Mail

Smarty's Send-Mail



Smarty's Send-Mail

You can use Smarty's Mail-System to send e-mails. For example, to signal States in a End2End-Testing Script.

If you combine the String-capabilities with the `FEX.` (Enum-Commands), Smarty will also be a great Bulk-Mail program.

Smarty's Mail-System supports the following features:

- configurable SMTP Send-Mail
- **easy to use** (GUI for Parameters)
- choose Port 25 or any alternative Port you need
- supports Login Authentication if needed
- **encrypted Password** if you use "Mailconfig.dat"-feature
- returns success or failure
- GUI-Mailconfig.exe to set reusable Send-Mail Configurations

*© 2023 Theo Gottwald * https://www.smart-package.com*

- can send Plain-Text, HTML or combined Mails
- can send unlimited Number of mail-attachments
- supports **CC**: and **BCC**: fields
- supports variable Fields for "**Localhost**" and "**Reply To**"
- *Fast, fast, fast* ... use `SMB.` to send Mails with maximum speed.
- Send **large Mails** that need long time to be **sent, in the background**
- **Sent multiple Mails at the same time**
- the only limit is the limit your provider sets you.

In short, you can sent any thinkable E-Mail using Smarty's Mail-Command.
I have sent up to 100 E-Mails at the same time using the `SMB.`-command.

Trying to send **more then 100 E-Mails (at the same time !)** i got this Error from my Providers Mail-Server:

```
Result from 5972 = ERROR: 421 too many connections
Result from 5968 = ERROR: 421 too many connections
Result from 5980 = ERROR: 421 too many connections
Result from 5996 = ERROR: 421 too many connections
```

If you overrun the capacity that the Mail-Provider gives you, you will get this error.
It proofs, that using Smarty's Send-Mail, you can sent mails to the maximum.

Configuring Smarty's Send-Mail Settings

All Mails are sent using the **POP / SMTP**-Protocol. For this to work, there are some settings that need to be configured.

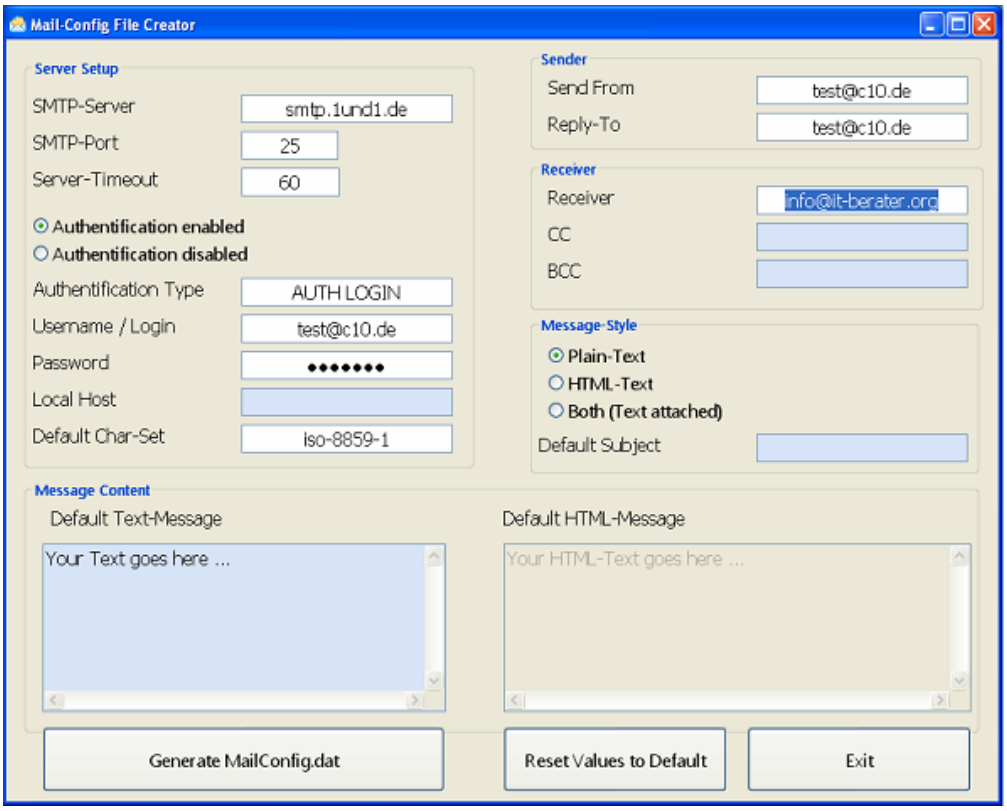
There are two ways to configure Smarty's Send-Mail-System:

1. the `SMP.` - command
2. the "MailConfig.exe" Utility and the resulting "MailConfig.dat"-File

If you use the "Mailconfig.dat"-Option, you can override any of the loaded settings using the `SMP.` commands. This way, you can combine both methods.

Let us now take a quick look on Smarty's "**MailConfig.exe**".

*© 2023 Theo Gottwald * https://www.smart-package.com*



What is a "MailConfig.dat"-File?

A "MailConfig.dat"-File is a file that contains all settings needed to sent an E-Mail out.
A "MailConfig.dat"-File may contain only basic settings, in that case you can define all other settings using the `SMP.`-command.

A "MailConfig.dat"-File **is encrypted,** There is no supported way to read - for example - an **E-Mail Password** out of it. Therefore it serves the purpose that nobody can get your e-mail Password "the easy way".
Note that while all Data inside the "Mailconfig.dat"-file is heavily encrypted, there is no technical way, to guarantee that a dedicated hacker can not get the password out of it.
Therefore you should think of this encryption as a sort of "hiding the password".

How do i generate a "MailConfig.dat"-File?

You can generate a "MailConfig.dat"-File using the supplied "MailConfig.exe"-Utility.

1. To do this, you simply fill out all required fields (they are marked white).
2. And you can fill all optional fields (they are marked blue).
3. Then you press the button "Generate MailConfig.dat".

That's all. Finally you can grab your "MailConfig.dat" on your desktop.

Why do i need the "MailConfig.exe"-Utility?

*© 2023 Theo Gottwald * https://www.smart-package.com*

The "MailConfig.exe"-Utility is the only way to generate a encrypted File called "MailConfig.dat". This file contains all settings that are needed to send e-mails using the `SMA.`-Command.

Do i need to use '#INC: to include the MailConfig.dat into my executable?

No, generally this is done automatically, for you.
If the path of the "`MailConfig.dat`" file is "`?path\`" and if it does not contain variables, it will automatically be added to an executable during compile.
Generally said, the path must be available at compile-time, variables are only available at runtime. In all other cases, you have to add this file to the executable using `'#INC:.`

What does the SMP-Command do, if the file is not available?

You will get a error-message that tells you exactly what was wrong.

How do i add attachments to my Mail?

Use the `SMP.`-command like in the example below.

```
SMP.addfile=?path\Text1.txt;?desktop\results.dat
```

What do i specify as "Receiver"?

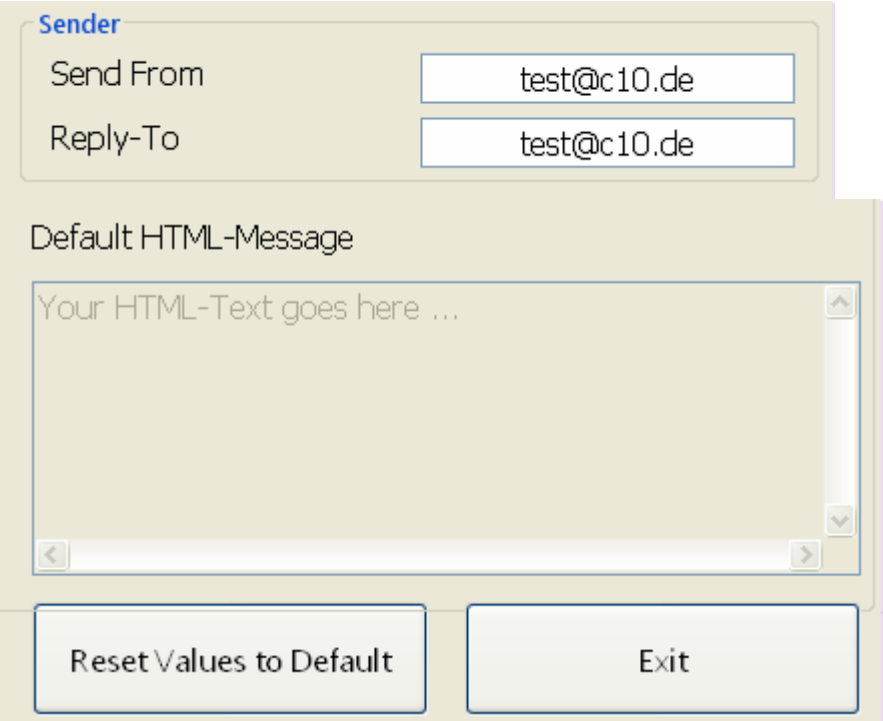
In the fields "Receiver","CC" and "BCC" must be only valid e-mail addresses.
From these fields, the "Receiver" filed is necessary, because that is, where you specify the receiver of the mail. The other two fields van be left blank if you do not need them.
If you sent the same mail to multiple persons, you may think of putting all the receiver mail addresses into BCC, then they will not be visible to each other.

Receiver - e-mail address of the person that shall become the e-mail.

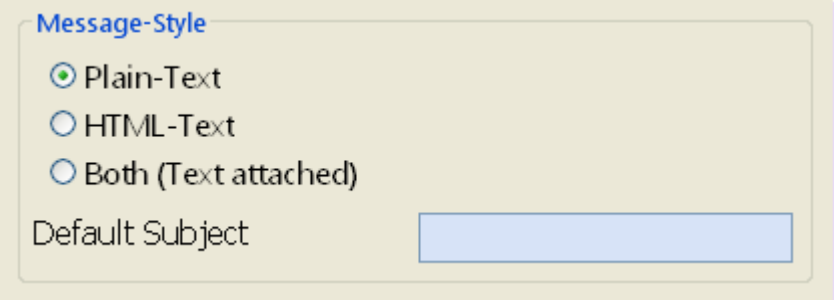
CC (Carbon Copy) - (optional) - e-mail address of person(s) that shall be informed on the subject but are not the primary receiver of the mail.

BCC (Blind Carbon Copy) - e-mail address of person(s) that shall be informed on the subject but are not the primary receiver of the mail and shall not be visible with their mail address to any of the receivers of the mail.

© 2023 Theo Gottwald * https://www.smart-package.com

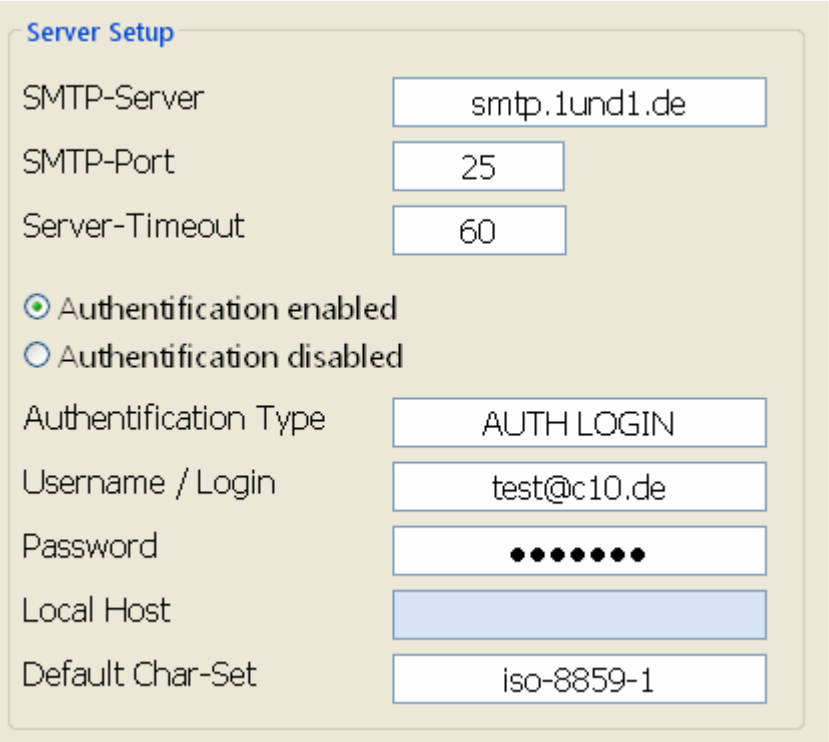


Sent From - This field shows the Sender that is displayed in the receivers e-mail program.
Reply-To: this is the e-mail address which will be used by an e-mail program in case that the receiver of your e-mail will open your mail and press the "Reply" Button in his e-mail program.



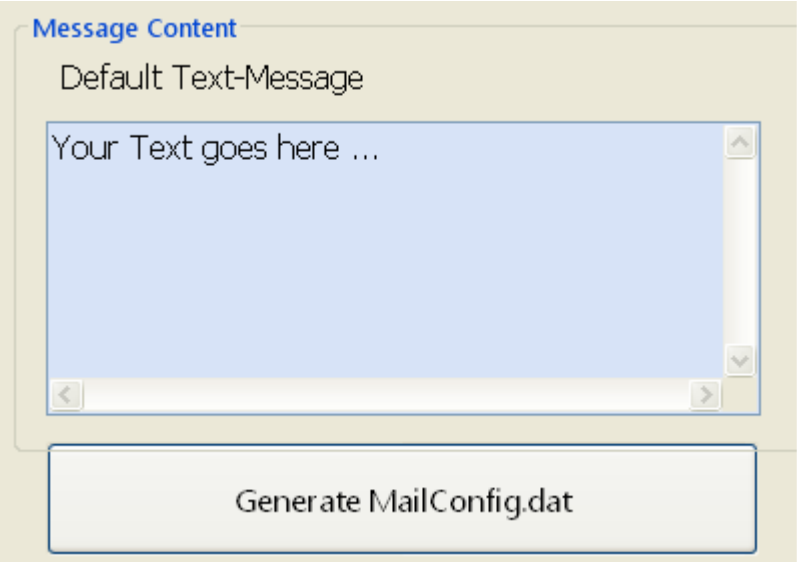
Message-Style: Plain Text / HTML / Both - Choose the format of the e-mail that shall be sent. Depending on your choice some fields in the GUI may become activated or deactivated.

© 2023 Theo Gottwald * https://www.smart-package.com



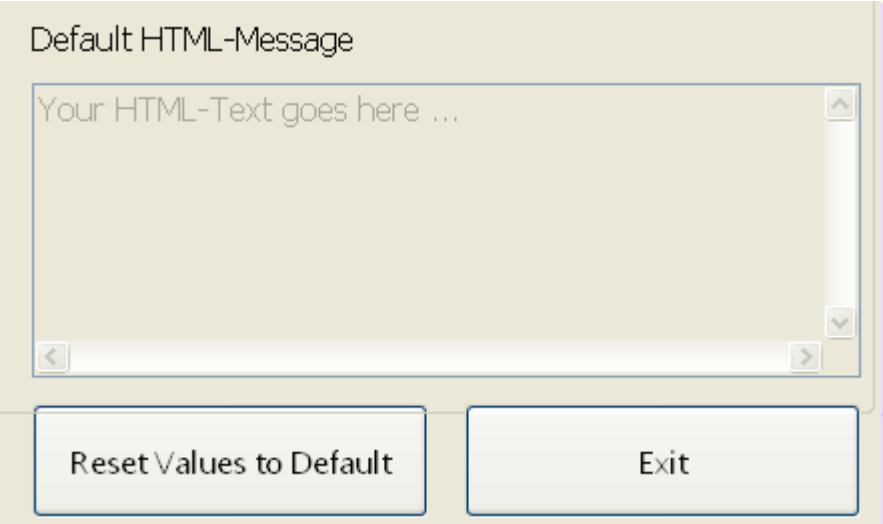
SMTP-Server - these and all following parameters are the same parameters that you may have used in your actual e-mail program. If you do not know them, ask your e-mail administrator or your e-mail provider.

Local Host - E-Mail Programs do include the name of the sending computer with any e-mail. In case you do not want that, you can override this using the "Local Host" Fields. In most cases, its best that you just leave that field empty. The Mail-Command will then internally provide the needed information.



Default Text Message.- you can specify a default text message, that is sent if the mail-message-style is set to "Plain" or to "both". You can override it anytime using the `SMP`.-command.

© 2023 Theo Gottwald * https://www.smart-package.com



Default HTML Message.- you can specify a default HTML-message, that is sent if the mail-message-style is set to "HTML" or to "both". Preferably, you will just paste the HTML code into this field. You can override it anytime using the `SMP.`-command.

What happens in case of errors during the send?

Generally the `SMA.` command does not generate a Error-Message with a dialog. Because even if everything is all right, a mail may not be sent, because the provider has trouble on his mail or DNS-Server.

What you get is a Return-Value.
If you use a "MailConfig.dat", and the file is in `?path\`, then your mail-script can be as simple as:

```
SMP.
SMA.
' Print Returncode or OK Message
DBP.$$000
```

If everything worked fine, this is what you get:

```
[15] OK
```

In case your parameters are not valid, or in case the server returns an error, this is what you get:

```
[13] ERROR: 501 Address syntax error: <sendto>
```
or
```
[13] ERROR: 501 Address syntax error: <Theo's Testaccount (@.)>
```

In these cases, check the field that is shown in the error-message.

If you get this error, you need to provide valid Login-Credentials for your **SMTP-Server.**

3.49.2 SMA . - Send e-Mail

MiniRobotLanguage (MRL)

SMA. - Send e-Mail

Send e-Mail

Intention

Send a e-Mail that was previously defined using the SMP.-command.
Wait until the e-mail was sent, or until he server returned an error.

Please see the SMP.-command 803 for further information on how to define and send an e-mail. Example:

```
' Set E-Mail Configuration
SMP.?path\MailConfig.dat
' Send E-Mail and wait ...
SMA.
' Return the Answer of the Mail-Server from Stack
DBP.$$000
' End the script
ENR.
```

In case you need to send multiple Mails with attachments, this can take a while. To prevent your Script from being blocked, you can use SMB. (Send Mail Background) in that case.

Syntax

SMA.[P1][|P2]

Parameter Explanation

P1 - (optional) If given, this value will overwrite the content of the "Send-To" Field.

P2 - *(optional)* Variable that will contain the answer of the Mail server.

Example

```
'**********************************
' SMA.-Sample
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
SMP.smtp-server=smtp.1und1.de
SMP.port=25
SMP.sender=you@yourdomain.com
SMP.receiver=yourfriend@hisdomain.com
SMP.subject=Invitation
SMP.text=Hallo friends,$crlf$this is going to be interesting!
SMP.auth=1
SMP.password=dsa8sdkj-*
' And let it go ...
SMA.
' Print if it was OK
DBP.$$000
ENR.

'**********************************
' SMA.-Sample
'**********************************
SMP.?path\MailConfig.dat
SMA.
DBP.$$000
ENR.
```

Remarks

-

Limitations:

When using `PRR.`, the Parallelrobot will not inherit the Mailconfiguration from the Starting Robot. To send Mails in the Background, use `SMB`.

3.49.3 SMB. - Send Mail Background

MiniRobotLanguage (MRL)

SMB. - Send e-Mail Background

Send an e-Mail in the Background

Intention

Send a e-Mail that was previously defined using the `SMP.`-command.
Sent the E-Mail "Non Blocking", script execution will go on, while the e-mail is been send.

Unlike with `SMA.`, the script execution will **not** wait until the e-mail is sent.
Instead, the script can go on with execution. The e-mail is sent in the background.
`SMB.` will leave a "ticket number" that will give you anytime access to the Result of the background operation. Please use `DRS.` (Drop Result) is you do not want to Get that result of the background operation.

Please see the SMP.-command 803 for further information on how to define and send an e-mail. Example:

```
' Set E-Mail Configuration
SMP.?path\MailConfig.dat
' Send E-Mail and wait ...
SMB.
' Do anything else you want in this time
' here while the mail is sent
' ...
' Then wait until the background operation has finished.
WRS.
' Get the result of the last background operation on TOS
GRS.
' Always Drop the result, so it won't waste Memory
DRS.
' Return the Answer of the Mail-Server from Stack
DBP.$$000
' End the script
ENR.
```

How can I get the result of exactly this mail, if its running in the background?

The `SMB.` - command will drop an "**ticket number**" on the TOS.
Or, if **P2** is given, the ticket-number will be in the given variable.

Now you can get the result any time using the "**ticket number**" and these commands.
Any result behind an "ticket-number" ist stored as long, until you get it using `GRS.` or until you Drop it, using `DRS.` You do not need to wait until the Operation is

*© 2023 Theo Gottwald * https://www.smart-package.com*

finished, to drop the result. You can drop the result at any time, even if the Operation is just been started.

Use these commands:

- GRS. - Get Result of Operation
- WRS. - Wait until (one or more) Operation(s) is/are finished
- DRS. - Drop Result of Operation if you do not need it.

to handle the result of the background mail-operation(s).

Example:

```
' Assume that a file "?path\MailConfig.dat"
' is available
SMP.
' It makes mostly sense with attachements
' SMP.attachment=?path\Send-Mail.zip
' Send the Mail, get the ticket number
SMB.
' If we do not specify a ticket number,
' WRS. will automatically remember the last ticket number
' and use it.
WRS.
' If we do not specify a ticket number,
' GRS. will automatically remember the last ticket number
' and use it.
GRS.
DBP.$$000
' If we do not specify a ticket number,
' DRS. will automatically remember the last ticket number
' and use it.
' DRS. free's the Memory location that was used to hold the
' Result of the background operation.
DRS.
ENR.
```

In case you need to send multiple Mails with attachments, this can take a while. To prevent your Script from being blocked, you can use SMB. (Send Mail Background) in that case.

Syntax

SMB.[P1][|P2]

Parameter Explanation

P1 - (optional) If given, this value will overwrite the content of the "Send-To" Field.

P2 - *(optional)* Variable that will contain the "Ticket-Number" which can be used to get the answer of the Mail server an any time, using the GRS.-command..

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' SMB.-Sample
'**********************************
' Send away 25 Mails
' then wait until they are sent
' and then show the results of all 25 Mails.
'
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Background Mailer-Demo
' Please provide a complete MailConfig.dat
SMP.?path\MailConfig.dat
' Try with attachement also!
' SMP.attachment=?path\Send-Mail.zip
$$HND=
' Be careful or you may end up with in
' an error 421 - too many connections
' from your provider
FOR.$$CNT|1|25
  GSB.Lab
NEX.
DBP.$$HND
WRS.$$HND
' Display Results
FEM.Lab_dis|$$TXT|$$HND|,
MBX.!
ENR.
'-------------------------------------------------------------
:Lab_dis
GRS.$$TXT|$$RES
' Always drop Results you do not need anymore
DRS.$$TXT
DBP. Result from $$TXT = $$RES
RET.
'-------------------------------------------------------------
:Lab
SMB.
$$HND=$$HND,$$000
RET.
'-------------------------------------------------------------
```

Remarks

If you use Background Operations, always drop the result of the operation using `DRS..` Otherwise it will be kept in Memory until the Script ends.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

When using PRR., the Parallelrobot will not inherit the Mailconfiguration from the Starting Robot. To send Mails in the Background, use SMB.

3.49.4 SMP. - Set e-Mail Parameter

MiniRobotLanguage (MRL)

SMP. Command

Set e-Mail Parameter

Intention

The `SMP.` command will define all parameters, that are needed to send an e-mail, using the `SMA.` - command.

You have two ways to use the SMP. - command:

1. Use it to **load an "`MailConfig.dat`" file** with an previously saved, encrypted Mail-Configuration.
2. Use it to **define some or all parameters directly**. In this mode, parameters that have already been defined using a "MailConfig.dat" can be overwritten with other values.

Let's start using Mode 1 and the "MailConfig.dat". How do you generate this file? There is GUI-Utility that helps you to generate it. You can read all this here:

! Smarty's Send-Mail 789

Be sure to read that before going on.

whether you use a "`MailConfig.dat`" as Base-Configuration, or not, in any way you can set or change Mail-Parameters using `SMP.`

Actually you can not retrieve Mail-Parameters that have been set. If you are not sure about these values, just set them again with the proper values. This way, any parameters that have been set using the "MailConfig.dat" are kept secret.

Let us now take a look on how you are really sing to sent an e-mail, in both modes of operation.

If you have already defined an "`MailConfig.dat`" file, and placed it in ?path\ 345, then there is not much to do. Your script could look as simple as:

```
' SMP without any parameter will load a file called
' "MailConfig.dat" from ?path\
SMP.

' SMA. will just send away the previously defined e-mail.
SMA.

' Thats just the END of the Script
END.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Now in most cases, you may have defined a base-Configuration containing your provider-Settings etc. in a "MailConfig.dat" file. And you add all variable settings later using SMP. Like in this example:

```
' First we load our predefined Mailconfiguration
SMP.
' Now we add two file-attachments
SMP.addfile=?path\Text.txt;?desktop\File.zip
' This is the new text for our mail
SMP.text=Hallo Peter$crlf$Do you have time this weekend for a
football match?
' We make sure that the mail is sent as an plain-text-mail
SMP.style=plain
' We set the receivers e-mailaddress
SMP.to=Peter@c10.de
' Now we let our bird fly.
SMA.
' and end the script
ENR.
```

But there is no need to use the "Mailconfig.dat" file. You can do the whole Mail-configuration solely using the SMP.command. You will however need to write a bit more, like in the following example:

```
SMP.smtp-server=smtp.1und1.de
SMP.port=25
SMP.sender=you@yourdomain.com
SMP.receiver=yourfriend@hisdomain.com
SMP.subject=Invitation
SMP.text=Hallo friends,$crlf$this is going to be interesting!
SMP.auth=1
SMP.password=dsa8sdkj-*
' And let it go ...
SMA.
' Print if it was OK
DBP.$$000
ENR.
```

As you can see, we did not specify the fields:

- reply-to
- login

because these two are set automatically to the same value as "send from", in case you leave them "empty".

The field "Localhost" is been set to the name of the actual computer, once when the robot starts up. If you clear the field, it will be automatically set to the term "localhost".

The following fields are set up with default values, once the robot starts up:

```
Timeout     =   60 seconds
CharSet     =   "iso-8859-1"
Style       =   "plain text"
SMTPPort    =   25
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EnableAuth   =    %FALSE
AuthType     =    "AUTH LOGIN"
LocalHost    = actual Computer's name
```

Syntax

SMP.[P1]

Parameter Explanation

P1 - (optional) can be one of two formats:

1. **empty**, in this case a file "MailConfig.dat" is searched for in "?path\". If the file is found, it is loaded and all values are set according to the content of the file.

2. A **value-equation**, like: smtpport=25
   in this case, the equation is been evaluated and the value is set. You can not make multiple equations in a single line.
   Use a new line with a new SMP.-command for each necessary equation. This was necessary, to have all sorts of characters available for the "text" and the "password" fields.
   Also you will find it very readable.

You can specify the following equations. Note that for all equations, the term on the left side is **not** case sensitive.

"SMTP-Server","smtp"
Will choose the desired SMTP-Server.

Examples:
```
SMP.smtp=pop.gmail.com
SMP.smtp=pop3.live.com
SMP.mail.comcast.net
SMP.popmail.t-online.de
```

"SMTP-Port","SmtpPort","port"
Will choose the desired SMTP-Server Port.
Often used values are 25 or 587. As the value of 25 is pre-set, in many cases you do not need to touch this setting.

Example:
```
SMP.port=25
SMP.port=587
```

© 2023 Theo Gottwald * https://www.smart-package.com

"SendFrom","send from","send-from","from","Sender"
Will set the e-mails "sender" address. This is the mailaddress that is shown to receiver of the mail, when he finds the mail in his Inbox. You have to specify something that looks like a e-mail address in this field, to have the mail sent. Note that this is not necessarily the mail addresss, a "reply" will be sent to. Use the "Reply-to" field for this.

Example:
```
' All three lines below do the same.
SMP.Sender=info@it-berater.org
SMP.from=info@it-berater.org
SMP.sendfrom=info@it-berater.org
```

"receiver","sendto","send-to","to"
You need to specify this field. It must contain a valid e-mail address.
This field contains the e-mail address of the primary receiver(s) of the e-mail.
You can specify multiple receivers, if you separate them using a semicolon ";".
There is no limitation on number of receivers from the `SMP.`-command.
Note that any receiver can see all other receivers that are in the receiver field.
Example:
```
SMP.receiver=mailbox1@fa2.de;yourmail@c10.de
SMP.to=mailbox1@fa2.de;yourmail@c10.de
SMP.send-to=mailbox1@fa2.de;yourmail@c10.de
```

"CC","Carbon Copy","carbon-copy"
You do not need to specify this field. If you do so, it must contain a valid e-mail address.
This field contains the e-mail address of secondary receiver(s) of the e-mail.
You can specify multiple secondary receivers, if you separate them using a semicolon ";".
There is no limitation on number of CC-receivers from the `SMP.`-command.
Note that any receiver can see all other receivers that are in the CC-receiver field.

Example:
```
SMP.CC=mailbox1@fa2.de;yourmail@c10.de
SMP.carbon copy=mailbox1@fa2.de;yourmail@c10.de
SMP.carbon-copy=mailbox1@fa2.de;yourmail@c10.de
```

"bcc","blind copy","blind-copy"
You do not need to specify this field. If you do so, it must contain a valid e-mail address.
This field contains the e-mail address of secondary receiver(s) of the e-mail.
You can specify multiple secondary receivers, if you separate them using a semicolon ";".
There is no limitation on number of CC-receivers from the `SMP.`-command.
Note that any receiver that was specified in the BCC-field is hidden and can not be seen by all other mail-recipients Example:

```
SMP.BCC=mailbox1@fa2.de;yourmail@c10.de
SMP.blind copy=mailbox1@fa2.de;yourmail@c10.de
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SMP.blind-copy=mailbox1@fa2.de;yourmail@c10.de
```

"Reply","reply to","reply-to","ReplyTo"
You do not need to specify this field. If you do so, it must contain a valid e-mail address.
This field contains the e-mail address that a mail will be sent to, if the recipient of the mail click on the "Reply" button.

Example:

```
SMP.reply=mailbox1@fa2.de
SMP.reply to=mailbox1@fa2.de;yourmail@c10.de
SMP.replyto=mailbox1@fa2.de;yourmail@c10.de
```

"subject","titel"
This is the Subject of your e-mail. You do not need to specify a subject.

```
SMP.Titel=Birthday Invitation
SMP.Subject=Testing Result from X5/8452
```

"plain-msg","plain-message","text","text-msg"
This field contains a plain-text message, if you send one. There is no limit in text-size from the `SMP.`-commands. There may however very likely be a limit from your SMTP-Server for the total size of your mail.
You would do something like this:

```
' Read Textmessage from a file
CFF.$$FIL|$$TXT
' You can do Text-Replace here to customize Mails.
' using the String-Commands.
' This Line will set the text for the Mail
SMP.Text=$$TXT
```

"html","html-text","html-msg","Html-Message"
This field contains a html-text message, if you send one. There is no limit in html-text-size from the `SMP.`-commands. There may however very likely be a limit from your SMTP-Server for the total size of your mail. You can do something like this:

```
' Read Textmessage from a file
CFF.$$FIL|$$TXT
' You can do Text-Replace here to customize Mails.
' using the String-Commands.
' This Line will set the text for the Mail
SMP.HTML=$$TXT
```

"auth","anmeldung","authentication"
This field contains a "1" if the SMTP-Server needs a User-Authentication and a "0" if not.
You can also use the terms "On" and "Off" to make it more readable.

Examples:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
SMP.Auth=On
SMP.Authentication=Off
```

"Auth-type"
This field contains the only currently supported Authentication type. You can change it, however that may lead to unforeseeable results. Most likely things will not work anymore.
If you set this field to empty, it will automatically be reset to its default value, that is "`AUTH LOGIN`".

"Login","user","Username","Auth-Username"
If User-Authentication is set to "**On**", then this field contains the Login-credential. This is most often the users e-mail-address.
If you leave this field empty, then it is automatically filled with the content of the "**sender**" field. Example:

```
SMP.Login=info@it-berater.org
```

"pwd","Password","pass","AuthPassword"
If User-Authentication is set to "**On**", then this field contains the needed Password. The password can contain any character, especially if you deliver it inside a variable. Variables behind the password-field are only resolved once (binary compatible). Therefore your password could contain a sequence like "`$$TXT`" without having it resolved as a variable, if the password itself is fully inside a variable. You can use the `VAB.`-command to specify a password safely. If you do not want to specify the password openly visible, use the "`MailConfig.exe`" and encrypt it inside the "`Mailconfig.dat`" file.

Example:

```
' This will really work.
VAB.$$PWD=a3D$$TXA34?pa
SMP.pwd=$$PWD

' This is the normal case
SMP.pwd=das8!%sasad34_2
```

"pc","localhost","host","SenderHost"
The localhost field specifies the name of the sending computer.
If you set the field to empty, because you do not want your computers name to show up,
it will internally be set to "localhost"-

"style","msg-style","MessageStyle","message-style"
Using this field, you can specify the e-mail format.
That is, if you want to send the e-mail as "Plain Text" or as "HTML-Text" or as both.
The default format is "Plain" and therefore you may not need to change that in most cases. You can choose between:

*© 2023 Theo Gottwald * https://www.smart-package.com*

- **"1","Plain"**
- **"2","html"**
- **"3","Both"**

Example:

```
' Send message as Text-Message
SMP.style=plain
' Send Message as HTML Message
SMP.style=2
' Send Message as combined Text/HTML Message
SMP.style=Both
```

"attachment","addfile","sendfile"
You can add attachments to your e-mail. Unlike all other properties, attachments can only be added using the `SMP.`-command. They can not be predefined in the `"Mailconfig.dat"` file. There is no technical limit on the number of attachments until your Mail-Server will not accept any more.
To add one or more attachments, just add their filenames (including pathes) separated by semicolons behind the `SMP.` command. Like this:

```
SMP.addfile=?desktop\myfile.zip;?path\mytext.txt
' You can also specify a variable, if the line
' would be getting too long otherwise.
SMP.sendfile=$$FIL
SMP.attachment=$$FIL;$$FIA;$$FIB
```

"char","Char-Set","chars","charset"
You can specify the used char-set to have the receiver see the mail in the proper way.
Most often, you will use just:

```
' Use "us-ascii" charset
SMP.char=us

or
' Use "iso-8859-1" charset
SMP.char=iso
```

You can specify any other char-set you want:

```
' PL, CZ etc. may use this charset
SMP.char=iso-8859-2
```

"TimeOut","Server-TimeOut","ServerTimeout"
This field contains the Server-Timeout in seconds.
If the server does not respond within this time, an error is been internally generated.

More Hints:

© 2023 Theo Gottwald * https://www.smart-package.com

The fields:

- **reply-to**
- **login**

are set automatically to the same value as ifrom "**send from**", in case you leave them "empty".

The field "**Localhost**" is been set to the name of the actual computer, once when the robot starts up. If you clear the field, it will be automatically set to the term "**localhost**".
Because it can't be empty.

The following fields are set up with default values, once the robot starts up:

```
Timeout      =   60 seconds
CharSet      =   "iso-8859-1"
Style        =   "plain text"
SMTPPort     =   25
EnableAuth   =   %FALSE
AuthType     =   "AUTH LOGIN"
LocalHost    = actual Computer's name
```

Example

```
'**********************************
' SMP./SMA.-Sample
'**********************************
' First we load our predefined Mailconfiguration
SMP.
' Now we add two file-attachments
SMP.addfile=?path\Text.txt;?desktop\File.zip
' This is the new text for our mail
SMP.text=Hallo Peter$crlfDo you have time this weekend for a
football match?
' We make sure that the mail is sent as an plain-text-mail
SMP.style=plain
' We set the receivers e-mail-address
' please put your own mail-address here
' so you can receive your own Test-mail.
SMP.to=Peter@c10.de
' Now we let our bird (with the message) fly.
SMA.
' and end the script
ENR.
```

Remarks

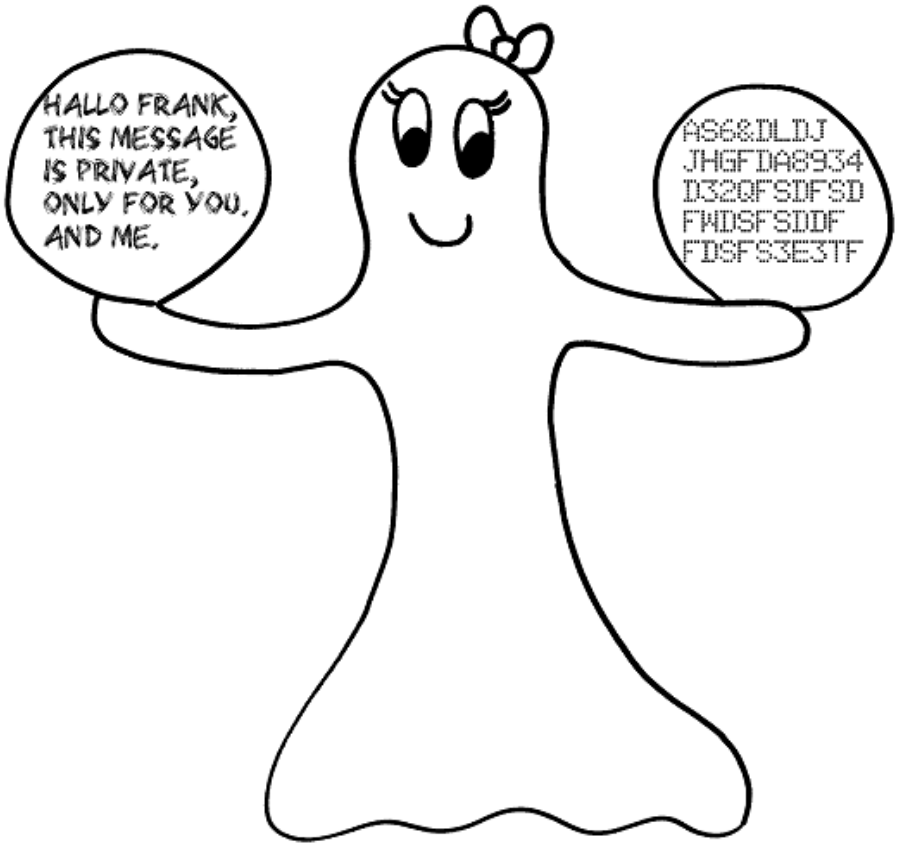
3.50 Encryption and Hash Functions

3.50.1 ! Smarty's Encryption and Hashing Commands

Smarty's Encryption- and Hash-Functions **Previous** 803 **Top** 41 **Next** 825

Smarty's Encryption- and Hash-Function

Using GEC, you can make Smarty encrypt Messages for you. To make a long story short, **Smarty supports unbreakable Cryptography, if you keep some rules.**



Using GEC, you can make Smarty encrypt Messages for you. To make a long story short, **Smarty supports unbreakable Cryptography, if you keep some rules.**

There are many cryptographical algorhytmns out there with nice sounding names.
But there is **only one of all these, that is scientifically unbreakable**.
It is the so called "**One Time Pad**" (OTP).
Its mathematically proven, that a OTP is safe against cracking, as long as its done properly. Read more about a "One Time Pad".
In short, a OTP is a combination of your (prepared) message with a matrix of totaly random characters. We will however use the Term OTP also for the "Matrix of random characters" itself.

*© 2023 Theo Gottwald * https://www.smart-package.com*

To use the OTP properly, these rules must be followed:
1.The OTP must only be know by you and be the receiver of the message
2. the OTP must have at least the size of the Message that is to be encrypted
3. the OTP must only be used once and then deleted on both sides
4. the OTP must be cryptographically random, this means that a "true random number generator" with a very long periode - or a hardware random number generator - must be used.
5. Your computer, as well as the computer from your contact, must not be compromised (Trojan etc.).
6. To delete the OTP, you need to use a safe method, not just the windows "Delete File".
For this purpose, we have included a "safe-erase file" in to the "DEL.-Command".

If any of these points above is not followed, the OTP may not be perfectly safe, see here: Possible OTP-Exploits.

Comment about deleting used "Pads":
As said, OTP's should only be used "once". Why?
Because once somebody can guess part of the content of a message, he can calculate the OTP and would then be able to decode all conversations.
Imagine an OTP as

There are mostly two standards to safely erase files,
1. The US DoD 5220.22-M standard (3-pass and 7-pass) -which is to weak for today.*
2. the Gutmann method, which overwrites the file with random data 35 times.
The SPR will beat both standards and add some passes to make sure your file is safely overwritten.
File-Buffering should be taken into account when using the SPR or any other of such tools.
Also if you use SSD's, they must never get into wrong hands, as a safe data-erase on SSD's may be a problem, due to the fact that the SSD internally tries to limit the write access to single blocks by exchanging them transparently against "blocks with less writes".. Which could lead to the fact that the blocks with the data may be left somewhere on the SSD, until the SSD is completely cleared.

Comments about the PRNG's in the SPR:
To make a unbreakable OTP-Encryption, we need a "Pad" of the highest possible quality.

To make sure, that the SPR meets all of these requirements, we have:
1. Included several Pseudo-Random Number Generator's (PRNG) into the SPR.
Any of these should be safe for cryptographical use. These PRNGs are integrated in the
! STR. - String Command 3150 and this way you have a choice which of these you use.
And nobody knows.
2. Of course you can and should test the Quality of your SPR generated Random Numbers here:
BATTERIES OF STATISTICAL TESTS FOR RANDOM NUMBER GENERATORS
but after submitting them to the Internet, don't use them any more - generate new OTP's
instead.
3. By just combining a OTP of a limited Bit-Range - like a Text - with a Full-ASCII-Range OTP, the result may be statistically unsafe. Therefore the GEC-Command will first encrypt the
Message with the TEA-Encryption, and then use the unbreakable OTP.

© 2023 Theo Gottwald * https://www.smart-package.com

This way, the Message has already a nearly perfect bit-distribution, before the OTP is used.
4. You can combine generated OTP's using the XOR. - XOR - Encryption 843. In fact this is done
internally already with STR.CHARS D and therefore of no need from as we see it.
If you decide to do so, use only Pads of highest cryptographicaly safe randomness.
Otherwise this may decrease the level of safety, rather then improving it. For details on
the used PRNG's see the ! STR. - String Command 3150.
5. While we believe that the Random number generators that we use in the SPR are safe for
cryptographical use, we can supply a hardware-Random Number generator that uses electronical noise to generate random numbers. If you need such a device you can contact us.

Other possible encryption methods

The SPR can apply normal Password-Protected Encryption using the TEA-Encryption scheme.

TEA is safe and generally fine when:

1. keys are random, this is the case if you use ! STR. - String Command 3150. to generate the Keys.
2. the encrypted data is less then 1 GB
3. Safety is even better, if you use the optional "Bit-Flood" in the GEC.-Command.
Anyway for a maximum security against professionals, we can only recommend OTP's.

Here is an example on how to go:
1. Use the ! STR. - String Command 3150 to generate as many "One Time Pads", as you need for your communication. The SPR can easily create 1000'th of them in a Minute.
2. Share these "One-Time Pads" with your communication partner.
3. Use each OTP only one time (one day for example), next day - next Pad.
Think of these OTP's like your TAN-Numbers from the home-banking.
4. Have the OTP's numbered for each day in an month and use the OTP only on that day.

There is more ...
Using the SPR you can split large files of virtually any size into smaller files, using the `FIL.Split File` - command.
And later you can join the small parts again to the original file, using `FIL.Join delete` - command.
Also the above command will make an basic encryption of your splitted file with (default) 30 Rounds of TEA.

Then there is the "Byte-Flood"-Algo. Its implemented in the `HIT.-command.`
This command can be used to make a fast XOR.-encryption without having a password. Using "Byte-Flood", the file itself is been used as Encryption Matrix.

There are no secrets ...
All cryptographical technologies used in teh SPR are based on public available, scientifically approved methods.Mostly based on direct machine-code of very short size. Therefore the result of all algorhytms (TEA., XOR.,SHA., GMD. etc.) can be tested and compared to public sources.

Random Number generation...

© 2023 Theo Gottwald * https://www.smart-package.com

Its like the generation of TAN-Numbers for your home-banking. Once an attacker would get an idea how you generate your numbers, he could theoretically calculate the whole periode of random numbers and try to guess them.
The bad news is that the time to calculate the whole periode of random numbers, we use in the SPR is theoretically about 1700 years on a Standard computer.
But now what we do is, we combine the resulting numbers (random times) with other generated numbers. The result is that even if somebody could "crack" our PRNG, he would need to also check a lot of combinations and the possible combinations of such a large sequence is quadratic to such a sequence. Now note that we do not only combine 2 such random "Pads" but 10 or 20 when using for example
`STR.CHARS D`
to generate a One-TIme-Pad.

The only alternative to this is, to use a **hardware-Random Number Generator** on a Computer that is not connected to any network.For companies who want the maximum safety, this is the system that we recommend for the OTP-(Random Number) Generation.
The "Random Numbers" (OTP's) can then be given to company members via USB-Sticks or on a CDR. We can supply such a Hardware RNG, please contact us if you are interested.

How can you make your own perfect OTP's?
The perfect OTP-Generator is a Computer that is not connected to a network.
It will just be dedicated to the Generation of OTP's and store them on USB-Sticks.
If possible, it will use a hardware random device. However ... our Software PRNG's are also very good. And at the time of this writing i have no reason to assume that anybody in the world could guess their random number sequence with actual technology.

How fast does the SPR create "OTP"'s / random numbers?

We have used the script below to generate random numbers using all four *PRNG's*

```
'
'SPR Script-file: PAD-Sample
'Purpose:

The picture below shows the time in seconds, for the generation of 500 Million Random Numbers using all four algos. As you can see, Algo "`STR.CHARS B`" is the slowest. That is because he will internally generate 20 "Random Pads" and combine them.

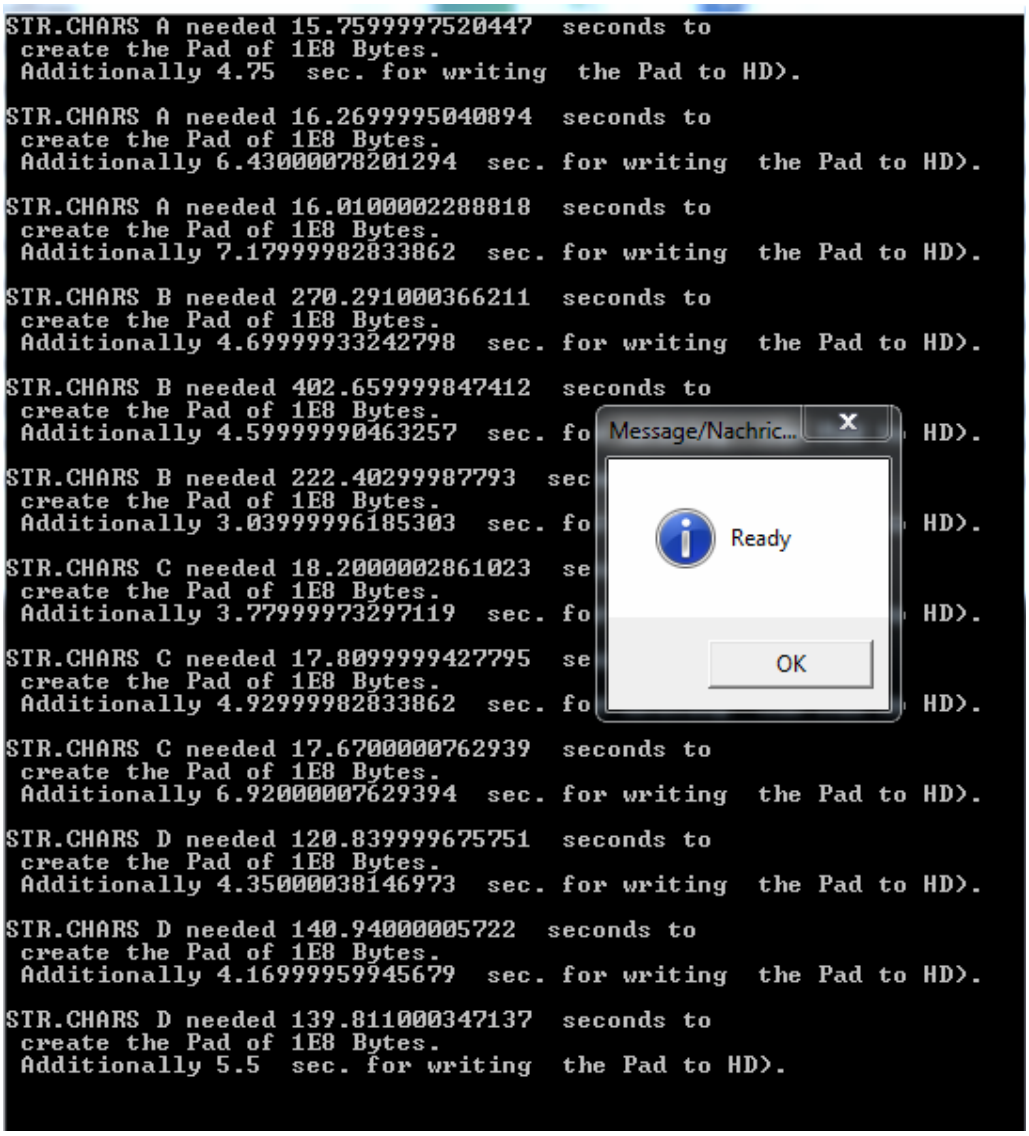
The next slowest Algo is "`STR.CHARS D`", he will combine about ~5 Random Pads. You can however get a OTP of 500 MB in 1 and a half Minute, using the "`STR.CHARS A`" Algo.

© 2023 Theo Gottwald * https://www.smart-package.com

How good are our random numbers?

To Test Random Numbers there are several Methods out there,
One of them is the so called "**ENT-Test Suite**".
We could not use this suite on our 500 MB Pads because the ENT Programm was unable to handle data of this size. SO we created smaller Pads of 100 MB.
Note that these numbers below may not be perfectly accurate because there were other processes running on the test computer in the background.

© 2023 Theo Gottwald * https://www.smart-package.com



Next we tried the "ENT-Suite" on our 100 MB OTB's.
Here is the result.

© 2023 Theo Gottwald * https://www.smart-package.com

```
>ENT PAD_A1.txt
Entropy = 7.999998 bits per byte.

Optimum compression would reduce the size
of this 100000000 byte file by 0 percent.

Chi square distribution for 100000000 samples is 262.98, and randomly
would exceed this value 50.00 percent of the times.

Arithmetic mean value of data bytes is 127.4912 (127.5 = random).
Monte Carlo value for Pi is 3.141722046 (error 0.00 percent).
Serial correlation coefficient is -0.000151 (totally uncorrelated = 0.0).

>ENT PAD_A2.txt
Entropy = 7.999998 bits per byte.

Optimum compression would reduce the size
of this 100000000 byte file by 0 percent.

Chi square distribution for 100000000 samples is 275.60, and randomly
would exceed this value 25.00 percent of the times.

Arithmetic mean value of data bytes is 127.5022 (127.5 = random).
Monte Carlo value for Pi is 3.141564846 (error 0.00 percent).
Serial correlation coefficient is 0.000046 (totally uncorrelated = 0.0).

>ENT PAD_A3.txt
Entropy = 7.999998 bits per byte.

Optimum compression would reduce the size
of this 100000000 byte file by 0 percent.

Chi square distribution for 100000000 samples is 277.06, and randomly
would exceed this value 25.00 percent of the times.

Arithmetic mean value of data bytes is 127.5102 (127.5 = random).
Monte Carlo value for Pi is 3.141658446 (error 0.00 percent).
Serial correlation coefficient is 0.000027 (totally uncorrelated = 0.0).

>
```

```
>ENT PAD_B1.txt
Entropy = 7.999998 bits per byte.

Optimum compression would reduce the size
of this 100000000 byte file by 0 percent.

Chi square distribution for 100000000 samples is 269.32, and randomly
would exceed this value 50.00 percent of the times.

Arithmetic mean value of data bytes is 127.5083 (127.5 = random).
Monte Carlo value for Pi is 3.141868686 (error 0.01 percent).
Serial correlation coefficient is 0.000063 (totally uncorrelated = 0.0).

>ENT PAD_B2.txt
Entropy = 7.999998 bits per byte.

Optimum compression would reduce the size
of this 100000000 byte file by 0 percent.

Chi square distribution for 100000000 samples is 223.41, and randomly
would exceed this value 90.00 percent of the times.

Arithmetic mean value of data bytes is 127.5009 (127.5 = random).
Monte Carlo value for Pi is 3.141755166 (error 0.01 percent).
Serial correlation coefficient is -0.000148 (totally uncorrelated = 0.0).

>ENT PAD_B3.txt
Entropy = 7.999998 bits per byte.

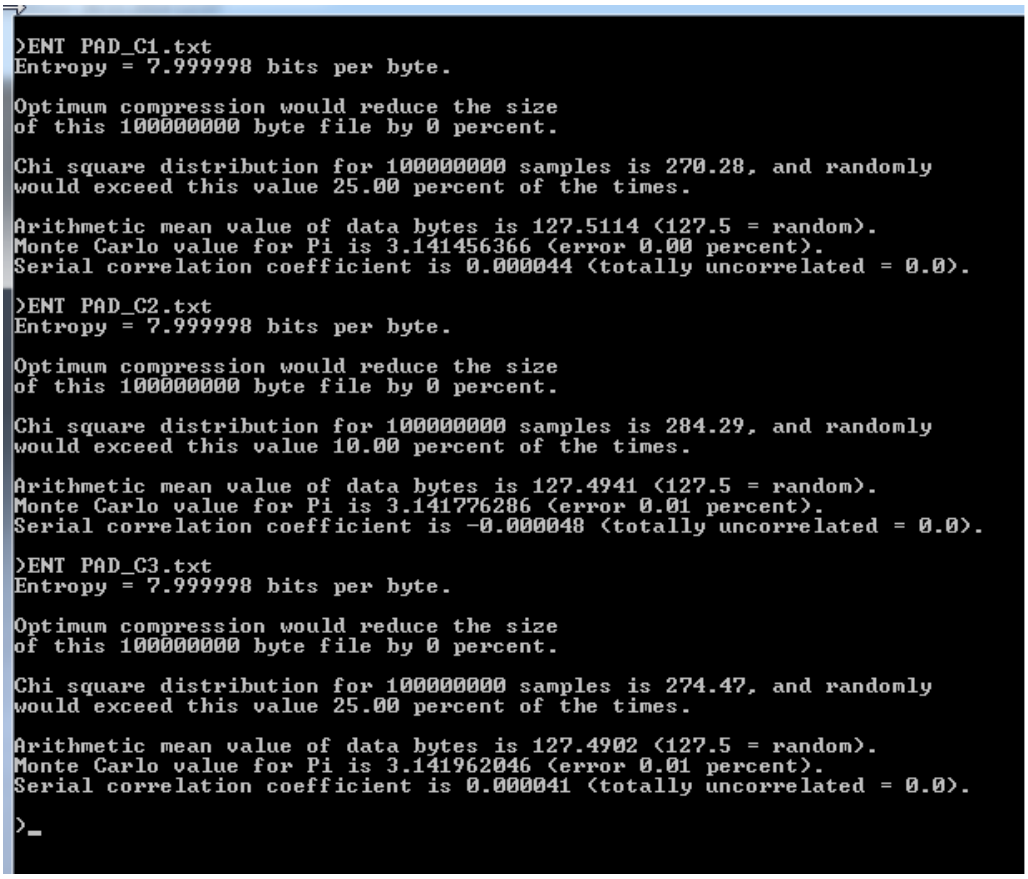
Optimum compression would reduce the size
of this 100000000 byte file by 0 percent.

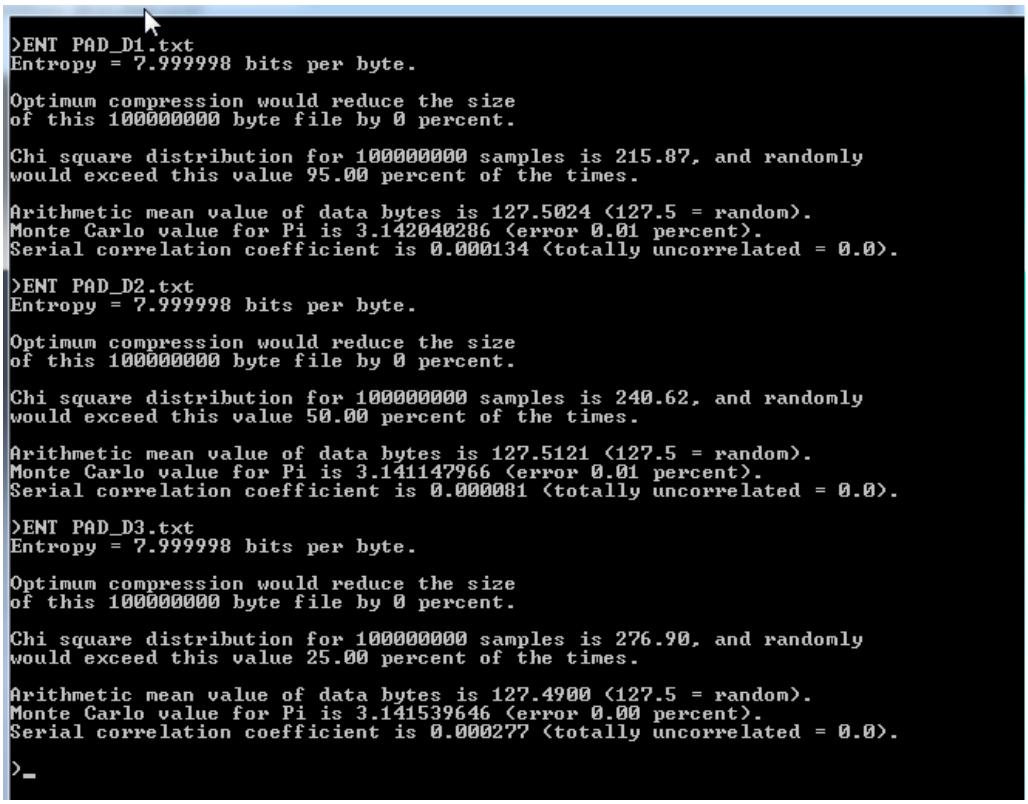
Chi square distribution for 100000000 samples is 254.71, and randomly
would exceed this value 50.00 percent of the times.

Arithmetic mean value of data bytes is 127.5110 (127.5 = random).
Monte Carlo value for Pi is 3.141103086 (error 0.02 percent).
Serial correlation coefficient is 0.000017 (totally uncorrelated = 0.0).

>_
```

© 2023 Theo Gottwald * https://www.smart-package.com

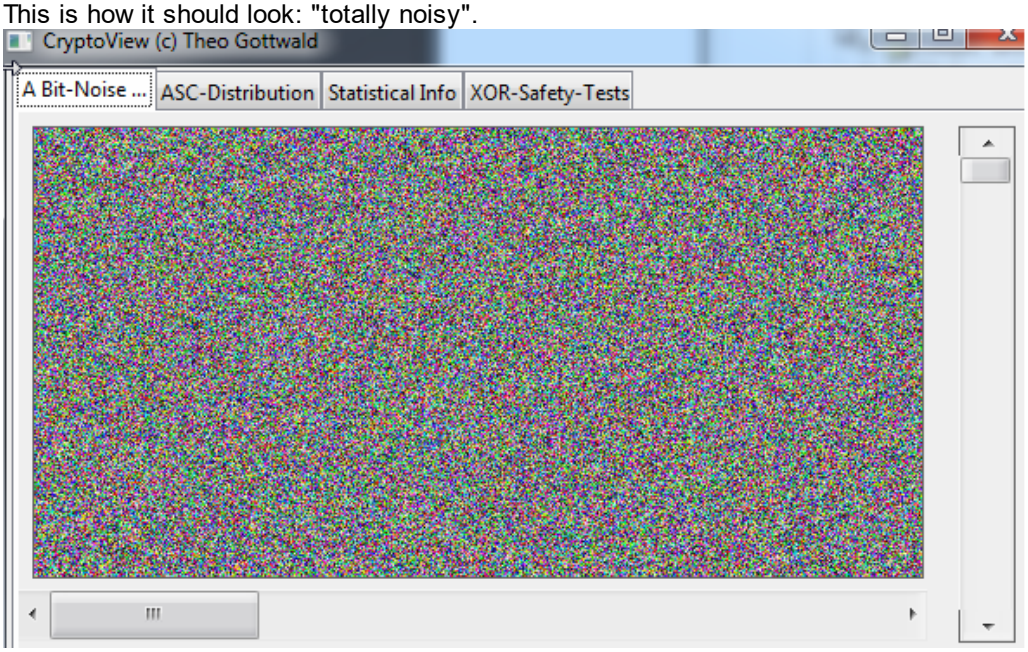




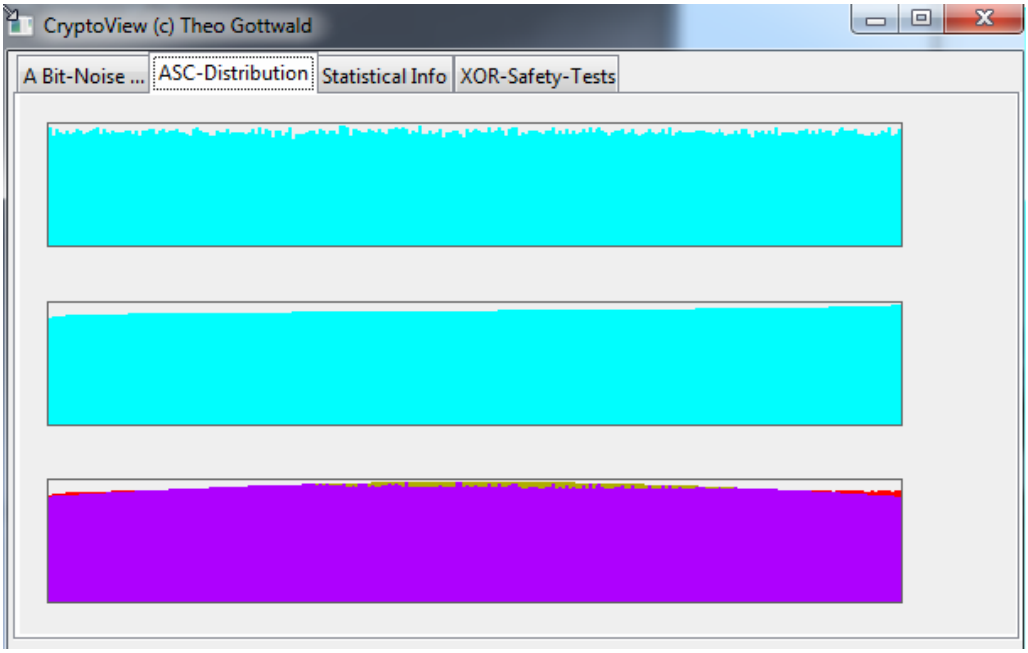
We will supply also a new tool together with this version of the SPR: "Crypto-View".
Using Crypto-View you can identify non perfect random distributions more easily.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Lets first take a look on our Pads in "Crypto-View".
This is how it should look: "totally noisy".

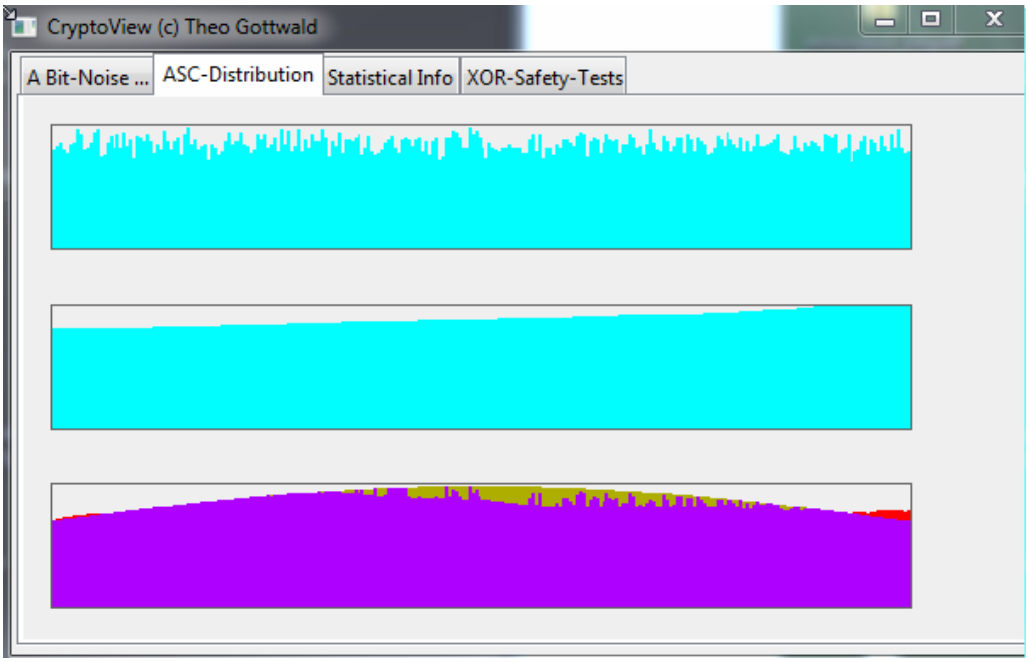


On the second TAB "ASC-Distribution", you should see a GAUSS-Curve in the third picture,
The larger the OTP-file, the less "round". Here are two examples of SPR generated OTP's.



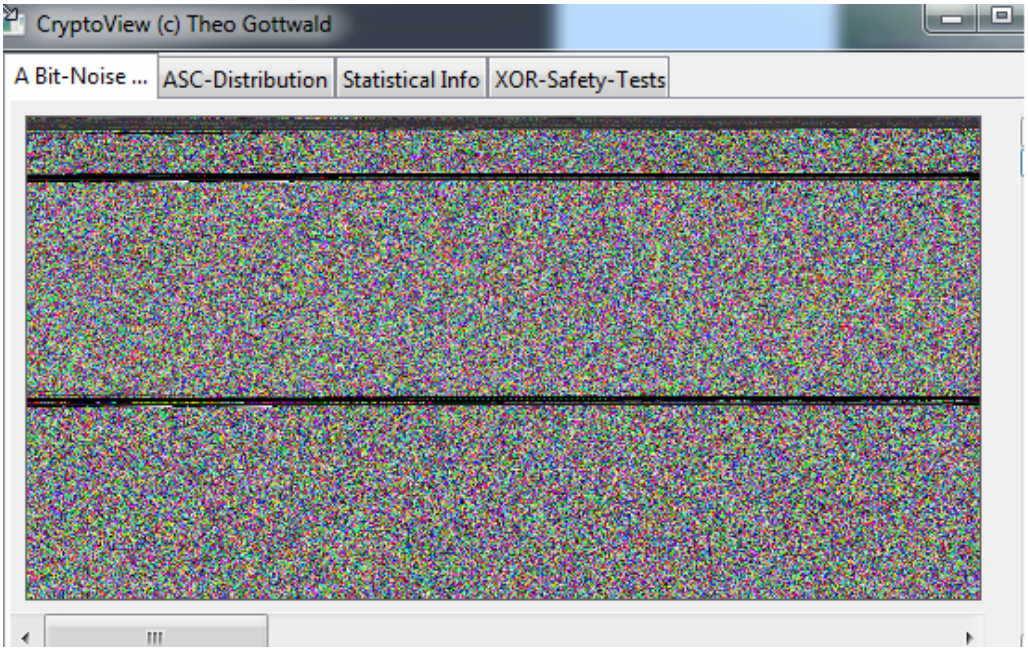
This is a "Crypto-View" from an OTP of about 500.000 Bytes.

© 2023 Theo Gottwald * https://www.smart-package.com



This is a "Crypto-View" from an OTP of about 50.000 Bytes. Of course with such smaller files, the distortion is more clear visible.

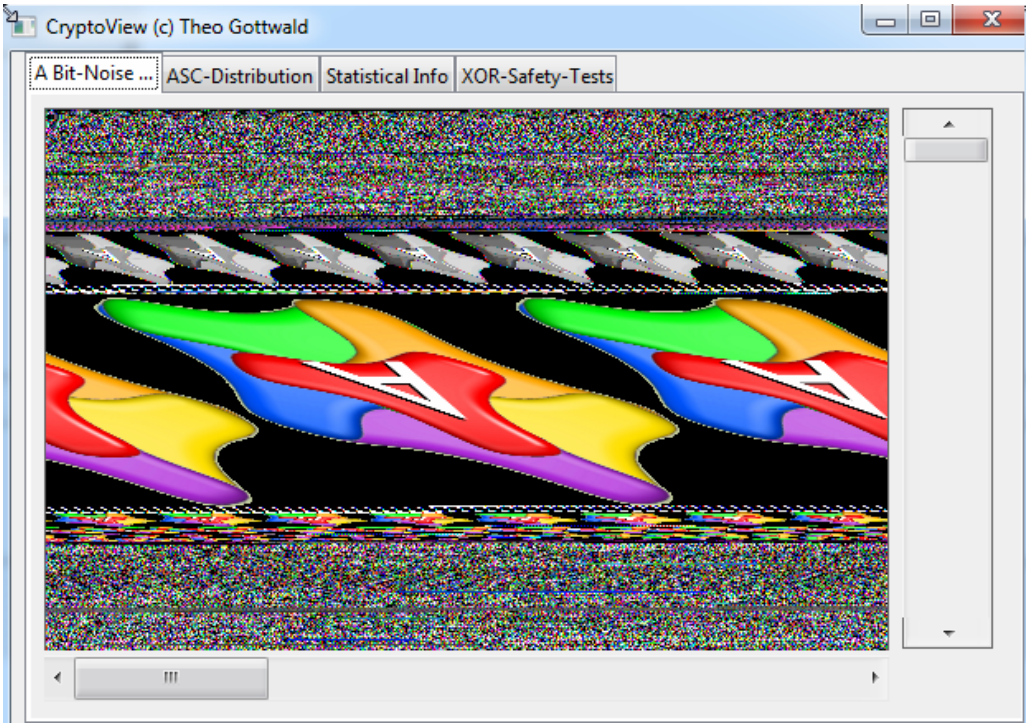
Lets take a look on a file that is not perfectly distributed. A ZIP-Archive for example. You can drag and Drop it on Crypto-View. Watch out for these horizontal lines. They tell you ... its something else.



This is a PDF-File.

© 2023 Theo Gottwald * https://www.smart-package.com

This is an executable. You see the "lines" sometimes more clear - sometimes less clear (with larger files). If you move the slider on the right side downwards, the colors may change and get a red, green or blue "touch". If that happens - its NOT RANDOM.



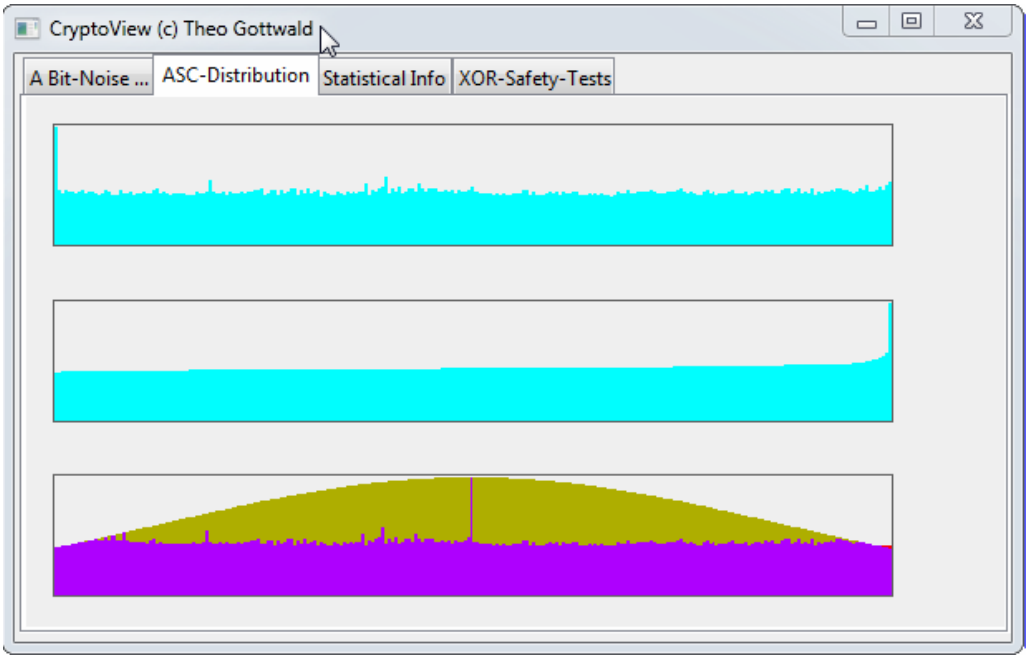
This is the Crypto-View of an SPR-Executable-File. As you can see the most space is used by the new modern Icon-Look. And the rest contains some horizontal lines, which identify it as "Non-random".

The easiest way to sort bad Random numbers out, is to watch for the Gauss-Curve.

What is a Gauss-Curve?

© 2023 Theo Gottwald * https://www.smart-package.com

You know that story.If you have a shop, long time no customer comes ... and then they come all at once. Just if they had an appointment at that time. Thats a so called "Gauss-bell".
Its just "random distribution". The same happens in true Random numbers.
With very large files you get more and more straight lines and the curve is not so good to see.
But you will always know when its a Gauss - or not.
For example ... this below is not a Gauss (red lines).
If its not a ... more or less ... Gauss ... its not a true Random File.



The SPR is a Cryptography Construction Set
You can generate your own Encryption-System using the SPR.
You can compile it and use it.

* NIST Guidelines for Media Sanitization

3.50.2 GEC. - Get Encryption

MiniRobotLanguage (MRL)

GEC. Command

Get Encryption

Intention

Encrypts a string or a file, to a string or a file. And decrypts such a string or file. The usage on string is simple:

```
' Encrypt Variable into Variable
GEC.e1|$$TXT|$$KEY|$$TXT

'This way you can save the result as file immediately.
' Decrypt Variable into file
GEC.do1|$$TXT|$$KEY|$$FIL

' Here we encrypt a file
GEC.efo1|$$FIL|$$KEY|$$FIL

' Here we decrypt a file
GEC.dfo1|$$FIL|$$KEY|$$FIL

' This example encrypts a file into a variable
GEC.ef1|$$FIL|$$KEY|$$TXT
```

For details see example 2 below.

File-size of string or file is been changed to a multiple of 8. Optimal size for the password is 16 bytes. Longer password size will internally be shortened to 16 Bytes.

GEC. has been enhanced in the update 1/2015.
In the previouse implemtation of `GEC.`, Passwords wit ha length of less then 16 Bytes (128 Bit) have been autofilled with ASCII(32) (Space).
In the actual GEC.-Implementation this is been changed to a more difficult Bit-Pattern that is computed from the given Password.
Therefore, if you recompile "old Scripts" that have used short passwords, they may not be able to decrypt old data-files, until you fill the old Password with ASC 32.

Also there are many new Options with `GEC.` that make it to a simple to use - yet unbreakable Crypto-Construction Set.

Speed considerations:

© 2023 Theo Gottwald * https://www.smart-package.com

On a typical test-system, a file with **17.8 MB** is encrypted with lowest strenght in **0.3 seconds**. The decryption of the same file takes about 0.2 seconds. Note that for most use-cases, this level is all you will ever need.

The same file is been encrypted with standard strength (140 Rounds) in about 1.9 seconds. The decryption for that file takes 1.7 seconds.

The same file is been encrypted with highest strength (level 9) in about 12.8 seconds. The decryption for that file takes 12.3 seconds.

Syntax

GEC.P1|P2|P3[|P4]

Parameter Explanation

P1 **-** VAR/Prototypes
P2 **-** VAR with the String or the Filename to process
P3 **-** VAR with Key to en-/decrypt
P4 **-** ***(optional)*** VAR with Filename or Variable for the result, if omitted, result goes to TOS

Prototypes must be lowercase letters like following:
f -input from file - if f is not specified, the Variable is been resolved to a string.
e - "Encrypt". If **e** is not specified the input is been decrypted.
p - Use "one Time Pad" encryption (XOR) after using the TEA-Encryption.
In this case **P3** contains the "One Time Pad".
You can create "One Time Pads" using the STR.CHARS D etc. command.
When using the "**p**"- Option, the Passwort for the TEA-Encryption is taken out of the "One Time Pad".
q - Additionally use a "Byte-Flood"-Algo. This will additionally confuse the resulting Bit-Pattern.
o - output result to a file. if o is not specified, output is directed into the variable P3, or if none to the TOS.
k - kill-file. If specified, source-file is been deleted after encryption. If specified with variable, the variable is been cleared.
m - **max** Encryption. Multiply number of Rounds times 1000.
Specify this to use maximum strong encryption. If given, the normally used number of
rounds is multiplied by 1000.
For example:
m1 - normally 1 Round will then be 1000 Rounds.
m9 - 1024000 Rounds (don't worry its still very fast!
1-9 strength of encryption (if omitted, default = 140 Rounds).

Here are the details on the strength value:

© 2023 Theo Gottwald * https://www.smart-package.com

0 - Encrypt with just 1 Round. This is for testing and learning purpose, do NOT use it for encryption. Unless you use other algos after this.
1 - (10 Rounds) is already above so called "weak encryption"
2 to **8:** Multiply the number times 25 to get the number of rounds.
Example: 2 = 50 Rounds, 8 = 200 Rounds
9 - Use 1024 Rounds (maximum strength)

As we have **complete diffusion** after only 6 rounds, even the lowest Level of "**1**" is already above "weak encryption" and strong enough for non-professional use. The strongest level has 1024 Rounds.

Example

```
'*************************************************************
*****
' GEC-Sample 1
'*************************************************************
*****
' The following line contains the password
' for encryption and de-cryption
: $$KEY=My_Password

GEC.df1|$$FIL|$$KEY|$$TXT
MBX.The File was successfully decrypted to:$crlf$$$TXT.
ENR.
```

Remarks

GEC. is provided to enable you, to hide data, like Passwords and such, with a cryptographic algo, that is tested to make your data unreadable.
From a scientific standpoint, the use of GEC. together with the OTP (One-Time-Pad) Option "**p**", the result should be unbreakable.
For more Details see ! Smarty's Encryption and Hashing Commands 812.

While giving the best we can provide, we can not take any responsibility for safety of your encrypted data. Computers get faster, science makes progress. There is no warranty that data being encrypted today can be seen as safe tomorrow.
Therefore use GEC. on your own risk.
Note that even if you specify the "**k**"-Option, which will delete a file after overwriting it 40 times with Byte-Patterns, the original file may under unknown circumstances still be undeleted by professional undelete experts, especially when it was on a SSD-Drive.

To use the encrypted characters in Chat-Programs or e-mail, do not forget to use the STR.TEXT TO MIME 3215 before,
Of course the encoding must be reversed on the other side before decryption.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

1. File-Size
The actual Implementation tries to load the complete file into Memory before applying the Encryption. Therefore Files with a size that exceeds the Systems RAM Capabilities can not be encrypted or decrypted.
In case there are File-Errors, an empty string is returned.
Please note that the smallest possible Encryption-Result is always 8 bytes or a multiple of 8 bytes. After Decryption the File/string will have its original size, that it the size it had before being encrypted.

2. Encryption Limitations:
TEA* - Tiny Encryption Algorhytmus
Stats of the TEA*-Encryption:
· Block Symmetric Feistel cipher.
· 128 bit key
· Encrypts 64 bits at a time
· Highly resistant to differential cyptanalysis
· Achieves complete diffusion after 6 rounds
- one bit difference in plaintext will cause approximately 32 bit differences in ciphertext

The used TEA*-Encryption is very fast and can be seen as safe for normal "house use". From seven "Encryption-Rounds" up it is already above so called "weak Encryption". As each "Prototype" value counts for 25 Encryption rounds, this is already the case for our lowest Encryption level (level "1"). Because even in level "1" we make 10 internal "Encryption Rounds".
While being already safe for "house use", it may be vulnerable to professionals via "related-key attacks". To prevent this, it should be used with keys that are generated by a strong Random Number Generator, or by a source of bits that are sufficiently uncorrelated (such as the output of a hash function).
Even with a non-perfect key, the prototype "4" (internally= 100 Encryption rounds) should cure most sins, while still being very fast.

For more in Detail mathematical information see "Block Ciphers and Cryptanalysis".

3. CPU-Limitations
For best possible Speed, MMX was used. Therefore the results on "non-MMX CPU's are unpredictable.

3.50.3 GMD. - Get Message Digest

MiniRobotLanguage (MRL)

GMD. Command

Get Message Digest

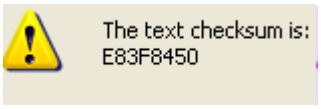
Intention

This command returns the checksum of a string or a file. If you are not sure what a checksum is, or what it is good for, read this WEB-Link: Checksum.

Lets start with the checksum of a string:

```
: $$TXT=Smart
GMD.|$$TXT|$$TXT
MBX.The text checksum is:$crlf$$$TXT
```

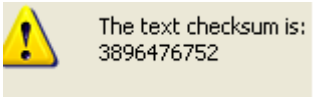
For this simple operation, no prototypes are needed.
The result is a hexadecimal checksum (see picture below) that used an FNV32 algo.
This is the default algorithm, if no other algorithm is selected.



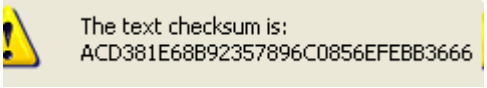
We can give some prototypes to change the checksum algo or the output format.
Like this:

```
GMD.d|$$TXT|$$TXT
```

The result is the same number as decimal number. See following picture.



Now lets choose another checksum algo. Lets try MD5.



MD5 will always return such a long hexadezimal string. It will ignore other options.

Next, lets take a checksum from a file. It's as simple as before. We just give the prototype "f" and the first variable contains the filename.

```
: $$FIL=?desktop\New_Update.zip
GMD.vf|$$FIL|$$TXT
```

© 2023 Theo Gottwald * https://www.smart-package.com

This way you can easily make a file integrity check of any file!

Now let's do some ...

Speed considerations:

For a file with a size of >100 MB i get a checksum-time of about 0.3 seconds.

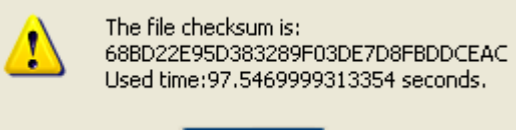
```
' Checksum-time FNV32: 0.3 seconds
GMD.vf|$$FIL|$$TXT

' Checksum-time Elf32: 0.5 seconds
GMD.ef|$$FIL|$$TXT

' Checksum-time CRC-32: 0.5 seconds
GMD.cf|$$FIL|$$TXT
```

As we can see, this checksums does not cost you a lot of time. But how about MD5?

```
' Checksum-time MD5: 97.5 seconds
GMD.mf|$$FIL|$$TXT
```



MD5 may eat a full second per Megabyte, depending on the speed of your system. But even this is a very good time!

Now this speed can only be reached, because we hold the complete data in computer memory in one piece.

For very large files (>500 MB? or >1 GB? this depends on your memory situation) this is not possible. If you need checksums of large files, choose the option "b" or for special uses "s".

```
' Get Checksum from Textfile
VAR.$$TIM=#dtime#
GMD.s|$$FIL|$$TXT
MBX.The file checksum is:$crlf$$$TXT$crlf$Used time:#dsince#
seconds.
ENR.
```

Syntax

GMD.P1|P2[|P3]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - VAR/Prototypes

```
Prototypes must consist of one or two letters.

The first letter shall be:
f - input from file, if omitted input is taken from variable
b - file is bigger then System RAM, choose slower "block-by
block"
    algorithm. This option (unlike f or s) does not support
    a second letter.
s - calculate a string checkum from a long file. This Option
is
    similar to "b" but the result is much more exact. Result
is
    a string with a checksum for each 8192 characters of the
    source-file.  This option (unlike f or s) does
    not support a second letter. It may return a large
    checksum-string.

All of the following prototypes will be ignored when options
"b" or "s" are used:

v - use FNV32 Hash (default if omitted).
c - use CRC32 Hash.
e - use Elf 32 Hash.
m - use the MD5 checksum (slower, more safe). Result is a
string.

All of the following prototypes will be ignored when option
"s" or "m" is used:

h  - Hexadecimal Output as string (default if omitted)
o  - Octal Output as string
d  - Decimal Output
i  - Binary Output as string
```

P2 - VAR with the String or the Filename to process
P3 - optional VAR for Result, if omitted TOS is used

Example

-

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

-

Limitations:

File-Size
File-Size is limited by System RAM, and generally to a maximum of 2 GB (32 bit), unless the option **b** or **s** is specified. These Options should be able to handle any possible file-size (64 bit).

3.50.4 HIT. - Hide Text

MiniRobotLanguage (MRL)

HIT. Command

Hide Text using the "Byte-Flood" Algo

Intention

This command offers a very basic encryption, by XOR'ing a Text with an internal 250 Byte hardcoded Pad. Also it will do an XOR with the neighbour Byte ("Byte Flood") and therefore make things definitely unreadable.
The advantage is that it does not need a Password, because it uses the internal Pad and the Data itself as "Key".
Note that this algo alone is not safe encryption, because anybody who owns the SPR can decrypt it!
It shall only be used in combination with other commands like `XOR` and `GEC`..
It can also be used if you just want to hide something and make it unreadable.
I recommend this algo as a part of a private encryption scheme, not as a standalone encryption.
You can influence the number of rounds by choosing an appropriate selection of prototypes. Unlike with XOR. - XOR - Encryption 843, the "Byte Flood" encryption and decryption use separate algos, therefore you need to choose "**d**" or "**e**" depending on what you are doing.

Here is an example, before and after using :

```
Danke für Ihren Auftrag.  Ihre Transaktionsnummer (MTCN) ist: 1559298090
Wir sind gerade dabei, die Transaktion mit Ihrer Bank abzuschließen.
Sobald sie durchgeführt wurde, senden wir eine Bestätigung an Sie.
```

We use a Script that produces an encrypted file:

```
$$FIL=?path\Western.txt
$$OUT=?path\WesternC.txt
HIT.efo0|$$FIL|$$OUT
```

```
i...nw2¥=pJ"Ä·ð¾÷¶¬[ÿF/ß›ñÍ;...MîWD¹-]ó¢Ø¯öØ°‹,Á1  ›KóÎÔÿwŽsmnÈ†I6×þ
```

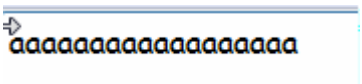
This is just a part of the result. And its definitely unreadable.
This way you can send the Western Union code safely.

While do not use it for the new important new developments of your company.
Because anybody who owns an SPR can decrypt it. This is the decryption script:

```
$$NEW=?path\Receiver.txt
HIT.dfo0|$$OUT|$$NEW
```

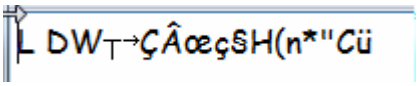
*© 2023 Theo Gottwald * https://www.smart-package.com*

HIT. will not fail fail even on diffcult Plain-Texts, due to the used hardcoded Pad.
Therefore in the actual implementation, 0 rounds is completely safe.
A higher number of Rounds produce other results.
If you use more then 0 rounds, check the result. For example, take this Plain-Text:



Crypted with a Single Round HIT., it will look like this:

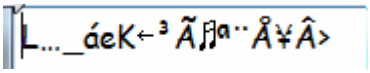
```
$$FIL=?path\Difficult.txt
$$OUT=?path\Crypted.txt
HIT.0ef|$$FIL|$$OUT
```



Does not leave any wishes open so far. Lets see what happens if we increase number of rounds. Now the result from this:

```
HIT.efo2|$$FIL|$$OUT
```

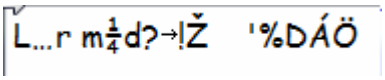
looks like this:



A simple

```
HIT.efo2h|$$FIL|$$OUT
```

would have this result:



Generally HIT. is an additional tool to quickly make stuff unreadable.
Its not an unbreakable encryption.

Back to decryption. Note, that we have used the "2h" and that if we use it for encryption,
we must use the same parameters for decryption!

```
' We decrypt it like this
$$NEW=?path\Receiver.txt
HIT.2hdfo|$$OUT|$$NEW
ENR.
```

Looks like HIT. can get a good result with difficult Plain-Texts.

To get a much better result, we can add a fix Pattern in front of the message.
The longer, the better.

© 2023 Theo Gottwald * https://www.smart-package.com

Doing this, the result can only easily be decrypted from somebody who knows that Prefix.
Is it safe?
Possibly not. But its good for hiding Text. Thats why the name os "HIT."
Here is an example:

```
' We encrypt "file to Variable"
$$FIL=?path\Difficult.txt
$$OUT=?path\Crypted.txt
$$PRE=1-+rD
CFF.$$FIL|$$PLA
' Add a Prefix for better encryption
VAR.$$PLB=$$PRE$$PLA
HIT.1eo|$$PLB|$$OUT

' We decrypt it like this
$$NEW=?path\Receiver.txt
' We encrypt "file to Variable"
HIT.1df|$$OUT|$$PLC
' Remove $$PRE from Result
GSS.6|0|$$PLC|$$PLD
' Save it to a file
CTF.$$NEW|$$PLD
ENR.
```

On the other side ... who needs a Message like "aaaaaaaaaaaaaaaa"?

If you have difficult Plain-Texts, i recommend to combine multiple systems, for example GEC. and XOR. (one time Pad).
HIT. is for hiding unimportant stuff, where you do not need to remember a Password.

Syntax

HIT.proto|P1[|P2]

Parameter Explanation

P1 - VAR, Filename or String to encrypt.

P2 - *(optional)* - VAR for Return value. If omitted, TOS is used.

The following prototypes can be used:

£ - if given, then **P1** is a filename, not a Text-String. If omitted, the content of **P1** is taken.

o - if given, then **P2** is a filename, not a Variable for ther result.
If omitted, the content of **P2** is treated as a variable where the result shall be stored.
If **P2** is omitted, then the result is been placed on TOS.
If "**o**" is specified, then a filename for the result-file must be given!

© 2023 Theo Gottwald * https://www.smart-package.com

z - multiply number of rounds times 10.
m - multiply number of rounds times 100.
h - multiply number of rounds times 500.
e - signals that the encryption-algo shall be used.
d - signals that the decryption-algo shall be used.

Numbers from 0 to 9

0-9 You can specify numbers from 0 to 9 to specify the number of rounds that should be done.

Example

```
'******************************************************
' HIT. - Sample
'******************************************************
' We encrypt "file to file"
$$FIL=?path\Western.txt
$$OUT=?path\WesternC.txt
HIT.efo|$$FIL|$$OUT

' We decrypt it like this
$$NEW=?path\WesternD.txt
HIT.dfo|$$OUT|$$NEW
ENR.

'******************************************************
' HIT. - Sample #2
'******************************************************
' We encrypt "file to Variable"
$$FIL=?path\Difficult.txt
$$OUT=?path\Crypted.txt
$$PRE=1-+rD
CFF.$$FIL|$$PLA
' Add a Prefix for better encryption
VAR.$$PLB=$$PRE$$PLA
HIT.1eo|$$PLB|$$OUT

' We decrypt it like this
$$NEW=?path\Receiver.txt
' We encrypt "file to Variable"
HIT.1df|$$OUT|$$PLC
' Remove $$PRE from Result
GSS.6|0|$$PLC|$$PLD
' Save it to a file
CTF.$$NEW|$$PLD
ENR.
```

Remarks

To use the encrypted characters in Chat-Programs or e-mail, do not forget to use the STR.TEXT TO MIME[3215] before,
Of course the encoding must be reversed on the other side before decryption.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

Possible maximum file-Size is limited by System RAM, and generally to a maximum of 1-2 GB (32 bit).

3.50.5 SHA. - Safer Hash Algo

MiniRobotLanguage (MRL)

SHA. Command

Get Message Digest SHA I from String or File

Intention

This command returns the checksum of a string or a file. If you are not sure what a checksum is, or what it is good for, read this WEB-Link: Checksum.

Using `SHA.` you can currently choose between:

- **SHA** Details SHA
- **MD5** Details MD5

Usage is very simple:

```
' Name and Path of the file
$$FIL=?desktop\MyFile.exe
SHA.$$FIL
' Display result
DBP.$$000
```

You can use a variable instead of the TOS:

```
' Name and Path of the file
$$FIL=?desktop\MyFile.exe
' $$RES will contain the SHA checksum
SHA.$$FIL|$$RES
' Display result
DBP.$$RES
```

If you prefer to get the MD4 checksum:

```
' Name and Path of the file
$$FIL=?desktop\MyFile.exe
' $$RES will contain the SHA checksum
SHA.$$FIL|$$RES|m
' Display result
DBP.$$RES
```

There are some more built in Options that influence the outlook of the result. You can:

- make the result string uppercase (use U in **P3**)
- make the result string lowercase (use L in **P3**)
- choose to have spaces for better readability when using `SHA` I, like this:
  `EC91328073 A651B13403 BA5B2D9730 861F312F88`
- choose the MD5 Algo instead, specify "`M`" as **P3**

*© 2023 Theo Gottwald * https://www.smart-package.com*

- Prefix **P1** with the **<** Sign. In this case the String will be taken as Binary Data, instead of as Filename

Syntax

SHA.P1[|P2][|P3]

Parameter Explanation

P1 - VAR, Filename or String to calculate the checksum for. If the first letter is "<" then
input is taken from following variable using binary, one time resolution.
Otherwise P1 is taken as a filename/path for file that should be loaded
and processed.

P2 - *(optional)* - VAR for Return value. If omitted, TOS is used.

P3 - *(optional)* - any combination of these letters:
M - use the MD5 checksum. Result is a string of length 32.
L - Lowercase Result
U - Uppercase Result
S - Insert Spaces for better readability into SHA I Output.
This flag has no influence on the MD5 output.

Example

```
' Load the file and calculate SHA I checksum
$$FIL=?pfad\Sha1.exe
SHA.$$FIL|$$RES|s
DBP.$$RES
ENR.
```

Remarks

-

Limitations:

Possible maximum file-Size is limited by System RAM, and generally to a maximum of 2 GB (32 bit).

3.50.6 XOR. - XOR - Encryption

MiniRobotLanguage (MRL)

XOR. Command

XOR Encryption

Intention

Logical operations on Bit-Level. Combines/Encrypts or decrypts Bit-Patterns.
Works from a string or a file, to a string or a file.

While the name of the Command is just "**XOR.**" this command knows all possible encryptions-on-bit level.

You can choose from the following logical operations to encrypt or decrypt any Plain-Text on Bit-Level:

- XOR (default option or "**x**")
- ADD/SUB (Option "**a**")
- ROL/ROR (Option "**s**")
- Byte-Flood

And you can even combine all of them just as you like in a single command.
This command uses a "Pipelined architecture" therefore you can apply all of the above options with a single command. Then all Options will be applied with the same KEY on to the same Clear-Text. One after the other, In the right Order - which is important for decryption.

We will take a look on what happens with a Message when being decrypted.

> Danke für Ihren Auftrag. Ihre Transaktionsnummer (MTCN) ist: 1559298090
> Wir sind gerade dabei, die Transaktion mit Ihrer Bank abzuschließen.
> Sobald sie durchgeführt wurde, senden wir eine Bestätigung an Sie.

```
$$FIL=?path\Western.txt
$$OUT=?path\Crypted.txt
$$KEY=1-+rDsdf/(klsdaf
' We encrypt "file to file"
XOR.efo|$$FIL|$$KEY|$$OUT

' We decrypt it like this
$$NEW=?path\Receiver.txt
XOR.dfo|$$OUT|$$KEY|$$NEW
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

To make sure that we do not have a pure "character substitution", the command offers additional features (Byte-Flood).

This will help especially with short keys, if there is a chance that somebody will try brute force to crack your Cryptography.

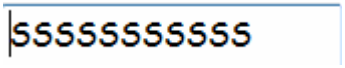
`XOR.` with a weak and short Password is far from being a safe method.
It becomes safe, in combination with a "One Time Pad" that has the size of the code that is to be encrypted.

Let me show this to you with an example:

```
$$OUT=?path\Crypted.txt
$$KEY=1
$$TEX=bbbbbbbbbbb
' We encrypt "file to file"
XOR.eo|$$TEX|$$KEY|$$OUT

' We decrypt it like this
$$NEW=?path\Receiver.txt
XOR.dfo|$$OUT|$$KEY|$$NEW
ENR.
```

Will produce this crypted text:



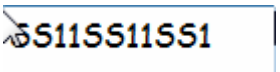
you can still make assumptions on the source-code.
Of course this will get better if we use a more complex `$$KEY`.

But first lets try this addition to XOR:

```
$$OUT=?path\Crypted.txt
$$KEY=1
$$TEX=bbbbbbbbbbb
' We encrypt "file to file"
XOR.3eo|$$TEX|$$KEY|$$OUT

' We decrypt it like this
$$NEW=?path\Receiver.txt
XOR.3dfo|$$OUT|$$KEY|$$NEW
ENR.
```

The result we get is this, and this is at least a few bits better.

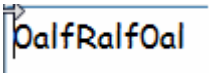


© 2023 Theo Gottwald * https://www.smart-package.com

Note that there is a chance that Passwords can become visible when using XOR. and Bit-Flood in an unlucky way and with difficult Plain-text. Like in this case:

```
$$OUT=?path\Crypted.txt
$$KEY=Ralf
$$TEX=bbbbbbbbbbb
' We encrypt "file to file"
XOR.2eo|$$TEX|$$KEY|$$OUT

' We decrypt it like this
$$NEW=?path\Receiver.txt
XOR.2dfo|$$OUT|$$KEY|$$NEW
ENR.
```



Therefore check the result of your operations in a HEX-Editor.
Or better use only cryptographical safe Passwords that make no sense when using `XOR.`
Of course the best way is to first use `GEC.` and then add up something else.
Best use a real "One Time Pad" 812.

The usage on strings is simple:

```
' Combine $$TXT and $$KEY
XOR.e|$$TXT|$$KEY|$$TXT

' This way you can save the result as file immediately.
' Combine Variables into a file
XOR.do|$$TXT|$$KEY|$$FIL
XOR.efo|$$FIL|$$KEY|$$FIL

' This example loads a file and places
' the result into a variable
XOR.ef|$$FIL|$$KEY|$$TXT
```

What happens, if the $$KEY is shorter or longer then the $$SRC
In either case, the XOR COmmand will handle the situation automatically.
To long `$$KEY's` will be shortened internally before beeing used. And if $$KEY is shorter then t$$TXT, the `$$KEY` will be repeated as often as needed to fill the gap.
For example:

```
$$TXT=Hallo Leute
$$KEY=12
' Then XOR will repeat $$KEY and use internally:
$$TXT=Hallo Leute
$$KEY=12121212121
```

While this will definitely make the text unreadable, it is far from bullet-proof encryption.

XOR-Encryption alone may under several circumstances not lead to professional security, therefore we recommend to use the **GEC.**-Command for encryption.

© 2023 Theo Gottwald * https://www.smart-package.com

The XOR. can be used to combine Random Numbers of different sources to a single result.
If you just want to hide something, you can use the HIT.-Command.

Do multiple XOR's make the result more secure?
No, as mathematically all XOR's can be shortened to a single XOR Operation.
Its just like an addition ... many additions can be shortened to a single addition.
However if you additionally use the ADD/SUB or ROL/ROR and the "Byte-Flood", the result will be hard to beat.

How can i make a definitely scientifically proven safe encryption that is unbreakable?
The only way is to use a so called "One-Time Pad". That is a "Key-File" with Random Data Bytes, that is only available to you, and tot the receiver of the message.
Then I recommend to use first GEC. on any important Plain-Text Message - just to make a statistical Binary from your Plain-Text.
And after that apply XOR. with some of its Options and a "Random Pad Key" that you have generated using the STR.CHARS D command. Doing so the result is mathematically unbreakable as long as the sender doesn't get hands on the decryption key.
Then make 500 Pads on a USB-Stick and give the stick to your communication partner.
So he can use every day a new "Pad" and delete the old Pad.
This way the message can never in the future be encrypted any more.
To help you about this we have now a included a "Safe-Erase" for "Pads" in the DEL.-Command. It will overwrite the Pad 40 times with Random Data before deleting it.
Making as sure as possible that your messages will stay private to you and the receiver.
What is most important when encrypting with XOR?
The most important point is the quality of the used PRNG for the Encryption Key.
For Details about it see ! Smarty's Encryption and Hashing Commands 812

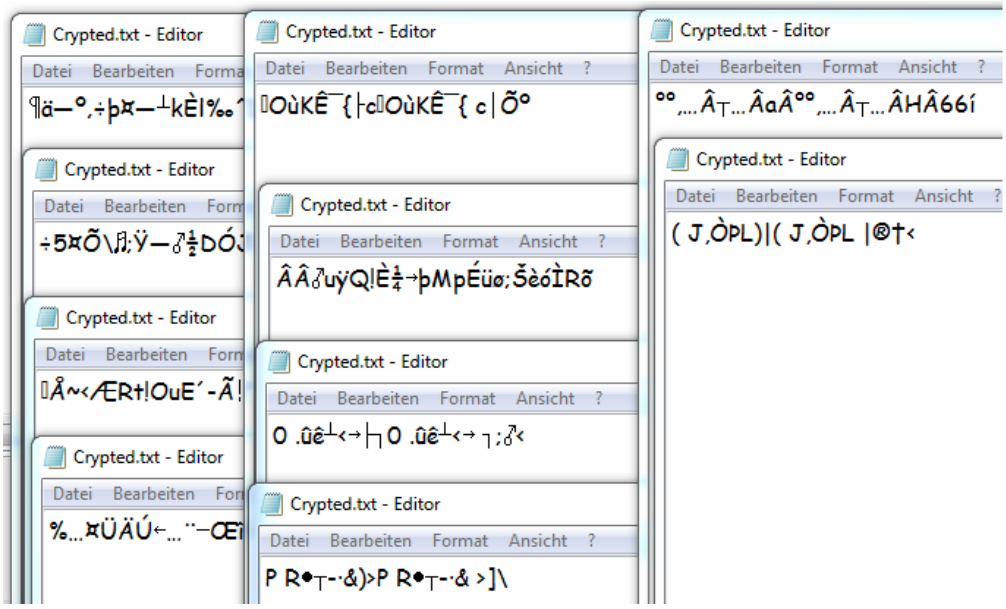
Making your own Encryption System
Using XOR. and GEC. the SPR is a "Crypro-Construction Set".
Making things as easy for you as possible. However there is something for you, to care about. In case you want to construct your own Encryption/Decryption using multiple
XOR.-Commands please note the following rule:

```
Plain-Text -> XOR.KEY1 -> XOR.KEY2 -> XOR.KEY3 -> Ciphertext
```
must be encrypted in reverse Order like this:
```
Ciphertext -> XOR.KEY3 -> XOR.KEY2 -> XOR.KEY1 ->Plain-Text
```

You only need to worry about this if you use multiple XOR./GEC. Encryption Commands in a chain. If you use just one command with multiple Options, they will internally be sorted in a way that it will work as expected.
By varying the prototypes between the given options, you always get different Ciphertexts. Below some Ciphertexts all from the same Plain-Text. All with just one XOR.-Command.
Technically the "**d**" - decrypt - Option is always the reverse of the "**e**" - encrypt option.

© 2023 Theo Gottwald * https://www.smart-package.com

Therefore you can also use "**d**" for encryption and in this case "**e**" for decryption.
The ciphertext will in this case look different from the normal results.



This picture shows some possible Ciphertexts, all from the same Plain-Text. All with just one `XOR.`-Command and changed prototypes.

What is most important when encrypting with XOR?
The most important point is the quality of the used PRNG (Noise-Overlay/ the One-Time-Pad) for the Encryption Key.
For Details about it see ! Smarty's Encryption and Hashing Commands 812

Speed considerations:
On a typical test-system, a file with **17.8 MB** is encrypted with lowest strenght in **0.3 seconds**. The decryption of the same file takes about 0.2 seconds. Note that for most use-cases, this level is all you will ever need.

The same file is been encrypted with standard strength (140 Rounds) in about 1.9 seconds. The decryption for that file takes 1.7 seconds.

The same file is been encrypted with highest strength (level 9) in about 12.8 seconds. The decryption for that file takes 12.3 seconds.

Syntax

XOR.P1|P2|P3[|P4]

Parameter Explanation

P1 – VAR/Prototypes
P2 – VAR with the String or the Filename to process

© 2023 Theo Gottwald * https://www.smart-package.com

P3 – VAR with Key to en-/decrypt
P4 – (optional) VAR with Filename or Variable for the result, if omitted, result goes to TOS

Prototypes must be lowercase letters like following:
f -input from file - if f is not specified, the Variable is been resolved to a string.
e - "Encrypt". If **e** is not specified the input is been decrypted.
o - output result to a file. if o is not specified, output is directed into the variable P3, or if none to the TOS.
s - (Shift Operation) "ROR"/"ROL" - used together with "**e**" it will use the "ROR" (Rotate Right) algo. Used together with "**d**", this will use the "ROL" (Rotate Left) algo. "ROR" and "ROL" are complementary operations. Each can be used to decrypt the other, or to encrypt for the other operation.
a - "ADD"/"SUB" - used together with "**e**" it will use the "ADD" algo. Used together with "**d**", this will use the "SUB" algo. "ADD" and "SUB" are complementary operations. Each can be used to decrypt the other, or to encrypt for the other operation.
x - (default if no "**s**" or "**a**" is specified. Will use XOR-Encryption/decryption. If "**s**" or "**a**" was specified, then "**x**" must be given to additionally use XOR.
Numbers from 1 to 4 add the "Byte-Flood Algo".
This will additionally shift Bytes around to confuse the result.
While for normal XOR-Operation, the Use of "e" is optional, in case of using "Byte Flood", the use of "d" or "e" are necessary to get the wanted result.

0 - Do a single "Byte-Flood-Round".
1 - Do as Many Rounds as the Target has Bytes.
2 - Do 5 times the Rounds as the Target has Bytes.
3 - Do 6 times the Rounds as the Target has Bytes.
4 - Do 8 times the Rounds as the Target has Bytes.

Example

```
'*************************************************************
*****
' XOR-Sample
'*************************************************************
*****
'
' We encrypt "file to file"
$$FIL=?path\Western.txt
$$OUT=?path\Crypted.txt
$$KEY=1-+rDsdf/(klsdaf

XOR.e$$CNT|$$KLA|$$KEY
PRT.Verschlüsselt: $$KLA
XOR.d$$CNT|$$KLA|$$KEY
PRT.Klartext=$$KLA
MBX.!
ENR.
```

Remarks

`XOR.` is provided to enable you, to apply mathematical XOR on any amount of Data.
To generate an encrypted "One Time Pad", we recommend that you rather use the `GEC.`-Command.

To use the encrypted characters in Chat-Programs or e-mail, do not forget to use the STR.TEXT TO MIME 3215 before,
Of course the encoding must be reversed on the other side before decryption.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

1. File-Size
The actual Implementation tries to load the complete file into Memory before applying the Encryption. Therefore Files with a size that exceeds the Systems RAM Capabilities can not be encrypted or decrypted. In case there are File-Errors, an empty string is returned.

3.51 Environment Variables and Global Signals

3.51.1 EVE. - Environment Variable Expand

EVE. - Environment Variable Expand Previous 843 Top 41 Next 854

MiniRobotLanguage (MRL)

EVE. Command

Environment Variable Expand

Intention

Expands Environment Variables. It will expand one or more environment-variables in the given P1 parameter. The result will be on TOS (Top of Stack) or in P2 (Parmeter 2) if given.

Usage is as simple as you can see in the picture below.

While in normal use, you should always use variables which would look like this:

```
: $$WIN=%windir%
EVE.$$WIN
MBX.The result is: $tos$
ENR.
```

With exactly the same result. You can give a second parameter, in that case the result will not be on TOS (Top of Stack(, but in that variable.

```
: $$WIN=%windir%\system\
EVE.$$WIN|$$RES
MBX.The result is: $$RES
ENR.
```

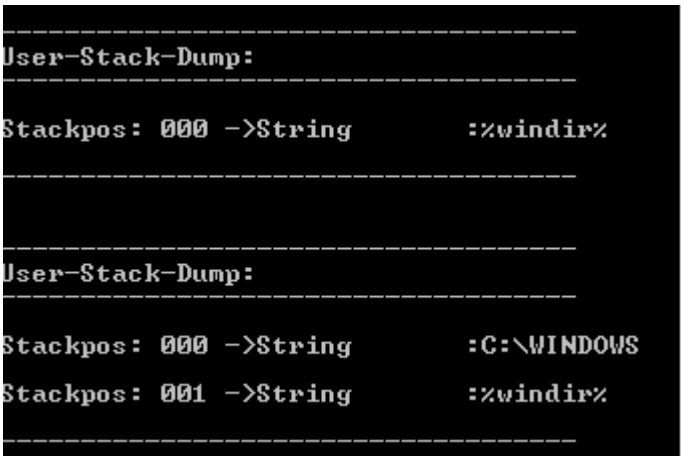
EVE. allows you to work "from stack to stack 369". If you do this:

```
VAR.$$WER=%windir%
PUV.$$WER
STS.DUMP
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EVE.
STS.DUMP
```

This is how the stack will look like:



If you just want to get the value of a Environment variable, you should use `EVG.`
Use `EVS.` to set/change the value of environment variables.

Syntax

EVE.P1[|P2]

Parameter Explanation

P1 - (in) Environment variable
P1 - (optional) (out) Variable if omitted, TOS is used

Example

```
'*****************************************
' EVE. - Sample
'*****************************************
'DBM.2
VAR.$$WER=%windir%
PRT.Unexpanded: $$WER
EVE.$$WER
PRT.from stack ->$$000-
PRT.=======================================
VAR.$$WER=%windir%
PRT.Unexpanded: $$WER
EVE.$$WER|$$RES
PRT.from variable->$$RES-
PRT.=======================================
DMP.4
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
:over
MBX.Halt to read output
'*********************************************
```

Remarks

3.51.2 EVG. - Environment Variable Get

MiniRobotLanguage (MRL)

EVG. Command

Environment Variable Get

Intention

Reads Environment Variables and return their values. Depending on parameters these can be from the local or from the global Environment variables table.

If you specify a numbered parameter P1, then you can get the Environment variable with that number. Example:

```
EVG.#3
STS.DUMP
```

the result on theTOS (Top of stack) 369 will look like this:

```
------------------------------------
User-Stack-Dump:
------------------------------------
Stackpos: 000 ->String       :CLASSPATH=.;C:\Programme\Java\jre6\lib\ext\QTJava.zip
------------------------------------
```

of course it can look different on your computer, as you may have other environment variables.

The global Environment table is been read from (32-bit) registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session
Manager\Environment
```

Syntax

EVG.[P1][|P2][|P3]

Parameter Explanation

P1 - (in) is taken as name for the environment-variable to get. Result is placed on TOS (top on stack). You can specify a "#(num)Parameter to get the Entry with that number. "#(num)" will only work with the local table. Trying "#(num)" with the global table will result in an error.

 *© 2023 Theo Gottwald * https://www.smart-package.com*

P2 - `(out) Result is placed in variable, if given.`

P3 - `Options`
```
  e - (expand) will expand environment variable.
  g - (gobal) reads String from global Environment-table
      instead from local Application Table.
  n - (noexpand) will not expand the result.
  t - (table)  reads String from local Application Table
      instead of from global Environment-table
```

* Expand means %path(something)% is replaced with the real physical path.

In case there is no Parameter, TOS is taken as Name for the Environment-Variable to get.
Result is placed on TOS.

Example

```
'*******************************************
' EVG./EVS. - Sample
'*******************************************
'DBM.2
' Get %SystemRoot%
EVG.SYSTEMROOT|$$VAR
PRT.Systemroot=>$$VAR
PRT.=========================================
' EVS. without opt writes a global Environment variable
EVS.MyVar|MyValue
EVG.MyVar|$$RES|g
PRT.$$RES
PRT.=========================================
' EVS. with opt t writes a local Environment variable
EVS.MyVar|MyValue|t
EVG.MyVar|$$RES
PRT.$$RES
PRT.=========================================
DMP.4

:over
MBX.Halt to read output
'*******************************************
```

Remarks

-

Limitations:

The option to get Environment entries by their number `"#(num)"` will only work with the local table. Trying "#(num)" with the global table will result in an error.

© 2023 Theo Gottwald * https://www.smart-package.com

The global environment table is read from 32-bit registry.

3.51.3 EVS. - Environment-Variable-Set

MiniRobotLanguage (MRL)

EVS. Command

Environment Variable Set

Intention

Sets or clears an Environment Variable entry. Depending on parameters these can be from the local or from the global Environment variables table.

The global Environment table is been read directly out of 32-bit registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session
Manager\Environment
```

Syntax

EVS.P1|P2[|P3]

Parameter Explanation

P1 **-** (in) is taken as name for the environment-variable to use.
P2 **-** (in) this is the value that is stored in P1

P3 **-** Options
  g - (gobal) write String from global Environment-table
instead
  to local Application Table.
  t - (table) writes String to local Application Table
instead
  of to global Environment-table

Example

```
'*******************************************
' EVG./EVS. - Sample
'*******************************************
'DBM.2
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Get %SystemRoot%
EVG.SYSTEMROOT|§§VAR
PRT.Systemroot=>§§VAR
PRT.========================================
' EVS. without opt writes a global Environment variable
EVS.MyVar|MyValue
EVG.MyVar|§§RES|g
PRT.§§RES
PRT.========================================
' EVS. with opt t writes a local Environment variable
EVS.MyVar|MyValue|t
EVG.MyVar|§§RES
PRT.§§RES
PRT.========================================
DMP.4

:over
MBX.Halt to read output
'*****************************************
```

Remarks

-

Limitations:

The global environment table is read from 32-bit registry.

3.51.4 IGS. / NGS. - If-Global-Signal (Mutex)

IGS. / NGS. - If-Global-Signal (Mutex,Atom) ***Previous*** 857 ***Top*** 41 ***Next*** 861

MiniRobotLanguage (MRL)

IGS. Conditional Statement

If Global Signal

Intention

Conditional Statement.

Test if a specified Global Signal (Atom) or Global Alive-Signal (Mutex) exists.
Most often they will be set from another Robot.
Such a Signal has a name, and it is is set or is not set.
Such a Signal can be set or tested from any windows application to signal something to other programs. Normally the `SGS.` - command is used to set or delete these signals.

A Mutex can be set from another instance of this robot using SGS - Set Global Signal (Mutex) 861 or any other application, using the windows-API CreateMutex.
While a "Alive Signal" (=Mutex) can only be deleted by the application that created the Signal, the second Sort of Signals, the so called "Atoms" can be deleted by anybody who knows their name.

The negative Form of this statement is `NGS.`.

* *Mutex:* systemwide, global Signal.

Syntax

```
IGS.P1[|A] … ELS. … EIF.
```

Parameter Explanation

P1 - `Variable = Variable (must be a Variable or Stackvar, Len=5)`
`do NOT use Search Patterns with this command.`

A - `If P2 evaluates to "A" then IGS. does check for so called "Atoms". This is the second sort of global Signals that can be set using SGS. Command.`

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'***********************************
' IGS.-Test
' Let this script run on instance 1
'***********************************
SGS.Peter
DOL.1
IGS.Theo

© 2023 Theo Gottwald * https://www.smart-package.com

3.51.5 SGS. - Set Global Signal (Mutex)

SGS - Set Global Signal (Mutex,Atom) Previous 859 Top 41 Next 867

MiniRobotLanguage (MRL)

SGS. Command

Set Global Alive-Signal (Mutex)

Intention

The `SGS.`-Command can be used to **set/remove or wait for a PC-Global Signal**, which can be checked for its existence in another instance of this robot using `IGS.` or `SGS.`

You can imagine these Signals like a Table with names in it.
Any program in the Computer can
- add a name to that table
- ask "Is the name XXX already in the table?"
- delete self created names (in case of Mutex)
- or delete any names (in case of Atoms)

There are two types of Global Signals that are currently available: one is called "Mutex" and the second is called "Atom". Both are different in some points.

1. Mutex disappear when the program closes that has set these mutex.
2. Atom do not necessarily disappear when a program closes
3. Mutex can only be deleted by the program which created them
4. Atoms can be deleted by anybody who knows the name of the "Atom"

A Mutex can be set from another instance of this robot using SGS - Set Global Signal (Mutex) 861 or any other application, using the windows-API CreateMutex.
While a "Alive Signal" (=Mutex) can only be deleted by the application that created the Signal, the second Sort of Signals, the so called "Atoms" can be deleted by anybody who knows their name.

You can set a signal, then this signal will stay until the Robot is closed, or until the

```
SGS.[Signal]|R
```

Command is executed. If you prefer to use an Atom rather then a Mutex, just add an "A".

```
SGS.[Signal]|RA
```

Please note that in case of Mutex, only the Process that created the Signal can remove the Signal.

`SGS.` can be used to **synchronize systemwide resources.**

© 2023 Theo Gottwald * https://www.smart-package.com

Therefore it can wait for a Signal to be removed, and then it can automatically set the Signal for itself. This way resources can be shared over many instances or programs.

You could even run several installations at the same time, while leaving the mouse to the instance which actually owns the Signal.

The Signal is an "Alive-Signal", it will only be there as long as the robot that has set the signal is "alive". Therefore the Signal **can also be used to trap, if a robot has been killed** or has ended its task. Because then the signal is automatically destroyed.

Technically the robot should be able to receive Variable-Content (`PRV.`,`WFV.`) while waiting for a signal with `SGS.`.

"Global Alive Signals" (Mutex) can also be used to synchronize your script with self written applications*.

*use MSDN-API: OpenMutex()

Syntax

SGS.P1[|P2]

Parameter Explanation

P1 - Name of the Mutex or Atom that should be handled.
P2 - ***(optional)***one of the letters below. If omitted, the "M" (create Mutex) is the default.

```
For Mutex:
 M - Create Mutex (Raise Signal).
 R - Remove Signal - the Signal will be removed.
     Only Signals which have been raised by this instance
     can be removed from this instance.
 W - Wait (unlimited time!) for Signal to be removed by
     another instance or program.
 C - Wait-and-set signal. Wait till the Signal is removed,
     then set the signal himself.
 F - Wait for Signal to be set.

For Atoms:
 MA - Create Mutex (Raise Atom).
 RA - Remove Signal - the Signal will be removed.
 WA - Wait (unlimited time!) for Signal to be removed by
     another instance or program.
 CA - Wait-and-set signal. Wait till the Signal is removed,
      then set the signal himself.
 FA - Wait for Signal to be set.
 FA - Wait for Signal to be set. When Signal was set,
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
      delete Signal and go on ...
```

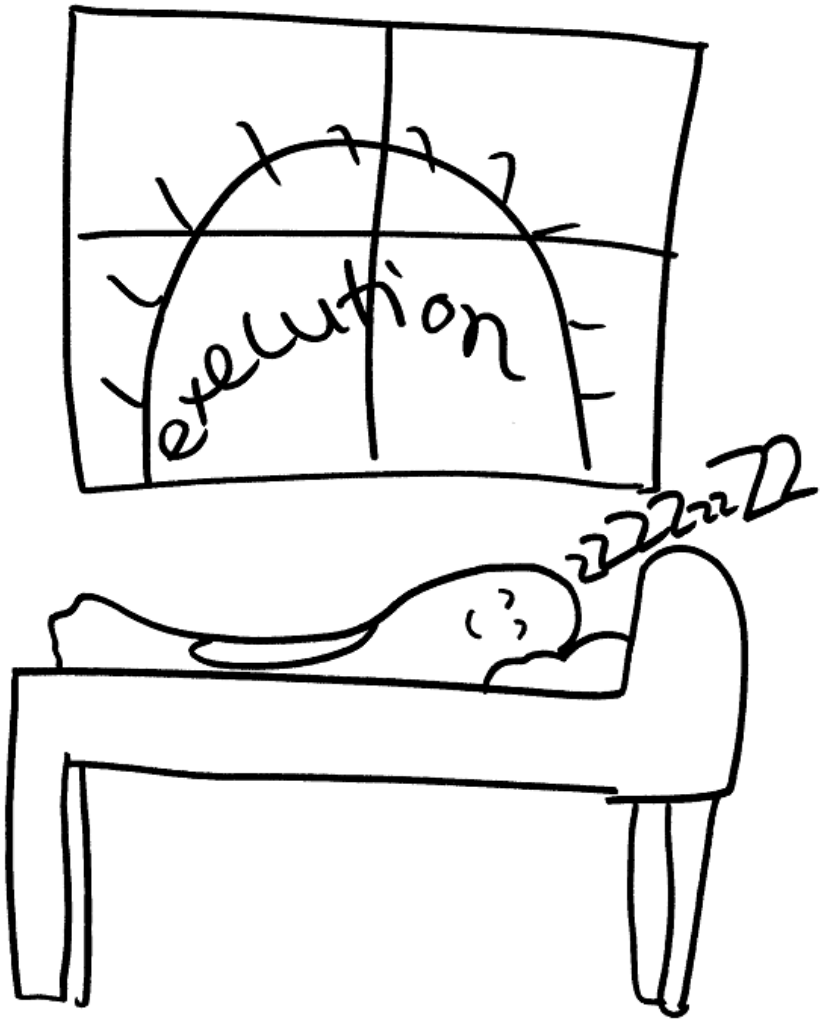
3.52 Execute-Commands

3.52.1 ! Smarty's Execution Commands

Smarty's Execution Commands



In many cases, you can just drag and drop an executable into the Editor to get the right execution command inserted.

Execution commands in general

These commands will "start" another programm, a Uninstallation or a document.
They will of course also start an compiled SPR-Script or nearly an other file that can be started.

Sometimes you will need to try which of the commands works fine in your case.

*© 2023 Theo Gottwald * https://www.smart-package.com*

They use different technologies internally to give you a broad range of options.

`EXE.` is maybe the most often used execution command.
In case that does not work, try `EXO.`, or `EXS.`

Now if all of these do not do what you want, take a closer look.

Is it an MSI.-file?
Use `EXM.`

Is it an registered document file?
Use `EXR.`

Do you want to uninstall something?
Then `EXU.` is possibly what you need.

Do you want to run a batch file with DOS-Commands?
Use `EXC.` for that.

Do you want to start a lot of Applications as fast as possible?
Use `EXF.` then.

Generally there are two ways of starting an executable:
- blocking -> script will wait until the executable has finished)
- non blocking -> script will start the executable and continue running, without waiting for the executable to end.

This is the first choice you have to make, when choosing the right execution command.

Execution on the "Hidden System Desktop"

Hint: This Feature requires Windows Vista or higher.

Imagine, you can execute a Installation or Automation on a hidden Desktop that the user can not see.
To be able to do this, the SPR must have full Admin-Rights.

Then you can simply use the Command:

```
EXV.?path\myfile.exe|c
ENR.
```

To start your executable with System-Rights on the Hidden Desktop.
The "`|c`" means "Cleanup" and should be used after any call to start something on the Hidden System-Desktop.
In case you have started your executable like this:

```
EXV.?path\myfile.exe
PAU.10
' then you can later do the cleanup like this
EXV.|c
ENR.
```

How can I see the the "Hidden System Desktop"?

© 2023 Theo Gottwald * https://www.smart-package.com

There are some steps necessary to be able to see the Hidden Desktop.

1. Preparation:

We have implemented all necessary steps into the `EXV.` - Command to make it easy for you.
Just type:

```
EXV.|pc
ENR.
```

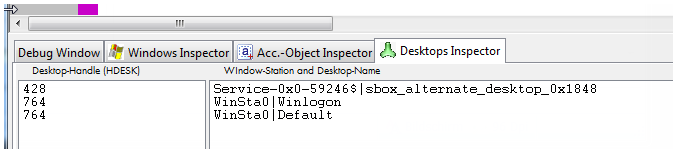
And execute this script. This will make all preparation to enable you to see the hidden Desktop.

2. Open a Window on the Hidden Desktop

This can most easily be done like this:

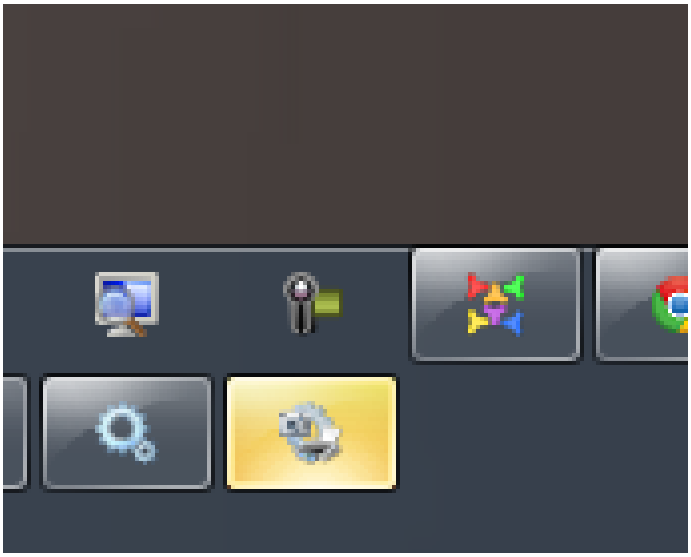
```
EXV.-|c
ENR.
```

The SPR-Editor has a "Desktops-Analyzer" that will show the "Hidden Desktop" once it has been opened.



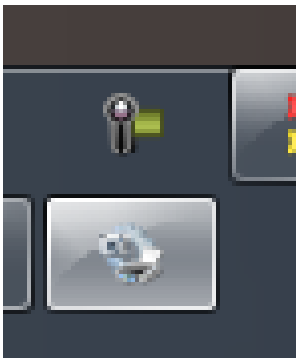
3. Now you should see something like this in your Windows-Taskbar

Click on it.



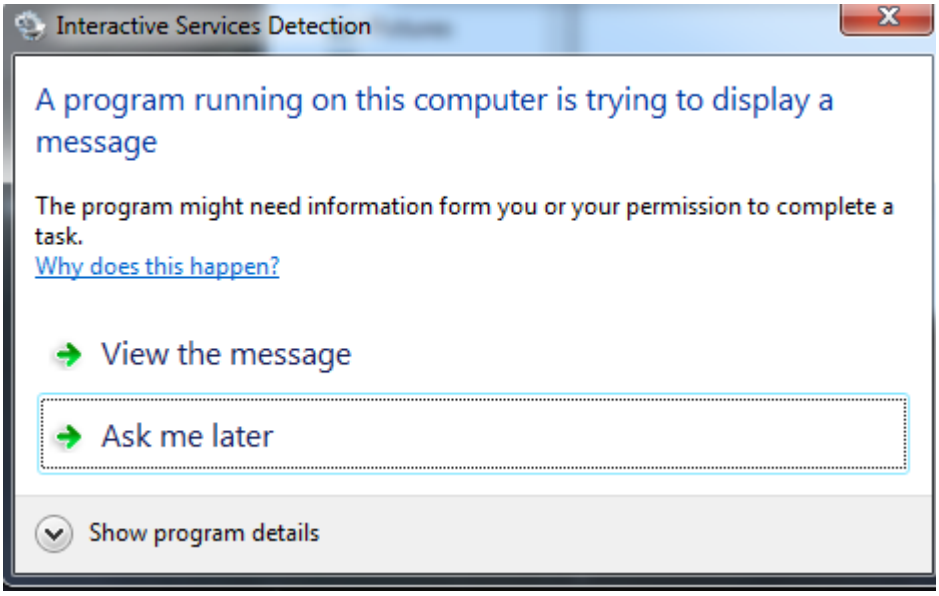
Once you have touched it with the Mouse, it will stop blinking and look like this:

© 2023 Theo Gottwald * https://www.smart-package.com



4. Now click the upper choice.

Anyway, just click on it with the Mouse. Next you will see this window:

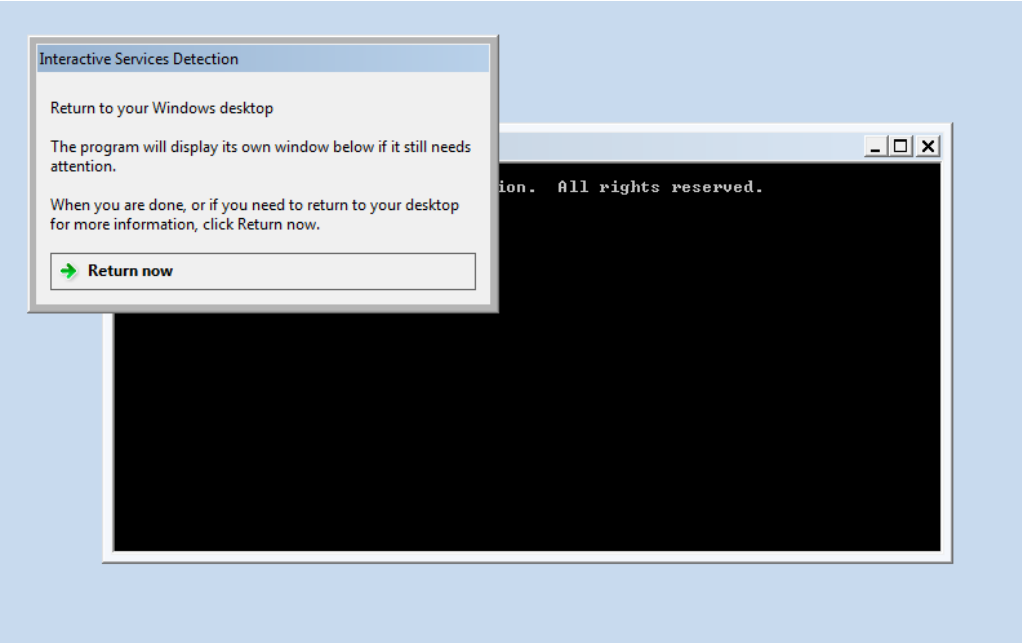


In this case you would click on:

"View the message"

5. Voila ... the Hidden Desktop will show up to you!

© 2023 Theo Gottwald * https://www.smart-package.com



It will look somehow like this:

Note: On the "Hidden Desktop" you have complete System-Rights!
Type "`WhoAmI`" in to the Console window and hit enter to see your current account.
To return to your normal Desktop, close the console window and click the Button in the grey window.
If you leave the console window open, you will always be able to easily return to the "Hidden Desktop".

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.52.2 EXA. - Execute Asynchron

MiniRobotLanguage (MRL)

EXA. Command

Execute Asyncron

Intention

`EXA.` can be used to start executable files, non-blocking*. The command will not wait until the process is started. Therefore `EXA.` is very fast.
Usage is as simple as:

```
EXA.?exepath\Sample Apps\TestApp_01.exe
```

If you use `EXA.`, internally a background process will be started to do the job. This **background process** will:

1. Set the given variable - if any - to zero
2. start the executable
3. wait for it to run
4. assign the PID 137 to the given variable if there is any. This can happen at any time later.

Therefore the PID may not be available immediately after the command. As this depends on the target process, there is no warranty when/if the PID will be available.

As the given PID-variable (**P2**) will be set to zero at the start of the `EXA.`-command, you can wait for the PID to become available in case you need that.

`EXA.` itself can not be blocked and that is its strong side. Internally its as fast as `EXF.`
It may deliver the PID if you give a variable.

Special Mode: Stack-Variable as P2
If you give a stack variable (`$$000` for example) as **P2** then the script assumes that a real variable name is been placed on the stack before and will try to resolve the stack for that variable. If that is successful, this real variable will get the PID when its available. If that fails because there is no variable-name on the stack, the result is been placed in the given stack variable.

*The term "non-blocking" means that the command will never block the script from further execution. The script will continue with execution no matter what sort of executable has been started.

Syntax

 *© 2023 Theo Gottwald * https://www.smart-package.com*

EXA.P1[|P2]

Parameter Explanation

P1 - Document-Filename (can be a hyperlink)

P2 - (optional) Variable that will be filled with PID of the started process. Important: This happens at ANY TIME later.
If omitted, PID is been dropped (NOT placed on TOS, NOT put into #pid#).

P3 - (optional) Window Size Parameter
You can use the following window-size parameters for P2

0 - HIDE - Hides the window and activates another window.
1 - SHOW NORMAL Activates and displays a window.
2 - SHOW MINIMIZED - Activates the window and displays it as a minimized window.
3 - MAXIMIZE - Maximizes the specified window.
4 - SHOW-NO-ACTIVATE - Displays a window in its most recent Size and position. The active window remains active.
5 - SHOW - Activates the window and displays it in its current size and position.
6 - MINIMIZE - Minimizes the specified window and activates the next top-level window in the Z order.
7 - SHOW-MIN-NO-ACTIVE - Displays the window as a minimized window. The active window remains active.
8 - SHOW-NO-ACTIVE - Displays the window in its current state. The active window remains active.
9 - RESTORE - Activates and displays the window.
10 - SHOW-DEFAULT - Sets the SHOW STATE to default.

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.52.3 EXB. - Execute-Blocking

MiniRobotLanguage (MRL)

EXB. Command

Execute Blocking. Halt script execution until the started program has finished.

Intention

Run an executable program synchronously and deliver the exit-code. The current script is suspended until the called program ends.

The **Exitcode** (Error-level, Returncode) of the started application/command-line will be **placed on the stack** (TOS 369) .

Usage of `EXB.` is as simple as it can be:

```
VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
EXB.$$LNK
```

You can add a window-size parameter **P2** for example if you want the application to start maximized or minimized.

```
' Start the application maximized
EXB.$$LNK|3
```

As an alternative to `EXB.` you can use EXE 883. and use the PID 137 together with WPT 2913.

```
' Wait until the started application ends
VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
EXE.$$LNK
WPT.#pid#
ENR.
```

You can work with the started application from a parallel running robot.
See example below.

Syntax

EXB.P1[|P2]

Parameter Explanation

P1 - `Document-Filename (can be a hyperlink)`
P2 - `Window Size Parameter`
`You can use the following window-size parameters`

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
    0 - HIDE    -   Hides the window and activates another
    window.
    1 - SHOW NORMAL   Activates and displays a window.
    2 - SHOW MINIMIZED - Activates the window and displays it
    as a
        minimized window.
    3 - MAXIMIZE -   Maximizes the specified window.
    4 - SHOW-NO-ACTIVATE - Displays a window in its
        most recent Size and position.
        The active window remains active.
    5 - SHOW - Activates the window and displays it
        in its current size and position.
    6 - MINIMIZE - Minimizes the specified window and
        activates the next top-level window in the Z order.
    7 - SHOW-MIN-NO-ACTIVE - Displays the window as
        a minimized window. The active window remains active.
    8  - SHOW-NO-ACTIVE - Displays the window in its current
    state.
          The active window remains active.
    9 - RESTORE - Activates and displays the window.
    10 - SHOW-DEFAULT - Sets the SHOW STATE to default.
```

The Exitcode (Errorlevel, Returncode) of the started Application/comandline will be placed on the stack (TOS 369).

Example

```
'***********************************************
' Example 1 - without Windows-Parameter
'***********************************************
' First we start a Parallelrobot that will
' end the started Application after 5 seconds.
PRR.
  PAU.5
  KPN.TestApp_01.exe|a
  ENR.
PRE.
' EXB. - Beispiel
VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
' Here we will wait until the Application ends
EXB.$$LNK
DBP.Exit-Code: $tos$
ENR.'***********************************************
```

Remarks

Technical remark: `EXB.` uses synchronous Shell- / Create-Process-Technology and is compatible with other commands that use this technology.

© 2023 Theo Gottwald * https://www.smart-package.com

EXB. will suspend the script process until the started process has ended. The script process is not waiting, its suspended. The suspended script process does not need any CPU resources, but also does not react on any message or whatever.

Limitations:

-

See also:

- 1.7. Application and PID 137
- 3.3 Specialfolders 345

3.52.4 EXC. - Execute Batch Command

MiniRobotLanguage (MRL)

EXC. Command

Execute Batch Command

Intention

Starts a Batch-File. `EXC.` will try to deliver #pid# 137 and `#tid#`. `EXC.` is generally a non-blocking command. This means that normally script execution goes on, while the started application is still running.

`EXC.` will only Batch-files. Usage is as simple as this:

```
EXC.?desktop\test.bat
```

You can omit the ".bat" and write also:

```
EXC.?desktop\test
```

Which will do just the same. Also you can specify a second parameter, as the current directory for the batch process:

```
EXC.?desktop\test.bat|?desktop\
```

While `EXC.` is generally a "Non blocking" command, you can make it wait until the batch file is processed, like this:

```
EXC.?desktop\test.bat|?desktop\
WPT.#pid#
```

If `EXC.` can not start the file, the timeout-flag #tio# 334 will be set to 1, else it will be reset to 0.

Syntax

EXC.P1[|P2]

Parameter Explanation

P1 - batch file path and name

P2 - (optional) current directory for the batch process

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'Example-Batch File: "Test.bat"
@ECHO off
ECHO Hello World!
PAUSE

'***********************************************
' Example 1
'***********************************************
EXC.?desktop\test.bat
'***********************************************

'***********************************************
' Example 2 - using Windows-Parameter
'***********************************************'
'
EXC.?desktop\test.bat|?desktop\
'***********************************************
```

Remarks

-

Limitations:

There may be cases where `EXC.` seems not to deliver the proper PID[137]/ TID. This depends on the target application, and may be influenced by the fact, if the target application is already running or not. In a closer look, the PID and TID from `EXC.` was accurate, but the target application gave control to another (already running or newly started) instance of herself.

3.52.5 EXD. - Execute Direct

MiniRobotLanguage (MRL)

EXD. Command

Execute Direct Command

Intention

Starts a File/executable. `EXD.` will try to deliver #pid# 137 and `#tid#`. `EXD.` is generally a non-blocking command. This means that normally script execution goes on, while the started application is still running.

But there is a chance, that `EXD.` can possibly be blocked by some applications. Use another command in that case, for example EXA. - Execute Asynchron 872.

`EXD.` will only start executable files. Usage is as simple as this:

```
EXD.?pfad\TestApp.exe
```

You can specify a command-line parameter for the started application.

```
EXD.?pfad\TestApp.exe|your command-line
```

If `EXD.` can not start the file, the timeout-flag #tio# 334 will be set to 1, else it will be reset to 0.

Syntax

EXD.P1[|P2]

Parameter Explanation

P1 - executable with complete path

P2 - (optional) `command-line Parameter for the started application`

Example

```
'*********************************************
' Example 1
'*********************************************
' Start the batch file
EXD.?ws\cmd.exe|/c "?desktop\Test.bat"
' Wait until the batch file has ended
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
WPT.#pid#
'*******************************************
```

Remarks

Technical remark: EXD. uses Create-Process--Technology and is compatible with other commands that use this technology.
EXD. is non-blocking, but can be blocked by a process that it has started. If this turns to be a problem, choose EXA. or EXF. instead. For starting Batch-Files, prefer EXC. - Execute Command 879.

Limitations:

There may be cases where EXC. seems not to deliver the proper PID 137/ TID. This depends on the target application, and may be influenced by the fact, if the target application is already running or not. In a closer look, the PID and TID from EXC. was accurate, but the target application gave control to another (already running or newly started) instance of herself.

- EXO. - Execute Open Document 895

© 2023 Theo Gottwald * https://www.smart-package.com

3.52.6 EXE. - Execute Programm

MiniRobotLanguage (MRL)

EXE. Command

Execute Programm

Intention

Will execute the given program or command-line and return the `PID` of the started program in `#pid#`. The system variable `#tid#` is set to zero.

`EXE.` is optimized for command-lines that need parameters. Place the parameters in P1.

If you want to wait until the started process ends, use WPT. - Wait-Process-Termination 2913. with the PID 137 that has been delivered by `EXE.`.

```
' Wait until the started application ends
VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
EXE.$$LNK
WPT.#pid#
ENR.
```

Syntax

EXE.P1[|P2]

Parameter Explanation

```
P1 - Filename of program to start

P2 - (optional) command-line-parameter to command in P1
```

Example

```
'*********************************************
' Example 1
'*********************************************

EXE.?ws\mspaint.exe|yourpic.bmp
PRT.#pid#--#tid#
MBX.!
END.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
'************************************************

'************************************************
' Example 2
'************************************************
' Wait until the started application ends
VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
EXE.$$LNK|1
WPT.#pid#
ENR.
```

Remark

Technical remark: `EXE.` uses asynchronous Shell- / Create-Process-Technology and is compatible with other commands that use this technology.

If you want to have the Exit-Code of the started application, use EXB. - Execute-Blocking 876 instead.

Limitations:

-

See also:

- **3.3 Specialfolders** 345
- EXX. - Execute-Extended 916
- EXH. - Execute-Handle 890
- EXA. - Execute Asynchron 872
- EXB. - Execute-Blocking 876
- EXO. - Execute Open Document 895
- **IEF. / NEF. - If - exist - File** 1050
- **IEP. / NEP. - If-Exists-Process** 2900

© 2023 Theo Gottwald * https://www.smart-package.com

3.52.7 EXF. - Execute File/Document

EXF - Execute File/Document Previous 883 Top 41 Next 890

MiniRobotLanguage (MRL)

EXF. Command

Execute File/Document

Intention

Starts a file or document like when you click on it with the mouse. `EXF.` will not only start executable files. It will also **start any registered file**, like a office-document or text-file. `EXF.` will also open folders.

`EXF.` will open hyperlinks and even download-links. This will both work as expected:

```
EXF.http://www.heise.de/
EXF.www.heise.de/
```

The document will be started somehow like if you have clicked on it with the mouse.

```
' Open a document
EXF.?desktop 345\MyActions.txt

' Open a system folder, like you click on a folder-icon
EXF.?ws\ 345
```

Disadvantage from that system is, that it does NOT deliver `#pid#` or `#tid#`.

`EXF.` is technically similar to `EXS.` (Execute Shell). It will however be more fast. In result, `EXF.` is not able to return an error code if there was a problem, because it just doesn't wait for that.

If you plan to start a lot of executable files very fast, or if the executable that you start blocks the script when you use `EXS.`, then `EXF.` is just what you need.

If you start a lot of executable files, `EXS.` is safe and slower, because it waits(/blocks the script-execution) until all internal system processes that start the file are running.

`EXF.` will just be very fast and start whatever you want as fast as your system can do.
`EXF.` unlike `EXS.` breaks through all API-limits (and can even crash a process if used careless). Try this example using `EXS.` or `EXF.` and see the difference.

```
KPN.iexplore.exe|a
FOR.$$CNT|1|20
  EXF.iexplore|www.fa2.de
NEX.
STS.DUMP
MBX.Click to Close all IE's
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
KPN.iexplore.exe|a
ENR.
```

however if you want to open many TAB's in your browser, `EXF.` is just faster: Try this:

```
' Open your daily browser
EXF.http://dict.leo.org
EXF.http://www.facebook.com
EXF.http://www.heise.de/
EXF.www.fa2.de
ENR.
```

Syntax

EXF.P1[|P2][|P3][|P4]

Parameter Explanation

P1 - Executable or Document-Filename (can be a hyperlink)
P2 - ***(optional)*** Parameter for command-line
P3 - ***(optional)*** Path/Folder for command, if omitted current folder is used
P4 - ***(optional)*** Window Size Parameter, if omitted NORMAL is the default size

```
Parameter - (optional) Parameter/timeout
It will wait the given timeout that the window will be
realized.
When you add +100 to the windowsize, then you tell them NOT to
wait.
```

You can use the following window-size parameters

```
    0 - HIDE    -   Hides the window and activates another
    window.
    1 - SHOW NORMAL   Activates and displays a window.
    2 - SHOW MINIMIZED - Activates the window and displays it
    as a
        minimized window.
    3 - MAXIMIZE -   Maximizes the specified window.
    4 - SHOW-NO-ACTIVATE - Displays a window in its
        most recent Size and position.
        The active window remains active.
    5 - SHOW - Activates the window and displays it
        in its current size and position.
    6 - MINIMIZE - Minimizes the specified window and
        activates the next top-level window in the Z order.
    7 - SHOW-MIN-NO-ACTIVE - Displays the window as
        a minimized window. The active window remains active.
    8  - SHOW-NO-ACTIVE - Displays the window in its current
    state.
          The active window remains active.
    9 - RESTORE - Activates and displays the window.
    10 - SHOW-DEFAULT - Sets the SHOW STATE to default.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*********************************************
' Example 1 - without Windows-Parameter
'*********************************************

' Example1
DBM.2
EXS.?desktop\MR.txt|103
DMP.
END.

'*********************************************
' Example 2 - using Windows-Parameter
'*********************************************
' Example 2
DBM.2
' Variablen und Spezialordner können verwendet werden.
: §§FIL=?desktop\MyWord.doc
EXS.§§FIL|§§WIN
DMP.
END.
```

Remarks

Technical remark: `EXF.` uses multithreaded ShellExecute-Technology and is compatible with other commands that use this technology. `EXF.` can never be blocked by a process that it has started.

`EXF.` may work with some of these (depending on the OS):

```
EXF.system.ini
EXF.control
EXF.write
EXF.pbrush
EXF.winword
EXF.excel

' Start NetMeeting (XP)
EXF.conf
```

etc.

```
EXF. uses the default search path and will understand
following shortcuts to these executables in the window-folder.

'  Will open system control panel (XP, Win 7)
EXF.control

' Will open "Control Panel\All Control Panel
Items\Administrative Tools"
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' XP, Win7
EXF.control admintools

' WIll open the  Clipboard Viewer
' XP only
EXF.clipbrd

' Systemconsole Prompt
' XP, Win7
EXF.CMD

' NotePad
' XP, Win7
EXF.notepad

' Windows Explorer
' XP, Win7
EXF.explorer

' XP, Win7
EXF.mspaint

' Open RegEdit
' XP, WIn7
EXF.regedit

' Windows Soundrecorder
' XP only
EXF.sndrec32

' Windows System Editor
' XP only
EXF.sysedit

You can use EXF. to open folders:

EXF.?ws\
EXF.?wi\
```

Limitations:

EXF. does deliver #pid# 137 or #tid#. It also does not deliver an error-code in case something did not work.
EXF. may not work well as the last command in your script, because the script may end before the background processes were processed. Also some programs may get an overrun from the speed of EXF.

- EXO. - Execute Open Document 895

© 2023 Theo Gottwald * https://www.smart-package.com

3.52.8 EXH. - Execute-Handle

MiniRobotLanguage (MRL)

EXH. Command

Execute Handle

Intention

Starts a program and returns directly the Window-Handle and the PID of the stared program.
The system Variable #pid# is set to the PID of the started process. #tid# is set to 0.
The Top-window handle from that process is been placed on the stack (TOS).

`EXH.` is using the Settings of OPT. 2406 for `WII` (Wait for Input Idle) and for WS (Windows-Size).

Syntax

EXH.P1

Parameter Explanation

P1 – ***complete Path and*** Executable (incl. Commandline)

This command will wait until the process is started and has a valid PID. It will then try to catch a window from that process within 30 seconds.

uses several general settings and sets the Systemvariable `#pid#`.

The general settings include:
- Sleep time in waiting-cycle

Example

```
'*********************************************
' Example EXH.
'*********************************************
EXH.?exepath\Sample Apps\TestApp_01.exe
VAR.§§HWN=$$000
MBX.PID=#pid# / Handle=§§HWN
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

Technical remark: `EXH.` uses asynchronous Shell- / Create-Process-Technology and is compatible with other commands that use this technology.

The general default waiting time, that the program actually waits for a window to appear can not be changed at this time. This will be possible in a future version.

Limitations:

If the process you start, does not create a window by itself, this command will wait up to 30 seconds for such a window and set the timeout flag if no window appeared in this timne. Take for example the "Google Chrome" Browser. If you start it like this:

```
EXH.C:..\chrome.exe
```

and there are already running instances of it, the starting process is not the process that finally creates the window that you get to see. Therefore the command would end up waiting for a window that will never come.

Here is another example that will solve this issue using `CAW`.

```
CAW.RegEdit_RegEdit|Reg&AND:Edit
EXX.regedit
STS.DUMP
MBX.Ready
```

- EXE. - Execute Programm 883
- OPT. - Optional Settings 2406

© 2023 Theo Gottwald * https://www.smart-package.com

3.52.9 EXM. - Execute MSI

MiniRobotLanguage (MRL)

EXM. Command

Execute MSI-Installer

Intention

`EXM.` is specially designed to easily start ".msi"-setup programs. Usage is as easy as possible. In most cases you can simply drag the MSI-File into the MRE-Editor and you will get a line like this:

```
EXM./i "?desktop\LibreOffice 3.4\libreoffice34.msi"
```

which is often all you need. If not, you can add MSI-Parameters 389.

`EXM.` will set `#pid#` and place the PID 137 of the started MSI-Setup on the Stack. Note that often the process you start will start another process. In that case the PID that you got from `EXM.` is not the PID of the process that generates a new window.

Important Hint:

`EXM.` will possibly **NOT work** on LAN Drives, like `\\drive\something`.

This compromise has been made to deliver #pid#.

If you need to start the Package on LAN, use `EXS.` instead.
Example:

```
EXS. ?ws\msiexec.exe|/i "$$PFA\tightvnc-2.7.10-setup-
64bit.msi"
```

Syntax

EXM.P1[|P2]

Parameter Explanation

```
P1 - Filename of MSI to start
     or in case of 2 Parameters the MSI-Call

P2 - Filename of MSI to start
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'*********************************************
' Example 1
'*********************************************

EXM./i "?path\myfile.msi"
PRT.#pid#--$$000
MBX.!
END.

'*********************************************
' Example 2 (2 Parameter)
'*********************************************

EXM.?ws\msiexec.exe|/i "?path\myfile.msi"
PRT.#pid#--$$000
MBX.!
END.

'*********************************************
' Example 3 (1 Parameter wie EXE.)
'*********************************************

EXM.?ws\msiexec.exe /i "?path\myfile.msi"
PRT.#pid#--$$000
MBX.!
END.

'*********************************************
```

Remarks

Technical remark: `EXM.` uses asynchronous Shell- / Create-Process-Technology and is compatible with other commands that use this technology.

Limitations:

`EXM.` will possibly **NOT work** on LAN Drives, like

```
\\drive\something
```

This compromise has been made to deliver `#pid#.`
If you need to start the Package on LAN, use `EXS.` instead.
Example:

```
EXS. ?ws\msiexec.exe|/i "$$PFA\tightvnc-2.7.10-setup-
64bit.msi"
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.52.10 EXO. - Execute Open Document

MiniRobotLanguage (MRL)

EXO. Command

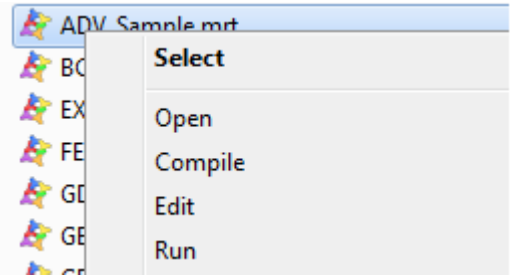
Execute Open Document

Intention

`EXO.` is an enhanced version of EXS. 905 It will simulate an "Explorer command".

`EXO.` will start a File or Document just like if you click on it with the right Mouse Button and choose something in the Explorer-Menu.

There are several options and Modes of operation. In the picture below you can see some examples. "**open**" is the default option, which is used if you omit parameter **P4**.



Here are some examples:

```
' Print the file
EXO.?desktop\readme.txt|||print

EXO.?desktop\readme.txt|||edit

' Open the "Find Dialog"
EXO.?desktop\|||find
```

EXO. is a versatile command that can start nearly anything you can imagine. Also it will provide you with `#pid#` 137 if possible. `#tid#` is not changed. Here is a sample script.

```
' Close all IE's
KPN.iexplore|a
' Open an IE
EXO.iexplore|"www.fa2.de"||open|(1+16+64)
MBX.PID of the new started process is: #pid#
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

EXO.P1[|P2][|P3][|P4][|P5]

Parameter Explanation

P1 **- executable** or Document-Filename or link, hyperlink

P2 **-** ***(optional)*** Parameter for executable that is been started
Example: EXO.iexplore|www.fa2.de

P3 **-** ***(optional)*** Folder for executable. This is for special purposes only. Current directory is set to this folder.

P4 **- (optional) Action parameter**
Some commonly used actions for P4 are:

edit
Launches an editor and opens the document for editing. If **P1** is not a valid executable/document file, the function may fail.

explore
Explores the folder specified by **P1**. May **need** the specification of **+32** for **P5 to work**.

find
Initiates a search starting from the specified directory. Opens the Find-dialog.

open
This is the default action, if none is specified. It opens the file specified by the **P1** parameter. The file can be an executable file, a document file, a folder or an hyperlink.

print
Prints the document file specified by P1. If P1 is not a valid document file, or can not be printed, the function may fail.

properties
Displays the file or folder's properties.

runas
There is also a new action called "**runas**". Under XP it will show the "RunAs"-Dialog. Under Vista and higher, it will launch the process as Administrator causing UAC elevation if required. Under the hood, it is the same as the explorer menu command "Run as administrator".

```
EXO.$$LNK|||runas
```

© 2023 Theo Gottwald * https://www.smart-package.com

***P5* - (optional) window-size and options parameter**

```
0 - HIDE    -   Hides the window and activates another
window.
1 - SHOW NORMAL   Activates and displays a window.
2 - SHOW MINIMIZED - Activates the window and displays it
as a
    minimized window.
3 - MAXIMIZE -   Maximizes the specified window.
4 - SHOW-NO-ACTIVATE - Displays a window in its
    most recent Size and position.
    The active window remains active.
5 - SHOW - Activates the window and displays it
    in its current size and position.
6 - MINIMIZE - Minimizes the specified window and
    activates the next top-level window in the Z order.
7 - SHOW-MIN-NO-ACTIVE - Displays the window as
    a minimized window. The active window remains active.
8  - SHOW-NO-ACTIVE - Displays the window in its current
state.
      The active window remains active.
9 - RESTORE - Activates and displays the window.
10 - SHOW-DEFAULT - Sets the SHOW STATE to default.
```

P5 - Special Flags
Add the following numbers to **P5** to get the desired effect:

+16 - enable internal asynchronous execution (faster!)

+32 - Display Error-Messages and User Interfaces
Example:

```
' Leads to an error-message
EXO.iexplore|www.google.de||explore|33
```

+64 - Deactivates the built in "Wait-for-input-Idle".
If this flag is set, the script will not wait until the started executable is able to receive input. It will immediately return. This default-active builtin feature has an unchangeable time-limit of 60 seconds. Example with deactivated WII.:

```
EXO.iexplore|www.google.de||open|(33+16+64)
MBX.PID of the new started process is: #pid#
```

+128 - special quotation processing. If you use command-line-scripts and they do not work as expected, you can try this Option.

Hint: For better readability you can specify a formula as **P5** like here:

```
EXO.excel|mysheet.xls||edit|(1+32+16+64)
MBX.PID of the new started process is: #pid#
```

Error-codes from EXO. on TOS 369.

© 2023 Theo Gottwald * https://www.smart-package.com

```
   0       - (no error) the command executed as expected
   1       - OS reports out out memory
   2       - The system cannot find the file specified.
   3       - The system cannot find the path specified.
   5       - Access to that file was denied.
   8       - Not enough memory is available to process this command.
   11      - The .EXE file is invalid (non-Win32 .EXE).
   15      - The system cannot find the drive specified.
   27      - The filename association is incomplete or invalid.
   28 - 30   DDE-Errors
   31      - This file-ending is not registered
   32      - There is a DLL is missing.
```

Example

```
'***********************************************
' Example 1 - start new IE with Link
'***********************************************
VAR.$$LNK=http://www.fa2.de
' Will run internet explorer
EXO.iexplore|$$LNK
PAU.1
' Will run the default browser
EXO.$$LNK
:over
MBX.Halt to read output
'***********************************************

'***********************************************
' Example 2 - without Windows-Parameter
'***********************************************'

:over
MBX.Halt to read output
'***********************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
:over
MBX.Halt to read output
'*******************************************
```

Remarks

Technical remark: EXO. uses extended ShellExecute-Technology and is compatible with other commands that use this technology.

EXO. can be blocked by a process that it has started. In this case specify the +64 and the +16 (= +80) parameter for P5. If that does not work, you can use EXF. in many cases.

Note that the returned PID[137] in #pid# may not always be accurate, which is not a problem of the command but depends on target application design.
Some applications do behave that they do not keep the started process, but just open a TAB in an already open process. Examples are IE, or Chrome WEB-Browser. In such cases you may need to first close all running instances using CAW. or KPN. and then start a new instance. In that case the #pid# will be the true PID of that instance.

For example when doing things like this, you will successfully open the browser(-Tab), but get only a zero as #pid#:

```
EXO.www.fa2.de||||(16+1)
MBX.#pid#
```

Error-messages:
It may be a good idea to enable error-messages, If you add **+32** to the **P5** flags, the command will display interactive User Interfaces and also **Error-Messages**, no matter if the command USM.[786] is specified or not.

Zone-Check for downloaded files:
This command bypasses the "Zone Check" for files that have been downloaded from the internet.

Shortcut commands:
EXO. may work with some of these (depending on the OS):

```
EXO.system.ini
EXO.control
EXO.write
EXO.pbrush
EXO.winword
EXO.excel

' Start NetMeeting (XP)
EXO.conf
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EXO. uses the default search path and will understand
following shortcuts to these executables in the window-folder.

'  Will open system control panel (XP, Win 7)
EXO.control

' Will open "Control Panel\All Control Panel
Items\Administrative Tools"
' XP, Win7
EXO.control admintools

' WIll open the  Clipboard Viewer
' XP only
EXO.clipbrd

' Systemconsole Prompt
' XP, Win7
EXO.CMD

' NotePad
' XP, Win7
EXO.notepad

' Windows Explorer
' XP, Win7
EXO.explorer

' XP, Win7
EXO.mspaint

' Open RegEdit
' XP, WIn7
EXO.regedit

' Windows Soundrecorder
' XP only
EXO.sndrec32

' Windows System Editor
' XP only
EXO.sysedit

You can use EXS. to open folders:

EXO.?ws\
EXO.?wi\
```

Limitations:

This command requires Windows XP, SP1 or higher.

3.52.11 EXR. - Executer-from-Registry

MiniRobotLanguage (MRL)

EXR. Command

Execute from Registry

Intention

Starts a File or Document.

`EXR.` will try to deliver #pid# 137 and `#tid#`.
`EXR.` will only start files with a registered, valid File-Extension.

You can start a document, like this:
`EXR.?desktop\MR.txt`

or an executable:

```
EXR.?pfad\XYZ.msi
EXR.?pfad\TestApp.exe
```

You can specify a window-size-flag, however this will only work, if the application supports this.

If `EXR.` can not start the file, the timeout-flag #tio# 334 will be set to 1, else it will be reset to 0.

Syntax

EXR.P1[|P2]

Parameter Explanation

P1 - executable or Document-Filename or a hyperlink, ending with a valid registered file-ending.

P2 - (optional) Window Size Parameter

```
    0 - HIDE    -   Hides the window and activates another
    window.
    1 - SHOW NORMAL   Activates and displays a window.
    2 - SHOW MINIMIZED - Activates the window and displays it
    as a
        minimized window.
    3 - MAXIMIZE -   Maximizes the specified window.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
4 - SHOW-NO-ACTIVATE - Displays a window in its
    most recent Size and position.
    The active window remains active.
5 - SHOW - Activates the window and displays it
    in its current size and position.
6 - MINIMIZE - Minimizes the specified window and
    activates the next top-level window in the Z order.
7 - SHOW-MIN-NO-ACTIVE - Displays the window as
    a minimized window. The active window remains active.
8  - SHOW-NO-ACTIVE - Displays the window in its current
state.
      The active window remains active.
9 - RESTORE - Activates and displays the window.
10 - SHOW-DEFAULT - Sets the SHOW STATE to default.
```

Example

```
'*********************************************
' Example 1 - without Windows-Parameter
'*********************************************
VAR.$$LNK=http://www.fa2.de
EXR.?desktop\MR.txt
:over
MBX.Halt to read output
'*********************************************

'*********************************************
' Example 2 - using Windows-Parameter
'*********************************************'
' EXR. - Beispiel
DBM.2
' Start document minimized
: §§FIL=?desktop\MyWord.doc
EXR.§§FIL|6
DMP

:over
MBX.Halt to read output
'*********************************************
```

Remarks

Technical remark: `EXR.` uses Create-Process-FindExecutable-Technology and is compatible with other commands that use this technology.
`EXR.` can be blocked by a process that it has started. If this turns to be a problem, choose `EXA.` or `EXF.` as alternative.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

There may be cases where EXR. can not deliver the proper PID 137/ TID. This depends on the target application, and may be influenced by the fact, if the target application is already running.

See also:

- GEP. - Get-Executable-Path 2582
- **EXS. - Execute Shell** 905
- EXF. - Execute Fast 885
- EXH. - Execute-Handle 890
- EXO. - Execute Open Document 895

© 2023 Theo Gottwald * https://www.smart-package.com

3.52.12 EXS. - Execute Shell

MiniRobotLanguage (MRL)

EXS. Command

Execute Shell

Intention

Starts a file or document like when you click on it with the mouse. `EXS.` will not only start executable files. It will also **start any registered file**, like a office-document or text-file.

`EXS.` will open hyperlinks and even download-links. This will both work as expected:

```
EXS.http://www.heise.de/
EXS.www.heise.de/
```

The document will be started somehow like if you have clicked on it with the mouse.

```
' Open a document
EXS.?desktop345\MyActions.txt

' Open a system folder, like you click on a folder-icon
EXS.?ws\345
```

Disadvantage from that system is, that it does NOT deliver `#pid#` or `#tid#`.

`EXS.` is technically similar to `EXF.` (Execute Fast). It will however be less fast.
In result, `EXS.` is able to return an error code if there was a problem, while `EXF.` will not.

`EXS.` will return an error code on the TOS 369, if there was a problem. If there was no problem, `EXS.` will return a zero on the TOS.

If you plan to start a lot of executable files very fast, or if the executable that you start blocks the script when you use `EXS.`, then prefer using `EXF.`

If you start a lot of executable files, `EXS.` is safe and slower, because it waits(/blocks the script-execution) until all internal system processes that start the file are running.

`EXF.` will just be very fast and start whatever you want as fast as your system can do.
`EXF.` unlike `EXS.` breaks through all API-limits (and can even crash a process if used careless). Try this example using `EXS.` or `EXF.` and see the difference.

```
KPN.iexplore.exe|a
FOR.$$CNT|1|20
  EXS.iexplore|www.fa2.de
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
NEX.
STS.DUMP
MBX.Click to Close all IE's
KPN.iexplore.exe|a
ENR.
```

however if you want to open many TAB's in your browser, `EXF.` is just faster: Try this:

```
' Open your daily browser
EXF.http://dict.leo.org
EXF.http://www.facebook.com
EXF.http://www.heise.de/
EXF.www.fa2.de
ENR.
```

Syntax

EXS.P1[|P2][|P3][|P4]

Parameter Explanation

P1 - Executable or Document-Filename (can be a hyperlink)
P2 - ***(optional)*** Parameter for command-line
P3 - ***(optional)*** Path/Folder for command, if omitted current folder is used
P4 - ***(optional)*** Window Size Parameter, if omitted NORMAL is the default size

You can use the following window-size parameters for P4

```
0 - HIDE    -   Hides the window and activates another
window.
1 - SHOW NORMAL   Activates and displays a window.
2 - SHOW MINIMIZED - Activates the window and displays it
as a
    minimized window.
3 - MAXIMIZE -   Maximizes the specified window.
4 - SHOW-NO-ACTIVATE - Displays a window in its
    most recent Size and position.
    The active window remains active.
5 - SHOW - Activates the window and displays it
    in its current size and position.
6 - MINIMIZE - Minimizes the specified window and
    activates the next top-level window in the Z order.
7 - SHOW-MIN-NO-ACTIVE - Displays the window as
    a minimized window. The active window remains active.
8  - SHOW-NO-ACTIVE - Displays the window in its current
state.
    The active window remains active.
9 - RESTORE - Activates and displays the window.
10 - SHOW-DEFAULT - Sets the SHOW STATE to default.
```

Error-codes from EXS.

© 2023 Theo Gottwald * https://www.smart-package.com

```
   2       - The system cannot find the file specified.
   3       - The system cannot find the path specified.
   5       - Access to that file was denied.
   8       - Not enough memory is available to process this command.
   11      - The .EXE file is invalid (non-Win32 .EXE).
   15      - The system cannot find the drive specified.
   27      - The filename association is incomplete or invalid.
   28 - 30   DDE-Errors
   31      - This file-ending is not registered
   32      - DLL is missing.
```

Example

```
'***********************************************
' Example 1 - without Windows-Parameter
'***********************************************

' Example1
DBM.2
' Vars and special folders can be used.
' Don`t wait = 100 + 3 for maximize window = 103
EXS.?desktop\MR.txt|103
DMP.
END.

'***********************************************
' Example 2 - using Windows-Parameter
'***********************************************
' Example 2
DBM.2
' Variablen und Spezialordner können verwendet werden.
: §§FIL=?desktop\MyWord.doc
EXS.§§FIL|§§WIN
DMP.
END.
```

Remarks

Technical remark: `EXS.` uses ShellExecute-Technology and is compatible with other commands that use this technology. `EXS.` can be blocked by a process that it has started.

`EXS.` may work with some of these (depending on the OS):

```
EXS.system.ini
EXS.control
EXS.write
EXS.pbrush
EXS.winword
EXS.excel

' Start NetMeeting (XP)
EXS.conf
```

© 2023 Theo Gottwald * https://www.smart-package.com

etc.

```
EXS. uses the default search path and will understand
following shortcuts to these executables in the window-folder.

'  Will open system control panel (XP, Win 7)
EXS.control

' Will open "Control Panel\All Control Panel
Items\Administrative Tools"
' XP, Win7
EXS.control admintools

' WIll open the  Clipboard Viewer
' XP only
EXS.clipbrd

' Systemconsole Prompt
' XP, Win7
EXS.CMD

' NotePad
' XP, Win7
EXS.notepad

' Windows Explorer
' XP, Win7
EXS.explorer

' XP, Win7
EXS.mspaint

' Open RegEdit
' XP, WIn7
EXS.regedit

' Windows Soundrecorder
' XP only
EXS.sndrec32

' Windows System Editor
' XP only
EXS.sysedit

You can use EXS. to open folders:

EXS.?ws\
EXS.?wi\
```

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

`EXF`. does deliver #pid# 137 or `#tid#`. It does not deliver an error-code in case something did not work.

3.52.13 EXU. - Execute Uninstall

MiniRobotLanguage (MRL)

EXU. Command

Execute Uninstall

Intention

This command is be used to start an Uninstallation, just like if you call "Startmenu/Controlpannel/Programs/Uninstall".

It will retrieve the complete Application name and start the Uninstallation. Standard-Search Pattern can be used.

Please be careful using Patterns, as the first fitting Uninstall-Entry is started.

If you want to wait until the started process ends, use WPT. - Wait-Process-Termination 2913. with the PID 137 that has been delivered by `EXU. in #pid#`.

```
' Wait until the started application ends
VAR.$$LNK=Paint 1.54
EXU.$$LNK|s
WPT.#pid#
ENR.
```

Syntax

EXU.P1[|P2]

Parameter Explanation

P1 **-** Application to start uninstall/modify
P2 **-** letter specifies what to look for. Details see below.

```
s - return command-line for silent Uninstallation
u - return command-line for standard Uninstallation.
m - return command-line for standard Modify-Path
   (Add-/Remove Setup)
a - return Standard Application Name
```

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'*********************************************
' EXU. - Sample
'*********************************************
DBM.2
'PRT.=========================================
: §§MYA=quote|u
GII.§§MYA|§§NAM|a
PRT. Application-name is: §§NAM
EXU.§§NAM
PRT.=========================================

:over
MBX.Halt to read output

END.
```

Remarks

The command works transparently with both x32 and x64 applications.

Technical remark: `EXU.` uses asynchronous Shell- / Create-Process-Technology and is compatible with other commands that use this technology.

Limitations:

-

See also:

- IAI. / NAI. - If-Application-Installed 2601

- EXF. - Execute File/Document 885

© 2023 Theo Gottwald * https://www.smart-package.com

3.52.14 EXV. - Execute via System-Desktop

MiniRobotLanguage (MRL)

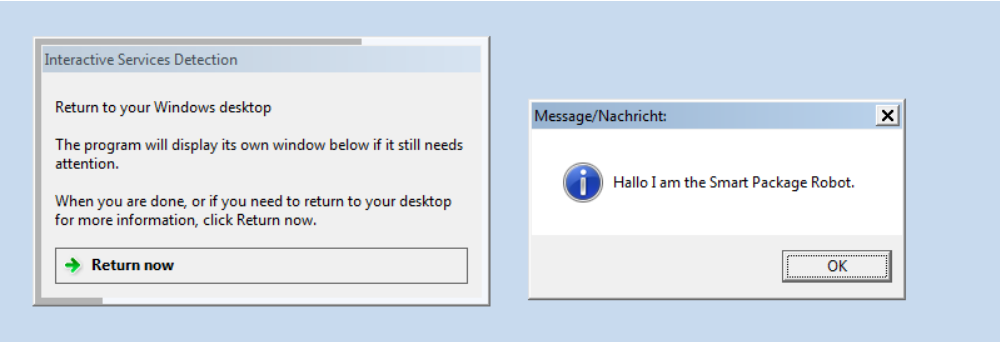
EXV. - Execute via System-Desktop

Execute Blocking via System-Desktop.

Intention

Run an executable on the hidden System-Desktop synchronously and deliver the exit-code.
The current script is suspended until the called program ends.

What is the System-Desktop?
Imagine there is a hidden place in your computer, where you can execute all your automation scripts, and the user can not see it,
because its on another desktop. You can even click on Buttons, using the Mouse!



Notice that this picture was made using the following Script using the Compiler-directive '"#EXV:", NOT using the command `EXV.`

```
'#EXV:itsme
 MBX.Hallo, I am the Smart Package Robot.
 ENR.
```

Generally for most tasks, the Compiler-directive `'#EXV:` is more useful then using the `EXV.`-command.
`EXV.` as a command will only start another task on the "Hidden desktop". The robot itself will stay on the normal user-desktop.
Using the compiler-directive `'#EXV:`, the robot will start on the "Hidden Desktop".

How can I see what is going on, on the "Hidden Desktop"?

You can switch to the "Hidden Desktop" using the `EXV.`-Command.

*© 2023 Theo Gottwald * https://www.smart-package.com*

For more Details see here "Switch to the Hidden Desktop 867".

Will I get an Exit-Code from the Executable that i have started?

The command EXV. will return an **Exitcode** (Error-level, Returncode) of the started application/command-line will be **placed on the stack** (TOS 369) .
General Usage of EXV. is as simple as it can be:

```
VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
EXV.$$LNK|c
```

You should always add the "|c" at the end of the command, or you can specify the "Cleanup" in a separate command like this:

```
VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
EXV.$$LNK
PAU.10
EXV.|c
ENR.
```

The EXV. -command is blocking the script-execution as long, as the started program is alive.
If you need to do something while the application was started, use PRR. / PRE.
These commands will make the EXV. run in a parallel process and will therefore not block your script.
You can still access the return code using WRS. and GRS.
Like in this example:

```
PRR.
 VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
 EXV.$$LNK
 PRS.$$000
 ENR.
PRE.
$$ROA=$$001
' Wait for Parallel-Process to end
WRS.$$ROA
' Get Result from EXV.
GRS.$$ROA
ENR.
```

Syntax

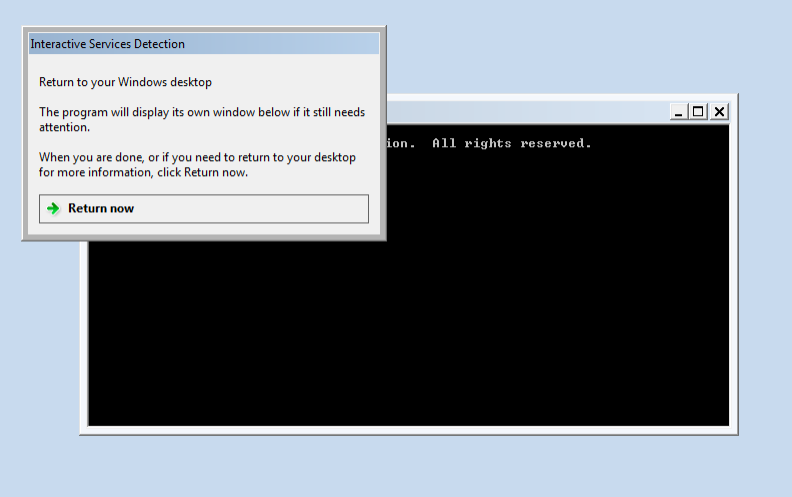
EXV.P1[|P2]

Parameter Explanation

***P1* - *[optional] Filename & Path* of the executable that shall be started on the Hidden Desktop.**

© 2023 Theo Gottwald * https://www.smart-package.com

If P1 is "-", just a commandline is started on the hidden desktop.(See picture below).
This will enable you to take a look on the Hidden Desktop 867.



P2 - [optional] can be one of two Parameters "c" or "p":
c - cleanup
p - prepare

c - will cleanup some internal structures that have been needed to start the executable.

d - disable switching to "Hidden Desktop". This is the opposite to "p - prepare". THis will change your system settings in a way that you can not switch to the Hidden Desktop.

p - prepares your system in a way that you can switch to the Hidden Desktop.
Espeacially under Windows 8 it may not possible to switch to the "Hidden Desktop" without first using
EXV.|p

All three options (c,d and p) can be combined or used alone.

EXV. returns:
The Exitcode (Errorlevel, Returncode) of the started Application/comandline will be placed on the stack (TOS 369).

Example

```
'************************************************
' Example 1
'************************************************
PRR.
 VAR.$$LNK=?exepath\Sample Apps\TestApp_01.exe
 EXV.$$LNK
 PRS.$$000
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
 ENR.
PRE.
$$ROA=$$001
' Wait for Parallel-Process to end
WRS.$$ROA
' Get Result from EXV.
GRS.$$ROA
ENR.
ENR.'*******************************************
```

Remarks

Technical remark: `EXV.` uses synchronous Shell- / Create-Process-Technology and is compatible with other commands that use this technology.
`EXV.` will suspend the script process until the started process has ended. The script process is not waiting, its suspended.
The suspended script process does not need any CPU resources, but also does not react on any message or whatever.

Generally for most tasks, the Compiler-directive `'#EXV:` is more useful then using the `EXV.`-command.
`EXV.` as a command will only start another task on the "Hidden desktop". The robot itself will stay on the normal user-desktop.
Using the compiler-directive `'#EXV:`, the robot will start on the "Hidden Desktop".

Limitations:

Hint: This Feature requires Windows Vista or higher.

3.52.15 EXX. - Execute-Extended

MiniRobotLanguage (MRL)

EXX. Command

Execute Extended

Intention

Start a program.

`EXX.` will start a program asynchronous. It will not wait until the program has ended.

`EXX.` uses an internal "Wait for Input Idle" (`WII.`) to wait for a window to appear. For this, it uses the default WII.-timeout (taken from the last WII.-call).

Therefore EXX. may deliver a window handle on TOS for some programs, or may just deliver a zero. This depends on the started software as well as other factors, like the WII.-timeout. If you need a handle to be delivered on stack, prefer `EXH`.

Example for this:

```
CAW.RegEdit_RegEdit|Reg&AND:Edit
EXX.regedit
STS.DUMP
MBX.Ready
```

This example will deliver the handle of the RegEdit-Window on the stack. As long, as RegEdit has not been started before, and the window was there before. You can use CAW. 3586 to prevent that case. See example.

`EXX.` will deliver #pid# 137 but will set `#tid#` to zero.

You can supply a second, numerical parameter P2 that may influence the size of the started application window, if the started application supports that. This way you can start an application minimized. Like this:

```
' Will start the Furmark minimized.
EXX.?progs\Geeks3D\Benchmarks\FurMark_1.9.1\FurMark.exe|2
```

If you add +100 to that second parameter, then `EXX.` will NOT even try to wait for the window of the started application to appear and therefore will also not deliver a window handle on TOS 369.

Syntax

 *© 2023 Theo Gottwald * https://www.smart-package.com*

EXX.P1[|P2]

Parameter Explanation

P1 - Document-Filename (can be a hyperlink)
P2 - (optional) Window Size Parameter
When you add +100 to the window size, the command will not wait for the window to appear and yet not be able to deliver the window handle.

You can use the following window-size parameters

```
0 - HIDE    -   Hides the window and activates another
window.
1 - SHOW NORMAL   Activates and displays a window.
2 - SHOW MINIMIZED - Activates the window and displays it
as a
    minimized window.
3 - MAXIMIZE -   Maximizes the specified window.
4 - SHOW-NO-ACTIVATE - Displays a window in its
    most recent Size and position.
    The active window remains active.
5 - SHOW - Activates the window and displays it
    in its current size and position.
6 - MINIMIZE - Minimizes the specified window and
    activates the next top-level window in the Z order.
7 - SHOW-MIN-NO-ACTIVE - Displays the window as
    a minimized window. The active window remains active.
8  - SHOW-NO-ACTIVE - Displays the window in its current
state.
      The active window remains active.
9 - RESTORE - Activates and displays the window.
10 - SHOW-DEFAULT - Sets the SHOW STATE to default.
```

Example

```
'*********************************************
' Example 1 - EXX.
'*********************************************

' Example1
DBM.2
' Vars and special folders can be used.

' Will start the Furmark minimized.
EXX.?progs\Geeks3D\Benchmarks\FurMark_1.9.1\FurMark.exe|2

' Will start the FUrMark minimized and without waiting
EXX.?progs\Geeks3D\Benchmarks\FurMark_1.9.1\FurMark.exe|
(2+100)
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*********************************************
' Example 2 - EXX.
'*********************************************
'
CAW.RegEdit_RegEdit|Reg&AND:Edit
EXX.regedit
STS.DUMP
MBX.Ready
```

Remarks

Technical remark: `EXX.` uses asynchronous Shell- / Create-Process-Technology and is compatible with other commands that use this technology.

```
EXX. uses the default search path and will understand
following shortcuts to these executables in the window-folder.

'  Will open system control panel (XP, Win 7)
EXX.control

' Will open "Control Panel\All Control Panel
Items\Administrative Tools"
' XP, Win7
EXX.control admintools

' WIll open the  Clipboard Viewer
' XP only
EXX.clipbrd

' Systemconsole Prompt
' XP, Win7
EXX.CMD

' NotePad
' XP, Win7
EXX.notepad

' Windows Explorer
' XP, Win7
EXX.explorer

' XP, Win7
EXX.mspaint

' Open RegEdit
' XP, WIn7
EXX.regedit

' Windows Soundrecorder
' XP only
EXX.sndrec32
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Windows System Editor
' XP only
EXX.sysedit
```

You can not use EXX. to open a folder. Use EXS. or EXF. for that.
If you do this:

```
EXS.?ws\
EXS.?wi\
```

you can see the executable files in your system folders. They can be started using EXX. like see above.

Limitations:

EXX. will start a program asynchronous. It will not wait until the program has ended. In some cases it can still happen that it will wait, or that it will wait too long for #pid# to be delivered. Use EXA. in these cases, as EXA. can not be blocked, yet may also not deliver #pid#.

See also:

- EXH. - Execute-Handle 890
- EXS. - Execute Shell 905

3.53 FEX. - Enumerations

3.53.1 ! Smarty's FEX-Commands

Smarty's FEX-Commands

Using `FEX`, you can make Smarty count for you. There are many things she will count for you:

- Files or Folders

*© 2023 Theo Gottwald * https://www.smart-package.com*

- Lines in a text file
- Lines in a variable that contains a text-file
- processes
- parts of a delimited string (`FEM.`)
- and much more.

And Smarty will do more.

She will execute tasks that you define, FOR EACH of the elements that she is counting.
This way she can save you a lot of work!

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.53.2 EFX. - Exit - FEX

MiniRobotLanguage (MRL)

EFX. Statement

Exit FEX Command

Intention

Stops the current Enumeration of any of the following "FEX" commands:

`FEF. FEL. FEM. FEP. FER. FEV. FES.`

In nested FEX-commands, only the actual enumeration is been stopped.

`EFX.` does not need or accept any parameter.

Syntax

EFX.

Parameter Explanation

There is no Parameter

Example

```
'*********************************************
' EFX-Sample
'*********************************************
DBM.2
: $$PAT=Ralf Rolf Peter Franz Jacob
: $$TAR=Monika Sabine Pauline June Sabine

FEM.:Lev1|$$VAR|$$TAR
DMP.
MBX.Ready
END.

'------------------------------------------------------------
:Lev1
'DBP.-Level 1 ($$VAR)

FEM.:Lev2|$$BAR|$$PAT
RET.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'-------------------------------------------------------------
:Lev2
'DBP.--Level 2 ($$BAR)

DBP.Now is $$VAR + $$BAR
IVS.$$VAR=June
  IVS.$$BAR=Peter
    EFX.
  EIF.
EIF.
RET.
'-
```

Remarks

`EFX.` is a member of the FEX-family "For Each X". They are used for easy enumeration.

Limitations:

-

See also:

- 3.1 Systemvariables 334 especially: `#fex#, #fxd#` . etc.
- 1.6.1. Program Flow Control 121
- FEF. - For-Each-File(/Dir) 924
- FEL - For-Each-Line 927
- FEM. - For Each Member 929
- FEP. - For-Each-Process 932
- FER. - For-Each-Registry 935
- FEV. - For-Each-Variable(-Line) 937

© 2023 Theo Gottwald * https://www.smart-package.com

3.53.3 FEF. - For-Each-File(/Dir)

MiniRobotLanguage (MRL)

FEF. Enumeration Command

For each File (directory)

Intention

You want to make a list with all files in a folder? Print those hundreds of files? Or join them in one file? Or run a scan over all dirs in a drive or folder?

All these and many more jobs can be done using `FEF`.

Generally `FEF.` will enumerate and count Files and/or Directories from a given source path. After all this function leaves up to four information on the Stack (see below).

These are:

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->QuadInt       :1091
Stackpos: 001 ->QuadInt       :16827
Stackpos: 002 ->QuadInt       :171670813215
Stackpos: 003 ->QuadInt       :15736

-----------------------------------
```

In detail the four values inform you about this:

1. Number of directories
2. Number of files and directories together
3. Bytes in all files, total
4. Number of files in all folders

Syntax

FEF.P1|P2|P3[|P4][|P5]

Parameter Explanation

P1 - `Label where the for each will jump "for each element"`
P2 - `Temp. Variable, updated by FEX each round.`
P3 - `Root-Directory`

*© 2023 Theo Gottwald * https://www.smart-package.com*

P4 - (optional) Filepattern. If omitted, ****.**** is used.
P5 - (optional) Attribute, if omitted 69 is used. (Recurse, Files, Cooperative)

```
    Attributes-Parameter

     1 - Recurse into Subfolders
     2 - Hidden files and folder, too.
     4 - Files
     8 - Dirs
    16 - SizeDepth
    32 - CountAll
    64 - CoOperative Mode (Slower)
   128 - System Files, too.
   256 - Sort Downwards
```

Example

```
'*********************************************
' FEF-Sample
'*********************************************
' DBM.2
' Use an existing path here
: §§ROT=F:\00_Image
: §§PAT=*.*

FEF.:Tar|§§FIL|§§ROT|§§PAT|(1+4+8+64)
DMP.4

:over
MBX.Halt to read output

END.

:Tar
PRT.§§FIL
RET.
'*********************************************
```

Remarks

FEF. is a Member of the FEX-Family "For Each X". They are used for easy enumeration

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

The internal data storage can hold up to several hundred Megabytes of Directory data. Yet there is no warranty that there is not a file-system out there, that is too large in size to be fully enumerated.

3.53.4 FEL. - For-Each-Line

MiniRobotLanguage (MRL)

FEL. Enumeration Command

For each Line (in a file)

Intention

Enumerate all lines in a file.

Syntax

FEL.P1|P2|P3[|P4][|P5]

Parameter Explanation

P1 - Label where the for each will jump "for each element"
P2 - Temp. Variable, updated by FEX each round.
P3 - ***Filename***
P4 - ***(optional)*** Pattern for the Lines to enumerate. If omitted, ****.**** is used and all lines are enumerated.
P5 - ***(optional)*** maximum line-number to enumerate (stop-line)

Example

```
'*********************************************
' FEL-Sample
' Copies all line containing a C-Comment into
' a new Textfile.

3.53.5 FEM. - For Each Member

MiniRobotLanguage (MRL)

FEM. Enumeration Command

For each Member (string between delimiter)

Intention

Enumerate parts of a string. They must be delimited with a blank or other specified character.

Syntax

FEM.P1|P2|P3[|P4][|P5]

Parameter Explanation

P1 - Label where the for each will jump "for each element"
P2 - Temp. Variable, updated by FEX each round.
P3 - ***(variable)*** source string that will be enumerated
P4 - ***(optional)*** delimiter between the parts of P3,
if omitted Space (ASCI 32) is used.
P5 - ***(optional)*** optional Standard Pattern

Example

```

Remarks

`FEM`. is a Member of the FEX-Family "For Each X". They are used for easy enumeration

Limitations:

-

See also:

- 3.1 Systemvariables 334 especially: `#fex#, #fxd#` . etc.
- 1.6.1. Program Flow Control 121
- FEF. - For-Each-File(/Dir) 924
- FEL - For-Each-Line 927
- FEP. - For-Each-Process 932
- FEV. - For-Each-Variable(-Line) 937

© 2023 Theo Gottwald * https://www.smart-package.com

3.53.6 FEP. - For-Each-Process

MiniRobotLanguage (MRL)

FEP. Enumeration Command

For each process

Intention

Enumerate (count ...) all running EXE's (x32 and x64).

Process a script or subprogram for each Exe. You can also specify a 3.2 Standard-Search Pattern 341, this is applied to the filename of the loaded executable. If given only those executables are enumerated, which fit to the specified pattern.

You get in the Variable P2 the name of the EXE with or without a path. Additionally #pid# is set to the PID (Process ID) of the enumerated EXE. Using the PID you will be able to get any further needed Information. For example using GDF. or GPI.

Syntax

FEP.P1|P2|P3[|P4]

Parameter Explanation

P1 - Label where the for each will jump "for each element"
P2 - Temp. Variable, updated by FEX each round.
P3 - Flag can be:

```
' 1,3,5 - Enum loaded EXE's
' 2,4,6 - Enum loaded DLL's (32 bit only)
' +0 give only exe/dll-name
' +2 give full path instead
' +4 give PID of parent process instead
' #pid# is always set
```

P4 - optional Standard-Pattern, is always applied to ONLY the name of the exe (without path). You can omit P4, then ALL Exe's are enumerated.

Example

```
'*******************************************
' FEP-Sample
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Shows all running processes with PID
'*********************************************

FEP.doit|$$FIL|1

'*********************************************

'*********************************************
' FEP-Sample
' Shows different Flags for enum of executables
'*********************************************
FOR.$$FLA|1|6|2
  MBX. Enumerating with Flag=$$FLA
  : $$CNT=0
  FEP.doit|$$FIL|$$FLA
NEX.

MBX.Ready
ENR.

:doit
VIC.$$CNT
DBP.$$CNT. [PID=#pid#]  $$FIL
RET.
```

Remarks

`FEP.` is a Member of the FEX-Family "For Each X". They are used for easy enumeration of system objects like for example windows, processes or files.

Limitations:

The enumeration of executables will work for all executables, including x64 executables. The enumeration of DLL's is experimental and only for x32.

See also:

3.53.7 FER. - For-Each-Registry

MiniRobotLanguage (MRL)

FER. Enumeration Command

For each Registry

Intention

Enumerate registry entries. These can be Registry-keys or values.

The result is delivered as a Array which is placed in the FEX-Variable.

Use GFB. - Get-From-Block 680 to extract the single Blocki-Elements (1-6) out of the FEX-Variable. (see example)

Syntax

FER.P1|P2|P3[|P4][|P5]

Parameter Explanation

P1 - Label where the for each will jump "for each element"
P2 - Temp. Variable, updated by FEX each round.

P3 - Start Registry Path
P4 - optional 1,2,4,8 or 16, default is 3

```
   1 - only get keys
   2 - only get values
   4 - use Pattern with actual key
   8 - use Pattern with actual value
  16 - use Pattern for Entry-Name

Values of  3 and 0 - are equal, therefore 3 is default.
```

P5 - optional Standard-Pattern

Example

```
'*********************************************
' FER. - Sample
'*********************************************
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
'DBM.2
VAR.$$REG=HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\Curren
tVersion\Uninstall\
FER.doit|$$BLO|$$REG|2
:over

3.53.8 FEV. - For-Each-Variable(-Line)

MiniRobotLanguage (MRL)

FEV. Enumeration Command

For each Variable

Intention

Enumerate all lines in a given variable.

Checks first if the Lines are delimited with CR,LF or CRLF and chooses the right Line-Separator.

If you load a complete Text-file into a variable using `CFF.` (Copy from file), you can go through each line of the text very fast, using `FEV.`

As `FEV.` work in Memory, its much faster then `FEL.` (For each line) that works on the file-system.

Syntax

FEV.P1|P2|P3[|P4]

Parameter Explanation

P1 - Label where the for each will jump "for each element"
P2 - Temp. Variable, updated by FEX each round.
P3 - Variable with Text
P4 - optional Standard-Pattern

Example

```
'*********************************************
' FEV-Sample
'*********************************************
VAR.$$FIL=?desktop\2Line.txt
CFF.$$FIL|$$FIA
PRT.$$FIA
PRT.**************************************
FEV.:Tar|$$VAR|$$FIA|Line
```

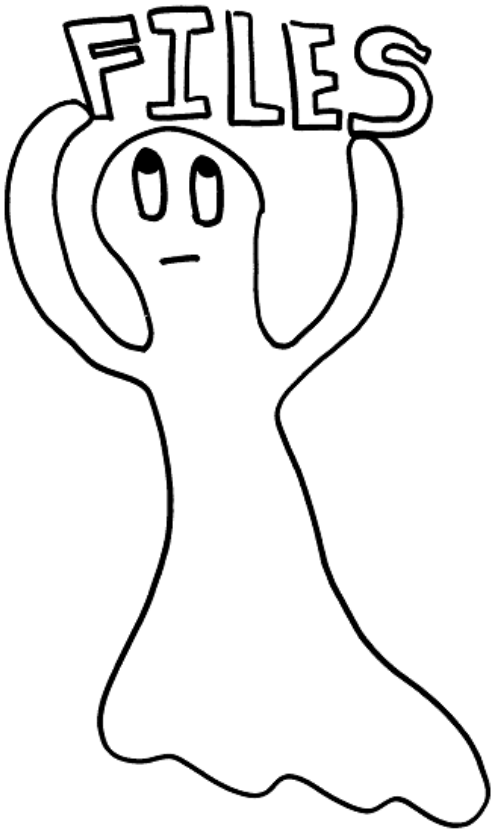
3.54 Filesystem-Commands

3.54.1 ! Smarty's File-Commands

Smarty's File Commands



Smarty can work with files in any way you want.
You can:

- Write or append to Log-Files (`ATF.`)
- Write text- or binary files (`CTF.`)
- read text- or binary files (`CFF.`)
- change the actual directory and drive (`CHD.`)
- copy files (`COP.`)
- rename files (`REN.`)
- delete files (`DEL.`)
- Make directories (`MKD.`)
- delete directories (`RMD.`)
- check if a file exists (`IEF.`) or
- Wait until a file appears or disappears (`WFF.`)
- Find any Text or Wildcard Pattern in files using the sophisticates `FIF.` - command
- Split the path of a file into its parts

*© 2023 Theo Gottwald * https://www.smart-package.com*

- Split the Filename into its parts (GFT.)
- Get file-date and version
- work with INI-Files (CTI./CFI.)
- Split large files of any size to smaller files and (FIL.SPLIT FILE)
- Concatenate these files to the original file again (FIL.JOIN FILE)
- copy files using the Windows-Shell (SHF.)
- move files using the Windows-Shell (SHF.)
- copy, rename and move directories and / or files using the SHF.-command
- and much more ...

You can also apply these methods to groups of files, using FEF.

Some commands call internally the windows shell, these commands are limited to the normal path length of ~260 characters.
Most other commands directly call the NTFS-API (Advanced Programming Interface) and therefore support one or more of these features:

The NTFS-Direct Feature enables you to use the full power of the NTFS-Filesystem.
You can use Pathes up to 32760 Bytes!
Note that most window-programs may not be able to access files deeper then ~250 Bytes-Path-length.

If you see this Logo, then you can use "Wildcards" in the Filesystem-Commands.

These are the well-known "*" and "?" - Wildcards.

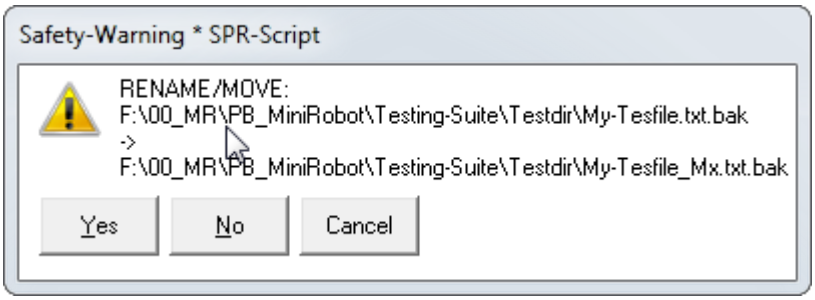
© 2023 Theo Gottwald * https://www.smart-package.com

Using Wildcards in the Pathname is not recommended, use them only in the Filename or extension.
Note that the first file or folder that fits to the wildcard is been taken.
Use Wildcards with extreme caution, as this may lead to unexpected results if there are multiple fitting files.

If you want to debug your Script safely, you can use the

```
OPT.SAFEFILE|1
```

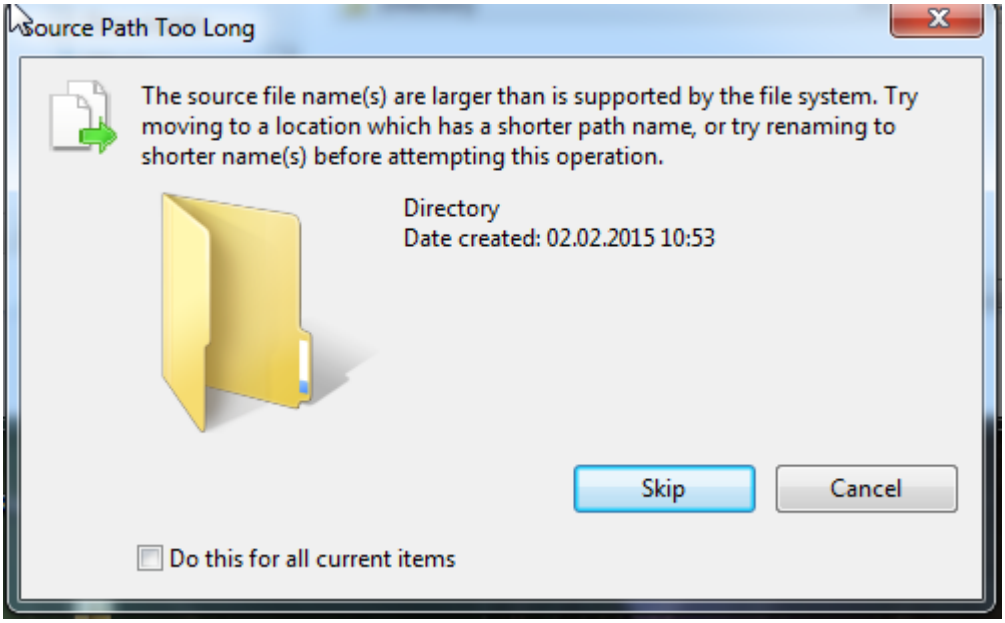
this will bring up such a Messagebox for destructive File-Operations like `DEL.`, `RMD.` `REN.` and `DCP.`



You can choose between

- "**Yes**" - this will start the requested file-operation
- "**No**" - this will prevent the requested file-operation and set the Timeout-Flag
- "**Cancel**" - this will prevent the requested file-operation and set the Timeout-Flag and end the script.

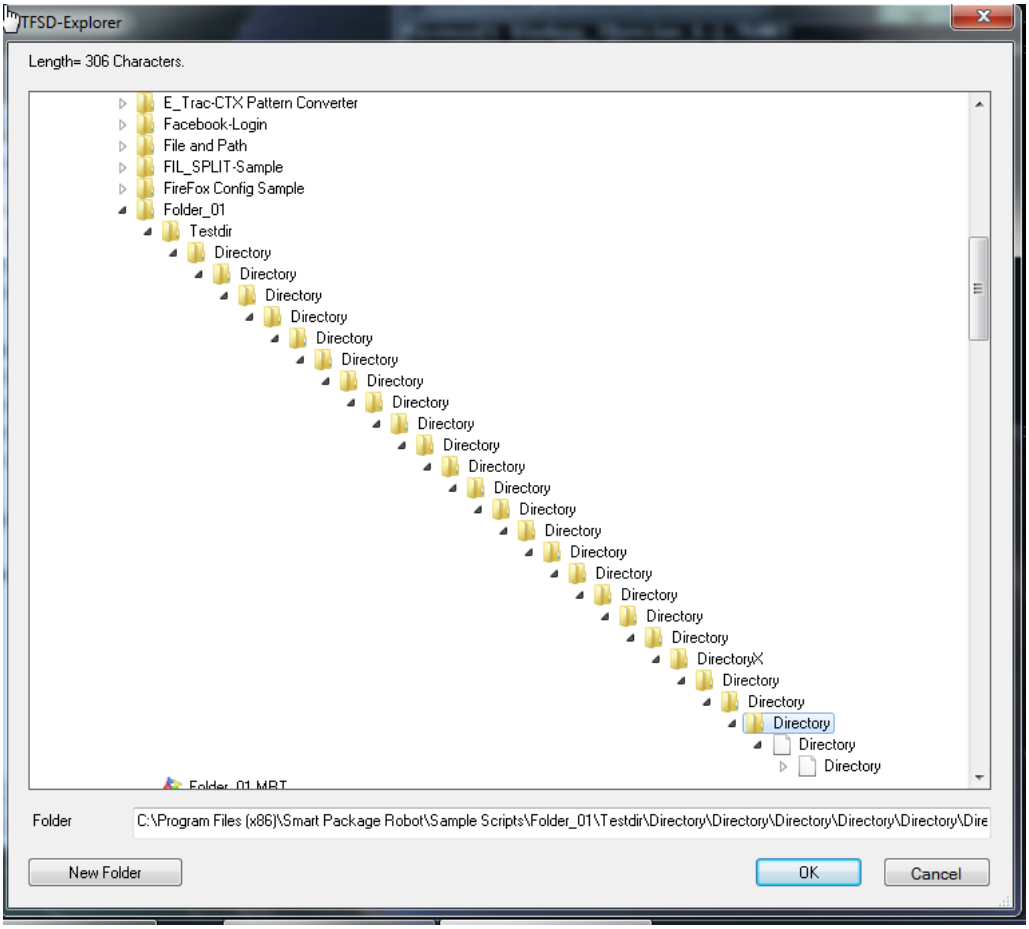
If you try to delete Pathes >260 characters with the Windows Explorer or Shell,
you may run into an error like the one below.
These Pathes can only be deleted, using the SPR-Command "`RMD.`".



Error-Message "Path longer then 260 character".

© 2023 Theo Gottwald * https://www.smart-package.com

Please note that the Explorer and Anti-Virus Tools may lock files and folders and prevent
the `RMD.`-Command from working as expected. In this case the Command will not delete the folder completely and the Timeout-Flag will be set.



You can use the supplied NTFSD-Explorer for simple File-Operations with very long pathes.
Note that Files may not have the proper Icons if you go deeper then 260 Characters.
This is not as bug its because the windows shell does not support this currently.

Here is a more complex Sample that will do a lot of file operations.

```

3.54.2 ATF. - Append-to-File

MiniRobotLanguage (MRL)

ATF. Command

Append to File

Intention

This command is useful to write Log-Files. It will append any content (Text or binary) to an already existing file. Or, if the file does not already exist, it will create a new file.
`ATF.` does not append newline-characters `$crlf$` automatically. This has to be done manually if needed.

Syntax

ATF.[P1] [|P2] [|P3]

Parameter Explanation

P1 - File Name

P2 - Text or Data

P3 - Opt. Variable which receives 1/0 if operation was successful.

Example

```
'******************************************************
' EXAMPLE 2: ATF. Append with Newlines
' create a Logfile on yourdesktop
'******************************************************
'DBM.2
' This is the filename and path on the desktop
: $$FIL=?desktop\RND.txt

FOR.$$AAA|1|20
' Generate a Random Number between 124 and 123125
  RND.124,123125,$$REB
' Here comes the Newline
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
  VAR.$$REB=$date$ ** $time$> The Number is: $$REB$crlf$
' Append the Numbers to the File without Newline
  ATF.$$FIL|$$REB|$$ERG
  PRT.[$$AAA]->$$ERG
NEX.
MBX.Please see the File $$FIL on your desktop.
END.
'***********************************************
```

Remarks

Limitations:

See also:

- ATF - Append-to-File 946
- CFF. - Copy-From-File 948
- CTF - Copy-To-File 964
- CTI. - Copy-To-Inifile 966
- CFI. - Copy-From_IniFile 951
- COP. - Copy File 957
- GLC. - Get-Line-Count 1043
- IEF. / NEF. - If - exist - File 1050
- LFF - Line-From-File 1056
- SHF. - Shell-File-Operation 1082
- WFF. - Wait-For-File 946

© 2023 Theo Gottwald * https://www.smart-package.com

3.54.3 CFF. - Copy-From-File

MiniRobotLanguage (MRL)

CFF. Command

Copy from File

Intention

This command is used to read any Text- or Binary Data from any file on into a variable.
It just like if you say "Put the content of this file into a variable". The syntax is very easy:

```
' put the filename into a variable
: $$FIL=C:\MyFilename.txt
' GEt the content of this file into $$CON
CFF.$$FIL|$$CON
```

Now the question is, did you get the file or not? To answer this question, there is a third parameter, which must be a variable. If you got the file, the content of this variable will be 1. If you did not get the file, the content of the variable will be 0. Also the timeout-flag will be set according to the success of the file-operation.

```
' put the filename into a variable
: $$FIL=C:\MyFilename.txt
' Get the content of this file into $$CON
CFF.$$FIL|$$CON|$$RES
IVV.$$RES=0
  MBX.I did not get the file!
EIF.
```

If you just specify a filename and you omit the path, it is assumed that you load the file from `?path\` - that is your project folder.

```
' put the filename into a variable
: $$FIL=ProjectConfig.ini
' Get the content of this file into $$CON
' the filename will internally be completed to
' ?path\MyFilename.txt
CFF.$$FIL|$$CON
```

And the limits?
The size of the file that is read, can be up to several hundred Megabytes. While the theoretical size limit of a variable is 2 GB, the real-life limit is set by windows, depending on how fragmented your memory is.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

CFF.[P1]|[P2]|[P3]

Parameter Explanation

P1 - Filename

P2 - Variable to insert data from file

P3 - Opt. Variable which receives a TRUE value when the operation was successful and a FALSE value when the operation failed.

Example

```
'*****************************************************
' EXAMPLE 1: CFF. Read from file
'*****************************************************
VAR.$$FIL=ProjectConfig.ini
IEF.?path\$$FIL
  CFF.$$FIL|$$VAR|$$RES
  MBX.$$RES
EIF.
MBX.Success: $$VAR
ENR.

'*****************************************************
' EXAMPLE 1: CFF. Read from file
'*****************************************************
VAR.§§FIL=?desktop\one.txt
CFF.§§FIL|§§DAT|§§RES
PRT. Success: §§RES - Data: §§DAT
' Read file, put on TOS
CFF.§§FIL
' Get TOS
PRT.$$000
CFF.§§FIL|§§DAT
PRT.§§DAT
END.
```

Remarks

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

While the theoretical limit of variables is 2 GB, in real life windows may not have so much string-memory available. This depends mostly on how fragmented your computer memory is. Under normal circumstances a file that is below 400 MB should be read into a variable with no problems.

3.54.4 CFI. - Copy-From_IniFile

MiniRobotLanguage (MRL)

CFI. Command

Copy from Inifile

Intention

This command is used to Read Entries from an INI-File. You can also read a full section from an INI-file. In case you want to read a whole INI-File, use the `CFF.`-command.
In short these are the four Modes of operation:

```
' Mode 1: Copies all Section-Names into Output-Var
CFI.Inifilename|Output-Var              '

' Mode 2: Copies all Keys to Output-Var
CFI.Inifilename|Section|Output-Var

' Mode 3: Copies the specified Key to the Output-Var
CFI.Inifilename|Section|Key|Output-Var

' Mode 4: Copies the given Key to Output-Var, succes-flag to
0/1
CFI.Inifilename|Section|Key|Output-Var|Success-Flag
```

Mode 3 is the one that is most often used. You can read a value or string from an INI-File into a given variable.

Mode 4 is an enhancement of Mode 3. It gives you a flag that shows you if the operation was successful or not. This makes sense, because the result of the operation would be the same, whether the operation failed or the value was empty. See the example in the example -section below. The syntax is like that:

```
VAR.$$FIL=?desktop\one.ini
VAR.$$SEC=Section
VAR.$$KEY=Key
CFI.$$FIL|$$SEC|$$KEY|$$VAL|$$RES
MBX. We got this value from the INI-File: $$VAL
```

In Mode 1, all returned Section Names are separated by `$crlf$`. Therefore you can easily enumerate them using `FEV`.

Note that the Timeout-flag is also set according to the success of the operation. See the example below for a complete example that writes and reads an INI-File.

Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

CFI.P1|P2[|P3][|P4][|P5]

Parameter Explanation

P1 **-** Filename of Ini to write to
P2 **-** Section-Name
P3 **-** Key-Name*
P4 **-** ***(out)*** Value*
P5 **-** (out) Variable for Success-flag 1/0*

*Position of parameters differs according to Mode of operation, see explanation above. The last Parameter is always the return variable. See examples.

- CFI.Inifilename|Output-Var ' Copies all Section-Names
- CFI.Inifilename|Section|Output-Var ' Copies all Keys
- CFI.Inifilename|Section|Key|Output-Var
  ' Copies the given Key to Output-Var
- CFI.Inifilename|Section|Key|Output-Var|Success-Flag
  ' Copies the given Key to Output-Var, succes-flag to 0/1

Speed in Ticks:

This command uses typically around 4500 Ticks heavily depending on many factors like Filesystem-Speed and Parameters.

Example

```
'*****************************************************
' EXAMPLE 1: Enumerate INI-File
'*****************************************************
VAR.§§FIL=?desktop\one.ini
VAR.§§SEC=Section
VAR.§§KEY=Key
VAR.$$BLO=ABCDEFGHIJ
VAR.§§VAL=MyValue

' First we write to a ini-file
FOR.§§CNT|1|3
  : §§SEA=§§SEC_§§CNT
  FOR.§§CNX|1|5
    DBP.§§SEA
    CTI.§§FIL|§§SEA|§§KEY_§§CNX|§§VAL#dtime#|§§RES
    IVV.§§RES=1
      DBP. Ini was written with success!
    ELS.
      DBP. Ini was NOT written with success!
    EIF.
  NEX.
NEX.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Now we read all Section-Names
CFI.§§FIL|§§MYS
PRT.Section-Names:$crlf§§§MYS

FEV.doit|§§SKA|§§MYS

MBX.Ready
ENR.

:doit
' Get all Keys from that section
CFI.§§FIL|§§SEA|§§MYK
PRT.Key-Names from §§SKA:$crlf§§§MYK

' Enumerate all Keys also
PRT. Key-Enumeration:
FEV.doitb|§§SIK|§§MYK
RET.

:doitb
CFI.§§FIL|§§SKA|§§SIK|§§VAL
PRT. Key: §§SIK   Value=§§VAL
RET.

'*****************************************************
' EXAMPLE 2: CTI./CFI. Write/Read INI-File
'*****************************************************
VAR.§§FIL=?desktop\one.ini
VAR.§§SEC=Section
VAR.§§KEY=Key
VAR.$$BLO=ABCDEFGHIJ
' Generating a string of length ~80000 ...
§§VAL=$$BLO
FOR.$$CNT|1|12
  VAR.§§VAL=$$BLO§§VAL§§VAL
NEX.
GSS.1|65530|§§VAL|§§VAL
LEN.§§VAL|$$RES
DBP.Trying to write a string of Len=$$RES to INI.
' First we write to a ini-file
FOR.§§CNT|1|3
  : §§SEA=§§SEC_§§CNT
  FOR.§§CNX|1|5
    DBP.§§SEA
    CTI.§§FIL|§§SEA|§§KEY_§§CNX|§§VAL|§§RES
    IVV.§§RES=1
      DBP. Ini was written with success!
    ELS.
      DBP. Ini was NOT written with success!
    EIF.
  NEX.
NEX.
' Now we read all Section-Names
CFI.§§FIL|§§MYS
PRT.Section-Names:$crlf§§§MYS

: §§SEA=Section_1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
CFI.§§FIL|§§SEA|§§MYT
PRT.Key-Names:$crlf$§§MYT

MBX.Ready

ENR.
```

Remarks

In Mode 1+2, all returned Section and Key Names are separated by `$crlf$`.
Therefore you can easily enumerate them using `FEV`.

Limitations:

The maximum length of values to be read from an INI-File is is 65535 Bytes.

3.54.5 CHD. - Change Directory and Drive

MiniRobotLanguage (MRL)

CHD. Command

Change current Directory and Drive

Intention

Change the "current directory". This command is somehow like CHDIR in old DOS times, but it will also change the current Drive. Usage is simple:

```
' Please use folders that are valid on your system
CHD.F:\00_S-Files\00_Desktop
DBP.?curdir\
CHD.?ws\
DBP.?curdir\
ENR.
```

Will result in something like this.

```
[9] F:\00_S-Files\00_Desktop\
[11] C:\WINDOWS\system32\
```

As you can see, we can switch the drive and the current directory in one strike.
If you only want to switch the current drive you can do it like that:

```
CHD.|C
```

The second parameter can be as long as it is, only the first letter on the left side will be taken, it should be a valid drive letter. For example:

```
VAR.$$FIL=F:\00_S-Files\00_Desktop
CHD.|$$FIL
```

is completely valid.

Note: `CHD.` will execute the command internally and then place the current directory on TOS 104. If `CHD.` will run into an error, you will find the unchanged current directory on the TOS.

Syntax

CHD.[P1][|P2]

Parameter Explanation

*© 2023 Theo Gottwald * https://www.smart-package.com*

P1 - (optional) File-path to be set as current directory.

P2 - (optional) valid drive-Letter to change the current drive

Example

```
'*****************************************
' Demo for CHD.
'*****************************************
CHD.F:\00_S-Files\00_Desktop
DBP.?curdir\
CHD.?ws\
DBP.?curdir\
ENR.
END.
```

Remarks

-

3.54.6 COP. - Copy File

MiniRobotLanguage (MRL)

COP. Command

Copy File

Intention

This command is used to copy files.
The command puts a zero (0) = "Operation failed or was aborted" or a one (1) = "operation successful" on the stack to flag if the operation was successful or not.

Usage is as easy as:

```
COP.source|dest
```

The Command has a optional network timeout.

```
COP.source|dest|timeout in sec.
```

In that case a timeout is applied. This can be helpful in Network environments like VPN's or WAN-Networks with high Latency times.

If only the folder is specified, the command will use the filename from the source. Like in this sample:

```
COP.C:\Myfolder\Myfile.txt|D:\Myfolder\
```

The command in its default-settings does not ask for any confirmation when overwriting files. It can do serious damages to your files and data. Therefore use it with care and on your own risk!

```
' Copy file with COP.
VAR.$$TIM=#dtime#
: $$SRC=F:\05-26-05.pst
: $$TAR=?desktop\Testfile.pst
COP.$$SRC|$$TAR|1
STS.DUMP
MBX.Ready: #dsince#
ENR.
```

On an test-system a file with 11.1 GB was copied in ~167 Seconds. The same operation used ~169 seconds using `SHF`. (Shell-File Operations). These times depend on the specific test system.

```
' Copy file with SHF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$TIM=#dtime#
: $$SRC=F:\05-26-05.pst
: $$TAR=?desktop\Testfile.pst
SHF.c|pcm|$$SRC|$$TAR
STS.DUMP
MBX.Ready: #dsince#
ENR.
```

Syntax

COP.P1|P2[|P3]

Parameter Explanation

P1 - Variable with source-file

P2 - Variable with destination-file name. If only the folder is specified, the command will use the filename from the source.

Example:
COP.C:\Myfolder\Myfile.txt|D:\Myfolder\

P3 - (optional) Timeout in seconds, default is 1 sec.

Example

```
'*****************************************************
' EXAMPLE: REN. and COP.
'*****************************************************
: §§PAT=F:\Testfiles
VAR.§§FIL=§§PAT\Audiograbber.zip
VAR.§§TAC=§§PAT\recent\Target.zip
: §§TIM=2
VAR.§§TAR=§§PAT\Target.zip
VAR.§§TAB=§§PAT\Targez.zip

COP.§§FIL|§§TAB
COP.§§FIL|§§TAB|(§§TIM+3)
' If Operation was successfull then Stack contains a 1 else a
0
PRT.$$000
IVV.$$000=1
PRT.Copy was successful
ELS.
PRT. There was an Error.
EVV.

' Rename-Example
REN.§§TAR|§§TAB

' Rename-Example with File-Timeout of 5 Seconds
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
REN.§§TAR|§§TAB|5
END.
```

Remarks

Wildcards are supported. The first file that fits the description is been copied.
The command will not copy multiple files that fit a description.

The Timeout will not be applied if directories shall be renamed.
For file-operations using wildcards and more options, try `SHF.`

Limitations:

-

3.54.7 CSC. - Create ShortCut

MiniRobotLanguage (MRL)

CSC. Command

Create Shortcut

Intention

This command is used to create a shortcut in the startmenu or an the desktop.
There are two paths we have to deal with.

1. The Path where the shortcut is been created. We call it the "Link-Path".
2. The Path of the file that the shortcut links to. We call it the "Target-Path".

The "Link-Path" is given by a keyword. For a complete List of the available keywords see below.

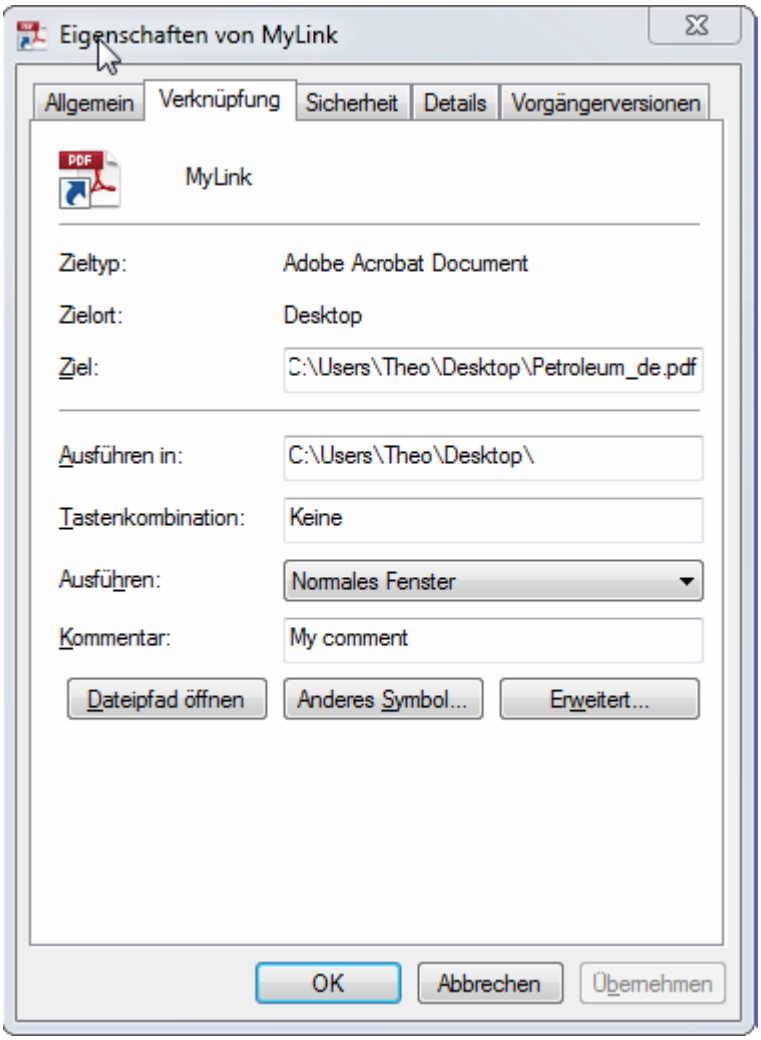
```
' Create a shortcut with CSC.

' This is the Target-Path
$$FIL=?desktop\Petroleum_de.pdf

' The Link-Path is specified by a keyword "desktop", and
' the Link-Name is "MyLink"
CSC.cdesktop|MyLink|$$FIL|||6|My comment
ENR.
```

Here is the Result:

© 2023 Theo Gottwald * https://www.smart-package.com



These are the Parameters that can be specified.

Syntax

COP.P1|P2|P3[|P4][|P5][|P6][|P7]

Parameter Explanation

P1 - Specify "Link-Path". That is the Place where the Link is been created. One of the following keywords can be used:

```
"desktop","cdesktop"    ->  <desktop>
"udesktop","userdesk"   ->  <user name>\Desktop
"cdesktop","cserdesk"   -> All Users\Desktop
"usmprog","ustartmenu programs" -> Start Menu\Programs
"csmprog","cstartmenu programs" -> All Users\Programs
"ustartmenu","usm"      -> <user name>\Start Menu
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
 "cstarmenu","csm"      -> All Users\Start Menu
 "mydocs"               -> My Documents
 "fav","favorites"       -> <user name>\Favorites
 "usmstartup","ustartup" -> Start Menu\Programs\Startup
(Autorun)
 "csmstartup","cstartup" -> All Users\Startup
 "usendto"               -> <user name>\SendTo
 "recent"                -> <user name>\Recent
 "bin","recycle bin"     -> <desktop>\Recycle Bin
 "drives"                -> My Computer
```

P2 - Link-Name, without the ".lnk"

P3 - Target Path. Path of the file that is linked.

P4 - (optional) - Commandline-Arguments for Target-File

P5 - (optional) Working-Directory.
If omitted, the Directory of the Target-Path is used.

P6 - (optional) numerical value that has the following meaning:

- 0 - HIDE Window
- 1 - SHOW NORMAL
- 2 - SHOWMINIMIZED
- 3 - SHOWMAXIMIZED

Please note that these values are interpreted (and often ignored) by the Target-program, not by windows.

P7 - (optional) Comment for the Comments field.

Example

```
'*****************************************************
' EXAMPLE: CSC. - Create Shortcut
'*****************************************************
$$FIL=?desktop\Petroleum_de.pdf
CSC.cdesktop|MyLink|$$FIL|||6|My comment
END.
```

Remarks

Wildcards are not supported.

The Timeout will be cleared. currently there is no internal check, if the operation was successful. You can use `IEF. (If exist file)` for this, if needed.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.54.8 CTF. - Copy-To-File

MiniRobotLanguage (MRL)

CTF. Command

Copy to File

Intention

This command is used to write any content (Text or binary) to a file.
If the file does not exist it will be created.
If the file exists it will be overwritten (the old file is deleted and the new file will take its place).

Syntax

CTF.P1|P2[|P3]

Parameter Explanation

P1 – Filename
P2 – Text or Data
P3 – Opt. Variable which receives a 1 value if operation was successful and a 0 value if the operation failed.

Example

```
'*****************************************************
' EXAMPLE 1: CTF. Write anything to a file
'*****************************************************
'DBM.2
' This is the filename and path on the desktop
: $$FIL=?desktop\RND.txt

FOR.$$AAA|1|200
' Generate a Random Number between 124 and 123125
RND.124,123125,$$REB
' and append it to $$TXT
VAR.$$TXT=$$TXT$$REB
NEX.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Now we write it all to the file
CTF.$$FIL|$$TXT|$$ERG
PRT.Succesful if its a One: $$ERG

MBX.!
END.
```

Remarks

Existing files with the given file-name will be overwritten without any confirmation-request.

Limitations:

-

3.54.9 CTI. - Copy-To-Inifile

MiniRobotLanguage (MRL)

CTI. Command

Copy to Inifile

Intention

This command is used to
- write entries into INI-Files,
- create INI files,
- delete keys, or
- delete sections from an INI-files.

When writing a value to an INI-File, the command
- checks if the length of the string to write is smaller then 65536 Bytes (MAXLEN for INI-Files is 65535 Bytes)
- if not the string is shortened to that length
- then writes that value into the INI-File
- then reads that value back and verifies that it has been written properly.

Only in that case you get an success (1) in Parameter P5. In case the written and read values differ, you get an failed (0) in P5.

Here are the 4 Modes of operation:

```
1.  CTI.Inifilename|Section -> Entire Section is been deleted
2.  CTI.Inifilename|Section|Key -> Key is deleted
3.  CTI.Inifilename|Section|Key|Value
    ' Copies the given Value into Key
4.  CTI.Inifilename|Section|Key|Value|Success-Flag
    ' Copies the given Value into Key, succes-flag to 0/1
```

Mode 2: You can delete the key:

```
CTI.§§FIL|§§SEC|§§KEY
```

There will not be any warning or such. The key will just be deleted, therefore use this with care!

Using Mode 1, you can delete the whole section. Its not much to type, but the result can be fatal if you don't know what you do. Use with care also.

```
CTI.§§FIL|§§SEC
```

The maximum length of values to be read from INI-Files is 65535 Bytes (tested under Win XP). Therefore the value to be written will internally be shortened to this length, in case its longer then this. Even then you will get a writing success in P5.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

CTI.P1|P2[|P3][|P4][|P5]

Parameter Explanation

P1 - Filename of Ini to write to
P2 - Section-Name
P3 - Key-Name
P4 - Value
P5 - (out) Variable for Success-flag 1/0.

Example

```
'******************************************************
' EXAMPLE 1: CTI. Write INI-File
'******************************************************
VAR.$$FIL=?desktop\one.ini
VAR.$$SEC=Section
VAR.$$KEY=Key
VAR.$$VAL=Value
CTI.$$FIL|$$SEC|$$KEY|$$VAL|$$RES

IVV.$$RES=1
     PRT. Ini was written with success!
ELS.
     PRT. Ini was NOT written with success!
EIF.

' Now we write without check
CTI.$$FIL|$$SEC|$$KEY|$$VAL

' Now we read the file
EXO.$$FIL

MBX. Now we delete this key!
CTI.$$FIL|$$SEC|$$KEY
MBX. Now we delete the whole section!
CTI.$$FIL|$$SEC

END.
```

Remarks

-

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

The maximum length of values to be read from INI-Files is 65535 Bytes (XP). Therefore the value to be written will internally be shortened to this length, in case its longer then this. Even then you will get a writing success.

3.54.10 CVF. - Convert File

MiniRobotLanguage (MRL)

CVF. Command

Coonvert File / Replace in File

Intention

This command is used to replace characters in a file and then write the file to an output file. Technically `CVF.` will load the whole file into memory and then do the replace.

You can convert files with different line-endings:

```
$$FIL=?path\MyFIle.xml
$$OUT=?path\MyFIle.txt
$$MAC=$lf$
$$PCE=$crlf$
CVF.$$FIL|$$MAC|$$PCE|$$OUT
```

or you can convert a XML-File into a textual readable file:

```
$$FIL=?path\MyFIle.xml
$$OUT=?path\MyFIle.txt
$$XML=><
$$PCE=>$crlf$<
CVF.$$FIL|$$XML|$$PCE|$$OUT
```

If you omit P4 then P1 is overwritten without further asking!

Syntax

CVF.P1|P2|P3[|P4]

Parameter Explanation

P1 – Filename
P2 – ***(Replace)*** Text or Data that is going to be replaced
P3 – ***(with)*** Text or Data that is going to replace the text **P2**
P4 – Opt. Variable which contains the Output filename, that the processed *file should be written to. If omitted **P1** is overwritten!*

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'******************************************************
' EXAMPLE 1: CVF.
'******************************************************
$$FIL=?path\MyFIle.xml
$$OUT=?path\MyFIle.txt
$$MAC=$lf$
$$PCE=$crlf$
CVF.$$FIL|$$MAC|$$PCE|$$OUT
MBX.!
END.
```

Remarks

Existing files with the given file-name **P4** will be overwritten without any confirmation-request.

Limitations:

-

See also:

- 3.3 Specialfolders 345
- **CTF. - Copy-To-File** 964
- ATF - Append-to-File 946

3.54.11 DCP. - Directory Copy

MiniRobotLanguage (MRL)

DCP. Command

Copy Directory

Intention

This command is used to copy complete folders with all files and sub-folders.
The command puts a zero (0) = "Operation failed or was aborted" or a one (1) = "operation successful" on the stack to flag if the operation was successful or not.
It will also set the TimeOut-Flag in case of an error.

Usage is as easy as:

```
DCP.source|dest
```

The Command needs a "\" at the end of each Path to make sure that its a Pathname, not a filename..

```
DCP.c:\folder\|d:\folderX\
```

will result in a new folder:

```
d:\folderX\folder\
```

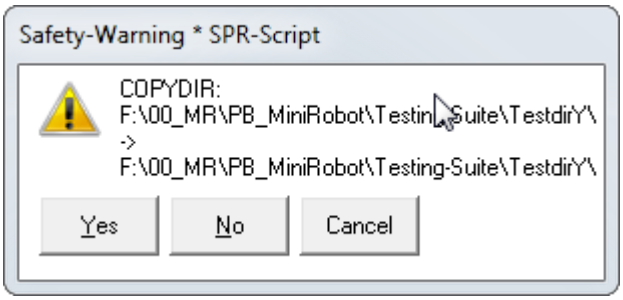
WARNING:
The command in its default-settings does not ask for any confirmation when overwriting files, even protected files.
Wrongly used on existing files, It can do serious damages to your files and data.
Therefore use it with care and on your own risk!

To debug your scripts safely, you can use:

```
OPT.SAFEFILE|1
```

this will bring up such a Messagebox for destructive File-Operations like `DEL.`, `RMD.` `REN.` and `DCP.`

*© 2023 Theo Gottwald * https://www.smart-package.com*



You can choose between

- "**Yes**" - this will start the requested file-operation
- "**No**" - this will prevent the requested file-operation and set the Timeout-Flag
- "**Cancel**" - this will prevent the requested file-operation and set the Timeout-Flag and end the script.

Syntax

DCP.P1|P2[|P3]

Parameter Explanation

P1 – Variable with source-folder, ending with a "`\`"
Example: `F:\folder\`

P2 – Variable with destination-folder, ending with a "`\`"
Example: `X:\folder\`

P3 – *(optional)* can only be "`a`". In case **P3** is given, then
DirCopy will continue to copy even in case of copy-errors.
It will place the path of files that can not be copied on TOS.
In case "**a**" is given, the TIO-Flag may not be accurate (will not reflect an error).
Look on the TOS instead.

The result of the Operation (0/1) can be found on the TOS.
Also the Timeout-Flag is been set if the operation has failed.

Example

```
'******************************************************
' EXAMPLE: DCP.
 '******************************************************
 $$BAS=F:\Testing-Suite\
 $$TPA=C:\
 $$TPB=$$TPATestdirX\
 $$STA=190
 DCP.$$TPB|$$BAS
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
JIT.ero
§§STA=192
NEF.§§PAE
  JIT.ero
EIF.
ENR.
:ero
MBX.Error §§STA happened!
END.
```

Remarks

Wildcards are not supported.
The Timeout will not be applied if directories shall be renamed.
To show that something is a folder, suffixe it with a "\".

```
' This is a file
§§FIA=C:\myname

' This is a folder
§§FIA=C:\myname\
```

Limitations:

-

3.54.12 DEL. - Delete File

MiniRobotLanguage (MRL)

DEL. Command

Delete File

Intention

This command is used to delete a file or more files. You can specify wildcards (e.g. ? and *). DEL. will not delete directories. Use `RMD.` for such tasks.

If you specify a "<>" in front of the filename, the file will be deleted to the User-trash of the current user.

```
' Delete to bin
DEL.<>?path\MyFile.txt
```

In case you use wildcards, the real, full filename and path of the file is been returned below TOS on position 2. On TOS is the success-flag.

`DEL.` has also a "**>>**" Option that will "**Safe-Erase**" Files. For this there are several Standards, one the most used Standards overwrites a file 35 times before deleting it.
We overwrite it 40 times, therefore we assume we are at the safe end with this option.

```
' This may take a while !
DEL.>>?path\MyFile.txt
```

Of course a safe-erase can never be combined with the recycle option.

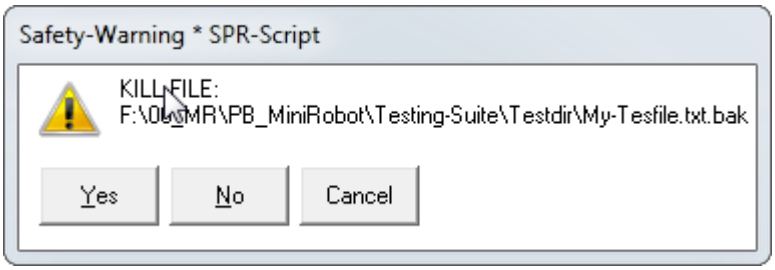
DANGER: If you do not use the "<>" then this command will permanently delete files from your hard disk. Use with care and on your own risk.

If you want to debug your Script safely, you can use the

```
OPT.SAFEFILE|1
```

this will bring up such a Messagebox for destructive File-Operations like `DEL.`, `RMD.` `REN.` and `DCP.`

*© 2023 Theo Gottwald * https://www.smart-package.com*



You can choose between

- "**Yes**" - this will start the requested file-operation
- "**No**" - this will prevent the requested file-operation and set the Timeout-Flag
- "**Cancel**" - this will prevent the requested file-operation and set the Timeout-Flag and end the script.

Syntax

DEL.P1[|P2]

Parameter Explanation

P1 **-** Filename to delete.
    <> - If you prefix the filename wit "<>" then the file will
          be deleted to the recycle bin.
    >> - Safe-Erase File. The file will be overwritten
          about 40 times, with changing Bit-Patterns and Random
          Characters before the file will be finally deleted.
          Should be at least as Strong as needed.
          Standard for other such programs is 35 times.
          This algo is for files below 1.5 GB.

    << - Large File Safe-Erase. This is a slower implementation,
          that uses 64 Bit and can therefore handle files of any
          size.

P2 **- (optional)** Variable for Success-flag 1/0.

Example

```
'*****************************************************
' EXAMPLE 1: DEL - File
'*****************************************************
'DBM.2
VAR.$$FIL=?desktop\one.ini
DEL.$$FIL|$$RES
PRT.$$RES -> success?
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
END.

'******************************************************
' EXAMPLE 1: DEL - File
'******************************************************
'
DEL.<>?path\Kopie*.in?
ENR.
```

Remarks

In case you use wildcards, the real full filename and path of the file is been returned below TOS on position 2. On TOS is the success-flag.

Limitations:

-

3.54.13 FIF. - Find in File

MiniRobotLanguage (MRL)

FIF. Command

Find in File

Intention

This command can be used to find Text or Patterns in files.
You can search in binary files or in text-files.
Search in Text-Files is line-based.
In all files, Wildcard-Search tries to deliver the optimum result.
Wildcards use:

```
?               Any single character
*               Zero or more characters
#               Any single digit (0-9)
[charlist]      Any single character in 'charlist'
[!charlist]     Any single character not in 'charlist'
```

Example:

```
$$TXT=Peter*Müller
FIF.tw|$$FIL|$$TXT|3
```

This will search in a Text File the 3rd Person with the Name
`"Peter (anything) Müller".`
It will find
`"Peter Ralf Müller"`
as well as
`"Peter Klaus Müller"`
The command will deliver that
- found name and the
- start and Ending position in the file where it was found.

It will try to find the smallest fitting pattern.

You can specify the term "`word`" to have an additional tracer, complete found words until their word-end.

You can specify "`nocase`" in all text searches to search case independent.

Usage is simple:

```
' Specify a filename
$$FIL=?path\Test.txt

' Set a Pattern to search for
$$SRC=11.?7.*
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' start the desired search
FIF.tsn|$$FIL|$$SRC

' See the results on TOS
STS.DUMP
' This is just to show we are ready
MBX.!
ENR.
```

Syntax

FIF.P1|P2|P3[|P4]

Parameter Explanation

P1 - Prototype can be one of these:

```
bw,binary wildcard
bs,binary string
tw,text wildcard
ts,text string
```

by adding "word" you have 2 more options

```
tww,text wildcard word
tsw,text string word
```

by adding "nocase" you have 4 more options

```
twwn,text wildcard nocase
tswn,text string nocase
twwn,text wildcard word nocase
tswn,text string word nocase
```

Generally all "binary" searches are "byte based" and not "Line based".
They will search any file "Byte by Byte".

This is slower then searching in text files. Therefore you can search in files that are not "Text-Files".
The result will show the start and end-byte-position in the binary file.
There is no "word"-option for binary files.

All searches with "text" are line-based. For this, the file must have an line-delimiter, best is $crlf$. But cr or lf should also work as line-delimiter.

In text based searches, the result on TOS will show the 1-based Linenumber, and the start- and end-byte-positions in the line.

Also the last stack position will contain the found line-delimiter as a string.
This is done so you can easily reconstruct the file with the same type of delimiter, in case you want to make changed copy.

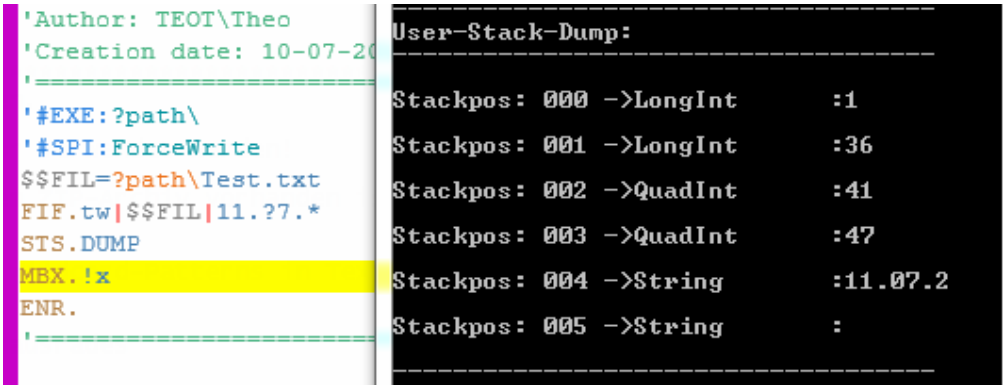
Adding the term "word" to the prototype will call an additional task, that will trace the found end-position to a word-boundary.
Currently word boundaries are:
ASCII(10,13,160,32) and TAB and ".,;"

© 2023 Theo Gottwald * https://www.smart-package.com

The "string" search modes do not compare pattern. They will just do an "Instring"-compare.

All compares are case-sensitive unless the two "nocase" searches.

Here is an example how the TOS looks after a text based Wildcard-search.

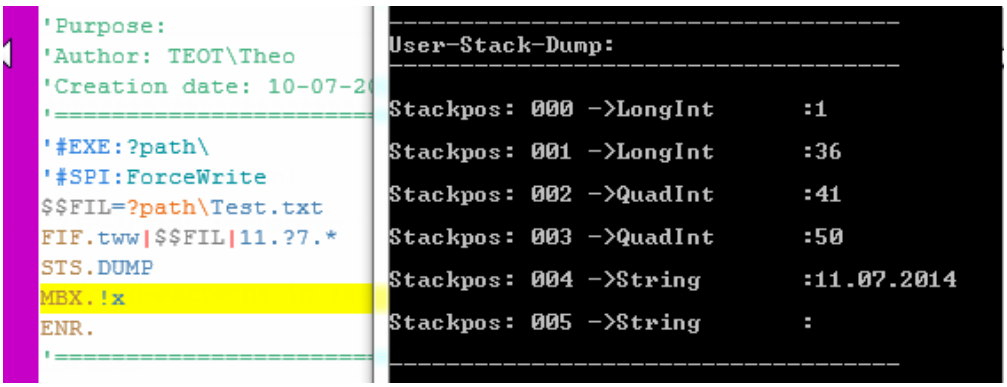


TOS

000 - Number 1 - signals that something was found.
In case the search fails, the TOS just contains a "0".

001 - Linenumber where the search found the text
002 - Starting Byte-position of the found text (in the line)
003 - Ending Byte-position of the found text (in the line)
004 - Found text as string
005 - Line delimiter that was found in the textfile as string

Using the "word" addition we can easily get the complete date!



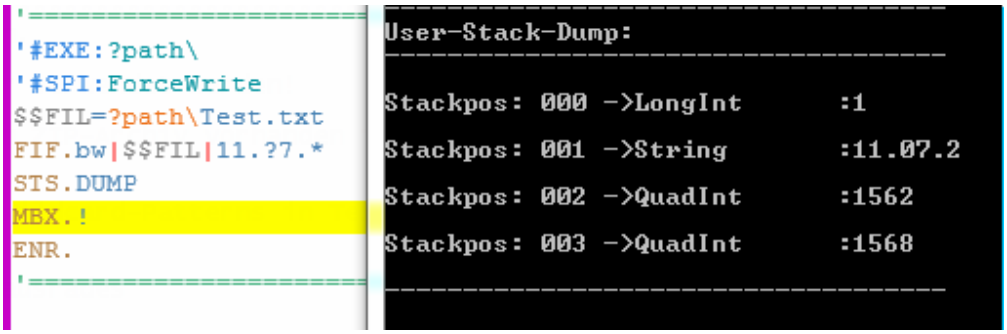
TOS - same as before. Just the string is been traced to the word-end.

000 - Number 1 - signals that something was found.
In case the search fails, the TOS just contains a "0".

001 - Linenumber where the search found the text
002 - Starting Byte-position of the found text (in the line)
003 - Ending Byte-position of the found text (in the line)
004 - Found text as string
005 - Line delimiter that was found in the textfile as string

© 2023 Theo Gottwald * https://www.smart-package.com

In binary searches the TOS looks a bit different:



```
TOS

000 - Number 1 - signals that something was found.
      In case the search fails, the TOS just contains a "0".

001 - Found text as string
002 - Starting Byte-position of the found text (in the line)
003 - Ending Byte-position of the found text (in the line)
```

P2 - Filename of the File to search.

P3 - Text or Wildcard-Pattern to search for

P4 - (*optional*) number of found result (1st .. 2nd .. 3rd etc.)

```
Wildcard-Pattern (in Wildcard-Mode only):
   ?              Any single character
   *              Zero or more characters
   #              Any single digit (0-9)
   [charlist]     Any single character in 'charlist'
   [!charlist]    Any single character not in 'charlist'
```

Example

```

MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com

ENR.

Remarks

Internally a brute force algo is used for the wildcard-search, therefore Wildcard-Search in large binary files can be quite slow!
This has to do with the Maximum Pattern size that is checked against the Pattern if you use a * - Wildcard.

Because a * Wildcard can have theoretically any length - up to the full length of the file, there is an internal limit for the maximum found String.
Currently that limit is 256 per default.
You can change that maximum Pattern size limit using the OPT.FIF|(number) - command. The larger the maximum Pattern size, the longer the search will possibly take in wildcard search mode. The larger results you can find using one or more * - Wildcards.

Limitations:

-

3.54.14 FIL. - File-Commands

3.54.14.1 FileDiff

MiniRobotLanguage (MRL)

FIL.FileDiff

Compare two files including their content and return the Position of the first difference

Intention

This command is used to compare two files "Byte by Byte" for equality.
If both files are equal, the result is 1, otherwise the result is zero. On the TOS is the Position of the fist different Byte.

The command checks these files see error-codes below.

Usage of the command is simple:

```
  ' $$FIA - File 1
  ' $$FIA - File 2
  ' $$SPO - Starting Position in Byte starting at 1 .. File-Len
  ' $$RES - Variable mit Ergebnis
FIL.FileDiff|$$FIA|$$FIB|$$SPO|$$RES
```

if P3 is missing, default Starting Position is always 1
If P4 is missing, the result will be placed on the TOS.

Another Sample:

```
  $$FOL=H:\Videotemp
  $$ORI=$$FOL\Text a.txt
  $$FIA=$$FOL\Text b.txt
  FIL.FileDiff|$$ORI|$$FIA|-1|$$RES
  VAN.$$DIF=$$000
  FIL.Length|$$FIA|$$LEN
  CAL.$$PLA=$$LEN-$$DIF+1
  IVV.$$RES=0
    DBP. Files are different at Reverse Position:$$DIF
    DBP. Files are different at Position $$PLA
  ELS.
    DBP.Files are equal
  EIF.
  FIL.FileDiff|$$ORI|$$FIA||$$RES
  IVV.$$RES=0
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  DBP. Files are different at: $$000
ELS.
  DBP.Files are equal
EIF.
MBX.!
ENR.

File A is:  AAAAAB
File B is:  AAAACB

Output:
[16:35:51]  Files are different at Reverse Position:2
[16:35:51]  Files are different at Position 5
[16:35:51]  Files are different at: 5
```

Possible Results:

```
1 - Files are Equal
```

If Files are not Equal, the Result is negative

```
-1 - can't compare Files or unequal size
-2 - File does not exist?, INVALID_FILE_ATTRIBUTES of Fi
-3 - File does not exist?, INVALID_FILE_ATTRIBUTES of Fi
-4 - File A File is a Folder
-5 - File B is a Folder
-6 - Can't Open File A
-7 - Can't Open File B
-8 - reserved
-9 - Starting Position > Filesize
-10 - Error during Read
```

Syntax

FIL.FileDiff|P1|P2[|P3][|P4]

Parameter Explanation

P1 - Filename for file 1

P2 - Filename for file 2

© 2023 Theo Gottwald * https://www.smart-package.com

P3 - (optional) Starting Byte Position for Compare (1 ... File-Length). if P3 is
If P3 = -1 then the Search will start at the End of the File. The result wi
See Sample below.

P4 - (optional) Variable for the result. The result will be 0 or 1 or one of the
In case the files compute as identical, the result is 1.
If the files are computed as "non identical", the result is zero. If P4 is

The Number of the first differing Byte is placed on TOS.

Example

```

3.54.14.2 Compare

MiniRobotLanguage (MRL)

FIL.Compare

Compare two files including their content

Intention

This command is used to compare two files "Byte by Byte" for equality.
If both files are equal, the result is 1, otherwise the result is zero.

The command checks these files for existence, if any of the files does not exist, the result is 0.
If one of the given Parameters evaluates to a folder the result is zero.

Usage of the command is simple:

```
  ' $$FIA - File 1
  ' $$FIA - File 2
  ' $$RES - Variable mit Ergebnis
FIL.Compare|$$FIA|$$FIB|$$RES
```

If P3 is missing, the result will be placed on the TOS.

```
  ' $$FIA - File 1
  ' $$FIA - File 2
  '
FIL.Compare|$$FIA|$$FIB
MBX.$tos$
```

Syntax

FIL.Compare|P1|P2[|P3]

Parameter Explanation

P1 - Filename for file 1

P2 - Filename for file 2

© 2023 Theo Gottwald * https://www.smart-package.com

P3 **- (optional)** Variable for the result. The result will be 0 or 1.
In case the files compute as identical, the result is 1.
If the files are computed as "non identical", do not exist, or if there are errors,
the result is zero.

Example

```
'*****************************************************
' EXAMPLE 1: FIL.Compare
' Save as "Tests.mrt"
'*****************************************************
$$FIA=?path\Tests.mrt
$$FIB=?path\Identic.txt
$$FIC=?path\False.txt

3.54.14.3 Join Delete

MiniRobotLanguage (MRL)

FIL.Join Delete

Join previously splitted files into a larger file and delete Splits

Intention

This command is used to join the files that have been created with Split File 1001 into the original large file. To join other files, prefer the ATF. - Append-to-File 946 command instead.
This command together with the Split Fil 1001 command help to automatically split larger files into smaller pieces. The command
`FIL.Join File`
does generally the same like
`FIL.Join delete`
command to restore the original file. The only difference between these two is, that the first command does not automatically delete the split-files after restoring the original file.

Usage of the command is simple:

```
' To split the file
VAF.$$FIA=?path\File.exe
FIL.SPLIT FILE|$$FIA|16000

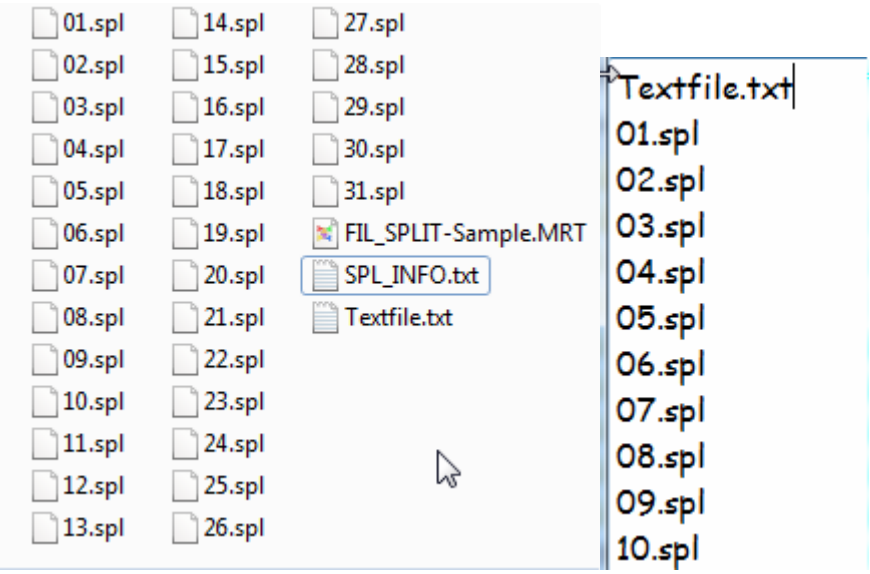
' To Join the file
```

would split the File into pieces of each 16000 Bytes, Of course the last piece may have a different size, as it contains just the remaining Bytes.

Also note that the `FIL.Split File` command has two dependencies on global settings.

Here is an example, how the File-Splitting looks in an explorer folder:

*© 2023 Theo Gottwald * https://www.smart-package.com*



On the right side is the content of the "SPL_INFO.txt"-file.
All lines are separated with $crlf$.

All the split-files are numbered and have currently the extension "spl".

The file "SPL_INFO.txt" contains all informations that are needed for the the `FIL-Join File` command to put the files together.
You can see an example, in the picture on the right side.
First it contains the original Filename of the file before it was splitted.
Secondly it contains all the filenames of the splitter-files in the right order.
Any changes you make in the "SPL_INFO.txt" will lead to changes in the final outcome.
There are no additional information on the splitting process in the splitter-files.
Therefore an "SPL_INFO.txt" is needed to concatenate these files to the original file.

Syntax

FIL.Join Delete|P1[|P2]

Parameter Explanation

P1 - `Filename and Path to "SPL_INFO.txt" file. Only a path is Ok.`

P2 - **`(optional)`** `Variable for 16 Byte-Key for TEA Encryption of splitted files. If given this password must of course be the same like it was used for decryption.*`

There are 2 dependencies on global settings:
*If "compression and encryption" is used, the size of the resulting files may

© 2023 Theo Gottwald * https://www.smart-package.com

be smaller then the given number in **P2**. To decide whether "compression and encryption" should be used, Set
`OPT.SPLITCOMP|1`
to 0 or 1. The default number of rounds (encryption strength) is 30.
You can change that using
`ENCRYPT|100`

`OPT.`this will set the default encryption to 100 rounds.

Example

```
'*****************************************************
' EXAMPLE 1: FIL.JoinFile
'*****************************************************
' no compression/encryption (default)
OPT.SPLITCOMP|0
VAF.$$FIA=?path\Textfile.txt

MBX.Got TIO
GTO. enx
```

Remarks

Time considerations:
In my testing environment, I tested to split a file of **6.85 GB** into **49 Pieces**.
The needed time with compression and encryption was: **10.5 Minutes**
The needed time without compression and encryption was: **6.5 Minutes**
The time needed **to join the file** was **8.3** Minutes with compression and encryption and **6** Minutes without compression and encryption.

Limitations:

The Splitter works with 64 bit internally. Therefore files of up to 18446744073709551615 Bytes can be splitted to smaller split-files. But there is a limit on the size of these splitted files.
Due to speed-considerations, the split-files can not exceed ~1-2 GB (depending on the pool of free 32-bit Memory in WOW64).
There is no limit on the number of Split-Files that you can generate (other then 32-bit).

3.54.14.4 Join File

MiniRobotLanguage (MRL)

FIL.Join File

Join previously splitted files into a larger file

Intention

This command is used to join the files that have been created with Split File 1001 into the original large file. To join other files, prefer the ATF. - Append-to-File 946 command instead.
This command together with the Split Fil 1001 command help to automatically split larger files into smaller pieces. The command
`FIL.Join File`
does generally the same like
`FIL.Join delete`
command to restore the original file. The only difference between these two is, that the first command does not automatically delete the split-files after restoring the original file.

Usage of the command is simple:

```
' To split the file
VAF.$$FIA=?path\File.exe
FIL.SPLIT FILE|$$FIA|16000

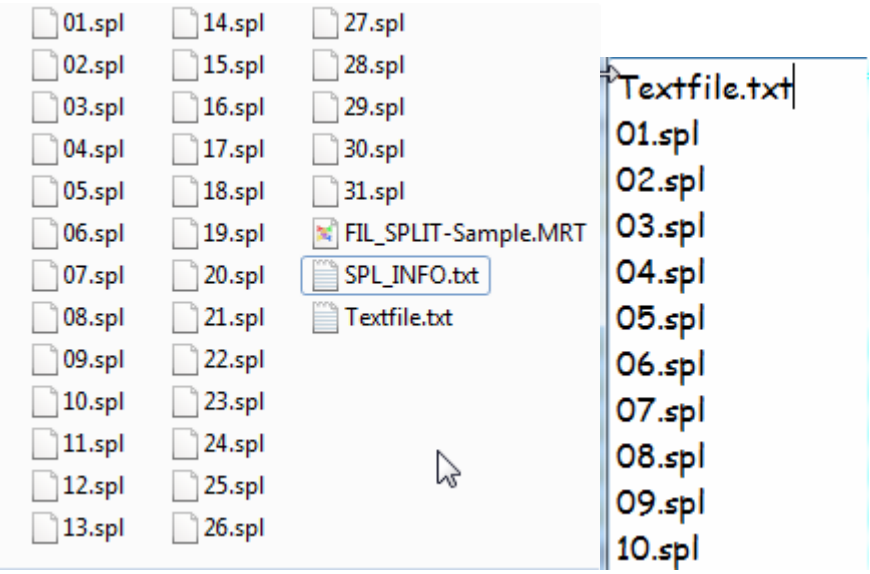
' To Join the file
```

would split the File into pieces of each 16000 Bytes, Of course the last piece may have a different size, as it contains just the remaining Bytes.

Also note that the `FIL.Split File` command has two dependencies on global settings.

Here is an example, how the File-Splitting looks in an explorer folder:

*© 2023 Theo Gottwald * https://www.smart-package.com*



On the right side is the content of the "SPL_INFO.txt"-file.
All lines are separated with $crlf$.

All the split-files are numbered and have currently the extension "spl".

The file "SPL_INFO.txt" contains all informations that are needed for the the `FIL-Join File` command to put the files together.
You can see an example, in the picture on the right side.
First it contains the original Filename of the file before it was splitted.
Secondly it contains all the filenames of the splitter-files in the right order.
Any changes you make in the "SPL_INFO.txt" will lead to changes in the final outcome.
There are no additional information on the splitting process in the splitter-files.
Therefore an "SPL_INFO.txt" is needed to concatenate these files to the original file.

Syntax

FIL.Join File|P1[|P2]

Parameter Explanation

P1 - Filename and Path to "SPL_INFO.txt" file. Only a path is Ok.

P2 - **(optional)** Variable for 16 Byte-Key for TEA Encryption of splitted files. If given this password must of course be the same like it was used for decryption.*

There are 2 dependencies on global settings:
*If "compression and encryption" is used, the size of the resulting files may

3.54.14.5 Length

MiniRobotLanguage (MRL)

FIL.Length

Returns the Length of a given File

Intention

This command is used to return the File-Length . The command

```
$$FIL=C:\Tesffile.txt
FIL.Length|$$FIL|$$RES
MBX.The file length is $$RES
```

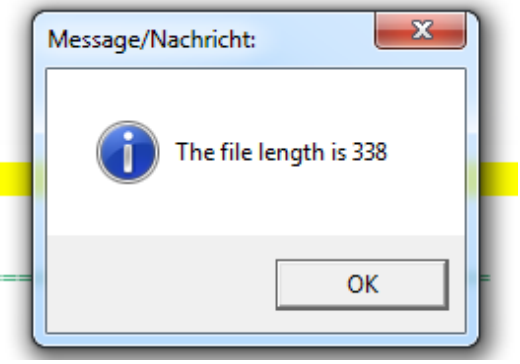
If you omit P3 then the result will be placed on the TOS.

```
$$FIL=C:\Tesffile.txt
FIL.Length|$$FIL
MBX.The file length is $tos$
```

```
'Creation date: 02-09-2015 at 19:36:11
'================================================================
'#EXE:?path\
'#SPI:ForceWrite

$$FIL=?path\Tests.mrt
FIL.Length|$$FIL
MBX.The file length is $tos$

ENR.
'================================
.
```



Syntax

FIL.Length|P1[|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **-** Filename and Path to the file

P2 **-** **(optional)** Variable for the result. If omitted the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: FIL.Length
'*****************************************************
$$FIL=?path\Tests.mrt
FIL.Length|$$FIL|$$RES
MBX.The file length is $$RES
ENR.

'*****************************************************
' EXAMPLE 2: FIL.Length
'*****************************************************
$$FIL=?path\Tests.mrt
FIL.Length|$$FIL
MBX.The file length is $tos$
ENR.
```

Remarks

Uses 64 bit numbers, can be used for files of any size.

Limitations:

3.54.14.6 Split File

MiniRobotLanguage (MRL)

FIL.Split File

Split large File into smaller files

Intention

This command is used to split large files up to any size (64-bit) can be splitted into smaller files - for example to send them away via Mail.

The receiver can use the
`FIL.Join File`
or the
`FIL.Join delete`
command to restore the original file. The only difference between these two is, that the first command does not automatically delete the split-files after restoring the original file.

Usage of the command is simple:

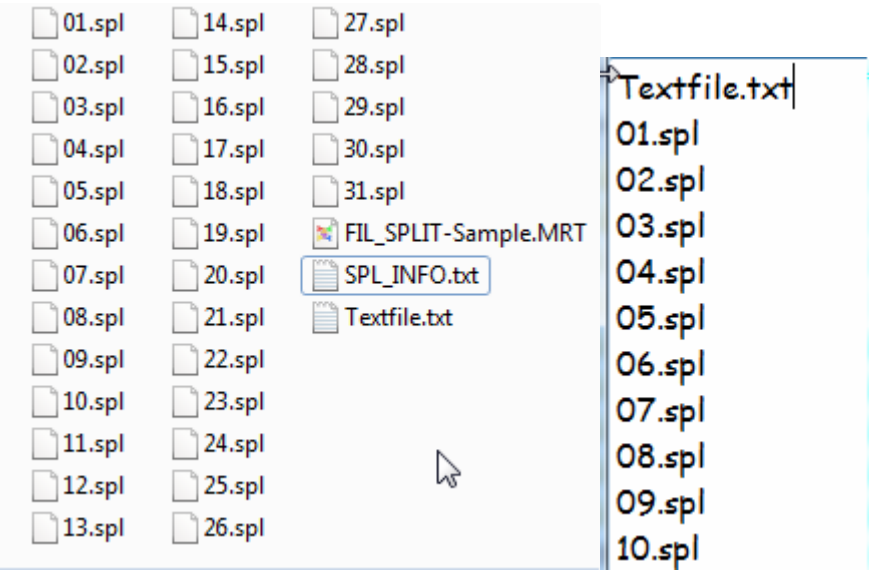
```
VAF.$$FIA=?path\File.exe
FIL.SPLIT FILE|$$FIA|16000
```

would split the File into pieces of each 16000 Bytes, Of course the last piece may have a different size, as it contains just the remaining Bytes.

Also note that the `FIL.Split File` command has two dependencies on global settings.

Here is an example, how the File-Splitting looks in an explorer folder:

© 2023 Theo Gottwald * https://www.smart-package.com



On the right side is the content of the "SPL_INFO.txt"-file.
All lines are separated with $crlf$.

All the split-files are numbered and have currently the extension "spl".

The file "SPL_INFO.txt" contains all informations that are needed for the the `FIL-Join File` command to put the files together.
You can see an example, in the picture on the right side.
First it contains the original Filename of the file before it was splitted.
Secondly it contains all the filenames of the splitter-files in the right order.
Any changes you make in the "SPL_INFO.txt" will lead to changes in the final outcome.
There are no additional information on the splitting process in the splitter-files.
Therefore an "SPL_INFO.txt" is needed to concatenate these files to the original file.

Syntax

FIL.Split File|P1|P2[|P3][|P4]

Parameter Explanation

P1 - Filename and Path.
P2 - ***numerical, size of the Split-Files in*** Bytes.
If you plan to send the files via E-Mail to somebody, you could for example choose 12000000 (12 MB).*

P3 - **(optional)** Variable for Target Folder. If omitted, ?path\ is taken.
P4 - **(optional)** Variable for 16 Byte-Key for TEA Encryption

© 2023 Theo Gottwald * https://www.smart-package.com

```
     of splitted files. If omitted a hardcoded password is
used.
     Of course anybody who owns a SPR can then decrypt the
files.*
```

There are 2 dependencies on global settings:
*If "compression and encryption" is used, the size of the resulting files may be smaller then the given number in **P2**. To decide whether "compression and encryption" should be used, Set

```
 OPT.SPLITCOMP|1
```

to 0 or 1. The default number of rounds (encryption strength) is 30.
You can change that using

```
OPT.ENCRYPT|100
```

this will set the default encryption to 100 rounds.

Example

```
'*****************************************************
' EXAMPLE 1: FIL.Split File

3.54.14.7 Generate numbered Files

MiniRobotLanguage (MRL)

FIL.gnf
FIL.Generate numbered Files

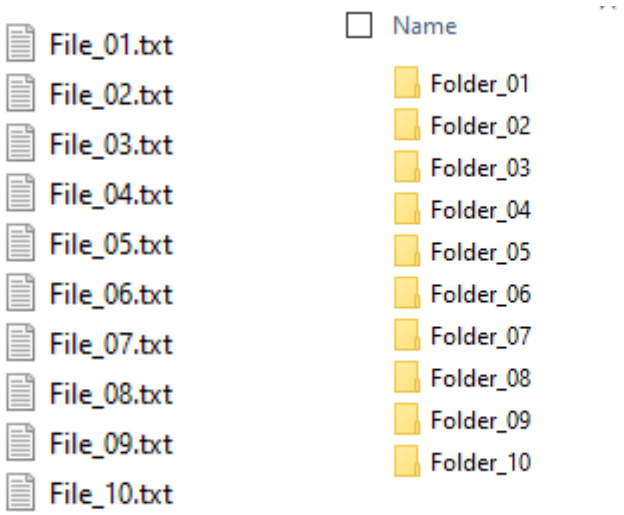
Generates a series of numbered files or folders

Intention

This command is used generate a series of Files or Folders with a builtin Number.
Generally the "?" in the Filename is replaced with that number.
If there is a supplied Text, with a "%n" in it, this will be replaced with the formatted number.

```
$$MSG=Teste FIL "GNF mit File".
$$LAB=$$LAAFile_?.txt
$$LAC=This Text has number %n.
FIL.gnf|$$LAB|$$LAC|1|10|2|1
VAR.$$LAE=$tos$
```

This is how such "Numbered files" or folders do look.



Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

FIL.gnf|P1|P2|P3[|P4][|P5]
FIL.generate numbered files|P1|P2|P3[|P4][|P5]

Parameter Explanation

P1 **-** Filename and Path to the file, it must contain a "?".
The "?" will be replaced with the formatted Number during the process.
If **P1** ends with a \ then its taken as a folder-name.

P2 **- (numeric)** Variable or value with the first number (starting number).

P3 **- (numeric)** Variable or value with the last number (ending number).
The process will generate the numbered files between the number in **P1** and **P2**.

P4 **- (numeric)** Variable or value with number of digits to format the number.
-1 - do not format the numbers, e.g. File_2.txt
0 - format with number of digits in **P3**, e.g. if **P3**=10, File_02.txt
1 - format with number of (digits in **P3**)+1, e.g. if **P3**=10, File_002.txt
For example: If the number is 3, then the values will be formatted like this: "005".
If this is 0 or 1 there will be no visible change.
Default: Numbers will be formatted depending on the (amount of digits in **P3**).

P5 **- (numeric)** Variable or value can be 0 or 1 and describes if you want to overwrite existing Files or not.
Default is "1" (Overwrite existing files).

Speed in Ticks:

This command uses typically around 1020 Ticks.

Example

```
'*****************************************************
' EXAMPLE 2: FIL.gnf
'*****************************************************
$$MSG=Teste FIL "GNF mit Ordner".
$$LAB=$$LAAFolder_?\
$$LAC=Dies ist ein Text mit der number %n.
FIL.gnf|$$LAB|$$LAC|1|10|2|1
' TOS contains the number of created files
VAR.$$LAE=$tos$
MBX.Files created: $$LAE
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

3.54.14.8 Find free Number

MiniRobotLanguage (MRL)

FIL.ffn
FIL.Find free Number

Find the next free number in a series of numbered files or folders

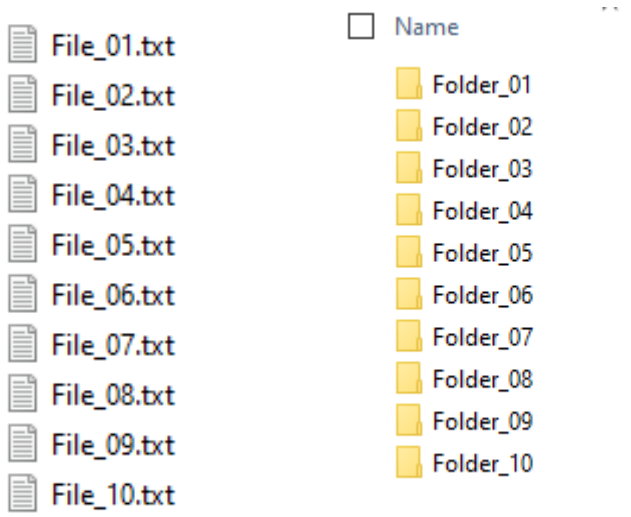
Intention

This command is used to find the next free number in a series of Files or Folders with a builtin Number.
Generally the "?" in the Filename is replaced with the number during the process.

```
$$MSG=Teste FIL "FFN Part 2".
$$LAB=$$LAAFile_?.txt
$$LAC=
' Create series of 10 files
FIL.gnf|$$LAB|$$LAC|1|5|3|1
VAR.$$LAE=$tos$
MBX. Created $$LAE files
$$LAC=1
$$LAD=3
$$LAE=0
FIL.ffn|$$LAB|$$LAC|$$LAD|$$LAE
'JIV.$$LAE!11|Lab_failed
MBX.Next Free Filenumber is: $$LAE
```

This is how such "Numbered files" or folders do look.

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

FIL.ffn|P1|P2|P3[|P4][|P5]
FIL.find free number|P1|P2|P3[|P4][|P5]

Parameter Explanation

P1 - Filename and Path to the first numbered file, it must contain a "?".
The "?" will be replaced with the formatted Number during the process.
If P1 ends with a \ then its taken as a folder-name.

P2 - **(numeric)** Variable or value with the first number (starting number).

P3 - **(numeric)** Variable or value with number of digits to format the number.
0/1 - do not format the numbers, e.g. File_2.txt
2 and higher: - format with number of digits in P3,
Default: Numbers will not be formatted.

P4 - **(numeric)** Variable with the result of the operation, that is a number between P1 and more.
If the last file that was found was File_010.txt, then this result will just be "11".

Speed in Ticks:

This command uses typically around 2150 Ticks.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************************
' EXAMPLE 2: FIL.ffn
'*****************************************************
$$MSG=Teste FIL "FFN".
$$LAB=$$LAAFile_?.txt

3.54.14.9 Generate numbered Name

MiniRobotLanguage (MRL)

FIL.gnn
FIL.Generate numbered Name

Just generate a Filename with a formatted Number in it

Intention

This command is used to generate a name for Files or Folders with a builtin Number, compatible with the otehr FIL.-commands of that sort.
Generally the "?" in the Filename is replaced with the number during the process.

```
'Teste FIL "GNN mit Folder".
VAR.$$LAA=?path\Testfolder\
$$LAB=$$LAAFile?\
$$LAC=5
$$LAD=3
FIL.gnn|$$LAB|$$LAC|$$LAD|$$RES
$$LAE=$$LAAFile005\
'JIS.$$RES!$$LAE|Lab_failed
MBX.Filename is: $$RES
```

This is how such "Numbered files" or folders do look.

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

FIL.gnn|P1|P2|P3[|P4]
FIL.Generate numbered Filename|P1|P2|P3[|P4]

Parameter Explanation

P1 - Filename and Path, it must contain a "?".
The "?" will be replaced with the formatted Number during the process.
If P1 ends with a \ then its taken as a folder-name.

P2 - **(numeric)** Variable or value with the number to insert.

P3 - **(numeric)** Variable or value with number of digits to format the number.
0/1 - do not format the numbers, e.g. File_2.txt
2 and higher: - format with number of digits in P3,
Default: Numbers will not be formatted.

P4 - **(Output)** Variable with the result of the operation.
If omitted the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 2: FIL.gnn
'*****************************************************
'Teste FIL "GNN mit Folder".
VAR.$$LAA=?path\Testfolder\
$$LAB=$$LAAFile?\
$$LAC=5
$$LAD=3
FIL.gnn|$$LAB|$$LAC|$$LAD|$$RES
$$LAE=$$LAAFile005\
'JIS.$$RES!$$LAE|Lab_failed
MBX.Filename is: $$RES
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

3.54.14.1 Move numbered Files

MiniRobotLanguage (MRL)

FIL.mov
FIL.Move numbered File

Move/Insert a file within a List of numbered Files up or down by swapping all intermediate files

Intention

This command is used to move files with a builtin Number between more such files.
For example, you want to move the File "File_02.txt" to Position "04" as "File_04.txt".
You could just Swap the files but then "File_02.txt" would be at Position "4".
So this command will now start swapping files in the right order, to insert the file at the right position.
All other files are just moved one place downward.
You could also think of "Insert numbered file" in this command.

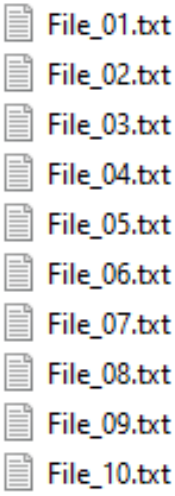
Move UP or DOWN?
If the file is moved "UP" or "DoWN", depends only on the Start- and End-Number Parameter.
If Start is higher, then the file is moved upwards until the END-Number.
If Start is lower number, then the file is moved downwards to the higher END-Number.

Generally the "?" in the Filename is replaced with the number during the process.

```
'Teste FIL "GNN mit Folder".
VAR.$$LAA=?path\Testfolder\
$$LAB=$$LAAFile_?.txt
' Move File_002 to the Place of File_009 shiftig the inbetween
files one place up
FIL.mov|$$LAB|2|8|3|$$RES
' Move file 009 to place of file 001 shiftig ann inbetween
files one place down
FIL.mov|$$LAB|9|1|3|$$RES
```

This is how such "Numbered files" look.

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

FIL.mov|P1|P2|P3[|P4][|P5]
FIL.Move numbered File|P1|P2|P3[|P4][|P5]

Parameter Explanation

P1 **-** Filename and Path, it must contain a "?".
The "?" will be replaced with the formatted Number during the process.
If P1 ends with a \ then its taken as a folder-name.

P2 **-** **(numeric)** Variable or value with the number of the File to Move.
P3 **-** **(numeric)** Variable or value with the number of the target-place.

P4 **-** **(numeric)** Variable or value with number of digits to format the number.
0/1 - do not format the numbers, e.g. File_2.txt
2 and higher: - format with number of digits in P3,
Default: Numbers will not be formatted.

P5 **-** **(Output)** Variable with the result of the operation.
If omitted the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 2: FIL.gnn
'*****************************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'Teste FIL "MOV".
VAR.$$LAA=?path\Testfolder\

3.54.14.1 Swap Files

MiniRobotLanguage (MRL)

FIL.swp
FIL.Swap Files

Exchange the name of two files

Intention

This command is used to "Swap two Files". This means that File A becomes File B and File B becomes File A.

```
'Teste FIL "Swap Files".
VAR.$$LAA=?path\Testfolder\
$$LAB=$$LAAFile_005.txt
$$LAC=$$LAAFile_009.txt
FIL.swp|$$LAB|$$LAC|$$RES
' In case of success result will be "1"
MBX.$$RES
ENR.
```

Syntax

FIL.swp|P1|P2[|P3]
FIL.Swap Files|P1|P2[|P3]

Parameter Explanation

P1 - Filename and Path, of File A

P2 - Filename and Path, of File B

P3 - **(Output)** Variable with the result of the operation.
If omitted the result is placed on TOS.
1 - Success 0 - Error
The timeout Flag is also set in case of Error.

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'*****************************************************
' EXAMPLE 2: FIL.Swp
'*****************************************************
'Teste FIL "Swap Files".
VAR.$$LAA=?path\Testfolder\
$$LAB=$$LAAFile_005.txt
$$LAC=$$LAAFile_009.txt

3.54.15 FPC. - Filepath Physical Convert

MiniRobotLanguage (MRL)

FPC. Command

Filepath Physical Convert

Intention

Convert a **physical File-path** like:

\Device\HarddiskVolume4\projects\explorer-guard.exe

into a **Letter-File-Path** like this:

F:\projects\explorer-guard.exe

You can also go all the way back and convert a Letter-File-path into a physical File-path.

`FPC.` has two Modes of Operations and in each you can choose, in which direction you want to convert.

If you simply write:

```
VAR.$$FIL=\Device\HarddiskVolume4\projects\explorer-guard.exe
FPC.$$FIL
DBP.$$FIL
```

You have converted the physical File-path to a Letter-File-path. This is what you get:

```
[15] F:\projects\explorer-guard.exe
```

To go the opposite direction, all you need to do is, to prefix the filename with a ">" Sign. Like this:

```
VAR.$$TXA=F:\projects\explorer-guard.exe
FPC.>$$TXA
DBP.$$TXA
ENR.
```

This way you have converted the Letter-File-path to a physical File-path. This is what you get:

```
\Device\HarddiskVolume4\projects\explorer-guard.exe
```

You can give two Parameters. In that case **P1** is the source-file-path and **P2** is the variable that will get the result after the conversion.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Or you can just write this:

```
FPC.\Device\HarddiskVolume4\projects\explorer-guard.exe|$$RES
```

In this case, the result will be placed in `$$RES`. Of course you can use a variable for the source filename:

```
VAR.$$SRC=\Device\HarddiskVolume4\projects\explorer-guard.exe
FPC.$$SRC|$$RES
```
is equal to:

```
VAR.$$SRC=\Device\HarddiskVolume4\projects\explorer-guard.exe
FPC.<$$SRC|$$RES
```

and is the same like:

```
VAR.$$SRC=<\Device\HarddiskVolume4\projects\explorer-guard.exe
FPC.$$SRC|$$RES
```

All these will do the same. We have just omitted the"<" because its the default operation, if the ">" is not given.

Syntax

FPC.[</>]P1[|P2]

Parameter Explanation

[</>] - Direction of conversion:
> - Convert Letter-File-Path to physical File-Path
< - **(defaul, if omitted)** Convert physical File-Path to Letter File-Path

P1 – VAR with the Source-Filename. If **P2** is omitted, **P1** is also the destination.

P2 – ***(optional)*** VAR for the conversion result. If omitted, the result will be placed in **P1**.

Example

```
'**********************************
' FPC.-DEMO 1
'**********************************
VAR.$$TXA=>explorer-guard.exe
FPC.$$TXA
DBP.$$TXA
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
' FPC.-DEMO 2
'**********************************
VAR.$$TXA=\Device\HarddiskVolume4\projects\explorer-guard.exe
FPC.$$TXA
DBP.$$TXA
ENR.

'**********************************
' FPC.-DEMO 3
'**********************************
FPC.\Device\HarddiskVolume4\projects\explorer-guard.exe|$$TXP
DBP.$$TXP
ENR.
```

Remarks

The file/folders must not physically exist, but the drive must exist and have a valid drive letter.

3.54.16 GFD. - Get File Date

MiniRobotLanguage (MRL)

GFD. Command

Get File Date

Intention

Returns a date information from a file. Depending on parameters this can be the:

1. creation date
2. last write
3. last access

date of the specified file.

If you just use

```
GFD.?desktop\SLI-Bridge.txt
```

This is what you get on the TOS:

It's the "Last Write" Date, delimited by *****. The reason, why it is delimited by ***** is, that this way you can more easy analyze the date using commands like SBD. 3070 and SBM. 3073 GES. 3067 Or FEM. 929

For most uses, these are the following three operation modes of GFD.

1. `GFD.$$FIL|$$RET|`**c**

This will put the **c**reation date of file $$FIL into $$RET.

2. `GFD.$$FIL|$$RET|`**a**

This will put the last **a**ccess date of file $$FIL into $$RET.

3. `GFD.$$FIL|$$RET|`**w**

This will put the last **w**rite date of file $$FIL into $$RET.

© 2023 Theo Gottwald * https://www.smart-package.com

To get more information on what to do with the results from this command, see also: 1.5.2 Working with Text-Strings 110.

Syntax

GFD.[P1][|P2[|P3]

Parameter Explanation

P1 - Filename
P2 - Variable or "-" to return the file-date (alternatively TOS is used)
P3 - optional c/a/w depending what file-date shall be returned

Example

```
''*******************************************
' GFD. - Sample
' Please use a path from files which are available
' on your system.
'*******************************************
'DBM.2
' Path to an existing file
VAR.$$FIL=?path\TestApp.exe
PRT.=========================================
GFD.$$FIL
PRT.Creation Date: $$000
GFD.$$FIL|-|a
PRT.Last access Date: $$000
GFD.$$FIL|$$RES|w
PRT.Last write Date: $$RES
PRT.=========================================
DMP.4
END.
```

Remarks

3.54.17 GFI. - Get File Information

MiniRobotLanguage (MRL)

GFI. Command

Get File Information

Intention

Returns version and other information from a file. Depending on parameters this can be the:

1. CompanyName
2. FileDescription
3. FileVersion
4. InternalName
5. LegalCopyright
6. OriginalFilename
7. ProductName
8. ProductVersion

or any other specified Information which is accessible in the Version Tab of the File-Properties..

Using the script below, we will get something like this on the Stack 369:

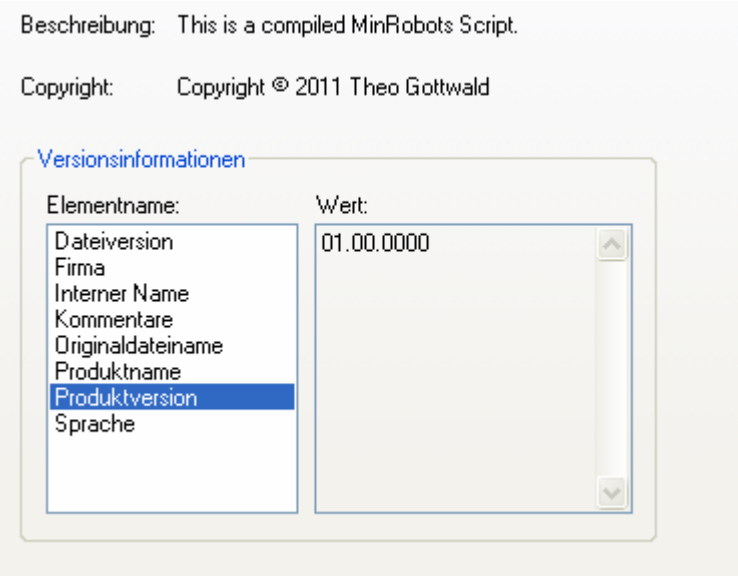
```
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->String        :CompanyName:*Theo Gottwa
FileDescription:*This is a compiled MinRobots Script.*
FileVersion:*01.00.0000*
InternalName:*MR Dropship.exe (Vista/Win 7)*
LegalCopyright:*Copyright © 2011 Theo Gottwald*
OriginalFilename:*Dropship.exe*
ProductName:*MiniRobots Automation System*
ProductVersion:*01.00.0000*

------------------------------------
```

which is another representation of what you get to see if you look in the Properties dialog for the file version (see picture below).

© 2023 Theo Gottwald * https://www.smart-package.com



And here is the example script that produces this output:

```
GFI.?desktop\IC_Stromwandler.exe
STS.DUMP
MBX.Ready
ENR.
```

`GFI.` has several modes of operation. Let us see them in more detail. If we just write:

```
GFI.
```

then the command will try to get the needed filename from the Stack[369]. Filename is taken from TOS. Result is been put on TOS. Result contains all above listed file-Infos in one Element. Here is an example script:

```
VAR.$$FIL=?desktop\IC_Stromwandler.exe
PUV.$$FIL
GFI.
STS.DUMP
MBX.Ready
ENR.
```

Secondly, you can provide the filename in a variable.

```
VAR.$$FIL=?desktop\IC_Stromwandler.exe
GFI.$$FIL
```

The result is just the same as above. Result is been put on TOS. Result contains all above listed file-Information.

Now, if this is too much unneeded Information for you, you can be more selective what Information you want to have returned. Use a second parameter with the Info about what you want.

```
VAR.$$FIL=?desktop\IC_Stromwandler.exe
VAR.$$PAR=ProductVersion
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
GFI.$$FIL|$$PAR|$$RES
PRT.Version: $$RES
```

The possible values for $$PAR are:

1. CompanyName
2. FileDescription
3. FileVersion
4. InternalName
5. LegalCopyright
6. OriginalFilename
7. ProductName
8. ProductVersion

and finally you can provide a country-code as **P4**, to get exactly the information you are looking for.

Syntax

GFI.[P1][|P2[|P3][|P4]

Parameter Explanation

P1 - Filename
P2 - Which Information to get
P3 - Variable or "-" to return the information,
if omitted TOS is used.
P4 - Country-code/Key-code to use.

GFI.P1

P1 - Filename

GFI.P1|P2

P1 - Filename P2 - Which Information to get
Result is been put on TOS. Result contains all above listed file-Infos.

GFI.P1|P2|P3

P1 - Filename
P2 - Which Information to get
P3 - Variable or "-" to return the information

GFI.[P1][|P2][|P3][|P4]

P1 - Filename
P2 - Which Information to get
P3 - Variable or "-" to return the information (alternatively TOS is used)

© 2023 Theo Gottwald * https://www.smart-package.com

P4 - Country-code/Key-code to use.

```
Country-Keycode can be a combination like:
  040904B0
 or can be omitted, in that case the code is automatically
choosen.
Alternatively a "*" can be specified in that case:
  040904E4
is used.
```

Example

```
'*********************************************
' GFI. - Sample
'*********************************************
'DBM.2
' Use Path to a existiing files
VAR.§§FIA=?path\PR01.Exe
VAR.§§FIB=?path\u9.exe
PRT.=========================================
' Get the Company-name on TOS
GFI.§§FIA|CompanyName

' Get Infos on TOS, separated with *
GFI.§§FIB

: §§VER=ProductVersion
GFI.§§FIB|§§VER|§§RES
PRT.Version: §§RES

: §§VER=ProductVersion
GFI.§§FIB|§§VER|§§RES
PRT.Version: §§RES

GFL.§§FIB|§§CKC|b
PRT.Country-Keyboard-Code: §§CKC

' uses §§CKC as StringFileInfo
GFI.§§FIA|CompanyName|§§RES|§§CKC
PRT.CompanyName: §§RES

' Uses 040904E4 as StringFileInfo
GFI.§§FIA|CompanyName|§§RES|*
PRT.CompanyName: §§RES

PRT.=========================================
DMP.4
END.
```

Remarks

-

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

3.54.18 GFL.-Get File Language

MiniRobotLanguage (MRL)

GFL. Command

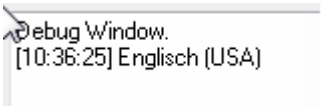
Get File Language

Intention

Returns the language from a file (exe or DLL).

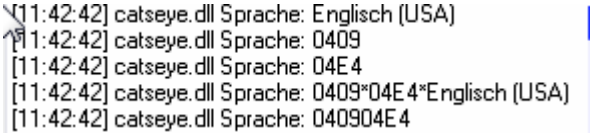
```
VAR.$$FIL=?exepath\MR01.Exe
GFL.$$FIL|$$RET
DBP.$$RET
ENR.
```

will return the information in a variable.



You can choose the Format of the Result using **P3**:

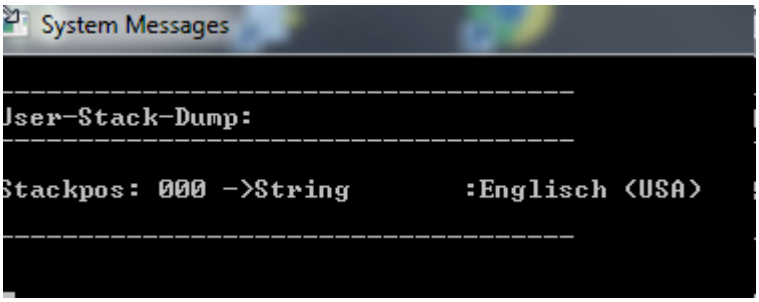
```
$$FIL=?exepath\catseye.dll
GFL.$$FIL|$$RES|t
DBP.catseye.dll Sprache: $$RES
GFL.$$FIL|$$RES|c
DBP.catseye.dll Sprache: $$RES
GFL.$$FIL|$$RES|k
DBP.catseye.dll Sprache: $$RES
GFL.$$FIL|$$RES|a
DBP.catseye.dll Sprache: $$RES
GFL.$$FIL|$$RES|b
DBP.catseye.dll Sprache: $$RES
```



```
VAR.$$FIL=?exepath\MR01.Exe
GFL.$$FIL
' Show the content of the stack
STS.DUMP
MBX.!
ENR.
```

will return the information on the Stack (TOS) 369.
You can see that in the picture below.

*© 2023 Theo Gottwald * https://www.smart-package.com*



You can also specify the format of the result:

```
GFV.?exepath\catseye.dll|§§RES
DBP.catseye.dll Version: §§RES
```

will result in something like:

```
catseye.dll Version: 3.0.2.24
```

If you need to compare file-versions, to find out if a file is never or older, use `IFL`.

Syntax

GFL.[P1][|P2][|P3]

Parameter Explanation

P1 **-** Filename (if omitted its taken from TOS)
P2 **- *(optional)*** Variable or "-" to return the file-date to TOS.
P3 **- *(optional)*** t/c/k/a/b - specify the format of the result as follows:

```
t - Text-Resut
c - codepage
k - keyboard code
a - all -> returns multiple formats delimited by a "*"
b - both
```

Here is the Format for **b** and **c**

```
[11:42:42] catseye.dll Sprache: 0409*04E4*Englisch (USA)
[11:42:42] catseye.dll Sprache: 040904E4
```

Example

```
'*******************************************
' GFL./GFV. - Sample
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*********************************************
$$FIL=?exepath\catseye.dll

3.54.19 GFT. - Get-File-Token

MiniRobotLanguage (MRL)

GFT. Command

Get File Token

Intention

GFT. evaluates a file-path. It returns a requested part of the file-name/path. The functionality is strictly one of parsing alone. No attempt is made to find the file on disk.

Here is an example:

```
$$FIL=c:\Folder\Filename.pdf
GFT.+hi|$$FIL|$$RET
' $$RET will return: "c:\Folder\Filename"
' Result will be placed in Clipboard
CLP.$$RET
END.
```

Syntax

GFT.P1|P2[|P3]...[|PX]

Parameter Explanation

P1: - Prototypes

We use $$FIL=c:\Folder\Filename.pdf as example for every option.

```
 a - Root-Drive -> "c:\"
 b - ALB 3045 -> "Filename.pdf"
 c - BLB 3051 -> "c:\Folder"
 d - File-Extension without "." -> "pdf"
 e - Filename without Extension -> "Filename"
 f - complete Path/filename without Root-Drive ->
"Folder\Filename.pdf"
 g - returns all without extension. -> "c:\Folder\Filename"
 h - Returns the path portion of the path/file name. -> "c:
\Folder\"
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
     That is the text up to and including the last backslash
(\) or colon (:).
    i - Return the name portion of the path/file name. That is the text to the rig
        ending just before the last period (.). -> "Filename"
    j - Returns the extension portion of the path/file name.
        That is the last period (.) in the string plus the text to the right of it
 k - filename.extension -> "Filename.pdf"
 l - If specified, the first letter of the Parts of the
filename will be   Uppercased (MCase-Processing).
 m - remove "\" from right side of P2 before processing
     e.g. C:\file\ -> c:\file
 + - If the "+" Sign is specified in prototypes, the result
will be concatenated and all be placed in P3.
     Example:
     $$FIL=c:\Folder\Filename.pdf
     GFT.+hi|$$FIL|$$RET
     ' $$RET will return: "c:\Folder\Filename"
- - If the "-" Sign is specified as a prototype, any "\\?\"
that prefixes the filename will be removed.
    Otherwise the "\\?\" will be treated as a part of the
root-drive.
```

P2 **-** Filepath: Path which shall be split into parts. Must be given.

P3 **..** ***Px*** **-** ***(optional)*** Variables which will be filled with the Parts according to the prototypes

Example

```
'**********************************
' GFT.-Demo
'**********************************
VAR.§§MYP=?pfad\Myexe.dll
GFT.abcdef|§§MYP|§§AAA|§§BBB|§§CCC|§§DDD|§§EEE|§§FFF
PRT.-------------------------------------------
PRT.Full-Path is: §§MYP$crlf$GFT. makes:
PRT.Parameter a: §§AAA
PRT.Parameter b: §§BBB
PRT.Parameter c: §§CCC
PRT.Parameter d: §§DDD
PRT.Parameter e: §§EEE
PRT.Parameter f: §§FFF
PRT.-------------------------------------------
:enx
MBX.!
END.
```

3.54.20 GFV. - Get File Version

MiniRobotLanguage (MRL)

GFV. Command

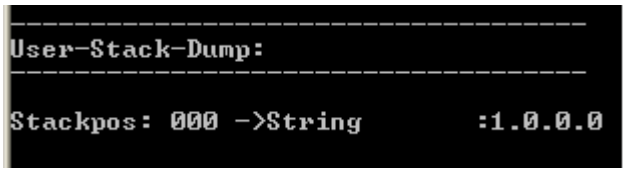
Get File Version

Intention

Returns the version information from a file (exe or DLL).

```
VAR.§§FIL=?exepath\MR01.Exe
GFV.§§FIL
STS.DUMP
```

will return the information on the Stack (TOS) 369.
You can see that in the picture below.



You can also specify a variable for the result:

```
GFV.?exepath\catseye.dll|§§RES
DBP.catseye.dll Version: §§RES
```

will result in something like:

```
catseye.dll Version: 3.0.2.24
```

If you need to compare file-versions, to find out if a file is never or older, use `IFV`.

The `GFV.`-Command has a search path. This path is used, if you omit the file-path.
The Search-Path is:

1. `?path\ - the path of the script-file itself.`
2. `?ws\ - the windows\system32 path`
3. `?wi\ - the windows-folder`

See Specialfolders 345.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

GFV.[P1][|P2]

Parameter Explanation

P1 **-** Filename (if omitted its taken from TOS)
P2 **-** ***(optional)*** Variable or "-" to return the file-date to TOS.

Example

```
'*******************************************
' GFV. - Sample
'
'*******************************************
DBP.=========================================
VAR.§§FIL=?exepath\MR01.Exe
GFV.§§FIL
DBP.MR01.exe Version: $$000
DBP.=========================================
GFV.?exepath\catseye.dll|§§RES
DBP.catseye.dll Version: §§RES
DBP.=========================================
'You can use a return variable instead of the stack
GFV.§§FIL|§§RES
DBP.Version: §§RES
DBP.=========================================
GFV.?exepath\catseye.dll|§§RES
DBP.catseye.dll Version: §§RES
DBP.=========================================
' You can omit path information if the DLL is in
' windows- or system32 or in the ?path\.
GFV.shlwapi.dll|§§RES
DBP.shlwapi.dll Version: §§RES
DBP.=========================================
END.
```

3.54.21 GLC. - Get-Line-Count

MiniRobotLanguage (MRL)

GLC. Command

Get Line Count

Intention

This command can be used to get the number of Lines of a given Text-File as well as the biggest line-width. Using with with binary files may lead to unexpected results.

Usage is simple:

```
: $$FIL=C:My_Textfile.txt
GLC.$$FIL|$$TXT|$$WIT
MBX.The Linecount is: $$TXT
MBX. The largest line-width is: $$WIT$

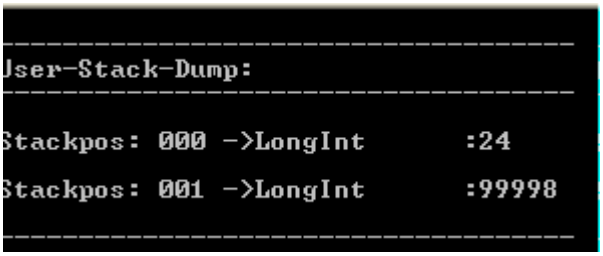
You can omit all parameters except the filename.

GLC.$$FIL
```

In that case you find the number of lines on the stack. The second information, the maximum line with is dropped in that case. It will only be delivered when using a third variable parameter.

You can however do this:

```
GLC.$$FIL||$$000
STS.DUMP
MBX.Whats on the stack?
ENR.
```



And also mix variable output and stack output.

```
GLC.$$FIL||$$WIT
STS.DUMP
MBX.Width is $$WIT
ENR.
```

This will get the Line-count onto the stack and the maximum line-width into a variable.

© 2023 Theo Gottwald * https://www.smart-package.com

Speed Considerations:

Our tests show that a Textfile with 99998 Lines and **2.5 MB** in Size is scanned in about **0.03 seconds**.

Syntax

GLC.P1[|P2][|P3]

Parameter Explanation

P1 **-** Filename to count Lines in.

P2 **-** optional variable to return the number of lines. If omitted TOS is used.

P3 **-** optional variable to return the width of the longest line. If omitted Value is been placed on TOS.

Example

```
'*****************************************
' Demo for GLC.
'*****************************************
VAR.$$TIM=#dtime#
GLC.$$FIL|$$TXT|$$WIT
MBX.The Linecount is: $$TXT-$$WIT$crlf$#dsince#
ENR.

'*****************************************
' Demo for LFF and GLC.
'*****************************************
'DBM.2
' This should be a valid name of a Text-File
: §$FIL=start.ini
GLC.§$FIL|$$RET
PRT.File: $$FIL contains: $$RET Lines.
FOR.$$AAA|1|20
' Read Lin Nr. $$AAA from File ?path\$$FIL into $$RET
LFF.§$FIL|$$AAA|$$REB
PRT.[$$AAA]->$$REB
NEX.
MBX.!
END.
```

3.54.22 GSI. - Get Shortcut Information

MiniRobotLanguage (MRL)

GSI. Command

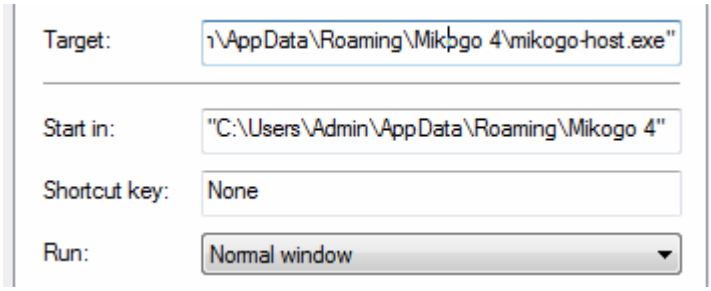
Get Shortcut Information

Intention

Returns Targetpath, workdirectory and other information from a specified shortcut. Depending on parameters this can be the:

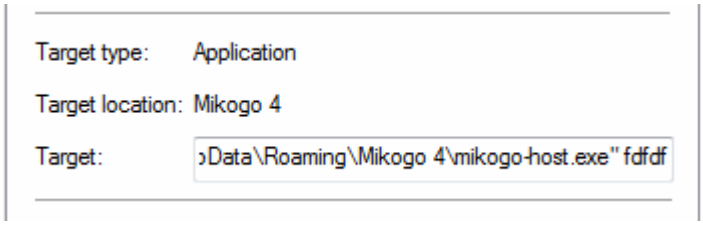
1. **LinkTarget**
2. **WorkDir**
3. **HotKey**
4. **ShowState**

these are equivalent to the contents of the fields in the dialog (see picture below).



Further you can get information about:

5. **Arguments**



```
$$LNK=?desktop\BSC-Testform
GSI.arguments|$$LNK
DBP.$$000
ENR.
```

In the case above, the result would be:

```
[13] fdfdf
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

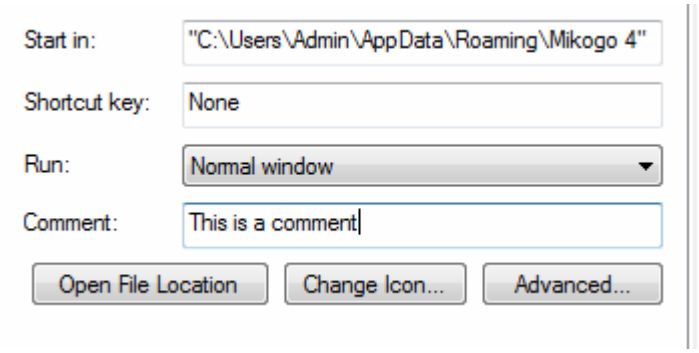
as these are the arguments of the commandline.

You can also return the following values:

6. **Hotkey**
7. **ShowState**
8. **Comment**

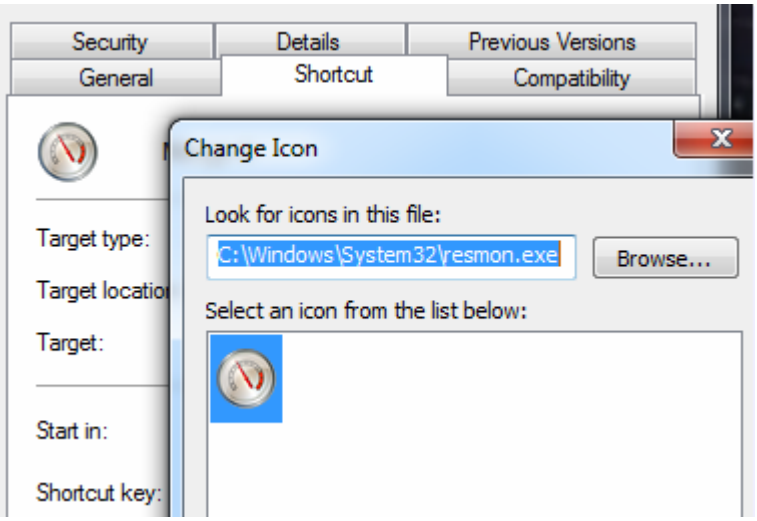
The following script will return the text in the "comment" field. Note that the number that is returned from the hotkey field is a "keycode" and you may only want to know if its a zero (no hotkey) or its a number.

```
$$LNK=?desktop\BSC-Testform
GSI.comment|$$LNK
DBP.$$000
ENR.
```



9. Iconlocation

returns the path of the location of the icon, if it is different from the link-target file.



10. show properties

You can make the command to open the file-properties dialog for any file (must not be a link).

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$LNK=?desktop\BSC-Testform
GSI.sfp|$$LNK
DBP.$$000
PAU.5
ENR.
```

Syntax

GSI.P1|P2[|P3]

Parameter Explanation

P1 - Subcommand

"comment","com" - returns the text from the "Comment field"
"arguments","arg" - returns the arguments from the "Command line"
"hotkey","hot" - returns a zero if no hotkey is defined, or a keycode number.
"workdir","wd" - returns the text from the "Start in" field
"linktarget","tar" - returns the text from the "Target" field
"iconlocation","ico" - returns the path of the location of the icon, if it is different from the link-target file.
"show state","sho" - returns a numerical representation of the "Run"-Setting as follows:
1 - normal
3 - start maximized
7 - start minimized

"show properties","sfp" - Will open the file-properties dialog for the given file, folder or shortcut.

P2 - Filename
P3 - ***(optional)*** Variable for the result, if omitted TOS is used.

Example

```
'*******************************************
' GSI. - Sample
'*******************************************
$$LNK=?desktop\BSC-Testform
GSI.sho|$$LNK
DBP.$$000
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$LNK=?desktop\BSC-Testform.lnk
GSI.sfp|$$LNK
DBP.$$000
PAU.5
ENR.
```

3.54.23 IEF. / NEF. - If - exist - File

MiniRobotLanguage (MRL)

IEF. Conditional Statement

If Exist File / Folder

Intention

Conditional Statement. Test if a specified file or directory exists or not.
You can specify additional Parameters to test if something is a file or a dir.

When you specify a directory path, the robot will check if the last sign of the name/path is a \ (backslash).
If the last sign is a backlash, then the command will check for a directory (NOT for a file!).
If the last sign is NOT a backslash, the command will check for a file NOT for a directory.

```
' We can use wildcards.
' The real name of the file or dir is on the TOS
'
IEF.?desktop\t*.*
 PRT.Is a file and exists: $tos$
ELS.
  PRT. does not exist or is not a file.
EIF.
```

You can use `NEF.`(Not Exists File) as the negative Form of the command.

Syntax

IEF.P1[|P2] … ELS. … EIF.

Parameter Explanation

P1 **-** Variable/filename/directory-path ending with a \ (backslash)
can contain wildcards like **?** and *****
P2 **-** Options: these can only be an **e** - e like "exclusive"

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  e - "exclusive" will only go on true if its a file and the
file
       is not locked (can be accessed).
```

Speed in Ticks:

This command uses typically around 1900 Ticks depending on general files-system Speed.

Example

```
'*******************************************
' IEF-Sample
'*******************************************
' DBM.2
: §§FIL=?desktop\2Line.txt

IEF.§§FIL
 PRT.File exists: §§FIL
ELS.
  PRT.File doesn't exist: §§FIL
EIF.

' Works with Dirs too ...
IEF.?ws\
 PRT.DIr exists: ?ws\
ELS.
  PRT.Dir doesn't exist: ?ws\
EIF.

' We can use wildcards.
' The real name of the fiel or dir is on the TOS
'
IEF.?desktop\t*.*
 PRT.Is a file and exists: $tos$
ELS.
  PRT. doesn't exist or is not a file.
EIF.

END.
```

Remarks

`IEF.` and other IXX. can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or `FEX.` (Enumerations) to unlimited Depth.

Limitations:

-

See also:

3.54.24 IVA. - If Volume available

IVA. / NVA. - If-Volume Available Previous 1050 Top 41 Next 1056

MiniRobotLanguage (MRL)

IVA. Conditional Statement

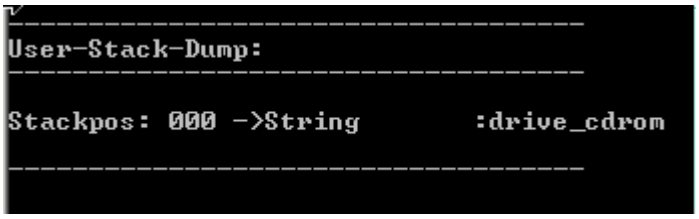
If Volume available

Intention

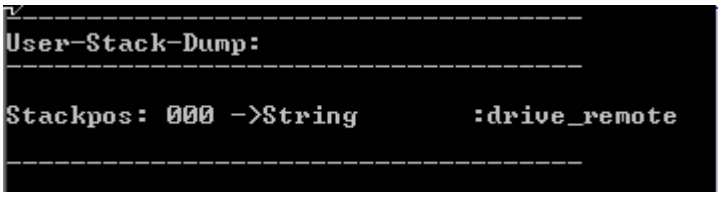
This command can be used to find out, if a specified Volume (Drive-letter) is available.

```
' Test if Volume e: is available
IVA.e
  DMP.6
  MBX.!
EIF.
```

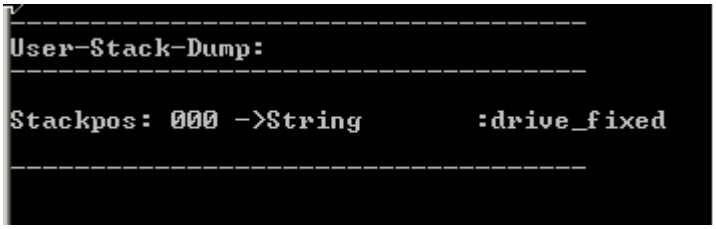
You will find the current usage on the TOS. In this case, E: is a CD-Rom or optical drive.



For a Network Drive you will get this.



and for a local Drive this:



You can specify the driveletter with- or without a ":" and in lowewr or in upper case.

```
IVA.Z:
  ' Show TOS
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  DMP.6
  MBX.!
EIF.
```

As a Bonus, you can also use the command like this:

```
$$PAT=\\PCNAME\Folder$
IVA.$$PAT|$$ERG
   PRT.$$ERG
   MBX.!
EIF.
ENR.
' Result could be "z:"
```

`NVA.` is the negative version of `IVA.`

Syntax

IVA.P1[|P2]

Parameter Explanation

P1 - driveletter, with ":" or without ":".
Alternative you can specify a path of a mapped drive to return the drive-letter.

P2 - (optional) - Variable for the result. If omitted TOS is used.

Example

```
'*******************************************
' IVA. - Sample
'*******************************************
IVA.e|$$ERG
   PRT.$$ERG
   MBX.!
EIF.
ENR.

'*******************************************
' IVA. - Sample 2
'*******************************************
$$PAT=\\PCNAME\Folder$
IVA.$$PAT|$$ERG
   PRT.$$ERG
   MBX.!
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
' Result could be "z:"
END.
```

3.54.25 LFF. - Line-From-File

MiniRobotLanguage (MRL)

LFF. Command

Line From File

Intention

This command can be used to read any line from a file. Usage is simple:

```
' This is the Filename
VAR.$$FIL=?path\ 345 start.ini

' This is the Linen-umber of the Line we want read
VAR.$$LIN=5

' The Line will be in the variable $$RES
LFF.$$FIL|$$LIN|$$RES

' We print it in the Editor
DPB.The Line is: $$RES
```

Syntax

LFF.P1|P2[|P3]

Parameter Explanation

P1 - Filename to count Lines in.

P2 - value of the line which shall be read

P3 - optional variable to return the line from the file.
If omitted the Line is been placed on TOS.

Example

```
'*****************************************
' Demo for LFF and GLC.
'*****************************************
'DBM.2
' This should be a valid name of a Text-File
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
: §§FIL=start.ini
GLC.§§FIL|$$RET
PRT.File: $$FIL contains: $$RET Lines.
FOR.$$AAA|1|20
' Read Lin Nr. $$AAA from File ?path\$$FIL into $$RET

3.54.26 LFN. - Long-File-Name

MiniRobotLanguage (MRL)

LFN. Command

Long FileName

Intention

Convert a 8+1 (Short-Filename) into a Long Filename (LFN) .
If you simply write:

```
LFN.
```

then the command will try to get the source-filename (the one that should be converted) from the stack 369. If you add a variable like this:

```
LFN.§§TXT
```

then the command will take the the source-filename (the one that should be converted) from the given variable `§§TXT` and put the result on the stack 369.

The next step is, that you give two variables as parameters, like this:

```
LFN.§§TXT|§§LFN
```

in that case, the robot will take the source-filename (the one that should be converted) from the given variable `§§TXT` and put the result into `§§LFN`.

Syntax

LFN.[P1][|P2]

Parameter Explanation

P1 - ***(optional)*** VAR with the Short-Filename. If omitted, source is taken from TOS.

P2 - ***(optional)*** VAR for the result. If omitted, the result will be placed on TOS.

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'**********************************
' LFN.-DEMO
'**********************************
'DBM.2
DBP.-------------------------
' We work from Stack to Stack if no Parameters are specified.
: $$TXT=c:\progra~1
PUV.$$TXT
LFN.
DBP.Result:>$$000<
DBP.-------------------------
' We work from Variable to Stack if one Parameters is
specified.
: $$TXT=c:\progra~1
LFN.$$TXT
DBP.Result:>$$000<
DBP.-------------------------
' We work from Variable to Stack if one Parameters is
specified.
: $$TXT=c:\progra~1
LFN.$$TXT|$$LFN
DBP.Result:>$$LFN<
DBP.-------------------------
END.
```

3.54.27 LFT. - Line-From-Text

MiniRobotLanguage (MRL)

LFT. - Line-From-Text

Line from Text File that was loaded into internal Buffer for faster processing

Intention

When doing "Line-based" Operations on a Textfile, the use of LFF. (Line from File) can become slow.
Therefore the Combination of LOF. and LFT. was made. These Command-Pair works "in Memory".
Therefore you can access any Line of the Textfile immediately without any harddrive access.
This can speed up any Text-Processing significantly.

Please also take a look at the TXT.-Commands 3252. These Commands can be used, to save or change the Textfile.

LFT. only works together with LOF. So you need to "Load the Textfile" first using LOF. before you can use LFT.
Generally LFT. has two Working-Modes:

1. Get Line from FIle
LFT. with a number from 1 to (Number of Lines), will return the Line with that number in $$RET:

```
LFT.$$IND|$$NUM|$RET
```

2. Get number of Lines in FIle
LFT. with a number -1, will return the number of stored Lines from that file with that Index-Number.

```
LFT.$$IND|-1|$$RET
```

As you can not change the loaded file using LFT., there are two options in case you need to cahnge the file:
1. You can transfer the file to the TXT.-Command and work there. TXT. was designed specially for these tasks.
2. You can do this:
If you need to process the file, then the workflow is taht <ou read the Source-File using LOF. and LFT.
and write a changed version using ATF 946.- or CTF 964. - Command.
FInally you can "Switch the filenames" using the new FIL.Swap 1018.-Command.

If you call LFT. with a Number larger then the number of Lines in that File, the returned Variable will be empty.

Currently you can load up to 128 Textfiles into the Buffer at the same time, each having its own Index-Number from 1 to 128. This is very good if you need to work on multiple Text-Files at the same time, but you do not want to access the harddrive so

 *© 2023 Theo Gottwald * https://www.smart-package.com*

often. Using LOF. the file is buffered and all further Operations using LFT. are done in memory.

Usage is simple:

```
VAR.$$FIL=?path\Test.txt
' Read the File into Memory
LOF.$$IND|$$FIL
'The Index Number for this file is now in $$IND
LFT.$$IND|-1|$$RET
'Using LFT. with " -1" as Linenumber, we get the Number of
'Lines in return (here in $$RET).
' Now we enumerate through the File without accessing
' the harddrive, at maximum Speed
FOR.$$LOP|1|$$RET
  LFT.$$IND|$$LOP|$$LIN
  PRT.$$LIN
NEX.
MBX.Ready
ENR.
```

Syntax

LFT.P1|P2[|P3]

Parameter Explanation

P1 - ***(Variable or number)*** In this Variable the Index of the File must be specified. You receive the Index when you call the `LOF.`-Command.

P2 - ***Linenumber*** of the Line to read. If this is "-1" then the Number of Lines in the referenced file is returned.

P3 - ***(Variable)*** In this Variable the result of the Operation is returned. This is whether the Line from that file, or it is the number of lines in that file. If omitted the result will be placed on TOS.

Example

```
'*****************************************
' Demo for LOF and LFT.
'*****************************************
VAR.$$FIL=?path\Test.txt
LOF.$$IND|$$FIL
PRT.The Index Number for this file is >$$IND<
LFT.$$IND|-1|$$RET
PRT.Using LFT. with " -1" we get the Number of Lines.
PRT.Which is $$RET.
' Now we enumerate through the File without accessing
' the harddrive, at maximum Speed
FOR.$$LOP|1|$$RET
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  LFT.$$IND|$$LOP|$$LIN
  PRT.$$LIN
NEX.
MBX.Ready
ENR.
```

Remarks

The current Limitation is that you can not load more then 128 Textfiles at the same time into Memory.
Also the delimiters must be $crlf$. If that is not the case, the Text-Files may be automatically converted when they are loaded.
For example, if there are only $CR in a File that is loaded, the Loader will add a $LF to each $CR so that in the Buffer you have a $crlf$ delimited FIle.

Limitations:
Currently you can load up to 128 Textfiles into the Buffer at the same time, each having its own Index-Number from 1 to 128. This is very good if you need to work on multiple Text-Files at the same time, but you do not want to access the harddrive so often. Using LOF. the file is buffered and all further Operations using LFT. are done in memory.
You can not change the loaded file, this is the price for the speed that you get using this command-Pair.
If you need to make changes to the file, switch over to the TXT.-Command 3252.

3.54.28 LOF. - Load-Text-File

MiniRobotLanguage (MRL)

LOF. - Load-Text-File

Load Text File into internal Buffer for faster processing

Intention

When doing "Line-based" Operations on a Textfile, the use of LFF. (Line from File) can become slow.
Therefore the Combination of LOF. and LFT. was made. These Command-Pair works "in Memory".
Therefore you can access any Line of the Textfile immediately without any harddrive access.
This can speed up any Text-Processing significantly.

This command can be used together with the LFT. - command to process Text files faster.
Please also take a look at the TXT.-Commands 3252. These Commands can be used, if there is more to do then just loading a file "Line by line".
It has two Working-Modes:

1.Load Text FIle into Buffer and return Index (`$$IND`):

```
LOF.$$IND|$$FIL
```

2. Remove Text File (`$$IND` is the Index) from Buffer

```
LOF.!$$IND
```

Currently you can load **up to 128 Textfiles** into the Buffer at the same time, each having its own Index-Number from 1 to 128.
This is very good if you need to work on multiple Text-Files at the same time, but you do not want to access the harddrive so often.
Using LOF. the file is buffered and all further Operations using LFT. are done **in memory**.

If you want to **change or save the loaded Text-File**, you need to transfer it to the TXT.-Command 3252 using:

```
VAR.$$FIL=?path\Test.txt
' Read the File into Memory
LOF.$$IND|$$FIL
' Transfer LOF.-Buffer to TXT.-Buffer clear LOF.-Buffer
TXT.gfl|$$IND
' Make all changes and save Text using the TXT.-Commands
TXT.Save
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Transfer Text back to LOF.-Buffer, clear TXT.-Buffer
TXT.tol|$$IND
```

Usage is simple:

```
VAR.$$FIL=?path\Test.txt
' Read the File into Memory
LOF.$$IND|$$FIL
'The Index Number for this file is now in $$IND
LFT.$$IND|-1|$$RET
'Using LFT. with " -1" as Linenumber, we get the Number of
'Lines in return (here in $$RET).
' Now we enumerate through the File without accessing
' the harddrive, at maximum Speed
FOR.$$LOP|1|$$RET
  LFT.$$IND|$$LOP|$$LIN
  PRT.$$LIN
NEX.
MBX.Ready
ENR.
```

Syntax

LOF.P1|P2

Parameter Explanation

P1 - ***(Variable)*** In this Variable the Index of the File is returned.
If P1 starts with a "!" then the FIle which is indexed by P1 will be released from Memory. You do not need to release Files from memory, this is done automatically when the Script ends.

P2 - `Filename` of the File to read.

Example

```
'*****************************************
' Demo for LOF and LFT.
'*****************************************
VAR.$$FIL=?path\Test.txt
LOF.$$IND|$$FIL
PRT.The Index Number for this file is >$$IND<
LFT.$$IND|-1|$$RET
PRT.Using LFT. with " -1" we get the Number of Lines.
PRT.Which is $$RET.
' Now we enumerate through the File without accessing
' the harddrive, at maximum Speed
FOR.$$LOP|1|$$RET
  LFT.$$IND|$$LOP|$$LIN
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  PRT.$$LIN
NEX.
MBX.Ready
ENR.
```

Remarks

The current Limitation is that you can not load more then 128 Textfiles at the same time into Memory.
Also the delimiters must be $crlf$. If that is not the case, the Text-Files may be automatically converted when they are loaded.
For example, if there are only $CR in a File that is loaded, the Loader will add a $LF to each $CR so that in the Buffer you have a $crlf$ delimited FIle.

Limitations:

Currently you can load up to 128 Textfiles into the Buffer at the same time, each having its own Index-Number from 1 to 128. This is very good if you need to work on multiple Text-Files at the same time, but you do not want to access the harddrive so often. Using LOF. the file is buffered and all further Operations using LFT. are done in memory.

3.54.29 MDF. - Make-Direktory-File

MiniRobotLanguage (MRL)

MDF. Command

Make Directory File

Intention

This command can be used to create a file and a directory in one strike.
It will create an directory with all folders and then create the file.

If the file/folder already exists or if the folder can't be created you will get an error in a return variable, if given.

You can synchronize programs using a file. This command will create a file instantly and tell you if it was successful. Usage is simple:

```
VAR.$$DIR=?desktop\MydirA\MyDirB\MyDirC\Myfile.txt
' Will create the directory and the file.
' If the directory exists, only the file is created.
MDF.$$DIB
```

Syntax

MDF.P1[|P2][|P3]

Parameter Explanation

P1 - Filepath

P2 - ***(optional)*** Filedata, Data to store in the file.
If Parameter 2 is omitted, an empty file is created.

P3 - ***(optional) Variable,*** Result of Operation (Error-Code)

Example

```
'************************************
' MFD - DEMO
'************************************
'DBM.2
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
VAR.§§DIR=?desktop\MydirA\MyDirB\MyDirC\Myfile.txt
VAR.§§DIB=?desktop\MydirA\MyDirB\MyDirC\Empty.txt
VAR.$$TXT=This text will be in that file$crlf$Line 2.
MDF.§§DIR|$$TXT|$$ERG
MDF.§§DIB
MBX.Success: $$ERG
END.
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.54.30 MKD. - Make-Directory

MiniRobotLanguage (MRL)

MKD. Command

MaKe Directory

Intention

This command can be used to create unlimited deep folders in one strike.
If the folder already exists or if the folder can't be created you won't get an error message.

Syntax

MKD.P1

Parameter Explanation

P1 - Name of the Directory you want to create

P1 is necessary. For safety reason it can't be omitted.

Example

```
''************************************
' MKD - DEMO
' This will create some Folders on
' your desktop.
''************************************
'DBM.2
'
VAR.$$DIR=?desktop\MydirA\MyDirB\MyDirC
MKD.$$DIR
END.
```

Remarks

*© 2023 Theo Gottwald * https://www.smart-package.com*

-

Limitations:

-

- DEL. - Delete File 974
- REN. - Rename File/Dir 1074

© 2023 Theo Gottwald * https://www.smart-package.com

3.54.31 MOV. - Move File/Dir

MiniRobotLanguage (MRL)

MOV. Command

Move file or directory

Intention

This command is used to Move/rename files.
The command puts a 0 (Operation failed or was aborted) or a 1 (operation successful) on the stack to show if the operation was successful or not.
The Command has a network timeout when used with files that are possibly openend.
The command in its default-settings does not ask for any confirmation and can do serious damages to your files and data.
Therefore be careful and use on your own risk!
Unlike the REN. - Command, it will also MOVE Folders across devices. For example it will move a Folder from drive D: to drive F:.
In this case, you may write:

```
MOV.d:\folder-to-move\|f:\
```

This will move the folder to
`f:\folder-to-move\`

This can not be done using `REN.`
This is the only difference to the REN.-Command.

```
$$FIA=<Filename A>
$$FIB=<Filename B>
MOV.$$FIA|$$FIB
ITO.
  MBX.An Error occured!
EIF.
ENR.
```

To show that something is a folder, suffixe it with a "\".

```
' Is a file
$$FIA=C:\myname

' Is a folder
$$FIA=C:\myname\
```

© 2023 Theo Gottwald * https://www.smart-package.com

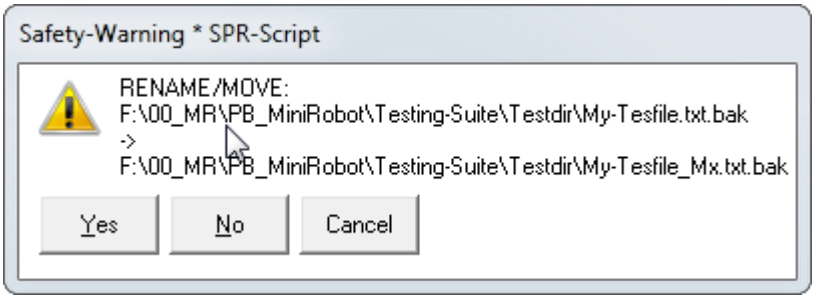
If you want to have a Warning-Messagebox before the Command does any RENAME, use the OPT.-Command and the SAFEFILE-Setting.

```
§§FIA=<Filename A>
§§FIB=<Filename B>
' Using this setting will produce a Safety Message-Box before dangerous File-Ope
OPT.SAFEFILE|1
MOV.§§FIA|§§FIB
ITO.
  MBX.An Error occured!
EIF.
ENR.
```

If you want to debug your Script safely, you can use the

```
OPT.SAFEFILE|1
```

this will bring up such a Messagebox for destructive File-Operations like `DEL.`, `RMD.` `REN.` and `DCP.`



You can choose between

- "**Yes**" - this will start the requested file-operation
- "**No**" - this will prevent the requested file-operation and set the Timeout-Flag
- "**Cancel**" - this will prevent the requested file-operation and set the Timeout-Flag and end the script.

Syntax

MOV.P1|P2[|P3]

Parameter Explanation

P1 – Variable with source-file
P2 – Variable with Destination file
P3 – (optional) Timeout, only for renaming of files

Wildcards are not supported.

The Timeout will not be applied if directories shall be renamed.

© 2023 Theo Gottwald * https://www.smart-package.com

For file-operations using wildcards and more options, use SHF.

Example

```
'*****************************************************
' EXAMPLE: MOV. and COP.
'*****************************************************
: §§PAT=F:\Testfiles
VAR.§§FIL=§§PAT\Audiograbber.zip
VAR.§§TAC=§§PAT\recent\Target.zip
: §§TIM=2
VAR.§§TAR=§§PAT\Target.zip
VAR.§§TAB=§§PAT\Targez.zip

COP.§§FIL|§§TAB
COP.§§FIL|§§TAB|(§§TIM+3)
' If Operation was successfull then Stack contains a 1 else a
0
PRT.$$000
IVV.$$000=1
 PRT.Copy was successful
ELS.
 PRT. There was an Error.
EVV.

' Rename-Example
MOV.§§TAR|§§TAB

' Rename-Example with File-Timeout of 5 Seconds
MOV.§§TAR|§§TAB|5
END.
```

Remarks

-

Limitations:

-

3.54.32 REN. - Rename File/Dir

MiniRobotLanguage (MRL)

REN. Command

REName file or directory

Intention

This command is used to rename files or folders.
The command puts a 0 (Operation failed or was aborted) or a 1 (operation successful) on the stack to show if the operation was successful or not.
The Command has a network timeout when used with files that are possibly openend.
The command in its default-settings does not ask for any confirmation and can do serious damages to your files and data.
Therefore be careful and use on your own risk!
The REN. - Command, it will NOT MOVE Folders across devices. For example it will NOT move a Folder from drive D: to drive F:.
For this use the MOV.-Command.

```
§§FIA=<Filename A>
§§FIB=<Filename B>
MOV.§§FIA|§§FIB
ITO.
  MBX.An Error occured!
EIF.
ENR.
```

To show that something is a folder, suffixe it with a "\".

```
' Is a file
§§FIA=C:\myname

' Is a folder
§§FIA=C:\myname\
```

If you want to have a Warning-Messagebox before the Command does any RENAME, use the OPT.-Command and the SAFEFILE-Setting.

```
§§FIA=<Filename A>
§§FIB=<Filename B>
' Using this setting will produce a Safety Message-Box before dangerous File-Ope
OPT.SAFEFILE|1
REN.§§FIA|§§FIB
ITO.
```

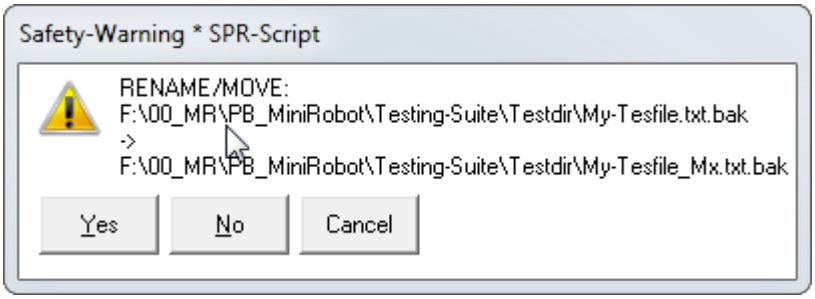
*© 2023 Theo Gottwald * https://www.smart-package.com*

```
    MBX.An Error occured!
  EIF.
  ENR.
```

If you want to debug your Script safely, you can use the

```
OPT.SAFEFILE|1
```

this will bring up such a Messagebox for destructive File-Operations like `DEL.`, `RMD.` `REN.` and `DCP.`



You can choose between

- "**Yes**" - this will start the requested file-operation
- "**No**" - this will prevent the requested file-operation and set the Timeout-Flag
- "**Cancel**" - this will prevent the requested file-operation and set the Timeout-Flag and end the script.

Syntax

REN.P1|P2[|P3]

Parameter Explanation

P1 - Variable with source-file
P2 - Variable with Destination file
P3 - (optional) Timeout, only for renaming of files

Wildcards are not supported.

The Timeout will not be applied if directories shall be renamed.
For file-operations using wildcards and more options, use SHF.

Example

```
'*****************************************************
' EXAMPLE: REN. and COP.
'*****************************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
: §§PAT=F:\Testfiles
VAR.§§FIL=§§PAT\Audiograbber.zip

3.54.33 RMD. - Remove-Directory

MiniRobotLanguage (MRL)

RMD. Command

ReMove Directory

Intention

This command is used to delete a folder and all of its contents.
This command will override software write protection.
Use with extreme caution.
You have to specify the clear path without wildcards.
This was done intentionally to prevent the deletion of unwanted content.

Usage is:

```
RMD.(dir to remove)
```

In case there are write-protected files and dirs in there and you want to kill'em all, choose the "force flag":

```
RMD.(dir to remove)|1
```

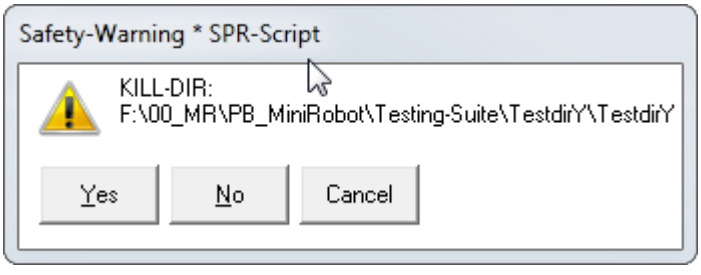
Finally you can specify a variable that will receive a 0 or a 1 if the folder could be removed or not.

```
RMD.(dir to remove)|$$RES
MBX.$$RES
```

If you want to debug your Script safely, you can use the

```
OPT.SAFEFILE|1
```

this will bring up such a Messagebox for destructive File-Operations like `DEL.`, `RMD.` `REN.` and `DCP.`



You can choose between

© 2023 Theo Gottwald * https://www.smart-package.com

- "**Yes**" - this will start the requested file-operation
- "**No**" - this will prevent the requested file-operation and set the Timeout-Flag
- "**Cancel**" - this will prevent the requested file-operation and set the Timeout-Flag and end the script.

Please note that the Explorer and Anti-Virus Tools may lock files and folders and prevent the `RMD.`-Command from working as expected. In this case the Command will not delete the folder completely and the Timeout-Flag will be set.

Syntax

RMD.P1[|P2]

Parameter Explanation

P1 **-** `Filename to delete`
P2 **-** `opt. Variable for result (1/0)`

Example

```
'*****************************************************
' EXAMPLE 1: RMD.
'*****************************************************
'DBM.2
VAR.§§FIL=?desktop\Kopie von Joomla_1.7-Stable-Full_Package
RMD.§§FIL|§§RES
PRT.§§RES -> success?
END.
```

Remarks

This command is somehow a "DELTREE" command, it can potentially delete your whole harddisk, be careful and use on your own risk!

Please note that the Explorer and Anti-Virus Tools may lock files and folders and prevent the `RMD.`-Command from working as expected. In this case the Command will not delete the folder completely and the Timeout-Flag will be set.

Limitations:

Has not been tested with asian- or unicode file-systems.

3.54.34 SFD. - Set File Date

MiniRobotLanguage (MRL)

SFD. Command

Set File Date

Intention

Set a date information from a file. Depending on parameters this can be the:

1. creation date
2. last write
3. last access

date of the specified file.

For most uses, these are the following three operation modes of `SFD`.

1. `SFD.$$FIL|$$RET|`**`c`**

This will change the **c**reation date of file $$FIL.

2. `SFD.$$FIL|$$RET|`**`a`**

This will change the last **a**ccess date of file $$FIL.

3. `GFD.$$FIL|$$RET|`**`w`**

This will change the last **w**rite date of file $$FIL.

Syntax

SFD.P1|P2[|P3]

Parameter Explanation

P1 - `Filename`
P2 - `Timestamp with Time to use. Format "YYYY:MM:DD:HH:MM:SS"`
P3 - `optional c/a/w depending what file-date shall be changed.`

Example

```
''*****************************************
' GFD. - Sample
' Please use a path from files which are available
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' on your system.
'*****************************************
'DBM.2
' Path to an existing file

3.54.35 SHF. - Shell-File-Operation

MiniRobotLanguage (MRL)

SHF. Command

SHell File operation

Intention

This command is used to copy, rename, move or delete files or folders.
You can specify wildcards "*" and "?".

The command puts a 0 (Operation failed or was aborted) or a 1 (operation successfull) on the stack to show if the operation was successful or not.

`SHF`. Supports the use of wildcards (* and ?). Also a progress-dialog can be displayed using the "p"-flag.

The command in its default-settings does not ask for any confirmation and can do serious damages to your files and data. Therefore be careful and use it at your own risk!

On an test-system a file with 11.1 GB was copied in ~169 seconds using `SHF`. (Shell-File Operations). These times depend on the specific test system.

```
' Copy file with SHF.
VAR.$$TIM=#dtime#
: $$SRC=F:\05-26-05.pst
: $$TAR=?desktop\Testfile.pst
SHF.c|pcm|$$SRC|$$TAR
STS.DUMP
MBX.Ready: #dsince#
ENR.

' Copy all content of the
' folder "Test" into the Folder "tar"
'
VAR.$$SRC=?pfad\Test\*
VAR.$$TAR=?pfad\tar\
SHF.c|p|$$SRC|$$TAR
ENR.
```

This command internally calls the "Windows-Shell" and therefore does currently not support the "NTFSD-Feature".

Syntax

SHF.P1|P2|P3[|P4]

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 - Operations-Code

```
  c - copy,
  m - move,
  r - rename or
  d - delete
```

P2 - Flags

```
  p - progress-dialog ( if not set, no progress is
displayed. )
  c - confirmation. If set you may need to responds to dialog
boxes
      that is displayed on file-conflicts.
      Default is that the conflict is solved with "Yes to
All",
      that is, everything is forced.
  r - rename-on-collision. Gives the file being operated on a
new
      name (such as "Copy #1 of...")in a move, copy, or rename
       operation if a file of the target name already exists.
  f - Files-Only. Performs the operation only on files if a
      wildcard filename (*.*) is specified.
  m - Confirm-MakeDir. If specified, does need the user to
confirm
       the creation of a new directory if the operation
requires
       one to be created.
  u - Allow-Undo. Preserves undo information, if possible.
      By adding the Allow-undo flag you can move a file to the
      Recycle Bin instead of deleting it.
```

P3 - Variable with source-file
P4 - must be there for any operation other then delete.

Example

```
'*****************************************************
' EXAMPLE 1: SHF.
'*****************************************************
: §§PAT=F:\Testfiles
VAR.§§FIL=§§PAT\Audiograbber.zip
VAR.§§TAR=§§PAT\Target.zip

© 2023 Theo Gottwald * https://www.smart-package.com

3.54.36 WFF. - Wait-For-File

MiniRobotLanguage (MRL)

WFF. Command

Wait For File

Intention

This command is useful to make your batch scripts error-tolerant. Using WFF. you can really wait until a file is available and accessible. Or you can use it to wait until a file is really deleted.
This way you can synchronize batch scripts via files.

`WFF.` can be used in two ways:

1. Wait until a file is available
2. Wait until a file has disappeared

In both cases you can set a "timeout" value, or wait endless. In case you use a Timeout-Value, the timeout-Flag will be set only if that timeout was reached.
You can check the TImeout-Flag using the `JIT.` or `ITO.` and such commands.

If you wait for a file, `WFF.` will also check if the file is accessible. If it can be "opened for read".
If the file is still locked because its not yet "ready", WFF. will not accept the file in case 1 (Wait for a file).

In case 2 (Wait for a file to be deleted), the file must disappear, a locked file does not count as "deleted".

This system makes `WFF.` a perfect companion for synchronizing Batch-Jobs with compilers and such.
Because it will wait until one task is ready and then start the next.

```
' Sample Script
 VAF.$$FJB=$$FIA\Openfile_lock*.txt
 WFF.$$FJB|1
 JIT.ero
```

Syntax

 *© 2023 Theo Gottwald * https://www.smart-package.com*

WFF.[P1] [|P2]

```
' Wait for file
WFF.(Filename)
WFF.(Filename)|Timeout in sec.
' Wait for file being deleted
WFF.<>(Filename)
WFF.<>(Filename)|Timeout in sec.
```

Parameter Explanation

P1 - File Name

P2 - Timeout in seconds

If you add the "**<>**" before the filename, WFF. will wait until the file is been deleted.

Example

```
'*****************************************************
' EXAMPLE 1: WFF/ATF. Append without Newline
' Create a file containing large numbers
' Synchronize two robots using a file.
'*****************************************************
: $$FIL=?desktop\RND.txt
' Run a second robot.
' Note that the second robot knows the value of $$FIL
PRR.
  DOL.
    PRT.Parallelrobot started, waiting for File ...
    WFF.$$FIL
    PRT.File existst ... now waiting for the file to be
deleted.
    WFF.<>$$FIL
    PRT.File was removed. Ending ...
    PAU.2
    GTO.out
  OOP.
  :out
  END.
PRE.
' This is the filename and path on the desktop
: $$FIL=?desktop\RND.txt

FOR.$$AAA|1|20
' Generate a Random Number between 124 and 123125
  RND.124,123125,$$REB
' Append the Numbers to the File without Newline
  ATF.$$FIL|$$REB|$$ERG
NEX.
DEL.$$FIL
MBX.Ready
END.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```

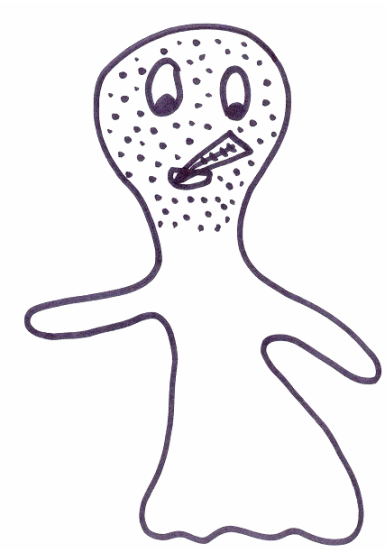
3.55 Image/Pixel-Color Operations

3.55.1 ! Smarty's Pixel-Operations

Smarty's Pixel Operations



Pixel-Operations can be used as last choice, if no other command can give you needed information on these topics:

- Did something in the dialog change? (`WRA.`)
- Is the button i need already available?
- Is the form ready to accept input?
- Or you can simply use it to take a Snapshot, for example under Error-conditions, to see what was going on (`CAP.`).

Pixel-Operations are most often the last choice, if all other commands fail to read the window content. The reasons are simple:

- Colors may differ from system to system
- coordinates may differ depending on screen dpi-settings and resolution

To make Pixel Operations as compatible as possible, you can use two special tools, provided here:

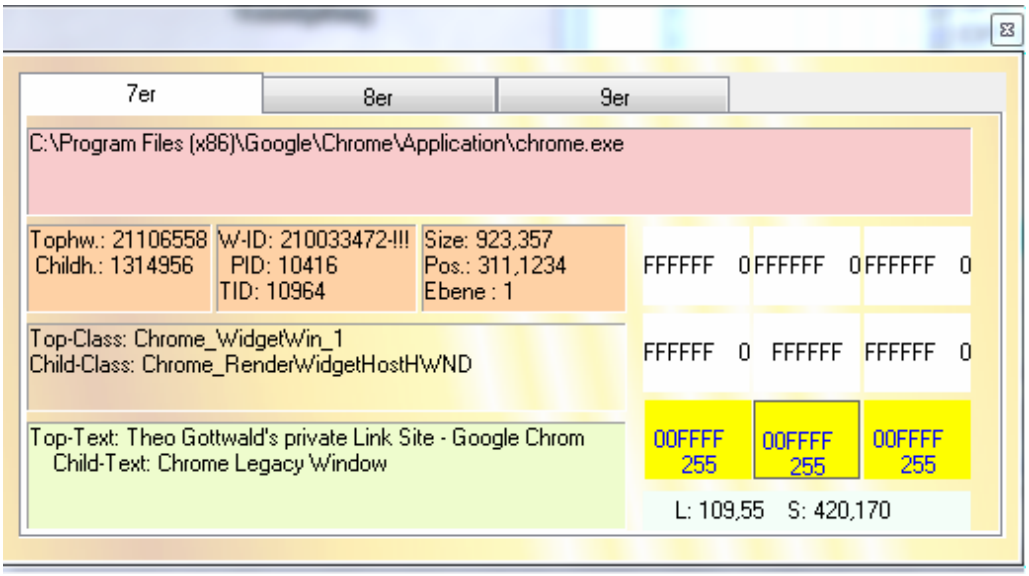
- Instead of "real colors" you can use the "System Colors" S1-S30. They are calculated on each system to their color-value. This way your color values will be independent from themes and settings. See here 3.4 System-Colors 349
- Instead of coordinates prefer using RECTs `{A1}` to `{D4}`.
  For Details see 3.6 Using Quadrant-Coordinates 356

Important:
All Pixel-Operations are "Compatible Engine" Operations.

*© 2023 Theo Gottwald * https://www.smart-package.com*

For Details see here:
1.C Direct Engine and Compatible Engine 231

Often with Pixel-Operations, you need to see single Pixels.
You can use the "Catseye-Analyzer" to find coordinates and color values.
The Catseye-Analyzer is located in the Installation Folder of the SPR.



Important note on Color-Depth.
In the actual Computers, we use 24 bit colors and this is what the Robot uses for its Pixel-commands. For Speed Reasons, no other Color-Depth is supported.
Using Pixel-Commands on other Color-Depth then 24 bit will lead to undefined Results.

Color-Values:
Color Values are decimal, integer numbers in the Range from 0 to 16777215.
In Hexadecimal Notation this is 0 to `&H FF FF FF`.

If you write the Color-Number in Hexadecimal Notation, you can see the Red-, Green-, and Blue-Part of the specified Color side-by-side.
The decimal notation does not have this feature, that is why we recommend that you use the hexadecimal numbers.
Technically there is no difference which notation you use, because the system will anyway convert it to Binary before execution.

Example using Google Chrome-Browser. In this Example, we have a Search WEB-Site with a background color of `&HF6F6F6`
Using this simple Script, we can locate the Input Box and move the Mouse there..

```
' https://duckduckgo.com/
STW.ct|Chrome_WidgetWin_1|DuckDuckGo Search Engine - Google Chrome
IRC.c|!&HF6F6F6
  VAR.$$TAR=$$000,$$000
  MMV.$$TAR
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

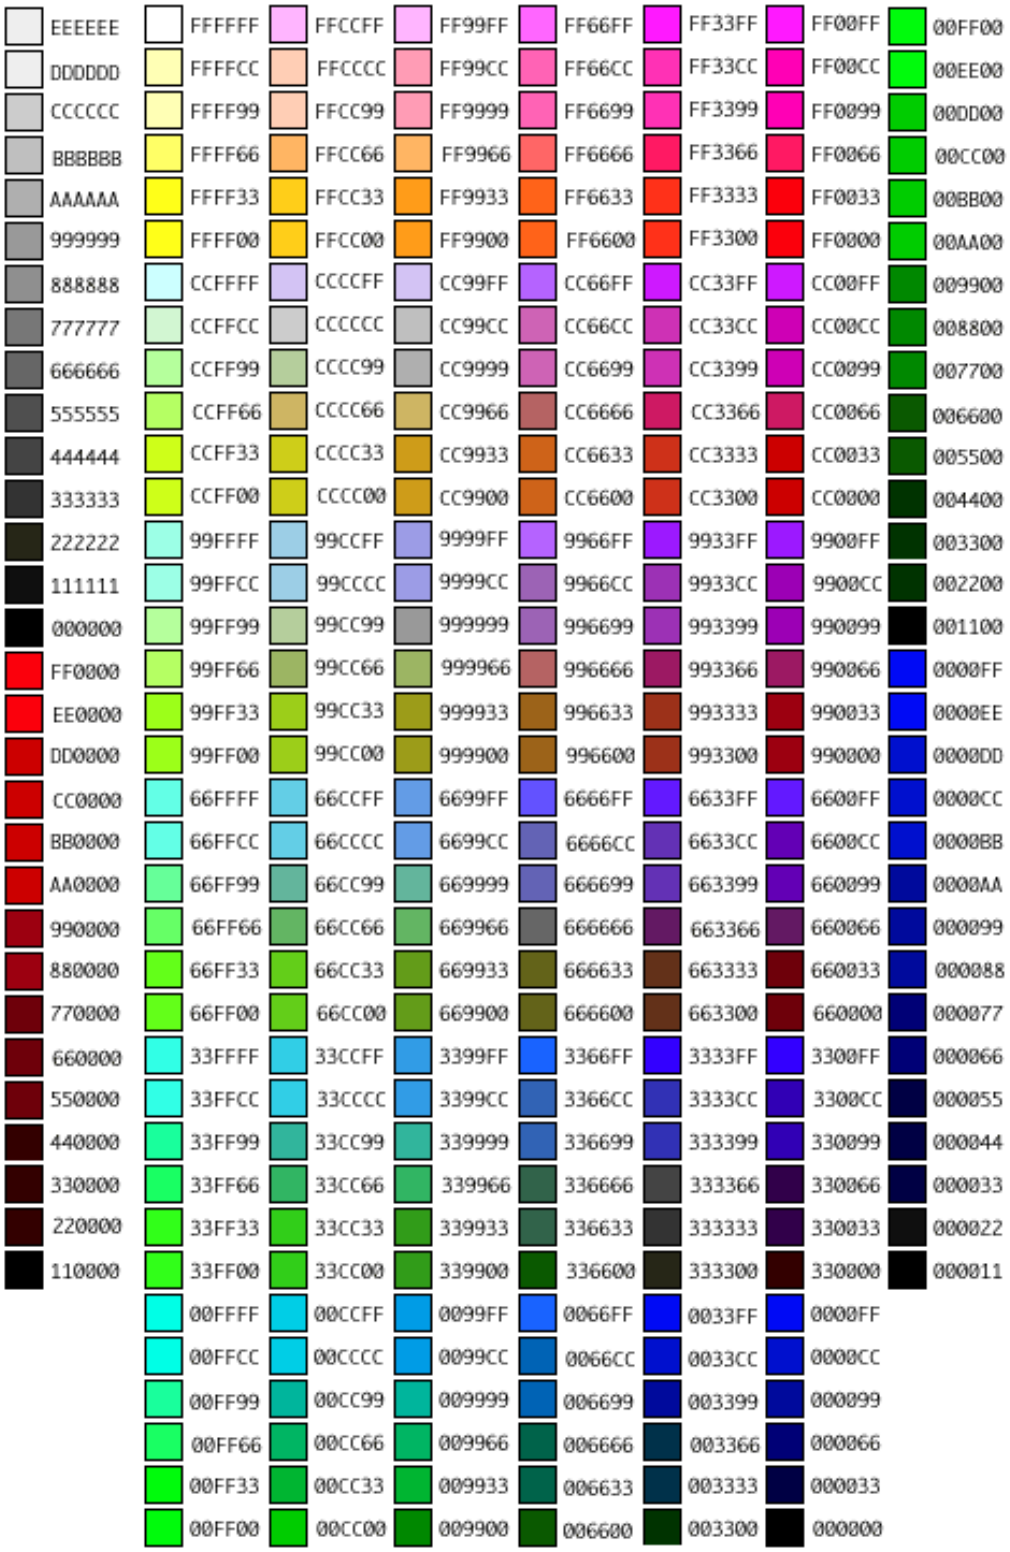
```
ENR.
```

Another Example using Google Chrome-Browser. In this Example, we have a Search WEB-Site with a background color of `&HF6F6F6`
Using this simple Script, we can locate the Input Box and move the Mouse there..Note the DMP.6 that will show the result of the IRC.-Command.

```
STW.ct|Chrome_WidgetWin_1|DuckDuckGo Search Engine - Google Chrome
IRC.c|&HFFFFFF
  DMP.6
  MBX.!
  VAR.$$TAR=$$000,$$000
  MMV.$$TAR
EIF.
ENR.
```

Here are some Color-Values in Hexadecimal notation.

© 2023 Theo Gottwald * https://www.smart-package.com



© 2023 Theo Gottwald * https://www.smart-package.com

3.55.2 ! Smarty's Pixel-Processing

Smarty's Pixel Pixel Processing Operations

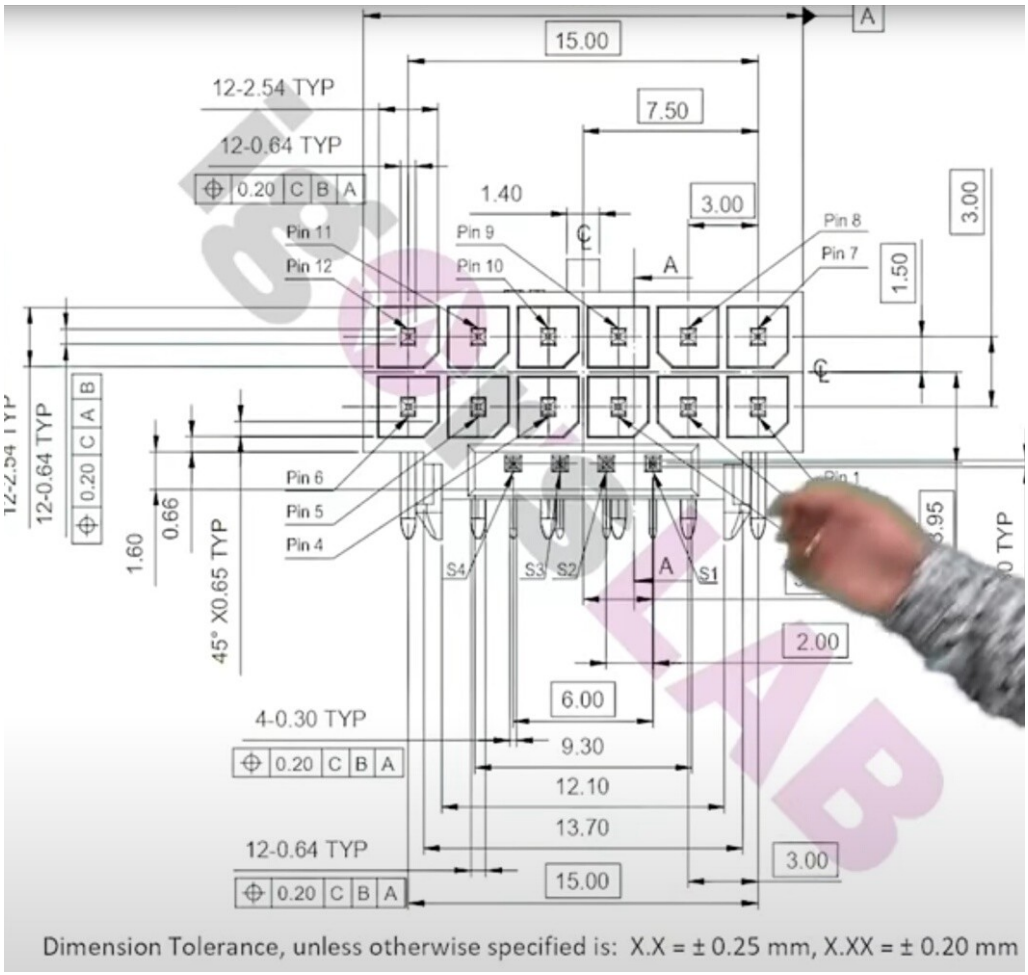
Pixel-Processing Operations are often not really fast but can save you a lot of work.
Using the Getpixel and SetPixel, you can do amazing Pixel-Operations.

Important:
Due to Speed Optimizations, the SPR is unable to STOP immediately while he is in optimzied Pixel-Processing Operations.
Therefore the SPR will not stop unless he is done with the Command. In such case you can just use the Cleanup-Button to "Kill all Robots".

Use the SPR to remove unwanted Artefacts

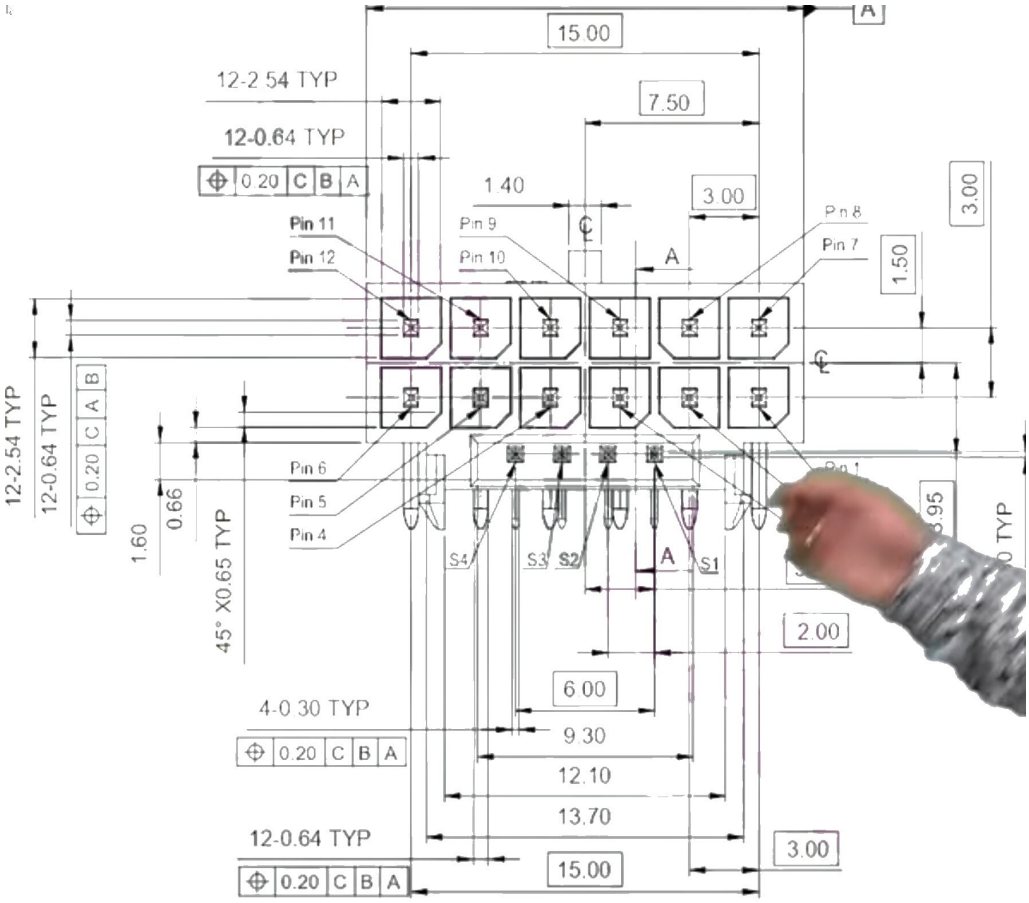
Here is a simple Example that can be adjusted for multiple purposes.
It will remove unwanted Artefacts - for example here a watermark - from a picture.

*© 2023 Theo Gottwald * https://www.smart-package.com*



->

© 2023 Theo Gottwald * https://www.smart-package.com



Dimension Tolerance, unless otherwise specified is: X.X = ± 0.25 mm, X.XX = ± 0.20 mm

And here is the Script:

Version 1: "Pixel by Pixel".
The structure of this Script is easy to understand and it can be modified for any case.

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\Igorslab.png
VAF.$$PIB=?exeloc\V1.png
ANA.Load|0|$$PIA
ANA.GetRes|0|$$XSZ|$$YSZ
FOR.$$YPO|0|$$YSZ
  PRT.$$YPO/$$YSZ
  FOR.$$XPO|1|$$XSZ
    ANA.GetPixelRGB|0|$$XPO|$$YPO|$$RED|$$GRN|$$BLU
    CAL.$$ERG=($$RED>&D0)+($$BLU>&HD0)+($$GRN>&HD0)
    IVV.$$ERG>2
      'ANA.getpixelcolor|1|$$XPO|$$YPO|$$PIX
      $$PIX=&HFFFFFF
      ANA.Setpixelcolor|0|$$XPO|$$YPO|$$PIX
    EIF.
    CAL.$$ERG=($$RED>&HC0)+($$RED<&HF0)+($$GRN>&HA9)+($$GRN<&HE0)+($$BLU>&HB9)+
    IVV.$$ERG>5
      $$PIX=&HFFFFFF
      ANA.Setpixelcolor|0|$$XPO|$$YPO|$$PIX

  NEX.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
NEX.
CAL.$$TIM=#time#-$$TIM
MBX.Used Time in Seconds: $$TIM
ANA.Show|0!
ANA.Save|0|$$PIB
ENR.
```

Depending on the number of Pixels, the Script will take quite some time (20 Minutes for a picture of size 1900x1700) due to the use of not optimized commands.
Therefore this method is perfectly flexible for any automated picture processing need.

Version using ICC.

You can do the same process using the specialized command ICC.:this way its twice as fast. The Script below uses only 8 Minutes compared to the Script above that uses 20 Minutes for a 1900x1700 (3 MP) Picture Process.
Note that using the "0" in the RMax-Field will set R/G/BMax to &HFF.

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\Igorslab.png
VAF.$$PIB=?exeloc\V1.png
ANA.Load|0|$$PIA
ANA.GetRes|0|$$XSZ|$$YSZ
$$PIX=&HFFFFFF
FOR.$$YPO|0|$$YSZ
  PRT.$$YPO/$$YSZ
  FOR.$$XPO|1|$$XSZ
    ICC.0|$$XPO|$$YPO|&HD0|0|&HD0|0|&HD0|0
    ANA.Setpixelcolor|0|$$XPO|$$YPO|$$PIX
  EIF.
  ICC.0|$$XPO|$$YPO|&HC0|&HF0|&HA9|&HE0|&HB9|&HE9
  ANA.Setpixelcolor|0|$$XPO|$$YPO|$$PIX
EIF.
NEX.
NEX.
CAL.$$TIM=#time#-$$TIM
MBX.Used Time in Seconds: $$TIM
ANA.Show|0!
ANA.Save|0|$$PIB
ENR.
```

There is another command that can be used to speed up this process that is RIC..
Using this command, will shorten the code more and make it even faster.
While the result is the same, this Script will only take 6 Minutes to process the same picture.

Version using RIC.

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\Igorslab.png
VAF.$$PIB=?exeloc\V1.png
ANA.Load|0|$$PIA
ANA.GetRes|0|$$XSZ|$$YSZ

3.55.3 Additional Commands

Here you can find some more useful commands, that mostly do not use the newer technologies.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.3.1 CAP. - Capture Screenshot

MiniRobotLanguage (MRL)

CAP. Command

Capture Screenshot

Intention

This command will capture a Screenshot from a specified part of a window or the complete Computer-Screen.

1. Capture Screenshot of complete Desktop into Clipboard

This will include all Screens on a Dual-Screen System.

```
CAP.Source=desktop;Target=clipboard
ITO.
  DBP.Desktop Capture failed!
EIF.
ENR.
```

2. Capture Screenshot of complete Desktop into a file

This will include all Screens on a Dual-Screen System. They will be saved as a single ".bmp" (BItmap-) File. You can currently not choose any other picture-format then "-bmp".

```
VAF.$$FIL=?desktop\Screenshot.bmp
CAP.Source=desktop;Target=file|$$FIL
ITO.
  DBP.Desktop Capture failed!
EIF.
ENR.
```

3. Capture Screenshot of complete Desktop into a variable

This will include all Screens on a Dual-Screen System. They will be saved as a single Screenshot into the given Variable.

```
CAP.Source=desktop;Target=var|$$VAR
ITO.
  DBP.Desktop Capture failed!
EIF.
LEN.$$VAR|$$RES
DBP.Size of Picture is $$RES Bytes.
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

4. Capture Screenshot of actual window into Clipboard/file/variable

If you just locate any window, or child window, you can take a screenshot into the System-Clipboard.

```
STW.ct|#32770|Basic-NAV Matrix 02
CAP.
ENR.
```

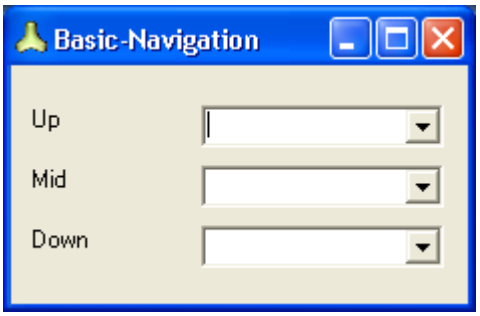
By using the Prototype "`Target=file`" or "`Target=var`" you can direct the output wherever you want it to go.

Capturing a window, you will see that only the so called "Client Area" is captured. That is the Area where the program draws its controls. The Title-bar and the window border (that is the so called "Non Client Area") is been clipped.

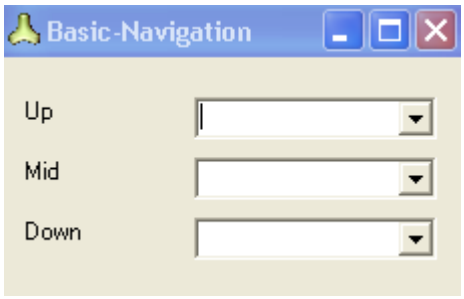
5. Capture Screenshot of actual window with Frame/Non Client Part

To capture the complete window, that includes the "Non-Client" Part of the window, use the "Frame=" Prototype. You can choose between

`Frame=Full`



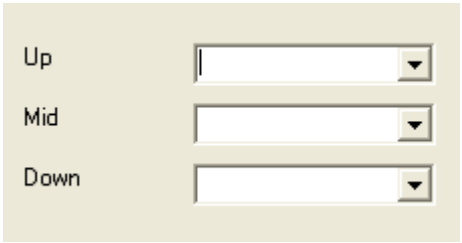
`Frame=Title`



Like this:

```
STW.ct|#32770|Basic-NAV Matrix 02
CAP.frame=full
ENR.
```

If you omit the "`Frame=`" or if you specify "`Frame=no border`", then you get the Snapshoot of just the Client-Area, like this:



`Frame=no Border` *(default)*

6. Capture Screenshot using Screen-Coordinates

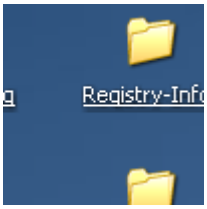
*© 2023 Theo Gottwald * https://www.smart-package.com*

To capture a screenshot using Screen-Coordinates, you can specify this:

```
CAP.Source=Screen-Coords|100,150,200,250
```

or something like this:

```
$$FIL=?desktop\Screenshot.bmp
CAP.Source=Screen-Coords;Target=File|100,150,200,250|$$FIL
```



Then you will get a Screenshot from these screen-coordinates. Screen-Coordinates should be avoided in most places. Prefer using Window-Coordinates instead.

7. Capture Screenshot using Window-Coordinates

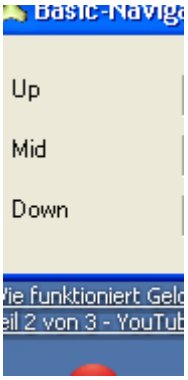
To capture a screenshot using Window-Coordinates, you can specify this:

```
STW.ct|Form1_Class|Basic-Navigation
CAP.Source=Window-Coords|100,150,200,250
```

or if you want to use a file:

```
$$FIL=?desktop\Screenshot.bmp
STW.ct|Form1_Class|Basic-Navigation
CAP.Source=Window-Coords;Target=File|10,15,100,200|$$FIL
```

Note that internally the Window-Coordinates are been converted to Screen-Coordinates, and the screenshot is taken from the desktop. Therefore, if the given Area is larger then the window, you will see what was behind in the screenshot.
Here is the picture from the example above:

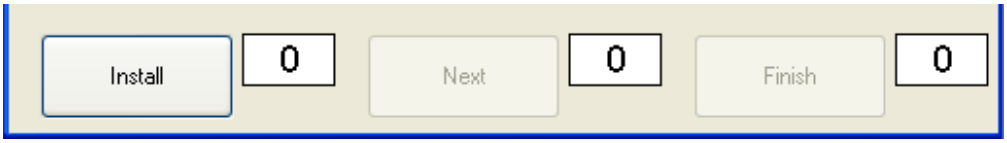


8. Capture Screenshot specifying a window-handle

To capture a screenshot using a resolution independent, yet defined part of a window, you can use Quadrant coordinates (`A1-D4`) like this:

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Will place the scrrenshot in the Clipboard
STW.ct|PBWindowClass:0|BCS - Testform
CAP.Source=wc|{D1,D4}
ENR.
```



You can combine these Prototypes, to snapshot to a file or to a variable.However any "Frame=" Prototype will be ignored in this case. Instead the Full window is taken as base-area.

Syntax

CAP.P1|P2[|P3][|P4]

Parameter Explanation

P1 - Prototype-String in readable format can contain this values:

Source=

- handle - use a window handle in **P2.** Use **P3** for Target.
- window - will use actual child- or topwindow or selected object. **P2** is for target,
- desktop - will make a snapshoot of the complete desktop. **P2** is for target,
- screen-coords - You can give screen-coordinates in **P2**. Use **P3** for Target.
- window-coords - You can specify window-coordinates or Quadrants in **P2**. Use **P3** for Target.

Frame=

- no Frame
- Full
- Title

Target=

- Clipboard - You can paste the content of the Clipboard directly into your favorite graphics or office program.
- File - you need to specify a complete file-path and name in the last (Target-) Parameter.
- Variable - Use this, if you need the binary data from the screenshot in a variable.
  For example to do yourself a color-analysis.

Putting a Screenshot inside a Variable will produce a Variable with this format insider the Variable:

- 8 Byte (4 Byte X- and 4 Byte Y-Size Information)
- XSize * YSize * 4 Byte Color-Information (4 Byte per Pixel)

© 2023 Theo Gottwald * https://www.smart-package.com

This format is not compatible with the RRA.-Bitmaps, as these are prefixed with 8 Bytes of Origin-Positional Information.

```
Depending on the given Text-Prototypes, the other parameters
may or may not be needed.
```

P2 – (optional) - In case that a handle, or any sort of coordinates need to be specified, these will be in **P2**. Any additional Target-Parameter like Filename or Variable will then be in **P3**. If P2 is not needed for the Source, the P2 will hold the Destination Parameter and P3 is not needed. In case you use "**Source=window**" then you can specify resolution independent Quadrant-Coordinates 356 at this place.

```
CAP.Source=wc|{D2,D4}
```

Doing so will however make the robot ignore any given "Frame=" Prototype. In this case the "Frame=Full" will automatically be used.

P3 - (optional) – Holds the Target variable, if **P2** is needed to specify the Source (Coordinates, handle). Then **P3** will hold the Destination value (Variable-Name, File-Name). In case the Source does not need any specifications, then **P2** will hold the Target-Information and **P3** must be omitted.

Example

```
'**********************************
' CAP.-Sample
'**********************************
CAP.Source=desktop;Target=var|$$VAR
ITO.
  DBP.Desktop Capture failed!
EIF.
LEN.$$VAR|$$RES
DBP.Size of Picture is $$RES Bytes.
ENR.
```

Remarks

Putting a Screenshot inside a Variable will produce a Variable with this format insider the Variable:
- 8 Byte (4 Byte X- and 4 Byte Y-Size Information)
- XSize * YSize * 4 Byte Color-Information (4 Byte per Pixel)

This format is not compatible with the RRA.-Bitmaps, as these are prefixed with 8 Bytes of Origin-Positional Information.

You can display the saved bitmaps, using the UCV.-command.

```
$$FIL=?desktop\Screenshot.bmp
STW.ct|Form1_Class|Basic-Navigation
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
CAP.Source=Window-Coords;Target=File|10,15,100,200|$$FIL
UCV.ldi|$$FIL
PAU.5
```

Limitations:

If Windows is unable to reserve the Memory for the Screenshot-Operation, the operation will fail and the timeout-flag will be set. In this case you can try again with a freshly booted system. It may also help, if you just screenshot a smaller area instead of the whole desktop.
In case the Screenshot command fails (for low system resources) you will have the timeout-flag set. Otherwise it will be cleared.

```
CAP.
ITO.
  DBP.Desktop Capture failed!
ELS.
  DBP. Capture was successful.
EIF.
```

3.55.3.2 CCD. - Calculate Color Distance

MiniRobotLanguage (MRL)

CCD. Command

Calculate Color Distance

Intention

This command will tell you, how similar two colors are. For this the command calculates the "Color-Distance" between these two given colors.
There are several Modes of operation for the `CCD.`-Command, all these may give different results. You may use 3.4 System-Colors 349 as parameter with this command.

1. Color Distance on TOS

```
' White Color
$$COA=&HFFFFFF
' Black Color
$$COB=&H000000
CCD.$$COA|$$COB
DBP.$$000
ENR.
```

`Result is:` **`441673`** `which is the` **`maximum Color Distance`** `in this mode.`

2. Color Distance to Variable.

This is exactly the same, just that we put the result into a variable instead of using the stack.

```
$$COA=&HFFFFFF
$$COB=&H000000
CCD.$$COA|$$COB|$$COD
DBP.$$COD
ENR.
```

3. Color Distance in IEE-FP-Format

This is exactly the same, just that we put the result has a maximum precision.

```
$$COA=&HFFFFFF
$$COB=&H000000
CCD.$$COA|$$COB|$$COD|F
DBP.$$COD
ENR.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
Result is: 441.67295593006371

Here are some other results:

&HFFFFFF/&HFFFFFE = 1
&HFFFFFF/&HFFFEFE = 1.41421356237309505
```

This way you can really get the most accurate color distance between two colors.

4. Color Distance as percentage from 0% to 100%.

This is exactly the same, just that we get the result as a percentage from 0% to 100%.
Fractions will not be calculated, as they will also not be used in places where such a color tolerance can be specified.

```
$$COA=&HFFFFFF
$$COA=&HFFFFFF
$$COB=&H000000
CCD.$$COA|$$COB|$$COD|P
DBP.$$COD
ENR.

Result is: 100
```

1. Extract Object from known Background using CCD. as a Tolerance-Factor
Using compressed Formats you will need to apply a Tolerance.
We can do this, using the CCD.-Command.
Here we use a Color-Distance of 5%, you can see that sharp borders make trouble.

```

Here we use a known Background to extract Sarah from the second Picture into the third Picture with yellow background.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Because we used a ".jpg"-File we still have some artefacts when using a Color-Distance Value of only 5%. In the second Picture we use a value of 10%. This will remove some problems and produce some other.
Thats why you should not use compressed Images for this sort of operations.

Syntax

CCD.P1|P2[|P3][|P4]

Parameter Explanation

P1 - Color A to calculate the distance from.
You can use 3.4 System-Colors 349 values like S1,S2 etc.

P2 - Color B to calculate the distance to
You can use 3.4 System-Colors 349 values like S1,S2 etc.

P3 - (optional) - Variable for the result. If omitted, TOS is used.

P4 - (optional) - Can be omitted then a integer result is delivered,
which is in the range from 0 to 441673.
P - Calculates a percentage result between 0 and 100
F - Calculates a Extended precision result. This is between 0 and 441.67295593006371

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' CCD.-Sample
'**********************************
'
$$COA=&HFFFFFF
$$COB=&H0
CCD.$$COA|$$COB|$$COD|P
DBP.$$COD
ENR.
```

Remarks

CCD. is a speed-optimized Operation that will only use 180 to 200 Ticks.

Limitations:

-

3.55.3.3 CCV. - Color Conversion

MiniRobotLanguage (MRL)

CCV. Command

Convert and split RGB/BGR Color

Intention

This command will help you to handle the Red,Green and Blue Values of 24/32 bit Colors.
There are several Modes of operation for the `CCV.`-Command.

Using the "H" and "K"-Modes, you can use the command to convert a decimal number to Hexadezimal (HEX) Color values.

Using other Modes (X,Y,U and V) you can use the command to generate random numbers and colors.

1. Convert RGB-Color to BGR Color
```
CCV.BGR|$$RGB|$$BGR
```

2. Convert BGR-Color to RGB Color
```
CCV.RGB|$$BGB|$$RGR
```

```
3.Convert Color value into Hexadezimal
CCV.H|$$COL|$$HEX

4.Swap R/B Color value and convert into Hexadezimal
CCV.K|$$COL|$$HEX
```

Here is a Sample script, using both features:

```
$$RGB=&H00FF10
CCV.BGR|$$RGB|$$BGR
CCV.H|$$BGR|$$RES
DBP.$$RES
ENR.
' Result is: &H10FF00
```

Also you can use the CCV. command to mix the RGB-parts into one color value.

5. Convert RGB-Color parts to BGR Color
```
CCV.BGR|$$RED,$$GRN,$$BLU|$$BGR
```

6. Convert BGR-Color parts to RGB Color
```
CCV.RGB|$$RED,$$GRN,$$BLU|$$RGR
```

Here is a Sample script, using this features:

```
$$RED=&H00
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$GRN=&HFF
$$BLU=&H10
CCV.BGR|$$RED,$$GRN,$$BLU|$$BGR
CCV.K|$$BGR|$$RES
DBP.$$RES
ENR.
' Result is: &H10FF00
```

Third you can use the `CCV.` command to split a color value into its R,G and B part.

```
7.Split Color value into RGB values
CCV.Split|$$COL|$$RED,$$GRN,$$BLU

8.Split Color value into BGR values
CCV.T|$$COL|$$RED,$$GRN,$$BLU
```

Here is a Sample script, using this features:

```
$$RGB=&H00FF10
CCV.T|$$RGB|$$RED,$$GRN,$$BLU
$$RES=$$RED-$$GRN-$$BLU
DBP.$$RES
ENR.
' Result is: 0-255-16
```

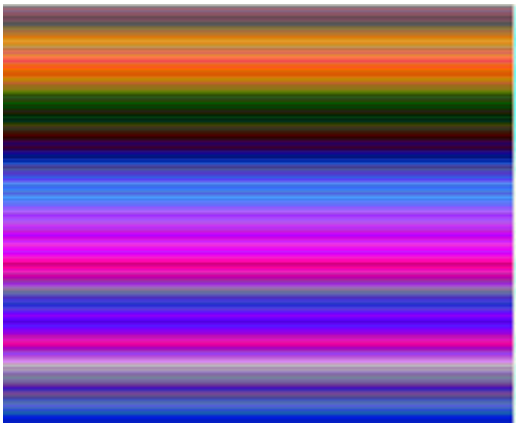
Fourth `CCV.` can be used to generate Random colors. There are are two random-number algorithms. The results are best described with these two pictures.

Algo 1 will use total random colors that are in no relation to the previous color.

Here is thesample program for algo 1:

```
UCV.nbi
UCV.cov
FOR.$$Y00|1|500
  CCV.x|$$RED,$$GRN,$$BLU
  CCV.r|$$RED,$$GRN,$$BLU|$$RGB
  UCV.fgr|$$RGB
  UCV.Line|0,$$Y00|500,$$Y00
NEX.
PAU.3
ENR.
```

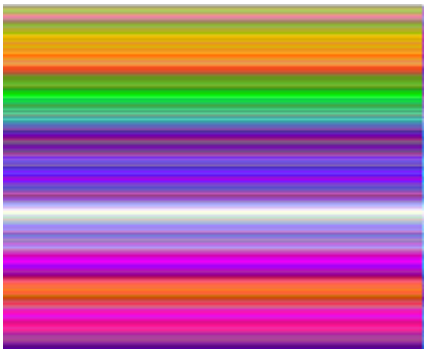
© 2023 Theo Gottwald * https://www.smart-package.com



Algo 2 will generate random numbers that are near the previous random number by the given additional value. Here a value of 25 was used.

Here is the sample program for algo 2, change the value of `$$VAL` to see the differences:

```
'#SPI:forcewrite
$$VAL=25
UCV.nbi
UCV.cov
FOR.$$Y00|1|500
 ' CCV.x|$$RED,$$GRN,$$BLU
  CCV.y|$$VAL|$$RED,$$GRN,$$BLU
  CCV.r|$$RED,$$GRN,$$BLU|$$RGB
  UCV.fgr|$$RGB
  UCV.Line|0,$$Y00|500,$$Y00
NEX.
PAU.3
ENR.
```



Here a value of 35 was used.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

CCV.[P1][|P2][,P3]

Parameter Explanation

P1 - prototypes

```
 RGB - convert input to RGB
     CCV.RGB|$$RED,$$GRN,$$BLU|$$COL
     CCV.RGB|$$INP|$$COL
     You can use 3.4 System-Colors 349 values like S1,S2 etc.

 BGR - convert input to BGR
     CCV.BGR|$$RED,$$GRN,$$BLU|$$COL
     CCV.BGR|$$INP|$$COL
     You can use 3.4 System-Colors 349 values like S1,S2 etc.

 Split - Split Input into RGB-values
     CCV.Split|$$COL|$$RED,$$GRN,$$BLU

 T - Split into RGB and Swap R and B value
     CCV.Split|$$COL|$$RED,$$GRN,$$BLU

 H - Convert number to Hexadezimal
     CCV.H|$$NUM|$$RES
     You can use this to see the values of 3.4 System-Colors 349
     like S1,S2 etc. Example:
     ' Show value od System color S2
     CCV.H|S2|$$HEX
     DBP.$$HEX

 K - Swap R and B value and Convert number to Hexadezimal
     CCV.K|$$NUM|$$RES

 X - Generate random color (algo 1)
     CCV.X|$$RED,$$GRN,$$BLU

 Y - Generate random color (algo 2 using $$VAL)
     CCV.Y|$$VAL|$$RED,$$GRN,$$BLU

 U - Generate random color (algo 1)
     CCV.U|$$COL

 V - Generate random color (algo 2 using $$VAL)
     CCV.U|$$VAL|$$COL
```

The parameters P2 and P3 depend on the mode of operation.

Example

```
'***********************************
' CCV.-Sample
'***********************************
'
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
CCV.RGB|&HFF,&H00,&HFF|$$RES
DBP.$$RES
CCV.S|16711935|$$RED,$$GRN,$$BLU
DBP.$$RED,$$GRN,$$BLU
ENR.

'**********************************
' CCV.-Sample
'**********************************
'
$$RGB=16711939
CCV.RGB|$$RGB|$$BGR
DBP.$$BGR
ENR.

'**********************************
' CCV.-Sample
'**********************************
'
'#SPI:forcewrite
$$VAL=35
UCV.nbi
UCV.cov
FOR.$$Y00|1|500
 ' CCV.x|$$RED,$$GRN,$$BLU
  CCV.y|$$VAL|$$RED,$$GRN,$$BLU
  CCV.r|$$RED,$$GRN,$$BLU|$$RGB
  UCV.fgr|$$RGB
  UCV.Line|0,$$Y00|500,$$Y00
NEX.
PAU.3
ENR.
```

Remarks

When specifying Colors as hexadecimal values, prefer using this format:
`&H0FFFFFF.`
`RRGGBB`
If you omit the "`&H0`" or just use the "`&H`" this may lead to strange results when the values is converted to decimal. The reason for this is::
`&HFFFF is -1 (conversion to signed number using "&H")`
while
`&H0FFFF is 65535 (conversion to unsigned number using "&H0")`
as expected.

Limitations:

-

3.55.3.4 DPI. - Get Desktop DPI-Settings

MiniRobotLanguage (MRL)

DPI. Command

Get Desktop Dots per Inch

Intention

`DPI.` will give you the

- `DPI.` X and Y values of the desktop
- `DPI.` X and Y-Ratio

Usage is simple. Using DPI. without any parameters will place the `dpi-X` and the `dpi-Y` values on Top of Stack.

```
DPI.
' Show TOS
DBP.$$000
ENR.
```

To get the X- and Y- Scaling Ratios, just add an **S**-prototype.

```
DPI.s
DBP.$tos$
ENR.
```

Now you can add prototypesand variables to get the results into variables instead into the TOS. Examples:

```
DPI.$$XDP,$$YDP
DBP.$$XDP,$$YDP
ENR.
```

and

```
DPI.s|$$XDP,$$YDP
DBP.$$XDP,$$YDP
ENR.
```

If you specify only one variable, you will get both values, separated with a comma into that variable. Examples:

```
DPI.d|$$XDP
DBP.$$XDP
ENR.

DPI.s|$$XDP
DBP.$$XDP
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

There is a special mode for `DPI.`:

```
DPI.$$XDP
DBP.$$XDP
ENR.
```

This way you can get just the x-dpi-value into a variable.As both values are often equal, it may be enough for most scripts.

Hint:
If you just want to check if the Target PC has a specific DPI (dots per Inch) -Setting, prefer the `IDP./NDP.` command.

Syntax

DPI.[P1][|P2][,P3]

Parameter Explanation

P1 **-** (optional) prototype

Prototype can be omitted or any of:

```
 d - get Screen dpi (default, can be omitted)
 s - get screen dpi-ratios (scaling)
 x - get x-dpi value
 y - get y-dpi value
```

If the **s**-prototype is omitted, **dpi**-values are returned, otherwise scaling-ratio values. The sequential order of the prototypes does not play a role in this command. The first variable will always hold the x- and the second variable may only hold the y--results.

P2 **-** (optional) - variable to store the result, depending on the prototypes

P3 **-** (optional) - variable to store the result, depending on the prototypes

Speed in Ticks:

This command uses typically around 1900 Ticks.

Example

```
'**********************************
' DPI.-Sample
'**********************************
DPI.$$XDP
DBP.$$XDP
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
END.
```

Remarks

-

Limitations:

-

See also:

- 1.8. Selecting the Application (Topwindow) 150
- IDP. / NDP. - If desktop dpi Setting 1126
- IPC. / NPC. - If-Pixel-Colour 1816
- GPC. - Get-Pixel-Colour 1801

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.3.5 IDP. / NDP. - If desktop dpi Setting

MiniRobotLanguage (MRL)

IDP. Conditional Statement

If Desktop Dots per Inch

Intention

Conditional Statement. Test if the desktop dpi-Settings are equal to your specified values. You can test the

- `DPI.` X and Y values of the desktop
- `DPI.` X and Y-scaling Ratio of the desktop

against values that you specify. The condition will evaluate TRUE if the Desktop DPI-values match those values that you have specified.

Usage is simple. Using `IDP.` without any parameters will test the `dpi-X` and the `dpi-Y` values against the default value of 96 dpi (WinXP). Example:

```
IDP.
  DBP.Yes we have 96 dpi
ELS.
  DBP.No we haven't 96 dpi
EIF.
ENR.
```

The next step would be to specify the dpi values we want to compare with. If you specify just one value, then both the X- and the Y-desktop dpi will be compared to that value.
If any of these does not match the 96 dpi, the script will decide FALSE and continue with `ELS./EIF.`

```
IDP.96
  DBP.Yes we have 96 dpi
ELS.
  DBP.No we haven't 96 dpi
EIF.
ENR.
```

Then you can specify both values, the x- and the y-dpi-value. And test for both. Like this:

```
IDP.96,96
  DBP.Yes we have 96 dpi
ELS.
  DBP.No we haven't 96 dpi
EIF.
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Now you can ass additional functionality to your script by adding prototypes. This will only compare the x-dpi settings against the specifies value.

```
IDP.x|96
  DBP.Yes we have 96 dpi
ELS.
  DBP.No we haven't 96 dpi
EIF.
ENR.
```

Also you can add an y-prototype and test both values.

```
IDP.xy|96,96
  DBP.Yes we have 96 dpi
ELS.
  DBP.No we haven't 96 dpi
EIF.
ENR.
```

Then you can specify the "**s**"-prototype to make the script test the ratio of the scaling instead of the dpi-values.

```
IDP.s|1
  DBV.Yes we have a ratio of 1
ELS.
  DBV.No we haven't a ratio of 1
EIF.
```

adding the prototype "**e**" will make the robot compare both the x- and the y- values and only evaluate to TRUE, if both are equal. This way we know that both ratios are 1:

```
IDP.es|1
  DBV.Yes we have a ratio of 1
ELS.
  DBV.No we haven't a ratio of 1
EIF.
ENR.
```

The same is possible with dpi-values also:

```
IDP.e|96
  DBP.Yes we have 96 dpi
ELS.
  DBP.No we haven't 96 dpi
EIF.
ENR.
```

Hint:
If you want to get the X-and the Y-value of the Target PC for calculations, prefer the `DPI.` command.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

IDP.P1[|P2][,P3] … ELS. … EIF.

Parameter Explanation

P1 **-** (optional) prototype

Prototype can be omitted or any of:

```
 d - get Screen dpi (default, can be omitted)
 s - get screen dpi-ratios (scaling)
 x - get x-dpi value
 y - get y-dpi value
```

If the **s**-prototype is omitted, **dpi**-values are used, otherwise scaling-ratio values. The sequential order of the prototypes does not play a role in this command. The first variable will always be compared against the x- and the second variable may be compared against the the y--values.

The usage of **P2** and **P3** depends on the prototypes

P2 **-** (optional) - variable holding the value to compare the actual
dpi-settings of the desktop with.

P3 **-** (optional) - variable holding the value to compare the actual
dpi-settings of the desktop with.

Example

```
'***********************************
' DPI.-Sample
'***********************************
DPI.$$XDP
DBP.$$XDP
ENR.
END.
```

3.55.3.6 QFR. - Quadrant from RECT

MiniRobotLanguage (MRL)

QFR. Command

Get Quadrant Coordinates from Rect

Intention

The QFR-Command will take any Rectangular Area, and calculate the Coordinates of a Quadrant-Rect inside of this Area.
This can be used to locate graphical Elements in a form, control or any part of a form.

`QFR.` understands Quadrant Coordinates, see 3.6 Using Quadrant-Coordinates 356.
It will take the last localized Object as base for the Quadrants. This way, you can split any type of objects or control in an resolution independent way into 16 Quadrants.

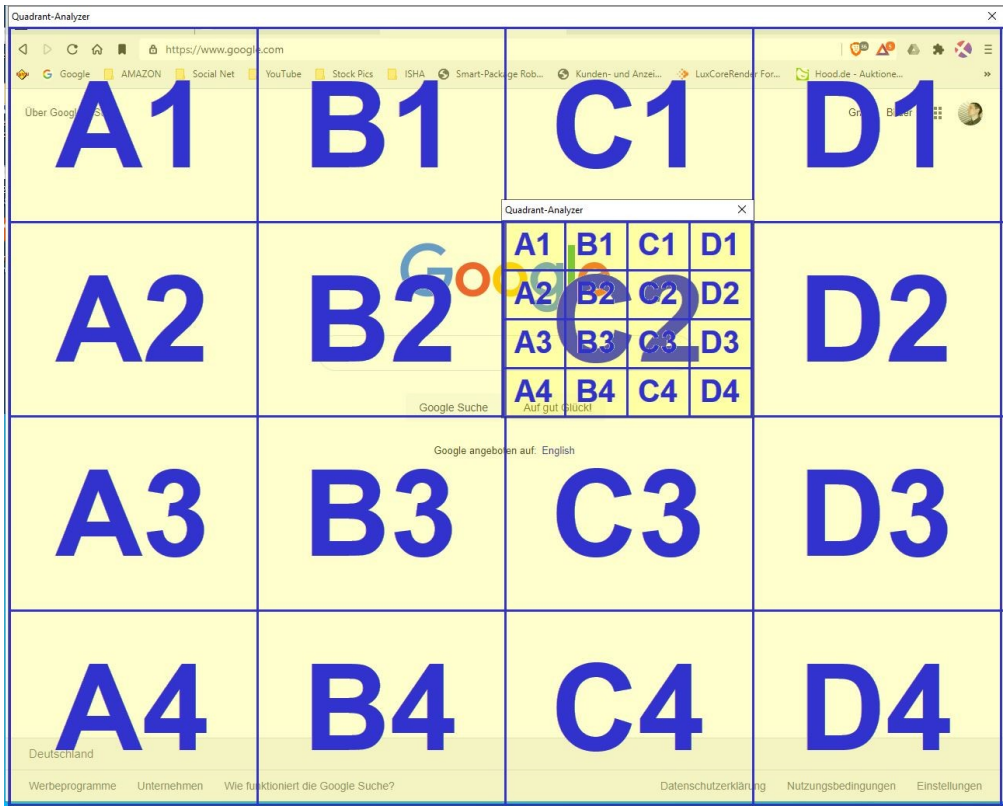
Depending on the Parameters you will normally use a 4x4 Quadrant-System.
Using the optional Parameter **P5**, `QFR.` can handle any Quadrant-System from 2x2 to 9x9.

The command is in a way designed that you can then use the result-from `QFR.` as Input for another `QFR` (nested Quadrants).

What is a Quadrant?
In the following picture you can see the Quadrants of a Topwindow.

What is a Quadrant good for?
Quadrants are resolution-independent. If you can click Buttons using Quadrants, the result will be resolution independent, as the original rectangle (for example a Top-Window) will always be divided into the same amount of Quadrants..
Using the "`o{..}`"-Option, you can split Elements that have been located, for example in a Treeview, or custom Control.
This way you can click parts of controls that can not be subdivided in other ways.

*© 2023 Theo Gottwald * https://www.smart-package.com*



This are the 4x4 Quadrants of a Window. They range from A1 to D4.

How do i Click into a Quadrant?
You can use the `GRM.`-Command to calculate the Middle-Point inside the Quadrant. Here is an example.

```
QFR.|{A1}|$$REC
GRM.$$REC|$$MID
MMV.$$MID
```

Can i combine multiple Quadrants into one?
You can combine multiple Quadrants, note that the resulting Quadrant will always be rectangular.
For example, if you combine `{A1}` and `{B2}` then the resulting Quadrant will automatically also include `{A2}` and `{B1}`.
Because the result needs to be rectangular. Technically you would write:

```
QFR.|{A1,B2}|$$REC
```

To combine these two Quadrants. Note that there is no limit on how many Quadrants you wish to combine.

```
QFR.|{A1,B2,C3,D3}|$$REC
```

Will also work as expected.

Can i combine multiple QFR-Calls into one?
You can combine multiple Calls into one. For this you can just enter the Quadrants in a sequential way.

*© 2023 Theo Gottwald * https://www.smart-package.com*

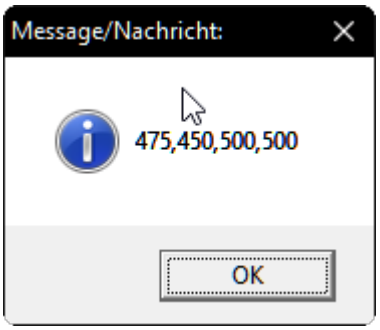
```
QFR.|{A1}{B1}|$$REC
```

Will calculate Quadrant `A1`, and then inside `A1` calculate the Quadrant `B1`.

```
' This is a nested QFR. it will calculate a Quadrant D4 inside
a Quadrant D3,D4.
QFR.100,100,500,500|{D4}{D3,D4}|$$RES
MBX.$$RES

' This is the same like the statement above in two QFR.-Calls
QFR.100,100,500,500|{D4}|$$RES
QFR.$$RES|{D3,D4}|$$RES
MBX.$$RES
```

In both cases this is the result.



How do I specify the Source-Rectangle, from which the Quadrants are calculated?
There are multiple ways to specify them.

1. Variation: Just specify nothing. Doing so, **`QFR.`** will take the last localized Rectangle (window or whatever).
Note that often Windows are moved after they have been localized. In such case this version of `QFR.` may use the "old" coordinates before the window was moved!

```
QFR.|{A1,A2}|$$REC|4
```

2. Variation: Specify "**c**","**w**","**t**" or Combinations of these.
Doing so, **`QFR.`** will take the last localized window "**w**", "**t**"-Top-Window and/or the "**c**"-Client-Coordinates of these windows.
Specifying just "c" will use the Client Coordinate of whatever window that was last localized.
Unlike Variation 1, this Variation will calculate the most actual window coordinates at the time of the Call to `QFR.`.

```
QFR.tc|{A1,A2}|$$REC|4
QFR.wc|{A1,A2}|$$REC|4
QFR.t|{A1,A2}|$$REC|4
QFR.w|{A1,A2}|$$REC|4
QFR.c|{A1,A2}|$$REC|4
```

3. Variation: Specify just the Screen-Coordinates of the Rectangle.

```
QFR.0,0,400,400|{A1,A2}|$$REC|4
' Result 0,0,100,200
```

4. Variation: Specify "**w**","**t**","**c**" and the Screen-Coordinates of the Rectangle.

© 2023 Theo Gottwald * https://www.smart-package.com

```
   ' Now the Coordinates are relative to the last located window.
QFR.w0,0,400,400|{A1,B1}|$$REC|4
```

5. Variation: Specify "**w**","**t**","**c**" and the Quadrant of the last localized window/Top-Window/Client-Area or Object.

```
' Now the Coordinates are relative to the last located
' Top-Window or Window or Client-Area or Object of these.
QFR.o{A1,A2}|{A1}|$$REC|4
QFR.tc{A1}|{A1,B2}|$$REC|4
QFR.w{A1}{A2-A4}|{A1,B2}|$$REC|4
```

More Examples:

```
QFR.0,0,400,400|{A1,A2,B2}|$$REC|4
' Result 0,0,200,200

' Return complete Windows-Rect (like GAR.)
STW.tc|PB|Testap
QFR.|{A1,D4}|$$REC
MBX.$$REC
' Get the Midpoint of that RECT
GRM.$$REC|$$MID
MBX.$$MID
```

`QFR.` can be used to get the Coordinates for other Pixel-Operations like:

- ILC. / NLC. - If Line Color 1805
- IRA. / NRA. - If Rect altered 1824
- RRA. - Remember Rectangular Area 1836
- and all such commands.

Syntax

QFR.[P1][|P2][|P3][|P4]

Parameter Explanation

P1 - (optional) *"`t`","`w`","`c`" or Combinations of these.*

And/or an Input-Rectangle. Format is: `x1,y1,x2,y2` if omitted, it will use the actual window or object rectangle.

Or you can specify Quadrant coordinates like `{A1}`.In such case these Coordinates are Screen-Coordinates unless

you prefix them with "`t`","`w`" or "`c`" or Combiantions of these.

If Parameter is omitted, it will take the last localized Object-rectangle as base for the Quadrants.

Generally the given coordinates stay in the Source-Coordinate-System.

If you input window-coordinates, the command will output window-relative coordinates.

P2 - (optional) Variable that contains the Quadrant(s) to compute the coordinates for.

© 2023 Theo Gottwald * https://www.smart-package.com

`QFR.` uses the 3.6 Using Quadrant-Coordinates 356.
Can be something like: `{A1} or {A2,A4} or {D4}` or multiple of these.
If you specify multiple Quadrants like `{A1}{A2,A4}{D4}` then the command will use the result of the first calculation
as Input for the next calculation.
This way you can split Quadrants in smaller pieces and calculate "`B4` inside of `D4`". There is no depth limit other
then a mathematical. If you omit **P2**, the command will use `{A1,D4}`.

P3 - (optional) Variable for the result. If omitted, TOS is used.

P4 - (optional) Using the optional Parameter **P4**, `QFR.` can handle any Quadrant-System from 2x2 to 9x9
To use Quadrants that are divided by 8, you would specify an "8".
`QFR.w0,0,400,400|{A1}|$$REC|8`

Example

```
' Use the Testapplication
STW.ct|PBWindowClass:0|TestApp
QFR.|{A1,D4}|$$LAA
GAR.$$LAB
MBX.$$LAA-$$LAB
ENR.

'-----------------------
' Listbox-Element will be divided in Quadrants
'
STW.ct|PBWindowClass:0|TestApp
SCW.nict|1|1029|ListBox|List-Item Nr.1
' Possible Commands are: LBE. (see help) | AGR.
LBE.List-Item Nr.6
' Holt Rect von Listbox
QFR.o{A1}|{A1-A4}|$$REC|4
' and move Mouse there
 GRM.$$REC|$$MID
 MMV.$$MID
```

3.55.4 ANA. - Imageworks

If you can not localize Controls in any way, you can now use the ANA.-Command to work on a graphical Patterns. This way you can localize things any way.

Also ANA. contains a lot of Graphic-commands that you can use for Batch-Image-Processing of Pictures.

Here are some general Informations that apply to all ANA.-Commands:

1. ANA gives you a Set of 20 Image-Registers.
In each command you can specify one or more Source-Registers, and sometimes also a destination register.

2. In most cases where you do not specify a destination register, the source register will be overweritten with the result of the operation.

3. You can copy or move content from one Image-Register to other Image Registers.

4. You can load an Image into these Registers or you can Snapshot a localized Window into these Registers
5. Then you can do several types of processing with these Images.
6. And finally you can save the pictures.

And:

7. ANA. contains commands for Patterns-Search. These commands are not simple Pattern-Searching Commands, but highly optimized commands that include a Fuzzy-Logic. This way you can also find things that do not look exactly like the pattern but "somehow".

Generally to use ANA. you will first need to fill the Image-Register(s) with some content. That will be processed in further steps.

We will call these "Image-Registers" in Short "IR".

You can use the first 20 Image Registers freely. There are some more Image-Registers available, but they are used by Operations internally (21-32).

The Blit-Command uses the GPU for fast Graphics-Operations. On some Operations there can be artefacts.
If you do not want these, you can use the "ANA.Logic" Command that uses the CPU.

Warning on Variables with Binary Content:
If you have Variables with Binary Content, or Picture-Content (like you get them from `ANA.ToVar`)
then please clear them before you use them as Return Variables for other ANA.-Commands.
Reason:
Generally all Variables that are given to the ANA.-Command are automatically resolved. Unless the Command is prefixed with a "#" (like `ANA.#FromVar`).
Now its possible that Binary Data that might be in a Variable, contains "`$$XXX`" Patterns,
and if these match with a real existing Variable, this could lead to endless Variable resolution.

© 2023 Theo Gottwald * https://www.smart-package.com

Therefore it makes sense that you clear all Variables that contain binary or picture-data before you use them with ANA.-Commands
other then those with a "#" in front of the Command-Name. The same can also happen with other commands then `ANA.`
If your Script hangs unexpectedly, this might be a reason.

Sample Image-Processing Script:

->

```
' Turning a b/w picture into a 3D-Logo
$$PAB=?exeloc\Pics\P3.jpg

$$BOR=4
CAL.$$BOB=$$BOR/2

IEF.$$PAB
  ANA.Load|1|$$PAB
  'ANA.Show|1!
ELS.
  MBX.File does not exist:$crlf$$$PAT
EIF.

ANA.GetRes|1|$$XPO|$$YPO
CAL.$$XPA=$$XPO+$$BOR
CAL.$$YPA=$$YPO+$$BOR

' Make a Resized Version of P3
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ANA.New|2|$$XPA|$$YPA|1
ANA.New|3|$$XPA|$$YPA

' Now mix Shiftzed and Resized Version
ANA.bsh|2|1|$$BOB|$$BOB|1
ANA.Invert|1
'ANA.bw|1|100
ANA.bw|2|600
ANA.Show|1!
ANA.Show|2!
ANA.Logic|3|1|2|A XOR B|RGB
ANA.Show|3!
'ANA.MixTar|1|2|2
ANA.Invert|3
ANA.Show|3!
ENR.

' Changing the first two lines like this, will produce the second picture:
$$BOR=2
CAL.$$BOB=$$BOR
```

IMPORTANT NOTICE about missing Administration Rights Effects

When you start the Script from an SPR-Editor that has NO Admin-Rights, you may not be able to load pictures
from the Standard Robot path because its below C\Programme (x86)\ and you need Admin-Access to load files there.
As a result you will get only BLACK PICTURES using ANA.Load.
So if you only get Black Pictures, try to use ADMIN-RIGHTS for the Script.

More Commands that are not yet documented:

```
ANA.SetMaxResults (no. of Results)

ANA.CompareBlock Target Index|Pattern Index|X-Pos Pattern|Y-Pos Pattern|Color To
Will put 2 Values on the TOS, TOS -> Number of Pixelhits, TOS-1 -> 0/1 if Error

ANA.ShowHits|Index IR with Snap|Size of Marker X|Size of Marker Y

ANA.ResetList

ANA.ResetResultsPack

ANA.SortResultsPack P1|P2
P1 - 0/1  (0 - Descending, 1 - Ascending Sort)
P2 - 0/1 (0 - Sort Y / 1 - Sort X)

ANA.GetResultItem P1|P2
P1 - Number of Item to get on TOS
P2 - 0/1 delete Item after get
```

Will place Items on the TOS:

```
0/1 - Error/Success
X,Y - Middlepoint of FoundRect
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
X1,Y1,X2,Y2 - Found Rectangle
Number of Source--Pattern (Multi-Find) or 1
Pattern-Size as String "8x8"

ANA.SnapFind1 P1|P2|P3|P4|P5|P6
P1 - Filepath Patternfile
P2 - Farbtoleranz
P3 - Pixel-Hits min.
P4 - 0/1 Debugmode
P5 - "0,0" Positionscorrection
P6 - Maximum Number of Finds
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.1 !The Human-Eye Recorder

Currently the following Pattern-Sizes are supported:

The following Pattern-Sizes are supported:

```
4x16
4x32
4x64
8x8
8x16
8x32
8x64
9x9
10x10
11x11
12x12
16x8
24x8
32x4
32x8
32x16
40x8
48x8
56x8
64x6
64x8
96x4
96x8
98x6
128x4
128x8
```

The "Debug-Flag"

The Debug Flag has been constantly enhanced during development. Currently the following Options are supported:

1 - Switch Debug Console ON

2 - Use "Snap again" during Search. This will update the Snapshot using the Parameters from the last taken Snapshot.

4 - Use "X-Ray Search". This will start an enhanced search that is more color-independent and takes much longer time.
Especially together with Option "64 -Extended Search" it may find a lot more results.
Using this Option, the most upper Line and the most left Line are ignored.
Therefore this Option will reduce the effective Pattern-Size by -1 in X- and Y-Direction.
For example a Pattern that was size "8x8" will be a Pattern size "7x7", this is important when you specify needed "Pixelhits".

8 - If added, this will disable one Layer of "Fuzzy-Logic". This Flag will make the Search more sensitive to small color-differences

© 2023 Theo Gottwald * https://www.smart-package.com

16 - If used, this Flag will internally invert the Images. Use it preferably with Option "4 - X-Ray Search".

32 - If used, this Flag will internally complement the Images. Use it preferably with Option "4 - X-Ray Search".

64 - "Extended Search". This search uses longer time, but returns more results. Use it preferably with Option "4 - X-Ray Search"

Using the Human-Eye Recorder and Pattern-Search Technology

Traditionally the SPR tries to find a Control or GUI-Element using the Windows- or Accessibilty-Properties.

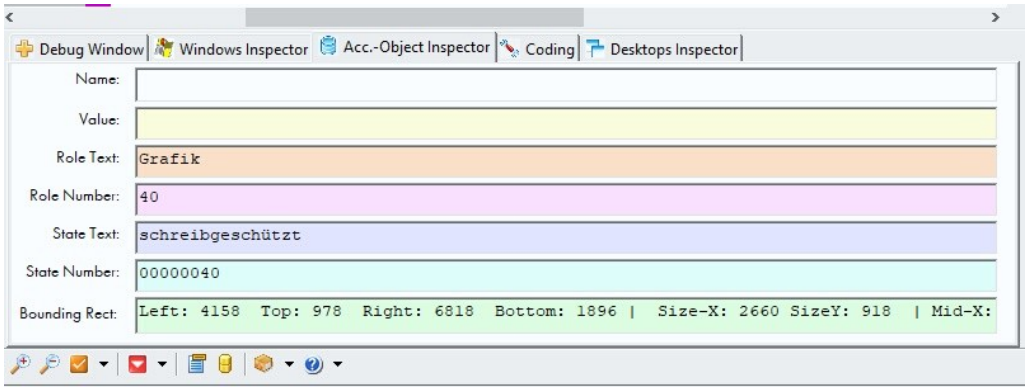
There are cases where GUI-Forms (for Example if they are Proprietary, Java-based, or in unsupported Browsers)
can not be analyzed, and therefore could traditionally not easily be accessed.

For all cases where you can not find anything using the traditional Technologies, the SPR now supports the "Human Eye Technology".

It does not analyze any "Windows internal structures". It does not need any PlugIns.
It will simply do what you also do: It will "Look at the Screen".

When do we use it?

The first thing you should do is, find out if you can use conventional Technology.
For this, the Acc.-Inspector which is built into the SPR-Editor gives you all needed Information.
If it does not reflect the Text in the Form, you are going to analyze, then the way to go is to use the new HE-Technology.



Using the Acc.-Inspoector you can easily find out if the conventional Acc.-Technology will work or not.

How does the HE-Technology work?

It will take Snapshot of the currently localized Window.

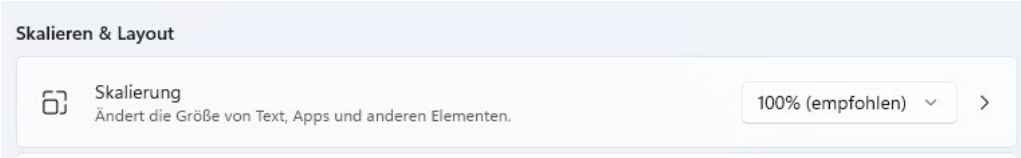
© 2023 Theo Gottwald * https://www.smart-package.com

Then it will simply find a Pattern that you provide.
It will work **very reliable** also on different Computers as long as the Application Sizing (dpi) is the same as on the recorded Computer.
This is because the internal "Fuzzy Logic" will recognize Patterns that are different from the original Pattern to a large degree.

When will it NOT work?
If the target System is set to 120% and the recording was made with 100% the current implementation will NOT work.
The reason is very Simple, in such case the Patterns do not match.

1. Best set the Scaling of your Screen to 100%, otherwise the HE-Recorder may not record the proper places.

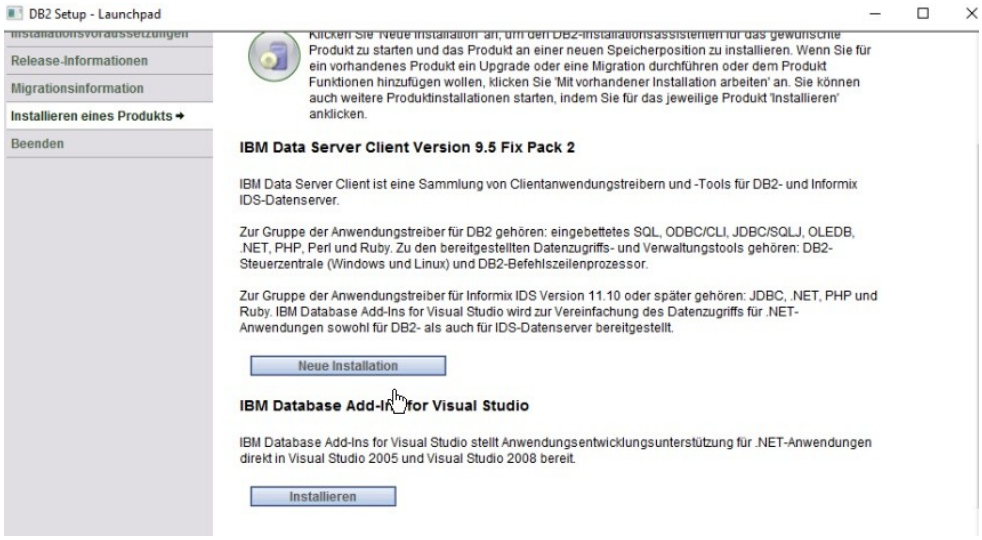
2. Under Windows 11 - generally - and under Windows 10 depending on what you are doing, the HE-Recorder NEEDS ADMIN_RIGHTS.
Otherwise you will see that only unicolored Boxes are recorded. This is a typical Sign that the HE-Recorder does not have sufficient Rights.

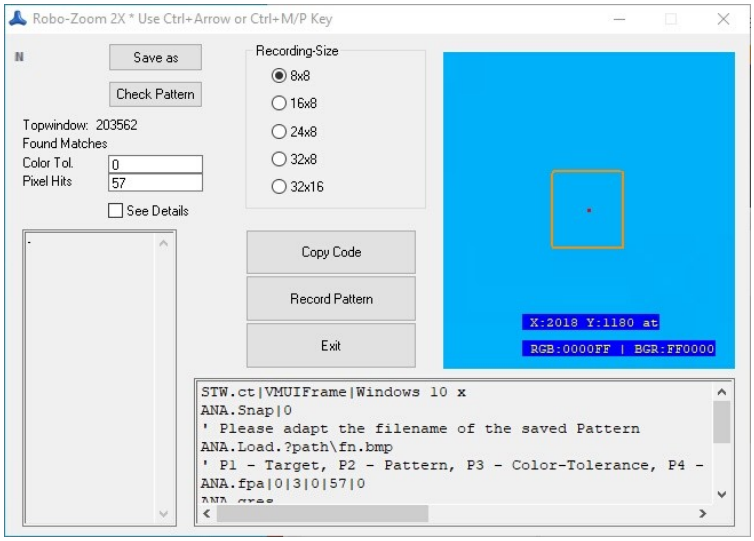


The whole Process is only a few steps.

1. Start The HE-Recorder, choose a Patternsize, for Example 16x8
2. Click on "Record Pattern"
3. Move the Mouse to the Pattern. Try to have the Pattern touch the left upper Border
4. Click the Left Mousebutton to record the Target Pattern
5. Click on "Check Pattern". A new Window opens and you can verify if the Parameters are perfect.
6. Now you can change the Parameters for "Color-Tolerance" and "Pixel-Hits"
7. When you are done, click on "Save as" and Save your recorded Pattern directly into the Project Folder.
8. Click the "Copy Code" Button to get the Code into the Clipboard.
9. Paste the Code into sour Script.

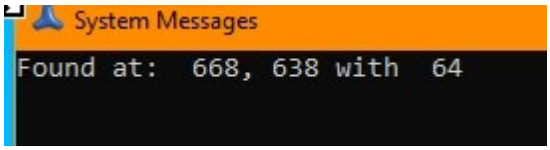
© 2023 Theo Gottwald * https://www.smart-package.com





This is the Form where we recorded a Buttonclick.

This is the HE-Recorder how he looks with the Record.



This is the Result when we click on "Check Pattern".

This is the Window that comes up when the "See Details" Button is checked.

*© 2023 Theo Gottwald * https://www.smart-package.com*

What does "Check Pattern" do?

"Check Pattern" will show you, if you have the right Parameters and get all needed Finds on a page.
You can change the "Color Tolerance" and the "Pixel Hits" Parameters to get different results.

What is the "Color Tolerance"?
The Color-Tolerance value is a number between 0 and 765 that will tell the Robot how "fuzzy" he should treat Pixels.
Even if the number is zero, there is still an internal tolerance that is generally applied. So in most cases zero will be fine.
In special cases (see example below) it may help to use a value up to 200. Higher values are not recommended.

What is the "Pixel Hits" Value?
Each Pattern has a number of Pixels, for example a 8x8 Pattern has a number of 64 Pixels.
A Pattern of size 24x8 has a Total of 192 Pixels. The Pixel Hits Values tells the Robot, how many hits are needed to accept the result.
So for a 8x8 Pattern, the value can be between 1 an 64 (while values below 32 make no sense).
And for a 24x8 Pattern the value can be 1 to 192. Again values lower then 50% of the total Pixel number do not make sense.

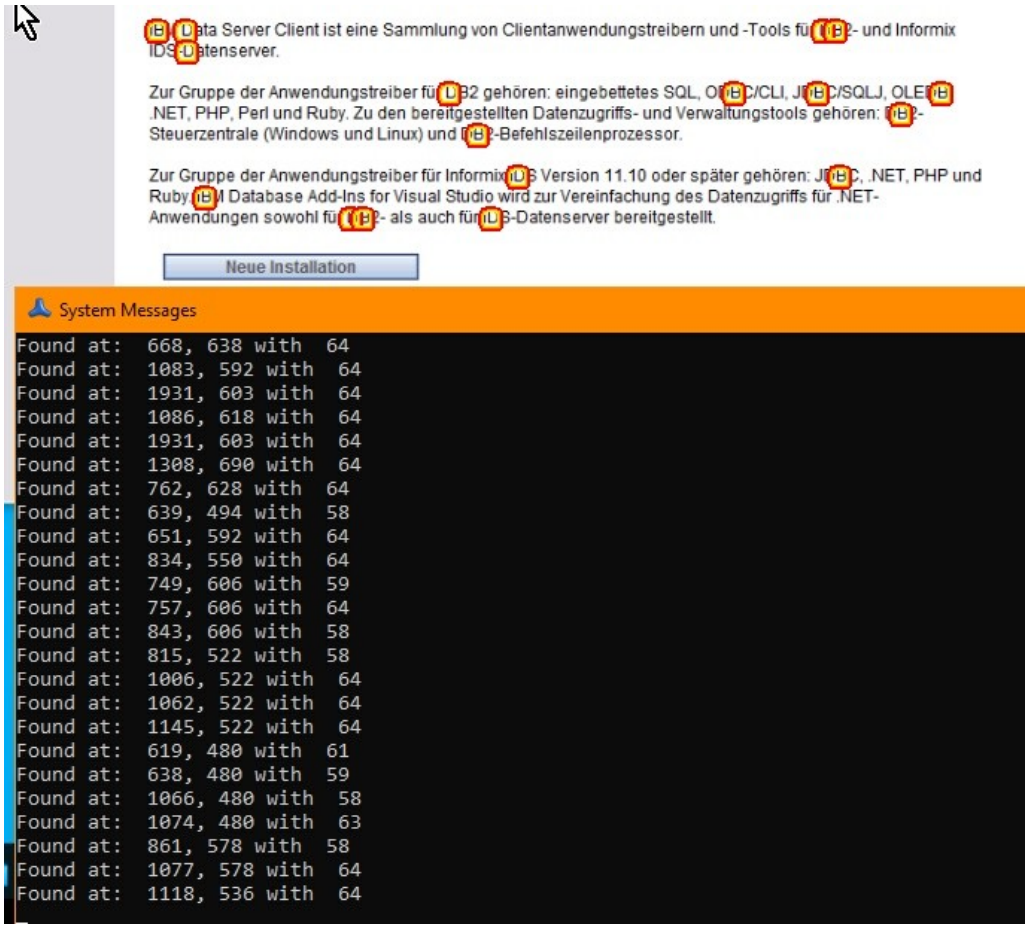
What is the "See Details" Checkmark good for?

If you use this Checkmark, a new Window will appear that show for each hit, how many Pixel-Hits it has.
In the example below (recorded with a very high Color Tolerance) we got several Hits below 64 Pixel-Hits.
So you can decide if you want these or not and adjust the Pixel-Hits - Value to lowest necessary number.

Always try to keep the Pixel Hits as high as possible to just get the results you want to get.

Also try to keep the Color Tolerance on zero if possible.

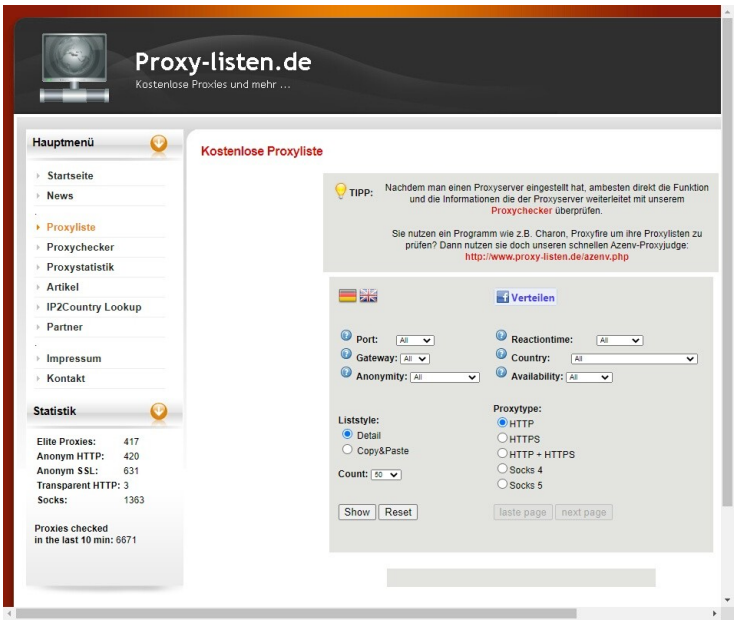
*© 2023 Theo Gottwald * https://www.smart-package.com*



Problems that can happen and the solution

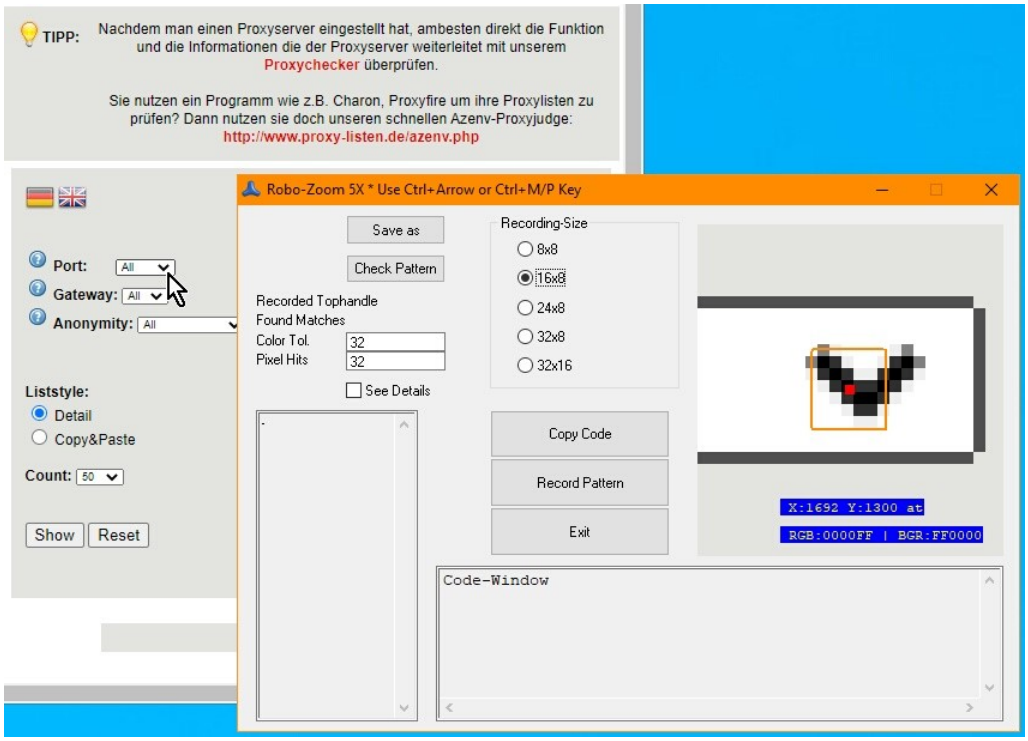
1. Lets say you have the Situation that you want to Click on some Control on a WEB-Site inside a Chrome-Type Browser.
These Browsers have not been supported so until now. Lets take this as an example.

*© 2023 Theo Gottwald * https://www.smart-package.com*



1. First we are starting the "HE-Recorder". It looks like this (Design and Features may change with next Updates).
The First thing we need to set is the "Recording Size". Currently you can choose between: 8x8, to 32x16 Pixel Objects.
As a rule of Thumb, the smaller the Object the better. Lets choose 16x8 this time.

2. While you move the Mouse over the Target Form, you can see how the Display in the "Robo-Lens" changes.
You can change the Magnification using the "ctrl-M" and "ctrl-P" Combination.

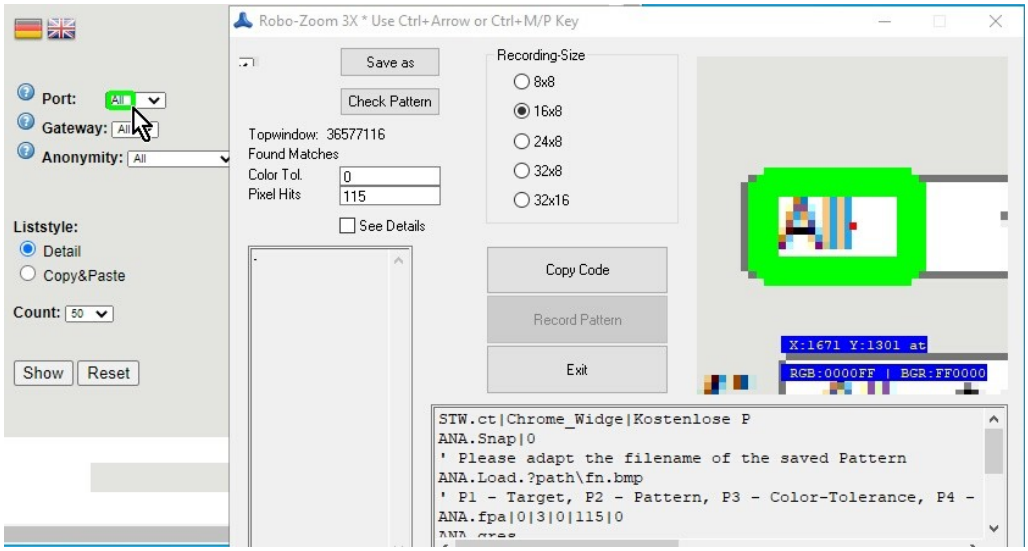


3. So next click "Record Pattern". The Mousepointer will change t and show a green Box that has inside exactly the size of 16x8.

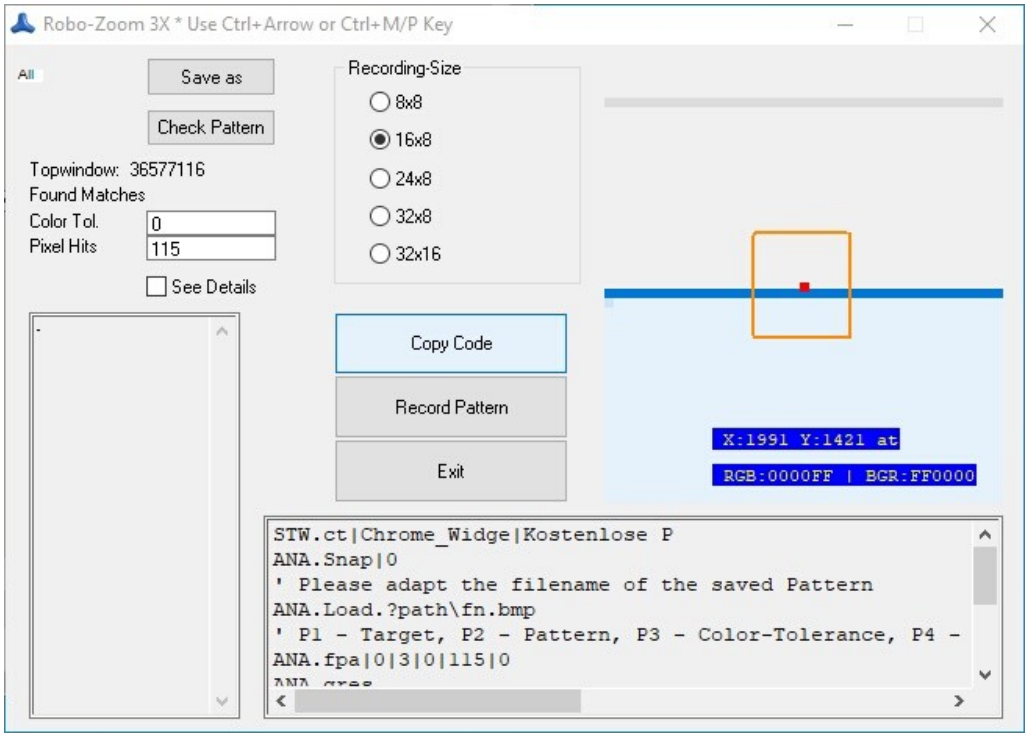
© 2023 Theo Gottwald * https://www.smart-package.com

Now drive to that Pattern and click the left Mouse-Button.

Hint: If the green Box will stay and not move, just click on the green Box and then Press "Record Pattern" again.

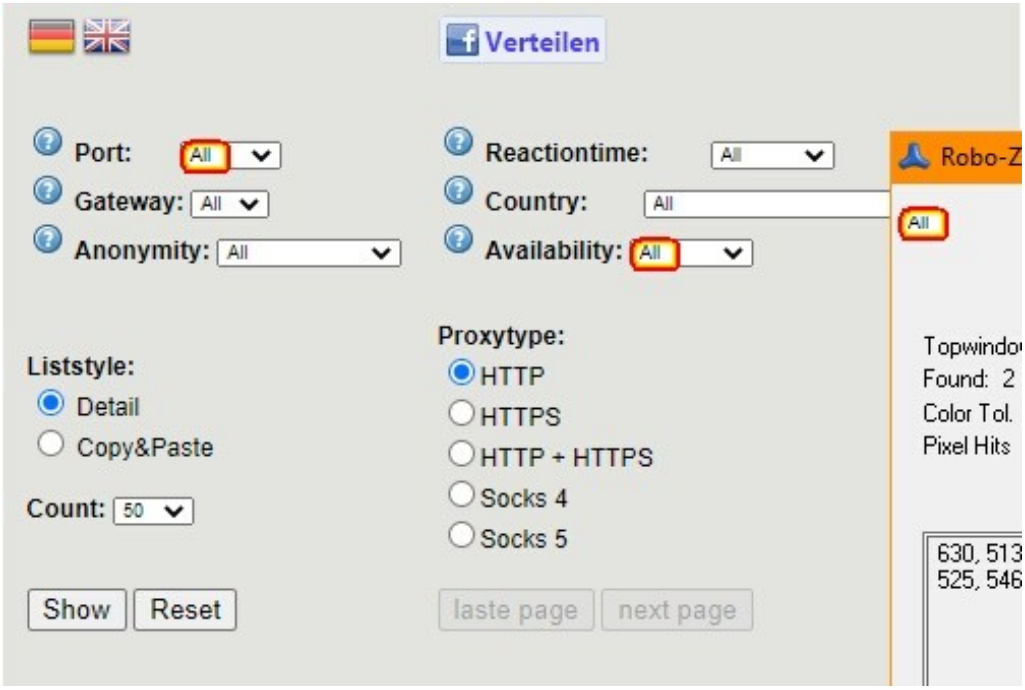


4. When the Recording is done, it is displayed in the upper left Corner. The Textbox down there shows the current Code.
But wait we are not yet done.



5. Click the "Check Pattern" Button. A new Window will appear and look like this:

© 2023 Theo Gottwald * https://www.smart-package.com



6. The Robot has found 3 Places with that Recorded Pattern. This is a very Simple Situation, you could just:

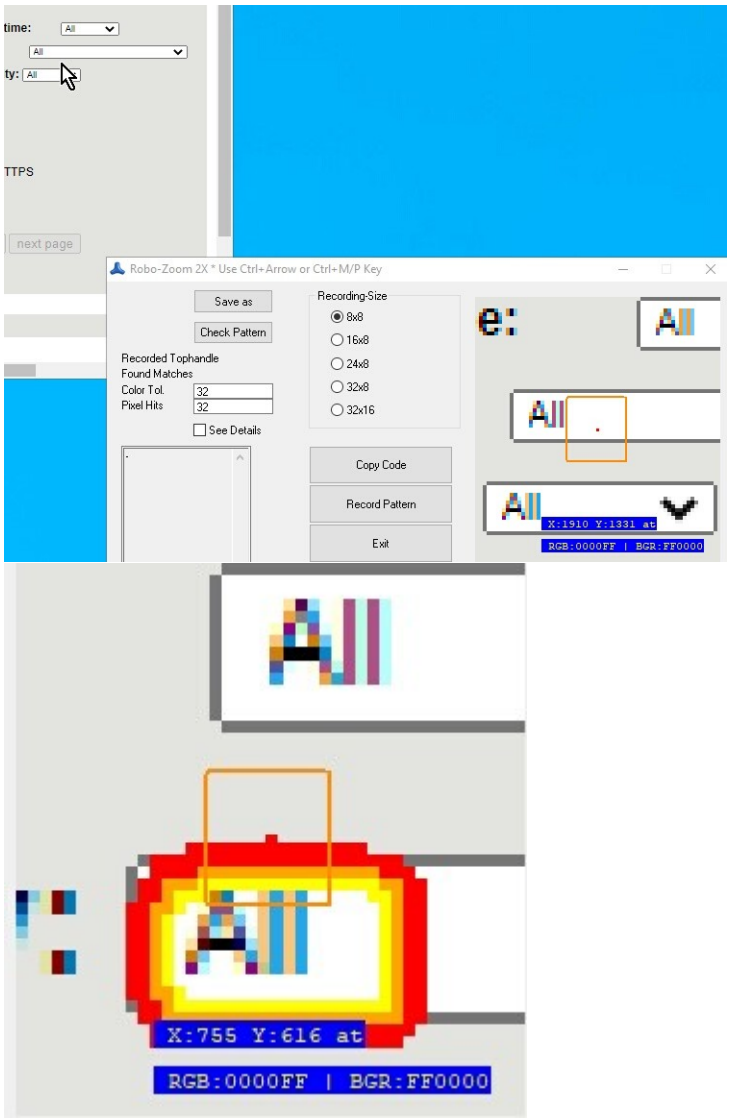
- Save the recorded Pattern into your Project Folder
- copy the code from the Textbox into your Script and correct the path for the Loading of the Pattern.
and you would be ready to go.

However, as you can see there are 4 Places with "All" that have not been selected. Click the Checkmark "See Details" and change the Value for "Pixel-Hits" to 99.

And change the Color-Tolerance Value to 200. Now click "Check Pattern" again. This time we will get nearly all "All"'s. Just one does not want to get selected.
The Lens will show you why. As you can see the rendering style for this All is too different. Watch out for this problem. If that happens, just record it separately.

Choosing the Color-Tolerance much too high may lead to thousands or even hundred thousands of "hits" that have to be tested.
Doing so may render the HE-Recorder "busy" for several Minutes. So better do not try Color Tolerances larger then 200. If that happens, just wait until the Recorder is available or in the worst case, kill it using the Task-Manager.

© 2023 Theo Gottwald * https://www.smart-package.com



If the Rendering style of the Pattern is too different, you may need to use separate Recordings.

The Final Code:

```
' Locate the Target Window
STW.ct|Chrome_Widge|Kostenlose P

' Snapshot it into an IR
ANA.Snap|0

' Please adapt the filename of the saved Pattern
ANA.Load.?path\fn.bmp

' P1 - Target, P2 - Pattern (Path and Filename)
' P3 - Color-Tolerance 0-765
' P4 - min. Hits (Pixel) this Value depends on the Patternsize. A 8x8 Pattern ha
' Generally the Recorder uses max. Hits-10%,
' P5 - Debugmode 0/1 - this is the same like the Details-Switch in the Recorder.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ANA.fpa|0|3|0|57|0

' Get The results
ANA.gres

' We take away the number of Hits from TOS
POP.$$NOH

' If no Hits, jump away to Lab_NoHits.
JIZ.$$NOH=0|Lab_NoHits

:Lab_NoHits
```

More Options?

Due to the Architecture of the ANA.-Commands, you can also use the ANA.fpa - Command on
Objects that have been processed.
You can use the ANA.Mask - Command, or use the ANA.Cdfx or other Commands to process the picture before applying the "FindPattern".
Of course you will need to also Record the Pattern then from an image that was processed before or just also apply the process to the Pattern.
In case of ANA.cdfx and ANA.cdfy it may be better to record from an processed picture.

```
ANA.Load|0|$$PAC\Plist.png
ANA.Load|1|$$PAC\All8.bmp
ANA.cdfy|0|2
ANA.Invert|2
ANA.Show|2!
```

```
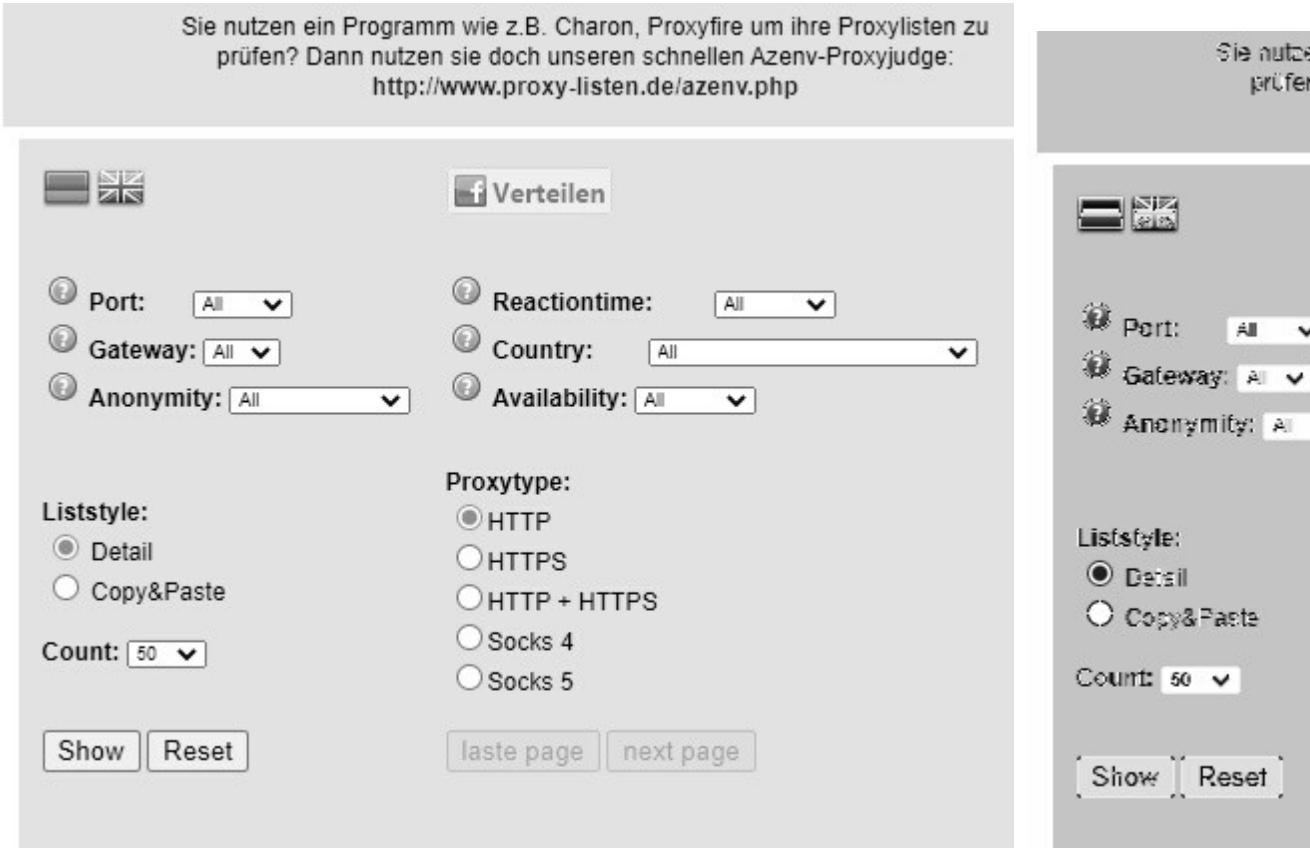
ANA.Grey|0|&H2
ANA.Show|0!
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



IMPORTANT NOTICE about Mouseover Effects:

When recording with the HE-Recorder, you may not see that the Button that you are over is changing its color. Due to "Mouseover Effects".

It is however visible for the FindPattern Command.

If you do NOT get AT LEAST the Pattern that you have recorded with a Color-Tolerance of "0" then you have had "Mouseover" Effects.

To prevent these, make a Screenshot of the Form (but not as .jpg due to Artefacts, but as .png or .bmp) and record from the Screenshot.

Recording from a Screenshot will prevent "Mouseover Effects".

You can test this yourself with our "Desktops-Manager" Tool. If your record a Button, there is an invisible "Mouseover Effect".

Therefore you will not get even one result with a Color-Tolerance of "0".

If you record from a Screenshot of the program, you will immediately get the hits even with a Color-Tolerance of "0".

In the picture below we used a Color Tolerance of 50 to get the desired text on grey as well as on white background.

3.55.4.2.2 ANA.MixTar

MiniRobotLanguage (MRL)

ANA.MixTar

Combine multiple Image-Register's (IR) in different ways

Intention

This command will combine/mix two IR's in multiple ways depending on the Blitmode.
For a Simple Color-Mix, use the "`ANA.BlendTo`" Command.
For special Mixing, look at "`ANA.MixRGB`" and there is lots more.

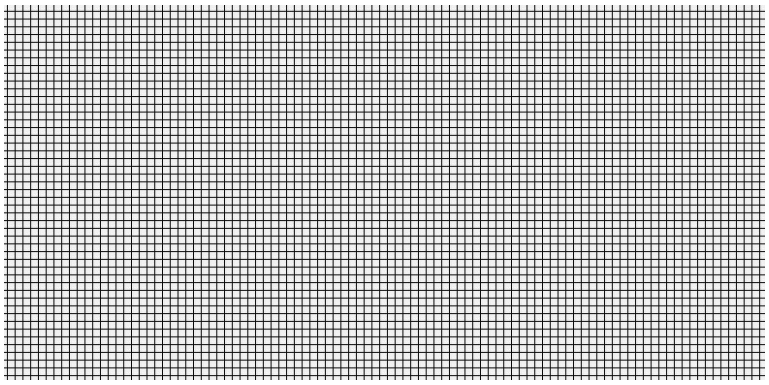
1. Mix a horizontal and a vertical Gradient and the n again mix these with another Pattern from the Fill-Command.
This will generate the Graphic below.

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF|&H00FFFF
ANA.Mix|0|2|7
ANA.Show|2!
ANA.New|1|800|400
ANA.Fill|1|&H000000|5|&HFFFFFF
ANA.Show|1!
ANA.mix|1|2
ANA.Show|2!
PAU.1
ENR.
```

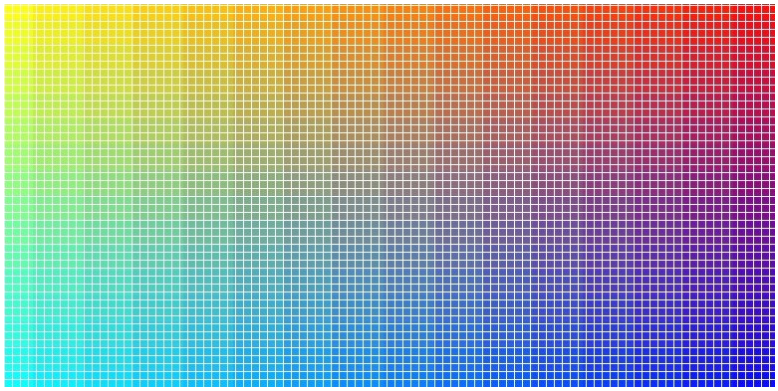
Using Blitmode 7:

© 2023 Theo Gottwald * https://www.smart-package.com

+



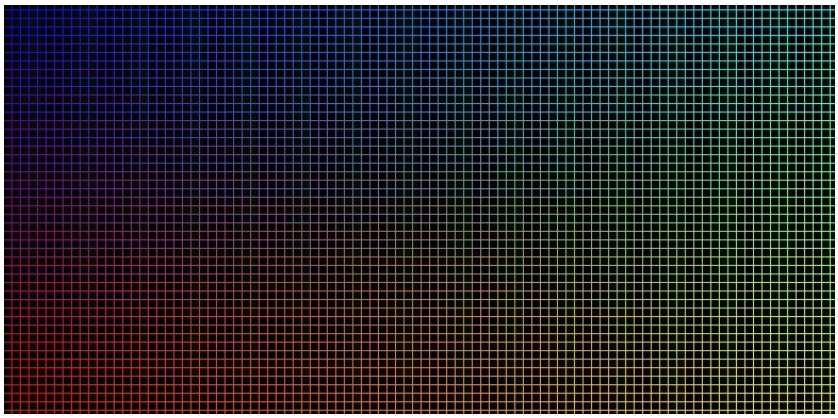
=

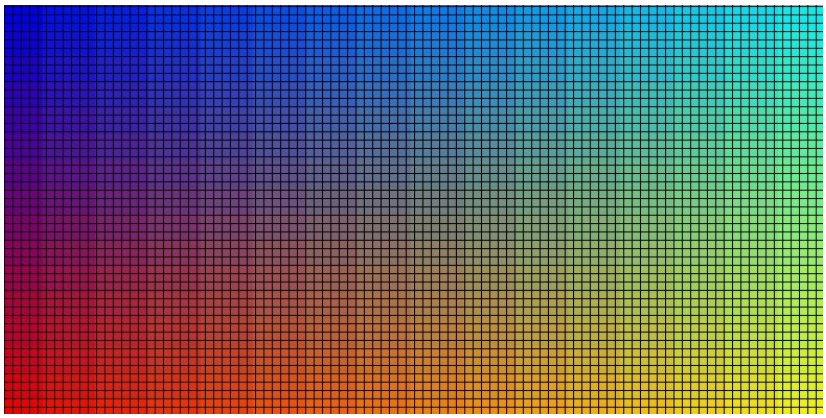


Using Blitmode 5 in the second Mix, you get this:

Using Blitmode 2 in the second Mix, you get this:

© 2023 Theo Gottwald * https://www.smart-package.com





2. Mixing IR's with themselves doe not make much sense as you will mostly get whether a white, black or inverted result.
However you an do that.

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.Show|0!
ANA.Mix|0|0|3
ANA.Show|0!
ENR.
```

3. Mixing IR's using a Blimtmode to let picture "shine through".
In this script we will make the second picture to shine through the first picture using Blimtode 2.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Dependinfd on the position of the

```
You can use:
ANA.mix|0|1|2
ANA.invert|1
or
ANA.invert|1
ANA.mix|0|1|2

to get any of these results below.
```

Command, the result may be any of these:

```
$$PAA=?exeloc\Pics\P3.jpg
$$PAB=?exeloc\Pics\P4.jpg
IEF.$$PAB
  ANA.Load|1|$$PAB
  'ANA.Show|1!#
ELS.
  MBX.File does not exist:$crlf$$$PAT
EIF.
IEF.$$PAA
  ANA.Load|0|$$PAA|1
  'ANA.Show|0!#
ELS.
  MBX.File does not exist:$crlf$$$PAT
EIF.
ANA.mix|0|1|2
ANA.invert|1
ANA.Show|1!#
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.MixTar[|P1][|P2][|P3]

Parameter Explanation

P1 - opt. Source Image-Register Number, if omitted, IR 0 will be used.
P2 - opt. Destination Image-Register Number, if omitted, IR 0 will be used.
P3 - opt. Blitmode 1156 **for Mixing.**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.MixTar-Sample
'**********************************
ANA.New|0|800|400
ANA.vgradient|0|&H00FF00|&HFF0000
ANA.New|1|800|400
ANA.hgradient|1|&H00FF00|&H00FFFF
ANA.Show|0!
ANA.Show|1!
$$BLI=7
ANA.mix|0|1|$$BLI
ANA.Show|1!
ENR.

' Here you can see a part of the result of the Operation.
```

3.55.4.2.3 ANA.BlendTo

MiniRobotLanguage (MRL)

ANA.BlendTo

Blend multiple Image-Register's (IR) in different ways.

Intention

This command will combine/mix two IR's in specified strength for each IR.
This way you can "Blend In" an IR into another.

For a Simple Color-Mix, use the "`ANA.BlendTo`" Command.
For special Mixing, look at "`ANA.MixRGB`" and there is lots more.

1. Mix
This will generate the Graphic below.

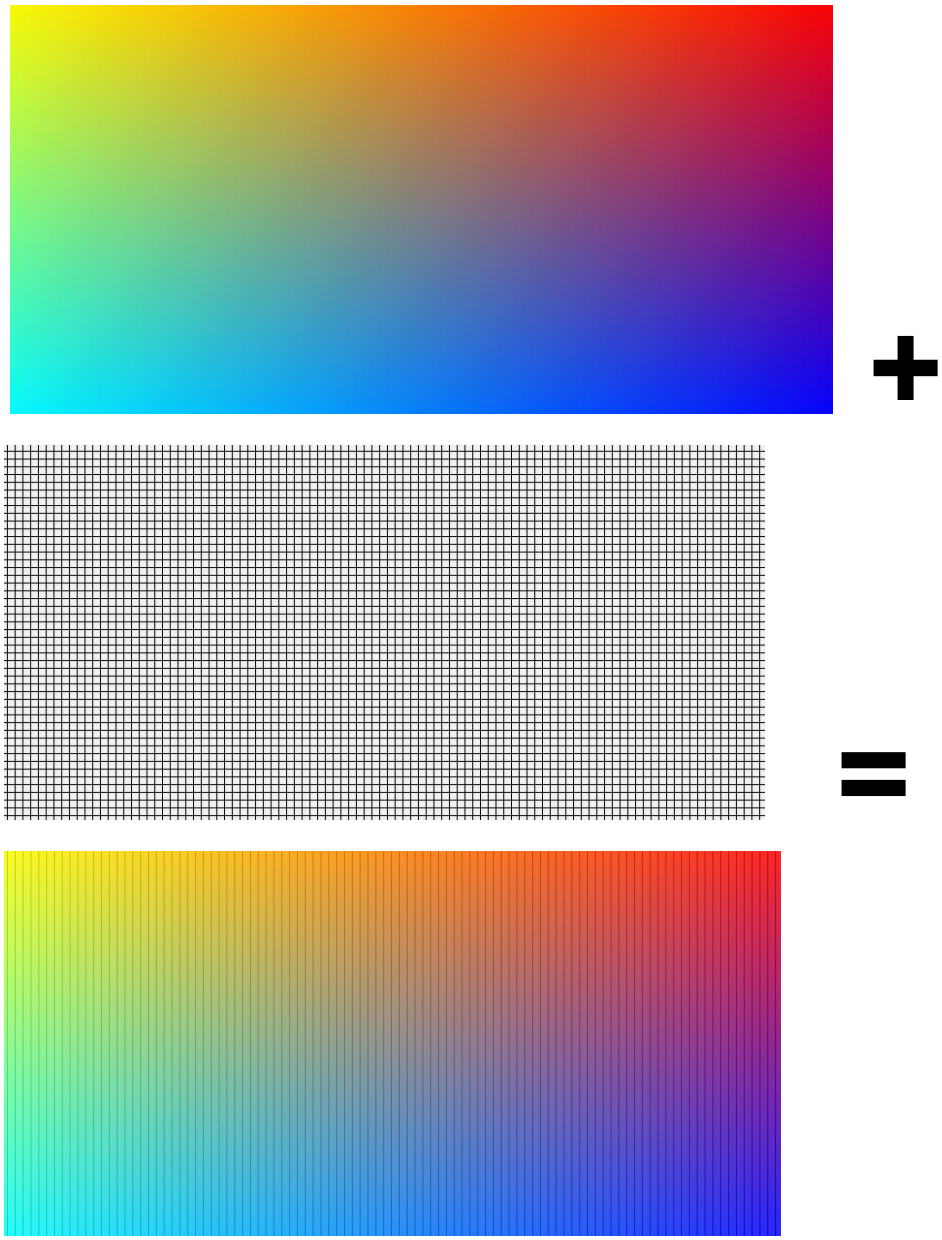
```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF|&H00FFFF
ANA.Mix|0|2|7
ANA.Show|2!

ANA.New|5|800|400
ANA.Fill|5|&H000000|4|&HFFFFFF
ANA.New|6|800|400
ANA.Fill|6|&H000000|3|&HFFFFFF
ANA.BlendTo|5|6|7|80
ANA.Show|7!

ANA.Show|1!
ANA.BlendTo|7|2|3|40
ANA.Show|3!
ENR.
```

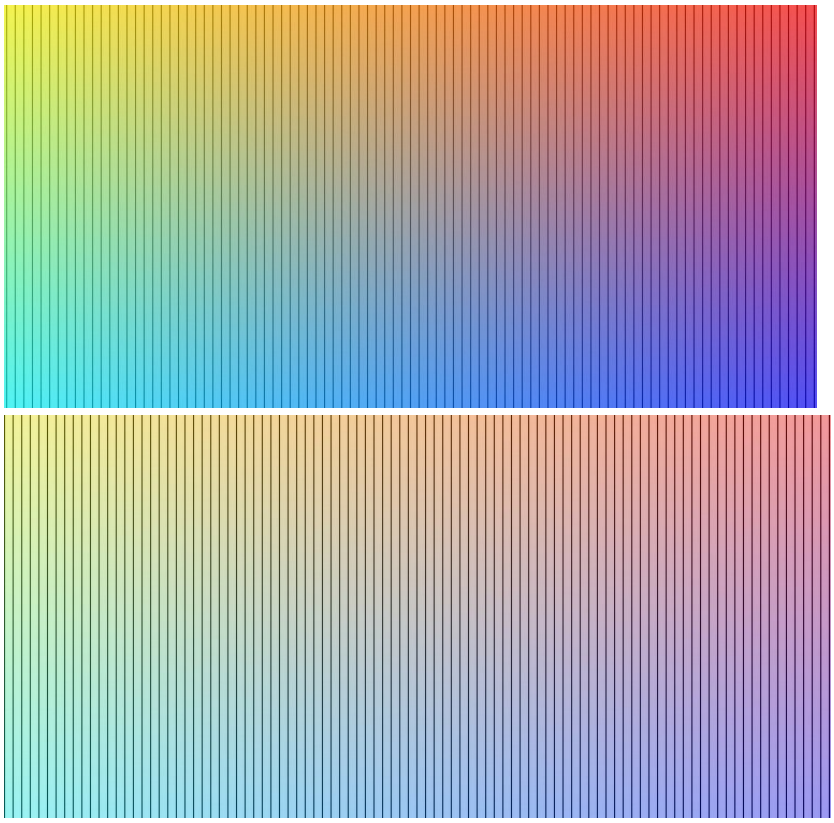
Using BlendTo with a strenght of 40

*© 2023 Theo Gottwald * https://www.smart-package.com*



Usiong different settings for strength, you can decide how strong each IR will be present in the result.

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

ANA.BlendTo[|P1][|P2][|P3][|P4]

Parameter Explanation

P1 - Source A Image-Register Number, if omitted, IR 0 will be used.
P2 - Source B Image-Register Number, if omitted, IR 0 will be used.
P3 - opt. Destination Image-Register Number, if omitted, IR 2 will be used.
P4 - opt. Strength of Blending, 0-255 (0-&HFF) 0 -> Source A is maximum strong, 255 - Source B is maximum strong, if omitted &H80 (128 dez) will be used.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.BlendTo-Sample
'***********************************
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF|&H00FFFF
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ANA.Mix|0|2|7
ANA.Show|2!

ANA.New|5|800|400
ANA.Fill|5|&H000000|4|&HFFFFFF
ANA.Show|5!
ANA.New|6|800|400
ANA.Fill|6|&H000000|2|&HFFFFFF
ANA.Show|6!
ANA.BlendTo|5|6|7|80
ANA.Show|7!

ANA.Show|1!
ANA.BlendTo|7|2|3|90
ANA.Show|3!
ENR.

' Here you can see the result of the Operation.
```

3.55.4.2.4 ANA.Blit

MiniRobotLanguage (MRL)

ANA.Blit

Use GPU to copy or mix Image-Register(s) (IR)

Intention

This command has a lot of Options to copy or mix Image Registers.
It uses the GPU and offers the Option to use several different Logic ways to get the final result.
Using this Command, Source IR and Target IR must have the same Resolution.
If that is not the case, use "`ANA.EqualRes`" to enforce the same resolution on the target-Side.

You can simply copy a IR over another or you can make logical combinations using Blit-Modes 1156

Here are two examples:

You will find much more examples on the Blit-Modes 1156 Page.

Sometimes the result depends on whether you "Blit A on B" or you "Blit B on A"
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Generate two Bitmaps with Colours
ANA.New|0|800|400
ANA.vgradient|0|&H000000|&HFFFFFF
ANA.New|1|800|400
ANA.hgradient|1|&H0000F1|&H1FFF0F

' Show you the Pictures
ANA.Show|0!
ANA.Show|1!

' Set Blitmode to 5
$$BLI=5

' Make a Copy of the Original IR for later use
ANA.Copy|1|2

' Blit 0 over 2 using Style "5"
ANA.blit|0|2|$$BLI

' Show you IR 2 (Result)
ANA.Show|2!

' Copy new Target to IR 2
ANA.Copy|0|2

' Blit 1 over 2 using same Blitmode
ANA.blit|1|2|$$BLI

' Show you IR 2
ANA.Show|2!
ENR.
```

Syntax

ANA.Blit[|P1]

Parameter Explanation

P1 - opt. Image-Register number, if omitted, IR 0 will be used.
P2 - opt. Image-Register number, if omitted, IR 0 will be used.
P3 - opt. Blit-Mode (default is 4)

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'*********************************
' ANA.Blit-Sample
'*********************************
ANA.New|0|800|400
ANA.vgradient|0|&H00FF00|&HFFFF
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ANA.Show|0!
$$BLI=2
ANA.blit|0|0|$$BLI
ANA.Show|0!
ENR.
```

The Command can blit over itself, see Sample.

Remarks

3.55.4.2.5 ANA.BlitCol

MiniRobotLanguage (MRL)

ANA.BlitCol

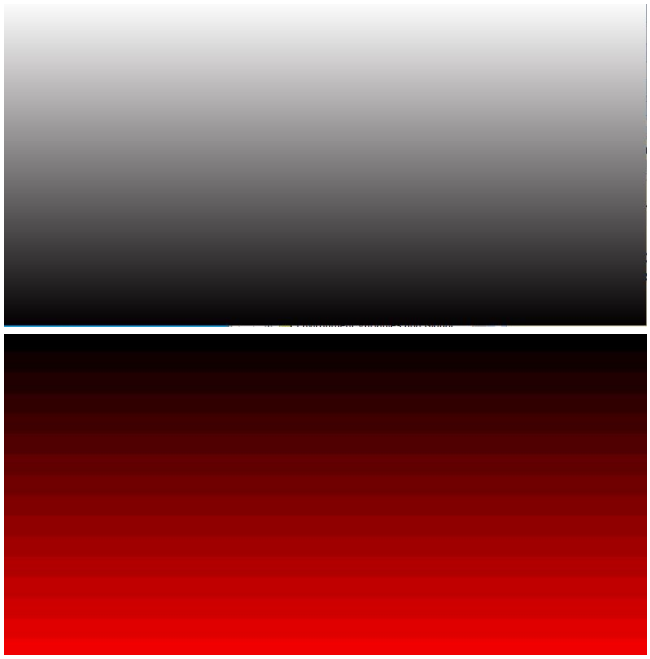
Mix an Image-Register (IR) with a solid color using Blitmodes

Intention

This command will generate an internal IR that is completely filled with a specified color.
It will then Blit this IR over the Source IR and store the result in destination.

1. Blit a defined Color over a IR
See the result below.

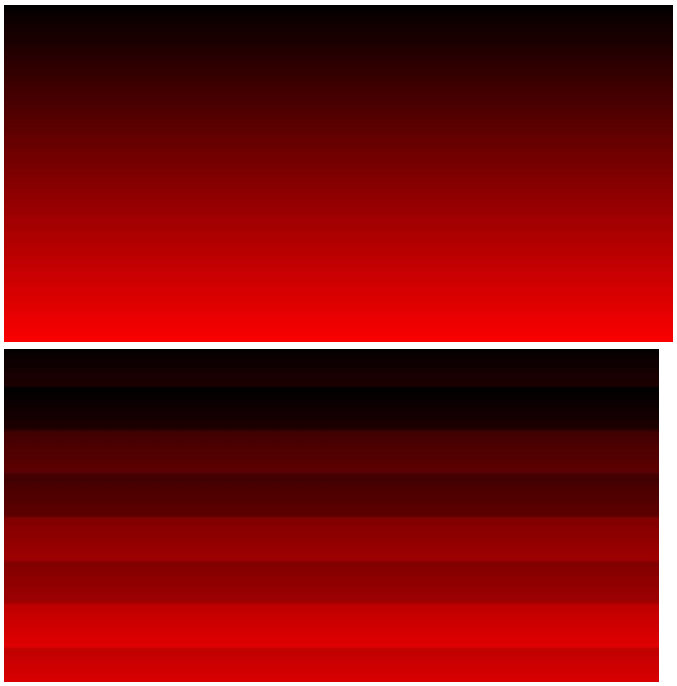
```
ANA.New|0|800|400
ANA.vgradient|0|&HFFFFFF|&H000000
ANA.Show|0!
'  Source|Target|Color|Blitmode
ANA.BlitCol|0|1|&HFFFF0F|2
ANA.Show|1!
ENR.
```



If we change the Color here to:

```
ANA.BlitCol|0|1|&HFFFF00|2
' We get less stripes
```

© 2023 Theo Gottwald * https://www.smart-package.com

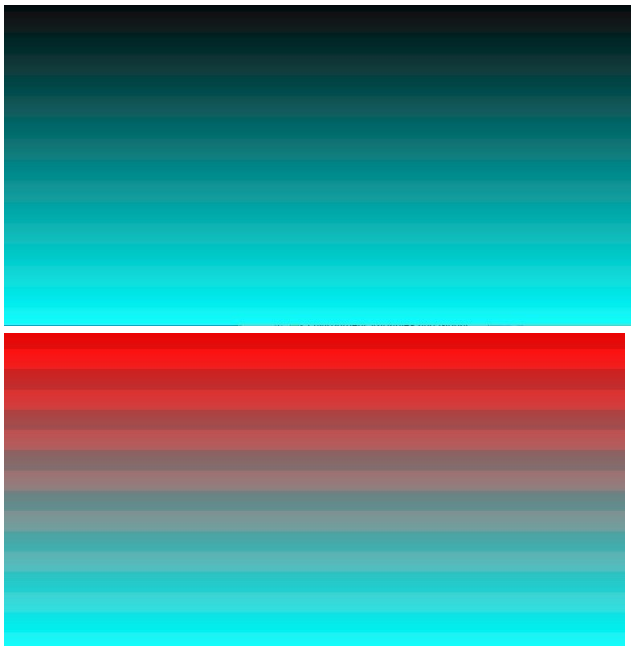


```
ANA.BlitCol|0|1|&HFFFF00|2
' We get less stripes
```

```
ANA.BlitCol|0|1|&HFFFF20|2
'We get more stripes
```

2. Use different Blitmodes to get different results.

Note that we used Blitmode 2. Depending on the Blitmode you get different result.
Here a result using Blitmode 5 and Blitmode 7.



```
ANA.New|0|800|400
ANA.vgradient|0|&HFFFFFF|&H000000
ANA.Show|0!
'  Source|Target|Color|Mixmode
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ANA.BlitCol|0|1|&HFFFF10|5
ANA.Show|1!
ENR.
```

Syntax

ANA.BlitCol[|P1][|P2][|P3][|P4]

Parameter Explanation

P1 - opt. Image-Register number, if omitted, IR 0 will be used.
P2 - opt. Image-Register number, if omitted, **P1** will be used.

P3 - opt. Color, if omitted &H808080 (Grey Color) is used.
P4 - opt. **Blitmode, if omitted Blitmode 12 "MergeNotSource" is used.**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.BlitCol-Sample
'**********************************
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.Show|0!
'  Source|Target|Color|Mixmode
ANA.BlitCol|0|1|&HFF0010|7
ANA.Show|1!
ENR.

' Here you can see a part of the result of the Operation.
```

3.55.4.2.6 ANA.BlitShift

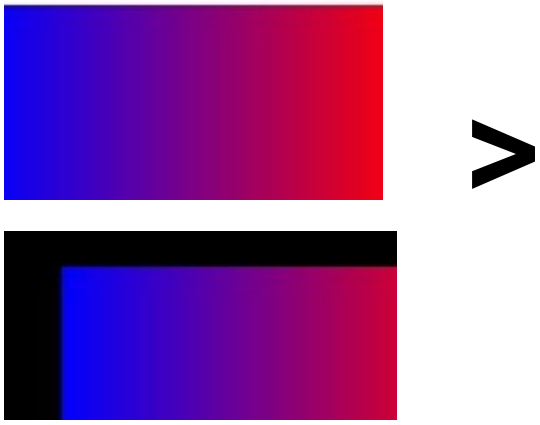
MiniRobotLanguage (MRL)

ANA.BlitShift

Move Image-Register (IR) Content left, right, up or down

Intention

This command will move the content of an IR up, down, left or right by a specified number of pixels.
The underlying IR can be automatically increased in Size - or not.

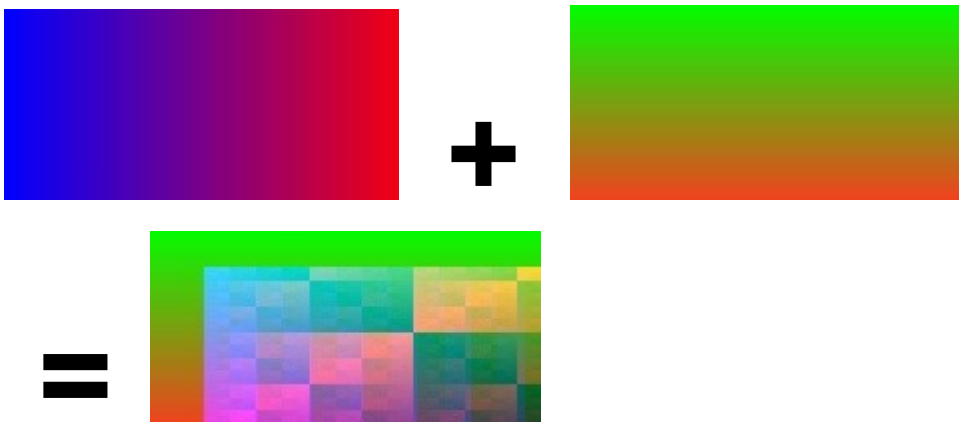


1. BlitShift with Source IR -> another IR
This will BlitShift the specified IR into another IR. Depending on the used Blitmode, the Content of the other IR will be part of the result.

```
ANA.New|0|200|100
ANA.hgradient|0|&HFF0000|&H1000F4
ANA.New|1|200|100
ANA.vgradient|1|&H00FF00|&H1F40F4
VAN.$$LOY=20
VAN.$$LOX=30
ANA.show|0!
ANA.show|1!
ANA.bsh|0|1|$$LOX|$$LOY|7
ANA.show|1!
ENR.
```

This is the above example, using Blitmode 7

© 2023 Theo Gottwald * https://www.smart-package.com



2. BlitShift over own IR
The result will vary depending on the used Blitmode.

```
ANA.New|0|200|100
ANA.hgradient|0|&HFF0000|&H1000F4
VAN.$$LOY=20
VAN.$$LOX=30
ANA.show|0!
ANA.bsh|0|0|$$LOX|$$LOY|7
ANA.show|0!
ENR.
```

2. BlitShift a 2D-Logi into a 3D-Logo
The result will vary depending on the Source Logo.

```
$$PAB=?exeloc\Pics\P3.jpg

$$BOR=10
CAL.$$BOB=$$BOR/2

IEF.$$PAB
  ANA.Load|1|$$PAB
  ANA.Show|1!

  MBX.File does not exist:$crlf$$$PAT
EIF.

ANA.GetRes|1|$$XPO|$$YPO
CAL.$$XPA=$$XPO+$$BOR
CAL.$$YPA=$$YPO+$$BOR
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Make a Resized Version of P3
ANA.New|2|$$XPA|$$YPA|1
ANA.New|3|$$XPA|$$YPA

' Now mix Shiftzed and Resized Version
ANA.bsh|3|1|$$BOB|$$BOB|2
ANA.Invert|1
ANA.MixTar|1|2|2
ANA.Invert|2
ANA.Show|2!
ENR.
```

Syntax

ANA.BlitShift[|P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - opt. Source Image-Register number, if omitted, IR 0 will be used.
P2 - opt. Destination Image-Register number, if omitted, IR 0 will be used.
P3 - opt. X-Shift in Pixel, if omitted 0 is used
P4 - opt. Y-Shift in Pixel, if omitted 0 is used
P5 - opt. Blitmode

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.BlitShift-Sample
' In this Sample we use a recorded 8x8 Pattern, that is filled into an IR
' and the blitted over a Picture. With the right "Shift" it will turn any a fitt

3.55.4.3 Change Resolution

These Operations are used to get and set the IR graphical resolution.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.3.1 ANA.CutRect

MiniRobotLanguage (MRL)

ANA.CutRect

Crop Borders from IR

Intention

This command cut a specified amount of Lines away from all 4 sides of an IR. I can be used to cut the Borders.

Use ANA.CutRect together with ANA.FromClipboard to store Clipboard-Content in IR 0 and display it
This will use IR 0 and also show the Contents.

```
$$PAF=?exeloc\Pics
$$FIL?$$PAF\P4.jpg
ANA.Load|0|$$FIL
' The CutRect Command is optional, it can be used to "Cut the borders" of an IR
ANA.CutRect|0|150|160|400|200
ANA.ToClipboard|0
' Picture is now in the Windows Clipboard
ENR.
```

ANA.CutRect is a bit special. Assume you have a picture of 640x400 and you specify:

```
ANA.CurRect|0|50|50|640|400
```

Then you may get a black Border of size 50 on the right side. This is because the limitation is the original Picture-Size.
If you specify instead a Target-Rectangle-Size that is larger then the original size, you will get a perfect match without a black Border.

```
ANA.CutRect|0|50|50|6400|4000
```

Of course you can specify exactly what you want, in such case please note that the X- and Y-Size is reduced by the values of how much you cut out at the upper and left side.
So this line would also do it:

```
ANA.CutRect|0|50|50|590|350
```

Syntax

ANA.CutRect[|P1][|P2|P3|P4|P5][|P6]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - opt. **Image-Register number** for Source and Target IR, if omitted, IR 0 will be used.

' If given, you must specify all 4 Rect-Parameters
P2 - Left-Border of Image to copy
P3 - Upper/Top-Border of Image to copy
P4 - Right-Border of Image to copy. If too large, will be replaced by Image maximum size.
P5 - Bottom-Border of Image to copy. If too large, will be replaced by Image maximum size.

P6 - Blit-Constant Parameter, if omitted Standard will be used. Details see Blit-Modes 1156

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.ToClipboard-Sample
'**********************************
$$PAF=?exeloc\Pics
$$FIL=$$PAF\P4.jpg
ANA.Load|0|$$FIL
ANA.CutRect|0|150|160|4000|2000
ANA.ToClipboard|0
ANA.Show|0!
ENR.

'**********************************
' ANA.ToClipboardRect-Sample
'**********************************
$$PAF=?exeloc\Pics
$$FIL=$$PAF\P4.jpg
ANA.Load|0|$$FIL
ANA.ToClipboardRect|0|150|88|290|189|2
ANA.FromClipboard|1
ANA.Show|1!
ENR.
```

3.55.4.3.2 ANA.EqualRes

ANA.EqualRes - Force equal Resolution for IR's ***Previous*** 1088 ***Top*** 41 ***Next*** 1109

MiniRobotLanguage (MRL)

ANA.EqualRes

Force equal Resolution between Image-Register's (IR)

Intention

This command will enforce that IR **P2** will have the same resolution as IR **P1**.
If **P2** does not exist, it will be created. If it exists, it will be stretched/resized to the Size of **P1**.

Generate two IR's with different resolution and then make the resolution equal including stretch
The following Script shows the use of `ANA.EqualRes`.

```
ANA.New|0|800|400
ANA.hgradient|0|&HFF0000|&H1000F4

ANA.New|1|400|800
ANA.vgradient|1|&HFF0000|&H10FFF4

ANA.Show|0!
ANA.Show|1!
' Make Resolution from P2 to the resolution from P1.
ANA.EqualRes|0|1
DMP.6
ANA.Show|1!
ENR.
```

Generate new IR with the Resolution of the original IR
This will create a new, empty (black) IR with the resolution of the IR P1.

```
ANA.New|0|800|400
ANA.hgradient|0|&HFF0000|&H1000F4
ANA.Show|0!
ANA.EqualRes|0|1
DMP.6
ANA.Show|1!
ENR.
```

Leaving away P2

If **P2** is omitted, it will be assumed to be **P1**+1

```
ANA.New|0|800|400
ANA.hgradient|0|&HFF0000|&H1000F4
ANA.Show|0!
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
ANA.EqualRes|0
DMP.6
ANA.Show|1!
ENR.
```

Syntax

ANA.EqualRes|P1[|P2]

Parameter Explanation

P1 **-** ***opt.*** Image-Register number, if omitted, IR 0 will be used.
P2 **-** ***opt.*** Image-Register number, this IR will be stretched to the resolution of **P1**. If it does not exist it will be created. If omitted, **P1**+1 will be used.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.EqualRes-Sample
'***********************************
ANA.New|0|800|400
ANA.hgradient|0|&HFF0000|&H1000F4

ANA.New|1|400|800
ANA.vgradient|1|&HFF0000|&H10FFF4

ANA.Show|0!
ANA.Show|1!
' Make Resolution from P2 to the resolution from P1.
ANA.EqualRes|0|1
DMP.6
ANA.Show|1!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.3.3 ANA.GetRes

ANA.GetRes - Get Resolution of specified IR Previous 1088 Top 41 Next 1109

MiniRobotLanguage (MRL)

ANA.GetRes

Get X- and Y- Resolution and the total number of Bytes of the specified Image-Register (IR)

Intention

This command will get the X- and the Y- Resolution of the specified IR.
It will also get the total number of Bytes of this IR.

1. Use ANA.GetRes with the Stack

This will use `ANA.GetRes` with the Stack.

```
STW.Act|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
ANA.Snap|0
ANA.GetRes|0
DMP.6
MBX.!
ENR.
```

The Stack will look like this:

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->LongInt      :624

Stackpos: 001 ->LongInt      :361

Stackpos: 002 ->LongInt      :901056

Stackpos: 003 ->LongInt      :1

-----------------------------------
```

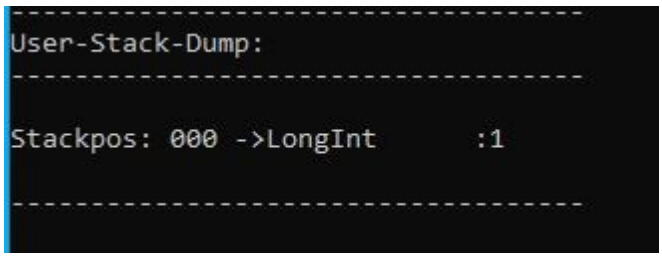
On TOS is the X-Resolution, followed by the Y-Resolution. Then the total Number of Bytes in the specified IR. This generally X+Y*4.

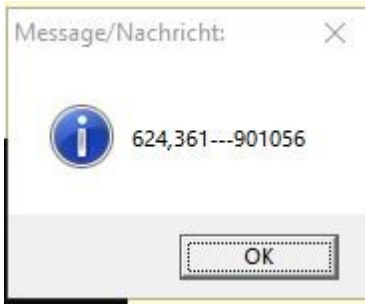
2. Use ANA.GetRes with Variables

© 2023 Theo Gottwald * https://www.smart-package.com

This will directly place the results in Variables. On the TOS there will be only a "1", or a "0" in case of error.

```
STW.Act|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
ANA.Snap|0
ANA.GetRes|0|$$XPO|$$YPO|$$SIZ
DMP.6
MBX.$$XPO,$$YPO---$$SIZ
MBX.!
ENR.
```





Syntax

ANA.GetRes|[|P1][|P2][|P3][|P4]

Parameter Explanation

***P1* - *opt.* Image-Register number, if omitted, IR 0 will be used.**
P2* - *opt. *Variable that will receive the X-Resolution*, if omitted, TOS will be used.
P3* - *opt. *Variable that will receive the Y-Resolution*, if omitted, TOS will be used.
P4* - *opt. *Variable that will receive the Size of the IR in Bytes*, if omitted TOS will be used.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.GetRes-Sample
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
' Will get Desktop-Resolution
STW.ct|Progman|Program Manager
ANA.Snap|0
ANA.GetRes|0|$$XPO|$$YPO|$$SIZ
DMP.6
MBX.$$XPO,$$YPO---$$SIZ
MBX.!
ENR.
```

Remarks

3.55.4.3.4 ANA.GetXYFromBytePos

MiniRobotLanguage (MRL)

ANA.GetXYFromBytePos

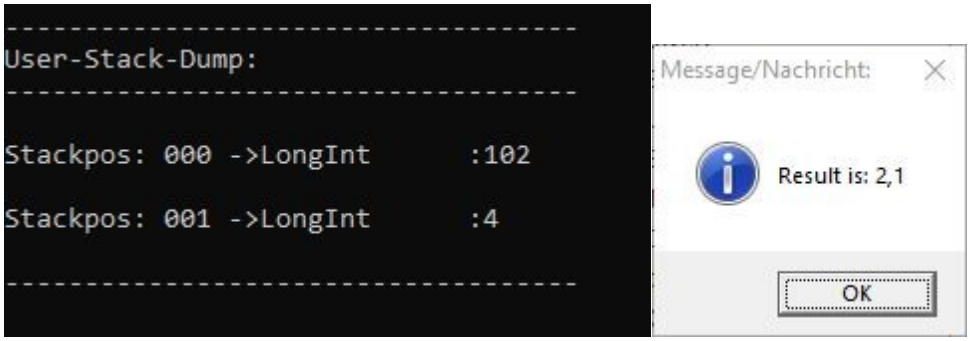
Get X- and Y- Position from the sequential Byte-Position-Number

Intention

This command will get the X- and the Y- Position from a Byte-Position of a specified IR.
The result is 0-based, means that the upper left coordinate is 0,0.
You also need to know that each Pixel has 4 Bytes (24-Bit Color+1 Byte Alpha).

For example, if IR-0 has a resolution of 100x400

```
ANA.New|0|100|400
ANA.GetXYFromBytePos|0|409|$$XPO|$$YPO
DMP.6
MBX.Result is: $$XPO,$$YPO
ENR.
```



This is the result from the above Script. On the Stack you can also see the "Pixelposition" that is 102.

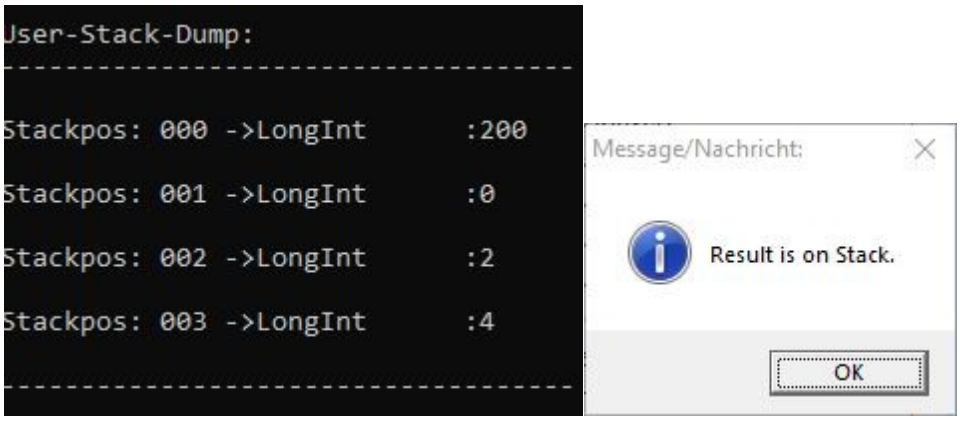
1. Use ANA.GetXYFromBytePos with the Stack

This will use `ANA.GetXYFromBytePos` with the Stack.

```
ANA.New|0|100|400
ANA.GetXYFromBytePos|0|801
DMP.6
MBX.Result is on Stack.
ENR.
```

The Stack will look like this:

© 2023 Theo Gottwald * https://www.smart-package.com



On TOS is the the "Pixelposition", followed by the X-Position, followed by the Y-Position.

Syntax

ANA.GetXYFromBytePos|[|P1][|P2][|P3][|P4]

Parameter Explanation

P1 – Image-Register number, if omitted, IR 0 will be used.
P2 – Byte-Position to convert.
P3 – ***opt.*** Variable that will receive the X-Position, if omitted, TOS will be used.
P4 – ***opt.*** Variable that will receive the Y-Position, if omitted TOS will be used.

The Command will leave the Pixel-Position on the TOS.

Example

```
'**********************************
' ANA.GetXYFromBytePos-Sample
'**********************************
ANA.New|0|100|400
ANA.GetXYFromBytePos|0|801
DMP.6
MBX.Result is on Stack.
ENR.
```

3.55.4.3.5 ANA.GetXYFromPixelPos

MiniRobotLanguage (MRL)

ANA.GetXYFromPixelPos

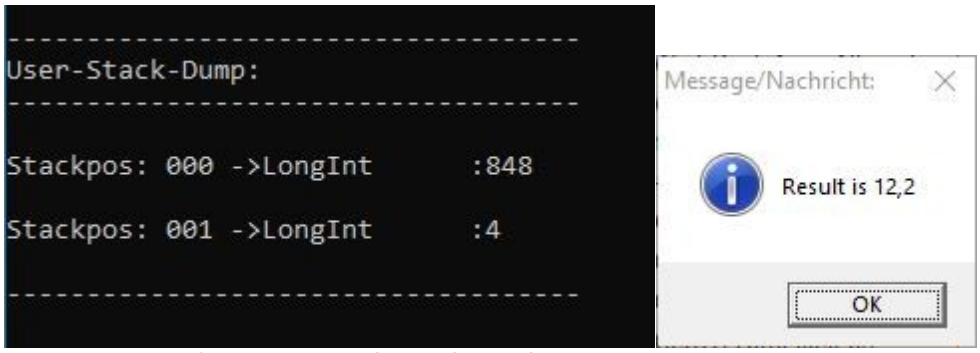
Get X- and Y- Position from the sequential Pixel-Position-Number

Intention

This command will get the X- and the Y- Position from a sequential-Pixel-Position Number of a specified IR.
The result is 0-based, means that the upper left coordinate is 0,0.
You also need to know that each Pixel has 4 Bytes (24-Bit Color+1 Byte Alpha).

For example, if IR-0 has a resolution of 100x400

```
ANA.New|0|100|400
ANA.GetXYFromPixelPos|0|212|$$XPO|$$YPO
DMP.6
MBX.Result is $$XPO,$$YPO
ENR.
```



This is the result from the above Script. On the Stack you can also see the "Byteposition" that is 848.
The last number, 4 is from the ANA.New-Command.

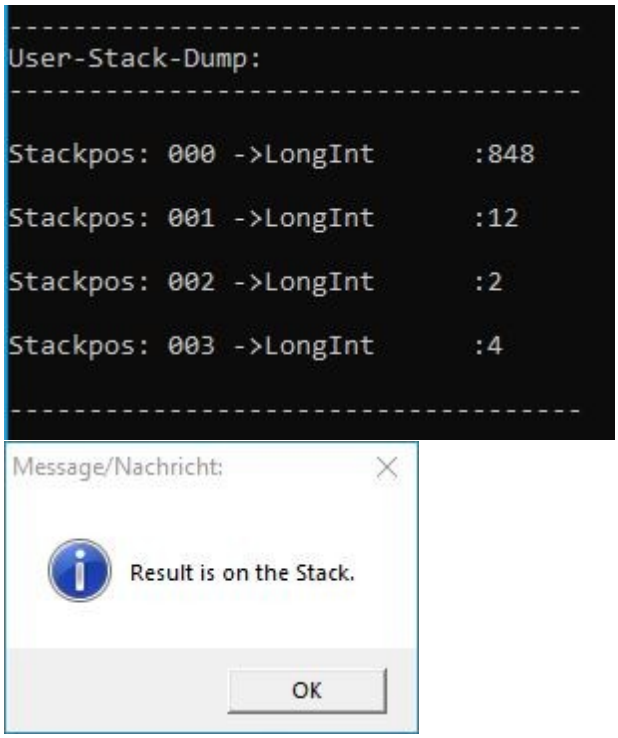
1. Use ANA.GetXYFromPixelPos with the Stack

This will use `ANA.GetXYFromPixelPos` with the Stack.

```
ANA.New|0|100|400
ANA.GetXYFromPixelPos|0|212
DMP.6
MBX.Result is on the Stack.
ENR.
```

The Stack will look like this:

© 2023 Theo Gottwald * https://www.smart-package.com



On TOS is the the "Byteposition", followed by the X-Position, followed by the Y-Position. The last number, 4 is from the ANA.New-Command.

Syntax

ANA.GetXYFromPixelPos|[|P1][|P2][|P3][|P4]

Parameter Explanation

P1 - Image-Register number, if omitted, IR 0 will be used.
P2 - ***Pixel***-Position to convert.
P3 - ***opt.*** Variable that will receive the X-Position, if omitted, TOS will be used.
P4 - ***opt.*** Variable that will receive the Y-Position, if omitted TOS will be used.

The Command will leave the Byteposition on the TOS.

Example

```
'**********************************
' ANA.GetXYFromPixelPos-Sample
'**********************************
ANA.New|0|100|400
ANA.GetXYFromPixelPos|0|212
DMP.6
MBX.Result is on the Stack.
ENR.
```

3.55.4.3.6 ANA.Grab

MiniRobotLanguage (MRL)

ANA.Grab

Copy a smaller Portion from an IR starting at 0,0 to another IR removing empty Lines (empty -> just Background)

Intention

This command removes empty Lines at top and left side and cuts out a specified amount of Lines away from Right and Bottom sides of IR P1. The result will be moved to **P2.**
`ANA.Grab` will also automatically move theSource Rectangle up direction 0,0, and remove all empty lines.

Use ANA.Grab together with ANA.FromClipboard to store Clipboard-Content in IR 0 and display it
This will use IR 0 and also show the Contents.

```
$$PAF=?exeloc\Pics
$$FIL?$$PAF\P4.jpg
ANA.Load|0|$$FIL
' The Grab Command is optional, it can be used to "Cut the borders" of an IR bef
ANA.Grab|0|1|160|400|3
ANA.ToClipboard|1
' Picture is now in the Windows Clipboard
ENR.
```

Syntax

ANA.Grab[|P1][|P2|P3|P4|P5][|P6]

Parameter Explanation

***P1* - Image-Register number for Source IR**
***P2* - Image-Register number for Target IR**

P3* - *Right-Border of Image to copy
P4* - *Bottom-Border of Image to copy

***P5* - *Blit-Constant Parameter*, if omitted Standard will be used. Details see Blit-Modes 1156**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' ANA.Grab-Sample

3.55.4.3.7 ANA.ResizeTo

MiniRobotLanguage (MRL)

ANA.ResizeTo

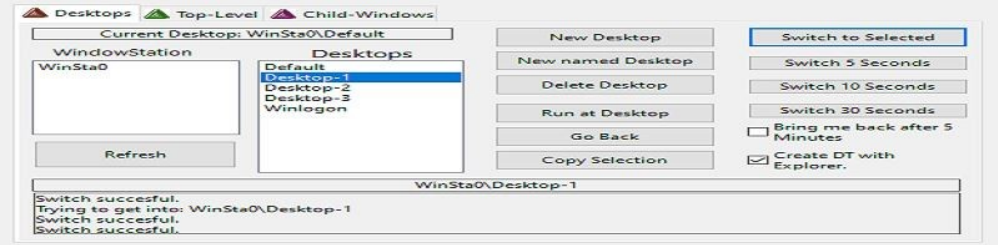
Resize existing IT to a new IR

Intention

This command can be used to resize an IR into a new IR with a specified resolution.
It will create a new IR with a specified resolution from a already existing IR.
It will "Stretch" the existing IR into the new IR's resolution.

1. Create new IR and copy the resized Content of another IR
As you can see below, the Resizing will not take any Aspect-Ratio into account, but use the full X and Y Size of the new IR.

```
STW.Act|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
ANA.Snap|1
ANA.ResizeTo|1|0|800|200
ANA.show|0!
ENR.
```

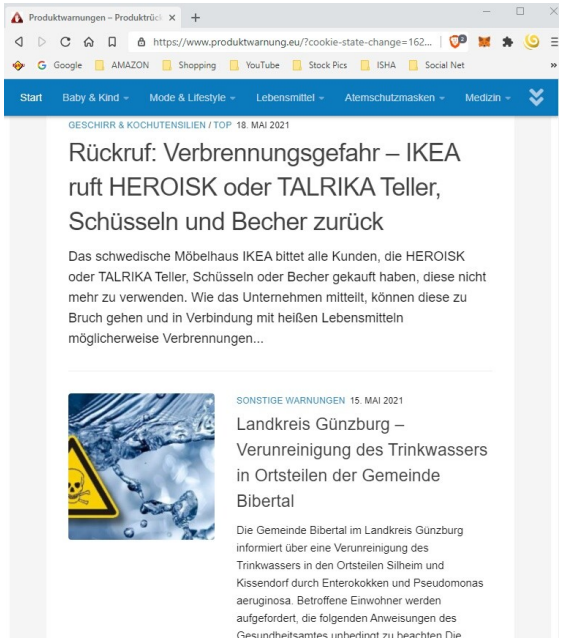


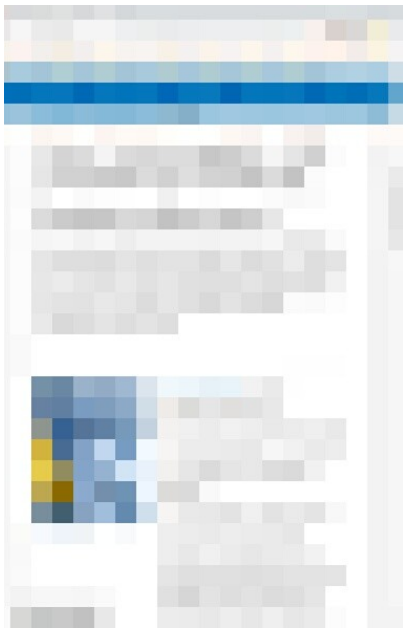
2. Resize IR to iself
You can also specify the Target IR with the same IR as the Source, then the IR itself will be resized.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.ResizeTo|0|0|20|30
ANA.ResizeTo|0|0|400|600
ANA.Show|0!
ENR.
```

Source **Result**

 *© 2023 Theo Gottwald * https://www.smart-package.com*





Syntax

ANA.ResizeTo|P1|P2|P3|P4

Parameter Explanation

P1 **- *Source* Image-Register Number for the IR that is to be resized.**
P2 **- *Target* Image-Register Number can be identical to the Source Register Number**
P3 **- *opt. X-Resolution* for the new IR Content (default is Target x-resolution)**

*© 2023 Theo Gottwald * https://www.smart-package.com*

***P4 - opt. Y-Resolution* for the new IR Content (default is Target y-resolution)**

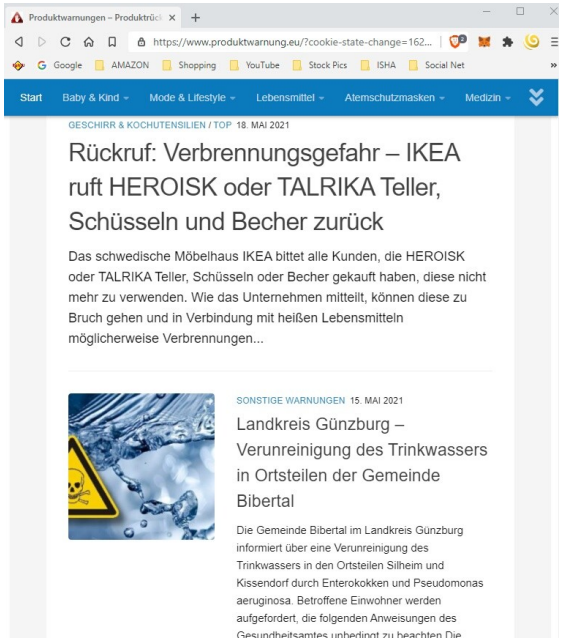
The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

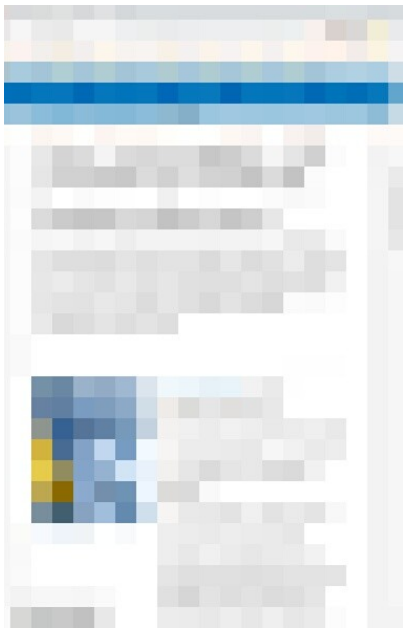
Example

```
'**********************************
' ANA.ResizeTo-Sample
'**********************************
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.ResizeTo|0|1|20|30
ANA.ResizeTo|1|0|400|600
ANA.Show|0!
ENR.

' Here you can see the Original Window and the result of the
Operation.
```

© 2023 Theo Gottwald * https://www.smart-package.com





Remarks

This Functionality is also included in the "`ANA.New`"-Command. As it would be hard to find, we have sorted the Parameters here in another way and made this extra-command.

Limitations:

-

3.55.4.4 Color Table Operations

These Operations work with the "Color Table", this is a sorted list with all colors in the IR.
This Color-Table is generated using

```
ANA.AnalyzeColor|0|1
```

In fact there are 2 Color-Tables:
0 - Color-Sort (Col_Srt) - This table contains the Colors sorted by number of Pixel per Color.
The Top-Entry is the color with the most Pixels. The bottom Entry is the color with the least number of Pixels.
1 - Color-Background (Col_Bgl) - This table is sorted by similarity to the Color that has most Pixel, which is assumed to be the Background Color.
Here the Top-Entry contains the Background Color and then any further Entry is sorted by Similarity to this Color.

The Col_Bgl Table can be sorted to another Color using:

```
ANA.Sort_Similar_To|&H26592A|$$MSK
```

Using the

```
ANA.AnalyzeColor|0|1

' These are some further commands that can be used after t
ANA.getcolorcount|0|$$CNT
ANA.getbgcolor|0|$$BGC
```

you can work with the list entries. For example you can remove colors from the list and the IR.

Remove Green Background

To do this, we first Analyze the Picture to generate the Color-Table.
Secondly we sort the Color Table in a way that its sorted by Similarity with the Background Green Color.
Third we remove the Entries that are similar to the Green Color.
The numbers that are used in detail are a bit of trial and error depending on the picture.

© 2023 Theo Gottwald * https://www.smart-package.com

```

The Speed-Dump was taken after the first round so the Line-execution count may not be accurate.

FASTER VERSION:

Using this Script the Writing will keep its original Color.
Single, unconnected Dots are removed in Stage 2.
This is technically the same Script as above, but twice as fast, as its using new Pixel-Commands
Needs 193 Seconds.

3.55.4.4.1 ANA.AnalyzeColor

MiniRobotLanguage (MRL)

ANA.AnalyzeColor

Analyze Color in an Image-Register (IR) and generate an Color-Table

Intention

These Operations work with the "Color Table", this is a sorted list with all colors in the IR.
In fact there are 2 Color-Tables:
0 - **Color-Sort** (Col_Srt) - This table contains the Colors sorted by number of Pixel per Color.
The Top-Entry is the color with the most Pixels. The bottom Entry is the color with the least number of Pixels.
1 - **Color-Background** (Col_Bgl) - This table is sorted by similarity to the Color that has most Pixel, which is assumed to be the Background Color.
Here the Top-Entry contains the Background Color and then any further Entry is sorted by Similarity to this Color.

This list can be made using the

```
ANA.AnalyzeColor|0|1
```

The Col_Bgl Table can be sorted to another Color using:

```
ANA.Sort_Similar_To|&H26592A|$$MSK
```

Thee are several other commands that will only work if the Color-Table has been updated before.
These are:

```
ANA.GetBGColor
ANA.GetSortedColor
ANA.GetColorCount
ANA.SimilarBGColor
ANA.Sort_Similar
ANA.ShowSimArray
ANA.ShowSortArray
ANA.RemoveIndexColors
ANA.RemoveSortedColors
ANA.Reduce_Colors
ANA.ReplaceColorT
```

Using this Script:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\BTC2.jpg
ANA.Load|0|$$PIA
ANA.AnalyzeColor|0|1
ANA.showsortarray|0
MBX.!
ENR.
```

You will get a listing of the color-table, this may lokk like this:

© 2023 Theo Gottwald * https://www.smart-package.com

```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Start of the Color-Tabel, Entries 0 to 41. the Entry for "Black" is on position 40.

Second part. As you can see, End of the Color-Table. Entries up to 1318.

Using this commands you can work with the list entries in the color table and do significant improvements in pictures.
Now you can improve the image. All colors are already sorted by Quantity (How many Pixels).

You can also get a sort on "Color difference to background". For this you can use:

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\BTC2.jpg
ANA.Load|0|$$PIA
ANA.AnalyzeColor|0|1
ANA.ShowSimArray|0
MBX.!
ENR.
```

Then you will get something like this:

© 2023 Theo Gottwald * https://www.smart-package.com

System Messages

```

```

In this table the black colors will be "on Top" while the White colors will be "bottom". For this sort the robot assumes that the color that is mostly in the picture "is the background color".
The he will sort all colors "by difference to the background". This is the result.

Using these tables you can significantly improve pictures with your Script.

For example you can remove colors from the list and the IR using:

```
' this command will remove the given color and replace it with another color.
ANA.removeindexcolors|0|300|$$CNV|0

```

This is the Speed-Dump of the Script. It uses just few Seconds for the complete run.

Syntax

ANA.AnalyzeColors|P1[|P2]

Parameter Explanation

P1 **- *Source* Image-Register Number**
P2 **- *0/1 - Force-Reanalyze-Flag. Default is 0.***
Generally the Analyze command will do nothing if this IR has already been analyzed.
In case you have made changes to the IR and need a new AnalyzeColors then must set the "Force-Flag" to 1.

Example

Remove Green Background

To do this, we first Analyze the Picture to generate the Color-Table.
Secondly we sort the Color Table in a way that its sorted by Similarity with the Background Green Color.
Third we remove the Entries that are similar to the Green Color.
The numbers that are used in detail are a bit of trial and error depending on the picture.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.4.2 ANA.GetBGColor

MiniRobotLanguage (MRL)

ANA.GetBGColor

Returns the Color of the Background of an IR

Intention

This Command needs the ANA.AnalyzeColor Command to count colors in an IR before it will work. It may also need the "Force-Flag" (P2) to be set.

```
ANA.AnalyzeColor|0|1

' These are some further commands that can be used after t
ANA.getcolorcount|0|$$CNT
ANA.getbgcolor|0|$$BGC
```

you can then work with the list entries.

This ccommand will return the color that is mostly used in the IR. It is assumed that the "Color of most of the Pixels" is the Background color.

```
$$PAT=?exeloc\pics\P5.jpg
IEF.$$PAT
  ANA.Load|0|$$PAT
  ANA.Show|0!

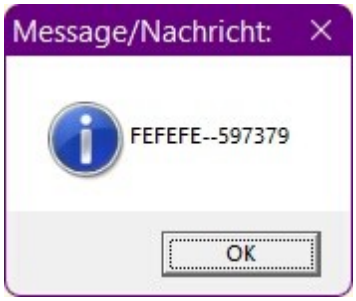
  MBX: FIle does not exist.
EIF.
ANA.AnalyzeColor|0|1
ANA.GetBgcolor|0|$$RES|$$ANZ
VTH.$$RES|$$HEX
MBX.$$HEX--$$ANZ
ENR.
```



Will bring up this Messagebox: that shows that the Color &HFEFEFE is most likely the Background Color. And this color is found 597379 times in the original picture.

© 2023 Theo Gottwald * https://www.smart-package.com

With this picture:

Syntax

ANA.GetBGColor[|P1][|P2][|P3]

Parameter Explanation

P1 **- *Source* Image-Register Number, if omitted 0 is used.**
P2 **- *(Result) Color of Background*, if omitted the result is placed on TOS.**
P3 **- *(Result) Number of Pixels using the Color of Background (in P2)*, if omitted the result is placed on TOS.**

The Command will not leave a 0/1 on the TOS. If the Operation fails, **P2** may be "-1".

Example

```
'**********************************
' ANA.Fill-Sample
'**********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```

ANA.GetColorCount[|P1][|P2]

Parameter Explanation

***P1 - Source* Image-Register Number, if omitted 0 is used.**
***P2 - (Result) Color of Background*, if omitted the result is placed on TOS.**
***P3 - (Result) Number of Pixels using the Color of Background (in P2)*, if omitted the result is placed on TOS.**

The Command will not leave a 0/1 on the TOS. If the Operation fails, **P2** may be "0".

3.55.4.4.4 ANA.Reduce_Colors

MiniRobotLanguage (MRL)

ANA.Reduce_Colors

Returns the number of Colors of an IR

Intention

This ccommand will choose 2 similar colors from the color table, calculate the color-mix between these two colors
and then replace both colors with the Mix-Color. This way reducing the number of colors.
This Command needs the ANA.AnalyzeColor Command to count colors in an IR before it will work. It may also need the "Force-Flag" (P2) to be set.
It will also use the Color-Similarity Table, therefore you will need to use the
`ANA.Sort_Similar_To|$$COL|$$MSK`
Command prior using this command.
Using the Tolerance Parameter with another value then 0 will slow down the process, but will also catch a lot more similar colors during the replace.
Somehow using the Tolerance, can be seen as if it is another command, as it will influence the result generally.
Therefore the number of Entries to reduce can be dramatically reduced when using Tolerance.

Using this command is in 5 steps:

```
1. Use
ANA.AnalyzeColor|0|1
to generate a Color-Table which contains all Colors and number of Pixels.

2. Sort the Color Table with Similarity to the Background Color
' Greenboard-Color, Mask and the color-range that shall be removed must be adjus
$$COL=&H30FF30
' Colors that do not apply to $$MSK will not be sorted
$$MSK=&HFFFFFF

3. (optional) Use
ANA.GetColorCount|0|$$CNT
to get the total number of colors

4. Use
ANA.Sort_Similar_To|$$COL|$$MSK
to sort the Color-Table by Similarity to the given Color

5. Now call the command to mix/reduce those colors that are most similar to the
' Remove Entries and Paint these Pixels with the Mix-color.
ANA.Reduce_Colors|0|10000|$$CNT|0|-1|2
```

© 2023 Theo Gottwald * https://www.smart-package.com

Here is a Sample-Script.

```
VAF.$$PIA=?exeloc\Sarah_BG.png
ANA.Load|0|$$PIA
ANA.Show|0!
ANA.AnalyzeColor|0|1
' Greenboard-Color, Mask and the color-range that shall be removed must be adjus
$$COL=&H30FF30
$$MSK=&HFFFFFF
ANA.GetColorCount|0|$$CNT
DBP.$$CNT
' Sort the Color Table with Similarity to the Background Color
ANA.Sort_Similar_To|$$COL|$$MSK
' Remove Entries and Paint these Pixels white that are Similar to the Backgroun
ANA.Reduce_Colors|0|30000|$$CNT|0|-1|2
DMP.6
ANA.Show|0!
ENR.
```

029 0000000000000000 0000 ENR.
```

Speed-Table of this Script.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

ANA.Reduce_Colors|P1|P2|P3[|P4][|P5][|P6]

Parameter Explanation

***P1** - Source and Destination* **Image-Register Number, if omitted 0 is used.**
***P2** - Color-Table-Start Index - must be lower then the total number of colors in the Color-Table.*
***P3** - Color-Table-End Index - In most cases this is the number of Entries in the Color-Table as its given by* ANA.GetColorCount|0|$$CNT.
If this number is too high it will automatically be cut down to the maximum. If P3<P2 then these two values will be exchanged.
***P4** - 0 or Color-Tolerance-Value. This value is used in the color-replacing part. If >0 the color-replace will also replace*
all colors within the Tolerance range of target-color + Tolerance value. This may slow down the process and also lead to unwanted results if wrongly used.
P5 - if -1 this Parameter is ignored, if 0-8, the command will use a Color-Condition Register (CCR) from 0 to 8 to replace only colors
within this range of the Color-Condition Register.
P6 - 0/1 - 0 - Use Col_Bgl (Backgound-Color Table), 1 - Use Col_Srt (Sorted Colors Table) default is 0
+ 2 Use Color-Ratio Algo for Color-Compare
+ 4 Change color-Mix Mode: 0 - Mix with evaluation by Number Count of Pixels,4 - just take larger color with more pixels
+ 8 Use Inverse CCR (Protect Colors given by the CCR)
+ 16 Use Pixelcount in Mix-Algo, means that colors with more pixels have larger influence on Mixing-Color.

The Command will leave a 0/1 on the TOS. If the Operation fails, TOS will show a "0".

Example

-

Remarks

-

Limitations:

While this command is not a slow command it may still take some seconds to some Minutes to execute, depending on how many colors to remove, the use of Color-Tolerance and the picture-Size.

3.55.4.4.6 ANA.RemoveSortedColors

MiniRobotLanguage (MRL)

ANA.RemoveSortedColors

Replace colors that are similar to a given color with a given color in an IR

Intention

This ccommand will replace colors that are sorted in the Col_Srt Colortable by "Number of Pixels".
This Command needs the ANA.AnalyzeColor Command to count colors in an IR before it will work. It may also need the "Force-Flag" (P2) to be set.
It will also use the Color-Similarity Table, therefore you will need to use the
`ANA.Sort_Similar_To|$$COL|$$MSK`
Command prior using this command.
This Command will work on the Col_Srt-Color Table that contains all Colors sorted by the Number of Pixels in the Picture.

Using this command is in 3 steps:

```
1. Use
ANA.AnalyzeColor|0|1
to generate a Color-Table which contains all Colors and number of Pixels.

2. (optional) Use
ANA.GetColorCount|0|$$CNT
to get the total number of colors

3. Now call the command to remove those colors that contain the most or least nu
ANA.RemoveSortedColors|0|40000|$$CNT|&HFFFFFF
```

Here is a Sample-Script. This Script will mark the Areas of the Picture which contain most of the Information.

```
VAF.$$PIA=?exeloc\Pics\Sarah_BG.png

3.55.4.4.8 ANA.ReplaceColorT

MiniRobotLanguage (MRL)

ANA.ReplaceColorT

Replace Color with Tolerance - Replace given Colors with another Color directly in the IR, using a Tolerance-Value.

Intention

This Command will directly replace colors in an IR. It will replace Color P2 (and all COlors taht fit to P2 with given Tolerance P3) with Color P4. In Image-Register P1. This Command is NOT really an Color-Table Operation, as it does not need the Color-Table.
Instead it will directly Replace Color P2 with Color P3 in Image-Register P1 using the Tolerance, which is given in 0-100%.

If Color **P2** is prefixed with an **!** then the Command will work in a **negative mode**, means it will replace the Color if it does NOT Fit to the Color **P2**.

In this Script we will replace the Black Color using a Tolerance of 10%, with Green.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.ReplaceColorT|P1|[!]P2[|P3][|P4]

Parameter Explanation

***P1 - Source & Destination* Image-Register Number, if omitted 0 is used.**
P2 - Color to be replaced with Color in P3.
If Color **P2** is prefixed with an **!** then the Command will work in a **negative mode**, means it will replace the Color if it does NOT Fit to the Color **P2**.
P3 - Color-Tolerance Value between 0-100 which is in Percent. 0 - do not use Tolerance, 100 - Replace any color.
P4 - (opt.) Color that will replace the Color in P2, if omitted &HFFFFFF (White) is used.

The Command will leave a 0/1 on the TOS. If the Operation fails, **P2** may be "0".

Example

This Example will show ANA.ReplaceColorT to make a Cleanup of a picture from a social network.
You got that Picture and it has a lot of JPG-Artefacts and the colors are not pure.
The SPR can quickly clean it up.

Remarks

This Command is really fast and will do its Job in a Second. Of course it will be slower then ANA.ReplaceColorD. This is not really Color-Table Operation because it does not use the Color-Table.

Limitations:

-

3.55.4.4.9 ANA.Show...Array

MiniRobotLanguage (MRL)

ANA.ShowSimArray

Show the Content of the Col_BGL - Color-Table

ANA.ShowSortArray

Show the Content of the Cl_Srt - Color-Table

Intention

These Operations work with the "Color Table", this is a sorted list with all colors in the IR.
In fact there are 2 Color-Tables:
0 - **Color-Sort** (Col_Srt) - This table contains the Colors sorted by number of Pixel per Color.
The Top-Entry is the color with the most Pixels. The bottom Entry is the color with the least number of Pixels.
1 - **Color-Background** (Col_Bgl) - This table is sorted by similarity to the Color that has most Pixel, which is assumed to be the Background Color.
Here the Top-Entry contains the Background Color and then any further Entry is sorted by Similarity to this Color.

Before using these Commands the Color Tables must be generated. This is done, using:

```
ANA.AnalyzeColor|0|1
```

The Col_Bgl Table can be sorted to Similarity from another Color using:

```
ANA.Sort_Similar_To|&H26592A|$$MSK
```

Thee are several other commands that will only work if the Color-Table has been updated before.
If you want to see the Contents of the Color-Tables - for Debugging - you can use these two Commands.

```
ANA.ShowSimArray
ANA.ShowSortArray
```

Using this Script:

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\BTC2.jpg
ANA.Load|0|$$PIA
ANA.AnalyzeColor|0|1
ANA.showsortarray|0
MBX.!
ENR.
```

You will get a listing of the Col_Srt-Table, this may look like this:

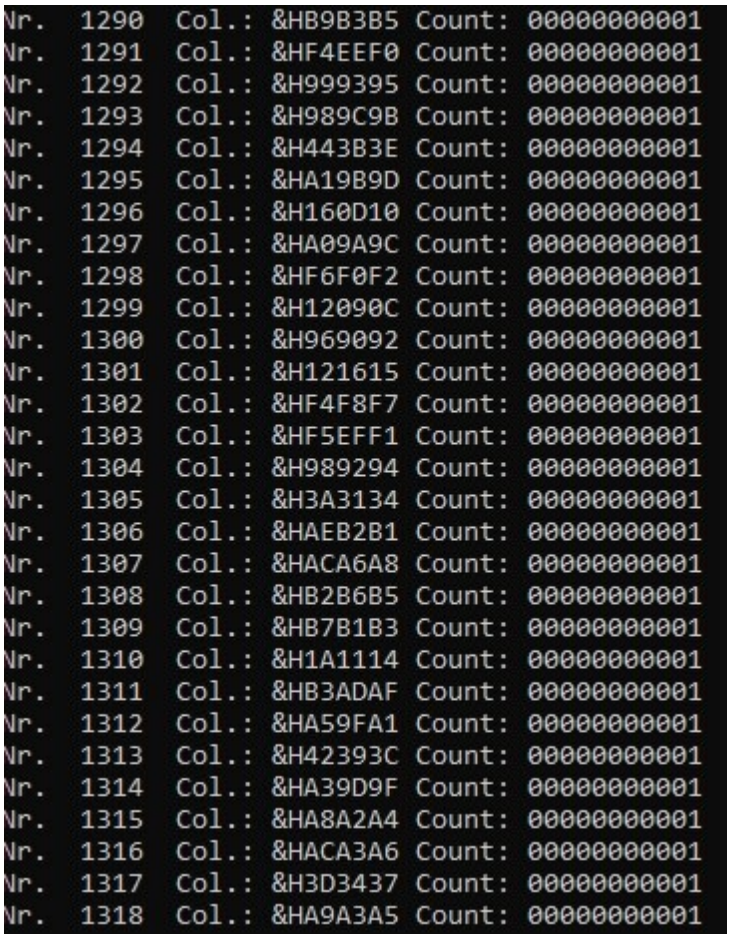
Nr.  64  Col.: &HE1E1E1 Count: 00000001509
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



Start of the Color-Tabel, Entries 0 to 41. the Entry for "Black" is on position 40.

Second part. As you can see, End of the Color-Table. Entries up to 1318.

Using this commands you can work with the list entries in the color table and do significant improvements in pictures.
Now you can improve the image. All colors are already sorted by Quantity (How many Pixels).

You can also get a sort on "Color difference to background". For this you can use:

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\BTC2.jpg
ANA.Load|0|$$PIA
ANA.AnalyzeColor|0|1
ANA.ShowSimArray|0
MBX.!
ENR.
```

Then you will get the Content of The Col_BGL-Table which looks somehow like this:

© 2023 Theo Gottwald * https://www.smart-package.com

```

In this table the black colors will be "on Top" while the White colors will be "bottom". For this sort the robot assumes that the color that is mostly in the picture "is the background color".
The he will sort all colors "by difference to the background". This is the result.

Using these tables you can significantly improve pictures with your Script.

For example you can remove colors from the list and the IR using:

```
' this command will remove the given color and replace it with another color.
ANA.removeindexcolors|0|300|$$CNV|0

3.55.4.5 Color-Calculation

Color-Calculations take one or more 24-Bit Color Values as Input and calculate an result or result color from that.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.5.1 ANA. Inverse_Color / Complementary_Color

ANA.Complementary_Color / ANA. Inverse_Color Previous 1088 Top 41 Next 1109

MiniRobotLanguage (MRL)

ANA.Complementary_Color

Calculate the Complementary Color Value for a given 24-bit Color-Value

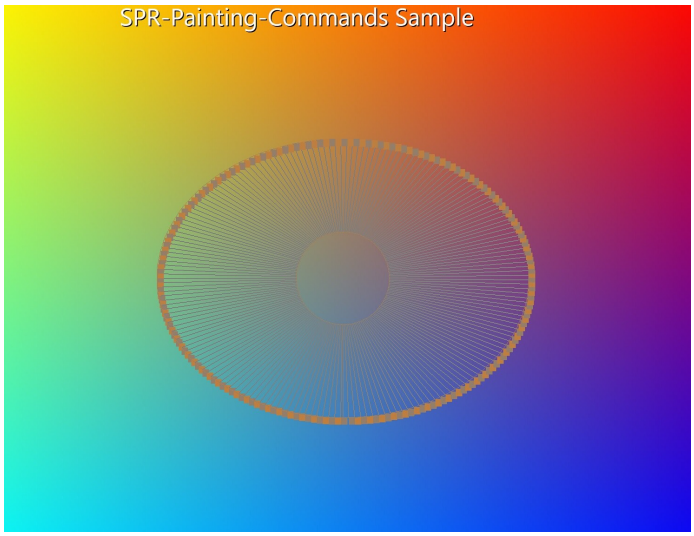
ANA.Inverse_Color

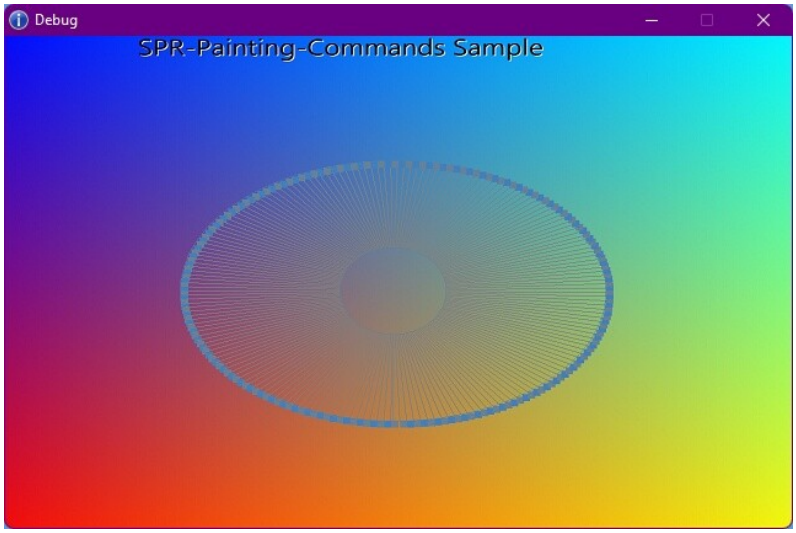
Calculate the Inverse Color Value for a given 24-bit Color-Value

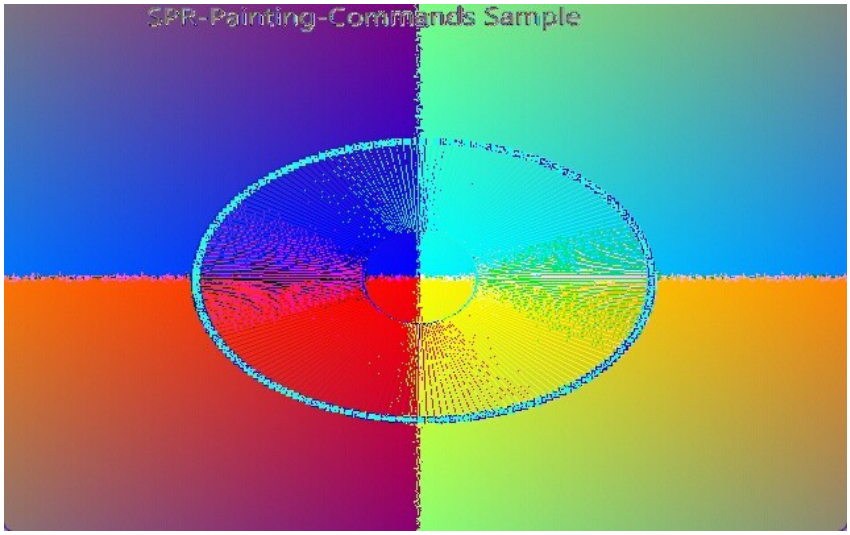
Intention

This command will return the Inverse / or complementary color value of a given 24-bit Color-Value.
To show the difference of both here is an example:

© 2023 Theo Gottwald * https://www.smart-package.com







Original Picture **Inverse Color**

Complementary Color

The Complementary Color is very good to use as Text on Pixels. The Inverse Color is exactly the Inverse Color in the Color-Wheel.

Syntax

ANA.Complementary_Color[|P1][|P2][|P3][|P4]
ANA.Inverse_Color[|P1][|P2][|P3][|P4]

Parameter Explanation

P1 - Source Color Value (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P2 - Variable for Color-Value for ***Red***
P3 - Variable for Color-Value for ***Green***
P4 - Variable for Color-Value for ***Blue***

If any of the Variables is missing, the value is been placed on the TOS.

Example

```
See above.
```

Remarks

The `ANA.Split_Color_RGB` is optimized for Speed. It will use only about 444 Ticks. Therefore the Robot could split more then 36000 Values per Second.

Limitations:

-

3.55.4.5.2 ANA.Add/Sub_Color / Mix_Colors

MiniRobotLanguage (MRL)

ANA.Sub_Color
Subtract Color P2 from Color P1
ANA.Add_2_Colors
Add 2 Colors additive
ANA.Add_3_Colors
Add 3 Colors additive
ANA.Add_4_Colors
Add 4 Colors additive
ANA.Mix_2_Colors
Average 2 Colors additive
ANA.Mix_3_Colors
Average 3 Colors additive
ANA.Mix_4_Colors
Average 4 Colors additive

Intention
Use the SPR like a box with watercolors. Add colors and use them for Painting. Also you can subtract colors -
that is somehow like watching through a colored glass.
These command do color calculations to Mix or Subtract colors.
For this it will internally split the colors into its three 8-Bit Color-Components for R,G and B.
And use these for the final calculation.

What is the difference between ADD and MIX?
Using **Add**, the color-values will just be added to each other therefore the result will be an real addition.
Using **Mix**, the color-values will be added and then divided by the number of Sources therefore the result will be an average of the sources.

While that does not Sound much, it enables you to do unlimited complex color Mixing and processing.
You can use Colors like physical colors that you can mix together and paint with these.

1. Color-Calculations

In this Sample we will just add and subtract some colors.

P2 - Color Value B (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P3 - Variable the result.

ANA.Mix_3_Colors|P1|P2|P3[|P4]

Parameter Explanation

P1 - Color Value A (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P2 - Color Value B (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P3 - Color Value C (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P4 - Variable the result.

ANA.Mix_4_Colors|P1|P2|P3|P4[|P5]

Parameter Explanation

P1 - Color Value A (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P2 - Color Value B (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P3 - Color Value C (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P4 - Color Value D (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P5 - Variable the result.

3.55.4.5.3 ANA.Color_Diff-Commands

MiniRobotLanguage (MRL)

ANA.Color_Diff_RGB and other ...

Split the a specified Color-Value into R,G and B

Intention

These commands will take 2 Color-Values and calculate the Color-Difference between these values. Internally the Color-Difference is the Sum of the Differences between the R,G and B Parts of both values.
The smaller the Color Difference, the the more equal the colors should be.
Generally most Information you can get using:

```
ANA.Color_Diff_RGB|&HF0F1F2|&HFFAADD|$$RED|$$GRN|$$BLUE
```

Here you will get all 3 Color-Differences between the 2 given colors, in 3 Variables.
Then you can calculate yourself whatever you are interested in.

The other Commands try to do some Speed-Up for special purpose Operations.

```
' This Command will return only the largest Color-Distance
ANA.Color_Diff_Max|&HF0F1F2|&HFFAADD|$$MAX

' This Command will return only the smallest Color-Distanc
ANA.Color_Diff_Min|&HF0F1F2|&HFFAADD|$$MIN

' This Command will return only the RED Color-Distance betw
ANA.Color_Diff_R|&HF0F1F2|&HFFAADD|$$RED

' This Command will return only the GREEN Color-Distance be
ANA.Color_Diff_G|&HF0F1F2|&HFFAADD|$$GRN

' This Command will return only the BLUE Color-Distance bet
ANA.Color_Diff_B|&HF0F1F2|&HFFAADD|$$BLU
```

1. Sample for ANA.Color_Diff_Max

Normally this Command can be used to find structures in GUI's, for example Letters.
Here we can use it for some Artwork.
We will find Borders and paint then red.

2. Multi-Step Picture Processing

*© 2023 Theo Gottwald * https://www.smart-package.com*

Here we have a 2-Pass Picture Processing. As the SPR can use multiple IR's, any intelligent sort of Picture Processing can be done in as man steps as needed.
In the first step we find the borders like in the picture above. In the second step we paint the borders larger.

The Speed-Dump of the Script shows that the ANA.Color_Diff_Max uses only about 200 Ticks execution Time.

Syntax

ANA.Color_Diff_RGB|P1|P2[|P3][|P4][|P5]

Parameter Explanation

P2 - Color A - Value, Color-Value 24-Bit. Example: &HFF00FF
P2 - Color B - Value, Color-Value 24-Bit. Example: &HFF00FF
P3 - Variable for Color-Value for ***Red, for resulting Color Value (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB). If missing the value is been placed on TOS.***
P4 - Variable for Color-Value for ***Green, for resulting Color Value (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB). If missing the value is been placed on TOS.***
P5 - Variable for Color-Value for ***Blue, for resulting Color Value (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB). If missing the value is been placed on TOS.***

ANA.Color_Diff_Max|P1|P2[|P3]
ANA.Color_Diff_Min|P1|P2[|P3]
ANA.Color_Diff_R|P1|P2[|P3]
ANA.Color_Diff_G|P1|P2[|P3]
ANA.Color_Diff_B|P1|P2[|P3]

Parameter Explanation

P2 - Color A - Value, Color-Value 24-Bit. Example: &HFF00FF
P2 - Color B - Value, Color-Value 24-Bit. Example: &HFF0000
P3 - Variable for result Color-Value ***(8-Bit, Format in Hexadezimal: 00-&HFF). If missing the value is been placed on TOS.***

Example

```
See above.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

The `ANA.Color_Diff-Commands are` optimized for Speed. It will use only about 300 Ticks. Therefore the Robot could execute it more then 53000 times per Second.

Limitations:

3.55.4.5.5 ANA.Split_RGB / Combine_RGB

MiniRobotLanguage (MRL)

ANA.Split_RGB

Split the a specified Color-Value into R,G and B

ANA.Combine_RGB

Combine the R,G and B Values into a Color-Value

Intention

This command will split an 24-bit Color-Value into the three 8-Bit Color-Components for R,G and B.
While that does not Sound much, it enables you to do unlimited complex Image processing,
Together with other Commands like `ANA.Combine_Color_RGB`.

1. Color-Processing

In this Sample we will additionally change the Colors.For this we use the two Commands:

```
        ANA.getpixelcolor|1|$$XPO|$$YPO|$$PIX
  ' This is just for example normally you would use ANA.GetPixelColor_RGB which co
        ANA.Split_RGB|$$PIX|$$COR|$$COG|$$COB
  ' We Combine the Colors in away that Blue and Green is exchanged.
        ANA.Combine_RGB|$$COG|$$COR|$$COB|$$PIX
  ' And Set the Pixel
        ANA.Setpixelcolor|0|$$XPO|$$YPO|$$PIX
```

And then Paint the Picture.
In the SPR you can use virtually unlimited Graphics Sources to be combined.

.

```
  ' Here is the Code.
  ' On my Computer it uses 5 Minutes Processing time for a Picture of Medium size

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.Split_Color_RGB[|P1][|P2][|P3][|P4]

Parameter Explanation

P1 - Color Value (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB)
P2 - Variable for Color-Value for ***Red***
P3 - Variable for Color-Value for ***Green***
P4 - Variable for Color-Value for ***Blue***

ANA.Combine_Color_RGB[|P1][|P2][|P3][|P4]

Parameter Explanation

P1 - Variable for Color-Value for ***Red***
P2 - Variable for Color-Value for ***Green***
P3 - Variable for Color-Value for ***Blue***
P4 - opt. Variable for resulting Color Value (24-Bit, Format in Hexadezimal: &HFFFFFF=RR GG BB). If missing the value is been placed on TOS.

Example

```
See above.
```

Remarks

The `ANA.Combine_Color_RGB` is optimized for Speed. It will use only about 444 Ticks. Therefore the Robot could split more then 36000 Values per Second.

3.55.4.6 Convert Colors

These Operations can be used to reduce color numbers in an IR.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.6.1 ANA.Brightness

MiniRobotLanguage (MRL)

ANA.Brightness

Change Brightness in an Image-Register (IR)

Intention

This command will change the Brightness value of an IR. The given **P2** value can be positive or negative.
Negative values for **P2**, will decrease the contrast. If **P3** is given, then the result will be stored in IR **P3**.

1. Change color Brightness in IR
In this case we do not specify **P3** therefore we will directly change the Original IR that contains the picture.

3.55.4.6.2 ANA.BW

MiniRobotLanguage (MRL)

ANA . BW

Convert an Image-Register (IR) to Black and White using an specified threshold

Intention

This command will convert the Content of an IR directly into an B/W Image using only 2 Colours: Black and White.
The difference between Black and White is made along a user specified threshold that can vary from 1 - all White - to 768 (all Black).
Using a value of 0 will internally use the optimum value of 383.

1. Capture Screenshot of open Browser and convert it to BW
You can do this with your own preferred window - just change the STW.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png
' If you use the value of "0", it will internally be used 383
ANA.bw|0|383
ANA.Save|0|?path\After.png
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

*© 2023 Theo Gottwald * https://www.smart-package.com*

Here you can see the picture before and after the operation, using the Threshhold of 383 and a threshold of 128.

2. Use BW with no Parameters
In this case the default values are taken, means "0" as the Source and Target IR, and &H17f (383 dec.) as threshold.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png
ANA.bw
ANA.Save|0|?path\After.png
ENR.
```

3. Making things darker
Here we use a threshold of 460.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png
ANA.bw|0|460
ANA.Save|0|?path\After.png
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

4. Quickly remove a watermark from a b/w picture.

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\Igorslab.png
VAF.$$PIB=?exeloc\V1.png
ANA.Load|0|$$PIA
ANA.TriColor|0|&H90FFFF

3.55.4.6.4 ANA.Grey

MiniRobotLanguage (MRL)

ANA.Grey

Convert an Image-Register (IR) to Grey using a threshold

Intention

This command will convert the Content of an IR directly into an Grey Image.
Changing the Second parameter will give you a lot of options.
Using a value of 0 for **P2** will internally use the optimum value of 1.
This command can be used to prepare an IR for Patternsearch or other operations in special cases where we do not want to depend on colors.

1. Capture Screenshot of open Browser and convert it to Grey
You can do this with your own preferred window - just change the STW.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png
ANA.Grey|0|0
ANA.Save|0|?path\After.png
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Here you can see the picture before and after the operation.

2. Use Grey with higher Threshold

In this case the effect is hardly foreseable. Due to the internal logic you will get an artificial result.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png

' Left Picture
ANA.Grey|0|2

' Second Picture
ANA.Grey|0|10
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Third Picture
ANA.Grey|0|400

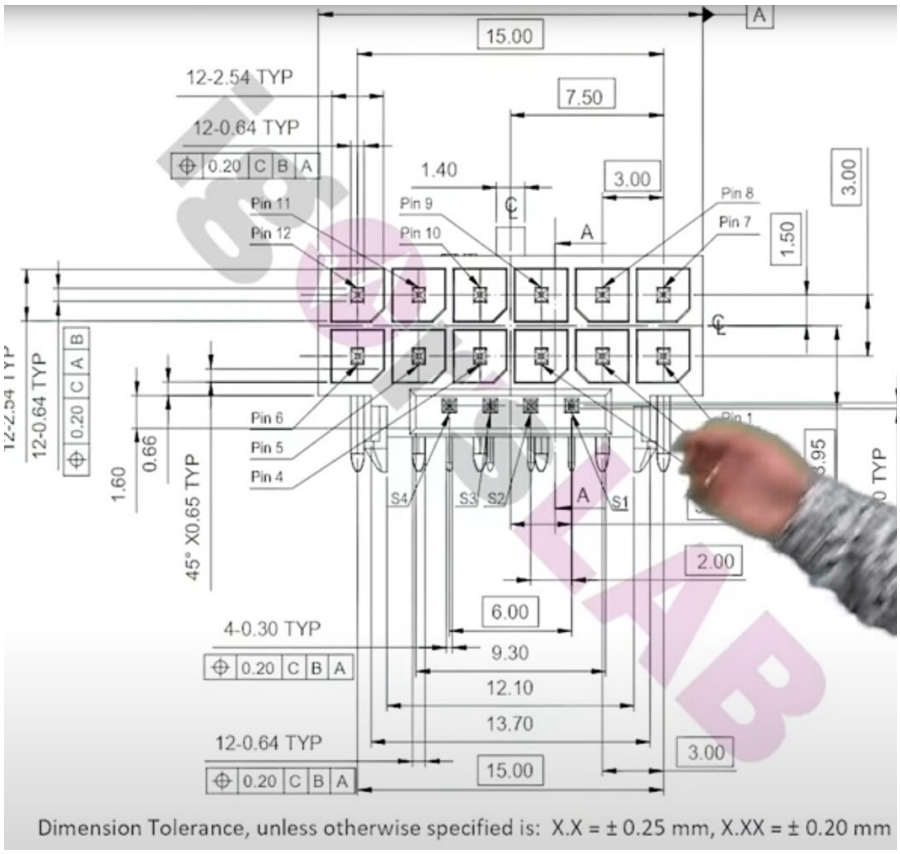
' Right Picture
ANA.Grey|0|1650

ANA.Save|0|?path\After.png
ENR.
```

3. Quickly remove a watermark from a b/w picture.

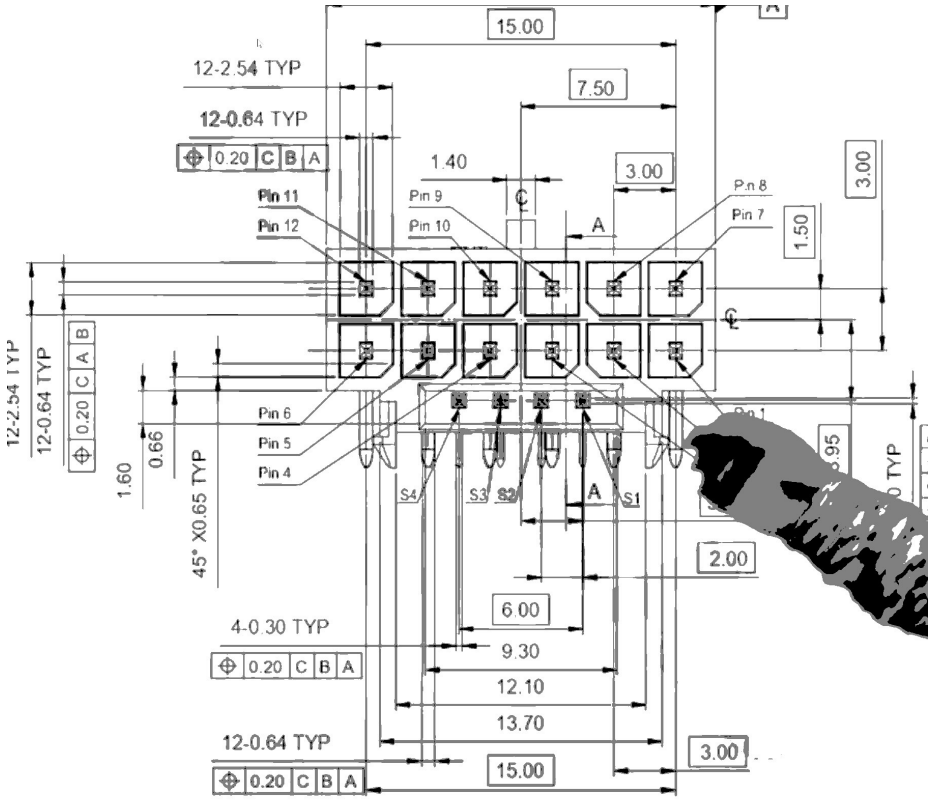
```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\Igorslab.png
VAF.$$PIB=?exeloc\V1.png
ANA.Load|0|$$PIA
ANA.TriColor|0|&H90FFFF
ANA.bw|0|760
ANA.Show|0!
ANA.Save|0|$$PIB
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



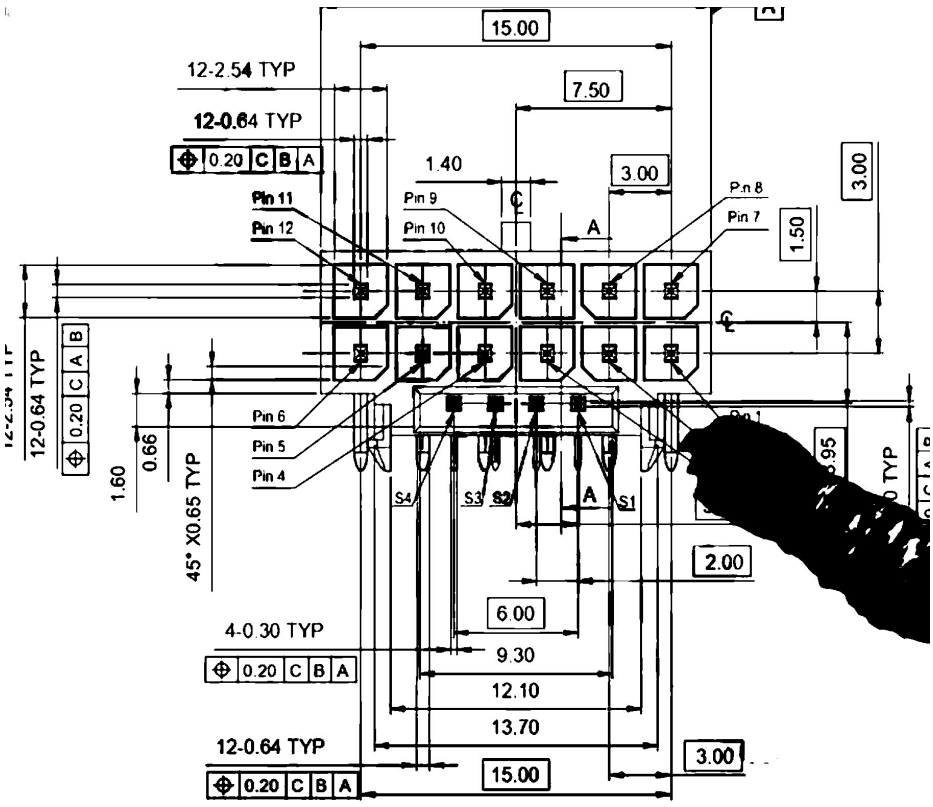
->

© 2023 Theo Gottwald * https://www.smart-package.com



Dimension Tolerance, unless otherwise specified is: X.X = ± 0.25 mm, X.XX = ± 0.20 mm

© 2023 Theo Gottwald * https://www.smart-package.com



Dimension Tolerance, unless otherwise specified is: X.X = ± 0.25 mm, X.XX = ± 0.20 mm

Syntax

ANA.Grey[|P1][|P2]

Parameter Explanation

P1 **-** ***opt.*** Image-Register Number, if omitted, IR 0 will be used.
P2 **-** ***opt.*** ***Threshold-Number***, if omitted,1 will be used. The higher, the finer structures will be created.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' ANA.Grey-Sample
'*********************************
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png
ANA.Grey|0|1
ANA.Save|0|?path\After.png
ENR.
```

Remarks

This command is optimized, it will process even large pictures in less then a second. For a Window with size 1140x1410 i needed 336402 Ticks (Speedtable using DMP.1), this is 0.02 Seconds on my computer, as my system can process 16000000 Ticks in one second.

Limitations:

3.55.4.6.5 ANA.Luminance / Change_Luminance

ANA.Brightness - Change Brightness in IR Previous 1088 Top 41 Next 1109

MiniRobotLanguage (MRL)

ANA.Luminance

Change HSL-Luminance in an full Image-Register (IR)

ANA.Change_Luminance

Calculate new HSL-Luminance for a given Color-Value

Intention

This command will change the Luminance-Value (HLS-System) for a full Image Register.
Luminosity or Luminance is somehow the brightness or brilliance of a picture.

There are 2 Modes:
A) Set Luminance to a fixed value between 0 and 1000
B) Change Luminance by a given value between -1000 and 1000
Which mode is used, depends on P3, if **P3** is 0 (absolute value to be set) or 1 (add/remove Luminance).
This command will work on the full given IR.

To just calculate the new Luminance from a single Pixel, use the equivalent command
`ANA.Change_Luminance|RGB-Color|Color-Value|0/1`

1. Change Luminance in IR relativ to current value
In this case we do set **P3** to 1. Therefore the command will change the Original luminance Value by adding or subtracting the given value **P2**..

Syntax

ANA.Luminance|P1|P2[|P3][|P4]
ANA.Lum|P1|P2[|P3][|P4]

Parameter Explanation

P1 - ***Source*** Image-Register Number, Source-IR, if omitted, IR 0 will be used.

P2 - ***(number, -1000 to +1000) Luminance Value,*** positive values will increase the contrast, negative values will decrease the contrast.

P3 - ***0/1 Value.*** Setting **P3** to 0 will limit **P2** to 0-1000. In this case **P2** will be added to the value of the Pixels in the IR. Setting **P3** to 1 will set the limit P2 to 0-1000.

P4 - ***Destination*** Image-Register Number, if omitted, IR **P1** will be used as destination IR.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

© 2023 Theo Gottwald * https://www.smart-package.com

ANA.Change_Luminance|P1|P2[|P3][|P4]
ANA.Clu|P1|P2[|P3][|P4]

Parameter Explanation

P1 - ***RGB-In Value, Example: &HF0AC45***
P2 - ***(number, -255 to +255) Brightness Value,*** positive values will increase the contrast, negative values will decrease the contrast.
P3 - ***0/1 Value.*** Setting **P3** to 0 will limit **P2** to 0-1000. In this case **P2** will be added to the value of the Pixels in the IR. Setting **P3** to 1 will set the limit P2 to 0-1000.
P4 - ***Destination Variable,*** if omitted TOS is used.

3.55.4.6.6 ANA.TriColor

MiniRobotLanguage (MRL)

ANA.TriColor

Convert an Image-Register (IR) to Black and White using an specified threshold

Intention

This command will convert the Content of an IR directly into an B/W Image using only 2 Colours: Black and White.
The difference between Black and White is made along a user specified threshold that can vary from 1 - all White - to 768 (all Black).
Using a value of 0 will internally use the optimum value of 383.

1. Capture Screenshot of open Browser and convert it to Three Colors
Here i have used a Color-Threshold of "0" that will evaluate to the default value of `&H808080`
You can do this with your own preferred window - just change the STW.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png
ANA.TriColor|0|0
ANA.Save|0|?path\After.png
ENR.
```

17 GESUNDHEITSMYTHEN IM CHECK
Brauche ich 5 Portionen Obst und Gemüse am Tag?
Acht Stunden Schlaf, 10 000 Schritte am Tag – was ist richtig und was überholt?
17 GESUNDHEITSMYTHEN IM CHECK
Brauche ich 5 Portionen Obst und Gemüse am Tag?
Acht Stunden Schlaf, 10 000 Schritte am Tag – was ist richtig und was überholt?
17 GESUNDHEITSMYTHEN IM CHECK
Brauche ich 5 Portionen Obst und Gemüse am Tag?
Acht Stunden Schlaf, 10 000 Schritte am Tag – was ist richtig und was überholt?

Here you can see the picture before and after the operation, using the Threshhold of &H808080 and a threshold of &HF0F0F0 the 4th picture has a Threshold of &HF010F0 and the last picture has a Threshold of &H1010F0.

2. Due to the used technology, there is no difference whether you use &H1010F0 or &HF01010

The Values are not sorted to RGB but play a role all together.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png

' This will result in a B/W picture (left picture below)
ANA.TriColor|0|&HFFFFFF

' This will result in a grey picture (right picture below) because "0" will use
ANA.TriColor|0|&H0

' This will result in the right picture below.
ANA.TriColor|0|&HFF40FF

ANA.Save|0|?path\After.png
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

3. Making things lighter
Here we use a threshold of &H101010.

```
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png
' This will result in a lighter picture (see picture below)
ANA.TriColor|0|&H010101
ANA.Save|0|?path\After.png
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Quickly remove a watermark from a b/w picture.

```
VAN.$$TIM=#time#
VAF.$$PIA=?exeloc\Igorslab.png
VAF.$$PIB=?exeloc\V1.png
ANA.Load|0|$$PIA
ANA.TriColor|0|&H90FFFF
ANA.bw|0|760

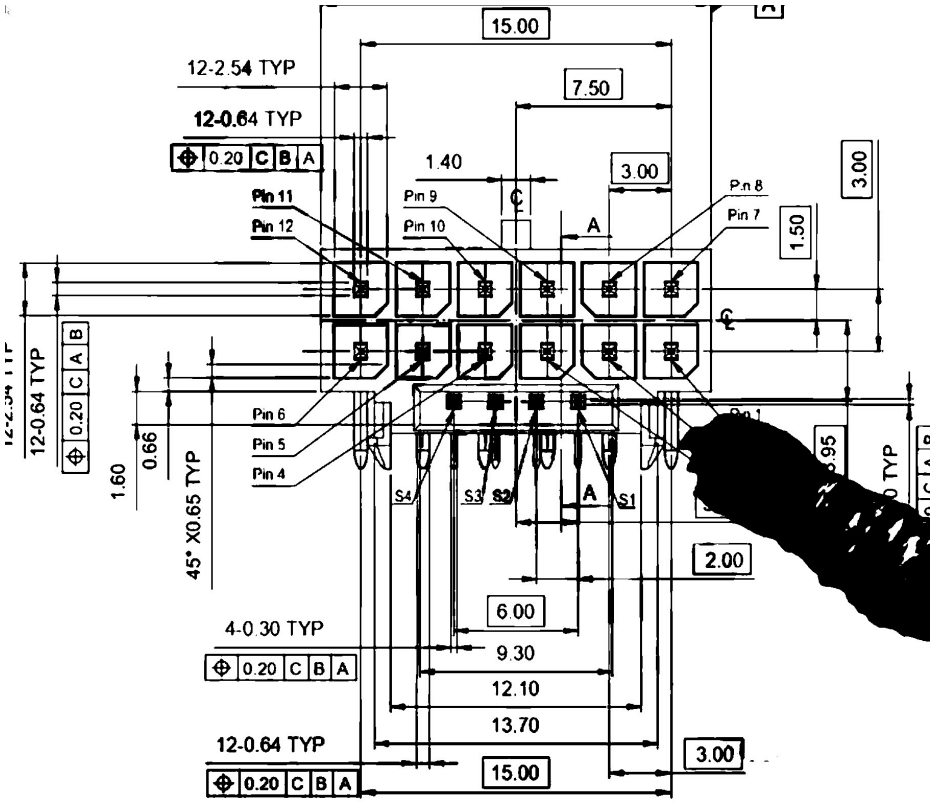
->

© 2023 Theo Gottwald * https://www.smart-package.com



Dimension Tolerance, unless otherwise specified is: X.X = ± 0.25 mm, X.XX = ± 0.20 mm

Syntax

ANA.TriColor[|P1][|P2]

Parameter Explanation

P1 - opt. Image-Register number, if omitted, IR 0 will be used.
P2 - opt. Threshold value for Grey. If omitted or zero, `&H808080` will be used.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.TriColor-Sample
'***********************************
STW.ct|Chrome_WidgetWin_1|- Brave
ANA.Snap|0
ANA.Save|0|?path\Before.png
ANA.TriColor|0|0
ANA.Save|0|?path\After.png
' See the speedtable
DMP.1
MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

Remarks

This command is not optimized, it may take up to several seconds for large pictures. For a Window with size 1140x1410 i needed 40572261 Ticks (Speedtable using DMP.1), this is 2.5 Seconds on my computer, as my system can process 16000000 Ticks in one second.

3.55.4.7 Debug & Show IR's

These Commands are used to improve your Scripts.

Using Multi-Pattern Find Operations with scaled Patterns and high Tolerance Settings can lead to the same Object
being found from several engines. Is such cases you see this effects.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.7.1 ANA.Show

MiniRobotLanguage (MRL)

ANA . Show

Display Content of an Image-Register (IR)

Intention

This command will display the content of an Image-Register. It will stay open as long as the Script runs.
Optionally it will wait for a "Confirmation" to close the Display-Window.

You can currently display only 1 IR at a time.

1. Generate a Gradient and then display it using Show

```
' Here we have a Sample-Script
ANA.New|0|800|400
ANA.vgradient|0|&HFF0000|&H00FFFF
ANA.Show|0!
ANA.New|1|800|400
ANA.hgradient|1|&H00FFFF|&HFF0000
ANA.Show|1!
ANA.blendTo|0|1|2|160
ANA.Show|2!
ANA.VFlip|2
DMP.6
ANA.Show|2!
ENR.
```

If you add a "!" to the Show Command, this window will appear.
If you press "Yes" then the Script will continue running, and the Graphics-Window will be closed.
If you press "No", the Script will end.

2. Capture Window and scale/Stretch it using "New" then display it using show
`ANA.Show` will not do any scaling from itself. It will display the content of the IR 1:1.
If you want to do a scaling, you can use other commands like "New" or "EqualRes" first.

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
STW.ct|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS|Desktops-Manager
ANA.Snap|0
' Create New IR with 800x600 Resolution, then "stretch" IR 0 into this one
ANA.New|1|800|600|0
' Display the stretched picture
ANA.Show|1!
ENR.
```

Syntax

ANA.Show[|P1][!][@][#]

Parameter Explanation

P1 - opt. **Image-Register number, if omitted, IR 0 will be used.**

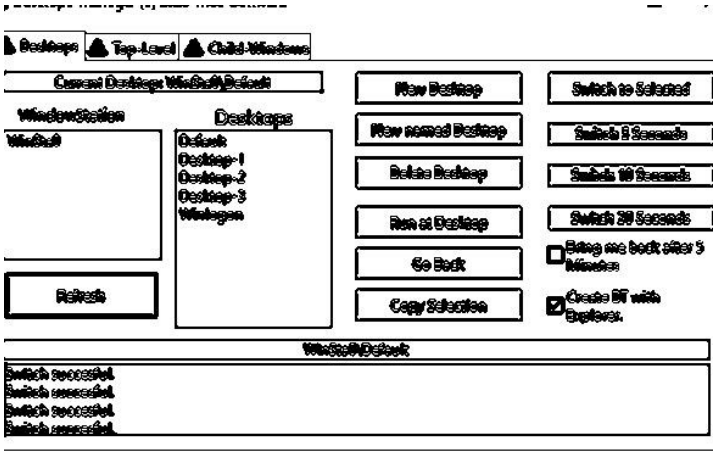
If the Snapshot worked fine, a "1" is returned on the TOS.
If Windows is unable to reserve the Memory for the Screenshot-Operation, the operation will fail and the command will return "0" on TOS.
If you add a "!" immediately after **P1**, then a Message-Box will appear and you can stop the Script and take closer Look.
If you add a "@" immediately after **P1**, then the result will be already filtered with a internal Fuzzy Logic. The effects may not be visible without a Lens.
If you add a "#" immediately after **P1**, then the Picture will be scaled to 512 Pixels using a internal logic that helps you preview the picture.

Example

```
'**********************************
' ANA.Show-Sample
'**********************************
STW.ct|Progman|Program Manager
ANA.snap|0
ANA.Copy|0|1
ANA.BlockTo|0|0|2
ANA.rct|0|&H0|260|&H0
ANA.rct|0|&HFFFFFF|200|&HFFFFFF
ANA.logic|0|1|0|A XOR B NOT T|RGB
ANA.rct|0|&H0|260|&H0
ANA.rct|0|&HFFFFFF|200|&HFFFFFF
ANA.show|0!
ENR.
```

Here you can see the result of the Operation.

© 2023 Theo Gottwald * https://www.smart-package.com



Remarks

Putting a Screenshot inside a Variable using "ToVar" will produce a Variable with this format insider the Variable:
- 8 Byte (4 Byte X- and 4 Byte Y-Size Information)
- (X-size * y-size)*4 Byte per Pixel-graphical Data in BGR-Order.

Limitations:

-

3.55.4.7.2 ANA.ShowHits

MiniRobotLanguage (MRL)

ANA.ShowHits

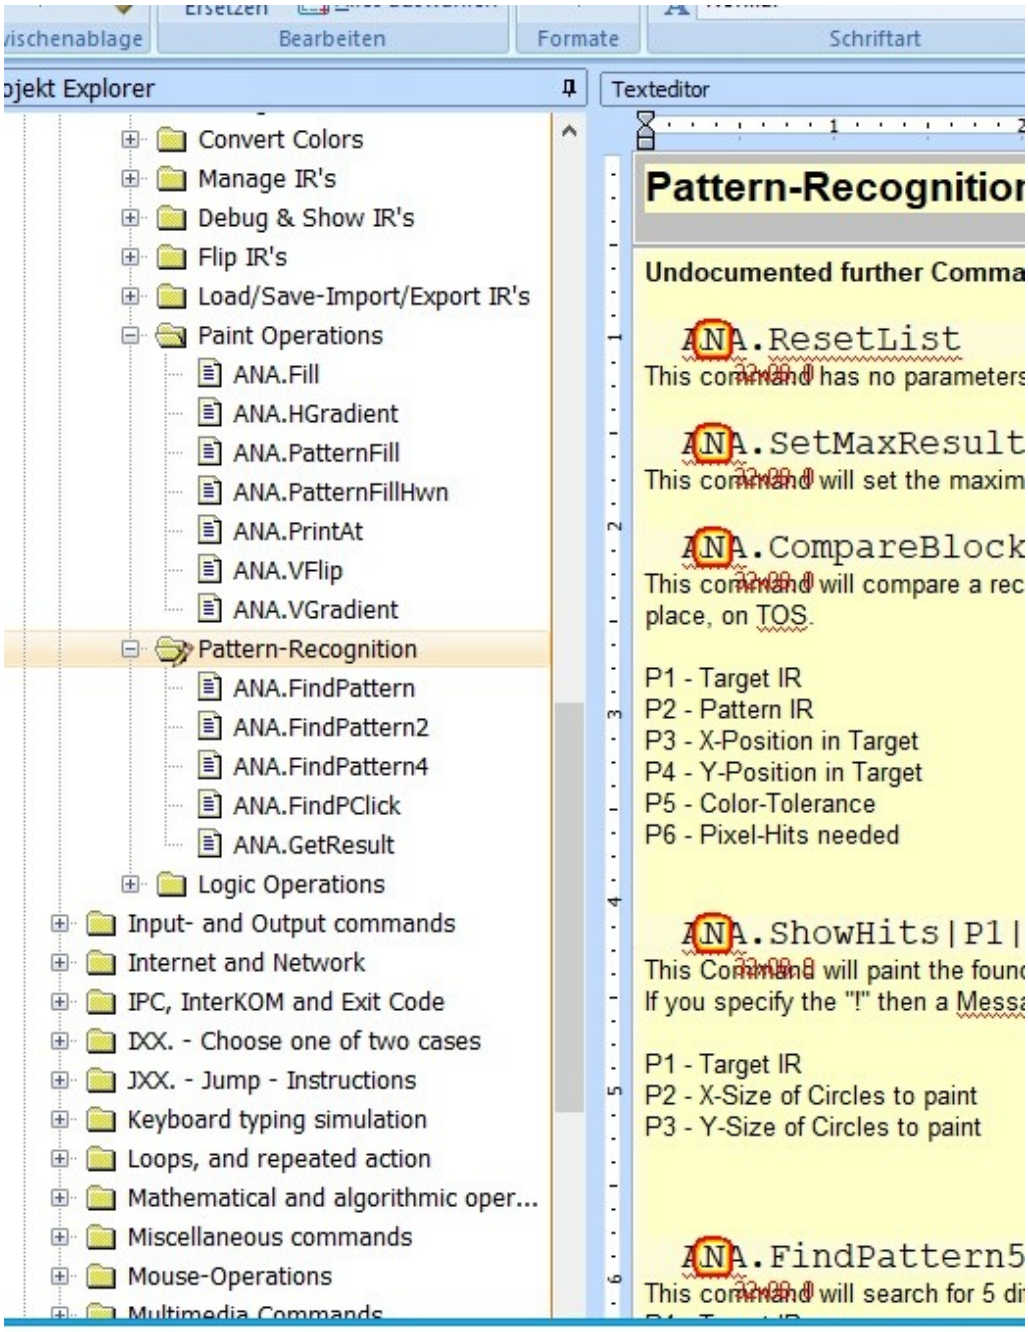
Display Result from Find-Operation

Intention

This Command will paint the found Hits in the given IR. Just like the "Show Hits" Button in the HE-Recorder.

```
'*********************************
' ANA.ShowHits-Sample
'*********************************
ANA.Load|0|?pattern\HelpM.png
' P1 - Target, P2 - Pattern, P3 - Color-Tolerance, P4 - min. Hits (Pixel) maximu
ANA.Load|1|?pattern\Big_Ana.bmp
ANA.fpa|0|1|0|46|0
DMP.6
ANA.ShowHits|0!
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



© 2023 Theo Gottwald * https://www.smart-package.com

Lower picture: This is the Stack after the call to ANA.fpa Command.
Upper Picture: This is the IR with the found Results painted.

Syntax

ANA.ShowHits[|P1][|P2][|P3][!][!]

Parameter Explanation

P1 - Target IR
P2 - X-Size of Circles to paint
P3 - Y-Size of Circles to paint

If you specify the "!" then a Messagebox will appear and prevent the Script from Continue running.
If you specify the "!!" then a Messagebox will appear and prevent the Script from Continue running also the picture will be prefiltered for noise like its done with the internal search

Example

```
'**********************************
' ANA.ShowHits-Sample
'**********************************
ANA.Load|0|?pattern\HelpM.png
' P1 - Target, P2 - Pattern, P3 - Color-Tolerance, P4 - min. Hits (Pixel) maximu
ANA.Load|1|?pattern\Big_Ana.bmp
ANA.fpa|0|1|0|46|0
DMP.6
ANA.ShowHits|0!
ENR.
```

3.55.4.8 Flip IR's

This command will flip the Content of IR 1 horizontally or vertically.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.8.1 ANA.HFlip

MiniRobotLanguage (MRL)

ANA.HFlip

Flip an Image-Register (IR) horizontally

Intention

This command will flip the Content of IR 1 horizontally..

1. Just Flip IR P1 horizontally
This simple Script shows the Use of `ANA.HFlip`.

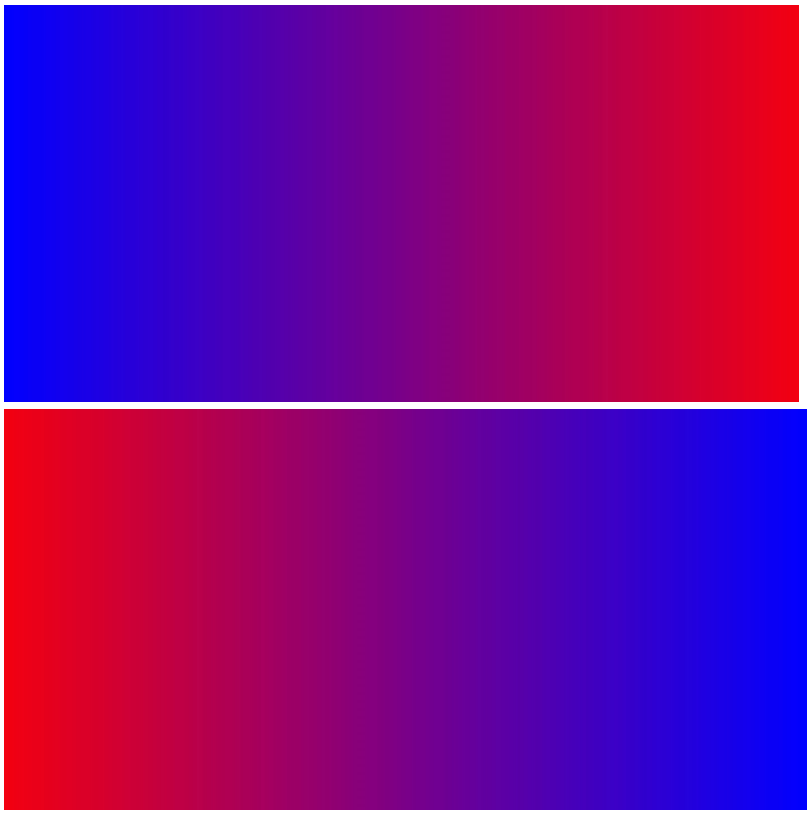
```
ANA.New|0|800|400
ANA.hgradient|0|&HFF0000|&H1000F4
ANA.Show|0!
' Make Resolution from P2 to the resolution from P1.
ANA.HFlip|0
DMP.6
ANA.Show|0!
ENR.
```

2. Flip P1 to P2
In this case, **P1** will be H-Flipped to **P2**.

```
ANA.New|0|800|400
ANA.hgradient|0|&HFF0000|&H1000F4
ANA.Show|0!
' Make Resolution from P2 to the resolution from P1.
ANA.HFlip|0|1
DMP.6
ANA.Show|1!
ENR.
```

Effect of HFlip:

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

ANA.HFlip|P1][|P2]

Parameter Explanation

P1 – Image-Register number, this IR contains the Image that is to be H-Flipped.
P2 – ***opt.*** Destination Image-Register number, if omitted, P1 will be used as Destination.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.HFlip-Sample
'***********************************
ANA.New|0|800|400
ANA.hgradient|0|&HFF0000|&H1000F4
ANA.Show|0!
' Make Resolution from P2 to the resolution from P1.

3.55.4.8.2 ANA.HVFlip

MiniRobotLanguage (MRL)

ANA.HVFlip

Flip an Image-Register (IR) vertically

Intention

This command will flip the Content of IR 1 vertically.

1. Just Flip IR P1 vertically and horizontally

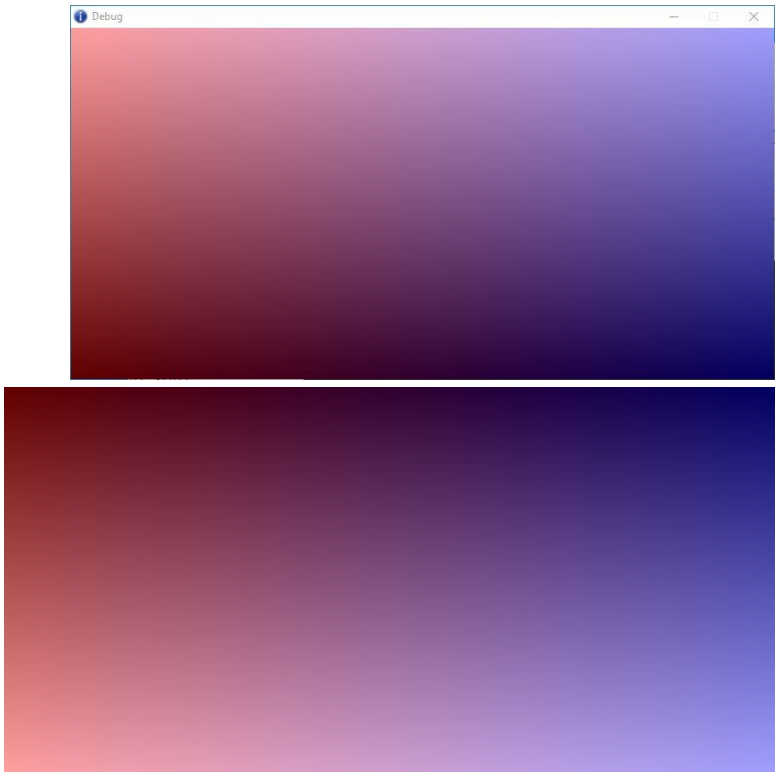
```
'This simple Script shows the Use of ANA.HVFlip.
ANA.New|0|800|400
ANA.vgradient|0|&H000000|&HFFFFFF
ANA.New|1|800|400
ANA.hgradient|1|&H0000FF|&HFF0000
ANA.blendTo|0|1|2|160
ANA.Show|2!
' Make Resolution from P2 to the resolution from P1.
ANA.HVFlip|2
DMP.6
ANA.Show|2!
ENR.
```

2. Flip P1 to P2
In this case, **P1** will be HV-Flipped to **P2**.

```
ANA.New|0|800|400
ANA.vgradient|0|&H000000|&HFFFFFF
ANA.New|1|800|400
ANA.hgradient|1|&H0000FF|&HFF0000
ANA.blendTo|0|1|2|160
ANA.Show|2!
ANA.HVFlip|2|1
DMP.6
ANA.Show|1!
ENR.
```

Effect of VFlip:

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

ANA.HVFlip|P1][|P2]

Parameter Explanation

P1 – Image-Register number, this IR contains the Image that is to be H-Flipped.
P2 – ***opt.*** Destination Image-Register number, if omitted, P1 will be used as Destination.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.HVFlip-Sample
'***********************************
ANA.New|0|800|400

3.55.4.9 Load/Save-Import/Export IR's

This command will Load and Save specified IR from a diskfile or variables.

This way you can use an nearly unlimited number of Images for your processing Operations.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.9.1 ANA.#FromVar

ANA.#FromVar - Restore IR-Content from Variable Previous 1088 Top 41 Next 1109

MiniRobotLanguage (MRL)

ANA.#FromVar

Restore Image-Register (IR) Content from SPR-Variable

Intention

This command will restore the IR Content from a SPR Variable.
It is the counterpart to `ANA.ToVar`. Using "`#FromVar`" you can later transfer it back into any IR.

Alternative you can also use the new Datamaker.exe-Utility to store Images in Data-Lines directly in the Script.
Then call the Data and use the Variable to restore the IR.

The Data that ANA.#FromVar expects is in a special Format that you get using `ANA.ToVar`.

Putting a IR into a Variable using "ToVar" will produce a Variable with this format insider the Variable:
- 8 Byte (4 Byte X- and 4 Byte Y-Size Information)
- (X-size * y-size)*4 Byte per Pixel-graphical Data in BGR-Order.

Therefore in many cases when the Data is from external Files, you may need to convert the Image-Data first using
GRA.vToBMP 1797 - Command.

```
' Load some Data that was imported from Datamaker
GSB.Inline_3838
' Convert external Format to Internal BMP-Format
GRA.vbm|$$DTA|$$DTA|.bmp
' Send it to the Image-Register
ANA.#FromVar|2|$$DTA
ANA.show|2!
MBX.Data Loaded.
ENR.
```

1. Use ToVar with IR 0 and store Content on TOS
This will use IR 0 and store the Content on TOS.

```
STW.ct|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS|Desktops-Manager (c) 2020 Theo Gottwa
' We Snapshot the Desktop into IR 0
ANA.Snap|0
' This will use IR 0 and TOS because no parameter were given.
ANA.ToVar
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Here we get the TOS into the Variable
POP.$$CON
' We put the Content into IR 1
ANA.#FromVar|1|$$CON
' We display the IR 1
ANA.show|1!
ENR.
```

2. Use ToVar with Parameters

This will include all Screens on a Dual-Screen System. They will be saved as a single ".bmp" (BItmap-) File. You can choose any widely used picture format, for example ".png" or "Jpg".

```
STW.ct|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS|Desktops-Manager (c) 2020 Theo Gottwa
' We Snapshot the Desktop into IR 0
ANA.Snap|0
' This will use IR 0 and TOS because no parameter were given.
ANA.ToVar|0|$$CON
' We put the Content into IR 1
ANA.#FromVar|1|$$CON
' We display the IR 1
ANA.show|1!
ENR.
```

3. Use Datamaker and VDA. as Source for the IR

This will load an Images "Inline" from Datas that have been imported into the Script.
Use the Datamaker-Tool to generate the Data-Part.

Sample-Script using VDA. and VDE.

```
GSB.Laa
ANA.#FromVar|1|$$DTA
ANA.Show|1#!
ENR.
'============================================================
:Laa

OwE=
VDE.
RET.
```

Remarks

This Command starts with a "#" due to internal Speed reasons ("#FromVar"). The reason why we did that is, that general variable resolution can not be used on Binary picture-Content, and the # signals this to the robot-engine.

Limitations:

-

3.55.4.9.2 ANA.FromClipboard

MiniRobotLanguage (MRL)

ANA.FromClipboard

Transfer Image from Clipboard into IR

Intention

This command will copy any picture that is in the Windows-Clipboard into the Image-Register that is specified using **P1**.
It is the Opposite Command to "Ana.ToClipboard".

Use ANA.FromClipboard to store Clipboard-Content in IR 0 and display it
This will use IR 0 and also show the Contents.

```
ANA.FromClipboard|0
ANA.Show|0!
ENR.
```

Syntax

ANA.FromClipboard[|P1]

Parameter Explanation

***P1* - *opt.* Image-Register number, if omitted, IR 0 will be used.**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'*********************************
' ANA.FromClipboard-Sample
'*********************************
ANA.FromClipboard|0
ANA.Show|0!
ENR.
```

Remarks

3.55.4.9.3 ANA.Load

MiniRobotLanguage (MRL)

ANA.Load

Load an Image-Register (IR) from diskfile, using original size or "Load-Stretch"

Intention

This command will Load an specified IR from a diskfile.
It is the counterpart to "ANA.Save".

This will Save IR 0 and Load it back into IR 1.

```
ANA.New|0|640|400
ANA.vgradient|0|&HFF1010|&H10FFFF
ANA.show|0
VAF.$$FIL=?path\Myfilename.png
' This will Save IR 0 to $$FIL
ANA.Load|0|$$FIL
'LEN.$$CON|$$LEN
' We will Load it back into IR 1
ANA.Load|1|$$FIL
' We display the IR 1
ANA.invert|1
ANA.show|1!
ENR.
```

You can omit the Parameters then Filename will be "`?pattern\BM_0.bmp`".
If you specify the IR-Number `ANA.Load|4`, then the Filename will be "`?pattern\BM_4.bmp`"

If you just write
`ANA.Load|1|<Filename>`
then the filename will be expandet to
`ANA.Load|1|?pattern\<Filename>.bmp`
which is `?path\Pattern\<Filename>.bmp`

If you specify **P3**, the Image will be stretched to the size of the specified IR.
In the Sample below we specify IR 1 in P3 so we get the size of the new created IR.

```
ANA.New|0|640|400
ANA.vgradient|0|&H10FF10|&H10FFFF
ANA.show|0
' This will Save IR 0 to $$FIL
VAF.$$FIL=?exeloc\BM_0.bmp
ANA.Save|0|$$FIL
ANA.new|1|1024|600
' We will Load it back into IR 1 using Stretch-Mode
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ANA.Load|1|$$FIL|1
' We display the IR 1
'ANA.invert|1
ANA.show|1!
ENR.
```

The ANA.Load supports these File-Extensions:

- BMP
- EMF
- JPG or JPEG
- GIF
- ICO
- PNG
- TIF or TIFF
- WMF

IMPORTANT NOTICE about missing Administration Rights Effects

When you start the Script from an SPR-Editor that has NO Admin-Rights, you may not be able to load pictures
from the Standard Robot path because its below C\Programme (x86)\ and you need Admin-Access to load files there.
As a result you will get only BLACK PICTURES using ANA.Load.
So if you only get Black Pictures, try to use ADMIN-RIGHTS for the Script.

Syntax

ANA.Load[|P1][|P2][|P3]

Parameter Explanation

P1 - opt. Image-Register number, if omitted, IR 0 will be used.

P2 - opt. *File-Path and Filename*, if omitted "?exeloc\BM_(IR-Number).bmp" will be used.

P3 - opt. Image-Register number, if given, the Image will be streched to the size of the Content of that IR.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.Load/Load-Sample
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
ANA.New|0|640|400
ANA.vgradient|0|&H10FF10|&H10FFFF
ANA.show|0
' This will Save IR 0 to $$FIL
VAF.$$FIL=?exeloc\BM_0.bmp
ANA.Save|0|$$FIL
ANA.new|1|1024|600
' We will Load it back into IR 1 using Stretch-Mode
ANA.Load|1|$$FIL|1
' We display the IR 1
ANA.invert|1
ANA.show|1!
ENR.
```

Here you can see the result of the Operation.

3.55.4.9.4 ANA.Save

MiniRobotLanguage (MRL)

ANA.Save

Save an Image-Register (IR) to diskfile

Intention

This command will save an specified IR to a diskfile.
It is the counterpart to "ANA.Load".

This will Save IR 0 and Load it back into IR 1.

```
ANA.New|0|640|400
ANA.vgradient|0|&HFF1010|&H10FFFF
ANA.show|0
VAF.$$FIL=?path\Myfilename.png
' This will Save IR 0 to $$FIL
ANA.Save|0|$$FIL
'LEN.$$CON|$$LEN
' We wil lLoad it back into IR 1
ANA.Load|1|$$FIL
' We display the IR 1
ANA.invert|1
ANA.show|1!
ENR.
```

You can omit the Parameters then Filename will be "`?exeloc\BM_0.bmp`**".**
If you specify the IR-Number `ANA.Save|4`**, then the Filename will be "**`?exeloc\BM_4.bmp`**"**

The `ANA.Save` supports these File-Extensions:

- BMP
- EMF
- JPG or JPEG
- GIF
- ICO
- PNG
- TIF or TIFF
- WMF

Syntax

ANA.Save[|P1][|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - opt. **Image-Register number, if omitted, IR 0 will be used.**

P2 - opt. *File-Path and Filename*, **if omitted** "?exeloc\BM_(IR-Number).bmp" **will be used.**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.Save/Load-Sample
'**********************************
ANA.New|0|640|400
ANA.vgradient|0|&HFF1010|&H10FFFF
ANA.show|0
' This will Save IR 0 to $$FIL
ANA.Save
VAF.$$FIL=?exeloc\BM_0.bmp
' We wil lLoad it back into IR 1
ANA.Load|1|$$FIL
' We display the IR 1
ANA.invert|1
ANA.show|1!
ENR.
```

Here you can see a part of the result of the Operation.

3.55.4.9.5 ANA.Snap

MiniRobotLanguage (MRL)

ANA.Snap

Capture Screenshot from localized WIndow and place it in an Image-Register (IR)

Intention

This command will capture a Screenshot from a specified window for further processing.

1. Capture Screenshot of complete Desktop and use it for Pattern-Search
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.ct|Progman|Program Manager
' We Snapshot the Desktop into IR 0
ANA.Snap|0
' This is the Pattern we search for
$$PAA=?path\Help16.bmp
' We load the Pattern into IR 1
ANA.Load|1|$$PAA

' This is the Pattern Searching Command,
' Due to the value "1" as last Parameter, we will get a Debugprint
' of all found Hits. The displayed Point is in the Center of the Pattern.
ANA.fpa|0|1|0|125|1
' This command will put the results of the search on to the Stack.
ANA.gres
' Number of found Patterns is on TOS
POP.$$POA
MBX. We got $$POA Results
' We do not need first 3 Found Pattern so we remove them from Stack
STJ.Remo|0,1,2
' This is the Pattern we drive to
POP.$$POA
MMV.t|$$POA
MBX.!
ENR.
```

2. Capture Screenshot of complete Desktop and save into a file
This will include all Screens on a Dual-Screen System. They will be saved as a single ".bmp" (BItmap-) File. You can choose any widely used picture format, for example ".png" or "Jpg".

```
STW.ct|Progman|Program Manager
ANA.Snap|0
$$FIL=?path\Desktop.png
ANA.Save|0|$$FIL
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

3. Capture Screenshot of complete Desktop into a variable

This will include all Screens on a Dual-Screen System. They will be saved as a single Screenshot into the given Variable.

```
STW.ct|Progman|Program Manager
ANA.Snap|0
ANA.ToVar|0|$$FIL
LEN.$$FIL|$$RES
MBX.$$RES
ENR.
```

4. Capture Screenshot of actual window into image register
If you just locate any window, or child window, you can take a screenshot of these windows.

```
STW.ct|#32770|Basic-NAV Matrix 02
' We snap into the IR 2 here
ANA.Snap|2
ENR.
```

Syntax

ANA.Snap[|P1][|P2]

Parameter Explanation

P1 - opt. Image-Register number, if omitted, IR 0 will be used.
P2 - opt. In case there are Problems that the Mouse moves to much up or down by the height of the Titlebar, you can choose here another value.
0 - Snap only Client-Area from Window (default)
1 - Snap whole Window, remove Borders
2 - Snap whole Window incl. Borders
4 - Use internal default value that can be changed with the ANA.SetData - Command

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.Snap-Sample
'**********************************
STW.ct|Progman|Program Manager
ANA.snap|0
ANA.Copy|0|1
ANA.BlockTo|0|0|2
ANA.rct|0|&H0|260|&H0
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  ANA.rct|0|&HFFFFFF|200|&HFFFFFF
  ANA.logic|0|1|0|A XOR B NOT T|RGB
  ANA.rct|0|&H0|260|&H0
  ANA.rct|0|&HFFFFFF|200|&HFFFFFF
  ANA.show|0!
  ENR.

' Here you can see a part of the result of the Operation.
```

3.55.4.9.6 ANA.ToClipboard/Rect

MiniRobotLanguage (MRL)

ANA.ToClipboard

Copy Image from IR to Clipboard

Intention

This command will copy any picture that is in an specified IR, into the Windows-Clipboard.
It is the Opposite Command to "Ana.FromClipboard".

Use ANA.FromClipboard to store Clipboard-Content in IR 0 and display it
This will use IR 0 and also show the Contents.

```
$$PAF=?exeloc\Pics
$$FIL?$$PAF\P4.jpg
ANA.Load|0|$$FIL
' The CutRect Command is optional, it can be used to "Cut the borders" of an IR
ANA.CutRect|0|150|160|400|200
ANA.ToClipboard|0
' Picture is now in the Windows Clipboard
ENR.
```

ANA.ToClipboardRect is a bit special. Assume you have a picture of 640x400 and you specify:

```
ANA.ToClipboardRect|0|50|50|640|400
```

Then you may get a black Border of size 50 on the right side. This is because the limitation is the original Picture-Size.
If you specify instead a Target-Rectangle-Size that is larger then the original size, you will get a perfect match without a black Border.

```
ANA.ToClipboardRect|0|50|50|6400|4000
```

Of course you can specify exactly what you want, in such case please note that the X- and Y-Size is reduced by the values of how much you cut out at the upper and left side.
So this line would also do it:

```
ANA.ToClipboardRect|0|50|50|590|350
```

Syntax

ANA.ToClipboard[|P1]

© 2023 Theo Gottwald * https://www.smart-package.com

ANA.ToClipboardRect[|P1][|P2|P3|P4|P5][|P6]

Parameter Explanation

P1 **- *opt.* Image-Register number, if omitted, IR 0 will be used.**

' If given, you must specify all 4 Rect-Parameters
P2 **- *Left-Border of Image to copy***
P3 **- *Upper/Top-Border of Image to copy***
P4 **- *Right-Border of Image to copy. If too large, will be replaced by Image maximum size.***
P5 **- *Bottom-Border of Image to copy. If too large, will be replaced by Image maximum size.***

P6 **- *Blit-Constant Parameter*, if omitted Standard will be used. Details see** **Blit-Modes** 1156

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.ToClipboard-Sample
'***********************************
$$PAF=?exeloc\Pics
$$FIL=$$PAF\P4.jpg
ANA.Load|0|$$FIL
ANA.CutRect|0|150|160|4000|2000
ANA.ToClipboard|0
ANA.Show|0!
ENR.

'***********************************
' ANA.ToClipboardRect-Sample
'***********************************
$$PAF=?exeloc\Pics
$$FIL=$$PAF\P4.jpg
ANA.Load|0|$$FIL
ANA.ToClipboardRect|0|150|88|290|189|2
ANA.FromClipboard|1
ANA.Show|1!
ENR.
```

Remarks

3.55.4.9.7 ANA.ToVar

MiniRobotLanguage (MRL)

ANA.ToVar

Transfer Image-Register (IR) Content into SPR-Variable

Intention

This command will transfer the IR Content into a SPR Variable. From there you can save it to disc, manipulate it yourself, or just keep it.
Using "FromVar" you can later transfer it back into an IR.

Putting a IR into a Variable using "ToVar" will produce a Variable with this format insider the Variable:
- 8 Byte (4 Byte X- and 4 Byte Y-Size Information)
- (X-size * y-size)*4 Byte per Pixel-graphical Data in BGR-Order.

1. Use ToVar with IR 0 and store Content on TOS
This will use IR 0 and store the Content on TOS.

```
STW.ct|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS|Desktops-Manager (c) 2020 Theo Gottwa
' We Snapshot the Desktop into IR 0
ANA.Snap|0
' This will use IR 0 and TOS because no parameter were given.
ANA.ToVar
' Here we get the TOS into the Variable
POP.$$CON
' We put the COntent into IR 1
ANA.#FromVar|1|$$CON
' We display the IR 1
ANA.show|1!
ENR.
```

2. Use ToVar with Parameters
This will include all Screens on a Dual-Screen System. They will be saved as a single ".bmp" (BItmap-) File. You can choose any widely used picture format, for example ".png" or "Jpg".

```
STW.ct|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS|Desktops-Manager (c) 2020 Theo Gottwa
' We Snapshot the Desktop into IR 0
ANA.Snap|0
' This will use IR 0 and TOS because no parameter were given.
ANA.ToVar|0|$$CON
' We put the Content into IR 1
ANA.#FromVar|1|$$CON
' We display the IR 1
ANA.show|1!
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

Syntax

ANA.ToVar|[|P1]

Parameter Explanation

P1 - opt. **Image-Register number, if omitted, IR 0 will be used.**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'*********************************
' ANA.ToVar/FromVar-Sample
'*********************************
ANA.New|0|640|400
ANA.vgradient|0|&HFF1010|&H10FFFF
ANA.show|0
' This will use IR 0 and TOS because no parameter were given.
ANA.ToVar|0|$$CON
'LEN.$$CON|$$LEN
' We put the COntent into IR 1
ANA.#FromVar|1|$$CON
' We display the IR 1
ANA.invert|1
ANA.show|1!
ENR.
```

3.55.4.10.1 ANA.ColorDiffMap

MiniRobotLanguage (MRL)

ANA.ColorDiffMapX

Generate a Outline based on the Color-Difference in X-Direction

ANA.ColorDiffMapY

Generate a Outline based on the Color-Difference in Y-Direction

ANA.ColorDiffMapXY

Generate a Outline based on the Color-Difference in X and Y-Direction

Intention

This Command will generate an Outline of the objects in the IR, it will search and find the borders of Objects.
Use it together with the ANA.Contrast Operation to get the results you may want.

This Example will show ANA.ReplaceColorT to make a Cleanup of a picture from a social network.
You got that Picture and it has a lot of JPG-Artefacts and the colors are not pure.
The SPR can quickly clean it up.

```
'**********************************
' ANA.ReplaceColorT-Sample

Syntax

ANA.ColorDiffMapX|P1|P2[|P3]
ANA.ColorDiffMapY|P1|P2[|P3]
ANA.ColorDiffMapXY|P1|P2[|P3]

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 **- *Source* Image-Register Number, if omitted 0 is used.**
P2 **- *Destination* Image-Register Number, if omitted 0 is used.**
P3 **- *(opt.) Value that is used for the internal "ToGrey" Conversion. This value will effect the result. Default is 1.***

The Command will not leave a 0/1 on the TOS.

Example

-

Remarks

This Command is really fast and will do its Job in a 1-2 Seconds.

Limitations:

-

3.55.4.10.2 ANA.Complement / ANA.Complementary_Color

MiniRobotLanguage (MRL)

ANA.Complement

Complement Colors in an Image-Register (IR)

ANA.Complementary_Color

Complement a specified color-value

Intention

This command will complement all Colours in an IR. Complementary Colors are very good for Overlays as they are good readable.
If you specify **P2**, then the result will be stored in another IR, **P2**.

1. Just complement IR 0
This is what happens if you do not specify any parameters.

```
ANA.New|0|640|400
ANA.vgradient|0|&HFF0000|&H1000FF
ANA.show|0!
ANA.Complement
ANA.show|0!
ENR.
```

2. Complement any specified IR
If you just specify the Source IR, it will also be the destination of the Operation.

```
ANA.New|0|640|400
ANA.vgradient|0|&HFF0000|&H1000FF
ANA.show|0!
ANA.Complement|0
ANA.show|0!
ENR.
```

3. Complement any specified IR to another IR
If you specify the Source IR and Destination IR, the Result will be in another IR. Anything that was in the Destination IR before will be discarded.

```
ANA.New|0|640|400
ANA.vgradient|0|&HFF0000|&H1000FF
ANA.copy|0|1

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.Complement[|P1][|P2]

Parameter Explanation

P1 - ***opt. Source*** Image-Register Number, Source-IR, if omitted, IR 0 will be used.
P2 - ***opt. Destination*** Image-Register Number, if omitted, IR **P1** will be used as destination IR.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

ANA.Complementary_Color|P1[|P2]

Parameter Explanation

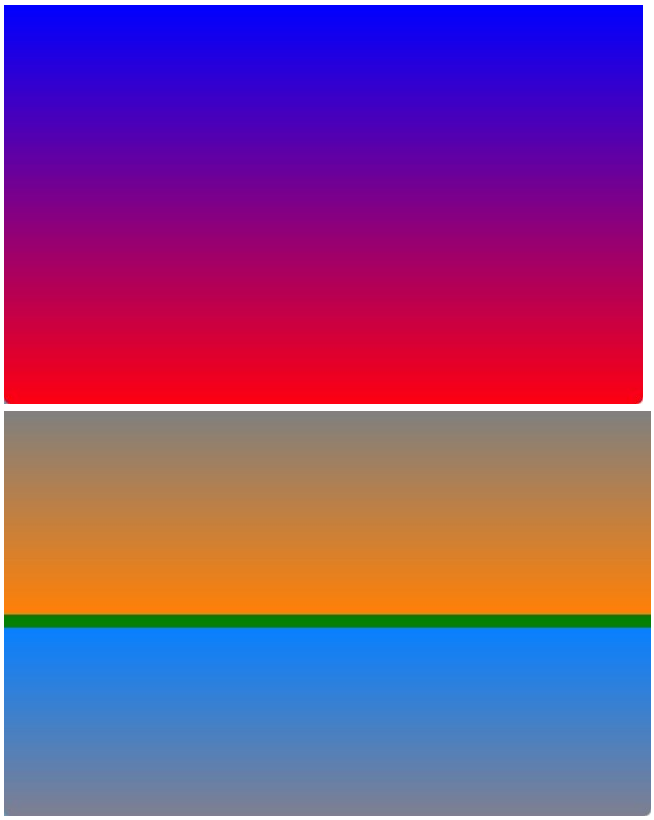
P1 - ***RGB-In Value, Example: &HF305A7***
P2 - ***opt. Variable*** for result. If omitted TOS is used.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' ANA.Complement-Sample
'**********************************
ANA.New|0|640|400
ANA.vgradient|0|&HFF0000|&H1000FF
ANA.copy|0|1
ANA.show|0!
ANA.show|1!
ANA.Complement|0|1
ANA.show|0!
ANA.show|1!
ENR.
```



Remarks

This command is not very optimized, it may take a few seconds for a pictures to get complemented.
If you need Speed, you may want to use ANA.Invert instead.

3.55.4.10.3 ANA.Invert / ANA.Inverse_Color

MiniRobotLanguage (MRL)

ANA.Invert

Invert Colors in an Image-Register (IR)

ANA.Inverse_Color

Invert specified RGB-Color

Intention

This command will Invert a specified RGB COlor or a compelte Image-Regster.
It will make yellow from blue, and black will become white.
If you specify **P2**, then the result will be stored in another IR, **P2**.

1. Just Invert IR 0
This is what happens if you do not specify any parameters.

```
ANA.New|0|640|400
ANA.vgradient|0|&HFF0000|&H1000FF
ANA.show|0!
ANA.invert
ANA.show|0!
ENR.
```

2. Invert any specified IR
If you just specify the Source IR, it will also be the destination of the Operation.

```
ANA.New|0|640|400
ANA.vgradient|0|&HFF0000|&H1000FF
ANA.show|0!
ANA.invert|0
ANA.show|0!
ENR.
```

3. Invert any specified IR to another IR
If you specify the Source IR and Destination IR, the Result will be in another IR.
Anything that was in the Destination IR before will be discarded.

```

3.55.4.10.4 ANA.Logic

ANA.Logic - Combine IR with Logic Operation Previous 1088 Top 41 Next 1109

MiniRobotLanguage (MRL)

ANA.Logic

Combine Image-Register (IR) Content with Logic Operations and with or without a Color-Mask

Intention

This command will combine the IR's using Logic like AND/OR etc. it will work on Bit-Level.

1. Logic with Source IR -A and B -> another IR
This Logic will distribute and then remove watermark artefacts using the ANA.Logic and the ANA.rct-Command.

```
' This Script is not intended for removing Copyright Artefacts
' yet i have nothing else at hand so i take it as an example
$$PAT=?path\Resized
$$FIA=$$PAT\BTC_1060.png
' We make a IR that is completely filled with the artefacts color
ANA.New|0|1060|1060
ANA.Fill|0|&H6f6d6e
ANA.Show|0!
' We load the Picture that contains the unwanted artefacts
ANA.Load|1|$$FIA
ANA.Show|1!
' We use the Logic Command to distribute the artefacts
ANA.Logic|2|1|0|A OR B
ANA.Show|2!
' Now we remove the artefacts using the "remove-color -with-Tolerance" Command.
ANA.rct|2|&H6f6d6f|10|0
ANA.rct|2|&H7f7d7f|10|0
ANA.Show|2!

Syntax

ANA.Logic[|P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - opt. Destination Image-Register number, if omitted, IR 0 will be used.
P2 - opt. Source A Image-Register number, if omitted, IR **P1+1** will be used.
P3 - opt Source B Image-Register number, if omitted, IR **P2+1** will be used.
P4 - opt. Logical Operator: AND, OR, XOR, EQV, IMP, SIMP can be used.
Like this:

```
ANA.Logic|0|1|2|A AND B|RGB
ANA.Logic|0|1|2|NOT A AND B|RG
ANA.Logic|0|1|2|A OR B NOT T|B
```

where A and B are the two Source-IR's and T is the Target IR

© 2023 Theo Gottwald * https://www.smart-package.com

P5 - opt. Color Mask, can be any Combination of R G B, for example RG will allow Red and Green in the Result and Filter Blue
If omitted the default Mask is `RGB`.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.Logic-Sample
' In this Sample we remove grey artefacts
' and save the result
'**********************************

Syntax

ANA.Mask[|P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - opt. Source Image-Register number, if omitted, IR 0 will be used.
P2 - opt. Mask - a 32 bit Integer can be given directly as Binary example: `&B01010101101010101001010101` if omitted, `&B11110000111110000011110000` is used.
P3 - opt. `Logical Operator: AND, OR, XOR, EQV, IMP, SIMP can be used. Like this:`
P4 - opt. Destination Image-Register number, if omitted, **P1** will be used.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

3.55.4.11 Manage IR's

These Operations can be used to create an IR, or copy an IR.
IR's will automatically be deleted when the Script ends or when the same IR Number is used for something else.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.11.1 ANA.Compare

ANA.Compare - Compare IR vs. IR with Tolerance Previous 1088 Top 41 Next 1109

MiniRobotLanguage (MRL)

ANA.Compare

Compare an Image-Register (IR) vs. another IR with Tolerance

Intention

This command will compare the Content of an IR with another IR, the result will be just 0 or 1 to show if the two are identical or not.
It can use a Fuzzy Logic-2 Step-Tolerance.
You can specify a Color-Tolerance between 0 and 442 and you can specify how many Pixels are allowed to be out of this Tolerance before the Compare fails.
The result will always be the Position of the Pixel that exceeds these two given Parameters.
For example: If you say "Tolerance 10, and 15 Pixel Count", the given Pixelwill be the 15th Pixel that does not match the Source Colour for more then the Pixel-Tolerance.
This Command can be combined with the "`ANA.BlockTo`" Command for Interesting effects.
If the two IR's that you want to Compare do not have the same resolution, you can use the `ANA.equalres` Command to enforce the same resolution.

Important: The Compare Operation currently is done Left->Right and Top->Bottom.
Both IR that will be compared, must have the same size!

1. Compare two IR with different results
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
ANA.New|0|160|40
ANA.vgradient|0|&HFF0000|&H1000FF
ANA.copy|0|1
ANA.Compare|0|1
DMP.6
MBX.Result is zero, both are equal
ANA.vgradient|1|&HFF0000|&H1000F4
ANA.Compare|0|1
DMP.6
MBX.Result is Pixel Number 5442 at Position 2,34 exceeds the given Parameters.
ANA.Compare|0|1|4|100
DMP.6
MBX.Result is Pixel Number 2181 at Position 101,13 exceeds the given Parameters.
ENR.
```

Here is the result of the Stack for the first `DMP.6`

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->LongInt      :0

Stackpos: 001 ->LongInt      :1

Stackpos: 002 ->LongInt      :4

-----------------------------------
```

Here is the result of the Stack for the second `DMP.6`

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->LongInt      :2181

Stackpos: 001 ->LongInt      :101

Stackpos: 002 ->LongInt      :13
```

Syntax

ANA.Compare|P1|P2[|P3][|P4]

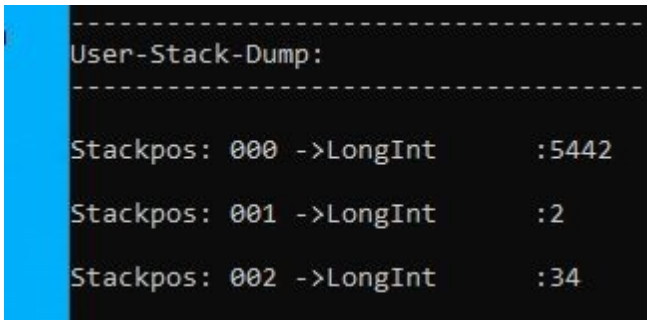
Parameter Explanation

P1 – Image-Register number
P2 – Image-Register number to compare with **P1**
P3 – ***opt.*** Colour-Tolerance between 0 and 442 (442 is the Colour-difference between black and white)
P4 – ***opt.*** Number of allowed "Hits", Pixels that do not match and do exceed the Color-Tolerance.

The Command will leave a 0 on the TOS if the two IR's do match.

If they do NOT match to each other, you will get a result like this:

© 2023 Theo Gottwald * https://www.smart-package.com



On TOS is the "Pixel-Number" of the last Pixel that exceeds the given conditions, below is the "X-Position" and below the "Y-Position" of that Pixel.

Example

```
'**********************************
' ANA.Compare-Sample
'**********************************
ANA.New|0|160|40

3.55.4.11.2 ANA.Copy

MiniRobotLanguage (MRL)

ANA.Copy

Copy Image Register (IR) to another Image-Register (IR)

Intention

This command will copy the Content of an Image Register to another Image Register.
The destination Image Register can be empty or not.
In case there is another picture in the destination IR, this will be overwritten.

```
STW.ct|#32770|Basic-NAV Matrix 02
' We snap into the IR 2 here
ANA.Snap|2
' Copy IR 2 into IR 1
ANA.Copy|2|1
' Display IR 1
ANA.Show|1!
ENR.
```

Syntax

ANA.Copy|P1|P2

Parameter Explanation

***P1* - *Source* Image-Register Number**
***P2* - *Dest* Image-Register Number**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.Copy-Sample
'**********************************
STW.ct|Progman|Program Manager
ANA.Snap|0
ANA.Copy|0|1
ANA.BlockTo|1|1|4
ANA.show|1!
ENR.

' Below you can see a part of the result of the Operation.
' We used it here to have a content that can be copied.

3.55.4.11.3 ANA.Move

MiniRobotLanguage (MRL)

ANA.Move

Move Image Register (IR) to another Image-Register (IR), deleting Source IR

Intention

This command will move the Content of an Image Register to another Image Register and then delete the original IR Content.
The destination Image Register can be empty or not.
In case there is another picture in the destination IR, this will be overwritten. The Source IR will be cleared.

```
STW.ct|#32770|Basic-NAV Matrix 02
' We snap into the IR 2 here
ANA.Snap|2
' Move IR 2 into IR 1
ANA.Move|2|1
' Display IR 1
ANA.Show|1!
ENR.
```

Syntax

ANA.Move|P1|P2

Parameter Explanation

***P1* - *Source* Image-Register Number**
***P2* - *Dest* Image-Register Number**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'*********************************
' ANA.Move-Sample
'*********************************
STW.ct|Progman|Program Manager
ANA.Snap|0
ANA.Move|0|1
ANA.BlockTo|1|1|4
ANA.show|1!
ENR.

' Below you can see a part of the result of the Operation.
' We used it here to have a content that can be moved.

3.55.4.11.4 ANA.New

MiniRobotLanguage (MRL)

ANA.New

Create new, empty Image-Register (IR) or create new IR with resized Content from other IR

Intention

This command will create a new IR with a specified resolution.
Generally the new IR will be empty (Black). If **P4** is specified, then the content of IR P4 will be copied and resized to the resolution into the new IR.

1. Create new, empty IR
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.Act|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
ANA.Snap|0
ANA.show|0!
ANA.New|0|800|200
' As you can see, IR 0 is deleted and has the specified size
ANA.show|0!
ENR.
```

2. Create new IR and copy the resized Content of another IR
As you can see below, the Resizing will not take any Aspect-Ratio into account, but use the full X and Y Size of the new IR.

```
STW.Act|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
ANA.Snap|2
ANA.New|0|800|200|2
ANA.show|0!
ENR.
```

 © 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.New|P1|P2|P3[|P4]

Parameter Explanation

P1 **- Image-Register Number for the IR** that will be created. If there is Content in this IR, it will be deleted.
P2 **- *X-Resolution* for the new IR Content**
P3 **- *Y-Resolution* for the new IR Content**
P4 **- *opt.* Image-Register Number**, if specified, the Content of this IR will be resized and copied into the new IR. If omitted, an empty IR will be created.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.New-Sample
'***********************************
STW.Act|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
ANA.Snap|0
ANA.BlockTo|0|1|5|2
ANA.New|0|800|300|1
ANA.show|0!
ENR.

' Here you can see the result of the Operation.
```

3.55.4.11.5 ANA.Swap

MiniRobotLanguage (MRL)

ANA.Swap

Swap Image Register (IR) with another Image-Register (IR)

Intention

This command will exchange the Content of an Image Register with another Image Register.
The destination Image Register can not be empty.
In case there is another picture in the destination IR, this will be overwritten.

```
STW.ct|#32770|Basic-NAV Matrix 02
' We snap into the IR 2 here
ANA.Swap|2
' Swap IR 2 into IR 1 and IR 1 into IR 2
ANA.Swap|2|1
' Display IR 1
ANA.Show|1!
ENR.
```

Syntax

ANA.Swap|P1|P2

Parameter Explanation

P1 **- *Source* Image-Register Number**
P2 **- *Dest* Image-Register Number**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'**********************************
' ANA.Swap-Sample
'**********************************
STW.Act|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
ANA.Snap|0
ANA.BlockTo|0|1|40

3.55.4.12.1 ANA.DrawBox

MiniRobotLanguage (MRL)

ANA.DrawBox

Draw a Box into an Image-Register (IR)

Intention

The ANA.DrawBox command allows you to create a box within an Image Register (IR). This box can be either an outline or filled, and can be drawn in a solid color or with an inverted background color.

Creating a Box with Inverted Colors:

In this example, we'll create a background and then draw a filled box over it. We'll use the color "-1", which signifies "Invert Background Color".

Please note, due to the loop running 255 iterations, it's recommended to initiate the script in the Editor using the "Freerun Mode". The robot's drawing will not be visible until the Show command is executed.

Remember, the ANA commands provide you with a set of 20 Image Registers.
You can specify one or more source registers and sometimes a destination register in each command.
If a destination register is not specified, the source register will be overwritten with the result of the operation.
You can copy or move content from one Image Register to another, load an image into these registers, or snapshot a localized window into these registers. After filling the Image Registers with content, you can perform several types of processing with these images, and finally save the pictures.

To use ANA, you'll first need to fill the Image Registers (IRs) with some content, which will be processed in subsequent steps.
The first 20 Image Registers can be used freely, while registers 21-32 are reserved for internal operations.

The Blit command uses the GPU for fast graphics operations, which may result in artifacts in some operations.
If you prefer to avoid these, you can use the "ANA.Logic" command, which uses the CPU.

You will not see the Robot Painting unless the Show command is been called.

```
ANA.New|0|800|400
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ANA.vgradient|0|&HFF00FF|&H000000

2. Draw only the Outline of the Box

In the following Script we will draw only the Outline of the box, not filling the box.
However we will draw 2500 Boxes. In "Freerun-Mode" this will take less than a second.
Infact the Robot can - in my test - draw up to 25000 unfilled Boxes per Second.

```
ANA.New|0|800|400

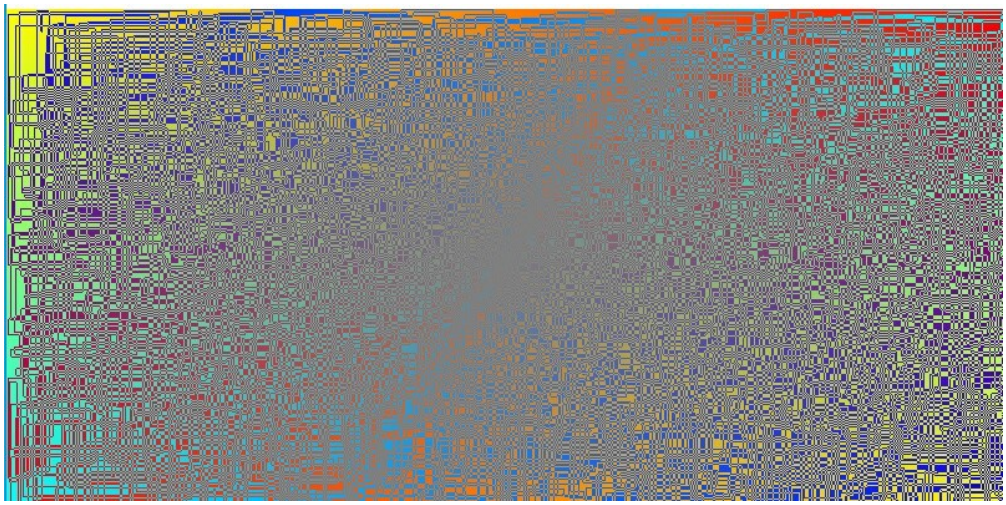
Here is the result:

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

ANA.DrawBox[|P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - Source Image-Register number
P2 - X1 - Upper Left Coordinat X-Value
P3 - Y1 - Upper Left Coordinat Y-Value
P4 - X1 - Lower Right Coordinat X-Value
P5 - Y1 - Lower Right Coordinat Y-Value
P6 - opt. Color-Value (like &HFF00FF), if omitted 0 is used. If -1 is given, the Pixel-Color will be inverted.
P7 - opt. Fill-Flag (0/1), if 1 the Box is filled. If its 0 the just the outline is been painted. If omitted 0 is used.

The Command will leave a 0 on the TOS in case of error, otherwise you get the number of copied patterns.

```
  PAU..1
NEX.
ANA.Show|2!
ENR.
```

Remarks

A rather complex DrawBox-Command without Fill but with several Variables uses on my computer up to 640 Ticks. This **is 1/25000 th of a second on my Computer**.
A Drawbox invert or with color, with a filled Box can use more then 3000 Ticks on my Computer. Therefore the Robot could draw more then 5000 such filled Boxes per Second.

Limitations:

The Coordinates in the lower, right corner may not be smaller then the Coordinates in the upper, right ccorner.

3.55.4.12.2 ANA.DrawLine

MiniRobotLanguage (MRL)

ANA.DrawLine

Draw a Line into an Image-Register (IR)

Intention

This command will draw a line into an IR.
The line can whether be drawn with a solid color or use inverted background-color.

1. Draw a Line that will invert the underlying Colors
In this Sample we will generate a Backgound and then Paint Lines over it. As Color we use "-1" that is "Invert Background Color".
Due to the use of a Loop with 255 Iterations, it is recommended to start the script in the Editor using "Freerun Mode".
You will not see the Robot Painting unless the Show command is been called.

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.New|2|800|400

035 0000000000000000 0000 NEX.
```

The Speed-dump shows that the Robot can draw several thousands Lines per second.

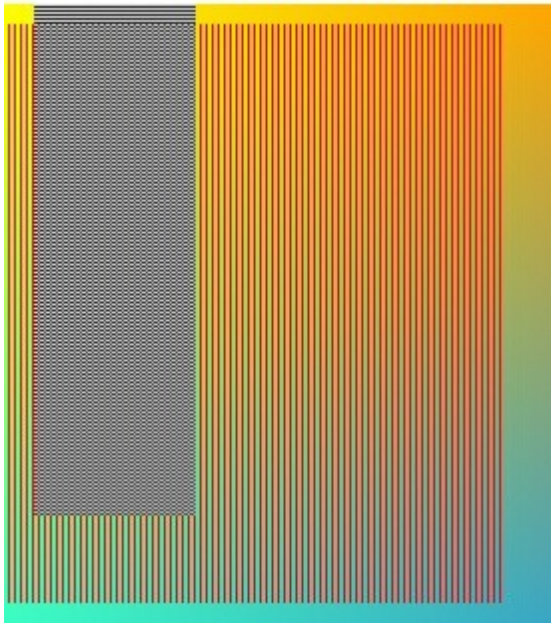
*© 2023 Theo Gottwald * https://www.smart-package.com*

2. Line-Patterns

Drawing Lines with a step of 2 or 3 can bring your display to the Limit of its abilities in showing clear colors.
If you draw Lines in a specified color and it looks like they have another color, then its a "Display issue".

.

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF|&H00FFFF
ANA.Mix|0|2|7
' Draw red line
FOR.$$LU3|1|255|3
  ANA.DrawLine|2|$$LU3|10|$$LU3|299|&HFF0000
NEX.
' Draw inverted Line
FOR.$$LU3|1|255|2
  ANA.DrawLine|2|100|$$LU3|20|$$LU3|-1
NEX.
ANA.Show|2!
ENR.
```



3. Draw inverted Lines

In the following Script we will draw sort of random lines.
We will draw 2500 Lines. In "Freerun-Mode" this will take less than a second.
Infact the Robot can - in my test - draw up to 10400 inverted Lines per Second.

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF|&H00FFFF
ANA.Mix|0|2|7
```

```

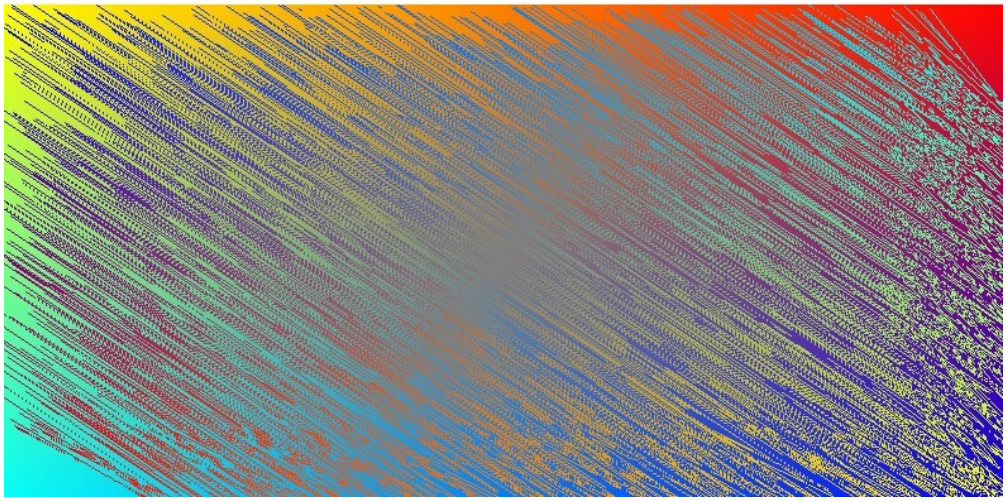
Here is the result:



Syntax

ANA.DrawLine[|P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - Source Image-Register number
P2 - X1 - Upper Left Coordinat X-Value
P3 - Y1 - Upper Left Coordinat Y-Value
P4 - X1 - Lower Right Coordinat X-Value
P5 - Y1 - Lower Right Coordinat Y-Value

© 2023 Theo Gottwald * https://www.smart-package.com

P6 - opt. Color-Value (like &HFF00FF), if omitted -1 is used. If -1 is given, the Pixel-Color will be inverted.

The Command will leave a 0 on the TOS in case of error, otherwise you get the number of copied patterns.

Example

```
'**********************************
' ANA.DrawLine-Sample
'**********************************
' This Sample will Draw about 25000 Lines per Second
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000

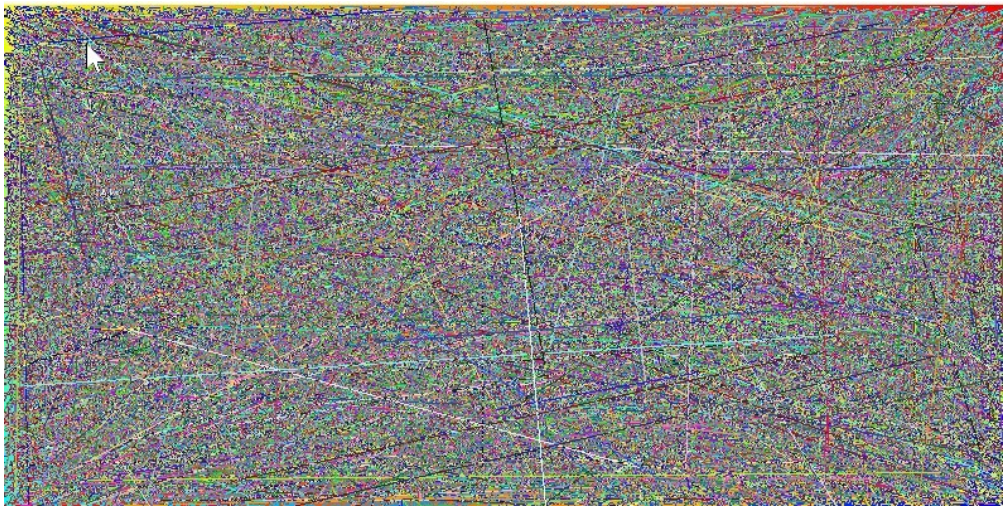
  RND.1|799|$$XP2
  RND.1|399|$$YP1
  RND.1|399|$$YP2
  RND.-1|1|$$COA
  IVV.$$COA<1
    VAN.$$COL=-1
  ELS.
    RND.0|&HFFFFFF|$$COL
  EIF.
  ANA.DrawLine|2|$$XP1|$$YP1|$$XP2|$$YP2|$$COL
NEX.
ANA.Show|2!
ENR.
```



Remarks

A rather complex DrawLine-Command with several Variables uses on my computer between 400 to 1540 Ticks. This **is at most 1/10000 th of a second on my Computer.**

© 2023 Theo Gottwald * https://www.smart-package.com

Therefore the Robot could draw more then 10000 Lines per Second.

Limitations:

-

3.55.4.12.3 ANA.Fill

ANA.Fill - Fill IR with Colour or Line-Pattern **Previous** 1088 **Top** 41 **Next** 1109

MiniRobotLanguage (MRL)

ANA.Fill

Fill Register (IR) with Color or Line-Pattern

Intention

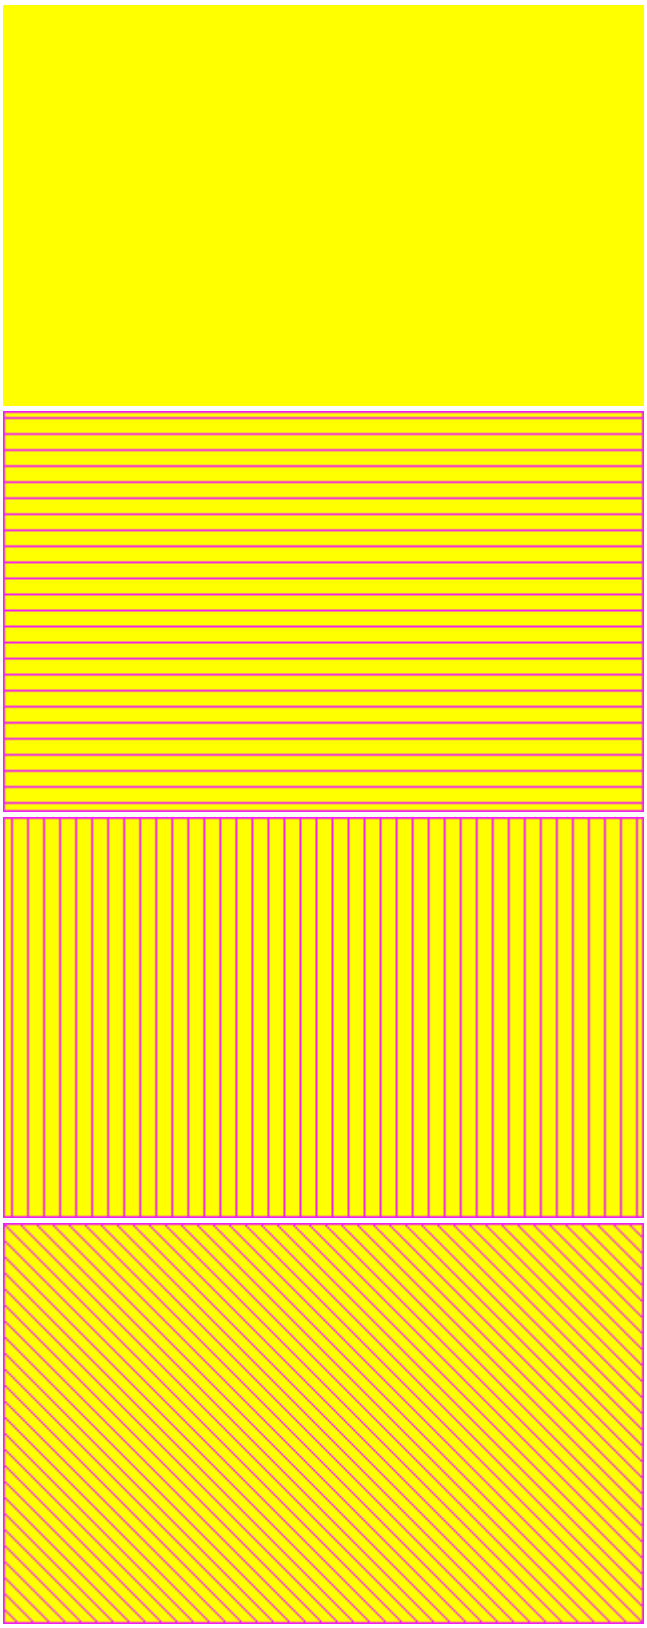
This command will fill an IR with a solid Background-Color. Optionally it will then draw a Pattern on this.
In case there is another picture in the IR, this will be overwritten.

```
STW.ct|#32770|Basic-NAV Matrix 02
' We snap into the IR 2 here
ANA.Snap|2
' Copy IR 2 into IR 1
ANA.Fill|2|1
' Display IR 1
ANA.Show|1!
ENR.
```

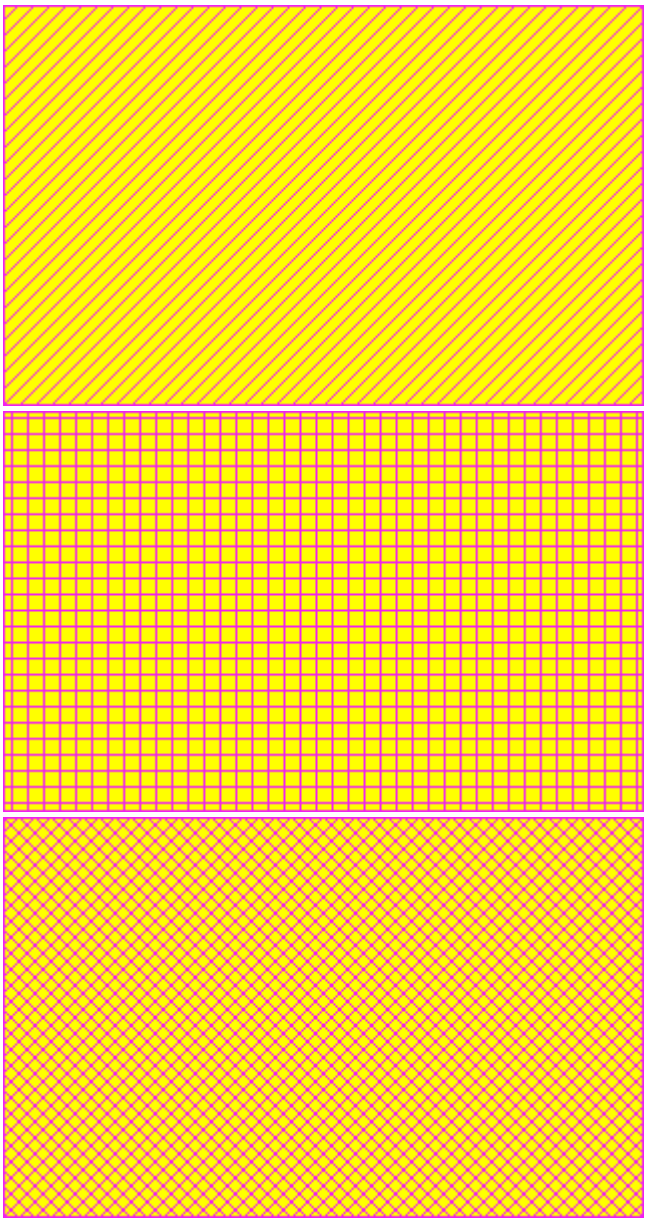
This will create a series of Patterns. Note that you can not just fill an empty IR, you need to create an IR first, using the `ANA.New`-Command.

```
ANA.New|0|320|200
FOR.$$LOP|0|6
  ANA.Fill|0|&H00FFFF|$$LOP|&HF020F0
  ANA.Save|0|?path\Pat_$$LOP.png
NEX.
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

ANA.Fill[|P1][|P2][|P3]

Parameter Explanation

P1 - *opt. Source* Image-Register Number, if omitted 0 is used.
P2 - *opt. Color for Background,* if omitted White (&HFFFFFF) is used.
P3 - *opt.* Number for Pattern, if omitted 0 is used.
 0 - Solid (default)
 1 - Horizontal Lines
 2 - Vertical Lines
 3 - Upward Diagonal Lines
 4 - Downward Diagonal Lines
 5 - Crossed Lines

© 2023 Theo Gottwald * https://www.smart-package.com

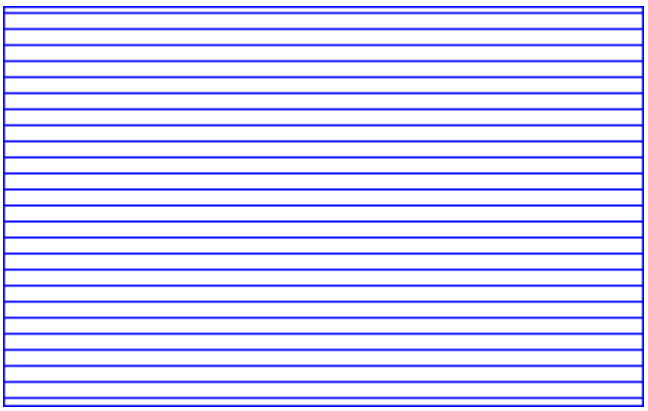
6 - Diagonal Crossed Lines
***P4 - opt. Color for Pattern,* if omitted Black (&H0) is used.**

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```
'***********************************
' ANA.Fill-Sample
'***********************************
ANA.New|0|320|200
ANA.Fill|0|&HFFFFFF|1|&HFF0000
ANA.Show|0!
ANA.Save|0|?path\Lines01.png
ENR.

' Below you can see the result of the Operation.
```



Remarks

Currently there is no way to change the distance between the lines or the thickness of the lines.

Limitations:

-

3.55.4.12.4 ANA.HGradient

MiniRobotLanguage (MRL)

ANA.HGradient

Generate a horizontal Color Gradient between two Colors in an Image-Register (IR)

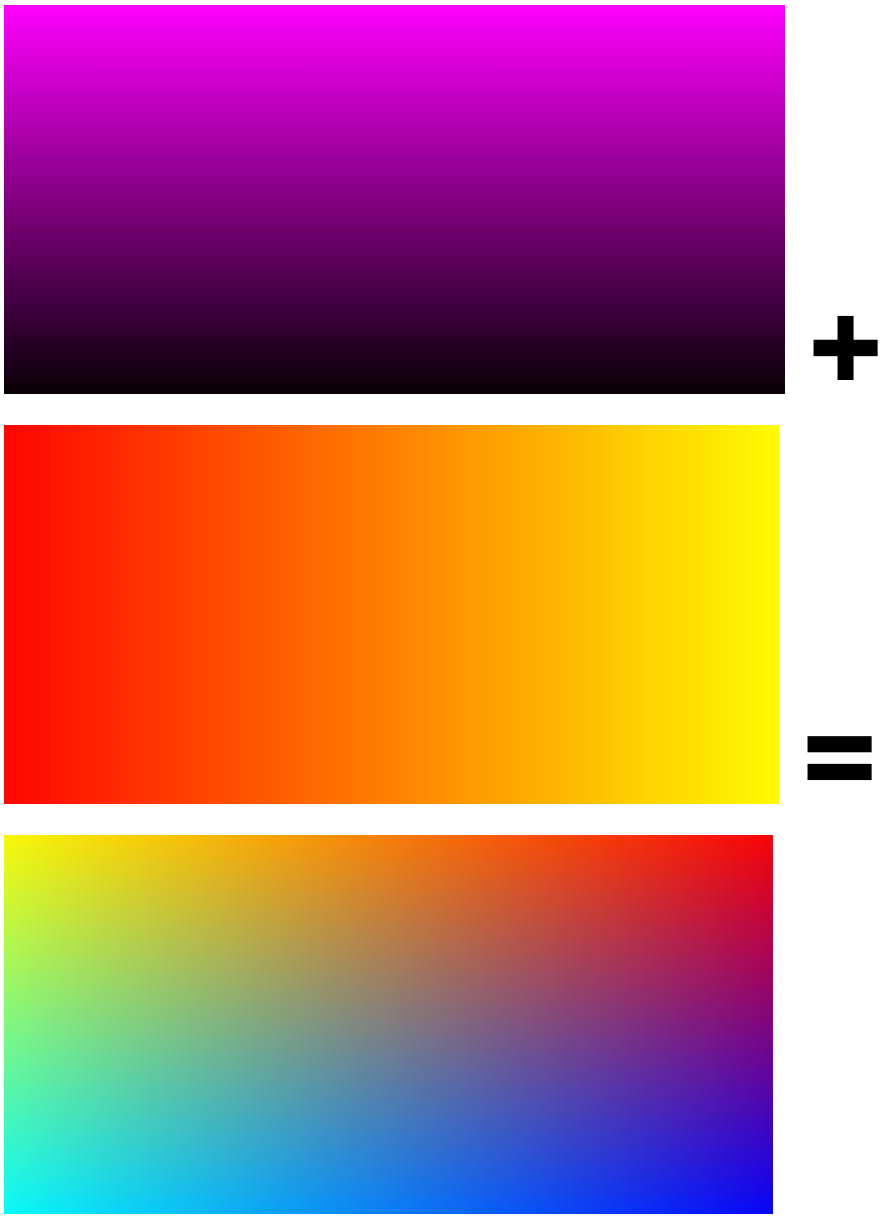
Intention

This command will generate an Gradient in horizontal direction, between two Colors.

1. Generate a H-Gradient and Mix it with a V-Gradient to get a Multi-Gradient
This will generate a V- and a H-Grradient and Mix them together using Blitmode 7 to get a Multi-Gradient.

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.Show|0!
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF|&H00FFFF
ANA.Show|2!
ANA.Mix|0|2|7
ANA.Show|2!
ENR.
```

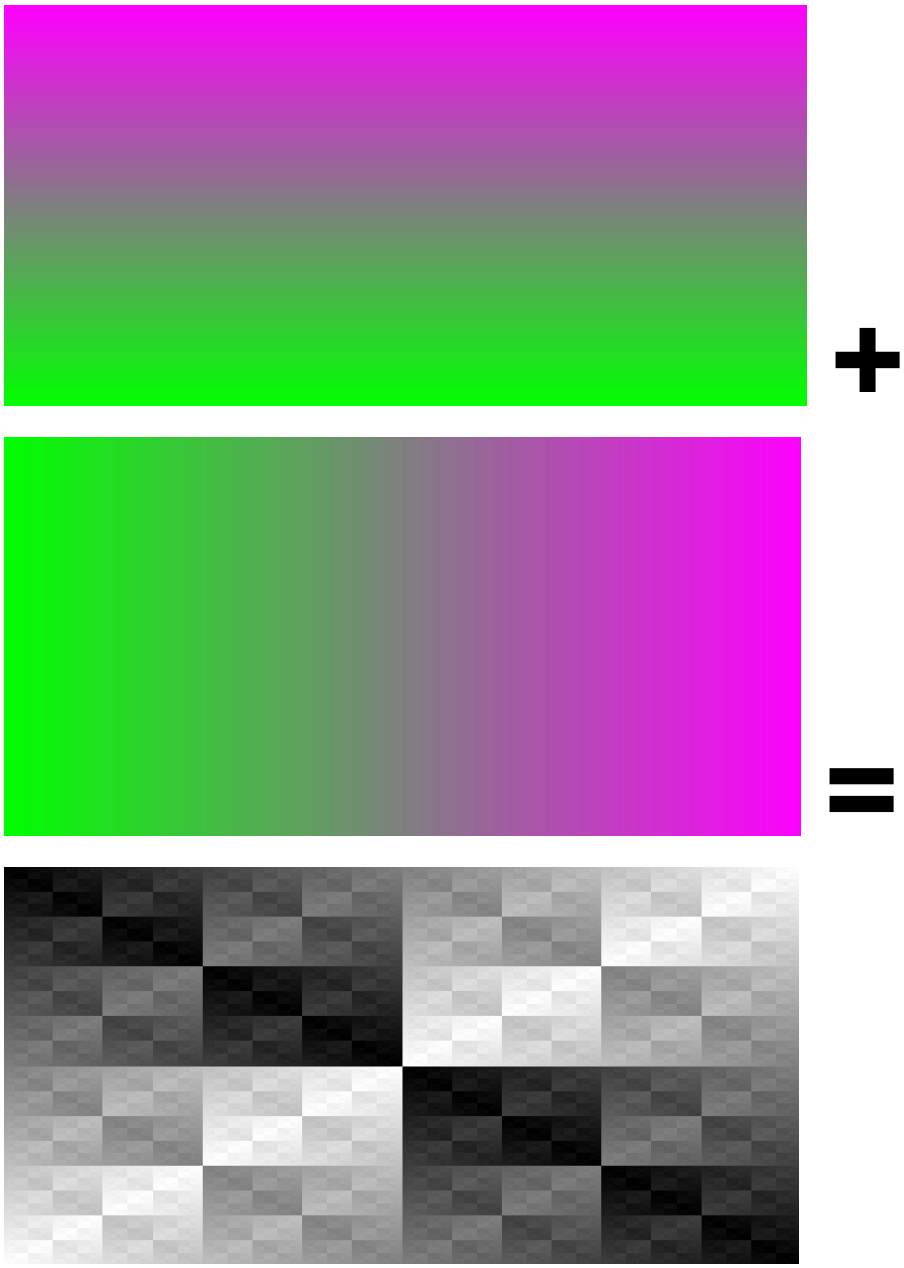
© 2023 Theo Gottwald * https://www.smart-package.com



2. If you omit P3, you will get an automatic selected color
If you om,it P3, the second Color will be automatically calculated using the Formula: &HFFFFFF-**P2**

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF
ANA.Show|0!
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF
ANA.Show|2!
ANA.Mix|0|2|7
ANA.Show|2!
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

ANA.HGradient[|P1][|P2][|P3]

Parameter Explanation

P1 - opt. Target Image-Register number, if omitted, IR 0 will be used. There must be Content in that IR, it must exist.
P2 - opt. Color A (Top Color)
P3 - opt. Color B (Bottom Color)

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

© 2023 Theo Gottwald * https://www.smart-package.com

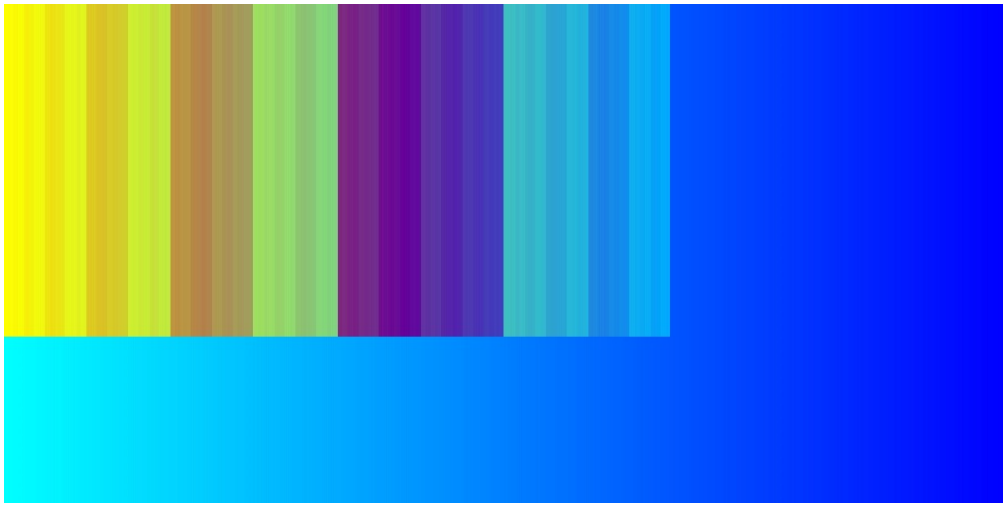
Example

```
'**********************************
' ANA.H/VGradient-Sample
'**********************************
ANA.New|0|1200|600
ANA.hgradient|0|&H0000ff|&H00FFFF
ANA.Show|0!

ANA.New|2|800|400
ANA.hgradient|2|&HFF00FF|&H00FF00
ANA.Show|2!

ANA.Mix|0|2|7
ANA.Show|2!
ENR.

' Here we mix two Gradients of different resolution.
```



Remarks

A H-Gradient on a 6000x4000 large Picture will need 3159658 Ticks, that is on my Computer 0.19 Seconds.

Using the SPR for commercial Pictures?
Yes, is possible.

I have set this Picture for Sale on Dreamstime, see: "Color Whee Background".

3.55.4.12.5 ANA.PatternFill

MiniRobotLanguage (MRL)

ANA.PatternFill

Copy multiple equal Patterns into an Image-Register (IR)

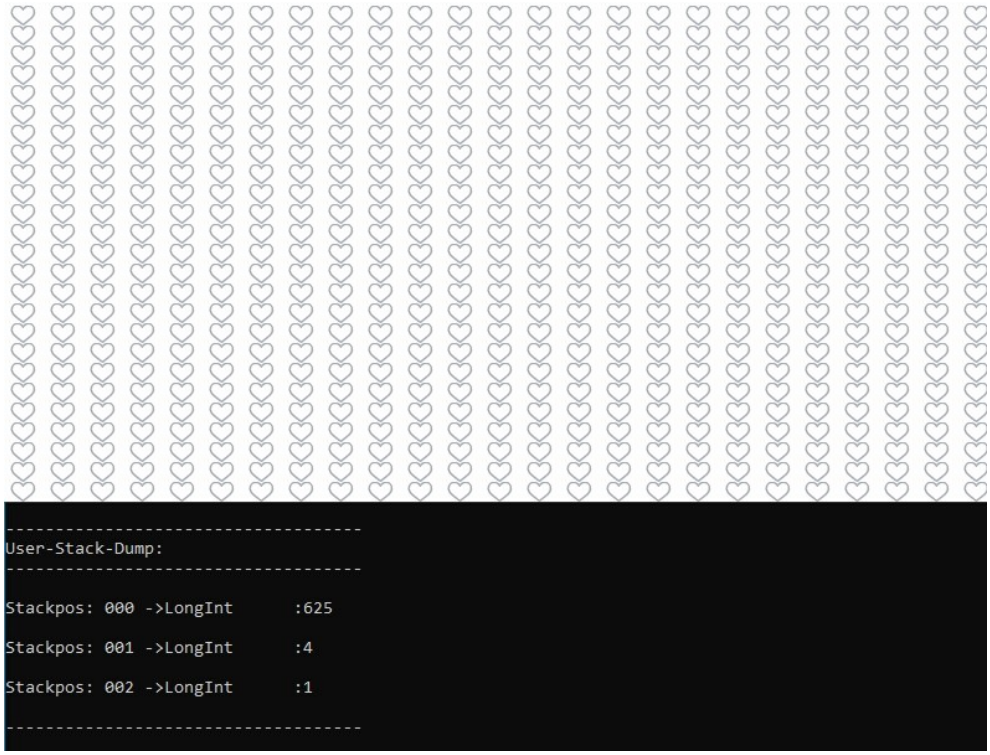
Intention

This command will fill an IR with the Pattern from a smaller IR.

1. Fill an IR with a Pattern
You need to have an IR already, otherwise create one using the ANA.New Command.
Then Load the Pattern and start the Filling.

```
ANA.Load|0|Heart.bmp
ANA.New|1|600|400
ANA.paf|0|1|&HFFFFFF
ANA.Show|1!
ENR.
```

Using this Pattern, we get the result below.
On the TOS you will find the number of copied Patterns, in this case its 625.



© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.PatternFill[|P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - opt. Source Image-Register number, if omitted, IR 0 will be used.
P2 - opt. Destination Image-Register number, if omitted, IR 0 will be used.
P3 - opt. Color for Background
P4 - opt. X-Shift in Pixel, if omitted 0 is used
P5 - opt. Y-Shift in Pixel, if omitted 0 is used

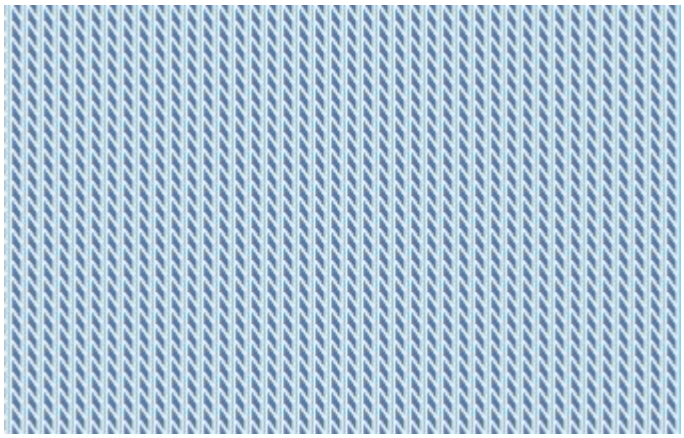
The Command will leave a 0 on the TOS in case of error, otherwise you get the number of copied patterns.

Example

```
'**********************************
' ANA.PatternFillHwn-Sample
'**********************************
ANA.Load|0|Heart.bmp
ANA.New|1|6000|4000
ANA.paf|0|1|&HFFFFFF
ANA.Show|1!
DMP.1
DMP.6
MBX.!
ENR.

' Here you can see a typical operation.
```

Picture 1: This is the recorded Pattern



Remarks

Plotting 93750 Copies of a Pattern on a 8000x6000 IR will take on my Computer 2498738 Ticks. That around 0.1 Seconds.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

-

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.12.6 ANA.PatternFillHwn

MiniRobotLanguage (MRL)

ANA.PatternFillHwn

Copy multiple equal Patterns into an Image-Register (IR) using a Windowhandle as Referenz for the Size of the Target.

Intention

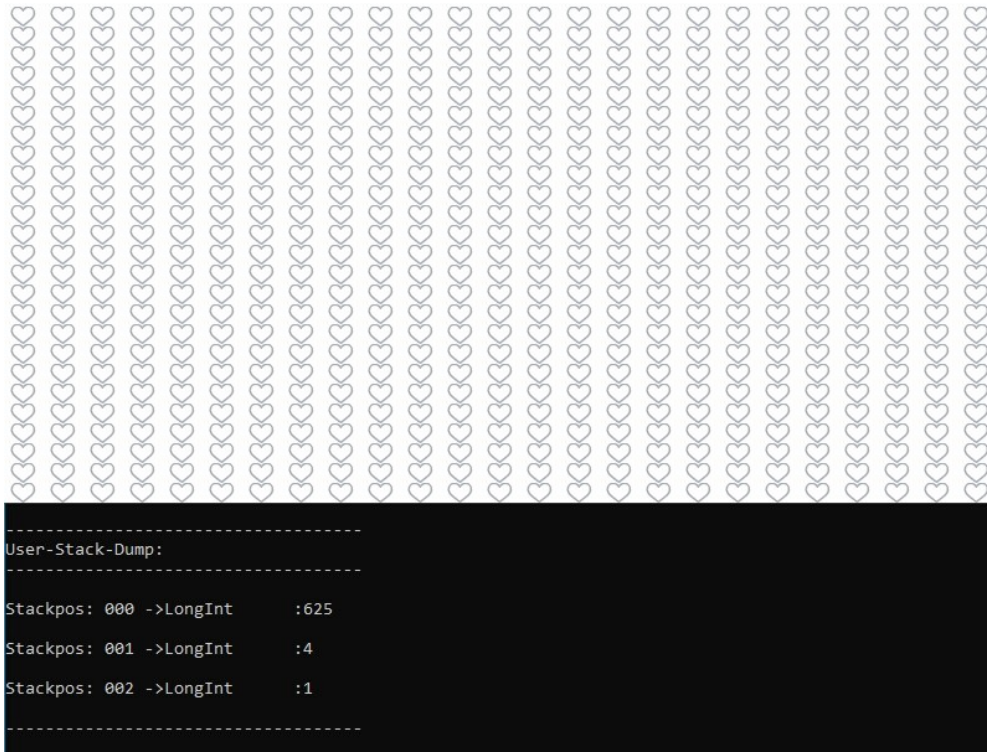
This command will fill an IR with the Pattern from a smaller IR. It will use a Windowhandle in **P4** as a Reference for the Target-Site.
The Target IR will be new created.

1. Fill an IR with a Pattern
You need to have an IR already, otherwise create one using the ANA.New Command.
Then Load the Pattern and start the Filling.

```
STW.ct|Chrome_WidgetWin_1|- Brave
HTV.$$HWN
ANA.Load|0|Heart.bmp
ANA.pafh|0|1|&HFFFFFF|$$HWN
ANA.Show|1!
ENR.
```

Using this Pattern, we get the result below.
On the TOS you will find the number of copied Patterns, in this case its 625.

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

ANA.PatternFillHwn[|P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - opt. Source Image-Register number, if omitted, IR 0 will be used.
P2 - opt. Destination Image-Register number, if omitted, IR 0 will be used.
P3 - opt. Color for Background
P4 - Window-Handle

The Command will leave a 0 on the TOS in case of error, otherwise you get the number of copied patterns.

Example

```
'***********************************
' ANA.PatternFillHwn-Sample
' In this Sample we use a recorded 8x8 Pattern, that is filled into an IR
' and the blitted over a Picture. With the right "Shift" it will turn any a fitt
'***********************************
' Load Picture

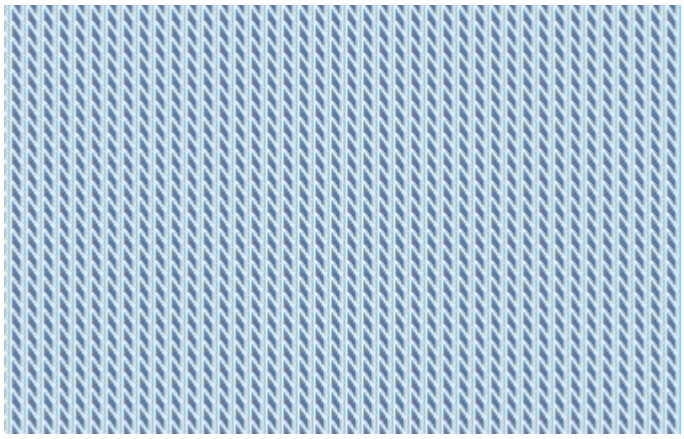
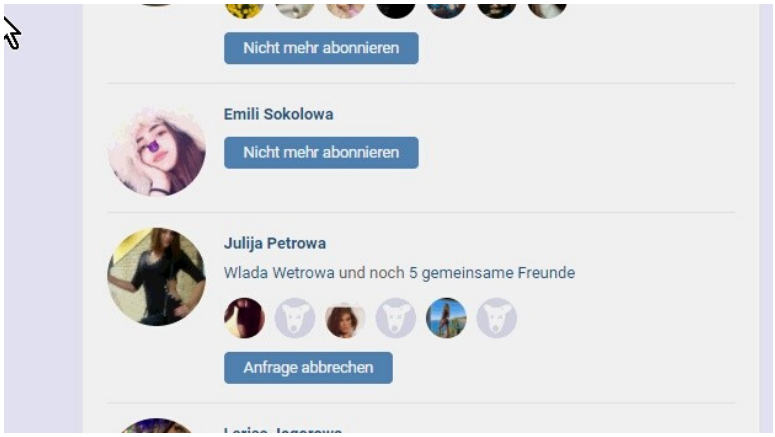
ANA.show|1
' Find black pattern
ANA.scc|1|&H0|8|0
MMV.
MBX.!
ENR.

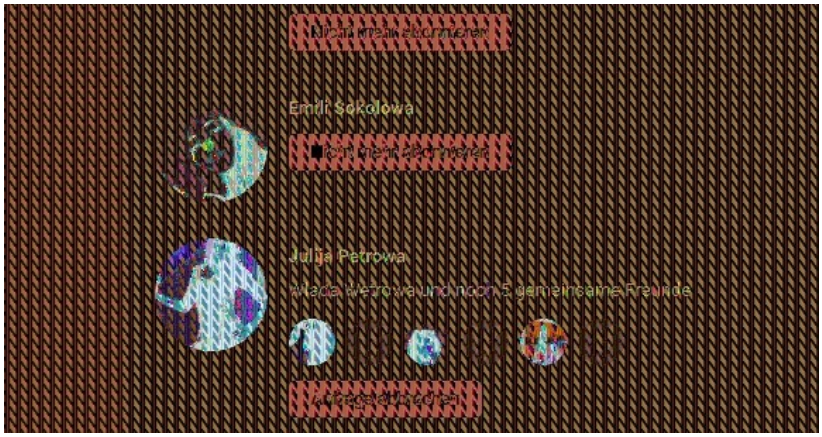
' Here you can see a typical operation.
```

Picture 1: This is the recorded Pattern **Picture 2 This is the Fake-Site where we recorded the pattern** **As a result of the Blit-Operation, the place where the pattern fits turns into a black Square.**

© 2023 Theo Gottwald * https://www.smart-package.com







As a result of the Blit-Operation with Blit-Mode 7, the place where the pattern fits turns black, see the black square in the Middle.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Remarks

Plotting 93750 Copies of a Pattern on a 8000x6000 IR will take on my Computer 2498738 Ticks. That around 0.1 Seconds.

Limitations:

While the Aspect-Ration of he window will be equal with the Result, the total size may differ depending on the local settings.
This Command was used during the development, maybe its not of much use in the final version.

3.55.4.12.8 ANA.VGradient

MiniRobotLanguage (MRL)

ANA.VGradient

Generate a Vertical Gradient between two Colors in an Image-Register (IR)

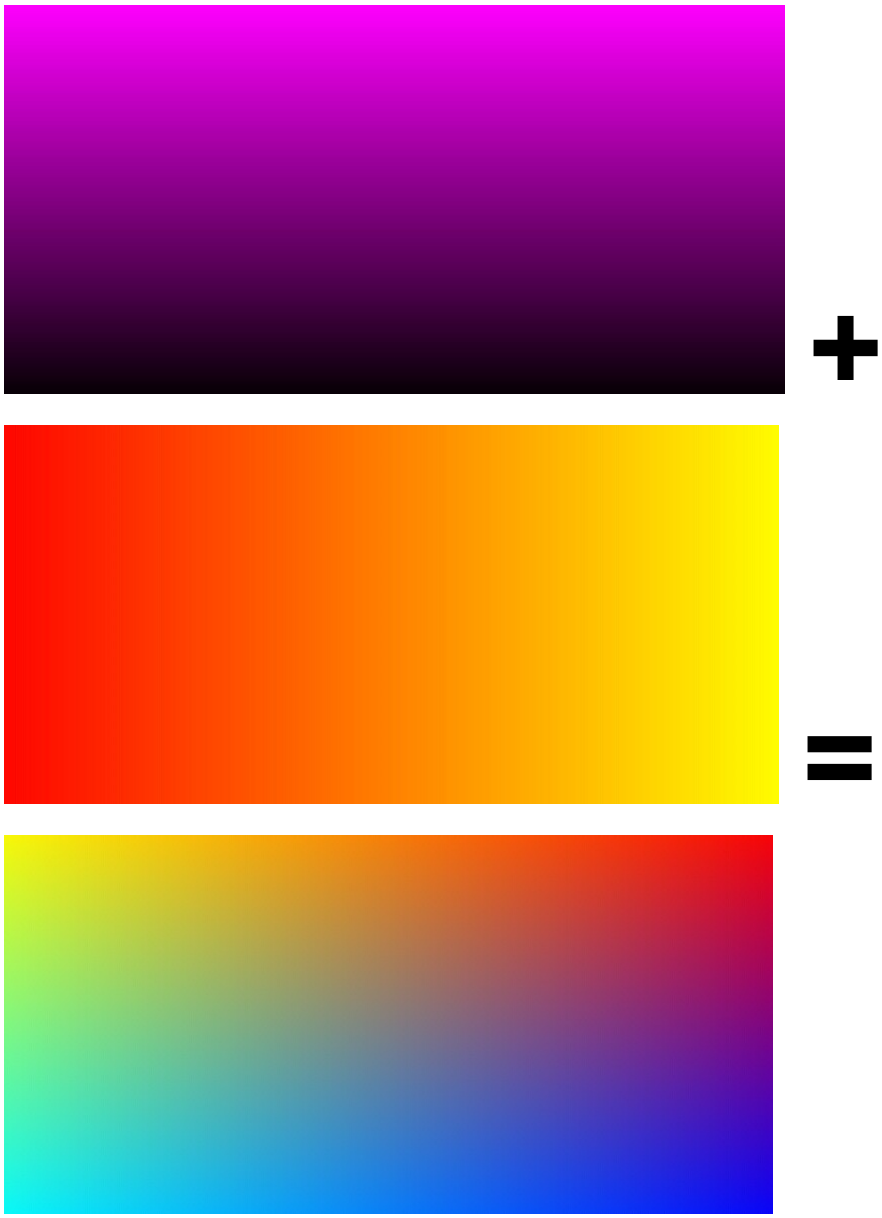
Intention

This command will generate an Gradient in vertical direction, between two Colors.

1. Generate a V-Gradient and Mix it with a H-Gradient to get a Multi-Gradient
This will generate a V- and a H- Grradient and Mix them together using Blitmode 7 to get a Multi-Gradient.

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF|&H000000
ANA.Show|0!
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF|&H00FFFF
ANA.Show|2!
ANA.Mix|0|2|7
ANA.Show|2!
ENR.
```

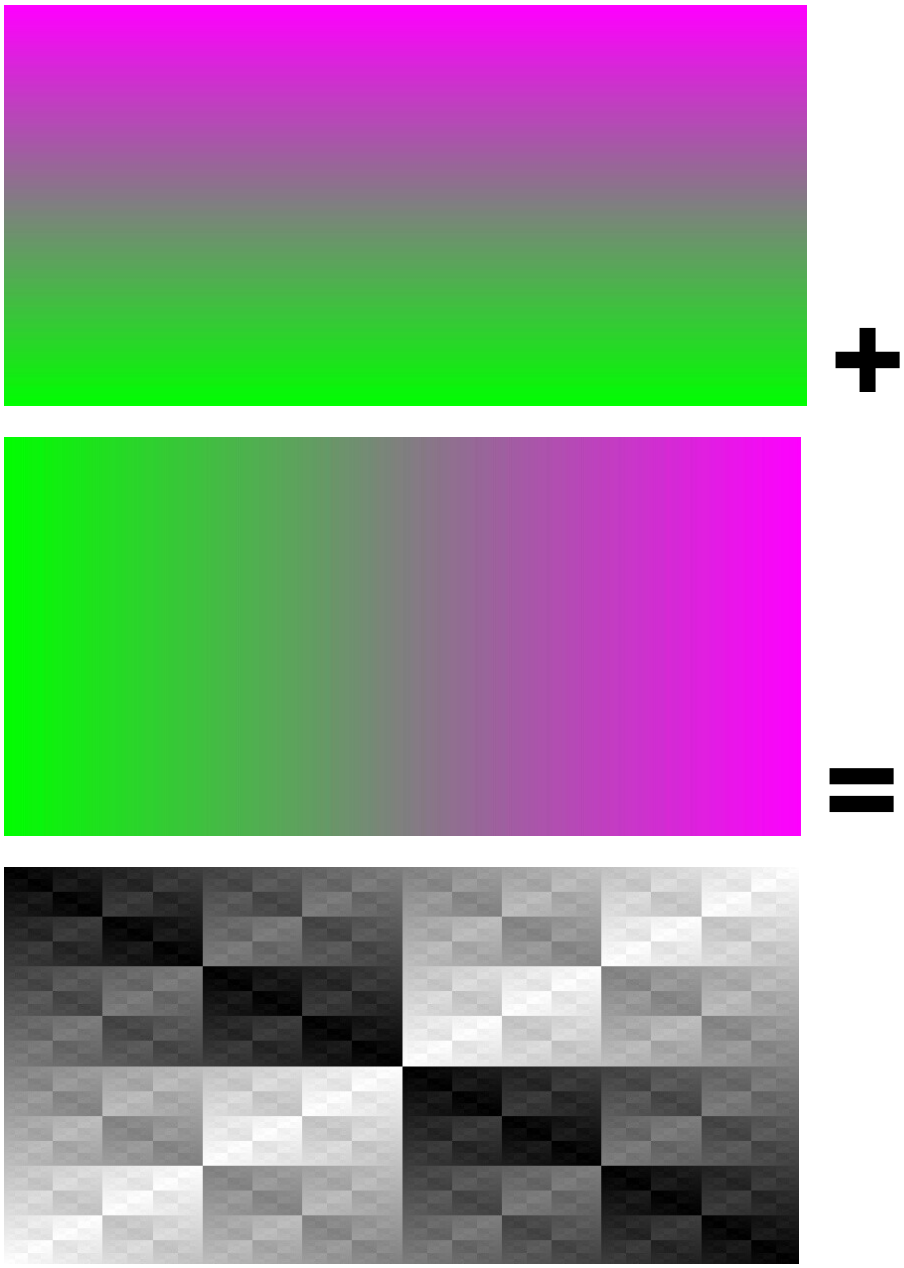
© 2023 Theo Gottwald * https://www.smart-package.com



2. If you omit P3, you will get an automatic selected color
If you om,it P3, the second Color will be automatically calculated using the Formula: &HFFFFFF-**P2**

```
ANA.New|0|800|400
ANA.vgradient|0|&HFF00FF
ANA.Show|0!
ANA.New|2|800|400
ANA.hgradient|2|&H0000FF
ANA.Show|2!
ANA.Mix|0|2|7
ANA.Show|2!
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

ANA.VGradient[|P1][|P2][|P3]

Parameter Explanation

P1 - opt. Target Image-Register number, if omitted, IR 0 will be used. There must be Content in that IR, it must exist.
P2 - opt. Color A (Top Color)
P3 - opt. Color B (Bottom Color)

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

© 2023 Theo Gottwald * https://www.smart-package.com

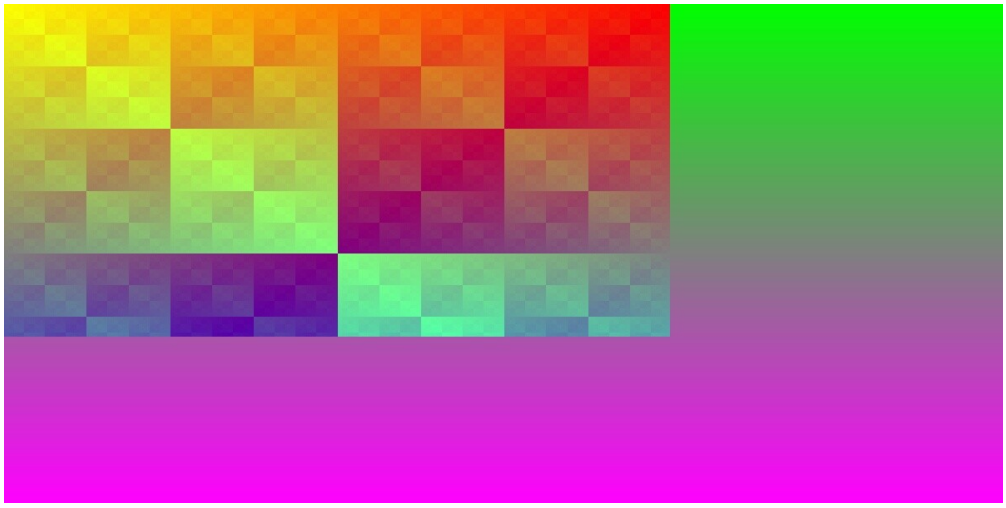
Example

```
'**********************************
' ANA.H/VGradient-Sample
'**********************************
ANA.New|0|1200|600
ANA.vgradient|0|&HFF00FF|&H00FF00
ANA.Show|0!

ANA.New|2|800|400
ANA.hgradient|2|&H0000ff|&H00FFFF
ANA.Show|2!

ANA.Mix|0|2|7
ANA.Show|2!
ENR.

' Here we mix two Gradients of different resolution.
```



Remarks

A V-Gradient on a 6000x4000 large Picture will need 1429447 Ticks, that is on my Computer 0.89 Seconds.

Using the SPR for commercial Pictures?
Yes, is possible.

I have set this Picture for Sale on Dreamstime, see: "Color Whee Background".

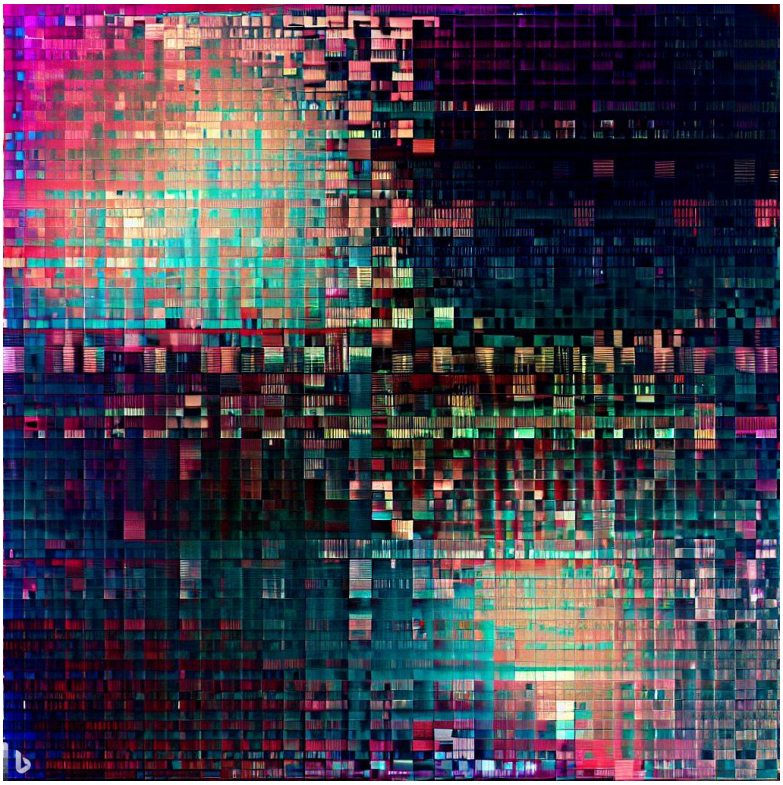
3.55.4.13 Pattern-Recognition

This Chapter contains the new Pattern-Recognition Engine Commands.



Get more detailed Information about the usable Pattern-Sizes and the Debug-Flag, here:

Pattern-Search Details 1862

Currently "Undocumented Commands":

```
ANA.FindPattern5|P1|P2|P3|P4|P5|P6|P7|P8|P9|P10|P11
```

This command will search for 5 different Patterns in one Run. These could be different Sizes of something.

Target IR is always IR 0
First Pattern-IR is always IR 1 alle further Patterns must be in the IR's 2 to 5

P1 + P2 - Color-Tolerance and PixelHits Pattern 1
P3 + P4 - Color-Tolerance and PixelHits Pattern 2
P5 + P6 - Color-Tolerance and PixelHits Pattern 3
P7+ P8 - Color-Tolerance and PixelHits Pattern 4
P9 + P10 - Color-Tolerance and PixelHits Pattern 5
P11 - Debug Flag

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.13.1 ANA.CompareBlock

MiniRobotLanguage (MRL)

ANA.CompareBlock

Compares a rectangular area in an Image-Register (IR) with a given Pattern. The result includes the number of pixel hits and a 0/1 value indicating whether the pattern matches at that position.

Intention

The ANA.CompareBlock command allows you to compare a rectangular area within an Image-Register (IR) with a specified Pattern.
It provides information on the number of pixel hits and whether the pattern matches at the given position.
This command is useful when you need to assess the similarity or presence of a pattern within a specific area of an image.
This command will compare a rectangular Area in an IR with the given Pattern.
The result will be the number of Pixel-Hits and 0/1 if the Pattern will match at that place, on TOS.

For more Details please see the
ANA.FindPattern Command 1537

Syntax

ANA.CompareBlock|P1|P2[|P3][|P4][|P5][|P6]

Parameter Explanation

P1 – Target Image-Register (IR): The Image-Register containing the target area for comparison.
P2 – Pattern Image-Register (IR): The Image-Register containing the pattern to be compared.

P3 – X-Position in Target: The X-coordinate of the upper-left corner of the target area.
P4 – Y-Position in Target: The Y-coordinate of the upper-left corner of the target area.
P5 – Color Tolerance: The allowed difference in color values between the target and pattern pixels.
P6 – Pixel-Hits Needed: The minimum number of pixel hits required for the pattern to be considered a match.

About the P6 - Parameter ("Pixel-Hits"):

© 2023 Theo Gottwald * https://www.smart-package.com

The maximum number of matching pixels in your pattern is determined by its size. For example, an 8x8 pattern can have up to 64 matching pixels, whereas a 24x8 pattern can have up to 192.
P6 is based on the total number of pixels in the pattern.
If you set it to 63, for instance, it means that at least 63 pixels must match the pattern, including the tolerance.
If you input a negative number for **P6**, such as "-15", it's treated as a percentage of the total pixel count, translating to "15% of the maximum pixels of that pattern".
If you leave it empty or set it to 0, the default value will be 85% of the pixel count in the pattern.
P4 denotes the minimum number of matches needed to accept a result.
Be careful not to set **P6** too low, as it could potentially overwhelm the system with a massive number of results.

This command has some special features regarding the "**Pixel-Hit Tolerance Parameters**".

1. If you specify "0", the command will calculate the maximum possible number of hits for the loaded pattern and take 85% of that value.
2. If you specify a negative value like "-69", the command will also calculate the maximum possible number of hits for the loaded pattern and take that as 100%. In this example, it would be 69%, so if this is a 12x12 pattern and therefore has a maximum of 144 pixel-hits, 69% of that would be 99 pixels.
3. You can directly specify a positive value that is the exact number of needed pattern-pixels for the pattern to be considered as found.
4. The maximum number of found results is limited by the setting of "MaxResults" using the ANA.SetData command.
5. Due to the use of multiple CPU cores at different places at the same time, there is no guarantee in which order matches are returned.
6. The command will leave a 0/1 on the TOS. As always, a 0 means error, while a 1 means "all fine". For example, if one of the IR's does not exist, then you will get a result "0" on TOS. The program will not generate an error message.

Get the result on TOS

This command will compare a rectangular Area in an IR with the given Pattern.
The result will be the number of Pixel-Hits and 0/1 if the Pattern will match at that place, on TOS.

Example

```
' To compare a rectangular area in IR 0 with the pattern in IR 1 at position (10
' with a color tolerance of 5 and requiring at least 50 pixel hits, use the foll
ANA.CompareBlock|0|1|10|20|5|50|1
```

Remarks

Speed Considerations:
1. The Command is "Multithreaded" and works best with a Multicore CPU.
2. The Command will need a lot of CPU-Power, it may also use the GPU at some point internally.
3. Generally the Command is very fast even in very large windows, as long as the Computer has a modern CPU.
4. The larger the Pattern, the slower the process.
5. Currently it may speed up the process, if you have the pattern touch the upper left corner. This may change in the future.
6. If a Pattern is very slow, just record another Pattern. And try this again.

© 2023 Theo Gottwald * https://www.smart-package.com

7. A pattern that is completely empty will not work as there is nothing to recognize in it.

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

- ANA_FindPattern 1537

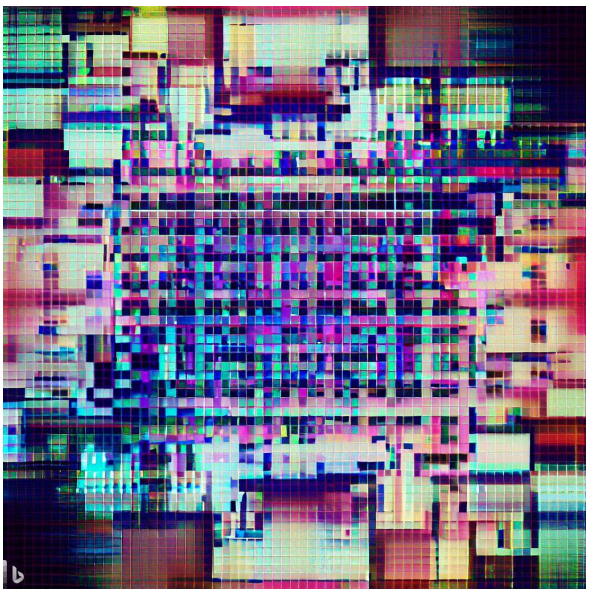
© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.13.2 ANA.DownScale

MiniRobotLanguage (MRL)

ANA.DownScale

DownScale a 12x12 Pattern (inside an IR) to smaller Sizes



Intention

If you have a 12x12 pattern and you want it to be recognized at different zoom settings, the best approach is to record the pattern in its native resolution.

As an alternative, you can use the ANA.DownScale command to automatically generate smaller patterns from the original 12x12 pattern. This method works best with simple symbols and patterns that do not use Cleartype.

Assume your browser setting is at 100%. We will record a red cross as a pattern and then generate a downscaled version.

You can use the "`ANA.FindPattern4|0|$$COT|$$PIH|$$COT|$$PIH|$$COT|$$PIH|$$COT|$$PIH`" command to search for multiple patterns at once. The ANA.ShowHits command can be used to identify which patterns have been detected.
Due to the way fonts are rendered in Windows (using "Cleartype"), downscaled versions may not work well with text.
They are more effective when used with symbols.

If the downscaled versions are ineffective, simply record the pattern at the desired zoom level using the HE-Recorder. If you record using the 12x12 pattern size, the HE-Recorder will automatically call the "Downscale" command and save multiple sizes. However, it's generally more effective to record patterns at their native resolution. Even with a high tolerance setting, the success rate with downscaled patterns may not be perfect.

© 2023 Theo Gottwald * https://www.smart-package.com

The images below show browser symbols at 100% and 75% zoom, detected using a downscaled pattern with high tolerances.

```
STW.ct|Chrome_WidgetWin_1|General Discussion - Brave
SWP.12,9|1216,717|T
VAR.$$PA1=?pattern\Cross_12.bmp

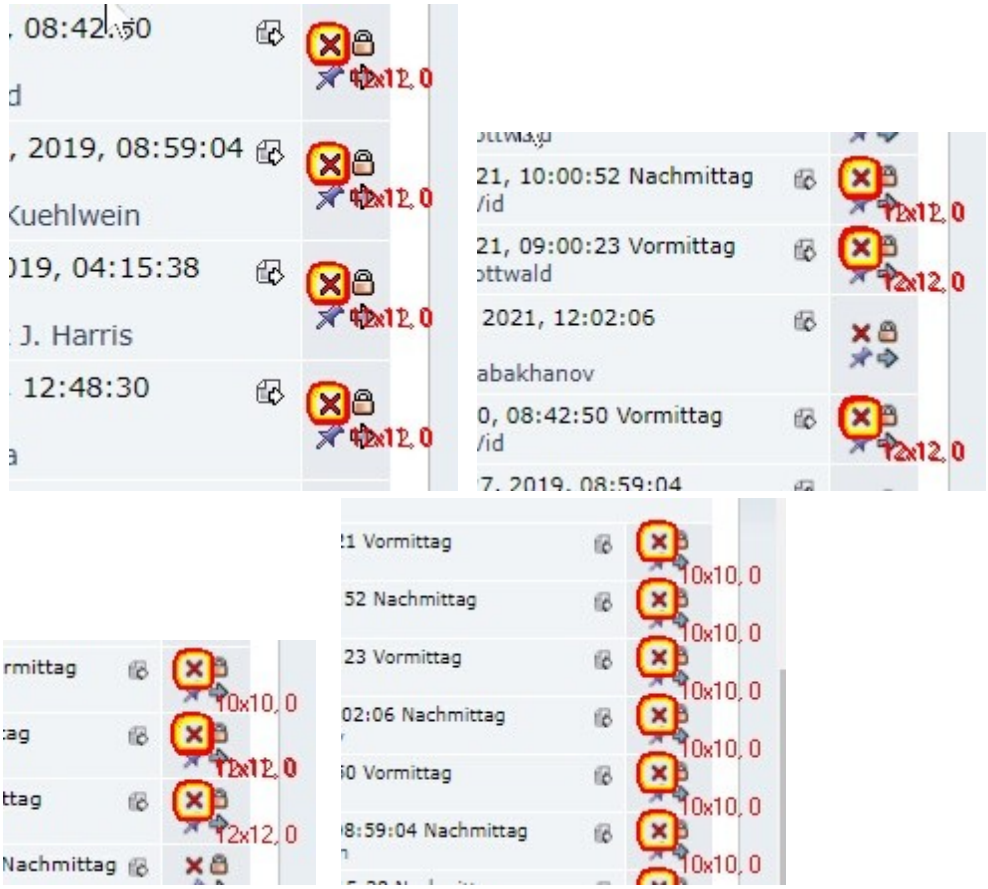
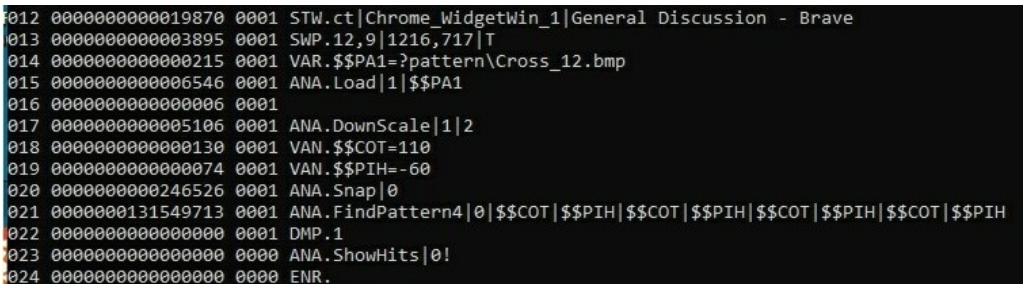
ANA.FindPattern4|0|$$COT|$$PIH|$$COT|$$PIH|$$COT|$$PIH|$$COT|$$PIH
DMP.1
ANA.ShowHits|0!
ENR.
```



The first Picture shows the Finds at a Browser Zoom of 100%. The following Pictures show the findings at a Browser Zoom of 80%, 75%, and 67% using the downscaled Patterns.

© 2023 Theo Gottwald * https://www.smart-package.com



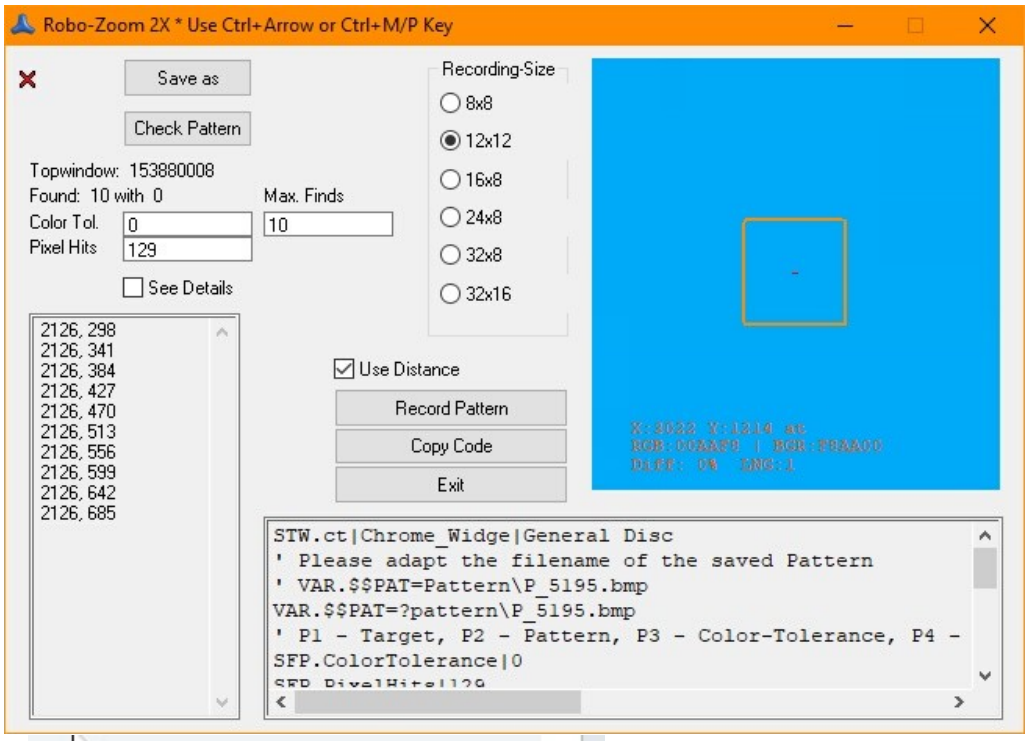
The first Picture shows the Speed-Dump.

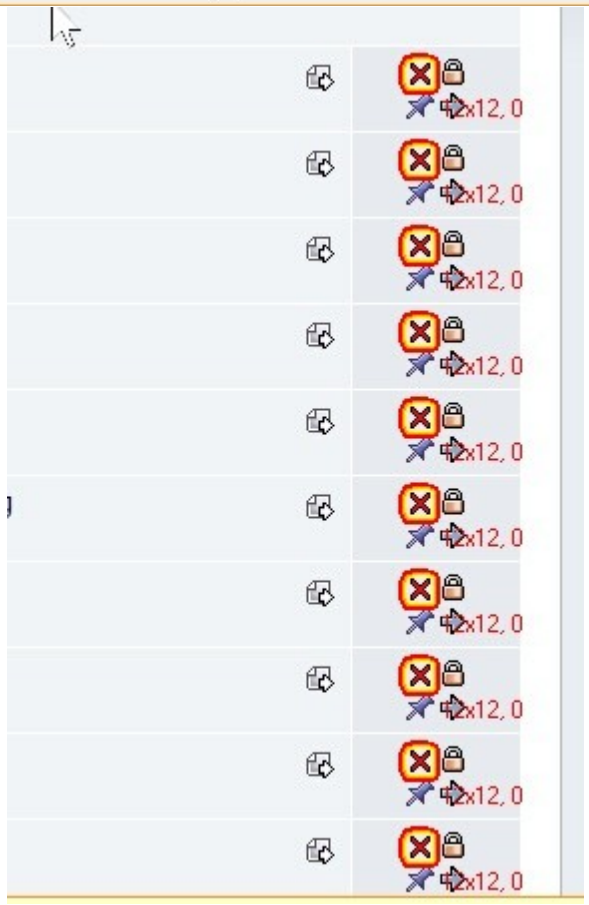
Here is another Sample-Script, in case you have the Patterns already in the ?Pattern\ Folder..

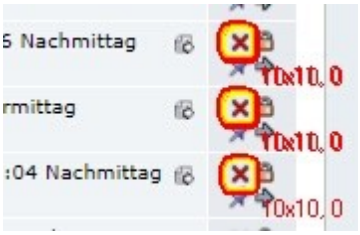
```
' If you alread have the downscaled Variants
' maybe from the HE-Recorder
' Then you can just load them like this:
STW.ct|Chrome_WidgetWin_1|General Discussion - Brave
SWP.12,9|1216,717|T
VAR.$$PA1=?pattern\Cross_12.bmp
FOR.$$LR3|1|4
  CAL.$$NUM=$$LR3+8
  VAR.$$PA1=?pattern\Cross_$$NUM.bmp
  ANA.Load|$$LR3|$$PA1
  DBP.Loading: $$PA1
NEX.
VAN.$$COT=110
VAN.$$PIH=-60
ANA.Snap|0
ANA.FindPattern4|0|$$COT|$$PIH|$$COT|$$PIH|$$COT|$$PIH|$$COT|$$PIH
DMP.6
ANA.ShowHits|0!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com







If you save the Pattern with the HE-Recorder, you will automatically get more versions:

*© 2023 Theo Gottwald * https://www.smart-package.com*

This is internally the result of "DownScale" using the HE-Recorder with a Pattern-Size of 12x12.

Syntax

ANA.DownScale[|P1][|P2][|P3][!][!]

Parameter Explanation

P1 - Source-Pattern IR (Pattern to Scale)
P2 - First Target IR, other Targets are successive IR's -> P2+X...
P3 - Number of downscaled Variants to produce

Example

```
STW.ct|Chrome_WidgetWin_1|General Discussion - Brave
SWP.12,9|1216,717|T
VAR.$$PA1=?pattern\Cross_12.bmp
ANA.Load|1|$$PA1
' This will generate the 4 Downscaled Versions
ANA.DownScale|1|2
VAN.$$COT=110
VAN.$$PIH=-60

3.55.4.13.3 ANA.FindPattern

MiniRobotLanguage (MRL)

ANA.FindPattern

Get Locations of a specified Pattern-Object in an Image-Register (IR)

Intention

The "FindPattern" command is designed to identify the positions of a specific object within an image. This command utilizes a four-level Fuzzy-Logic algorithm. Users can modify the color tolerance and specify the minimum number of "pixel hits" necessary for a match.
To streamline the process of pattern recording, we offer a tool called the
Human Eye-Recorder 1140.
This tool simplifies and accelerates the recording of patterns. However, please consider the following when using the pattern recording feature:

1. Mouseover Effects: If the recorded pattern includes objects that change color when the mouse hovers over them, these color changes might not be visually noticeable. Despite this, the pattern matcher will detect these changes and might avoid matching the pattern if the color tolerance is set to zero. To manage this, we suggest capturing a screenshot of the window and recording the pattern from the screenshot to ensure a consistent color representation.

2. Image Format: It is important to use image formats without compression artifacts when working with the pattern matcher commands. Avoid using JPG or other compressed formats, as they may introduce unknown quality issues. It is best to use uncompressed formats such as BMP or PNG.

© 2023 Theo Gottwald * https://www.smart-package.com

If you face difficulties with pattern matching due to mouseover effects or other factors, consider adjusting the color tolerance or capturing a screenshot for pattern recording. While increasing the color tolerance is not ideal, it might still provide satisfactory results in many cases.

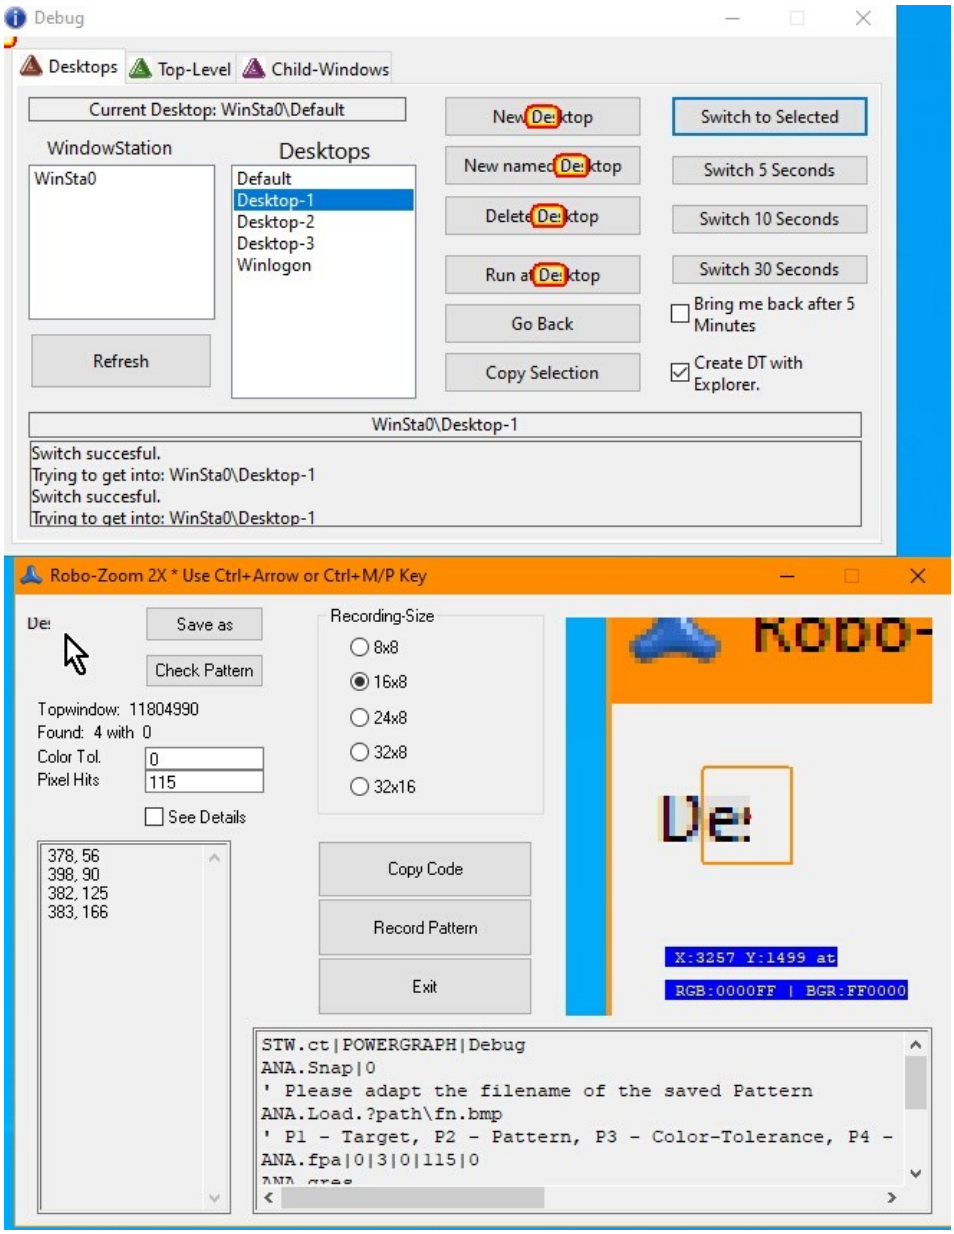
1. Capture Screenshot of Window and use it for Pattern-Search
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.ct|Progman|Program Manager
' We Snapshot the Desktop into IR 0
ANA.Snap|0
' This is the Pattern we search for
$$PAA=?path\Help16.bmp
' We load the Pattern into IR 1
ANA.Load|1|$$PAA

' This is the Pattern Searching Command,
' Due to the value "1" as last Parameter, we will get a Debugprint
' of all found Hits. The displayed Point is in the Center of the Pattern.
ANA.fpa|0|1|0|125|1
' This command will put the results of the search on to the Stack.
' Number of found Patterns is on TOS
POP.$$POA
MBX. We got $$POA Results
' We do not need first 3 Found Pattern so we remove them from Stack
STJ.Remo|0|1|2
' This is the Pattern we drive to
POP.$$POA
MMV.t|$$POA
MBX.!
ENR.
```

2. Capture Screenshot of a Window and use it for Patternsearch
This is the normal case. You will only search the Pattern in a Target Window. Using the HE-Recorder-Tool and the "Check Pattern" Button,
you may get a result like this:

© 2023 Theo Gottwald * https://www.smart-package.com



Using the HE-Recorder Program you may get a result like this.

The Code is generated using the HE-Recorder. You may need to change the Path for the Pattern.

```
    The "found hits" will be on the TOS.

STW.ct|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
'SWP.4090,2|640,400|T
ANA.Snap|0

ANA.Load|1|?path\De16.bmp
' P1 - Target, P2 - Pattern, P3 - Color-Tolerance, P4 - min. Hits (Pixel) maximu
ANA.fpa|0|1|0|115|0
' We take away the number of Hits from TOS
POP.$$NOH
' If no Hits, jump away to Lab_NoHits.
MBX.$$NOH
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

IMPORTANT NOTICE about Mouseover Effects:

It is important to note that when recording patterns using the HE-Recorder, you may not visually perceive the "Mouseover Effects" on buttons or objects. However, these effects are visible to the FindPattern command during pattern matching.

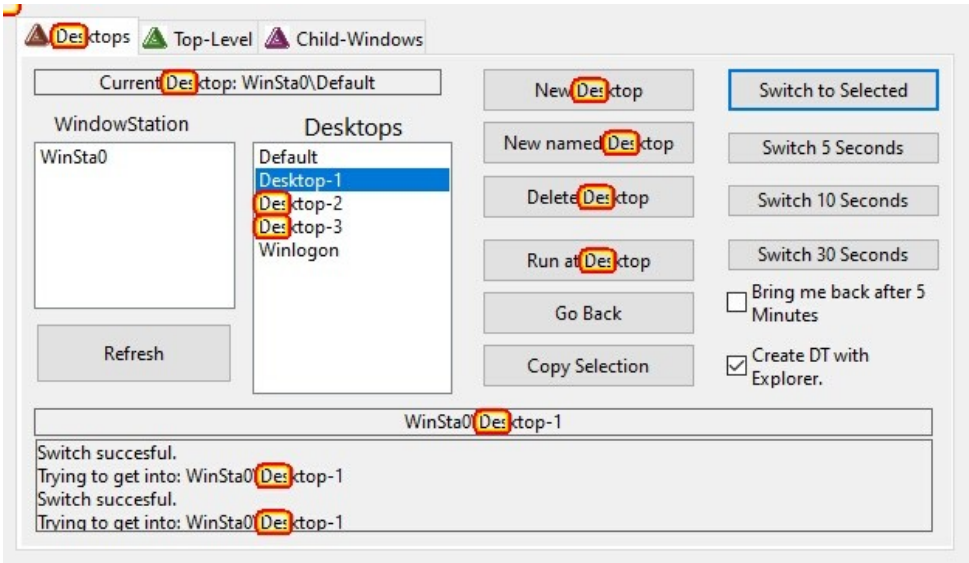
If you are searching for a recorded pattern and do not obtain any matches when using a color tolerance of "0," it indicates that "Mouseover Effects" were present during the recording. To avoid this issue, it is recommended to capture a screenshot of the form or window (preferably in .png or .bmp format to avoid compression artifacts) and record the pattern from the screenshot.

Recording from a Screenshot will prevent "Mouseover Effects".

Recording patterns from a screenshot eliminates the influence of "Mouseover Effects" and ensures accurate pattern matching. You can verify this behavior by using our "Desktops-Manager" tool and recording a button with invisible "Mouseover Effects." Without a screenshot, you will not obtain any matches with a color tolerance of "0." However, by recording from a screenshot, you will immediately obtain the desired matches even with a color tolerance of "0."

Alternatively, you can overcome "Mouseover Effects" by using a higher color tolerance. However, this approach may result in an increased number of unintended matches, so caution should be exercised. For example, using a color tolerance of 50 may yield more hits, including false positives.

© 2023 Theo Gottwald * https://www.smart-package.com



Here i have used a Color-Tolerance of 50. So i got results on grey and on white background.

IMPORTANT NOTICE about missing Administration Rights Effects:

If you're initiating the script from an SPR-Editor without administrative rights, you might face challenges in loading images from the standard robot path.
This path is located under C:\Program Files (x86), a directory that generally requires administrative access to load files. This could lead to black images when using the ANA.Load command.
To circumvent this issue, try executing the script with administrative privileges. This should provide the necessary permissions to correctly load the images.

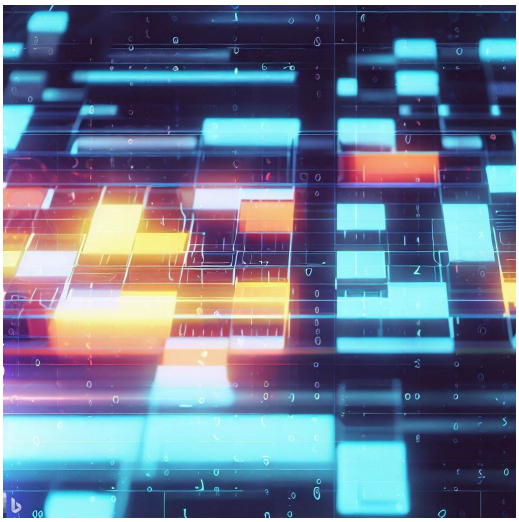
Syntax

ANA.FindPattern[|P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - opt. Target IR Image-Register number for Target, if omitted, IR 0 will be used.
P2 - opt. Pattern IR Image-Register number for Pattern, if omitted, IR 1 will be used.
P3 - opt. Color Tolerance, if omitted 0 will be used.
P4 - opt. Pixel-Hit Tolerance, if omitted a default value will be used. This value depends on the Pattern-Size that you feed into the Command.
Please see below for a comprehensive explanation of **P4**.
P5 - opt. 0/1 - Debug-Flag see below

© 2023 Theo Gottwald * https://www.smart-package.com



About the P4 - Parameter ("Pixel-Hits"):

The maximum number of matching pixels in your pattern is determined by its size. For example, an 8x8 pattern can have up to 64 matching pixels, whereas a 24x8 pattern can have up to 192.
P4 is based on the total number of pixels in the pattern.
If you set it to 63, for instance, it means that at least 63 pixels must match the pattern, including the tolerance.
If you input a negative number for **P4**, such as "-15", it's treated as a percentage of the total pixel count, translating to "15% of the maximum pixels of that pattern".
If you leave it empty or set it to 0, the default value will be 85% of the pixel count in the pattern.
P4 denotes the minimum number of matches needed to accept a result.
Be careful not to set **P4** too low, as it could potentially overwhelm the system with a massive number of results.

This command has some special features regarding the "**Pixel-Hit Tolerance Parameters**".

1. If you specify "0", the command will calculate the maximum possible number of hits for the loaded pattern and take 85% of that value.
2. If you specify a negative value like "-69", the command will also calculate the maximum possible number of hits for the loaded pattern and take that as 100%. In this example, it would be 69%, so if this is a 12x12 pattern and therefore has a maximum of 144 pixel-hits, 69% of that would be 99 pixels.
3. You can directly specify a positive value that is the exact number of needed pattern-pixels for the pattern to be considered as found.
4. The maximum number of found results is limited by the setting of "MaxResults" using the ANA.SetData command.
5. Due to the use of multiple CPU cores at different places at the same time, there is no guarantee in which order matches are returned.
6. The command will leave a 0/1 on the TOS. As always, a 0 means error, while a 1 means "all fine". For example, if one of the IR's does not exist, then you will get a result "0" on TOS. The program will not generate an error message.

The command leaves a 0/1 on the TOS. Consistently, 0 signifies an error, while 1 indicates that everything is fine.
For instance, if one of the IR's doesn't exist, you'll receive a "0" on the TOS.
The program won't generate an error message in this case.

About the P5 - Parameter ("Debug Flag"):

The Flag-Parameter meanwhile can do a lot more then just help Debugging.

© 2023 Theo Gottwald * https://www.smart-package.com

1 - Enable Debug-Output in Console Window
2 - Snap last used Window again if not found
4 - Use "Difference Map Search"
8 - Disable Filtering (if set)
16 - Use "Invert Pattern"
32 - Use "Complement Pattern"
64 - Use "Extended Search" (takes longer, makes more evaluations)

The results of the Operation can be accessed with the "`ANA.gres`" Command.

Example

Capture Screenshot of complete Desktop and use it for Pattern-Search
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```

Remarks

Speed Considerations:
1. The Command is "Multithreaded" and works best with a Multicore CPU.
2. The Command will need a lot of CPU-Power, it may also use the GPU at some point internally.
3. Generally the Command is very fast even in very large windows, as long as the Computer has a modern CPU.
4. The larger the Pattern, the slower the process.
5. Currently it may speed up the process, if you have the pattern touch the upper left corner. This may change in the future.
6. If a Pattern is very slow, just record another Pattern. And try this again.
7. A pattern that is completely empty will not work as there is nothing to recognize in it.

© 2023 Theo Gottwald * https://www.smart-package.com

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:
Choosing wrong values for **P3** and **P4** may overrun the robot with too many "fitting results" and may keep the system busy for minutes.
We did not yet implement an "Maximum number of results" at this time.

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.4.13.4 ANA.FindPattern2

MiniRobotLanguage (MRL)

ANA.FindPattern2

Locate either one or two specified Pattern-Objects in an Target Image-Register (IR)

Intention

I could have named this Command: "Find Alternative Pattern". It will take two Patterns as Parameter and find either of these.
They can, but they must not have the same size. Each Pattern also has its own values for Color-Tolerance and Minimum Pixel-Hits.

This command will find the Locations where either of these two specified Patterns are is in an Image.
You must load the Target-Picture into IR 0 and load the two Patterns into IR 1 and IR 2.

For more Details please see the
ANA.FindPattern Command 1537

Syntax

ANA.FindPattern2|P1|P2[|P3][|P4][|P5]

Parameter Explanation

Target must be loaded into Image-Register IR 0.
Patterns must be loaded into IR 1 and IR 2
P1 - opt. Color Tolerance, if omitted 0 will be used.
P2 - opt. Pixel-Hit Tolerance, This value depends on the Pattern that you feed into the Command.
If your Pattern is 8x8 then the maximum number of Pixels that could match is 64. If its 24x8 the maximum Number is 192.
If you specify a negative number like "-15" then this is treated as a Percentage of the total Pixel-Number, means "15% of the maximum Pixels of that Pattern"
If omitted or 0 the default value will be 85% of Pixel-Number in Pattern.

P3 - opt. Color Tolerance, if omitted 0 will be used.
P4 - opt. Pixel-Hit Tolerance, This value depends on the Pattern that you feed into the Command.
P5 - opt. 0/1 - Debug-Flag

*© 2023 Theo Gottwald * https://www.smart-package.com*

About the P4 - Parameter ("Pixel-Hits"):

The maximum number of matching pixels in your pattern is determined by its size. For example, an 8x8 pattern can have up to 64 matching pixels, whereas a 24x8 pattern can have up to 192.
P4 is based on the total number of pixels in the pattern.
If you set it to 63, for instance, it means that at least 63 pixels must match the pattern, including the tolerance.
If you input a negative number for **P4**, such as "-15", it's treated as a percentage of the total pixel count, translating to "15% of the maximum pixels of that pattern".
If you leave it empty or set it to 0, the default value will be 85% of the pixel count in the pattern.
P4 denotes the minimum number of matches needed to accept a result.
Be careful not to set **P4** too low, as it could potentially overwhelm the system with a massive number of results.

This command has some special features regarding the "**Pixel-Hit Tolerance Parameters**".

1. If you specify "0", the command will calculate the maximum possible number of hits for the loaded pattern and take 85% of that value.
2. If you specify a negative value like "-69", the command will also calculate the maximum possible number of hits for the loaded pattern and take that as 100%. In this example, it would be 69%, so if this is a 12x12 pattern and therefore has a maximum of 144 pixel-hits, 69% of that would be 99 pixels.
3. You can directly specify a positive value that is the exact number of needed pattern-pixels for the pattern to be considered as found.
4. The maximum number of found results is limited by the setting of "MaxResults" using the ANA.SetData command.
5. Due to the use of multiple CPU cores at different places at the same time, there is no guarantee in which order matches are returned.
6. The command will leave a 0/1 on the TOS. As always, a 0 means error, while a 1 means "all fine". For example, if one of the IR's does not exist, then you will get a result "0" on TOS. The program will not generate an error message.

The command leaves a 0/1 on the TOS. Consistently, 0 signifies an error, while 1 indicates that everything is fine.
For instance, if one of the IR's doesn't exist, you'll receive a "0" on the TOS.
The program won't generate an error message in this case.

About the P5 - Parameter ("Debug Flag"):

The Flag-Parameter meanwhile can do a lot more then just help Debugging.

1 - Enable Debug-Output in Console Window
2 - Snap last used Window again if not found
4 - Use "Difference Map Search"
8 - Disable Filtering (if set)
16 - Use "Invert Pattern"
32 - Use "Complement Pattern"
64 - Use "Extended Search" (takes longer, makes more evaluations)

The results of the Operation can be accessed with the "`ANA.gres`" Command.

Example

Important Notice:

Please check the **ANA.FindPattern-Command**[1537] to see details on how to use this command.
There you will find important Information about "Mouseover-Effects" and "Admin-Rights".

Syntax

ANA.FindPattern4[|P1][|P2][|P3][|P4][|P5][|P6][|P7]

Parameter Explanation

P1 - opt. Target IT Image-Register number for Target, if omitted, IR 0 will be used. The Patterns to search for will always be in IR 1 and all following.
P2 - opt. Color Tolerance A, if omitted 0 will be used.
P3 - opt. Pixel-Hit Tolerance A, This value depends on the Pattern that you feed into the Command.

If your Pattern is 8x8 then the maximum number of Pixels that could match is 64. If its 24x8 the maximum Number is 192.

If you specify a negative number like "-85" then this is treated as a Percentage of the total Pixel-Number, means "85% of the maximum Pixels of that Pattern"

© 2023 Theo Gottwald * https://www.smart-package.com

If omitted or 0 the default value will be 85% of Pixel-Number in Pattern.

P4 - opt. Color Tolerance B, see P2.
P5 - opt. Pixel-Hit Tolerance B,see P3.
P6 - opt. Color Tolerance C, see P2.
P7 - opt. Pixel-Hit Tolerance C,see P3.
P8 - opt. Color Tolerance D, see P2.
P9 - opt. Pixel-Hit Tolerance D,see P3.
P10 - opt. 0/1 - Debug-Flag

About the P9 - Parameter ("Pixel-Hits"):

The maximum number of matching pixels in your pattern is determined by its size. For example, an 8x8 pattern can have up to 64 matching pixels, whereas a 24x8 pattern can have up to 192.
P9 is based on the total number of pixels in the pattern.
If you set it to 63, for instance, it means that at least 63 pixels must match the pattern, including the tolerance.
If you input a negative number for **P9**, such as "-15", it's treated as a percentage of the total pixel count, translating to "15% of the maximum pixels of that pattern".
If you leave it empty or set it to 0, the default value will be 85% of the pixel count in the pattern.
P9 denotes the minimum number of matches needed to accept a result.
Be careful not to set **P9** too low, as it could potentially overwhelm the system with a massive number of results.

This command has some special features regarding the "**Pixel-Hit Tolerance Parameters**".

1. If you specify "0", the command will calculate the maximum possible number of hits for the loaded pattern and take 85% of that value.
2. If you specify a negative value like "-69", the command will also calculate the maximum possible number of hits for the loaded pattern and take that as 100%. In this example, it would be 69%, so if this is a 12x12 pattern and therefore has a maximum of 144 pixel-hits, 69% of that would be 99 pixels.
3. You can directly specify a positive value that is the exact number of needed pattern-pixels for the pattern to be considered as found.
4. The maximum number of found results is limited by the setting of "MaxResults" using the ANA.SetData command.
5. Due to the use of multiple CPU cores at different places at the same time, there is no guarantee in which order matches are returned.
6. The command will leave a 0/1 on the TOS. As always, a 0 means error, while a 1 means "all fine". For example, if one of the IR's does not exist, then you will get a result "0" on TOS. The program will not generate an error message.

The command leaves a 0/1 on the TOS. Consistently, 0 signifies an error, while 1 indicates that everything is fine.
For instance, if one of the IR's doesn't exist, you'll receive a "0" on the TOS.
The program won't generate an error message in this case.

About the P10 - Parameter ("Debug Flag"):

The Flag-Parameter meanwhile can do a lot more then just help Debugging.

1 - Enable Debug-Output in Console Window
2 - Snap last used Window again if not found
4 - Use "Difference Map Search"
8 - Disable Filtering (if set)
16 - Use "Invert Pattern"

© 2023 Theo Gottwald * https://www.smart-package.com

32 - Use "Complement Pattern"
64 - Use "Extended Search" (takes longer, makes more evaluations)

The results of the Operation can be accessed with the "`ANA.gres`" Command.

Example

Capture Screenshot of complete Desktop and use it for Pattern-Search
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
'**********************************
' ANA.FindPattern-Sample
'
'**********************************
STW.ct|Progman|Program Manager
' We Snapshot the Desktop into IR 0
ANA.Snap|0

' This are the Pattern we search for
$$PAA=?path\Help12.bmp
$$PAB=?path\Help9.bmp
' We load the Pattern into IR 1+2
ANA.Load|1|$$PAA
ANA.Load|2|$$PAB

' This is the Pattern Searching Command,
' Due to the value "1" as last Parameter, we will get a Debugprint
' of all found Hits. The displayed Point is in the Center of the Pattern.
' Note that we use a different Numbers for the Pixel-Hits because the second Pat
ANA.fpa2|0|1|0|125|0|74|1
' This command will put the results of the search on to the Stack.
' Number of found Patterns is on TOS
POP.$$POA
MBX. We got $$POA Results
' We do not need first 3 Found Pattern so we remove them from Stack
STJ.Remo|0|1|2
' This is the Pattern we drive to
POP.$$POA
MMV.t|$$POA
MBX.!
ENR.
```

Remarks

Speed Considerations:
1. The Command is "Multithreaded" and works best with a Multicore CPU.
2. The Command will need a lot of CPU-Power, it may also use the GPU at some point internally.
3. Generally the Command is very fast even in very large windows, as long as the Computer has a modern CPU.
4. The larger the Pattern, the slower the process.

© 2023 Theo Gottwald * https://www.smart-package.com

5. Currently it may speed up the process, if you have the pattern touch the upper left corner. This may change in the future.
6. If a Pattern is very slow, just record another Pattern. And try this again.
7. A pattern that is completely empty will not work as there is nothing to recognize in it.

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:
Choosing wrong values for **P3,P4** and **P5,P6** may overrun the robot with too many "fitting results" and may keep the system busy for minutes.
We did not yet implement an "Maximum number of results" at this time.

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

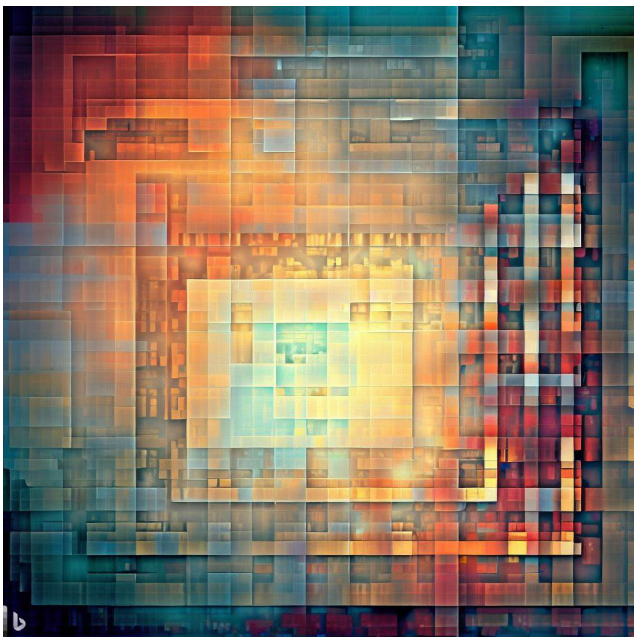
3.55.4.13.6 ANA.FindPattern5

MiniRobotLanguage (MRL)

ANA.FindPattern5

Locate up to five specified Pattern-Objects in a Target Image-Register (IR)



Using FIndpattern5, you can find 5 sizes of an object to make the script independent of Scaling.

Intention

The ANA.FindPattern5 command is designed to find multiple patterns within a single image. It takes up to five Patterns as parameters and searches for their presence. Each pattern can have different sizes, color tolerances, and minimum pixel hits.

This command will identify the locations where any of the specified patterns are present in the Image.
Load the Target Image into IR 0 and load the patterns into IR 1, IR 2, IR 3, IR 4, and IR 5.

For more Details please see the
ANA.FindPattern Command 1537

1. Capture Screenshot of Brave-Browser and use it for Pattern-Search
We will search for 4 Patterns at the same time.

Important Notice:

Please check the **ANA.FindPattern-Command**[1537] to see details on how to use this command.
There you will find important Information about "Mouseover-Effects" and "Admin-Rights".

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

ANA.FindPattern5[|P1][|P2][|P3][|P4][|P5][|P6][|P7]

Parameter Explanation

Target IR Image-Register number for Target is always 0.

First Pattern-IR is always IR 1 alle further Patterns must be in the IR's 2 to 5

P1 - opt. Color Tolerance A, if omitted 0 will be used.
P2 - opt. Pixel-Hit Tolerance A, This value depends on the Pattern that you feed into the Command.
If your Pattern is 8x8 then the maximum number of Pixels that could match is 64. If its 24x8 the maximum Number is 192.
If you specify a negative number like "-85" then this is treated as a Percentage of the total Pixel-Number, means "85% of the maximum Pixels of that Pattern"
If omitted or 0 the default value will be 85% of Pixel-Number in Pattern.
P3 - opt. Color Tolerance B, see P2.
P4 - opt. Pixel-Hit Tolerance B,see P3.
P5 - opt. Color Tolerance C, see P2.
P6 - opt. Pixel-Hit Tolerance C,see P3.
P7 - opt. Color Tolerance D, see P2.
P8 - opt. Pixel-Hit Tolerance D,see P3.
P9 - opt. Color Tolerance D, see P2.
P10 - opt. Pixel-Hit Tolerance D,see P3.
P11 - opt. 0/1 - Debug-Flag

About the P2 - Parameter ("Pixel-Hits"):

The maximum number of matching pixels in your pattern is determined by its size. For example, an 8x8 pattern can have up to 64 matching pixels, whereas a 24x8 pattern can have up to 192.
P2 is based on the total number of pixels in the pattern.
If you set it to 63, for instance, it means that at least 63 pixels must match the pattern, including the tolerance.
If you input a negative number for **P2**, such as "-15", it's treated as a percentage of the total pixel count, translating to "15% of the maximum pixels of that pattern".
If you leave it empty or set it to 0, the default value will be 85% of the pixel count in the pattern.
P2 denotes the minimum number of matches needed to accept a result.
Be careful not to set **P2** too low, as it could potentially overwhelm the system with a massive number of results.

This command has some special features regarding the "**Pixel-Hit Tolerance Parameters**".

1. If you specify "0", the command will calculate the maximum possible number of hits for the loaded pattern and take 85% of that value.
2. If you specify a negative value like "-69", the command will also calculate the maximum possible number of hits for the loaded pattern and take that as 100%. In this example, it would be 69%, so if this is a 12x12 pattern and therefore has a maximum of 144 pixel-hits, 69% of that would be 99 pixels.
3. You can directly specify a positive value that is the exact number of needed pattern-pixels for the pattern to be considered as found.

© 2023 Theo Gottwald * https://www.smart-package.com

4. The maximum number of found results is limited by the setting of "MaxResults" using the ANA.SetData command.
5. Due to the use of multiple CPU cores at different places at the same time, there is no guarantee in which order matches are returned.
6. The command will leave a 0/1 on the TOS. As always, a 0 means error, while a 1 means "all fine". For example, if one of the IR's does not exist, then you will get a result "0" on TOS. The program will not generate an error message.

The command leaves a 0/1 on the TOS. Consistently, 0 signifies an error, while 1 indicates that everything is fine.
For instance, if one of the IR's doesn't exist, you'll receive a "0" on the TOS.
The program won't generate an error message in this case.

About the P11 - Parameter ("Debug Flag"):

The Flag-Parameter meanwhile can do a lot more then just help Debugging.

1 - Enable Debug-Output in Console Window
2 - Snap last used Window again if not found
4 - Use "Difference Map Search"
8 - Disable Filtering (if set)
16 - Use "Invert Pattern"
32 - Use "Complement Pattern"
64 - Use "Extended Search" (takes longer, makes more evaluations)

The results of the Operation can be accessed with the "`ANA.gres`" Command.

Example

-

Remarks

Speed Considerations:
1. The Command is "Multithreaded" and works best with a Multicore CPU.
2. The Command will need a lot of CPU-Power, it may also use the GPU at some point internally.
3. Generally the Command is very fast even in very large windows, as long as the Computer has a modern CPU.
4. The larger the Pattern, the slower the process.
5. Currently it may speed up the process, if you have the pattern touch the upper left corner. This may change in the future.
6. If a Pattern is very slow, just record another Pattern. And try this again.
7. A pattern that is completely empty will not work as there is nothing to recognize in it.

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:

Choosing wrong values for **P1, P2 etc.** may overrun the robot with too many "fitting results" and may keep the system busy for minutes.
We did not yet implement an "Maximum number of results" at this time.

© 2023 Theo Gottwald * https://www.smart-package.com

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.4.13.7 ANA.FindPClick

MiniRobotLanguage (MRL)

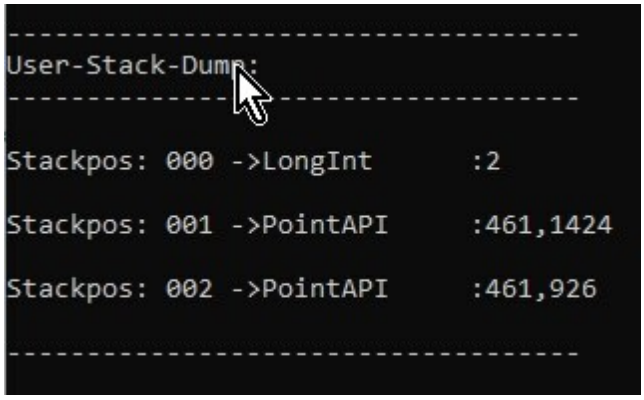
ANA.FindPClick

Get Locations of a specified Pattern-Object and Click one or multiple times

Intention

Welcome to the advanced `FindPClick`-Command.
It makes finding and clicking a Pattern a breeze.
Here's the magic it performs:

- It captures the scene of the active window (Stored in IR 24)
- Your chosen Pattern is loaded, keeping its original size (Secured in IR 23)
- It seeks out the specified Pattern, once or multiple times
- The locations of the Pattern are carefully noted on the TOS
- Clicks are performed at the identified locations, once or multiple times
- After the task is done, all the information you need is neatly arranged on the TOS



The TOS will show: 0 - If NO Pattern were found, otherwise the number of found Patterns. And below that the Coordinates of the found Patterns.

Imagine you're browsing a social network and want to click all the 'LIKE' buttons currently on display.
Just one call to this command, and it's done!

```
' Locate the Top-Window
STW.ct|Chrome_WidgetWin_1| - Brave
' Define the Location for the Pattern
$$FIA=?path\Like.bmp
' Call the Command
ANA.fpc|$$FIA|0|60|0|8|4,16|4|2
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Crucial Reminder:

To fully understand how to use this command, please look into the **ANA.FindPattern-Command**[1537].

We've intentionally omitted details on 'Mouseover-Effects' and 'Admin-Rights' here, so do take the time to read about them there.

Syntax

ANA.FindPClick[|P1][|P2][|P3][|P4][|P5][|P6][|P7][|P8]

Parameter Explanation

P1 - Filepath and Filename of the Pattern-Image-File.

P2 - opt. Color Tolerance, if omitted 0 will be used.

P3 - opt. Pixel-Hit Tolerance, if omitted 33 will be used. This valuie depends on the Pattern that you feed into the Command.

If your Pattern is 8x8 then the maximum number of Pixels that could match is 64. If its 24x8 the maximum Number is 192.

So **P4** is the minimum number of Matches to accept a result. Do not make P4 too low or else you may overrun the system with hundred-thousands of results.

P4 - opt. 0/1 - Debug-Flag

P5 - opt. Click-Type 1 - MLE. 2 - MLI. 4 - MLM. 8 - MLC. 16 - MRM. 32 - MDC.

For **P5** you can add the numbers to make multiple Clicks. For example 8+1=9 means you make an `MLE.` and an `MLC.` Click at each Location.

Please take care that all Clicks here are multiplied with the number in **P7**

P6 - opt. Move Mouse relativ before Click, defaul is "0,0".

P7 - opt. Number of Clicks to do at each found place. (default is 1, maximum is 255)

P8 - opt. How many Findings should be clicked at (default is "0" means that all Findings will be clicked at)

Assume, that you want only to click at the first element to be found, then you will just use a "1" here.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".
For example, if one of the IR's does not exist then you will get a result "0" on TOS. The program will **not generate an Error-Message**.

Example

Click Pattern in Browser and Scroll

This will Click a specified Pattern in a Browser-Window and then Scroll forward.

```

RET.
```

Remarks

Speed Guidelines:

1. The Command, being 'Multithreaded', loves to work with a Multicore CPUs.
   It has a hearty appetite for CPU power and may even call upon the GPU's resources.
2. It prides itself on speed, even with large windows, given a modern CPU is in action.
3. Remember, larger Patterns mean a slower operation.
4. Current speed secrets?
   Have the pattern touch the upper left corner. But stay flexible, this may not always be the case.
5. If a Pattern is being sluggish, recording a new Pattern and trying again might do the trick.
6. Patterns with nothing in them won't work. They need something to latch onto.
7. Steer clear of '.jpg' images or ones with artefact compression. Stick with '.bmp' or '.png' images for results you can count on.

Limitations:

Choosing wrong values for **P2** and **P3** may overrun the robot with too many "fitting results" and may keep the system busy for minutes.
We did not yet implement an "Maximum number of results" at this time.

© 2023 Theo Gottwald * https://www.smart-package.com

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.4.13.8 ANA.Get/Set_Data

MiniRobotLanguage (MRL)

ANA.Get_Data
ANA.Set_Data

Get or Set Internal Values mostly needed for Find-Operation

Intention

Depending on **P1** this command is used to get or set Internal Data-Registers.
These are:

0 - Number of IR where the last ANA.Snap-Command has been taken a Snapshot
1 - Windowhandle of the last ANA.Snap
2 - Snapshot- X-Size
3 - Snapshot- Y-Size
4 - CPU-Cores used for Pattern-Find Operations, this will normally return the number of CPU-Cores in the System.
Setting this number to a value, much higher then the really available Cores, may lead to unforeseable
results including can make Windows too hang due to too many open threads.
5 - Last Operation Result (currently only used by some Operations)
6 - Max-Result Number Setting, this number will limit the number of Finds of all FindPattern-Operations.
7 - Single-Result Flag. Set this Flag to "1" to only get a Single Result with the next Find Operation,
this way you can leave MaxResults untouched.
8 - Default Bordersize for Window Snapshot for the ANA.Snap-Command and FinPattern-Commands that have an internal Snapshot-Command.
The values can be:

```
0 - Clientarea only
1 - Whole Window
2 - Whole Window, No Border
4 - Use Value from Object
```

9 - Default Value for "PixelHits"
10 - Default value for "Color Tolerance"
11 Default Value for Use "Debugmode" (0/1)

Left picture: This is the Stack before and after the call to ANA.GetResult.
Right Picture: This is the Stack after the first Result - that is the number of Found Elements - has been "Pop'ed".

Here is the Code that shows the usage of ANA.GetResult.

```
' Reads the Value of MaxResults.
ANA.Get_Data|6|$$RES
MBX.$$RES
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Change and Read the Value for MaxResults
ANA.Set_Data|6|39
ANA.Get_Data|6|$$RES
MBX.$$RES
ENR.
```

Syntax

ANA.Get_Data[|P1][|P2]

Parameter Explanation

P1 **-** ***opt.*** this Parameter is the number (currently 0 - 11) that specifies the value that should be read.
The complete List is above.

P2 **-** ***opt.*** Variable that will get the result value.If omitted the value is placed on TOS.

ANA.Set_Data[|P1][|P2]

Parameter Explanation

P1 **-** ***opt.*** this Parameter is the number (currently 0 - 11) that specifies the value that should be get/set.
The complete List is above.

P2 **-** ***opt.*** Value to be assign to the internal Variable that is specified by **P1**.

Example

```
'*********************************
' ANA.Get_Data / Set_Data Sample
'*********************************
ANA.Set_Data|6|39
ANA.Get_Data|6|$$RES
MBX.$$RES
ENR.
```

3.55.4.13.9 ANA.GetResult

MiniRobotLanguage (MRL)

ANA.GetResult

Get Result from Find-Operation on TOS

Intention

This command is called internally automatically after FindPattern Operations like "ANA.FIndPattern".
It is possibly not needed anymore as from now find-Operations call it internally.

It will place the result of these Operation on the TOS.
It will also clear the internal Find-Operation Memory, therefore you can call it only one time after each Find-Operation.

If you do not need the results from the last Find-Operation, you can use
"ANA.ResetList"
to clear the Find-Memory without dropping the results on the Stack.

© 2023 Theo Gottwald * https://www.smart-package.com

Left picture: This is the Stack before and after the call to ANA.GetResult.
Right Picture: This is the Stack after the first Result - that is the number of Found Elements - has been "Pop'ed".

Here is the Code that shows the usage of `ANA.GetResult`.

```
STW.ct|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
'SWP.4090,2|640,400|T
ANA.Snap|0
' Please adapt the filename of the saved Pattern
ANA.Load|1|?path\De16.bmp
' P1 - Target, P2 - Pattern, P3 - Color-Tolerance, P4 - min. Hits (Pixel) maximu
ANA.fpa|0|1|0|115|0
DMP.6
ANA.gres
DMP.6
' We take away the number of Hits from TOS
POP.$$NOH
DMP.6
' If no Hits, jump away to Lab_NoHits.
MBX.$$NOH
ENR.
```

Syntax

ANA.GetResult[|P1]

Parameter Explanation

P1 - opt. this Parameter is currently not used,

© 2023 Theo Gottwald * https://www.smart-package.com

The Command will leave a 0 on the TOS in case of error.
Otherwise it will put the results of the last Find-Operation on the Stack in sorted Order.

The first number on the TOS is the "Number of results", After that the results come one after the other.
Generally the results are sorted from Bottom to Top.

Example

```
'**********************************
' ANA.GetResult-Sample
'**********************************
' You can not run this example
' its a Subprogram-code that will search for alternative patterns
' if the first pattern is not found.

3.55.4.13.10 ANA.GetResultsPack

MiniRobotLanguage (MRL)

ANA.GetResultsPack

Get detailled Result from Find-Operation on TOS

Intention

This command plays a crucial role in obtaining comprehensive results following FindPattern operations, such as '`ANA.FindPattern`'.
It yields more in-depth results than the standard output on TOS, and notably, these results aren't automatically deleted.

The command serves two primary functions:

1. It places a single finding on the stack.
2. When called with **P1**=0, it simply puts the number of finds on TOS.

If the results from the previous Find-Operation are not required,
'`ANA.ResetResultsPack`' can be used to clear the Find-Memory.
The subsequent code demonstrates the usage of this command:
`ANA.GetResultsPack`.

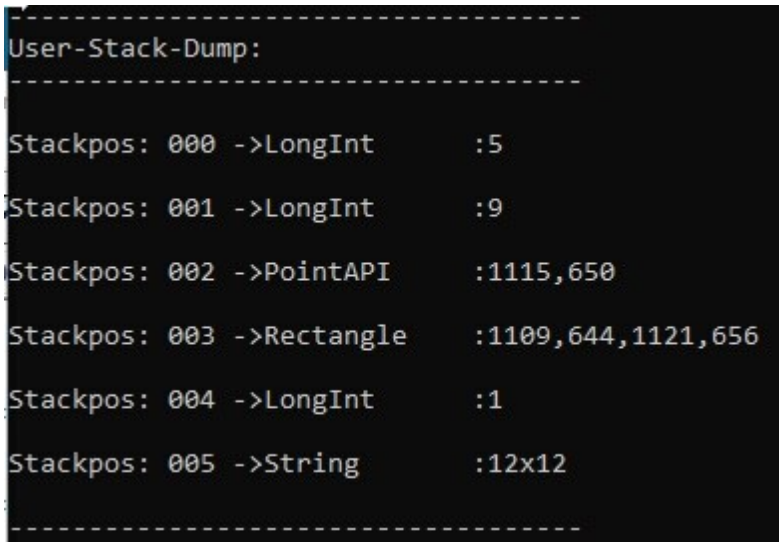
```
STW.ct|Chrome_WidgetWin_1|General Discussion - Brave
SWP.12,9|1216,717|T
VAR.$$PA1=?pattern\Cross_12.bmp
ANA.Load|1|$$PA1
' This will generate the 4 Downscaled Versions
ANA.DownScale|1|2
VAN.$$COT=110
VAN.$$PIH=-60
' Setting Maximum stored results to 40 - is 10 by default.
ANA.Set_Data|6|40
ANA.Snap|0
ANA.FindPattern4|0|$$COT|$$PIH|$$COT|$$PIH|$$COT|$$PIH|$$COT|$$PIH
PRT.----------------------------
' This command will clear the stack so we only get the Results-Pack-Item
STS.CLEAR
' Here we ask for the 5th Found Item.
ANA.GetResultsPack|5
DMP.6
ANA.ShowHits|0!
ENR.
```

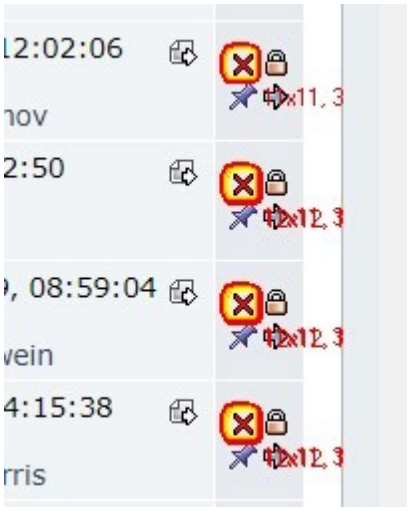
Note that this command will just place the one specified "Find" on the Stack. You will get a lot of additional Information for the find:

`$$000/TOS:` Number of Find that is on Stack.
`$$001` Number of remaining Finds in Memory.

© 2023 Theo Gottwald * https://www.smart-package.com

$$002 Coordinates of Middlepoint of this Find. These are in Top-Window-Coordinates.
$$003 Coordinates of the Find-Rectangle of this Find. These are in Top-Window-Coordinates.
$$004 Engine Number that has found the Pattern - this references the Pattern-Number in "FindPattern4"
$$005 Pattern-Size of the found Pattern.





Left picture: This is the Stack after the call to ANA.GetResultspack|5.

Right Picture: Using Multi-Pattern Find Operations with scaled Patterns and high Tolerance Settings can lead to the same Object being found from several engines.

Syntax

ANA.GetResultsPack[|P1][|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - opt. Number of the Find to get. This number should be in a range from 1 to "Number of Finds".
If **P1** is zero, the command will just return the number of stored Finds.

P2 - opt. 0/1 If **P2** is 1 then the Result that was on TOS is been deleted from Results-Memory.
As the results are organized like an internal Stack, another result will take its number
and the number of remaining results will decrease.

The Command will leave a 0 on the TOS in case of error.
Generally the results are sorted from Bottom to Top.

Example

```
'**********************************
' ANA.GetResult-Sample
'**********************************
STW.ct|Chrome_WidgetWin_1|General Discussion - Brave
SWP.12,9|1216,717|T

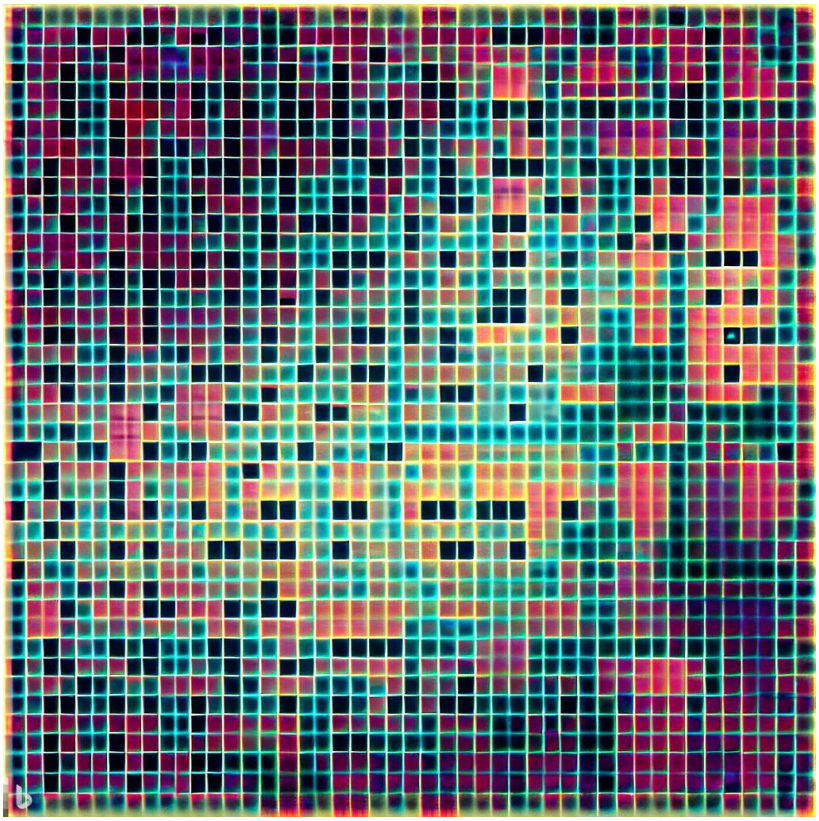
3.55.4.13.11 ANA.ResetList

MiniRobotLanguage (MRL)

ANA.ResetList

Clear Results from Find-Operation



Intention

This command has no parameters.
It will reset the FindPattern-Result List which internal Name is C01.

Here is the Code that shows the usage of ANA.ResetList

```
STW.ct|FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
'SWP.4090,2|640,400|T
ANA.Snap|0
' Please adapt the filename of the saved Pattern
ANA.Load|1|?path\De16.bmp
' P1 - Target, P2 - Pattern, P3 - Color-Tolerance, P4 - min. Hits (Pixel) maximu

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.13.12 ANA.ResetResultsPack

MiniRobotLanguage (MRL)

ANA.ResetResultsPack

Sorts the Resultspack based on the specified parameter.

Intention

The ANA.ResetResultsPack command allows you to clear the Results-Pack completely.
It removes all stored results, providing a clean slate for new operations.

Syntax

ANA.SortResultsPack[|P1]

Parameter Explanation

This command does not require any parameters.

Example

```
'To clear the Results-Pack, use the following command:
ANA.ResetResultsPack
```

Remarks

- The ANA.ResetResultsPack command is useful when you want to start fresh and remove all previously stored results.
- By clearing the Results-Pack, you ensure that no old or irrelevant results are retained, avoiding any confusion or mix-up in subsequent operations.
- It's important to note that once the Results-Pack is cleared, all previous results will be permanently deleted and cannot be recovered.
- Use this command with caution, especially if you still need to refer to or analyze the existing results.

Limitations:

-

See also:

- ANA_FindPattern 1537

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.13.13 ANA.SetMaxResult

MiniRobotLanguage (MRL)

ANA.SetMaxResult

Sets the maximum number of results to be stored.

Intention

The `ANA.SetMaxResult` command allows you to define the maximum number of results to be stored in the Results-Pack.
By setting this limit, you can control the amount of memory and time used and manage the quantity of results obtained.
This command is useful when you want to restrict the number of results to a specific threshold or just to save time.

Syntax

ANA.SetMaxResult[|P1]

Parameter Explanation

P1 - Maximum number of results to acquire.

Example

```
' To set the maximum number of results to 100, use the following command:
ANA.SetMaxResult|100
```

Remarks

-

Limitations:

-

See also:

- ANA_FindPattern 1537

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.13.14 ANA.SnapFind1

MiniRobotLanguage (MRL)

ANA.Snapfind1

Snapshot current Window and start a Pattern-Find-Operation

Intention

The '`Snapfind`' command is an integral tool for locating and clicking a pattern within a window. It seamlessly merges the '`ANA.Snap`' and '`ANA.FindPattern`' commands, providing a robust solution for pattern recognition and interaction.
Moreover, it includes a feature for adjusting the target point by a specific pixel distance, offering you precision control.

The Snapfind command operates as follows:

1. It captures a snapshot of the current window, storing it in internal IR No. 24.
2. It loads the desired pattern into internal IR No. 23.
3. It executes the FindPattern command with IR 23 and 24.
4. If a match is identified, it utilizes the `MAP`.-Command to locate the first found object (as E9 with the size 8x8).
5. Subsequent to this, if a '`MMV`.' or '`MLC`.' etc. is written, the mouse will swiftly move to the point and execute the click.

The Snapfind command also provides a Target Adjustment feature, enabling the user to shift the target from the found position by a predetermined amount. This feature is beneficial in scenarios where the user needs to locate a point and click in a different location, such as identifying a checkmark using its text, but clicking on the checkmark box. An example of this would be locating checkmarks in an 'Unsupported Browser'."

Instead of searching the Circles to click on, like in the following picture ....

You can search the unique Text and then specify an Coordinate Adjustment - where to click. In this case you can not accidentally click the wrong checkmarks.

© 2023 Theo Gottwald * https://www.smart-package.com

In this Example,
`ANA.Snapfind1|$$LAA|0|0|1|55,-10|1`
will directly set the Active Point (where the Mouse will move to) to the Target.
This is possible because we use the "55,-10" as adjustments.

You can use the long version of Snapfind and use the "Findings on the TOS" this way:

```
'**********************************
' ANA.Snapfind-Sample
'**********************************
STW.ct|Chrome_WidgetWin_1|Amazon - Brave
'SWP.70,89|1195,977|T
$$LAA=?pattern\Checbkm.bmp
ANA.Snapfind1|$$LAA|0|0|1|55,-10|1
' Remove Number of Finds from TOS
POP.$$COO
' Get Coords from TOS
POP.$$COO
' Move Mouse to target
MMV.t|$$COO
ENR.
```

With '`Snapfind1`', all findings are conveniently left on the TOS.
At position 00, you'll first encounter the number of findings, capped by **P6**.
Moving on to position 01, you'll discover the coordinate of the first finding, with additional findings listed in the subsequent positions.

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->LongInt      :1

Stackpos: 001 ->PointAPI     :498,742

-----------------------------------
```

```
The short Form of Snapfind1 is to just use the first Finding
which will be automatically localized using an internal MAP. Command.
This way you can also write:

'**********************************
' ANA.Snapfind-Sample
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
STW.ct|Chrome_WidgetWin_1|Amazon - Brave
'SWP.70,89|1195,977|T
$$LAA=?pattern\Checbkm.bmp
ANA.Snapfind1|$$LAA|0|0|1|55,-10|1
' Move Mouse to target and Click
MLC.
ENR.
```

Syntax

ANA.Snapfind1|P1[|P2][|P3][|P4][|P5][|P6]

Parameter Explanation

P1 - [File] Pattern-Image File
P2 - ***opt.*** Color Tolerance for Search
P3 - ***opt.*** Pixel-Hits, this number depends on the total number of Pixel in the Pattern. For example, 63 would be a minimum Hit number of 63 Pixels that must match the Pattern including the Tolerance. If you specify a negative number like "-15" then this is treated as a Percentage of the total Pixel-Number, means "-75" would be 75%. If omitted or 0 the default value will be 85% of Pixel-Number in Pattern.
P4 - ***opt. Debug-Flag 0/1***
P5 - ***opt. [Coords]*** this is a coordinate like "0,0" or "`-200,-10`". This will move the Target Point by the specified amount of Pixels.
P6 - ***opt.*** Maximum Number of Finds that should be stored.

More Details:

For more detailed Information about **P4** and **P5** please see ANA.FindPattern 1537

Example

```
'**********************************
' ANA.Snapfind-Sample 1
'**********************************
STW.ct|Chrome_WidgetWin_1|Amazon - Brave
'SWP.70,89|1195,977|T

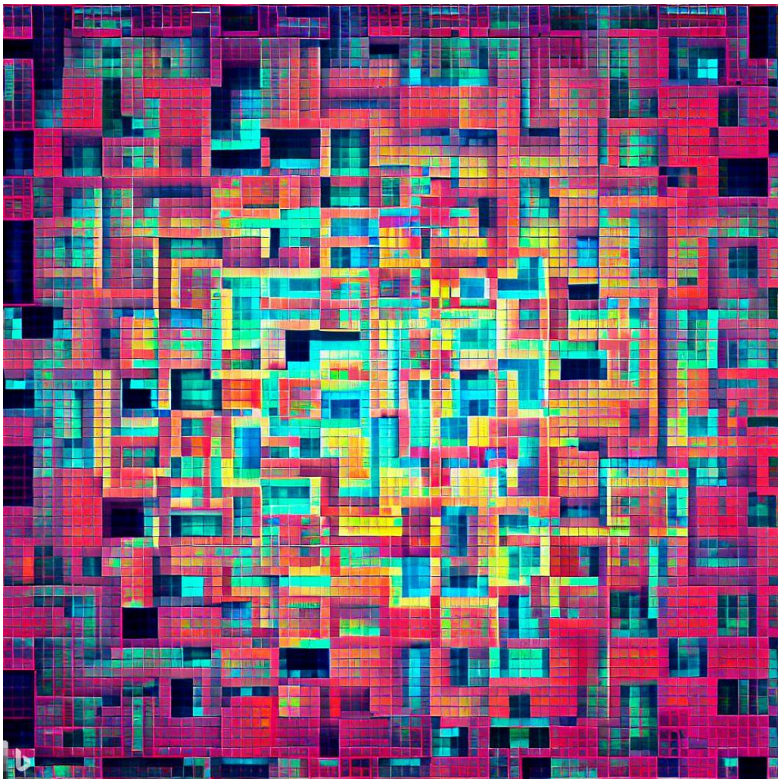
3.55.4.13.15 ANA.SortResultsPack

ANA.GetResult - Get Result on TOS Previous 1088 Top 41 Next 1109

MiniRobotLanguage (MRL)

ANA.SortResultsPack

Sorts the Resultspack based on the specified parameter.



Intention

The `ANA.SortResultsPack` command allows you to sort the Resultspack based on a specific parameter.
It takes one parameter, P1, which determines the sorting order.
By sorting the Resultspack, you can organize the results in either descending or ascending order, depending on your needs.

Syntax

ANA.SortResultsPack[|P1]

Parameter Explanation

P1 - Sort Order: 0 for descending sort, 1 for ascending sort.

About the P1 Parameter

© 2023 Theo Gottwald * https://www.smart-package.com

The **P1** parameter specifies the sorting order for the Resultspack. It controls whether the results will be sorted in descending or ascending order.

If **P1** is set to 0, the Resultspack will be sorted in descending order.
This means that the highest values or the most relevant results will appear first in the sorted list.

If **P1** is set to 1, the Resultspack will be sorted in ascending order.
This means that the lowest values or the least relevant results will appear first in the sorted list.

Example

```
'To sort the Resultspack in descending order, use the following command:
ANA.SortResultsPack|0

'To sort the Resultspack in ascending order, use the following command:
ANA.SortResultsPack|1
```

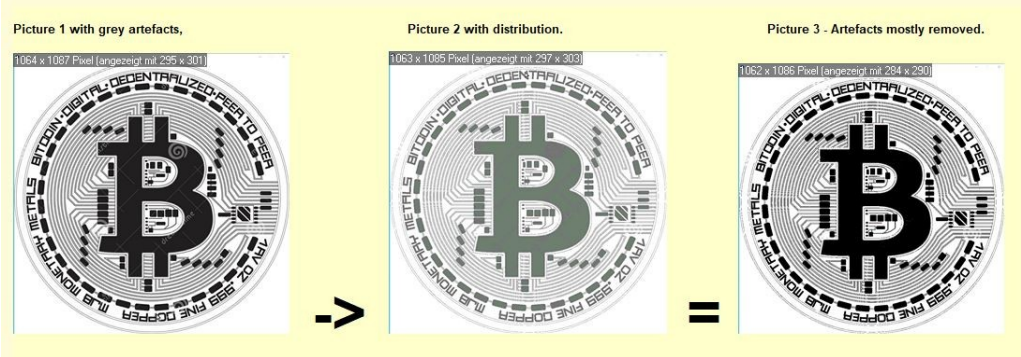
3.55.4.14 Pixel-Operation

ANA.Pixel-Operations

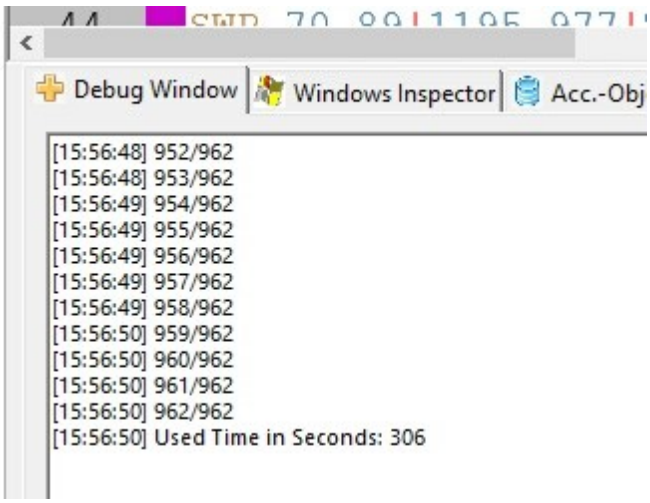
These Commands work on IR's only.
They can be used to manipulate pictures that you have loaded.
While these Operations can be slow on large pictures, you have a lot of options that you may not have available elsewhere.



Here you can see some Operations that are just Samples.

As the SPR is fast enough even for Pixel-based image-processing, you can do a lot of things. Much easier then with other systems.
And faster then most other Scripting languages.

1. Remove Green Background on Image using an SPR-Script
In this Sample we will remove the Background on a Image using the SPR.
For this we will read the Pixel, check if its mostly Green, and in that case replace it with the colors taken from another Picture.
Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Even then the Script still may use several Minutes to finish. You will see in the Editor-Debug-Window the current Line and the last line.



© 2023 Theo Gottwald * https://www.smart-package.com

You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.

The Speed-dump shows that the Robot can read about 40.000 Pixels per second.

2. Color-Processing

*© 2023 Theo Gottwald * https://www.smart-package.com*

In this Sample we will additionally change the Colors.For this we use the two Commands:

```
        ANA.getpixelcolor|1|$$XPO|$$YPO|$$PIX
  ' This is just for example normally you would use ANA.GetPixelColor_RGB which co
        ANA.Split_Color_RGB|$$PIX|$$COR|$$COG|$$COB
  ' We Combine the Colors in away that Blue and Green is exchanged.
        ANA.Combine_Color_RGB|$$COG|$$COR|$$COB|$$PIX
  ' And Set the Pixel
        ANA.Setpixelcolor|0|$$XPO|$$YPO|$$PIX
```

And then Paint the Picture.
In the SPR you can use virtually unlimited Graphics Sources to be combined.

.

```
  ' Here is the Code.
  ' On my Computer it uses 5 MinutesProcessing time for a Picture of Medium size i

4. Extract Object from known Background
If we do just change 1 Letter in the Script, we get the inverted result.
The Script will then extract the Person from the Baclground.
Hint: This is a very Simple Script it will only work with Pictures that are uncompressed like "-bmp", or ".png" etc.
Using other Formats you will need to apply a Tolerance.

© 2023 Theo Gottwald * https://www.smart-package.com

Here we use a known Background to extract Sarah from the second Picture into the third Picture with yellow background.
Because we used a ".jpg"-File we still have some artefacts when using a Color-Distance Value of only 5%. In the second Picture we use a value of 10%. This will remove some problems and produce some other.
Thats why you should not use compressed Images for this sort of operations.

031 0000000000000005 0001
032 0000000000000000 0001 DMP.1
```

The Speed-dump shows that the Robot can do such correction very fast, yet simple changes on the whole picture can be done faster using other commands.

Picture Mixing

*© 2023 Theo Gottwald * https://www.smart-package.com*

In this Sample we will mix 2 Pictures depending on the relation between Blue and Red.
In the SPR you can use virtually unlimited Graphics Sources to be combined.

.

3.55.4.14.1 ANA.GetPixelColor

MiniRobotLanguage (MRL)

ANA.GetPixelColor

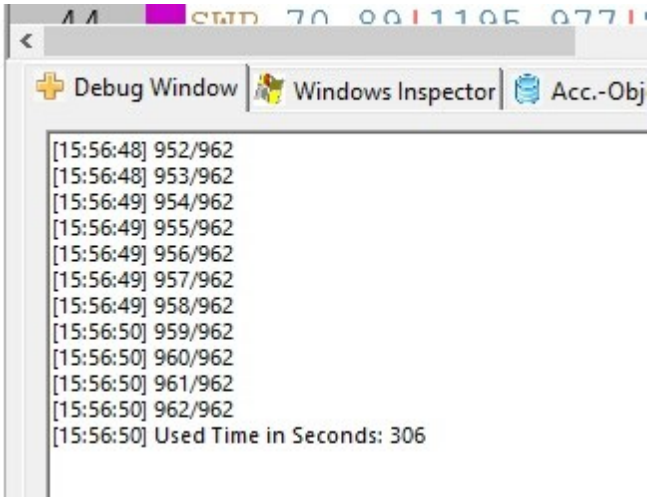
Get the Color of a Single Pixel from an Image-Register (IR)

Intention

This command will read the color of a Single Pixel in an IR. While that does not Sound much, it enables you to do unlimited complex Image processing. Use it together with other Commands like `ANA.SetPixelColor`.

With this command, the returned value is the 24-bit color of the Pixel.

1. Remove Green Background on a picture using an SPR-Script
In this Sample we will remove the Background on a picture using the SPR.
For this we will read the Pixel, check if its mostly Green, and in that case replace
Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Even then the Script still may use several Minutes to finish. You will see in the Editor-Debug-Window the current Line and the last line.



You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.GetPixelColor[|P1][|P2][|P3]

Parameter Explanation

P1 - Source Image-Register number
P2 - X1 - Upper Left Coordinat X-Value
P3 - Y1 - Upper Left Coordinat Y-Value
P4 - opt. Variable for returned Color-Value. If omitted TOS is used.

Example

```
See above.
```

Remarks

The `ANA.GetPixelColor` is optimized for Speed. It will use only about 365 Ticks. Therefore the Robot could read more then 43000 Pixels per Second.

Limitations:

-

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.14.2 ANA.GetPixelColor_4D

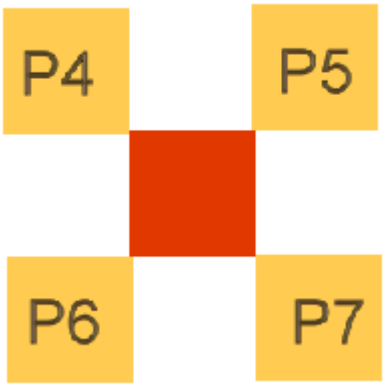
MiniRobotLanguage (MRL)

ANA.GetPixelColor_4D

Get the Color of 4 diagonal neighbor Pixels from an Image-Register (IR)

Intention

This command will read the colors of 4 Pixels that are diagonal neighbor to a given Pixel in an IR.
Together with other Commands like `ANA.SetPixelColor`, It can be used to clean up Images and remove noise.
This command replaces 4 separate GetPixelColor-Commands (plus needed calculations) and is therefore an Option to speed
up Scripts. If a Pixel has no neighbor (Border Pixels) the result of that Color is -1.



The Colors of these Pixels are returned in Variables in P4 to P7.

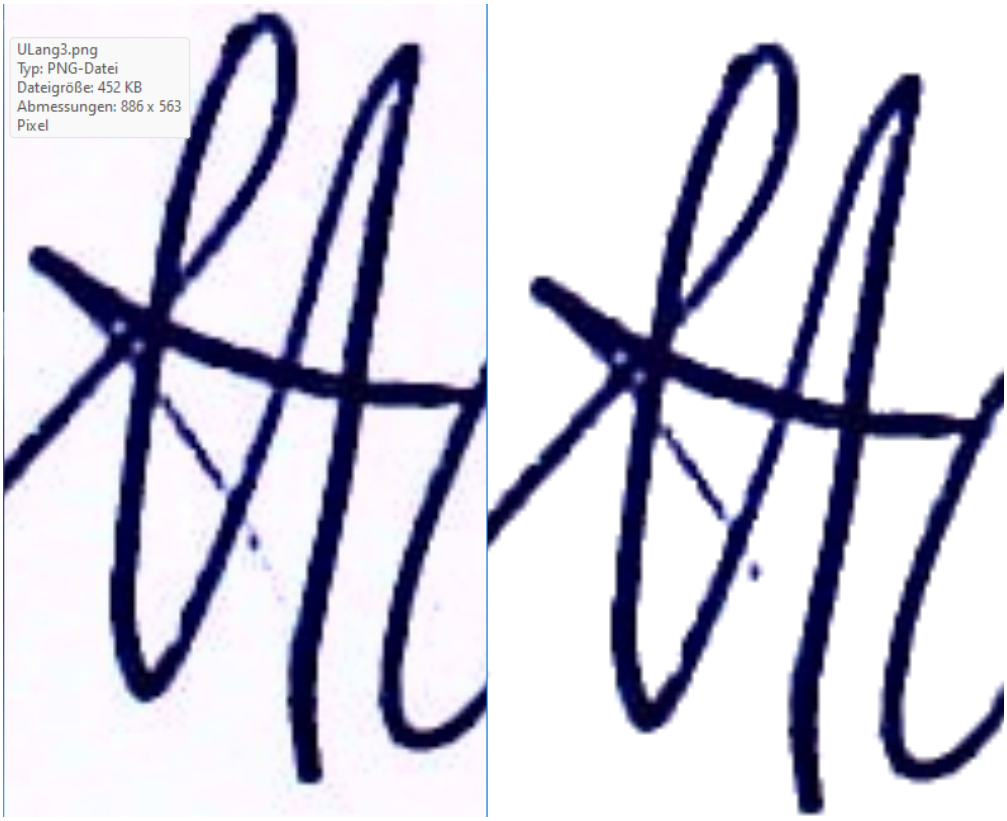
With this command, the returned value is always the 24-bit color of the Pixel unless there is no such Pixel.
If you specify a Pixel that is at a border and has no Pixel to the left/right etc. then the returned value will be -1.

1. Clean up a digitized Picture, remove noise using an SPR-Script
In this Sample we will remove the noise from a picture using the SPR.
For this we will read the Pixel, check if it has only white neighbors, and in that case replace it with a white dot.

Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Even then the Script still may use several Minutes to finish. You will see in the Editor-Debug-Window the current Line and the last line.

© 2023 Theo Gottwald * https://www.smart-package.com

You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.



```
' This Script will clean up the background of a digitized Writing

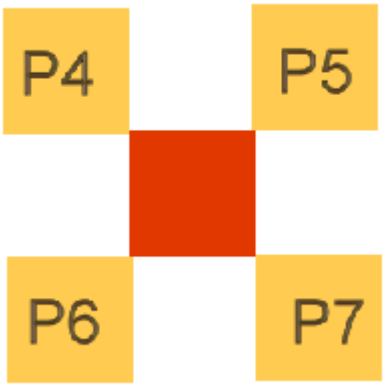
Syntax

ANA.GetPixelColor_4D|P1|P2|P3[|P4][|P5][|P6][|P7]
ANA.GPC4D|P1|P2|P3[|P4][|P5][|P6][|P7]

Parameter Explanation

P1 - Source Image-Register number
P2 - X - Center Pixel Coordinate X-Value
P3 - Y - Center Pixel Coordinate Y-Value
P4 - opt. Variable for returned Color-Value for the Upper-Left Pixel.
P5 - opt. Variable for returned Color-Value for the Upper-Right Pixel.
P6 - opt. Variable for returned Color-Value for the Lower-Left Pixel.
P7 - opt. Variable for returned Color-Value for the Lower-RIght Pixel.
If you omit **P4** to **P7**, TOS is used.



Example

```
See above.
```

Remarks

The `ANA.GetPixelColor_4D` is optimized for Speed. It will use only about 600 Ticks. Therefore the Robot can execute the command typically more then 26600 times per Second.

Limitations:

-

3.55.4.14.3 ANA.GetPixelColor_4S

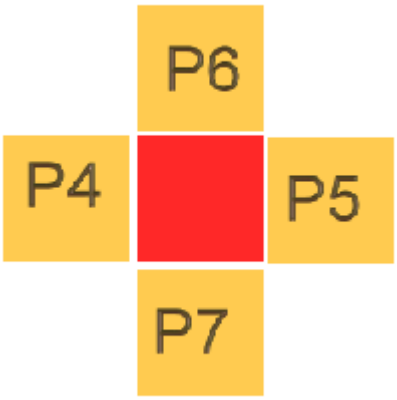
MiniRobotLanguage (MRL)

ANA.GetPixelColor_4S

Get the Color of the 4 direct neighbors of a Single Pixel from an Image-Register (IR)

Intention

This command will read the colors of 4 Pixels that are direct neighbor to a given Pixel in an IR.
Together with other Commands like `ANA.SetPixelColor`, It can be used to clean up Images and remove noise.
This command replaces 4 separate GetPixelColor-Commands (plus needed calculations) and is therefore an Option to speed
up Scripts. If a Pixel has no neighbor (Border Pixels) the result of that Color is -1.



The Colors of these Pixels are returned in Variables in P4 to P7.

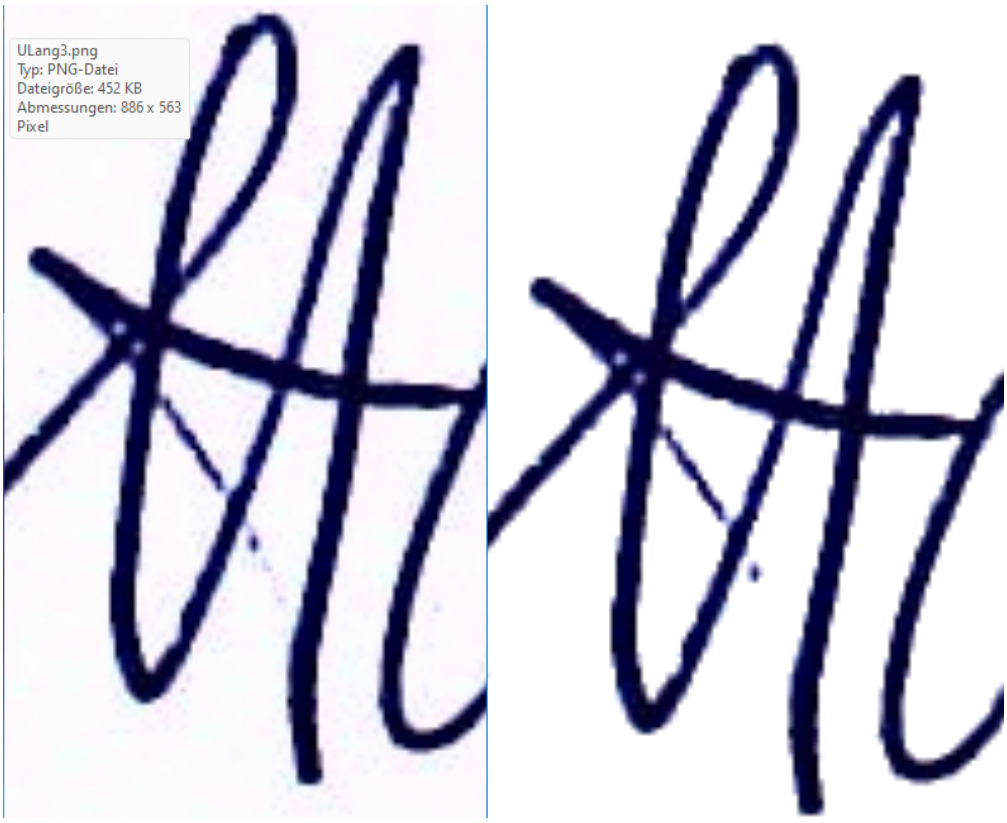
With this command, the returned value is always the 24-bit color of the Pixel unless there is no such Pixel.
If you specify a Pixel that is at a border and has no Pixel to the left/right etc. then the returned value will be -1.

1. Clean up a digitized Picture, remove noise using an SPR-Script
In this Sample we will remove the noise from a picture using the SPR.
For this we will read the Pixel, check if it has only white neighbors, and in that case replace it with a white dot.

© 2023 Theo Gottwald * https://www.smart-package.com

Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode". Even then the Script still may use several Minutes to finish. You will see in the Editor-Debug-Window the current Line and the last line.

You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.



```
' This Script will clean up the background of a digitized Writing

3.55.4.14.4 ANA.GetPixelColor_5h

MiniRobotLanguage (MRL)

ANA.GetPixelColor_5H

Get the Color of 5 successive horizontal Pixels from an Image-Register (IR)

Intention

This command will read the color of 5 successive Pixels in an IR. Its an Option to Speed up Image-Processing.
With this command, the returned value is the 24-bit color of the Pixels.
You do not need to worry, if the resolution is not a multiple of 5, illegal Coordinates will just be ignored.

Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Free-Run Button

You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.

```
' This code will invert the left half of a Picture.

Syntax

ANA.GetPixelColor_5V|P1|P2|P3|P4|P5|P6|P7|P8

Parameter Explanation

P1 - Source Image-Register number
P2 - X1 - Upper Left Coordinat X-Value
P3 - Y1 - Upper Left Coordinat Y-Value
P4 - Variable for returned Color-Value of Pixel 1 at (X1,Y1)
P5 - Variable for returned Color-Value of Pixel 2 at (X1,Y1+1)
P6 - Variable for returned Color-Value of Pixel 3 at (X1,Y1+2)
P7 - Variable for returned Color-Value of Pixel 4 at (X1,Y1+3)
P8 - Variable for returned Color-Value of Pixel 5 at (X1,Y1+4)

Example

```
See above.
```

Remarks

The `ANA.GetPixelColor_5V` is optimized for Speed. It will use only about 580 Ticks. Therefore the Robot could read more then 27500*5 Pixels per Second.

Limitations:

-

3.55.4.14.6 ANA.GetPixelColor_8

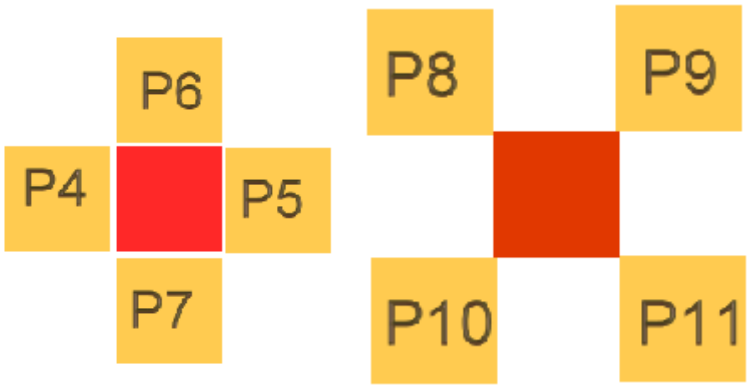
MiniRobotLanguage (MRL)

ANA.GetPixelColor_8

Get the Colors of all 8 Neighbor Pixels of a Single Pixel from an Image-Register (IR)

Intention

This command will read the colors of all 8 Pixels that are neighbor to a given Pixel in an IR.
Together with other Commands like `ANA.SetPixelColor`, It can be used to clean up Images and remove noise.
This command replaces 8 separate GetPixelColor-Commands (plus needed calculations) and is therefore an Option to speed
up Scripts. If a Pixel has no neighbor (Border Pixels) the result of that Color is -1.



The Colors of these Pixels are returned in Variables in P4 to P11.

With this command, the returned value is always the 24-bit color of the Pixel unless there is no such Pixel.
If you specify a Pixel that is at a border and has no Pixel to the left/right etc. then the returned value will be -1.

1. Clean up a digitized Picture, remove noise using an SPR-Script
In this Sample we will remove the noise from a picture using the SPR.
For this we will read the Pixel, check if it has only white neighbors, and in that case replace it with a white dot.

Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Even then the Script still may use several Minutes to finish. You will see in the Editor-Debug-Window the current Line and the last line.

© 2023 Theo Gottwald * https://www.smart-package.com

You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.

3.55.4.14.7 ANA.GetPixelRGB

MiniRobotLanguage (MRL)

ANA.GetPixelRGB

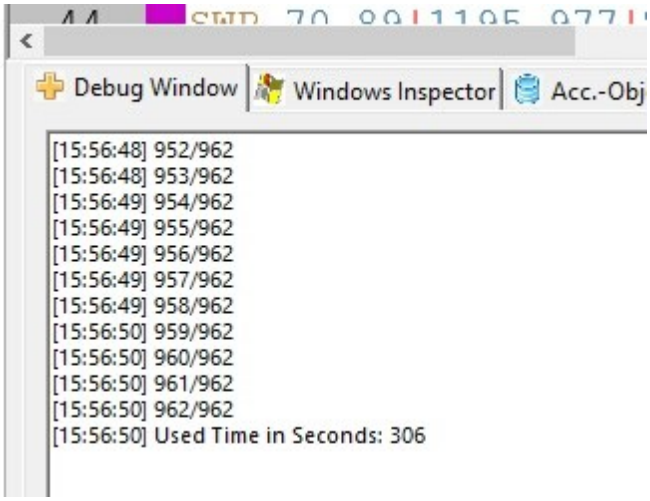
Get the Color of a Single Pixel from an Image-Register (IR) in three values for Red, Green and Blue

Intention

This command will read the color of a Single Pixel in an IR. It will return the Color in its Red, Green and Blue Component.
As we use 24-bit Colors, the returned color will be 0.255 (0-&HFF) for each Component Red, Green and Blue.

You can use this command together with other Commands like `ANA.SetPixelRGB`.

1. Remove Green Background on a picture using an SPR-Script
In this Sample we will remove the Background on a picture using the SPR.
For this we will read the Pixel, check if its mostly Green, and in that case replace
Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Even then the Script still may use several Minutes to finish. You will see in the Editor-Debug-Window the current Line and the last line.



You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.

033 0000000000000000 0001 DMP.1
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.GetPixelRGB[|P1][|P2][|P3][|P4][|P5][|P6]

Parameter Explanation

P1 - Source Image-Register number
P2 - X1 - Upper Left Coordinat X-Value
P3 - Y1 - Upper Left Coordinat Y-Value
P4 - opt. Variable for returned Color-Value RED. If omitted TOS is used.
P5 - opt. Variable for returned Color-Value GREEN. If omitted TOS is used.
P6 - opt. Variable for returned Color-Value BLUE. If omitted TOS is used.

The color values will always be in the range between 0-255. This is Hexadacimal: 0 - &HFF.

Example

```
See above.
```

Remarks

The `ANA.GetPixelRGB` is optimized for Speed. It will use only about 400 to 600 Ticks. Therefore the Robot could read more then 30000 Pixels per Second.

Limitations:

-

3.55.4.14.8 ANA.SetPixelColor

MiniRobotLanguage (MRL)

ANA.SetPixelColor

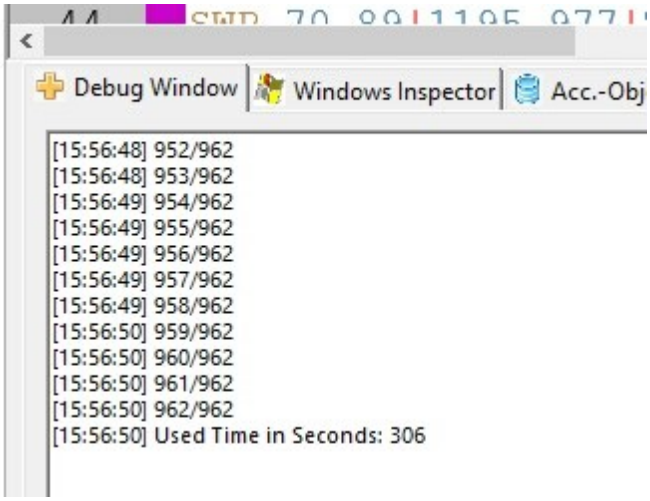
Set the Color of a Single Pixel from an Image-Register (IR)

Intention

This command will change the color of a Single Pixel in an IR. While that does not Sound much, it enables you to do unlimited complex Image processing,
Together with other Commands like `ANA.GetPixelColor`.

For Speed-Reasons, this command will never return anything on the TOS.

1. Remove Green Background on Image using an SPR-Script
In this Sample we will remove the Background on a Image using the SPR.
For this we will read the Pixel, check if its mostly Green, and in that case replace it with the colors taken from another Picture.
Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Even then the Script still may use several Minutes to finish. You will see in the Editor-Debug-Window the current Line and the last line.



You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.

2. Color-Processing

*© 2023 Theo Gottwald * https://www.smart-package.com*

In this Sample we will additionally change the Colors.For this we use the two Commands:

```
        ANA.getpixelcolor|1|$$XPO|$$YPO|$$PIX
  ' This is just for example normally you would use ANA.GetPixelColor_RGB which co
        ANA.Split_Color_RGB|$$PIX|$$COR|$$COG|$$COB
  ' We Combine the Colors in away that Blue and Green is exchanged.
        ANA.Combine_Color_RGB|$$COG|$$COR|$$COB|$$PIX
  ' And Set the Pixel
        ANA.Setpixelcolor|0|$$XPO|$$YPO|$$PIX
```

And then Paint the Picture.
In the SPR you can use virtually unlimited Graphics Sources to be combined.

.

```
  ' Here is the Code.

Here is the Speed-Dump for this Sample.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

ANA.SetPixelColor[|P1][|P2][|P3][|P4]

Parameter Explanation

P1 - Source Image-Register number
P2 - X1 - Upper Left Coordinat X-Value
P3 - Y1 - Upper Left Coordinat Y-Value
P4 - Variable for Color-Value.

Example

```
See above.
```

Remarks

The `ANA.SetPixelColor` is optimized for Speed. It will use only about 200 to 336 Ticks. Therefore the Robot could write more then 47000 Pixels per Second. In EXE Mode its even faster then in Free-Run Mode (from Editor).

Limitations:

-

See also:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.4.14.9 ANA.SetPixelColor_5h

MiniRobotLanguage (MRL)

ANA.SetPixelColor_5H

Set the Color of 5 successive horizontal Pixels from an Image-Register (IR)

Intention

This command will set/change the color of 5 successive Pixels in an IR. Its an Option to Speed up Image-Processing.
With this command, the returned value is the 24-bit color of the Pixels.
You do not need to worry, if the resolution is not a multiple of 5, illegal Coordinates will just be ignored.

Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Free-Run Button

You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.

```

Syntax

ANA.SetPixelColor_5h|P1|P2|P3|P4|P5|P6|P7|P8

Parameter Explanation

P1 - Source Image-Register number
P2 - X1 - Upper Left Coordinate X-Value
P3 - Y1 - Upper Left Coordinate Y-Value
P4 - Variable for Color-Value of Pixel 1 at (X1,Y1)
P5 - Variable for Color-Value of Pixel 2 at (X1+1,Y1)
P6 - Variable for Color-Value of Pixel 3 at (X1+2,Y1)
P7 - Variable for Color-Value of Pixel 4 at (X1+3,Y1)
P8 - Variable for Color-Value of Pixel 5 at (X1+4,Y1)

Example

See above.

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

The `ANA.SetPixelColor_5h` is optimized for Speed. It will use only about 350 Ticks. Therefore the Robot could set more then 300.000 Pixels per Second.

Limitations:

-

See also:

- ANA.GetPixelColor_5h 1639
-

3.55.4.14.10 ANA.SetPixelRGB

MiniRobotLanguage (MRL)

ANA.SetPixelRGB

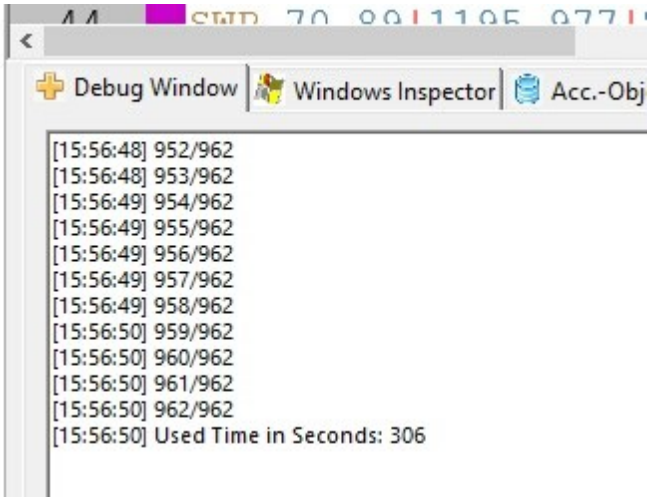
Set the Color of a Single Pixel from an Image-Register (IR) using the RGB-Values

Intention

This command will change the color of a Single Pixel in an IR. Instead of specifying the Color-Value as one Number, you can specify the R,G and B-Part here separately. Use this command together with other Commands like `ANA.GetPixelRGB`.

For Speed-Reasons, this command will never return anything on the TOS.

1. Doing Color-Changes/Corrections
In this Sample we will change the Colors in the Picture.
For this we will read the Pixel, check if its mostly Green, and in that case replace it with the colors taken from another Picture.
Due to the use of a nested Loop going "Line by Line" through all Pixels, it is recommended to start the script in the Editor using "Freerun Mode".
Even then the Script still may use several Minutes to finish. You will see in the Editor-Debug-Window the current Line and the last line.



You will not see the Robot Painting unless the Show command is been called which leads to an Update in the Show-Window.

The Speed-dump shows that the Robot can do such correction very fast, yet simple changes on the whole picture can be done faster using other commands.

2. Picture Mixing

*© 2023 Theo Gottwald * https://www.smart-package.com*

In this Sample we will mix 2 Pictures depending on the relation between Blue and Red.
In the SPR you can use virtually unlimited Graphics Sources to be combined.

.

Syntax

ANA.SetPixelRGB[|P1][|P2][|P3][|P4][|P5][|P6]

Parameter Explanation

P1 - Target Image-Register number
P2 - X1 - Upper Left Coordinat X-Value
P3 - Y1 - Upper Left Coordinat Y-Value
P4 - Variable for Color-Value RED.
P5 - Variable for Color-Value GREEN.
P6 - Variable for Color-Value BLUE.

The color values will always be in the range between 0-255.
This is Hexadacimal: 0 - &HFF.

Example

```
See above.
```

Remarks

The `ANA.SetPixelColor` is optimized for Speed. It will use only about 200 to 336 Ticks. Therefore the Robot could write more then 47000 Pixels per Second. In EXE Mode its even faster then in Free-Run Mode (from Editor).

Limitations:

-

3.55.4.14.11 ICC./NCC. - If Color Condition

MiniRobotLanguage (MRL)

ICC.If Color Condition
NCC.If NOT Color Condition

Get a Pixel from an IR and test the Pixel-Color-Value about R,G and B values

Intention

These commands will take 2 Color-Values for R,G and B value. The first in the "Minimum" and the second is the "Maximum".
So the Colour of the specified Pixel must be inside this RGB Range then the Condition will evaluate to "true".

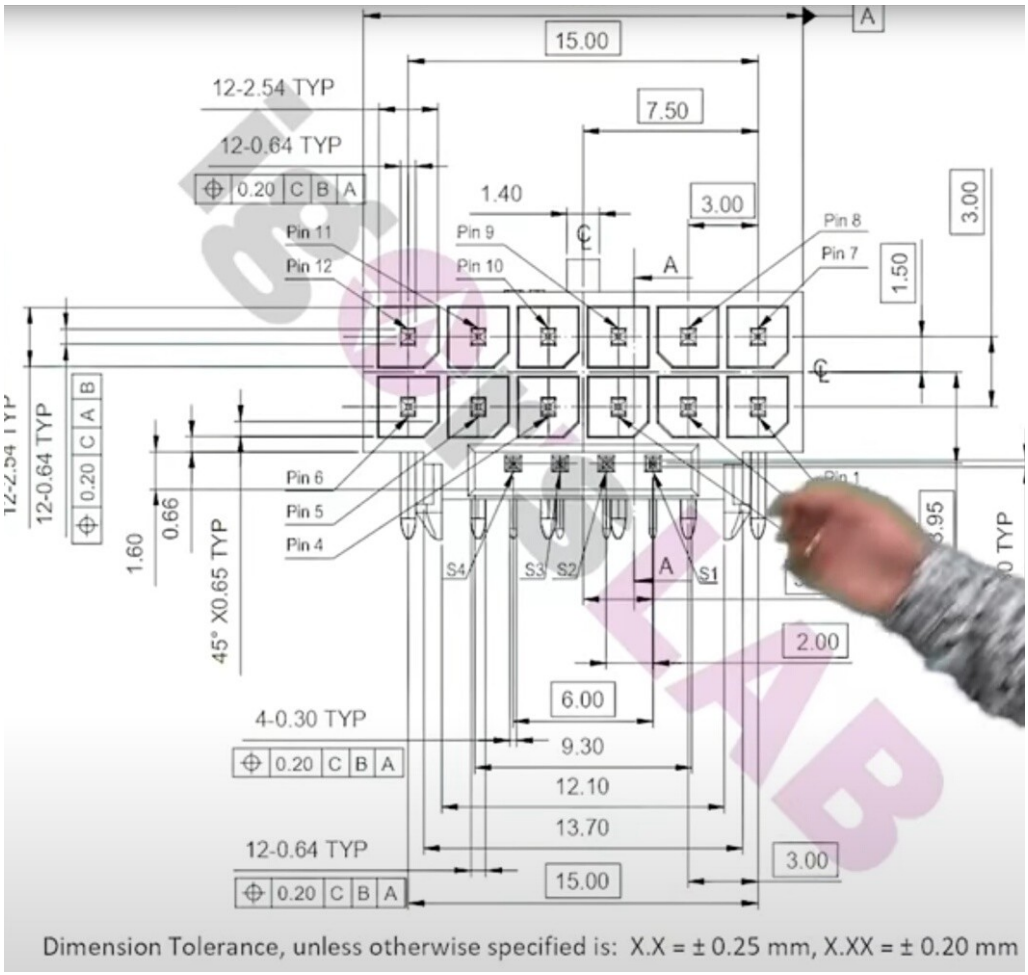
So the Command does this:

1. Read the specified Pixel from the IR.
2. Split the Pixelcolor into R,G and B values
3. Check if all 3 values (R,G and B) are inside the given range

If that is the case then the ICC. will evaluate "true" and NCC: will evaluate "false".

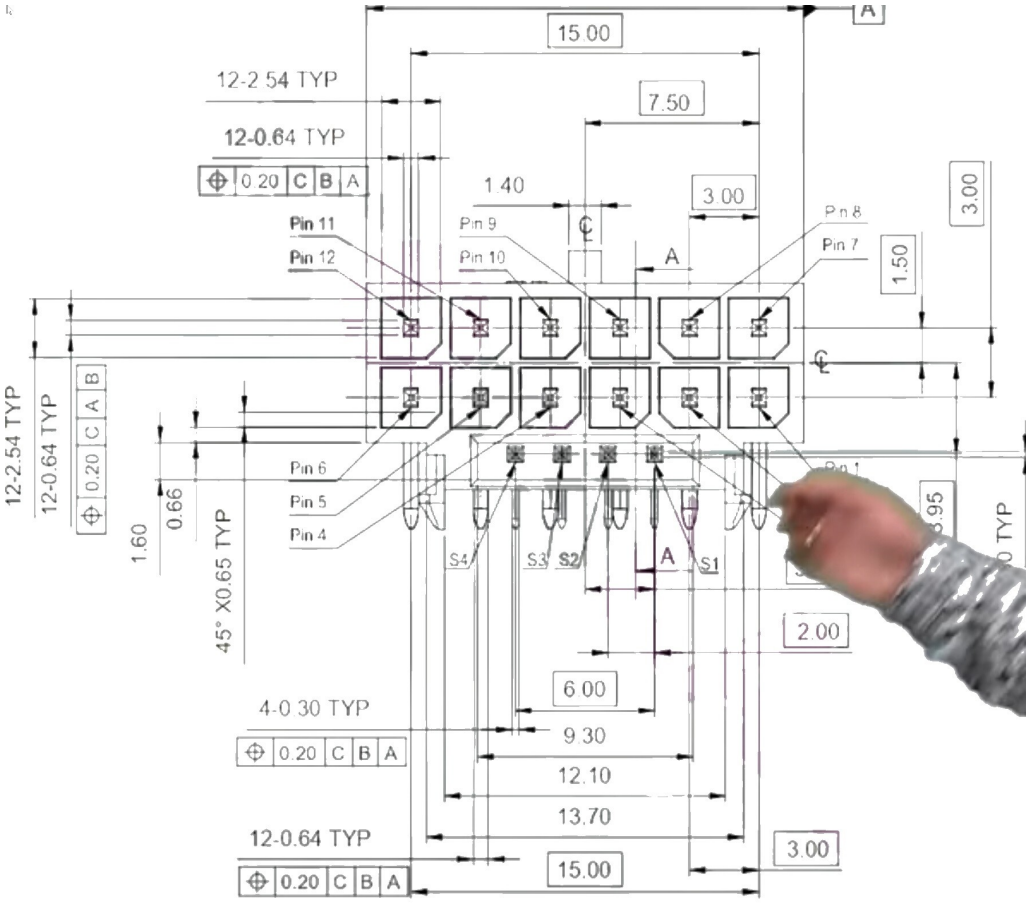
Here is a Sample Script that will remove unwanted Artefacts - for example here a watermark - from a picture.

© 2023 Theo Gottwald * https://www.smart-package.com



->

© 2023 Theo Gottwald * https://www.smart-package.com



Dimension Tolerance, unless otherwise specified is: X.X = ± 0.25 mm, X.XX = ± 0.20 mm

And here is the Script:

Pixelprocessing: "Pixel by Pixel" using the ICC.-Command.
The structure of this Script is easy to understand and it can be modified for any case.

P2 *- X-Coordinate for the Pixel to read in the Image-Register*
P3 *- Y-Coordinate for the Pixel to read in the Image-Register*

Syntax I
P4 /P5 *- (numeric) Min./Max. Values for Red, can be from 0 to 255 or in Hexadezimal from 0 to &HFF. If you write "0" in the Max-Field, it will be replaced with 255 (&HFF).*

© 2023 Theo Gottwald * https://www.smart-package.com

P6 /P7 *- (numeric) Min./Max. Values for Green, can be from 0 to 255 or in Hexadezimal from 0 to &HFF. If you write "0" in the Max-Field, it will be replaced with 255 (&HFF).*
P8 /P9 *- (numeric) Min./Max. Values for Blue, can be from 0 to 255 or in Hexadezimal from 0 to &HFF. If you write "0" in the Max-Field, it will be replaced with 255 (&HFF).*

Syntax II
P4 *- opt. Color Condition Register* Number (default 0). The Color Condition Register must be set using the SRG. - Command

Example

```
See above.
```

Remarks

The ICC.-Commands is fast. It will use only about 185 Ticks per Pixel. Therefore the Robot could execute it more then >85000 times per Second.

Limitations:

-

3.55.4.14.12 RCC. - Replace If Color Condition

RCC. - Replace If Color Condition for IR **Previous** 1088 **Top** 41 **Next** 1109

MiniRobotLanguage (MRL)

RCC.If Color Condition for IR

Process Block of Pixels or complete IR
Get a Pixel from an IR and test the Pixel-Color-Value about R,G and B values, if it matches the Condition, set the Pixel with a given color.

Intention

This Command is the optimized Version of RIC. It will not only process 1 Pixel but a Block of Pixels or the Complete IR in one Strike.
These command will take 2 Color-Values for R,G and B value. The first in the "Minimum" and the second is the "Maximum".
So the Colour of the specified Pixel must be inside this RGB Range then the Condition will evaluate to "true" and the Command will change the color of that Pixel to another color.

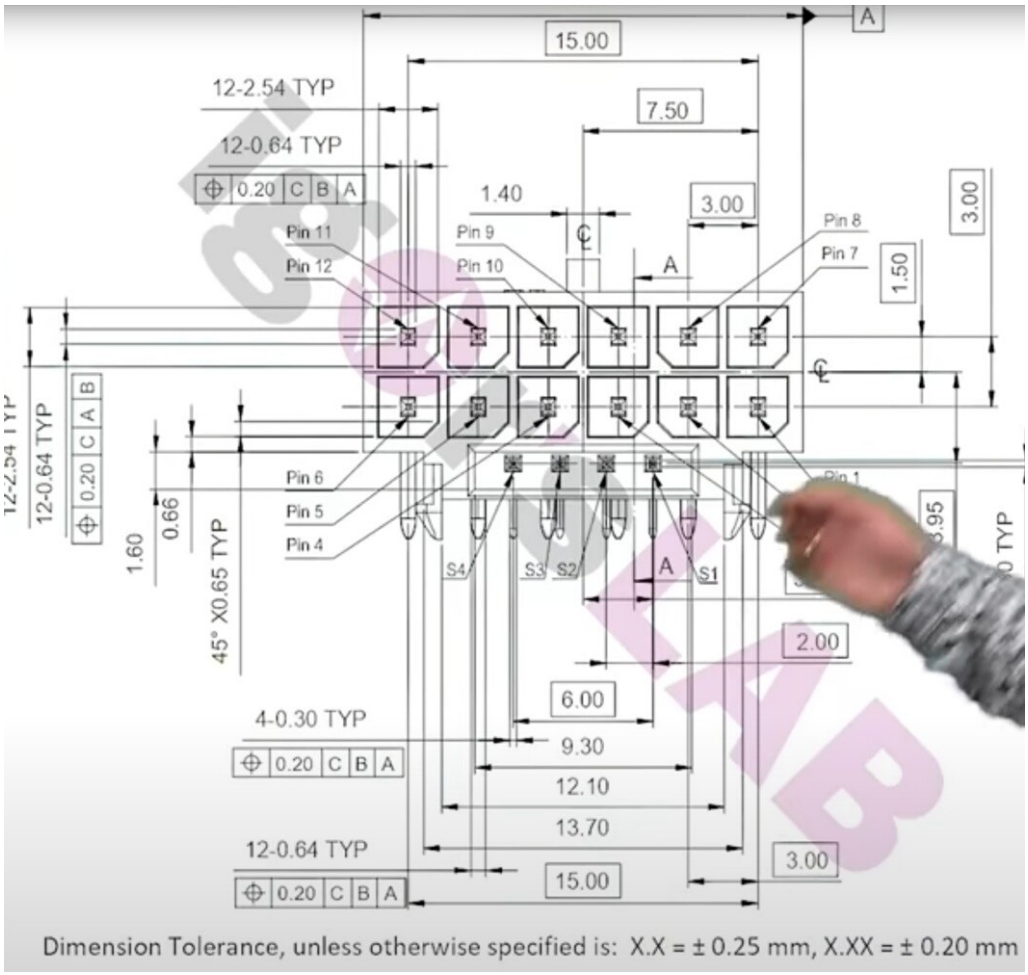
So the Command does this for the specified Block or the complete IR:

1. Read the specified Pixel from the IR.
2. Split the Pixelcolor into R,G and B values
3. Check if all 3 values (R,G and B) are inside the given range

If that is the case then the RIC. will evaluate "true" and directly change the color of that pixel to the specified color..

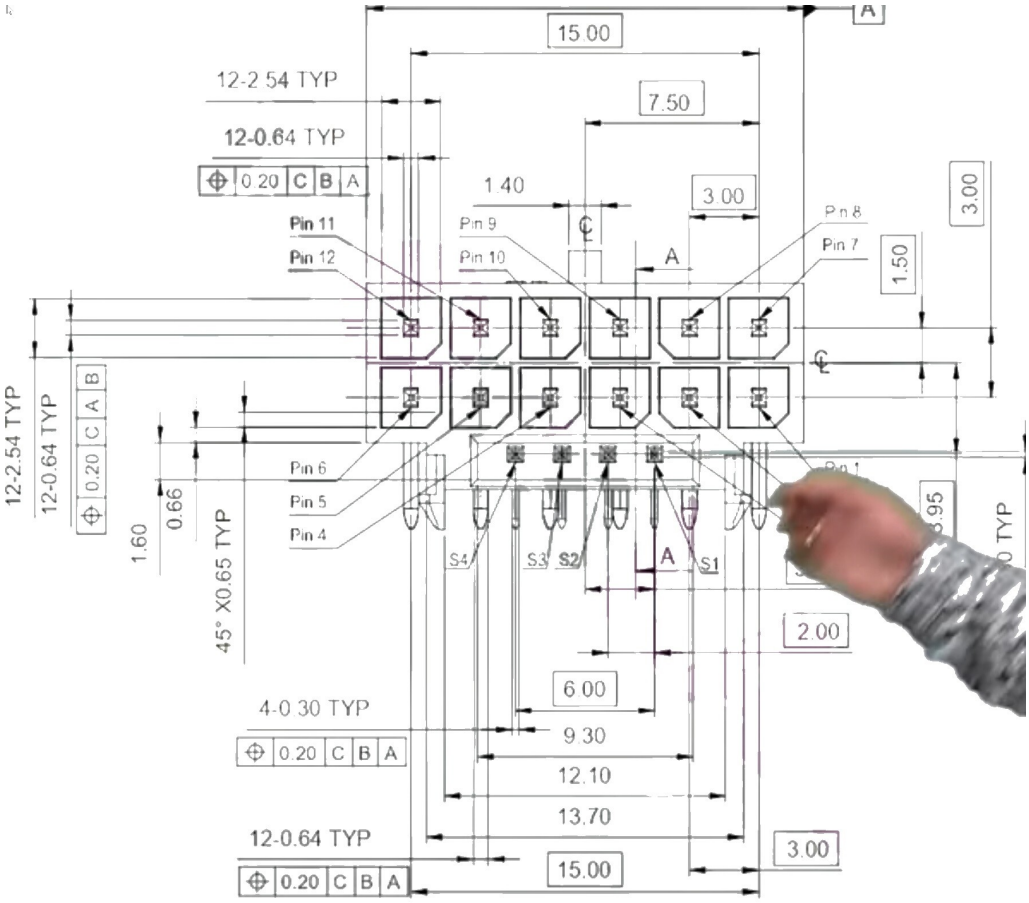
Here is a Sample Script that will remove unwanted Artefacts - for example here a watermark - from a picture.

*© 2023 Theo Gottwald * https://www.smart-package.com*



->

© 2023 Theo Gottwald * https://www.smart-package.com



Dimension Tolerance, unless otherwise specified is: X.X = ± 0.25 mm, X.XX = ± 0.20 mm

And here is the Script:

Pixelprocessing: "Complete IR in one Strike".
The structure of this Script is easy to understand and it can be modified for any case.

Syntax

RCC.[!]P1|P2|P3|P4|P5|P6|P7|P8[|P9][|P10][|P11][|P12]

Parameter Explanation

P1 - Image Register Number - if prefixed with an "!" then the Result of the Operation will be negated
P2 /P3 - (numeric) Min./Max. Values for Red, can be from 0 to 255 or in Hexadezimal from 0 to &HFF. If you write "0" in the Max-Field, it will be replaced with 255 (&HFF).
P4/P5 - (numeric) Min./Max. Values for Green, can be from 0 to 255 or in Hexadezimal from 0 to &HFF. If you write "0" in the Max-Field, it will be replaced with 255 (&HFF).
P6 /P7 - (numeric) Min./Max. Values for Blue, can be from 0 to 255 or in Hexadezimal from 0 to &HFF. If you write "0" in the Max-Field, it will be replaced with 255 (&HFF).
P8 - Color that will be used if condition is true
P9 - opt. X-Start-Position
P10 - opt. X-End-Position, if 0 then XMax is used
P11 - opt. Y-Start-Position
P12 - opt. Y-End-Position, if 0 then YMax is used

Using the ! - (Negate Result) Operator in P1, you get other Results.
If this Operator is set then RCC. will only set the Pixel-Color if the condition is NOT True.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
See above.
```

Remarks

The RCC.-Commands is optimized for Speed. It will use only about ~5 Ticks per Pixel. Therefore the Robot can process a full IR in just 1-2 seconds.

Limitations:

-

3.55.4.14.13 RIC. - Replace Pixel If Color Condition

MiniRobotLanguage (MRL)

RIC.If Color Condition

Get a Pixel from an IR and test the Pixel-Color-Value about R,G and B values, if it matches the Condition, set the Pixel with a given color.

Intention

These command will take 2 Color-Values for R,G and B value. The first in the "Minimum" and the second is the "Maximum".
So the Colour of the specified Pixel must be inside this RGB Range then the Condition will evaluate to "true" and the Command will change the color of that Pixel to another color.

So the Command does this:

1. Read the specified Pixel from the IR.
2. Split the Pixelcolor into R,G and B values
3. Check if all 3 values (R,G and B) are inside the given range

If that is the case then the RIC. will evaluate "true" and directly cahnge the color of that pixel to the specified color..

Here is a Sample Script that will remove unwanted Artefacts - for example here a watermark - from a picture.

3.55.4.14.14 SRG./GRG. - Set/Get Color Condition Register

SRG./GRG. - Set/Get Color Condition Register **Previous** 1088 **Top** 41 **Next** 1109

MiniRobotLanguage (MRL)

SRG. - Set Color Condition Register
GRG. - Get Color Condition Register

Get or Set the CCR (Color Condition Registers) for use with commands as ICC. and RIC. etc.

Intention

There are currently 8 Color Condition Registers that can be set and read using these commands.
They are numbered 0 to 7.
These commands will take 2 Color-Values for each CCR (Color Condition Register).
These two color values are the "Minimum" and the the "Maximum" value for each of "R,G and B".
So these 2 values define a "Condition". If you take any color and compare it to this condition, there is result whether the condition evaluates true or false.
So the Colour of the specified Pixel must be inside this RGB Range then the CCR Min and Max-Values then it will evaluate to "true".
Currently the SRG.-Command is the Command that is used.
The GRG. - Command is implemented for Completeness, but does not have any important use.

Here is a Sample Script that will remove unwanted Artefacts - for example here a watermark - from a picture.

```

Syntax

SRG.P1|P2|P3|P4|P5|P6|P7
GRG.P1|P2|P3|P4|P5|P6|P7

Parameter Explanation

P1 - one of the following Terms, that will specify the used Parameters:

All - in this case you need to specify all values (See example below) - the last value is the CCR-Number (0 to 7). If omitted 0 is the default.
Details see in the Example below.

LA - you specify 2 Color Values - these are Color-Values like &HA0FF1C that represents the three values which are Red-Min,Green-Min and Blue-Min and Red-Max,Green-Max and Blue-Max.
- the **P4** value is the CCR-Number (0 to 7). If omitted 0 is the default.

Min - you only specify the 3 values which are Red-Min,Green-Min and Blue-Min.
The last value is the CCR-Number (0 to 7). If omitted 0 is the default.

© 2023 Theo Gottwald * https://www.smart-package.com

If no further values for Max will be specified, R/G/B-Max is assumed to be 255.

Max - you only specify the 3 values which are Red-Max,Green-Max and Blue-Max. The value of 0 is not allowed for a Max-Value and will be replaced by &HFF.
- the last value is the CCR-Number (0 to 7). If omitted 0 is the default.
If no further values for Min will be specified, R/G/B-Min is assumed to be 0.

Minl - you only specify the 1 Value - that is a Color-Value like &HA0FF1C that represents the three values which are Red-Min,Green-Min and Blue-Min
- the **P3** value is the CCR-Number (0 to 7). If omitted 0 is the default.
If no further values for Max will be specified, R/G/B-Max is assumed to be &HFFFFFF.

Maxl - you only specify the 1 Value - that is a Color-Value like &HA0FF1C that represents the three values which are Red-Max,Green-Max and Blue-Max
- the **P3** value is the CCR-Number (0 to 7). If omitted 0 is the default.
If no further values for Min will be specified, R/G/B-Min is assumed to be &H00000.

Using SRG. you can use numerical Variables or directly numbers.
Using GRG. the Color Values must be given as Variables, then the values will be filled into these variables.

Example

```
SRG.All|$$RMin|$$RMax|$$GMin|$$GMax|$$BMin|$$BMax|$$Num
'     0    1     2       3       4     5       6   | 7
SRG.Min|$$RMin|$$GMin|$$BMin|$$Num
'     0    1     2       3       4
SRG.Max|$$RMax|$$GMax|$$BMax|$$Num
'     0    1     2       3       4

SRG.Minl|$$Col|$$Num
SRG.Maxl|$$Col|$$Num

3.55.4.15 RGB- and HLS-Operations

What is HLS ?

The hexadecimal colours and the RGB colours use amounts of Red Green and **Blue** to describe colours.
This is a nice analogue to how the pixels in the screen are lighting up.
On the other side it makes picking a colour not very human friendly.

A human way to think of colour asks questions like:
Is it light or dark?
What colour is it?
Is it vibrantly coloured?

E.g. Dark Vibrant Red or Light Pale Pink

There is a way of defining colours based on these propertiess.
This is the hLS - System. It helps you, adjust a colour lighter or darker or more colourful.
Or more red or more blue.

To convert your colors into our HLS-Format you can also use:
Color Converter
The values at "WinHSL 240" are our values from the SPR.

You can find a nice HLS-Colorpicker here:
https://hslpicker.com/
or here
http://www.workwithcolor.com/hsl-color-picker-01.htm
but you will need to convert the values to WinHLS240 using the Converter here.

What are the numbers from HLS ?

HLS is another Description for Color-Information.
It contains the 3 Components: H,L and S.

0-239 **H**ue is wavelength color.
0-240 **L**uminosity (brightness, brilliance) is black 0(0%) to white240(100%).
0-240 **S**aturation is relative bandwidth amount of grey in a color. 0(0%) to 240(100%)

as you can see, the Range from HLS is not exactly the same like it was RGB.

Due to the limited Resolution of WinHLS (Goes up to 239/240 while RGB goes up to 255)
a conversion "back and forth" will look like in the picture below and has some "stairs".

```

3.55.4.15.1 ANA.Change_HLSA / Change_HLSM

MiniRobotLanguage (MRL)

ANA.Change_HLSA

Change full Image-Register (IR) Content HLS Additive

ANA.Change_HLSM

Change full Image-Register (IR) Content HLS using Multiplication

Intention

This command will change the HLS-Values of a complete IR.
For this it will Add or Subtract Values for H,L and S.
These values can be directly the given values using ANA.Change_HLSA
or can be values where the given values will be multiplied with the current Pixel-Values using ANA.Change_HLSM.

What is HLS? 1731

0-239 **H**ue is wavelength color.
0-240 **L**uminosity (brightness, brilliance) is black 0(0%) to white240(100%).
0-240 **S**aturation is relative bandwidth amount of grey in a color. 0(0%) to 240(100%)
as you can see, the Range from HLS is not exactly the same like it was RGB.
For further use.

Syntax

ANA.Change_HLSM|P1[|P2][|P3][|P4][|P5]
ANA.Change_HLSA|P1[|P2][|P3][|P4][|P5]

Parameter Explanation

P1 **-** ***opt. Source*** Image-Register number, if omitted, IR 0 will be used.
P2 **-** ***opt Hue-Value*** This Value will be added or Subtracted from the Pixel-Color HLS-Value. If omitted 0 is used.
P3 **-** ***opt Luminosity-Value*** This Value will be added or Subtracted from the Pixel-Color HLS-Value. If omitted 0 is used.
P4 **-** ***opt Saturation-Value*** This Value will be added or Subtracted from the Pixel-Color HLS-Value. If omitted 0 is used.
P5 **-** ***opt.Destination IR*** Image-Register number, if omitted, IR **P1** will be used.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

ANA.RGB_HLS_IR|P1[|P2]
ANA.HLS_RGB_IR|P1[|P2]

Parameter Explanation

P1 - opt. Source Image-Register number, if omitted, IR 0 will be used.
P2 - opt.Destination IR Image-Register number, if omitted, IR **P1** will be used.

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

–

Remarks

`ANA.HLS_RGB_IR` is much slower then the `ANA.RGB_HLS_IR`.
Anyway, both of these should do their work in at most some seconds.
In this example the slowest time is 21 Seconds.

At a resolution of 5100x3400 this is the Speed-Dump:

```
013 0000000000000315 0001 CAL.$$XSZ=5100
014 0000000000000164 0001 CAL.$$YSZ=3400
015 0000000000702926 0001 ANA.New|0|$$XSZ|$$YSZ
016 0000000000855235 0001 ANA.vgradient|0|&HFF00FF|&H000000
017 0000000000684891 0001 ANA.New|2|$$XSZ|$$YSZ
018 0000000002103994 0001 ANA.hgradient|2|&H0000FF|&H00FFFF
019 0000000004004146 0001 ANA.Mix|0|2|7
020 0000000044712912 0001 ANA.Show|2!#
021 0000000006471893 0001 ANA.RGB_HLS_IR|2|1
022 0000000000000533 0001 GSB.Save|1
023 0000000341730901 0001 ANA.HLS_RGB_IR|2|3
024 0000000000000000 0001 DMP.1
025 0000000000000000 0000 GSB.Save|3
026 0000000000000000 0000 ENR.
```

Limitations:

I have tested the Script up to a resolution of 10200x6800 and it will work, however the Debug-Window can not display such a large resolution (because your Screeen may not have such a size) therefore you need to use the Parameter "#" for the ANA.Show Command. Anything else works fine, and you can also save the resulting pictures.

3.55.4.15.3 ANA.HLS_To_RGB / RGB_To_HLS

MiniRobotLanguage (MRL)

ANA.HLS_To_RGB
ANA.RGB_To_HLS

Convert values (Single or splitted vaues) from R,G B to H,L,S and opposite direction

Intention

This command will convert single values like &HF1F0A0 or Splitted values where R/G/B or H/L/S are splitted in 3 Parameters from R,G, B into H,L,S and the opposite direction.
To convert a Full-IR between HLS and RGB use other commands.

To convert your colors into our "WinHSL240"-Format, - here in short - HLS-Format, you can also use:
Color Converter
The values at "WinHSL 240" are our values from the SPR.
Due to technical rounding, our values may differ +/-3 with the values on the WEB-Site.

These commands can be called with a variety of Parameters.

Syntax

These Functions can be called with a different number of Paramenters. Depending on these number the Parameter have different meaning.

ANA.HLS_To_RGB|P1
ANA.RGB_To_HLS|P1

Parameter Explanation

P1 - Source Value for RGB / HLS. Example: &HF1A9B4 This value is interpreted as RGB or as HLS value.

The result of the Operation will be placed on TOS.

ANA.HLS_To_RGB|P1|P2
ANA.RGB_To_HLS|P1|P2

Parameter Explanation

P1 - Source Value for RGB / HLS. Example: &HF1A9B4 This value is interpreted as RGB or as HLS value.

P2 - Variable for Result.

ANA.HLS_To_RGB|P1|P2]|P3
ANA.RGB_To_HLS|P1|P2]|P3

Parameter Explanation

P1 - Source Value/Variable for Red / Hue.

P2 - Source Value/Variable for Green / Luminosity.

P3 - Source Value/Variable for Blue / Saturation.

The result of the Operation will be placed on TOS.

ANA.HLS_To_RGB|P1|P2|P3|P4

© 2023 Theo Gottwald * https://www.smart-package.com

ANA.RGB_To_HLS|P1|P2|P3|P4

Parameter Explanation

P1 - Source Value for RGB / HLS. Example: &HF1A9B4 This value is interpreted as RGB or as HLS value.
P2 - Destination Variable for Red / Hue.
P3 - Destination Variable Green / Luminosity.
P4 - Destination Variable Blue / Saturation.

ANA.HLS_To_RGB|P1|P2|P3|P4|P5|P6
ANA.RGB_To_HLS|P1|P2|P3|P4|P5|P6

Parameter Explanation

P1 - Source Value/Variable for Red / Hue.
P2 - Source Value/Variable for Green / Luminosity.
P3 - Source Value/Variable for Blue / Saturation.
P4 - Destination Variable for Red / Hue.
P5 - Destination Variable Green / Luminosity.
P6 - Destination Variable Blue / Saturation.

3.55.4.15.4 ANA.MixNG/NR/NB

MiniRobotLanguage (MRL)

ANA.MixNG

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR, will not mix the Green part

ANA.MixNR

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR, will not mix the Red part

ANA.MixNB

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR, will not mix the Blue part

Intention

This command will mix the Content of R,G and B-Part each in separate Image-Registers, into a Single IR-Picture.
It will drop the specified part and only mix the other two parts.

Split Picture in R,G and B-Parts and Mix it together into another Picture
SplitRGB is technically the Opposite then the ANA.MixRGB - Commands.

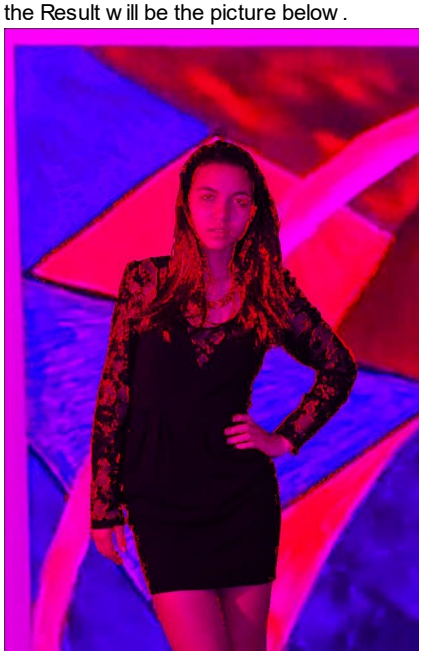
ANA.MixNG

the Result w ill be the picture below .



ANA.MixNR

the Result w ill be the picture below .

© 2023 Theo Gottwald * https://www.smart-package.com

ANA.MixNB

the Result w ill be the picture below .

Syntax

```
ANA.MixRGB[|P1][|P2]
ANA.MixBGR[|P1][|P2]
ANA.MixBRG[|P1][|P2]
ANA.MixGRB[|P1][|P2]
```

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - opt. Destination Image-Register number, if omitted, IR 0 will be used.
P2 - opt.Source R Image-Register number, if omitted, IR **P1+1** will be used.
Important:
The Image Registers for G+B are P2+1 and P2+2

The Command will leave a 0/1 on the TOS. As always, a 0 means Error, while a 1 means "all fine".

Example

```

3.55.4.15.6 ANA.MixROR/ROL/DROR/DROL

ANA.MixROR/ROL - Mix R,G and B Part into IR Previous 1088 Top 41 Next 1109

MiniRobotLanguage (MRL)

ANA.MixROR

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR using a Bit Right-Shift (by P3 Bits)

ANA.MixROL

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR, using a Bit Left-Shift (by P3 Bits)

ANA.MixDROR

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR, using a Bit Right-Shift (by P3 Bits) and doing a Bit-Reversal LSB<>MSB

ANA.MixDROL

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR, using a Bit Left-Shift (by P3 Bits) and doing a Bit-Reversal LSB<>MSB

ANA.MixRev

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR, using a Bit Left-Shift (by P3 Bits) and doing a Bit-Reversal LSB<>MSB

ANA.MixRevN

Mix Contents from 3 Image-Register (IR) that contain R,G and B-Part into a Single IR, using a Bit Left-Shift (by P3 Bits) and doing a Bit-Reversal LSB<>MSB and a Negation

Intention

This command will mix the Content of R,G and B-Part each in separate Image-Registers, into a Single IR-Picture.
Its intended to analyze the pictures or apply Special effects.

Split Picture in R,G and B-Parts and Mix it together using the ROL/ROR_Commands

Technically these commands eleminate some of the color-parts.

3.55.4.15.7 ANA.SplitRGB

ANA.SplitRGB - Split IR into R,G and B Part **Previous** 1088 **Top** 41 **Next** 1109

MiniRobotLanguage (MRL)

ANA.SplitRGB

Split Image-Register (IR) Content into R,G and B-Part

Intention

This command will Split the Content of an given IR into R,G and B-Part each in separate Image-Registers.
For further use.

1. Split Picture in R,G and B-Parts

SplitRGB is technically the Opposite then the ANA.MixRGB - Command.
You can NOT just swap the R,G and B - IR's and re-combine them. If you want to Swap R,G and B-Parts use the ANA. Mix_???-Commands for that.

```

3.55.5 GRA. - Picture/Image Commands

3.55.5.1 GRA.GetResolution

GRA. - Graphic Command: GetResolution Previous 1836 Top 41 Next 1846

MiniRobotLanguage (MRL)

GRA.GetResolution Command

Get Image X- and Y-Resolution

Intention

`GRA.get` will compute the X- and Y-Resolution of an Image in Pixels.

The following file-Types can be specified as Source file:

- BMP
- EMF
- JPG or JPEG
- GIF
- ICO
- PNG
- TIF or TIFF
- WMF

Usage is as simple as:

```
$$FIL=?desktop\MyPic.BMP
' $$XRE will get the X-Resolution, $$YRE will get the Y-Resolution
GRA.get|$$FIL|$$XRE|$$YRE
MBX.Resolutiuon is: $$XRE,$$YRE
```

Stack Usage / Return values:

Any `GRA.`-Operation will leave one or more values on the stack, depending on the success of the Operation.

Generally if there is a "0" on TOS then the Operation was successful. If you do not specify the Variables for the X- and Y-Resolution,

these values will be placed on the Stack also.

```
VAR.$$SRC=?path\DSC01987.JPG
STV.TOVCLEAR|$$DUM
GRA.get|$$SRC
DMP.6
MBX.!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
------------------------------------
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->LongInt       :0

Stackpos: 001 ->LongInt       :3672

Stackpos: 002 ->LongInt       :4896

------------------------------------
```

Here is an explanation of the stack values:

Position: Explanation:

```
    0 (TOS)  Is 0 if the GRA.-Operation was successful. Any other value may indica
    1       Y-Resolution
    2       X-Resolution
```

In case you specify only one of the two variables, the other value will be placed on the Stack.

Syntax

GRA.get|P1[|P2][|P3]
GRA.GetResolution|P1[|P2][|P3]

Parameter Explanation

P1 - Source file.

P2 - Variable for X-Resolution (Out). If this variable is omitted or -, the value is placed on the Stack.

P3 - Variable for Y-Resolution (Out). If this variable is omitted or -, the value is placed on the Stack.

Example:

```
    GRA.get|?desktop\MyFile.BMP|$$XRE|$$YRE
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
      ' have the Y-Resolution on the Stack
    GRA.get|$$FIL|$$XRE

      ' have the X-Resolution on the Stack
    GRA.get|$$FIL|-|$$YRE
```

See above which values are placed on the Stack during the Operation.

Example

```
VAR.$$SRC=?path\DSC01987.JPG
' Folgende Zeile löscht den Stack.
STV.TOVCLEAR|$$DUM
' Hier gehts los
GRA.get|$$SRC|$$YRE|$$XRE
' Diese Zeile zeigt den Stack an
DMP.6
MBX.$$XRE-$$YRE
ENR.
```

3.55.5.2 GRA.Scale

MiniRobotLanguage (MRL)

GRA.scale Command

Scale Image Size

Intention

`GRA.scale` will resize an image, keeping the Aspect Ratio. For this the Original image will be copied to a new file with the same or with another file extension.

The following file-Types can be specified as Source or destination file:

- `BMP`
- `EMF`
- `JPG or JPEG`
- `GIF`
- `ICO`
- `PNG`
- `TIF or TIFF`
- `WMF`

The resolution in Y-direction will automatically be calculated in a way that the original Apect-Ratio is been preserved.

To convert a .BMP-Picture to .JPG you could write:

```
' This will create a File MyPic.JPG on the Desktop
' Because this is where the Source file also comes
' from.
$$FIL=?desktop\MyPic.BMP
GRA.sca|$$FIL|JPG|1024#
```

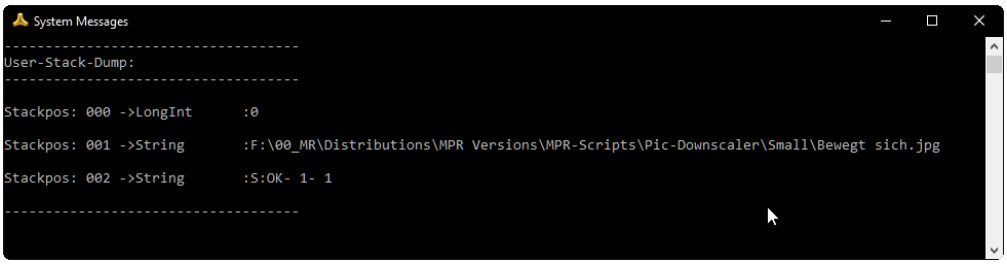
Instead of just writing the new Filetype as Destination, you can give a complete Filename and/or path.

```
GRA.sca|$$FIL|?desktop\MyFile.BMP
' The following two commands let you see the STACK content.
DMP.6
MBX.!
```

Stack Usage / Return values:

Any `GRA.`-Operation will leave several values on the stack, depending on the success of the Operation.
Here is an Example:

© 2023 Theo Gottwald * https://www.smart-package.com

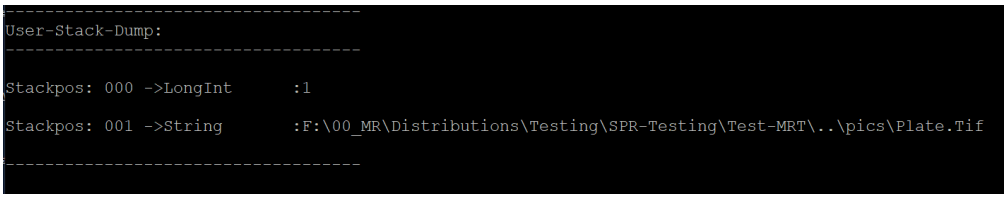


Here is an explanation of the stack values:

Position: Explanation:

```
    0 (TOS)  Is 0 if the GRA.-Operation was successful. Any other value may indica
    1        Path and Filename of the converted destination file.
    2        S:OK if all was fine or can be E:Error-Message if there was an Proble
```

In case of an parameter error - or an unusable destination path - the stack will just look like this.



Syntax

GRA.sca|P1|P2[|P3][|P4]
GRA.scale|P1|P2[|P3][|P4]

Parameter Explanation

P1 - Source file.

***P2* - Destination File Path this can be:**

a) complete path with Filename and extension

```
GRA.sca|$$FIL|?desktop\MyFile.BMP|1280#
```

b) just the extension of the new file like "JPG"

```
GRA.scale|$$FIL|BMP
```

c) Only a new Filename with Extension. In this case the Source-File Path is used for the destination file.

```
GRA.sca|$$FIL|MyFile.BMP|1280#
```

d) Omit the filetype. In this case ".jpg" is used as default.

```
GRA.sca|$$FIL|?desktop\MyFile
GRA.sca|$$LAC|MyFile
```

© 2023 Theo Gottwald * https://www.smart-package.com

P3 **-** X-Resolution of new Image. Y-Resolution is automatically choosen
using the Aspect-ratio of the Original Image.
If parameter is omitted, Original Image Resolution is taken.
Here you can specify the following 2 additional Parameters:
- This will allow to upscale pictures to a higher resolution. If omitted, the maximum resolution is the Original resolution.
@ - This will force the Process to keep the original resolution of the Source file

P4 **-** (optional) JPG - Compression Quality from 1 to 100.
If parameter is omitted, "75" is taken.

Example:
```
' Activate Up-Scaler
GRA.sca|$$FIL|?desktop\MyFile.BMP|1280#

' Force Original resolution
GRA.sca|$$FIL|?desktop\MyFile.BMP|@
```

See above which values are placed on the Stack during the Operation.

Example

```
' Dieses Beispielscript muß kompiliert werden.
' zieht man dann eine Grafikdatei auf die Verknüpfung der kompilierten EXE-Datei,
' dann wird dort wo die Grafikdatrei liegt ein Ordner "SMall" erstellt und in
' diesen Ordner wird eine verkleinerte Kopie der Grafikdatei gelegt.

```

Remarks

-

Limitations:

A Quadratic Image should be upscaled up to about 26000 Pixels X/Y-Size that is 676 MegPixel.
Larger sizes may work or fail, depending on the Memory Situation in Windows.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.5.3 GRA.Convert

MiniRobotLanguage (MRL)

GRA.convert Command

Convert Image

Intention

`GRA.con` will convert the format of an image into an other format. For this the Original image will be copied to a new file with another file extension.

The following file-Types can be specified as Source or destination file:

- `BMP`
- `EMF`
- `JPG or JPEG`
- `GIF`
- `ICO`
- `PNG`
- `TIF or TIFF`
- `WMF`

If you specify P$ then you can also specify a new file-resolution in X-direction. The resolution in Y-direction will automatically be calculated in a way that the original Apect-Ratio is been preserved.

To convert a .BMP-Picture to .JPG you could write:

```
' This will create a File MyPic.JPG on the Desktop
' Because this is where the Source file also comes
' from.
$$FIL=?desktop\MyPic.BMP
GRA.con|$$FIL|JPG
```

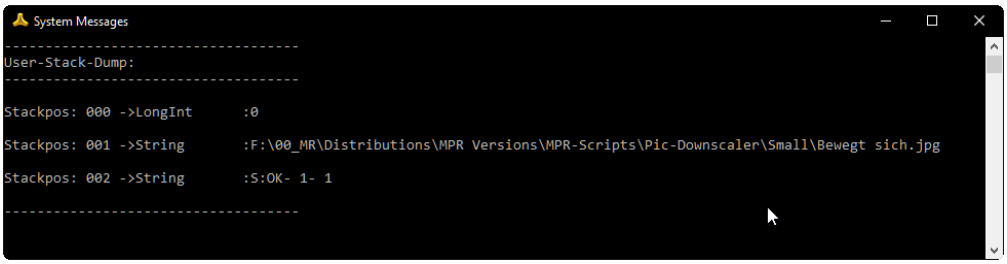
Instead of just writing the new Filetype as Destination, you can give a complete Filename and/or path.

```
GRA.con|$$FIL|?desktop\MyFile.BMP
' The following two commands let you see the STACK content.
DMP.6
MBX.!
```

Stack Usage / Return values:

Any `GRA.`-Operation will leave several values on the stack, depending on the success of the Operation.
Here is an Example:

© 2023 Theo Gottwald * https://www.smart-package.com

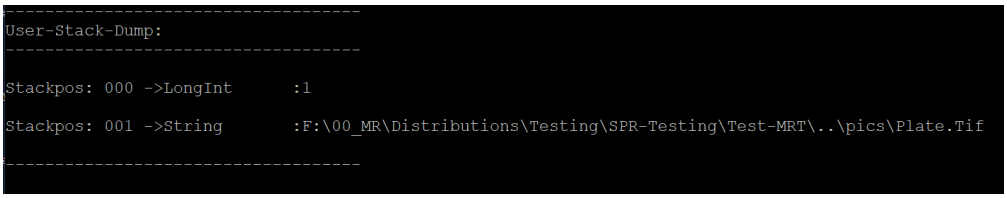


Here is an explanation of the stack values:

Position: Explanation:

```
    0 (TOS)  Is 0 if the GRA.-Operation was successful. Any other value may indica
    1        Path and Filename of the converted destination file.
    2        S:OK if all was fine or can be E:Error-Message if there was an Proble
```

In case of an parameter error - or an unusable destination path - the stack will just look like this.



Syntax

GRA.con|P1|P2[|P3][|P4]
GRA.convert|P1|P2[|P3][|P4]

Parameter Explanation

P1 - Source file.

***P2* - Destination File Path this can be:**

a) complete path with Filename and extension

```
GRA.con|$$FIL|?desktop\MyFile.BMP|78|1280#
```

b) just the extension of the new file like "JPG"

```
GRA.con|$$FIL|BMP
```

c) Only a new Filename with Extension. In this case the Source-File Path is used for the destination file.

```
GRA.con|$$FIL|MyFile.BMP||1280#
```

d) Omit the filetype. In this case ".jpg" is used as default.

```
GRA.con|$$FIL|?desktop\MyFile
GRA.con|$$LAC|MyFile
```

© 2023 Theo Gottwald * https://www.smart-package.com

P3 **-** (optional) JPG - Compression Quality from 1 to 100.
If parameter is omitted, "75" is taken.

P4 **-** X-Resolution of new Image. Y-Resolution is automatically choosen
using the Aspect-ratio of the Original Image.
If parameter is omitted, Original Image Resolution is taken.
Here you can specify the following 2 additional Parameters:
- This will allow to upscale pictures to a higher resolution. If omitted, the maximum resolution is the Original resolution.
@ - This will force the Process to keep the original resolution of the Source file

Example:
```
' Activate Up-Scaler
GRA.con|$$FIL|?desktop\MyFile.BMP||1280#

' Force Original resolution
GRA.con|$$FIL|?desktop\MyFile.BMP|75|@
```

See above which values are placed on the Stack during the Operation.

Example

```
' Dieses Beispielscript muß kompiliert werden.
' zieht man dann eine Grafikdatei auf die Verknüpfung der kompilierten EXE-Datei,
' dann wird dort wo die Grafikdatrei liegt ein Ordner "SMall" erstellt und in
' diesen Ordner wird eine verkleinerte Kopie der Grafikdatei gelegt.

Remarks

-

Limitations:

A Quadratic Image should be upscaled up to about 26000 Pixels X/Y-Size that is 676 MegPixel.
Larger sizes may work or fail, depending on the Memory Situation in Windows.

3.55.5.4 GRA.vToBMP

MiniRobotLanguage (MRL)

GRA.vToBMP Command

Convert Variable that contains an Image to the internal Bitmap-Format for use with ANA.-Commands

Intention

This Command is helpful, especially together with "ANA.#FromVar". GRA.vbm will convert the format of an image into the internal Bitmap-Format. The result will also be stored in a Variable.
This way you can use all Sorts of Images (see below) together with the ANA.-Commands, especially using "ANA.#FromVar".

The following file-Types can be specified as Source Formats:

- BMP
- EMF
- JPG or JPEG
- GIF
- ICO
- PNG
- TIF or TIFF
- WMF

If you specify P$ then you can also specify a new file-resolution in X-direction. The resolution in Y-direction will automatically be calculated in a way that the original Apect-Ratio is been preserved.

To convert a loaded .jpg you could write:

```
' Load a JPG-File, here from "Inline-Data", see Inline Data Commands 3483
GSB.GetPic
' Convert jpg to internal Bitmap Format
GRA.vbm|$$DTA|$$BMP|.jpg
' Use ANA.Command to directly load the Imagine int an Image Register
ANA.#FromVar|1|$$BMP
' Show the Image
ANA.Show|1!
ENR.
```

This may also be necessary for several types of ".bmp"-Files that do not match the internal specifications of the "ANA.#FromVar" Command.
In this case we just convert from ".bmp" to ".bmp" to be able to use the Picture.

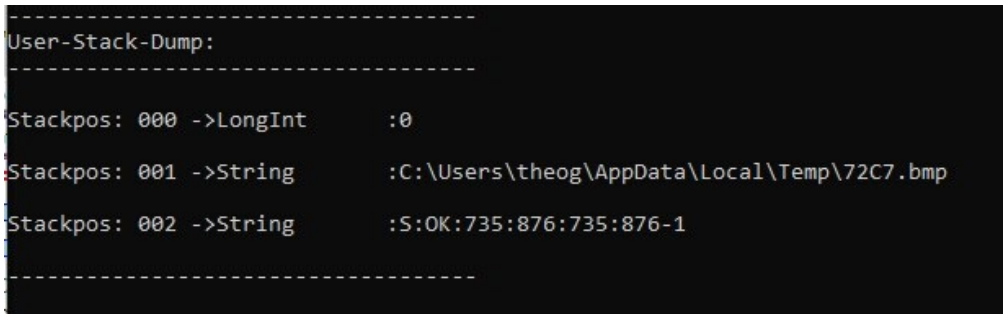
© 2023 Theo Gottwald * https://www.smart-package.com

```
' Load a JPG-File, here from "Inline-Data", see Inline Data Commands 3483
GSB.GetPic
' Convert .bmp to internal Bitmap Format
GRA.vbm|$$DTA|$$BMP|.bmp
' Use ANA.Command to directly load the Imagine int an Image Register
ANA.#FromVar|1|$$BMP
' Show the Image
ANA.Show|1!
ENR.
```

Stack Usage / Return values:

This GRA.-Operation will leave several values on the stack, depending on the success of the Operation.

Most Important is the most upper value that is a "0" if the Operation was successful.



Internally used temporary files will automatically be deleted.

Syntax

GRA.vbm|P1|P2[|P3][|P4]
GRA.vToBMP|P1|P2[|P3][|P4]

Parameter Explanation

P1 - Source file data inside a variable. Can be from Inline-Data, or you can load a picture using CFF.-Command.

P2 - Destination Variable. This Variable will receive the Data that can be used together with ANA.#FromVar

P3 - Filetype of P1-Data. Like ".bmp",".png",".jpg"

P4 - X-Resolution of new Image. Y-Resolution is automatically choosen using the Aspect-ratio of the Original Image.
If parameter is omitted, Original Image Resolution is taken.

© 2023 Theo Gottwald * https://www.smart-package.com

```
     Here you can specify the following 2 additional
Parameters:
     # - This will allow to upscale pictures to a higher
resolution. If omitted, the maximum resolution is the Original
resolution.
     @ - This will force the Process to keep the original
resolution of the Source file
```

Example

```
  '################################
  ' GRA.vbm-Sample
  '################################
  CFF.Mypicture.jpg|$$DTA
  GRA.vbm|$$DTA|$$BMP|.bmp
  ANA.#FromVar|1|$$BMP
  ANA.Show|1!
  ENR.
```

Remarks

-

Limitations:

A Quadratic Image should be upscaled up to about 26000 Pixels X/Y-Size that is 676 MegPixel.
Larger sizes may work or fail, depending on the Memory Situation in Windows.

3.55.6 Non-IR Operations

These are mostly older Commands taht are not using the newer Image-Registers (IR).

Possibly Commands like WRC. and WRA. should not be used, now that we have the new Pattern-Commands.
The contained GPC. and SPC.-Commands may also not make sense anymore and do only work under few circumstances.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.6.1 GPC. - Get-Pixel-Colour

MiniRobotLanguage (MRL)

GPC. Command

Get Pixel Color

Intention

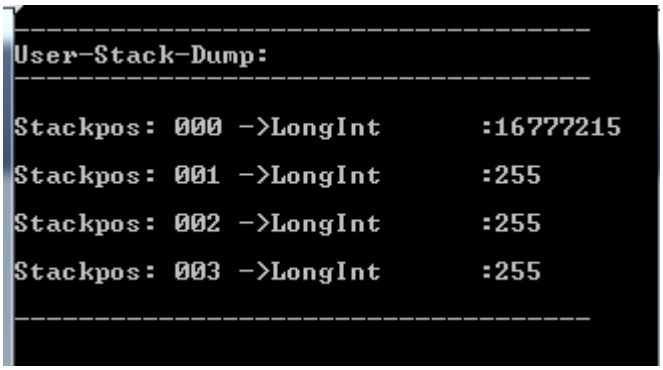
This command reads the screen color of a pixel in a window. You can specify coordinates in Screen- (desktop), or in window-coordinates.

You will also get the red, green and blue parts of the color (in this order) on the Stack 369.

In the simplest way you can check the Pixel-color at some point like this:

```
GPC.624,794
STS.DUMP
```

And this is what you may find on TOS.



First on Top, the 24-bit color value. Then next, the Blue-(`$$001`),Green-(`$$002`), and the Red (`$$003`)-Part of the Pixel-color.
If you just need the color value, you can get it using the `$$000` Stackvariable.

```
GPC.624,794
PRT.The 24-bit color is: $$000
STS.DUMP
MBX.!
```

Or you can just add one Parameter with a variable. The following Sample shows it. And it also shows that you can use a Point-Variable instead of two coordinated here.

```
VAP.$$COR=624,794
GPC.$$COR|$$COL
PRT.The 24-bit color is: $$COL
STS.DUMP
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX.!
ENR.
```

Syntax

GPC.[P1][|P2]
GPC.[proto]|P1,P2

Parameter Explanation

P1 - (optional) prototype coordinates
P2 - (optional) coordinates separated with ","
P3 - (optional) takes the pixel-colour, if omitted stack is used.

There are three prototypes:
- **c** - **C**hildwindow Coordinates (you can use "o" for this one also.)
- **a** - **a**ctual window coordinates
- **t** - **T**op-Window Coordinates
If prototype is omitted, Screen-Coordinates are taken.

Example

```
'***********************************
' GPC.-Demo
'***********************************
GPC.1028,1370
STS.DUMP
$$COL=$$000
VTH.$$COL
PRT.The 24-bit color is: $$COL
MBX.!
END.

STW.ctwo|notepad|Editor|0|overcn
CLW.
JMP.closeNotepads
:overcn
RET.
```

Remarks

Instead of using separate variables for X and Y, you can also use a Point-Variable, where x and y values are separated by a "," as follows:

```
VAR.§§PAP=10,10
GPC.§§PRE|§§PAP|§§COL
```

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

The RGB-Splitter works default with 24- or 32 bit colors. It will not work with 8 or 16 bit color depth.

See also:

- **1.8. Selecting the Application (Topwindow)** 150
- IPC. / NPC. - If-Pixel-Colour 1816
- SPC. -Set-Pixel-Colour 1843

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.6.2 ILC. / NLC. - If Line Color

MiniRobotLanguage (MRL)

ILC. / NLC. Conditional Statement

If Line Color

Intention

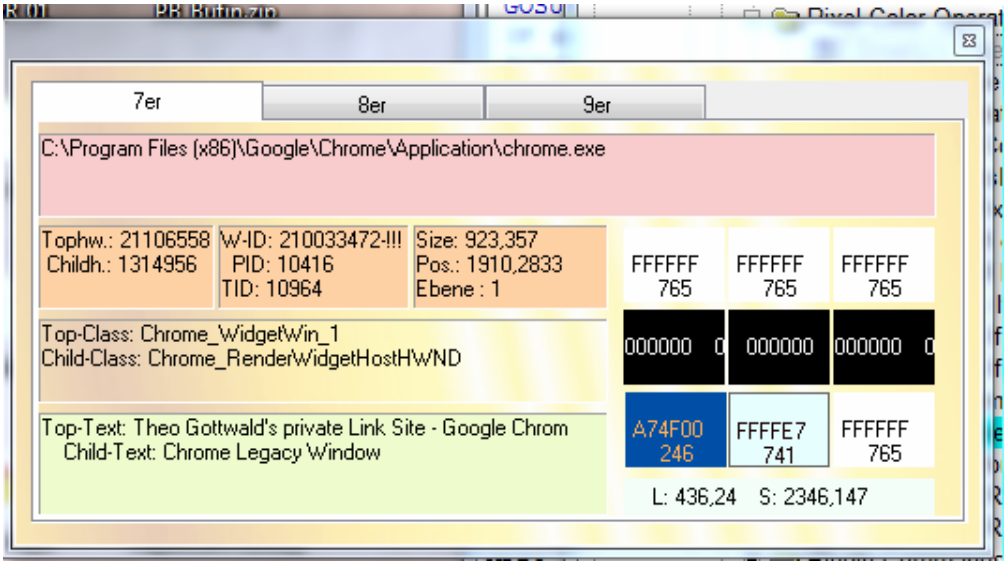
Conditional Statement.

Test if an defined Color is been found along a defined Line.
Or, test how often a color does not match a defined color along a given line.
This is done using the "**!**" Operator.

This command can be used to locate buttons in graphical environments, where we can not use any other commands to locate them.

Important: Color-Operations are often troublesome because colors may not match exactly. Therefore this command provides you with a "Color Tolerance" Option.
Also you have the choice of using a "negative version" which will just check that colors do NOT match a given color/tolerance. And you can combine all this, with the resolution independent SPR 3.6 Using Quadrant-Coordinates 356 to make your Scripts run as compatible as possible.

Hint:
When Designing Pixel-Operations, use the "Catseye-Analyzer".
It will show you Color-Values and other needed Information.
The "Catseye-Analyzer" is located in the Installation Folder.



*© 2023 Theo Gottwald * https://www.smart-package.com*

The four parameters are line-coordinates, Color, Color-Tolerance and Hit-Counter.

Parameter 1 - Line-Coordinates:
The Line is defined by a Start- and and Endpoint. Using the following Format:

```
ILC.x1,y1,x2,y2
```

As always, if you omit `y2` then `y2` is assumed to be equal to `y1`.
If you omit the coordinates, the last located window or other object-rectangle is been taken, and the line goes from the upper-left to the lower-right corner.

Instead of using Pixel-Coordinates, you can use 3.6 Using Quadrant-Coordinates 356 to make your Scripts run as compatible as possible.
Example:

```
ILC.{A1,A2}
```

Now writing this will use the Screen-Quadrant A1, which is most often not what we want. So we add an letter in front:

```
ILC.w{A1,A2}
```

This will tell the command that we want to use the Quadrant in the last located window (child- or Topwindow).
You can use:
"**w**" - Any window (Top- or Child-Window) that was last located
"**t**" - last located Top-Window
"**c**" - use Client-Coordinates of tzhe specified window. If no window is specified "w" is used as default.
"**o**" - use the last defined Object-Coordinates (window, Accessible Object or graphical Object).
You can combine the letters as far as it makes sense:
"**wc**" - use last windows Client-Coordinates
"t**c**" - use last Top-windows Client-Coordinates

at this place you can add 2 Special Characters:
"**@**" - Enable Debug Option. Using this special Character will open a Window that shows the part of the Screen that is used for the Command. Be careful, when using `WRC.` with this Option, as it will of course run in a Loop.
"#" - this Option will reduce the Border of the Target Area by 2 Pixels in all directions.
"**##**" - using multiple "#" will reduce the Border of the Target Area by 2 Pixels times the number of "#" in all directions. If you use "##" it will decrease the target size by 4 Pixel.
"**#8**" - using "#" followed by a numeric value, the border of the Target Rectangle will be decreased by the given Amount of Pixels. In this case the border would be decreased by 8 Pixels, from any direction.

You can omit the Quadrant coordinates and just write (using any of the letters from above):

```
ILC.w
```

Then internally the command will complete the target with

```
ILC.w{A1,D4}
```

© 2023 Theo Gottwald * https://www.smart-package.com

General Usage is as simple as:

```
' Using ILC. with a Edit-Box from TestApp
'
STW.ct|PBWindowClass:0|TestApp
SCW.nict|1|1023|Edit|{&NOTEXT:}
' Clear Edit-Box
SDT.
ILC.
  VAR.$$LAA=1
ELS.
  VAR.$$LAA=0
EIF.
MBX.Result is $$LAA
' Now we write into the Edit-Box
SDT.Hallo
ILC.
  VAR.$$LAA=1
ELS.
  VAR.$$LAA=0
EIF.
MBX.Result is $$LAA
ENR.

STW.ct|MyClassName|Sample Application
'SCW.nct|1|Edit|{&NOTEXT:}
:again
PAU..1
ILC.|&HFF0000|0|4
  DMP.6
  MBX.!
ELS.
  GTO.again
EIF.
:over
ENR.
```

Using local (window-) coordinates:

If you prefix the coordinates with a "w" then they will be interpreted as local window coordinates. Like in this example:

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
MMV.
:again
PAU..1
ILC.w1,1,10,10|!&HFFFFFF|0|3
  GTO.over
ELS.
  DMP.6
  GTO.again
EIF.
:over
DMP.6
MBX.Ready
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

Using SPR 3.6 Quadrant-Coordinates

```
' Looks like this
ILC.{D3}|$$COL|$$TOL
  DBP. 1
ELS.
  DBP. 0
EIF.
```

Parameter 2 - Color:

If this color is found along the defined Line then the decision will switch to "true". Colors can most easily be described as a HEX-Number, like this example:

```
&HFFEE22
&HRRGGBB
```

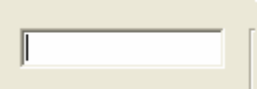
If you prefix the color-parameter with a "**!**" (NOT Operator) then the command will count all Pixels that do NOT have that defined color and tolerance.
Please note that this is different from the `NLC.`-command, which gives you additional options.

Parameter 3 - Color Tolerance:

If there are different graphic cards used, the pixels may not become rendered always in the exactly same way. Therefore the color tolerance gives you the chance to tell the robot "How sensitive" he should be when deciding **if a pixel is different or not.**
To make this decision, the robot will take the color of both pixels and calculate their "Color distance", that is "How similar the colors are". As a result he will get a number that can vary from 0 to 441673. Next Smarty will get your tolerance value and check if the calculated color distance is inside the chosen tolerance or not. Alternatively you can use a percentage value, if you add a %-sign after the number.

Parameter 4 - Hits-Counter:

Imagine a Textbox like this:



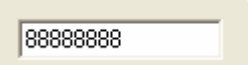
You want to wait until there is a text inside, but the blinking cursor should **not** make your Script react. Now what you tell Smarty is a "Hit Count" of lets say 12 Pixels.

This Script will switch, after you really typed "`88888888`" into the first, left textbox.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
:again
PAU..1
ILC.|0|0|12
  GTO.over
ELS.
  GTO.again
EIF.
:over
ENR.
```



This makes Smarty count the changed pixels, and only if she gets more then "Hit Count" she will switch. Otherwise the condition will not become true, even if there are changed pixels (but less).

The "negative Mode" using the "!" NOT Operator

Instead of counting the Pixels that do have a defined color, you can also do the opposite.
You can count the Pixel that do NOT have that defined color.
This is done, by prefixing the "Color-Parameter" with a **!**.
Like in this example.

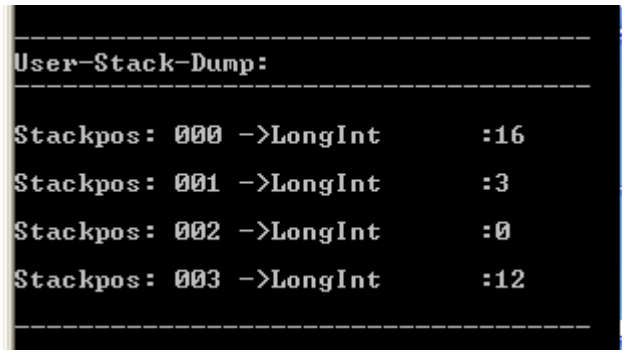
```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
:again
PAU..1
ILC.|!&HFFFFFF|0|12
  GTO.over
ELS.
  DMP.6
  GTO.again
EIF.
:over
ENR.
```

The Stack when using ILC.

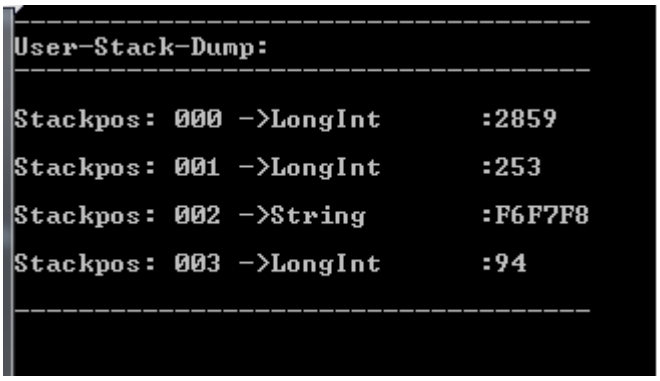
In case of success, `ILC.` will leave **four values on the stack**. As you can see below, these are:

```
TOS: X-Position of first found Hit
001: Y-Position of first found Hit
002: Color of first found Hit
003: Number of found Pixel meeting the condition
```

© 2023 Theo Gottwald * https://www.smart-package.com



Here is another example.
The color is in hexadezimal in RRGGBB.



And there is `NLC.`

`NLC.` is the negative version "If Not Line Color".

Syntax

```
ILC.[w/t/c/o][P1][|P2][|P3]…
ELS. … EIF.
```

Parameter Explanation

P1 **-** ***(optional)*** Start and End-Points of the Line. There are different possible Formats for these Coordinates. For details see description above. You can use:
"**w**" - Any window (Top- or Child-Window) that was last located
"**t**" - last located Top-Window
"**c**" - use Client-Coordinates of tzhe specified window. If no window is specified "w" is used as default.
"**o**" - use the last defined Object-Coordinates (window, Accessible Object or graphical Object).
You can combine the letters as far as it makes sense:
"**wc**" - use last windows Client-Coordinates
"**tc**" - use last Top-windows Client-Coordinates

© 2023 Theo Gottwald * https://www.smart-package.com

at this place you can add 2 Special Characters:
"**@**" - Enable Debug Option. Using this special Character will open a Window that shows the part of the Screen that is used for the Command. Be careful, when using `WRC.` with this Option, as it will of course run in a Loop.
"**#**" - this Option will reduce the Border of the Target Area by 2 Pixels in all directions.
"**##**" - using multiple "#" will reduce the Border of the Target Area by 2 Pixels times the number of "#" in all directions. If you use "##" it will decrease the target size by 4 Pixel.
"**#8**" - using "#" followed by a numeric value, the border of the Target Rectangle will be decreased by the given Amount of Pixels. In this case the border would be decreased by 8 Pixels, from any direction.

With out the leading "`w`", any coordinates are Screen-Coordinates. Its best practice, to prefer Child-Window-relative coordinates:
`ILC.w18,56,153,57|$$COL|$$TOL`

You can simply specify the start and end-point. In this format:
`ILC.x1,y1,x2,y2`
a real example would be:
`ILC.10,15,100,200`
Or you can specify a Rectangle, using only 3 Numbers like:
`ILC.10,15,100`
then `y2` is assumed to be the same as `y1.`

You can also use 3.6 Using Quadrant-Coordinates 356.
In this case the Line will be drawn from the upper-left corner straight to the lower right corner.

```
ILC.{D1,D2}|$$COL|$$TOL
ILC.{B1}|$$COL|$$TOL
```

If **P1** is omitted the Rectangle from the last localized Object or window is taken, same as "w".

P2 - (optional) numeric/variable contains the color value to scan for.

P3 - (optional) numeric/variable contains the Tolerance to be used when checking if a color is different. You can specify the color tolerance as a numeric value from 0 - `441673`, or you can specify a percentage from `0%` to `100%`. If you specify a percentage, just add the **%** Sign after the number. The color tolerance is the maximum allowed Color-Distance between two colors. The maximum color distance is **441673** that is the **distance between black and white**. If you omit this parameter, the system will use a zero Tolerance. In this case the colors are just "equal or not equal".

P4 - (optional) numeric/variable contains the minimum number of "Hits" that are pixels that have to be different to make the decision to become "`true`".

`ILC.`'s can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or `FEX.` (Enumerations) to unlimited Depth.

3.55.6.3 IPC. / NPC. - If-Pixel-Colour

MiniRobotLanguage (MRL)

IPC. / NPC. Conditional Statement

If Pixel Color

Intention

Conditional Statement. Test if a specified screen-pixel has a specified color or not. Useful in cases, where the window controls can not be accessed in any other way.

This command provides a lot of operation modes, to be as compatible as possible with changing desktop-themes, different video-cards etc. After all, this command should only be used as the last choice if nothing else will help you.
The reason is, that any dependency on pixel-colors may not work in cases of changing resolution, other **dpi**-settings or other video-cards or drivers.

Therefore it is recommended that you locate the pixel always window-relative instead of using screen coordinates. This is done if you specify the **|o** before the comma separated coordinates. In that case, the coordinates will be relative to the last located child- or top-window. Let's start with the very simple case of:

```
' Check if the colors will match exactly!
IPC.o|23,34|=$$COL
   DBP.I am in here!
EIF.
```

You can use the = (equal) or the ! (unequal) operator to check an exact match of colors.

```
 IPC.[o]|x,y|Formula
 IPC.o|23,34|=COL ' equal
 IPC.o|23,34|!COL ' unequal
```

In real life, white is not always white (`&HFFFFFF`). And black is not always really black (`&H0`). There need to be tolerances. They are implemented using the **w** (RGB<5) and the **b** (RGB>252) operators.

```
IPC.o|23,34|=w ' Is white
IPC.o|23,34|=b ' Is Black
IPC.o|23,34|=!w ' Is not white
IPC.o|23,34|=!b ' not black
```

Sometimes, you just need to know if a color is lighter or darker then another color. This is done by adding the RGB values and comparing the results.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
IPC.o|23,34|<COL ' dunkler als COLOR
IPC.o|23,34|>COL ' heller als COLOR
```

Many times, we are only interested if the red, green or blue part of a color is lighter or darker then a reference. Often that is a better indicator then the overall color. For these cases you can just add a letter:

```
IPC.o|23,34|=[rgb]COL
IPC.o|23,34|<[rgb]COL ' dunkler als COLOR
IPC.o|23,34|>[rgb]COL ' heller als COLOR

which would look like these example:

' weniger rot als COLOR
IPC.o|23,34|<r$$COL
   DBP.less red in here!
EIF.

' mehr grün als COLOR
IPC.o|23,34|>g$$COL
   DBP.More green in here!
EIF.
```

But now its gets even more compatible and interesting. To eliminate the problems i have told you above, there are more options.

```
' max. difference in % for r,g and b
' here we choose 20% max. difference
 IPC.o|23,34|~$$COL,20

' max. difference in % for r,g and b
' here we choose 15% max. difference
 IPC.o|23,34|~rgb$$COL,15

' max. difference in % for r and g
' here we choose 20% max. difference
 IPC.o|23,34|~rg$$COL,20

' max. difference in % for r only
' here we choose 20% max. difference
 IPC.o|23,34|~r$$COL,20

' max. difference in % for g only
' here we choose 20% max. difference
 IPC.o|23,34|~g$$COL,20

' max. difference in % for g and b
' here we choose 7% max. difference
 IPC.o|23,34|~gb$$COL,7

' max. difference in % for r and b
' here we choose 10% max. difference
 IPC.o|23,34|~rb$$COL,10
```

© 2023 Theo Gottwald * https://www.smart-package.com

Now we come to a very unique feature of IPC. It knows the system-colors of the actual system, its running on! You can find a table with the numbers of the system colors below "Parameters". As you can see, Nr.15 is:

```
15 = Face color for three-dimensional display elements and
     for dialog box backgrounds.
```

Now we can use these system colors directly with IPC, and NPC. using the "**S**" prefix. Here is an example, that checks if the button is there. It checks if the point has the system color it should have at this place. This is a large step ahead to make IPC. more usable even in Software distribution. Because using the "**S**" prefix, it can adapt to individual system colors!

```
STW.t|testap
SCW.ct|button|1
' Prüfen ob Farbwert mehr als 10% abweicht
IPC.o|116,38|s15
  MBX.$$CNT-$$000
EIF.
END.
```

For usage in browser-windows, take a look at the possibility of

```
' choose if the pixel is white or not
IPC.o|x,y,|!w
```

The color of the specified pixel is always placed on the actual stack. The **~** Operator can be used to check if a color is near - but not exact a given value.

This helps to make automations more compatible using different graphics-cards.

Negative form of this command is NPC.

Syntax

IPC.[P1]|P2|P3|P4 ELS. … EIF.

Parameter Explanation

P1 - (optional) can be:

```
r - do relative Movement from actual point
c - use child-coordinates
o - use coordinates from actual window whatever
t - use actual top-window coordinates
s - screen coordinates (default if omitted)
```

P2 **-** Variable[Operator]Variable

© 2023 Theo Gottwald * https://www.smart-package.com

P3 **-** Options:

```
If Parameter "sxx" is used, there are 30 possible system-
colors which can be used to compare with the found pixel-
color. Value B for Black or W for white is also possible.

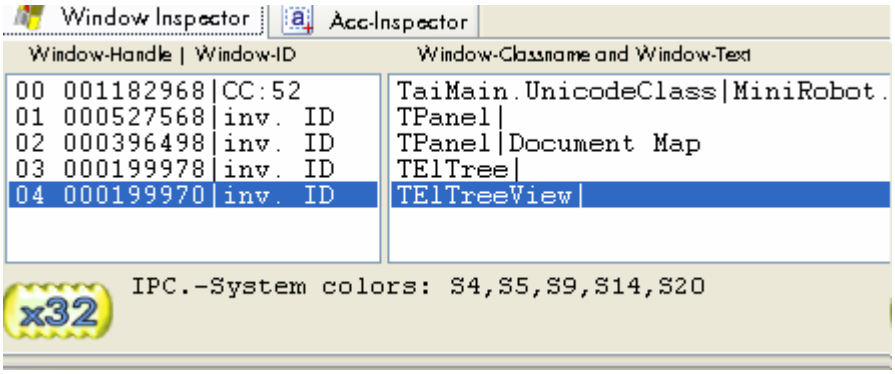
Please use the numeric value instead of the "xx" in "sxx".

 0 = Scroll bar gray area.
 1 = Desktop-color
 2 = Active window title bar. Also specifies the left side
     color in the color gradient of an active window's title
     bar if the gradient effect is enabled.
 3 = Inactive window caption. Also specifies the left side
color
     in the color gradient of an inactive window's title bar
if
     the gradient effect is enabled.
 4 = Menu/Messagebox  background.
 5 = Window and Button background.
 6 = Window frame.
 7 = Text in menus and Messageboxes.
 8 = Text in windows.
 9 = Text in caption, size box, and scroll bar arrow box.
 10 = Active window border.
 11 = Inactive window border.
 12 = Background color of multiple document
      interface (MDI) applications.
 13 = Item(s) selected in a control.
 14 = Text of item(s) selected in a control.
 15 = Face color for three-dimensional display elements and
      for dialog box backgrounds.
 16 = Shadow color for three-dimensional display elements
      (for edges facing away from the light source).
 17 = Grayed (disabled) text. This color is set to 0
      if the current display driver does not support
      a solid gray color.
 18 = Text on push buttons.
 19 = Color of text in an inactive caption.
 20 = Highlight color for three-dimensional display elements
     (for edges facing the light source.)
 21 = Dark shadow for three-dimensional display elements.
 22 = Light color for three-dimensional display elements
     (for edges facing the light source.)
 23 = Text color for tooltip controls.
 24 = Background color for tooltip controls.
 26 = Color for a hyperlink or hot-tracked item.
 27 = Right side color in the color gradient of an active
      window's title bar. Nr.2  specifies the left side color.
 28 = Right side color in the color gradient of an
      inactive window's title bar. Nr. 3 specifies the
      left side color.
 29 = The color used to highlight menu items when the menu
      appears as a flat menu. The highlighted menu item is
      outlined with Nr.13.
 30 = The background color for the menu bar when menus appear
```

© 2023 Theo Gottwald * https://www.smart-package.com

as flat menus. Anyway Nr.4 continues to specify the background color of menu popups.

You can see the system color of the pixel, below the mouse cursor in the windows-analyzer.



P4 - Value*

IPC's can be nested to unlimited Depth, and they can also enclose Sub-Programm Calls or FEX. (Enumerations) to unlimited Depth.

Formats:

```
' IPC.[o]|x,y|Formula
' IPC.o|23,34|=COL ' EUQAL
' IPC.o|23,34|!COL ' NOT EQUAL
' IPC.o|23,34|=w ' ' Is white (R,G and B each > 252)
' IPC.o|23,34|=b ' ' Is black (R,G and B each < 5)
' IPC.o|23,34|!w ' ' Is not white (R,G and B each < 253)
' IPC.o|23,34|!b ' ' Is not black (R,G and B each > 4)
' IPC.o|23,34|<COL ' darker then COLOR
' IPC.o|23,34|>COL ' lighter then COLOR

' This version compares color with actual system colors
' IPC.o|23,34|sxx ' xx stands for a number from 0 to 30

' You can check the r or g or b part only
' IPC.o|23,34|=[rgb]COL
' IPC.o|23,34|<[rgb]COL ' r/g/b darker then COLOR
' IPC.o|23,34|>[rgb]COL ' R/g/b lighter then COLOR
' You can check for a maximum difference in %
' where 100% is 255
'
' IPC.o|23,34|~COL,Zahl 'max. difference in % for r,g and b
' IPC.o|23,34|~rgbCOL,Zahl 'max. difference in % for r,g and b
' IPC.o|23,34|~rgCOL,Zahl 'max. difference in % for r and g
' IPC.o|23,34|~rCOL,Zahl 'max. difference in % for r only
' IPC.o|23,34|~gCOL,Zahl 'max. difference in % for g only
' IPC.o|23,34|~gbCOL,Zahl 'max. difference in % for g and b
' IPC.o|23,34|~rbCOL,Zahl 'max. difference in % for r and b
```

3.55.6.4 IRA. / NRA. - If Rect altered

IRA. / NRA. - If Rectangular area Altered Previous 1816 Top 41 Next 1828

MiniRobotLanguage (MRL)

IRA. / NRA. Conditional Statement

If RECT Altered

Intention

Conditional Statement.

Test if an rectangular Area (RECT) that was previously defined using `RRA.` has changed.

General Usage is as simple as:

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
' Remember the Area
RRA.
' Now check if it has changed
IRA.
  DBP.Areaa ha changed!
ELS.
  DBP.Area has not changed!
EIF.
ENR.
```

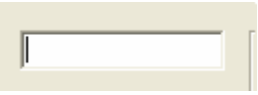
The two possible parameters are Color-Tolerance and Hit-Counter.

Color Tolerance:

If there are different graphic cards used, the pixels may not become rendered always in the exactly same way. Therefore the color tolerance gives you the chance to tell the robot "How sensitive" he should be when deciding **if a pixel is different or not.**
To make this decision, the robot will take the color of both pixels and calculate their "Color distance", that is "How similar the colors are". As a result he will get a number that can vary from 0 to 441673. Next Smarty will get your tolerance value and check if the calculated color distance is inside the chosen tolerance or not.

Hits-Counter:

Imagine a Textbox like this:



© 2023 Theo Gottwald * https://www.smart-package.com

You want to wait until there is a text inside, but the blinking cursor should **not** make your Script react. Now what you tell Smarty is a "Hit Count" of lets say 100 Pixels.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
RRA.
:again
PAU..1
IRA.0|100
  GTO.over
ELS.
  GTO.again
EIF.
:over
ENR.
```

This makes Smarty count the changed pixels, and only if she gets more then "Hit Count" she will switch. Otherwise the condition will not become true, even if there are changed pixels (but less).

`NRA.` is the negative version "If Not Rect altered".

Syntax

IRA.[P1][|P2]... ELS. ... EIF.

Parameter Explanation

P1 **-** ***(optional)*** numeric/variable contains the Tolerance to be used when checking if a color is different. You can specify the color tolerance as a numeric value from 0 - 441673, or you can specify a percentage from `0%` to `100%`. If you specify a percentage, just add the **%** Sign after the number. The color tolerance is the maximum allowed Color-Distance between two colors. The maximum color distance is **441673** that is the **distance between black and white**. If you omit this parameter, the system will use a zero Tolerance. In this case the colors are just "equal or not equal".

P2 **-** ***(optional)*** numeric/variable contains the minimum number of "Hits" that are pixels that have to be different to make the decision to become "`true`".

`IRA.`'s can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or `FEX.` (Enumerations) to unlimited Depth.

Example

```

3.55.6.5 IRC. / NRC, - If Rect Color

MiniRobotLanguage (MRL)

IRC. / NRC. Conditional Statement

If Rectangular Area Color

Intention

Conditional Statement.

Test if an defined Color is been found inside a defined rectangular area. The Scanning is done from left to right, and top to bottom.
The first point that fits the criteria is been returned. Then you can move the mouse to that point - for example.

Or, test colors inside a defined rectangular area, if they do not match a defined color. This is done using the "**!**" Operator.

`IRC.` can also be used to locate an colored object in a window. For example if you have a graphics with red dots somewhere in a window, you can use `IRC.` to locate such a red dot. This can be done, because `IRC.` leaves you the Screen-Coordinates of the first found pixel on the Stack.

Important: Color-Operations are often troublesome because colors may not match exactly. Therefore this command provides you with a "Color Tolerance" Option.
Also you have the choice of using a "negative version" which will just check that colors do NOT match a given color/tolerance. And you can combine all this, with the resolution independent SPR 3.6 Using Quadrant-Coordinates 356 to make your Scripts run as compatible as possible.

The **four parameters** are line-coordinates, Color, Color-Tolerance and Hit-Counter.

Parameter 1 - Line-Coordinates:
The Line is defined by a Start- and and Endpoint. Using the following Format:

```
IRC.x1,y1,x2,y2
```

Instead of using Screen-Coordinates, you should prefer to use Coordinates of the last located window/object.
This is done by prefixing the coordinates with a letter. You can use:

"**w**" - Any window (Top- or Child-Window) that was last located
"**t**" - last located Top-Window
"**c**" - use Client-Coordinates of tzhe specified window. If no window is specified "w" is used as default.

© 2023 Theo Gottwald * https://www.smart-package.com

"**o**" - use the last defined Object-Coordinates (window, Accessible Object or graphical Object).
You can combine the letters as far as it makes sense:
"**wc**" - use last windows Client-Coordinates
"**tc**" - use last Top-windows Client-Coordinates

at this place you can add 2 Special Characters:
"**@**" - Enable Debug Option. Using this special Character will open a Window that shows the part of the Screen that is used for the Command. Be careful, when using `WRC.` with this Option, as it will of course run in a Loop.
"#" - this Option will reduce the Border of the Target Area by 2 Pixels in all directions.
"**##**" - using multiple "#" will reduce the Border of the Target Area by 2 Pixels times the number of "#" in all directions. If you use "##" it will decrease the target size by 4 Pixel.
"**#8**" - using "#" followed by a numeric value, the border of the Target Rectangle will be decreased by the given Amount of Pixels. In this case the border would be decreased by 8 Pixels, from any direction.

You can omit the Quadrant coordinates and just write (using any of the letters from above):

```
ILC.w
```

Then internally the command will complete the target with

```
ILC.w{A1,D4}
```

As always, if you omit `y2` then `y2` is assumed to be equal to `y1`.

```
IRC.x1,y1,x2[,y2]
```

If you omit the coordinates, the last located window or other object-rectangle is been taken, and the line goes from the upper-left to the lower-right corner.

General Usage is as simple as:

```
STW.ct|MyClassName|Sample Application
'SCW.nct|1|Edit|{&NOTEXT:}
:again
PAU..1
IRC.|&H00|0|41
  DMP.6
  MBX.!
ELS.
  GTO.again
EIF.
:over
ENR.
```

Using local (window-) coordinates:

If you prefix the coordinates with a "w" then they will be interpreted as local window coordinates. Like in this example:

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MMV.
:again
PAU..1
IRC.w1,1,10,10|!&HFFFFFF|0|32
  GTO.over
ELS.
  DMP.6
  GTO.again
EIF.
:over
DMP.6
MBX.Ready
ENR.

' Scan the complete window to find this color
STW.ct|Chrome_WidgetWin| - Google Chrome
IRC.|&H723132
  $$XPO=$$000
  $$YPO=$$000
  MMV.$$XPO,$$YPO
ELS.
  MBX.No
EIF.

' Scan only a small box inside a window to find this color
STW.ct|Chrome_WidgetWin| - Google Chrome
IRC.w459,490,461,493|&HB3B3B3
  $$XPO=$$000
  $$YPO=$$000
  MMV.$$XPO,$$YPO
ELS.
  MBX.No
EIF.
```

Parameter 2 - Color:

If this color is found along the defined Line then the decision will switch to "true".
Colors can most easily be described as a HEX-Number, like this example:

```
&HFFEE22
&HRRGGBB
```

If you prefix the color-parameter with a "**!**" (NOT Operator) then the command will count all Pixels that do NOT have that defined color and tolerance.
Please note that this is different from the `NLC.`-command, which gives you additional options.

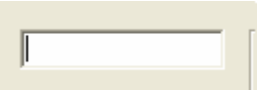
Parameter 3 - Color Tolerance:

*© 2023 Theo Gottwald * https://www.smart-package.com*

If there are different graphic cards used, the pixels may not become rendered always in the exactly same way. Therefore the color tolerance gives you the chance to tell the robot "How sensitive" he should be when deciding **if a pixel is different or not**.
To make this decision, the robot will take the color of both pixels and calculate their "Color distance", that is "How similar the colors are". As a result he will get a number that can vary from 0 to 441673. Next Smarty will get your tolerance value and check if the calculated color distance is inside the chosen tolerance or not.

Parameter 4 - Hits-Counter:

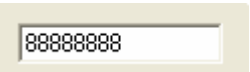
Imagine a Textbox like this:



You want to wait until there is a text inside, but the blinking cursor should **not** make your Script react. Now what you tell Smarty is a "Hit Count" of lets say 12 Pixels.

This Script will switch, after you really typed "88888888" into the first, left textbox.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
:again
PAU..1
IRC.|0|0|12
  GTO.over
ELS.
  GTO.again
EIF.
:over
ENR.
```



This makes Smarty count the changed pixels, and only if she gets more then "Hit Count" she will switch. Otherwise the condition will not become true, even if there are changed pixels (but less).

The "negative Mode" using the "!" NOT Operator

Instead of counting the Pixels that do have a defined color, you can also do the opposite.
You can count the Pixel that do NOT have that defined color.
This is done, by prefixing the "Color-Parameter" with a **!** .
Like in this example.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
:again
PAU..1
IRC.|!&HFFFFFF|0|12
  GTO.over
```

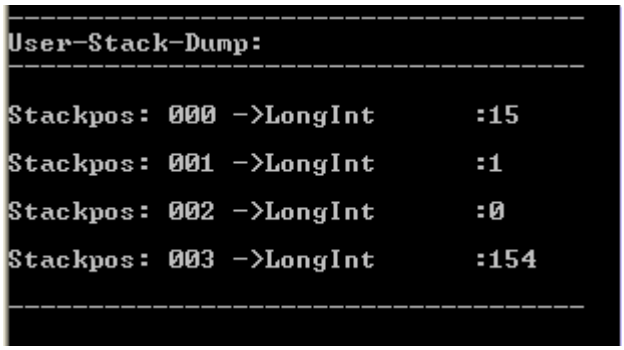
© 2023 Theo Gottwald * https://www.smart-package.com

```
ELS.
  DMP.6
  GTO.again
EIF.
:over
ENR.
```

The Stack when using IRC.

In case of success, `IRC.` will leave **four values on the stack**. As you can see below, these are:

```
TOS: X-Position of first found Hit
001: Y-Position of first found Hit
002: Color of first found Hit
003: Number of found Pixel meeting the condition
```



And there is NRC.

`NRC.` is the negative version "If Not Rect Color".

Syntax

IRC.[w][P1][|P2][|P3][|P4]…
ELS. … EIF.

Parameter Explanation

P1 **-** ***(optional)*** Upper-Left and lower right Coordinate Point of the rectangle. There are different possible Formats for these Coordinates. With out the leading "`w`", these are Screen-Coordinates.
Its best practice, to prefer Child-Window-relative coordinates:
`IRC.w18,56,153,57|$$COL|$$TOL`

You can simply specify the coordinates In this format:
`IRC.x1,y1,x2,y2`
a real example would be:

© 2023 Theo Gottwald * https://www.smart-package.com

```
IRC.10,15,100,200
```

Or you can specify a Rectangle, using Numbers like:

```
IRC.10,15,100
```

then `y2` is assumed to be the same as `y1`.

This will tell the command that we want to use the Quadrant in the last located window (child- or Topwindow).

You can use:

"**w**" - Any window (Top- or Child-Window) that was last located

"**t**" - last located Top-Window

"**c**" - use Client-Coordinates of tzhe specified window. If no window is specified "w" is used as default.

"**o**" - use the last defined Object-Coordinates (window, Accessible Object or graphical Object).

You can combine the letters as far as it makes sense:

"**wc**" - use last windows Client-Coordinates

"**tc**" - use last Top-windows Client-Coordinates

at this place you can add 2 Special Characters:

"**@**" - Enable Debug Option. Using this special Character will open a Window that shows the part of the Screen that is used for the Command. Be careful, when using `WRC.` with this Option, as it will of course run in a Loop.

"**#**" - this Option will reduce the Border of the Target Area by 2 Pixels in all directions.

"**##**" - using multiple "#" will reduce the Border of the Target Area by 2 Pixels times the number of "#" in all directions. If you use "##" it will decrease the target size by 4 Pixel.

"**#8**" - using "#" followed by a numeric value, the border of the Target Rectangle will be decreased by the given Amount of Pixels. In this case the border would be decreased by 8 Pixels, from any direction.

You can omit the Quadrant coordinates and just write (using any of the letters from above):

```
ILC.w
```

Then internally the command will complete the target with

```
ILC.w{A1,D4}
```

If omitted the Rectangle from the last localized Object or window is taken, same as "`W`".

P2 - (optional) numeric/variable contains the color value to scan for.

P3 - (optional) numeric/variable contains the Tolerance to be used when checking if a color is different. You can specify the color tolerance as a numeric value from 0 - `441673`, or you can specify a percentage from `0%` to `100%`. If you specify a percentage, just add the **%** Sign after the number. The color tolerance is the maximum allowed Color-Distance between two colors. The maximum color distance is **441673** that is the **distance between black and white**. If you omit this parameter, the system will use a zero Tolerance. In this case the colors are just "equal or not equal".

© 2023 Theo Gottwald * https://www.smart-package.com

P4 - (optional) numeric/variable contains the minimum number of "Hits" that are pixels that have to be different to make the decision to become "`true`".

`IRC.`'s can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or `FEX.` (Enumerations) to unlimited Depth.

Example

```
'**********************************
' IRC.-Sample
'**********************************
' Use "Sample Application"
' Click into the left Edit-Field
' and enter a large number
' to end the Loop

3.55.6.6 RRA. - Remember Rectangular Area

MiniRobotLanguage (MRL)

RRA. Command

Remember / store / administrate Rectangular Areas

Intention

`RRA.` remembers an defined Area. Later you can check if the Area has changed in any way using `IRA.` or `WRA.`

`RRA.` can remember several Areas and check if any of these is currently available, use the advanced `RRA.` -Options together with `IRA. or WRA.` for this.

`RRA.` can save and load Rectangular Regions into files. This way your Script can check for predefined graphical Patterns. As `IRA.` allows to specify a Color-Tolerance, there is no need to have a "Perfect Match" on the target side. You will just need to use the right values.

`RRA.` can store 9 Rectangular Pattern into 9 boxes. For this you can specify the number of the box, that you wish to use. In case you do not specify a number, **Box Nr.1 is the Standard Box that is been used in all operations of** `IRA.` **or** `WRA.` **etc..**

`RRA.` has features to manipulate those boxes and their content. Using these features, your target should be to move the Rect-Pattern that you need, into Box Nr.1 because this is where the `WRA.` and the `IRA.` can use it.

What is it good for?

Take for example a Form (Class "`Sunawt`" for example), where the robot is unable to detect if a button has appeared or not.
The Installation-Program is running an undefined time, when it ends, that button appears. You can see it, but the robot may under seldom circumstances be unable to see that button.

Now comes `RRA.` and `WRA.`
These commands are just for these cases where all other commands do fail.

`RRA.` will store a copy of the window or a part of it.
`WRA.` will hold your Script as long as "it did not change". Until something happens.

Built-in Safety Belt
Sometimes windows redraws content that is inside a window, that you might be watching for changes using `WRA.` To avoid such a Redraw/Refresh to fool your Script that "something has changed", the `WRA.` command has a built-in safety mechanism.

*© 2023 Theo Gottwald * https://www.smart-package.com*

It will check 3 times within 75 ms, and all three checks need to bring results that do differ from the original Pattern.

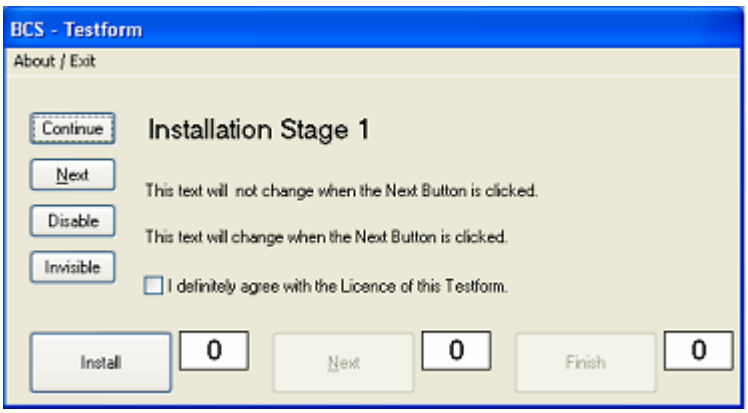
Hint: When using `RRA.`

Here are the modes of operation for `RRA.`:

```
' Using RRA. without any Parameter
RRA.
```

In this case `RRA.` will Remember the "Client-Area" of the actual Top/Childwindow.

Take this window for example:



In the picture below i have marked the "Client-Area" in yellow color, and the "Non-Client-Area" in Orange Color.

For more infos regarding the "Client" and the "Non-Client Area" see here:
1.8.1 The "Client" and the "Non-Client" Parts of a window 156

`RRA.` can be used with graphical or accessible Objects also.

You can also use `RRA.` with graphical or Accessible Objects, that are no windows. Like in this example.

Therefore it can also be used in Browser and Office-Programs.

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.ct|PBWindowClass:0|BCS - Testform
AGR.|&EXACT:Install
MMV.
RRA.
RRA.getpos|$$POS
DBP.$$POS
ENR.
```

Always specify a window or Rectangle directly before the RRA. command

```
' Right.
STW.ct|Chrome_WidgetWin| - Google Chrome
RRA.w20,552,22,552
WRA.

' This will locate an Actual Point somewhere
WLC.w270,821,971,821|&H0
RRA.clear

' Wrong.
' Thats why this has no more window
' Therefore it would use the Desktop-Window at these
coordinates
' Thats why you should always use STW. / SCW. directly before
the RRA.
RRA.w20,552,22,552
WRA.

' To watch an Edit-Control for getting the input Focus you
could use:
%T_RunTestApp 246
%Loc_Edit
RRA.Client
WRA.

' This would include the Edges of the window in the case of an
edit-box
%T_RunTestApp 246
%Loc_Edit
RRA.Window
WRA.

' This will show the coordinates of the window that is watched
(Screen coords)
%T_RunTestApp 246
%Loc_Edit
RRA.Client
RRA.XSize|$$XSA
RRA.YSize|$$YSA
RRA.XPos|$$XPO
RRA.YPos|$$YPO
DBP.$$XSA,$$YSA-$$XPO,$$YPO
WRA.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

RRA.[P1][|P2][|P3]

Parameter Explanation

P1 – (optional) can be an prototype or screen coordinates of a rectangle.

If you use `RRA.` without any parameter, the actual window is been used. It can be a Top- or a child-window. If a Top-Window is used, `RRA.` tries to only remember the Client-Area of the window. This excludes the window borders.

Using a **Rectangle in screen coordinates.** Example(s):

```
' If you just write coordinates, these will be interpreted
' as screen coordinates:
 RRA.100,150,200,200
' If you specify 3 coordinates only, y2 will be assumed to
' be eqal to x2
 RRA.100,150,200
```

You can specify in which "box" you want the area to be stored. Just use **P2** for this:

```
RRA.(rect)|$$NUM
```

You can specify a "w" infront of the coordinates to have window coordinates used.

```
RRA.w10,20,30,40|$$NUM
```

Prototypes:

The following Prototypes are currently implemented:

Clear - clear all Boxes from 1 - 9.

```
RRA.Clear
' Will just clear the specified Box:
RRA.Clear|$$NUM
```

Client - Use last localized Top or Childwindow-Borders

```
RRA.Client
```

Window - use Borders from last localized Element to fill `Box(1)`

```
RRA.Window
```

ToVar - this will store Box(**P2**) into a variable.
P2 is the number of the box to use. **P3** is the Variable-Name where things will be stored.

```
RRA.toVar|$$NUM|$$VAR
```

FromVar - this will restore the Data from a variable into the Box(**P2**), It is for use, together with "`ToVar`". **P2** is the number of the target box to use.

© 2023 Theo Gottwald * https://www.smart-package.com

P3 is the Variable with the Area-Data, that was created using "`ToVar`"..

```
RRA.toVar|$$NUM|$$VAR
RRA.fromVar|$$NUM|$$VAR
```

Swap - this will exchange the contents of Box(1) with the content of Box(`$$NUM`).

```
RRA.Swap|$$NUM
```

if you specify a second parameter, the content of these two boxes will be exchanged.

```
RRA.swap|$$NUM|$$NUA
```

Get - copies Box Nr. `$$NUM` into `Box(1)`. `Box(1)` is is been overwritten. `Box($$NUM)` is still available.

```
RRA.get|$$NUM
```

Store - Backup-Copy `Box(1)->Box($$NUM)`

```
RRA.store|$$NUM
```

RemPos - Use Rempos, the locate another Element. The stored Rect will be applied to the coordinates of this new element.
This will remove the positional information from the rectangle in box Nr. `$$NUM`. In case the window was moved, the the position information is not more accurate, because its stored in screen coordinates. This way you can mark the positional Informations as "invalid". The rectangular data can still be used, if a new position is given. If you omit `$$NUM` then box Nr.1 is used.

```
RRA.rempos|$$NUM
```

NewPos - Set a new position to an existing Box: Use Screen-coordinates, You can only change the position but never the size of a stored Area.

```
RRA.NewPos|$$NAM|$$XPO|$$YPO
```

GetPos - get the Position-Data (in screen coordinates) of the stored Area in Box(1) into Variable `$$VAR`. Format is X-Pos,Y-Pos.

```
RRA.GetPos|$$RES[|$$NUM]
```

XPos – get the X-Position of the (upper left corner of the) Area in Box Nr.1 into Variable `$$VAR`.

```
RRA.XPos|$$RES
```

YPos – get the Y-Position of the (upper left corner of the) Area in Box Nr.1 into Variable `$$VAR`.

```
RRA.YPos|$$RES
```

Size – get the size of the stored Area in Box(1) into Variable `$$VAR`. Format is X-Size,Y-Size.

```
RRA.size|$$RES
```

XSize – get the X-Size of the stored Area in Box(1) into Variable `$$VAR`.

```
RRA.xsize|$$RES
```

YSize – get the Y-Size of the stored Area in Box(1) into Variable `$$VAR`.

```
RRA.ysize|$$RES
```

P2, ***P3***, ***P4*** – (optional) - content of these parameters depend on the prototype in **P1**.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' RRA./WRA.-Demo
'**********************************
' You need to start the BCS:-Testform (Sample Apps)

' Move the mouse over the checkmark to have the
' Mouseover effect. This will make WRA. to switch.
'
STW.ct|PBWindowClass:0|BCS - Testform
SCW.nct|1|Button|I definitely agree with the Licence
' Watch the Checkmark
RRA.
' Wait until something changes in that rectangular area
WRA.
ENR.

'**********************************
' RRA.-Demo
'**********************************
' You need to start the BCS:-Testform (Sample Apps)
' for this Sample.
'
STW.ct|PBWindowClass:0|BCS - Testform
SCW.nct|1|Button|I definitely agree with
RRA.
RRA.getpos|$$POS
DBP.$$POS
ENR.
```

Remarks

To make sure that "Redrawing Effects" can not fool `WRA.`, `WRA.` has a built-in 75 ms security mechanism. That means, that there will be 3 checks done within 75 ms.
In these checks, all 25 ms the Area is been compared to the Original Area, and each time the Area must be different from the original Pattern that was captured using `RRA.`
This is done, to prevent a normal Refresh of a window to be taken as a "Ready Signal". Only if `WRA.` is sure, `WRA.` will switch and let the Script continue running.

While `RRA.` can actually hold up to 9 Rectangular Areas, there is also a "hidden" tenth box, **Box. Nr.0**, that you should not use in regular cases. This is the box where the last snaphot from the last call to `IRA.` / `WRA.` is internally stored.

Limitations:

3.55.6.7 SPC. - Set-Pixel-Colour

MiniRobotLanguage (MRL)

SPC. Command

Set Pixel Colour

Intention

SPC will set the color of a Screen-Pixel non-permanent. You can specify coordinates in Screen-, or as window-coordinates.

For drawing on any background, you can just omit the color value then the actual color of that point will be inverted.

Please prefer using the Drawing Commands from the ANA.-Command.
This Command is mostly for use with WLC. or IPC. etc.

Syntax

SPC.[P1][|P2,P3][|P4]

Parameter Explanation

P1 - (optional) prototype coordinates

```
Prototype can be omitted or any of:
 r - do relative Movement from actual point
 c - use child-coordinates
 o - use coordinates from actual window whatever
 t - use actual top-window coordinates
 l - when using "l", x and y values are ignored, and
internally
     calculated as the left side of the rectangle, where a
     checkmark could be. "l" - is for checkmarks.
 s - (default) use screen coordinates

If prototype is omitted, Screen-Coordinates are taken.
```

P2, P3 - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

P4 - the color to set the pixel to, if omitted actual pixel-color is inverted.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Instead of using separate variables for X and Y, you also use a Point-Variable, where x and y values are separated by a ",".

3.55.6.8 WLC. - Wait for Line Color

MiniRobotLanguage (MRL)

WLC. Wait Statement

Wait for Line Color

Intention

Wait for Condition Statement.

Wait until an defined Color is been found along a defined Line.

Or, Wait until colors along a given line do not match a defined color.
This is done using the "**!**" Operator.

Important: Color-Operations are often troublesome because colors may not match exactly. Therefore this command provides you with a "Color Tolerance" Option.
Also you have the choice of using a "negative version" which will just check that colors do NOT match a given color/tolerance. And you can combine all this, with the resolution independent SPR 3.6 Using Quadrant-Coordinates 356 to make your Scripts run as compatible as possible.

Parameter 1 - Line-Coordinates:
The Line is defined by a Start- and and Endpoint. Using the following Format:

```
WLC.x1,y1,x2,y2
```

Its best practice to always use window local coordinates. For this specify a small "w" just in front of the coordinates.

```
WLC.wx1,y1,x2,y2
```

As always, if you omit `y2` then `y2` is assumed to be equal to `y1`.
Also, you can simplify many tasks, by just using 3.6 Using Quadrant-Coordinates 356.
In this case do not specify the "`w`" as the Quadrants are always window local.

If you omit the coordinates, the last located window or other object-rectangle is been taken, and the line goes from the upper-left to the lower-right corner.

General Usage is as simple as:

```
STW.ct|MyClassName|Sample Application
'SCW.nct|1|Edit|{&NOTEXT:}
' Wait for Color "Black" (&H00) to appear inside the textbox
WLC.|&H00|0|4|60
DMP.6
MBX.!
ENR.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

The five parameters are line-coordinates, Color, Color-Tolerance and Hit-Counter and Timeout in Seconds.

Parameter 2 - Color:

If this color is found along the defined Line then the decision will switch to "true". Colors can most easily be described as a HEX-Number, like this example:

```
&HFFEE22
&HRRGGBB
```

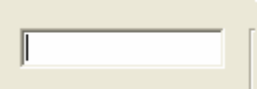
If you prefix the color-parameter with a "**!**" (NOT Operator) then the command will count all Pixels that do NOT have that defined color and tolerance.

Parameter 3 - Color Tolerance:

If there are different graphic cards used, the pixels may not become rendered always in the exactly same way. Therefore the color tolerance gives you the chance to tell the robot "How sensitive" he should be when deciding **if a pixel is different or not**.
To make this decision, the robot will take the color of both pixels and calculate their "Color distance", that is "How similar the colors are". As a result he will get a number that can vary from 0 to 441673. Next Smarty will get your tolerance value and check if the calculated color distance is inside the chosen tolerance or not.

Parameter 4 - Hits-Counter:

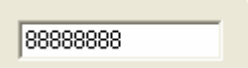
Imagine a Textbox like this:



You want to wait until there is a text inside, but the blinking cursor should **not** make your Script react. Now what you tell Smarty is a "Hit Count" of lets say 12 Pixels.

This Script will switch, after you really typed "88888888" into the first, left textbox.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
MMV.
WLC.|&H000|1|15|60
DMP.6
MBX.!
ENR.
```

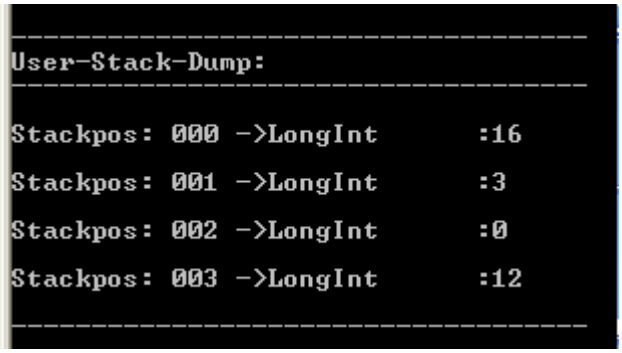


This makes Smarty count the changed pixels, and only if she gets more then "Hit Count" she will switch. Otherwise the condition will not become true, even if there are changed pixels (but less).

© 2023 Theo Gottwald * https://www.smart-package.com

In case of success, `WLC.` **will leave four values on the stack.** As you can see below, these are:

```
TOS: X-Position of first found Hit
001: Y-Position of first found Hit
002: Color of first found Hit
003: Number of found Pixel meeting the condition
```



The "negative Mode" using the "!" NOT Operator

Instead of counting the Pixels that do have a defined color, you can also do the opposite.
You can count the Pixel that do NOT have that defined color.
This is done, by prefixing the "Color-Parameter" with a **!**.
Like in this example.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
MMV.
WLC.|!&HFFFFFF|1|15|60
DMP.6
MBX.!
ENR.
```

Syntax

WLC.[w][P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 **-** ***(optional)*** Start and End-Points of the Line.
There are different possible Formats for these Coordinates.
With out the leading "w", these are Screen-Coordinates.
Its best practice, to prefer Child-Window-relative coordinates:
`WLC.w18,56,153,57|$$COL|$$TOL`

You can simply specify the start and end-point. In this format:

© 2023 Theo Gottwald * https://www.smart-package.com

`WLC.x1,y1,x2,y2`
a real example would be:
`WLC.10,15,100,200`
Or you can specify a Rectangle, using Numbers like:
`WLC.10,15,100`
then `y2` is assumed to be the same as `y1`.

You can also use 3.6 Using Quadrant-Coordinates 356.
In this case the Line will be drawn from the upper-left corner straight to the lower right corner.

```
WLC.{D1,D2}|$$COL|$$TOL|$$TIM
WLC.{B1}|$$COL|$$TOL
```

In the same way you can unse the large letter "`W`" or "`C`" and write:

```
ILC.W|$$COL|$$TOL|$$TIM
ILC.C|$$COL|$$TOL
```

If omitted the Rectangle from the last localized Object or window is taken, same as "`W`".

P2 - (optional) numeric/variable contains the color value to scan for.

P3 - (optional) numeric/variable contains the Tolerance to be used when checking if a color is different. You can specify the color tolerance as a numeric value from 0 - `441673`, or you can specify a percentage from `0%` to `100%`. If you specify a percentage, just add the **%** Sign after the number. The color tolerance is the maximum allowed Color-Distance between two colors. The maximum color distance is **441673** that is the **distance between black and white**. If you omit this parameter, the system will use a zero Tolerance. In this case the colors are just "equal or not equal".

P4 - (optional) numeric/variable contains the minimum number of "Hits" that are pixels that have to be different to make the decision to become "`true`".

P5 - (optional) numeric/variable contains the timeout time in seconds. After this time, the command will set the timeout-flag and just let the script go on running. You can ask for the state of the timeout-flag to find out, if a timeout happened or not.

Example

```
'**********************************
' WLC.-Sample
'**********************************
' Use "Sample Application"
'
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}

3.55.6.9 WRA. - Wait Rect-Area Altered

WRA. - Wait until Rectangular Area Altered **Previous** 1846 **Top** 41 **Next** 1856

MiniRobotLanguage (MRL)

WRA. Wait-Command

Wait until something in a rectangular area has changed

Intention

These command is just for these cases where all other commands do fail.

`RRA.` will store a copy (a Screenshot) of the window or a part of it.
`WRA.` will pause your Script as long as the stored Area "did not change".

This way you can wait until a program GUI reacts, even if you can not read any of the GUI Output in conventional way using other commands.

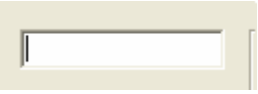
The first three possible parameters are Color-Tolerance and Hit-Counter.
The fourth Parameter is an optional Timeout in seconds.

Parameter 1 - Color Tolerance:

If there are different graphic cards used, the pixels may not become rendered always in the exactly same way. Therefore the color tolerance gives you the chance to tell the robot "How sensitive" he should be when deciding **if a pixel is different or not.**
To make this decision, the robot will take the color of both pixels and calculate their "Color distance", that is "How similar the colors are". As a result he will get a number that can vary from 0 to 441673. Next Smarty will get your tolerance value and check if the calculated color distance is inside the chosen tolerance or not.

Parameter 2 - Hits-Counter:

Imagine a Textbox like this:



You want to wait until there is a text inside, but the blinking cursor should **not** make your Script react. Now what you tell Smarty is a "Hit Count" of lets say 100 Pixels.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
RRA.
PAU..1
WRA.0|100
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

This makes Smarty count the changed pixels, and only if she gets more then "Hit Count" she will switch. Otherwise the condition will not become true, even if there are changed pixels (but less).

Parameter 3 - Wait-Timeout:

Imagine there is an Error somewhere in the target application. The reaction you are waiting for will never happen. This could make your script hang forever!
To avoid this, you have an "Timeout Option".
If you write an number here, it is a Timeout-Time in Seconds.
After this time has elapsed, the command will let the robot continue running, even if there has not been the change we have been waiting for.
In this case, the "Timeout Flag" will be set. In the normal case, the timeout flag will be cleared.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
RRA.
WRA.0|100
ITO
  DBP. Timeout, something went wrong!
ELS.
  DBP. All fine Script goes on.
EIF.
ENR.
```

Built-in Safety Belt
Sometimes windows redraws content that is inside a window, that you might be watching for changes using `WRA.` To avoid such a Redraw/Refresh to fool your Script that "something has changed", the `WRA.` command has a built-in safety mechanism. It will check 3 times within 75 ms, and all three checks need to bring results that do differ from the original Pattern.

Hint: When using `RRA.`

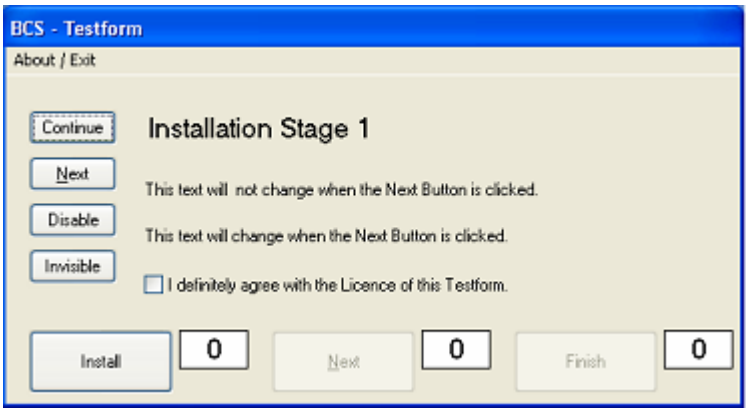
Here are the modes of operation for `RRA.`:

```
' Using RRA. without any Parameter
RRA.
```

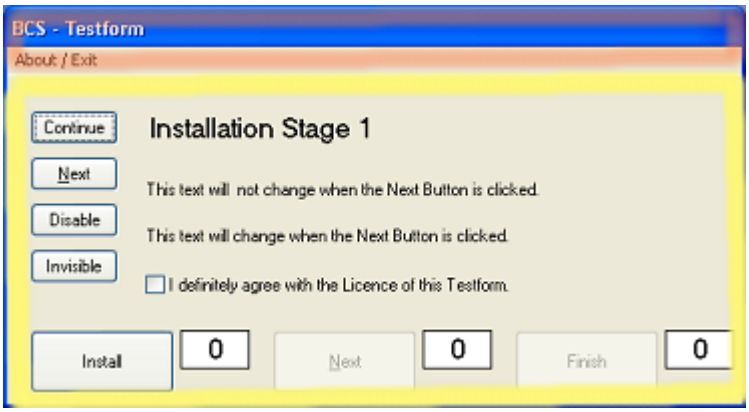
In this case `RRA.` will Remember the "Client-Area" of the actual Top/Childwindow.

Take this window for example:

© 2023 Theo Gottwald * https://www.smart-package.com



In the picture below i have marked the "Client-Area" in yellow color, and the "Non-Client-Area" in Orange Color.



For more infos regarding the "Client" and the "Non-Client Area" see here:
1.8.1 The "Client" and the "Non-Client" Parts of a window 156

WRA. can be used with graphical or accessible Objects also.

You can also use `WRA.` with graphical or Accessible Objects, that are no windows. Like in this example.

Therefore it can also be used in Browser and Office-Programs.

```
STW.ct|PBWindowClass:0|BCS - Testform
AGR.|&EXACT:Install
MMV.
RRA.
WRA.
RRA.getpos|$$POS
DBP.$$POS
ENR.
```

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

WRA.[P1][|P2][|P3]

Parameter Explanation

P1 **-** ***(optional)*** numeric/variable contains the Tolerance to be used when checking if a color is different. You can specify the color tolerance as a numeric value from 0 - 441673, or you can specify a percentage from `0%` to `100%`. If you specify a percentage, just add the **%** Sign after the number. The color tolerance is the maximum allowed Color-Distance between two colors. The maximum color distance is **441673** that is the **distance between black and white**. If you omit this parameter, the system will use a zero Tolerance. In this case the colors are equal or not equal.

P2 **-** ***(optional)*** numeric/variable contains the minimum number of "Hits" that are pixels that have to be different to make the decision to become "`true`".

P3 **-** ***(optional)*** numeric/variable contains the timeout time in seconds. After this time, the command will set the timeout-flag and just let the script go on running. You can ask for the state of the timeout-flag to find out, if a timeout happened or not.

Example

```
'**********************************
' WRA.-Demo
'**********************************
' You need to start the BCS:-Testform (Sample Apps)
' for this Sample.
' Move the mouse over the checkmark to have the
' Mouseover effect. This will make WRA. to switch.
'
STW.ct|PBWindowClass:0|BCS - Testform
SCW.nct|1|Button|I definitely agree with the Licence
' Watch the Checkmark
RRA.
' Wait until something changes in that rectangular area
WRA.
ITO.
  DBP.Timeout!
EIF.
ENR.

'**********************************
' WRA.-Demo
'**********************************
' You need to start the BCS:-Testform (Sample Apps)
' for this Sample.
'
STW.ct|PBWindowClass:0|BCS - Testform
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SCW.nct|1|Button|I definitely agree with
RRA.
WRA.
RRA.getpos|$$POS
DBP.$$POS
ENR.
```

Remarks

To make sure that "Redrawing Effects" can not fool `WRA.`, `WRA.` has a built-in 75 ms security mechanism. That means, that there will be 3 checks done within 75 ms.
In these checks, all 25 ms the Area is been compared to the Original Area, and each time the Area must be different from the original Pattern that was captured using `RRA.`
This is done, to prevent a normal Refresh of a window to be taken as a "Ready Signal".
Only if `WRA.` is sure, `WRA.` will switch and let the Script continue running.

While `RRA.` can actually hold up to 9 Rectangular Areas, there is also a "hidden" tenth box, **Box. Nr.0**, that you should not use in regular cases. This is the box where the last snaphot from the last call to `IRA.` / `WRA.` is internally stored.

Limitations:

-

3.55.6.10 WRC. - Wait Rect Color

MiniRobotLanguage (MRL)

WRC. Wait Statement

Wait for Color in Rectangular Areea

Intention

Wait for Condition Statement.
Wait until an defined Color is been found inside a defined rectangular area.
Or, Wait until colors inside a defined rectangular area do not match a defined color.
This is done using the "**!**" (not) Operator.

Important: Color-Operations are often troublesome because colors may not match exactly. Therefore this command provides you with a "Color Tolerance" Option.
Also you have the choice of using a "negative version" which will just check that colors do NOT match a given color/tolerance. And you can combine all this, with the resolution independent SPR 3.6 Using Quadrant-Coordinates 356 to make your Scripts run as compatible as possible.

This command is helpful to automate situations where no other command can locate a window or button.

Parameter 1 - Area-Coordinates:
The rectangular area is defined by a
- *the upper-left corner* and
- *the lower, right corner*
Using the following Format:

```
WRC.x1,y1,x2,y2
```

As always, if you omit `y2` then `y2` is assumed to be equal to `y1`.
Also, you can simplify many tasks, by just using 3.6 Using Quadrant-Coordinates 356.

If you omit the coordinates, the last located window or other object-rectangle is been taken, and the line goes from the upper-left to the lower-right corner.

General Usage is as simple as:

```
STW.ct|MyClassName|Sample Application
'SCW.nct|1|Edit|{&NOTEXT:}
:again
' Wait for Color "Black" (&H00) to appear inside the textbox
WRC.|&H00|0|4|60
DMP.6
MBX.!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

The five parameters are RECT-coordinates, Color, Color-Tolerance and Hit-Counter and Timeout in Seconds.

Parameter 2 - Color:

If this color is found inside the defined rectangular area then the decision will switch to "true". Colors can most easily be described as a HEX-Number, like this example:

```
&HFFEE22
&HRRGGBB
```

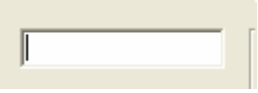
If you prefix the color-parameter with a "**!**" (NOT Operator) then the command will count all Pixels that do NOT have that defined color and tolerance.

Parameter 3 - Color Tolerance:

If there are different graphic cards used, the pixels may not become rendered always in the exactly same way. Therefore the color tolerance gives you the chance to tell the robot "How sensitive" he should be when deciding **if a pixel is different or not.**
To make this decision, the robot will take the color of both pixels and calculate their "Color distance", that is "How similar the colors are". As a result he will get a number that can vary from 0 to 441673. Next Smarty will get your tolerance value and check if the calculated color distance is inside the chosen tolerance or not.

Parameter 4 - Hits-Counter:

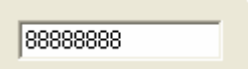
Imagine a Textbox like this:



You want to wait until there is a text inside, but the blinking cursor should **not** make your Script react. Now what you tell Smarty is a "Hit Count" of lets say 12 Pixels.

This Script will switch, after you really typed "`88888888`" into the first, left textbox.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
MMV.
WRC.|&H000|1|15|160
DMP.6
MBX.!
ENR.
```

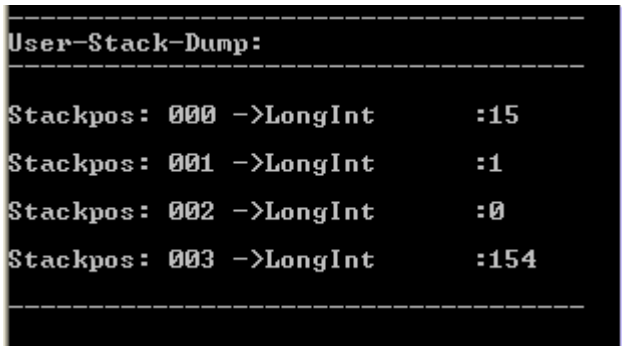


This makes Smarty count the changed pixels, and only if she gets more then "Hit Count" she will switch. Otherwise the condition will not become true, even if there are changed pixels (but less).

© 2023 Theo Gottwald * https://www.smart-package.com

In case of success, `WRC.` **will leave four values on the stack.** As you can see below, these are:

```
TOS: X-Position of first found Hit
001: Y-Position of first found Hit
002: Color of first found Hit
003: Number of found Pixel meeting the condition
```



The "negative Mode" using the "!" NOT Operator

Instead of counting the Pixels that do have a defined color, you can also do the opposite.
You can count the Pixel that do NOT have that defined color.
This is done, by prefixing the "Color-Parameter" with a **!**.
Like in this example.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
MMV.
WRC.|!&HFFFFFF|1|15|150
DMP.6
MBX.!
ENR.
```

Syntax

WRC.[w][P1][|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - (optional) Upper-Left and lower right Coordinate Point of the rectangle.
There are different possible Formats for these Coordinates.
With out the leading "w", these are Screen-Coordinates.
Its best practice, to prefer Child-Window-relative coordinates:
`WRC.w18,56,153,57|$$COL|$$TOL`

© 2023 Theo Gottwald * https://www.smart-package.com

You can simply specify the coordinates In this format:
`WRC.x1,y1,x2,y2`
a real example would be:
`WRC.10,15,100,200`
Or you can specify a Rectangle, using Numbers like:
`WRC.10,15,100`
then `y2` is assumed to be the same as `y1`.

You can also use 3.6 Using Quadrant-Coordinates 356.
In this case the Line will be drawn from the upper-left corner straight to the lower right corner.

```
WRC.{D1,D2}|$$COL|$$TOL|$$TIM
WRC.{B1}|$$COL|$$TOL
```

In the same way you can unse the large letter "`W`" or "`C`" and write:

```
WRC.W|$$COL|$$TOL|$$TIM
WRC.C|$$COL|$$TOL
```

If omitted the Rectangle from the last localized Object or window is taken, same as "`W`".

P2 - (optional) numeric/variable contains the color value to scan for.

P3 - (optional) numeric/variable contains the Tolerance to be used when checking if a color is different. You can specify the color tolerance as a numeric value from 0 - `441673`, or you can specify a percentage from `0%` to `100%`. If you specify a percentage, just add the **%** Sign after the number. The color tolerance is the maximum allowed Color-Distance between two colors. The maximum color distance is **441673** that is the **distance between black and white**. If you omit this parameter, the system will use a zero Tolerance. In this case the colors are just "equal or not equal".

P4 - (optional) numeric/variable contains the minimum number of "Hits" that are pixels that have to be different to make the decision to become "`true`".

P5 - (optional) numeric/variable contains the timeout time in seconds. After this time, the command will set the timeout-flag and just let the script go on running. You can ask for the state of the timeout-flag to find out, if a timeout happened or not.

Example

```

3.55.7 Pattern-Search

These Commands locate Patterns that have been recorded before.

They are similar to the Pattern-Commands that are available with the ANA.-Command.

Here the most used Parameters can be set as "default" using the

SFP. - Command (Set Find Pattern Parameters) 1899
GFP. - Command (Get Find Pattern Parameters) 1869

therefore the Pattern-Commands can be used with only very few Parameters.

The Pattern Commands of this Group include:

JFP. / JNP. - Jump if Pattern (not) found 1881
IFP. - NFP. (Not) If Pattern Found 1873

LFP. - Locate Find Pattern 1890

and

CFP. - Case Find Pattern 2993

The CFP.-Command is documented in the Section with the SCS.-Command 2982

From all these Commands there is a version that can search for 2 Pattern in one run.
These are the Versions with a "T": LTP. , JTP, etc.

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.7.1 ! How to record Patterns

Supported Pattern-Sizes

The following Pattern-Sizes are supported:

```
4x16
4x32
4x64
8x8
8x16
8x32
8x64
9x9
10x10
11x11
12x12
16x8
24x8
32x4
32x8
32x16
40x8
48x8
56x8
64x6
64x8
96x4
96x8
98x6
128x4
128x8
```

The "Debug-Flag"

The Debug Flag has been constantly enhanced during development. Currently the following Options are supported:

1 - Switch Debug Console ON

2 - Use "Snap again" during Search. This will update the Snapshot using the Parameters from the last taken Snapshot.

4 - Use "X-Ray Search". This will start an enhanced search that is more color-independent and takes much longer time.
Especially together with Option "64 -Extended Search" it may find a lot more results.
Using this Option, the most upper Line and the most left Line are ignored.
Therefore this Option will reduce the effective Pattern-Size by -1 in X- and Y-Direction.
For example a Pattern that was size "8x8" will be a Pattern size "7x7", this is important when you specify needed "Pixelhits".

*© 2023 Theo Gottwald * https://www.smart-package.com*

8 - If added, this will disable one Layer of "Fuzzy-Logic". This Flag will make the Search more sensitive to small color-differences

16 - If used, this Flag will internally invert the Images. Use it preferably with Option "4 - X-Ray Search".

32 - If used, this Flag will internally complement the Images. Use it preferably with Option "4 - X-Ray Search".

64 - "Extended Search". This search uses longer time, but returns more results. Use it preferably with Option "4 - X-Ray Search"

Use Picture-File as Pattern

Generally you can use any picture file for the Pattern-Search commands.
Please be aware that the resolution of the picture in the Image Register must be one of the allowed Pattern Resolutions.
Please use only Picture-File Formats that do compress losseless.
Lossless compression reduces file size without removing any bits of information. These are for example: ".bmp", ".png".
Do not use: ".jpg".

For this specify a Filepath/Filename.

```
$$FIL=?pattern\MyPattern.bmp
LFP.$$FIL
```

Use Inline-Data Pattern

You can use Inline Data for the Pattern-Search commands.
Instead of specifying a Filepath/Filename, you just specify

```
LFP.ID:$$DTA
```

The term ID: tells the Robot that the following variable contains Inline-Data.
And therefore will only be carefully binary resolved.

Use Image-Register as Pattern

You can use a Picture that is in teh Image-Register for the the Pattern-Search commands.
Please be aware that the resolution of the picture in the Image Register must be one of the allowed Pattern Resolutions.
Instead of specifying a Filepath/Filename, you just specify

```
LFP.IR:($$Num+1)
```

The term IR: tells the Robot that the following variable is numeric and specifies the Image-Register Number to use..

How to record Patterns

When recording a Pattern you should take a few things into account if you want the Pattern to be found faster.

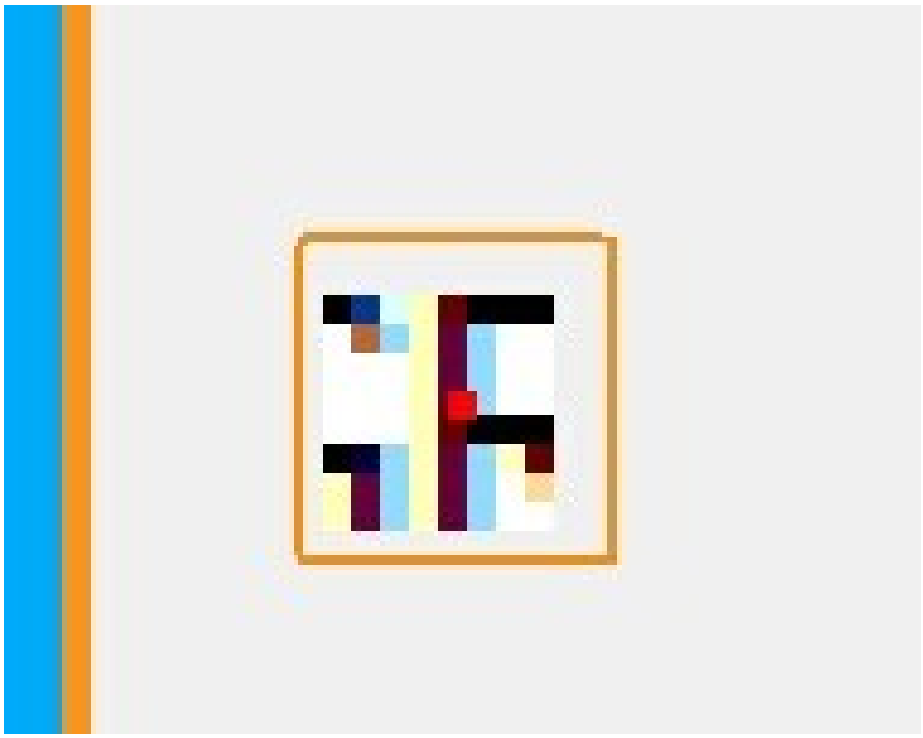
© 2023 Theo Gottwald * https://www.smart-package.com

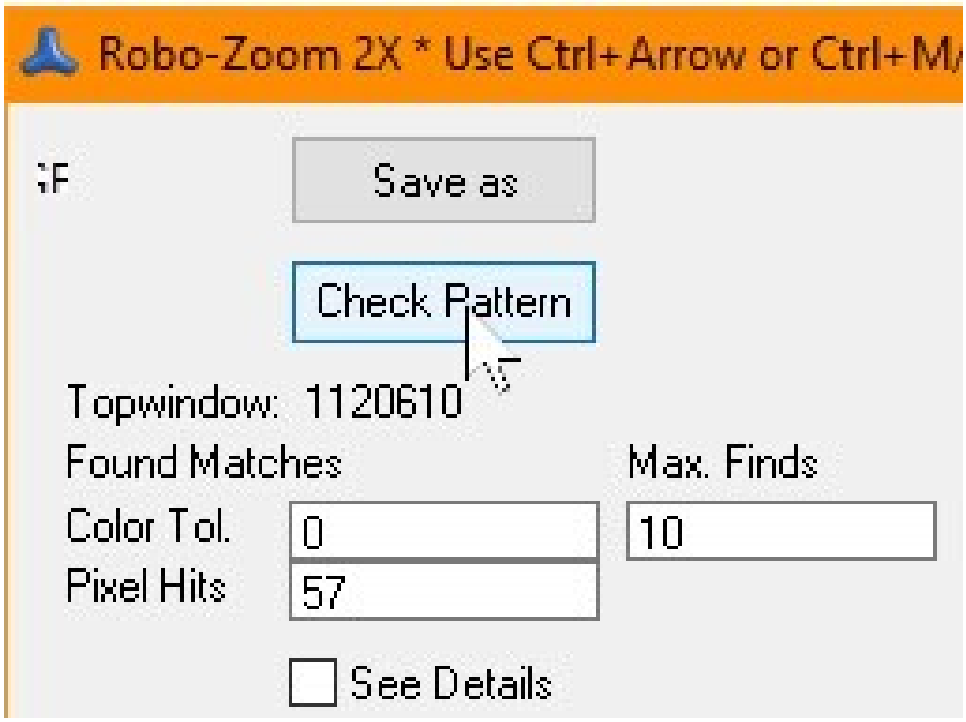
Here are some good and bad examples:

Here is a good Pattern

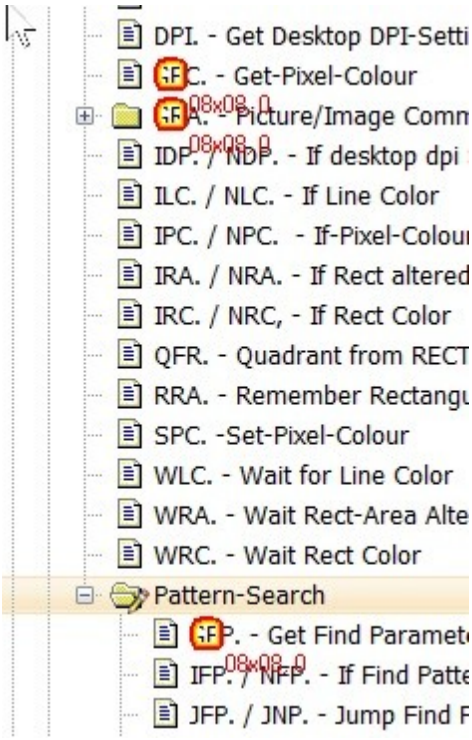
A good Pattern contains contrasted Pixels in the first Line and on the first 5 Pixesl.
Such Patterns will be found very fast.
You can test this if you press the "Check Pattern" button in the HE-Recorder.
A good Pattern should be found in less than a second on a good Computer. Even on a 4K Screen.

© 2023 Theo Gottwald * https://www.smart-package.com





© 2023 Theo Gottwald * https://www.smart-package.com

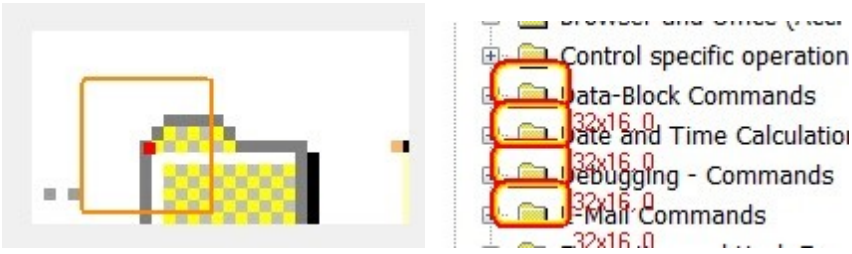


This is a good Pattern that will be found quickly.

Now lets see a *less good Pattern*.

This Pattern has two Speed-Penalties:
1. Its a large Pattern with 32x16 Points
2. The Top-Lines are all empty

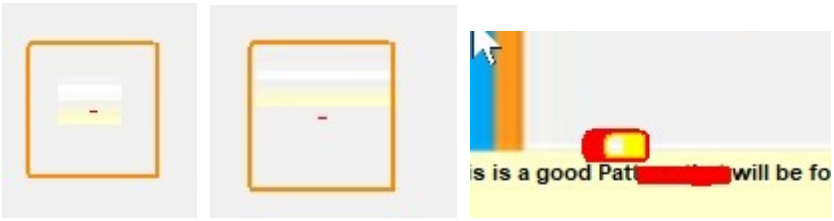
Still it will be found in a Second.
Please do not wonder if not all possible Finds are being marked.
Default the number of finds is now limited to 10.
The finds must not be sequential, due to the multi-threading core of the Find-Pattern Engine.
Also the sequence of the Finds is not guaranteed to always be in the same order.

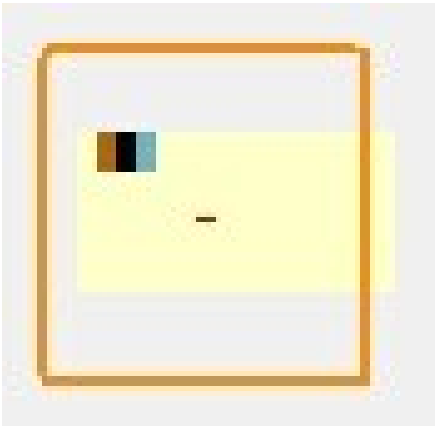


This Pattern is not so good as its larger and the Top-Lines all have the same colour.

A Pattern that is just few Lines is also not a very good Pattern.
Also choose the smallest possible Pattern-Size to optimize for Speed.

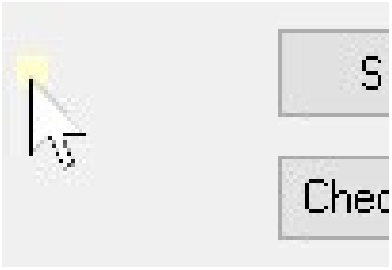
*© 2023 Theo Gottwald * https://www.smart-package.com*





Pattern that do not contain a lot of Information should try to have these in the upper left corner.

And finally this Pattern is a the worst case for the Pattern-Find Engine:



This Pattern is just the Background color.

A Pattern that is just a Background Color is not a Pattern and can not easily be matched.
The Pattern-Engine will search and find also this Pattern, but depending on how often the color is available, this may take a while.

Remarks
-

Limitations:
-

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.7.2 GFP. - Get Find Parameter

MiniRobotLanguage (MRL)

GFP. Get Find Pattern Parameter

Read internal Parameters for the Find Pattern Commands

Intention

This command helps to manage the Standard-Parameters for the Find-Pattern Commands.
To have the Find-Pattern Commands use only **3 Parameters,** all less important Parameters can be set using the SFP.-Command.
The GFP-Command will help you to read these **additional Parameters and several more Parameters that are set by the System.**

Such Parameters are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

Use SFP. and GFP. to set and Read the default Parameters

```
' Set and Read the value of "MaxResults"
SFP.mr|12
GFP.mr|$$RES
MBX.$$RES
ENR.

' Set the maximum Number of used CPU-Cores to 8
SFP.CPU|8
GFP.CPU|$$RES
MBX.$$RES
```

Explanation for the Parameter-Names:

"MaxResults" or "Mr"
This will tell the Pattern-Engine to stop searching for more results after this number of results has been found.

"PixelHits" or "Ph"
This number will tell the Engine how many Pixels from the Target must match the Source Pattern (taking the Color-Tolerance into account)
so that the Location is been marked as a "Hit". This Parameter must be set depending on the Pattern Size. If you leave it at "0" a default, calculated value is taken (85%).

"ColorTolerance" or "Ct"

*© 2023 Theo Gottwald * https://www.smart-package.com*

This number will define the Color-Tolerance that the Pattern-Search Engine applies to each Pixel before marking it as "valid" or "Invalid".
The higher this value, the more possible results can be found.

"DebugMode" or "db"
This number can only be 0 or 1. If set to one, after there have been results found, a Console Window will appear and list all the found results together with some technical informations, like the "Pixelhits" that have matched for the Find. Using the Debugmode you can find the best values for Tolerance and Pixelhits by looking over the results. If nothing is found, possibly no Console Window will appear.

"CPU"
Number of CPU-Cores in the System. If change this, the Subprogrammes may use less CPU-Cores and work possibly slower. If you set it too high (Higher then the real number of available CPU-Cores) then the System may become overloaded and get unresponsible. Best leave at the default value that is calculated when the Robot starts.

"Snap_Border" or "sb"
This can be set to 0, 1 or 2 and will influence the Bordersize that is taken when Snapshoting a Window.
"0" - Client-Area only
"1" - Whole Window
"2" - Whole WIndow without Border
It depends on the Target which is the best setting.

XSize, YSize
This gives you the X- and Y-Resolution of the last Snapshot, using any of the Pattern-Commands that do Snapshot a Window. Including `ANA.Snap`.
There are no know use cases where you would like to change these numbers. Doing so may have unforeseeable Side-Effects on some commands.

"MovePoint", "MP"
This is the preset for the Point-Shift Parameter. By default it is "0,0". The Preset is not yet implemented in all Pattern-Commands.

"LastPattern", "LP"
This is will return the number of the Pattern that was found if a "multi-Pattern-Command" was used. It is working for WTP. and LTP.-Commands.
Using this, you can find out which of multiple Patterns was found for example with

```
WTP.$$PAA|$$PAB|30,40|60
GFP.LastPattern|$$PAT
MBX.$$PAT
```

This will only make sense, if only 1 result was found.
In this case, `$$PAT` will be 1 or 2 depending if the Pattern in `$$PAA` or `$$PAB` was found.

"LastCount", "LC"
This will return the number of found matches from the last Pattern-Command. It may not yet be implemented in all Pattern-Commands. It is working for WTP. and LTP.-Commands where its mostly needed.

"LastHits", "LH"
This will return the number of Pixelhits that were diagnosed with the last find. Of course this makes only sense if there was just 1 find.

```
WTP.$$PAA|$$PAB|30,40|60
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
GFP.LH|$$PAT
MBX.Pixelhits: $$PAT
```

"LastSnap", "LS"
This will return the Number of the IR that got the last Snapshot (Read Only).

"FlagA", "FA"
This will return the Value of Flag "A". It has to do with Pattern Search. Generally the normal value is "0".
If set to 1,2 or 3 the Pattern-Operation check more Pixels before returning a result, this may lead to better yet may use longer time.

Syntax

GFP.P1[|P2]

Parameter Explanation

P1 - Parameter-Name this is the Name of the Parameter that is going to be changed. Please note that some Parameters-Names refer to "read-only" Parameters that can not be changed or may result in strange side-effects if you change them.

- MaxResults
- PixelHits
- ColorTolerance
- DebugMode
- HWnd
- Use_First
- Snap_Border
- CPU
- Snap_Border
- MovePoint
- LastPattern
- LastCount
- LastHits
- FlagA

Then there are several "Read Only" Parameter-Names
- LastSnap (RO)
- XSize (RO)
- YSize (RO)
- Result (RO)

P2 - opt. Variable The variable will return the value that is stored inside the given Parameter. If omitted TOS is used for the result.

Example
-

Remarks
-

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:
The values are not checked for validity. Specifying nonsense values may have unforeseeable side-effects.

See also:

- SFP. - Set Find Parameter 1899

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.7.3 IFP. / NFP. - If Find Pattern

MiniRobotLanguage (MRL)

IFP. - If Find Pattern
NFP. - Not Find Pattern

Check if a specified Pattern can be found in an Image-Register (IR)

Intention

This command will just check if a specified Pattern can be found or not.

If the Pattern can be found, it will then find the Locations where a specified Object is in an Image.
And put the number of found occurrences on the TOS, as well as all occurrences limited by the Setting of MaxResults (See SFP.-Command).
It uses only 1 Pattern and **3 Parameter** which are similar to the Parameters in LFP.

NFP. is generally just the Opposite of IFP. technically just the Blocks of "IF .(Block 1). ELS. .(Block 2). EIF." are swapped for NFP.

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

The IFP./NFP.-Command will use **additional Parameters that can be changed using the SFP.-Command.**
These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

Technically the IFP. is an enhanced Version of the WFP.-Command, as it has the same Parameters. With the difference that if you do NOT specify the Timeout-Value **P3**,

then WFP. will "wait forever" while IFP. will "return immediately". You can change this behavior with the P3-Value. Generally "0" means "wait forever" while "-1" means "return immediately".

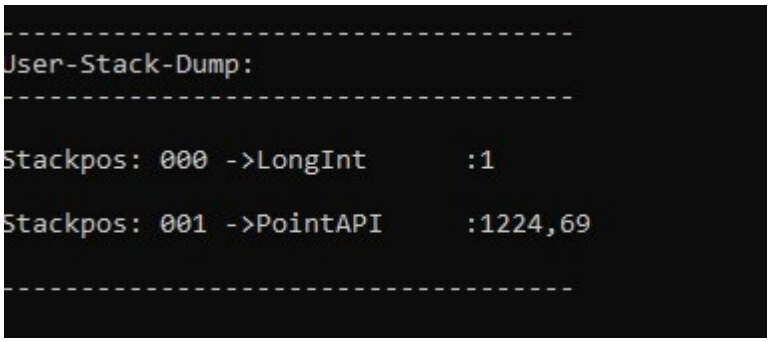
Please see the LFP.-Commands for more Details.

1. Use IFP with 3 Parameters and default settings
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
SWP.0,0|2807,1800|T
$$LAA=?pattern\JK_8.bmp
' P1 - Pattern-File, P2 - Target-Position adjust
IFP.$$LAA|0,50
   MMV.
ELS.
   MBX.Pattern was not found.
EIF.
' And here the same Sample using NFP.
NFP.$$LAA|0,50
   MBX.Pattern was not found.
ELS.
   MMV.
EIF.
ENR.
```



If you Specify P3, then P3 is the number of findings, limited by thesetting of Max-Results (see SFP.-Command).
On the TOS you will find all the Results.

2. Advance Use of IFP. / NFP.

You can change more advanced Parameters that IFP. uses with the SFP.-Command.
You can use Inline-Data using "ID:$$DTA".
And you can use directly pictures in an Image-Register - for example 1 - using "IR:1"

```
STW.ct|PBWindowClass:0|JK - IDE 2.
' Set Maxmimum Results Number to 4
SFP.MaxResults|4
' Set Minimum Pixel-Hits to 63
SFP.PixelHits|63
' Set Color-Tolerance to 12
SFP.ColorTolerance|12
$$LAA=?pattern\SP_8.bmp
' P1 - Pattern-File, P2 - Target-Position adjust
IFP.$$LAA|0,50
   MMV.
ELS.
   MBX.Pattern was not found.
EIF.
' And here the same Sample using NFP.
NFP.$$LAA|0,50
   MBX.Pattern was not found.
ELS.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
    MMV.
  EIF.
  ENR.
```

Syntax

```
IFP.P1[|P2][|P3][|P4] ...
ELS. ... EIF.
NFP.P1[|P2][|P3][|P4] ...
ELS. ... EIF.
```

Parameter Explanation

P1 - Pattern File-Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
***or Specify "ID:*$$DTA" und directly use Inline-Data as Pattern.**

P2 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.
For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.

P3 - opt. Wait-Time in Seconds Command will wait until the time is over if that Pattern will appear.
If not specified the Command will return immediately. If 0 is specified the command will wait "Forever". If "-1" is specified the command will not wait and therefore return immediately.

P4 - opt. Variable for Result. This variable will contain the number of Finds.
If omitted the result will be placed on TOS.

The Command will leave a the number of finds in **P3** (if given) or the TOS.

The Result "0" means "nothing found", a result of -1 means "Error", while a "1" or a higher number shows the number of found matches.
The maximum Number of found Locations is limited by the "Max-Results" Setting that can be changed using the "SFP.-Command".
The last found Position will automatically be set as the "Active Point".
If the Pattern does not exist then you will get a result "0" on TOS. The program will **not generate an Error-Message**.

Example

-

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:
The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.7.4 ITP. / NTP. - If Find any of Two Pattern

ITP.- / NFP. - If Find Pattern **Previous** 1088 **Top** 41 **Next** 1109

MiniRobotLanguage (MRL)

ITP. - If Find Pattern
NFP. - Not Find Pattern

Check if a specified Pattern can be found in an Image-Register (IR)

Intention

This command will check if at least one of two specified Pattern will be found in the specified **IR**.
You will find the number of the Pattern (1 or 2) that has appeared on the TOS below the Coordinates.

It will then find the Locations where the specified Object is and locate the Coordinates immediately.

The command can be given a Timeout Value, if this specified time is over the Command will exit and set the Timeout-Flag
and put a "0" on the TOS and use the "Not Found branch" after the "ELS." Command.

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

If the Pattern can be found, it will then find the Locations where a specified Object is in an Image.
And put the number of found occurrences on the TOS, as well as all occurrences limited by the Setting of MaxResults (See SFP.-Command).
It uses only 2 Pattern and optional **3 Parameter** which are similar to the Parameters in `LTP.`

NTP. is generally just the Opposite of ITP. technically just the Blocks of "IF .(Block 1). ELS. .(Block 2). EIF." are swapped for NTP.

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

The `ITP./NFP.`-Command will use **additional Parameters that can be changed using the** `SFP.`**-Command**.
These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

Technically the ITP. is an enhanced Version of the WTP.-Command, as it has the same Parameters. With the difference that if you do NOT specify the Timeout-Value

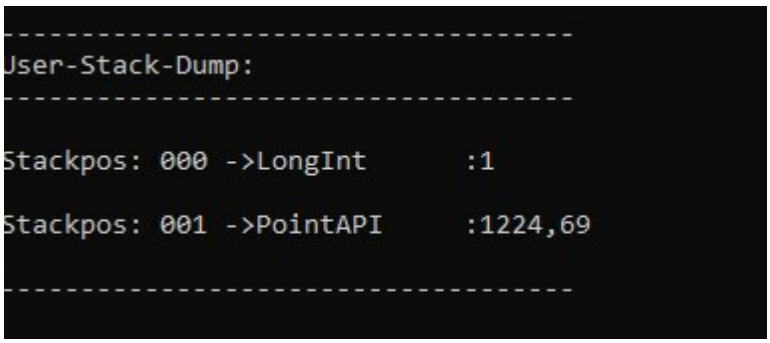
 *© 2023 Theo Gottwald * https://www.smart-package.com*

P3, then WTP. will "wait forever" while ITP. will "return immediately". You can change this behavior with the P3-Value. Genrally "0" means "wait forever" while "-1" means "return immediately".

Please see the LTP.-Commands for more Details.

1. Use ITP with 3 Parameters and default settings
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
SWP.0,0|2807,1800|T
$$LAA=?pattern\JK_8.bmp
$$LAB=?pattern\JK_10.bmp
' P1/P2 - Pattern-Files, P3 - Target-Position adjust
ITP.$$LAA|$$LAB|0,50
   MMV.
ELS.
   MBX.Pattern was not found.
EIF.
' And here the same Sample using NFP.
NTP.$$LAA|$$LAB|0,50
   MBX.Pattern was not found.
ELS.
   MMV.
EIF.
ENR.
```



If you Specify P3, then P3 is the number of findings, limited by thesetting of Max-Results (see SFP.-Command).
On the TOS you will find all the Results.

2. Advance Use of ITP. / NTP.

You can change more advanced Parameters that ITP. uses with the SFP.-Command.
You can use Inline-Data using "ID:$$DTA".
And you can use directly pictures in an Image-Register - for example 1 - using "IR:1"

```
STW.ct|PBWindowClass:0|JK - IDE 2.
' Set Maxmimum Results Number to 4
SFP.MaxResults|4
' Set Minimum Pixel-Hits to 63
SFP.PixelHits|63
' Set Color-Tolerance to 12
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SFP.ColorTolerance|12
$$LAA=?pattern\SP_8.bmp
' P1 - Pattern-File, P2 - Target-Position adjust
ITP.$$LAA|0,50
   MMV.
ELS.
   MBX.Pattern was not found.
EIF.
' And here the same Sample using NFP.
NFP.$$LAA|0,50
   MBX.Pattern was not found.
ELS.
   MMV.
EIF.
ENR.
```

Syntax

ITP.P1|P2[|P3][|P4][|P5] ...
ELS. ... EIF.
NTP.P1|P2[|P3][|P4][|P5] ...
ELS. ... EIF.

Parameter Explanation

P1 - Pattern A File-Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
***or Specify "ID*:$$DTA" und directly use Inline-Data as Pattern.**

P2 - Pattern B File-Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
***or Specify "ID*:$$DTA" und directly use Inline-Data as Pattern.**

P3 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.
For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.

P4 - opt. Wait-Time in Seconds Command will wait until the time is over if that Pattern will appear.
If not specified the Command will return immediately. If 0 is specified the command will wait "Forever". If "-1" is specified the command will not wait and therefore return immediately.

P5 - opt. Variable for Result. This variable will contain the number of Finds.
If omitted the result will be placed on TOS.

© 2023 Theo Gottwald * https://www.smart-package.com

The Command will leave a the number of finds in **P5** (if given) or the TOS.

The Result "0" means "nothing found", a result of -1 means "Error", while a "1" or a higher number shows the number of found matches. The maximum Number of found Locations is limited by the "Max-Results" Setting that can be changed using the "SFP.-Command".
The last found Position will automatically be set as the "Active Point".
If the Pattern does not exist then you will get a result "0" on TOS. The program will **not generate an Error-Message**.

Example

-

Remarks

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.7.5 JFP. / JNP. - Jump Find Pattern

MiniRobotLanguage (MRL)

JFP. - Jump if Find Pattern
JNP. - Jump if Not Find Pattern

Check if a specified Pattern can be found in an Image-Register (IR) and if so Jump to a Label

Intention

This command check if a specified Pattern can be found or not. If the Condition is met, the Jump to the specified Label will be made.

If the Pattern can be found, it will then find the Locations where a specified Object is in an Image.
And put the number of found occurrences on the TOS, as well as all occurrences limited by the Setting of MaxResults (See SFP.-Command).
It uses only **3 Parameter** which are similar to the Parameters in LFP..

NFP. is generally just the Opposite of IFP. technically just the Blocks of "IF .(Block 1). ELS. .(Block 2). EIF." are swapped for NFP.

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

The IFP./NFP.-Command will use **additional Parameters that can be changed using the SFP.-Command**.
These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

Technically the IFP. is an enhanced Version of the WFP.-Command, as it has the same Parameters. With the differnece that if you do NOT specify the Timeout-Value **P3**,
then WFP. will "wait forever" while IFP. will "return immediately". You can change this behavior with the P3-Value. Genrally "0" means "wait forever" while "-1" means "return immediately".

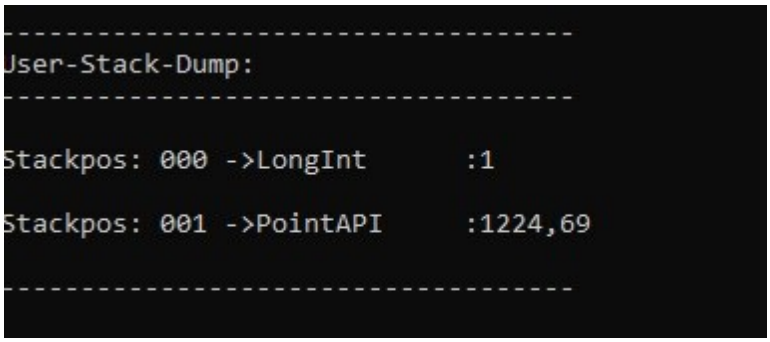
Please see the LFP.-Commands for more Details.

1. Use WFP with 3 Parameters and default settings
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SWP.0,0|2807,1800|T
$$LAA=?pattern\JK_8.bmp
' P1 - Pattern-File, P2 - Target-Position adjust
IFP.$$LAA|0,50
   MMV.
ELS.
   MBX.Pattern was not found.
EIF.
' And here the same Sample using NFP.
NFP.$$LAA|0,50
   MBX.Pattern was not found.
ELS.
   MMV.
EIF.
ENR.
```



If you Specify P3, then P3 is the number of findings, limited by thesetting of Max-Results (see SFP.-Command).
On the TOS you will find all the Results.

2. Use IFP. and set the default Parameters with SFP. before

You can change more advanced Parameters that WFP. uses with the SFP.-Command.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
' Set Maxmimum Results Number to 4
SFP.MaxResults|4
' Set Minimum Pixel-Hits to 63
SFP.PixelHits|63
' Set Color-Tolerance to 12
SFP.ColorTolerance|12
$$LAA=?pattern\SP_8.bmp
' P1 - Pattern-File, P2 - Target-Position adjust
IFP.$$LAA|0,50
   MMV.
ELS.
   MBX.Pattern was not found.
EIF.
' And here the same Sample using NFP.
NFP.$$LAA|0,50
   MBX.Pattern was not found.
ELS.
   MMV.
EIF.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

JFP.P1[|P2][|P3][|P4]
JNP.P1[|P2][|P3][|P4]

Parameter Explanation

P1 - Pattern File-Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
or Specify "ID:$$DTA" und directly use Inline-Data as Pattern.

P2 - Label - Label where the Jump will go if the condition is met. With the SPR Labels can also be dynamic and in Variables.

P3 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.
For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.

P4 - opt. Wait-Time in Seconds Command will wait until the time is over if that Pattern will appear.
If not specified the Command will return immediately.
If 0 is specified the command will wait "Forever". If "-1" is specified the command will not wait and therefore return immediately, this is the default option.

The Command will leave the number of finds on the TOS.

The Result "0" means "nothing found", a result of -1 means "Error", while a "1" or a higher number shows the number of found matches.
The maximum Number of found Locations is limited by the "Max-Results" Setting that can be changed using the "SFP.-Command".
The last found Position will automatically be set as the "Active Point".
If the Pattern does not exist then you will get a result "0" on TOS. The program will **not generate an Error-Message**.

Example

-

Remarks

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.7.6 JTP. / JTN. - Jump Two Pattern

JTP.- / JTN. - Jump If (n)one of Two Pattern **Previous** 1088 **Top** 41 **Next** 1109

MiniRobotLanguage (MRL)

JTP. - Jump if one of Two Pattern
JTN. - Jump if Two Pattern Not found

Check if one or more of two specified Pattern can be found in an Image-Register (IR) and if so Jump to a Label

Intention

This command check if a specified Pattern can be found or not. If the Condition is met, the Jump to the specified Label will be made using JTP.
JNT is just the opposite, it will jump in none of the two Patterns was found.

And put the number of found occurrences on the TOS, as well as all occurrences limited by the Setting of MaxResults (See SFP.-Command).
It uses only **3 Parameter** which are similar to the Parameters in LFP..

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

The JTP./JTN.-Command will use **additional Parameters that can be changed using the SFP.-Command**.
These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

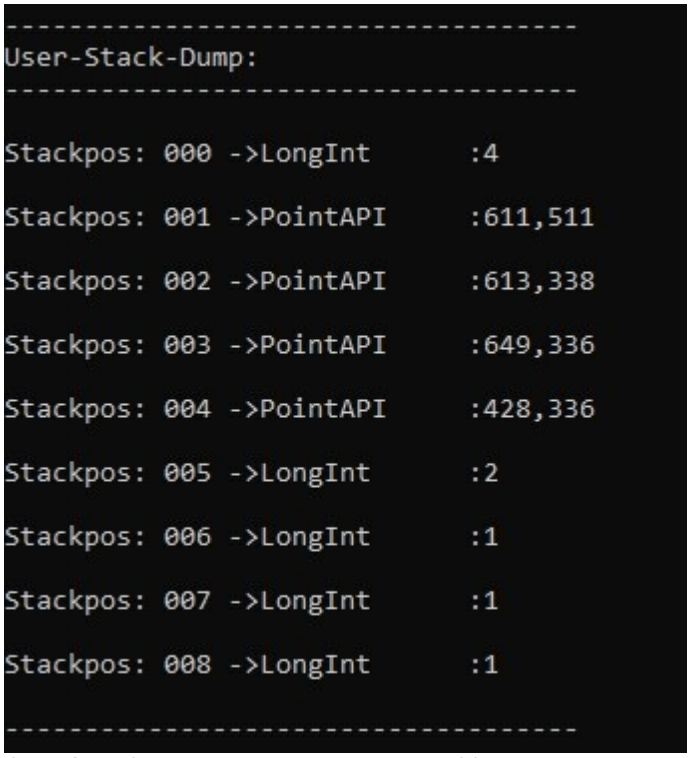
Technically the JTP. is an enhanced Version of the JFP.-Command, as it has the same Parameters but you can specify two Patterns.
Please see the LFP.-Commands for more Details.

1. Use WFP with 3 Parameters and default settings
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.ct|Chrome_Widge|Safir - Brav
SWP.0,1320|1098,668|T
VAR.$$PAA=?pattern\Py.bmp
VAR.$$PAB=?pattern\Pa.bmp
SFP.ColorTolerance|0
SFP.PixelHits|0
SFP.DebugMode|0
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
JTP.$$PAA|$$PAB|out|0,0|10
MBX.Pattern found
ENR.
:out
MMV.
DMP.6
MBX.Pattern found
ENR.
```



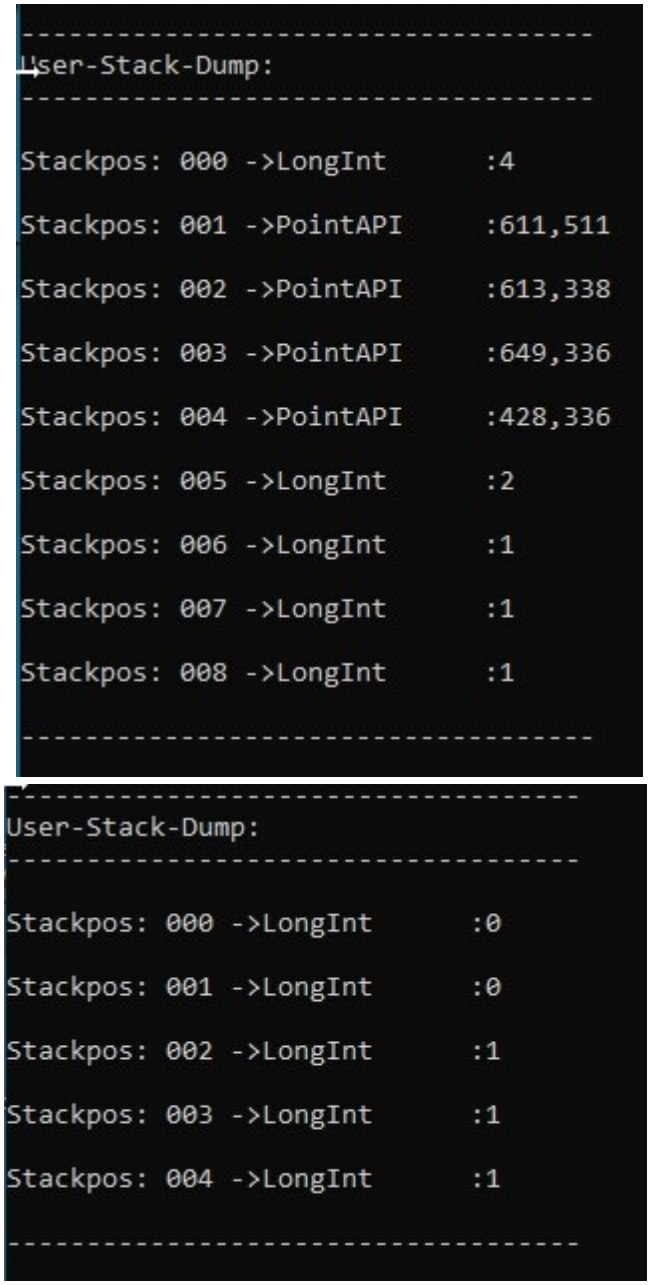
If you Specify P3, then P3 is the number of findings, limited by thesetting of Max-Results (see SFP.-Command).
On the TOS you will find all the Results.

Very useful is the negative Form of the Command. Assume taht you Click some Button and you expect a Menu to appear.
Now using this one Command, you can locate the Menu (or whatever the Pattern is). And in the same Command, you have a variable Waiting Time (to wait a moment if it appears), and if the Pattern does not appear you can jump back to Click again.
All in one Command.

```
STW.ct|Chrome_Widge|Safir - Brav
SWP.0,1320|1098,668|T
VAR.$$PAA=?pattern\Py.bmp
VAR.$$PAB=?pattern\Pa.bmp
SFP.ColorTolerance|0
SFP.PixelHits|0
SFP.DebugMode|0
JTN.$$PAA|$$PAB|out|0,0|1
MMV.
DMP.6
MBX.Pattern found
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
:out
MBX.Pattern not found
ENR.
```



The first Picture shows the Stack from JTN. if the Pattern was faound. The second Picture shows the Stack if the Pattern was not found.

Syntax

JTP.P1|P2[|P3][|P4][|P5]
JTN.P1|P2[|P3][|P4][|P5]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - Pattern File A - Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
or Specify "ID:$$DTA" und directly use Inline-Data as Pattern.

P2 - Pattern File B - Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
or Specify "ID:$$DTA" und directly use Inline-Data as Pattern.

P3 - Label - Label where the Jump will go if the condition is met. With the SPR Labels can also be dynamic and in Variables.

P4 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.
For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.

P5 - opt. Wait-Time in Seconds Command will wait until the time is over if that Pattern will appear.
If not specified the Command will return immediately.
If 0 is specified the command will wait "Forever". If "-1" is specified the command will not wait and therefore return immediately, this is the default option.

The Command will leave the number of finds on the TOS.

The Result "0" means "nothing found", a result of -1 means "Error", while a "1" or a higher number shows the number of found matches.
The maximum Number of found Locations is limited by the "Max-Results" Setting that can be changed using the "SFP.-Command".
The last found Position will automatically be set as the "Active Point".
If the Pattern does not exist then you will get a result "0" on TOS. The program will **not generate an Error-Message**.

Example

-

Remarks

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.7.7 LFP. - Locate Find Pattern

MiniRobotLanguage (MRL)

LFP. Locate and Find a Pattern

Get Locations of a specified Pattern-Object in an Image-Register (IR)

Intention

This command will find the Locations where a specified Object is in an Image. It uses only **3 Parameter** and is easy to use.

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

The LFP-Command will use **additional Parameters that can be changed using the SFP.-Command.**
These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

To use the FindPattern-Command, there is additional Program called "Human-Eye-Recorder" available with this distribution.
See a Description here: ***Human Eye-Recorder*** 1140

Using the HE-Recorder the recording of Patterns is easy and fast.

Here is an important Notice: if you record a Pattern, and you use "Check Pattern" and the Pattern is not found, then you have "Mouseover Effects".
This means that the Color of the Object changes if Mouse is nearby or over the Object.
You may **not** see this change visually.
The Pattern Matcher will definitely see it and avoid the Pattern, if Color Tolerance is zwero.

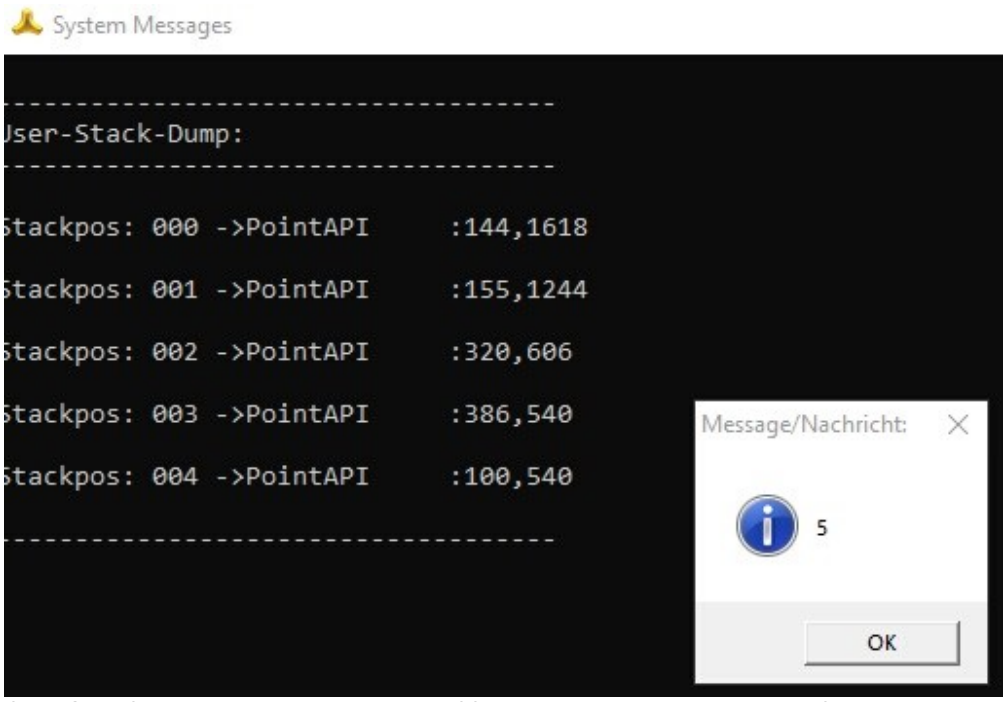
You can handle these Events best, if you first make a Screenshot from that Window and record the Pattern from the Screenshot.
Again, do never use a JPG or loosing Compression for working with the Pattern-Matcher Commands.
Due to Compression Artefacts the quality of the results is unknown. **Best use ".bmp" or ".png".**

Alternatively you can do the recording with an higher Color-Tolerance.
Which is not the best choice - but will work most often.

1. Use LFP with 3 Parameters and default settings
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
STW.ct|PBWindowClass:0|JK - IDE 2.
$$LAA=?pattern\SP_8.bmp
' LFP. uses only 3 Parameters
LFP.$$LAA|0,40|$$RES
DMP.6
MBX.$$RES
ENR.
```

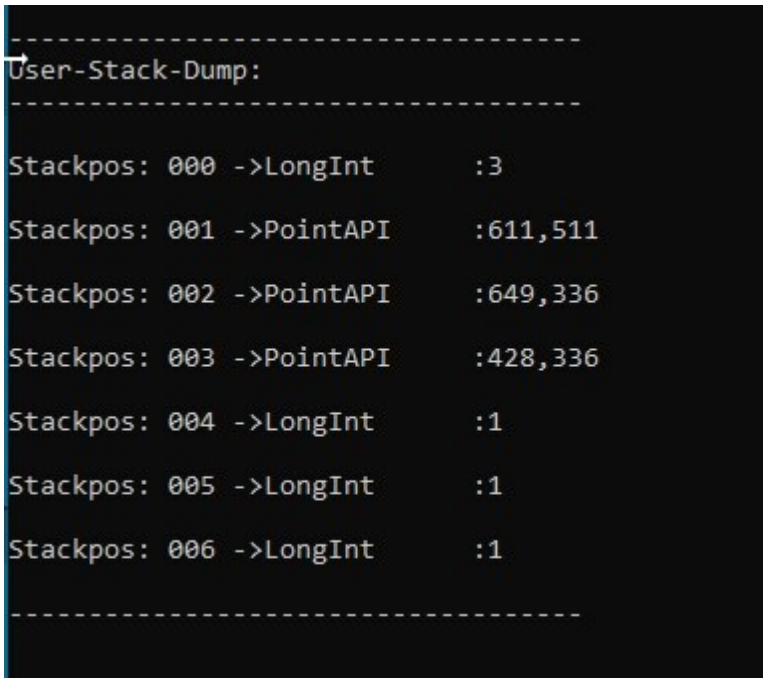


If you Specify P3, then P3 is the number of findings, limited by thesetting of Max-Results (see SFP.-Command).
On the TOS you will find all the Results.

If you omit the $$RES then you get the number of finds on TOS.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
$$LAA=?pattern\SP_8.bmp
' LFP. uses only 3 Parameters
LFP.$$LAA|0,40
DMP.6
MBX.$$RES
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com



2. Use LFP. and set the default Parameters with SFP. before
You can change the Parameters that LFP. uses with the SFP.-Command.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
' Set Maxmimum Results Number to 4
SFP.MaxResults|4
' Set Minimum Pixel-Hits to 63
SFP.PixelHits|63
' Set Color-Tolerance to 12
SFP.ColorTolerance|12
$$LAA=?pattern\SP_8.bmp
' LFP. uses only 3 Parameters but internally also uses the Parameters that can b
LFP.$$LAA|0,40|$$RES
DMP.6
MBX.$$RES
ENR.
```

Syntax

LFP.P1[|P2][|P3]

Parameter Explanation

P1 - Pattern File - Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
***or Specify "ID*:$$DTA" und directly use Inline-Data as Pattern.**

P2 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.

© 2023 Theo Gottwald * https://www.smart-package.com

For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.
P3 - opt. Variable for Result. if omitted the result will be placed on TOS.

The Command will leave a the number of finds in P3 (if given) or the TOS.

The Result "0" means "nothing found", a result of -1 means "Error", while a "1" or a higher number shows the number of found matches.
The maximum Number of found Locations is limited by the "Max-Results" Setting that can be changed using the "SFP.-Command".

The last found Position will automatically set as the "Active Point".

If the Pattern does not exist then you will get a result "0" on TOS. The program will **not generate an Error-Message**.

Example

-

Remarks

Speed Considerations:
1. The Command is "Multithreaded" and works best with a Multicore CPU.
2. The Command will need a lot of CPU-Power, it may also use the GPU at some point internally.
3. Generally the Command is very fast even in very large windows, as long as the Computer has a modern CPU.
4. The larger the Pattern, the slower the process.
5. Currently it may speed up the process, if you have the pattern touch the upper left corner. This may change in the future.
6. If a Pattern is very slow, just record another Pattern. And try this again. Check that there are no empty Lines on Top of the Pattern.
7. A pattern that is completely empty will not work as there is nothing to recognize in it.

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.7.8 LTP. - Locate Two Pattern

MiniRobotLanguage (MRL)

LTP. Locate and Find one or two Pattern

Get Locations of one or two specified Pattern-Objects in an Image-Register (IR)

Intention

This command will find the Locations where a specified Objects are in an Image. It uses only 4 **Parameter** and is easy to use.
Assume that you want to recognize the state in which a GUI is, that is not accessible to other commands.
Then you can record 2 Patterns and locate them using a single command.

If there are more then 2 Patterns that shall be taken into consideration, maybe use the SCS. and the CFP.-Command
it can work with an unlimited number of Patterns.

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

The LFP-Command will use **additional Parameters that can be changed using the SFP.-Command.**
These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

To use the FindPattern-Command, there is additional Program called "Human-Eye-Recorder" available with this distribution.
See a Description here: ***Human Eye-Recorder*** 1140

Using the HE-Recorder the recording of Patterns is easy and fast.

Here is an important Notice: if you record a Pattern, and you use "Check Pattern" and the Pattern is not found, then you have "Mouseover Effects".
This means that the Color of the Object changes if Mouse is nearby or over the Object.
You may **not** see this change visually.
The Pattern Matcher will definitely see it and avoid the Pattern, if Color Tolerance is zwero.

You can handle these Events best, if you first make a Screenshot from that Window and record the Pattern from the Screenshot.
Again, do never use a JPG or loosing Compression for working with the Pattern-Matcher Commands.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Due to Compression Artefacts the quality of the results is unknown. **Best use ".bmp" or ".png".**

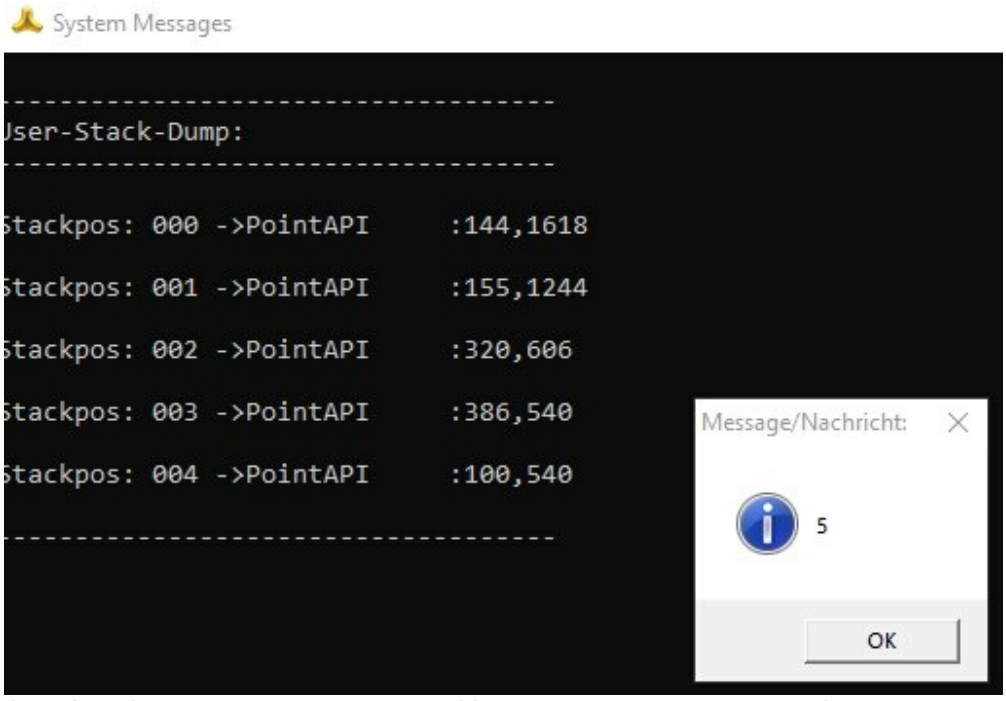
Alternatively you can do the recording with an higher Color-Tolerance.
Which is not the best choice - but will work most often.

Now you can find out which of multiple Patterns was found for example with

```
WTP.$$PAA|$$PAB|30,40|60
GFP.LastPattern|$$PAT
MBX.$$PAT
```

1. Use LTP with 4 Parameters and default settings
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
VAR.$$PAA=?pattern\Py.bmp
VAR.$$PAB=?pattern\Pa.bmp
' LTP. uses 4 Parameters
LTP.$$PAA|$$PAB|0,0|$$RES
DMP.6
MBX.$$RES
ENR.
```



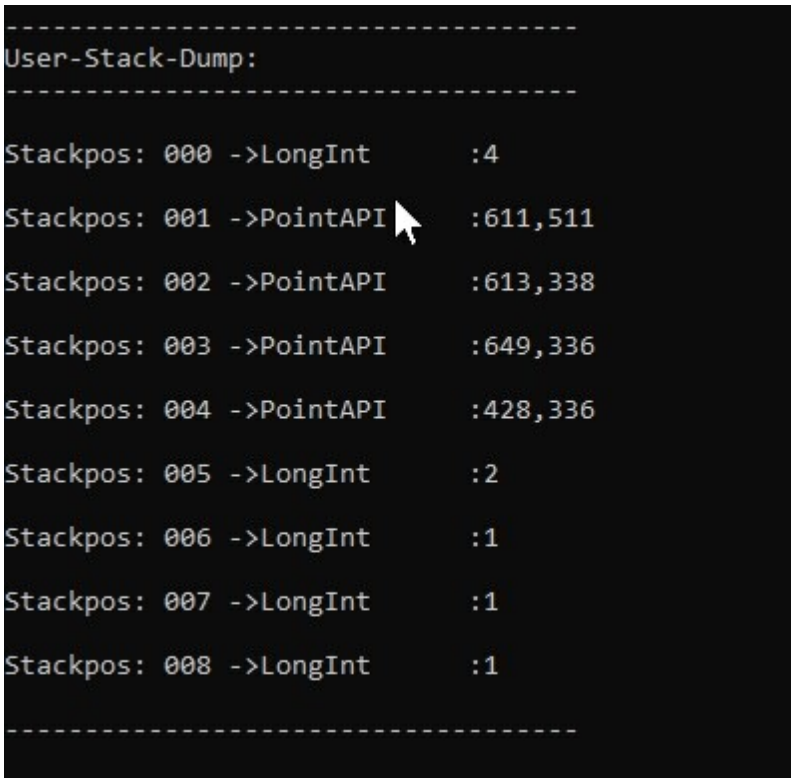
If you Specify P3, then P3 is the number of findings, limited by thesetting of Max-Results (see SFP.-Command).
On the TOS you will find all the Results.

If you omit the $$RES then you get the number of finds on TOS.

```
VAR.$$PAA=?pattern\Py.bmp
VAR.$$PAB=?pattern\Pa.bmp
STW.ct|PBWindowClass:0|JK - IDE 2.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$LAA=?pattern\SP_5.bmp
' LTP. uses only 3 Parameters
LTP.$$PAA|$$PAB|0,0
DMP.6
MBX.$$RES
ENR.
```



2. Use LTP. and set the default Parameters with SFP. before
You can change the Parameters that LTP. uses with the SFP.-Command.

```
VAR.$$PAA=?pattern\Py.bmp
VAR.$$PAB=?pattern\Pa.bmp
STW.ct|PBWindowClass:0|JK - IDE 2.
' Set Maxmimum Results Number to 4
SFP.MaxResults|4
' Set Minimum Pixel-Hits to 63
SFP.PixelHits|63
' Set Color-Tolerance to 12
SFP.ColorTolerance|12
$$LAA=?pattern\SP_8.bmp
LTP.$$PAA|$$PAB|0,0|$$RES
DMP.6
MBX.$$RES
ENR.
```

Syntax

LTP.P1|P2[|P3][|P4]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - Pattern File A - Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
or Specify "ID:$$DTA" und directly use Inline-Data as Pattern.

P2 - Pattern File B - Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
or Specify "ID:$$DTA" und directly use Inline-Data as Pattern.

P3 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.
For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.
P4 - opt. Variable for Result. if omitted the result will be placed on TOS.

The Command will leave a the number of finds in P4 (if given) or the TOS.

The Result "0" means "nothing found", a result of -1 means "Error", while a "1" or a higher number shows the number of found matches.
The maximum Number of found Locations is limited by the "Max-Results" Setting that can be changed using the "SFP.-Command".
The last found Position will automatically set as the "Active Point".

If the Pattern does not exist then you will get a result "0" on TOS. The program will **not generate an Error-Message**.

Example

-

Remarks

Speed Considerations:
1. The Command is "Multithreaded" and works best with a Multicore CPU.
2. The Command will need a lot of CPU-Power, it may also use the GPU at some point internally.
3. Generally the Command is very fast even in very large windows, as long as the Computer has a modern CPU.
4. The larger the Pattern, the slower the process.
5. Currently it may speed up the process, if you have the pattern touch the upper left corner. This may change in the future.
