6. If a Pattern is very slow, just record another Pattern. And try this again. Check that there are no empty Lines on Top of the Pattern.
7. A pattern that is completely empty will not work as there is nothing to recognize in it.

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:
The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.7.9 SFP. - Set Find Parameter

MiniRobotLanguage (MRL)

SFP. Set Find Pattern Parameter

Set internal Parameters for the Find Pattern Commands

Intention

This command manages the Standard-Parameters for the Find-Pattern Commands.
To have the Find-Pattern Commands use only **3 Parameters,** all less important Parameters can be set using this Command.

The SFP-Command will set all **additional Parameters**.

These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

1. Use LFP. and set the default Parameters with SFP. before
You can change the Parameters that LFP. uses with the SFP.-Command.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
' Set Maxmimum Results Number to 4
SFP.MaxResults|4
' Set Minimum Pixel-Hits to 63
SFP.PixelHits|63
' Set Color-Tolerance to 12
SFP.ColorTolerance|12
$$LAA=?pattern\SP_8.bmp
' LFP. uses only 3 Parameters but internally also uses the Parameters that can b
LFP.$$LAA|0,40|$$RES
DMP.6
MBX.$$RES
ENR.
```

Explanation for the Parameter-Names:

"MaxResults" or "Mr"
This will tell the Pattern-Engine to stop searching for more results after this number of results has been found.

"PixelHits" or "Ph"
This number will tell the Engine how many Pixels from the Target must match the Source Pattern (taking the Color-Tolerance into account)
so that the Location is been marked as a "Hit". This Parameter must be set depending on the Pattern Size. If you leave it at "0" a default, calculated value is taken (85%).

*© 2023 Theo Gottwald * https://www.smart-package.com*

"ColorTolerance" or "Ct"
This number will define the Color-Tolerance that the Pattern-Search Engine applies to each Pixel before marking it as "valid" or "Invalid".
The higher this value, the more possible results can be found.

"DebugMode" or "db"
This number can only be 0 or 1. If set to one, after there have been results found, a Console Window will appear and list all the found results together with some technical informations, like the "Pixelhits" that have matched for the Find. Using the Debugmode you can find the best values for Tolerance and Pixelhits by looking over the results. If nothing is found, possibly no Console Window will appear.

"CPU"
Number of CPU-Cores in the System. If change this, the Subprogrammes may use less CPU-Cores and work possibly slower. If you set it too high (Higher then the real number of available CPU-Cores) then the System may become overloaded and get unresponsible. Best leave at the default value that is calculated when the Robot starts.

"Snap_Border" or "sb"
This can be set to 0, 1 or 2 and will influence the Bordersize that is taken when Snapshoting a Window.
"0" - Client-Area only
"1" - Whole Window
"2" - Whole WIndow without Border
It depends on the Target which is the best setting.

XSize, YSize
This gives you the X- and Y-Resolution of the last Snapshot, using any of the Pattern-Commands that do Snapshot a Window. Including `ANA.Snap`.
There are no know use cases where you would like to change these numbers. Doing so may have unforeseeable Side-Effects on some commands.

"MovePoint", "MP"
This is the preset for the Point-Shift Parameter. By default it is "0,0". The Preset is not yet implemented in all Pattern-Commands.

"LastPattern", "LP"
This is will return the number of the Pattern that was found if a "multi-Pattern-Command" was used. It is working for WTP. and LTP.-Commands.
Using this, you can find out which of multiple Patterns was found for example with

```
WTP.$$PAA|$$PAB|30,40|60
GFP.LastPattern|$$PAT
MBX.$$PAT
```

This will only make sense, if only 1 result was found.
In this case, `$$PAT` will be 1 or 2 depending if the Pattern in `$$PAA` or `$$PAB` was found.

"LastCount", "LC"
This will return the number of found matches from the last Pattern-Command. It may not yet be implemented in all Pattern-Commands. It is working for WTP. and LTP.-Commands where its mostly needed.

"LastHits", "LH"
This will return the number of Pixelhits that were diagnosed with the last find. Of course this makes only sense if there was just 1 find.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
WTP.$$PAA|$$PAB|30,40|60
GFP.LH|$$PAT
MBX.Pixelhits: $$PAT
```

"LastSnap", "LS"
This will return the Number of the IR that got the last Snapshot (Read Only).

"FlagA", "FA"
This will Set the Value of Flag "A". It has to do with Pattern Search. Generally the normal value is "0".
If set to 1,2 or 3 the Pattern-Operation check more Pixels before returning a result, this may lead to better yet may use longer time.

Syntax

SFP.P1|P2

Parameter Explanation

P1 - Parameter-Name this is the Name of the Parameter that is going to be changed. Please note that some Parameters-Names refer to "read-only" Parameters that can not be changed or may result in strange side-effects if you change them.

- MaxResults
- PixelHits
- ColorTolerance
- DebugMode
- HWnd
- Use_First
- Snap_Border
- CPU
- Snap_Border
- MovePoint
- LastPattern
- LastCount
- LastHits
- FlagA

Then there are several "Read Only" Parameter-Names
- LastSnap (RO)
- XSize (RO)
- YSize (RO)
- Result (RO)

P2 - Value for Parameter The value that is to be stored inside the given Parameter.

The values are not checked for validity. Specifying nonsense values may have unforeseeable side-effects.

Example

```
' Set and Read the value of "MaxResults"
SFP.mr|12
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
GFP.mr|$$RES
MBX.$$RES
ENR.

' Set the maximum Number of used CPU-Cores to 8
SFP.CPU|8
GFP.CPU|$$RES
MBX.$$RES
```

Remarks

-

Limitations:

The values are not checked for validity. Specifying nonsense values may have unforeseeable side-effects.

3.55.7.10 WFP. - Wait For Pattern

MiniRobotLanguage (MRL)

WFP. Wait For Pattern

Wait for appearance of a Pattern and then get the Locations of a specified Pattern-Object in an Image-Register (IR)

Intention

This command will wait until a specified Pattern will appear or disappear.
It will then find the Locations where a specified Object is in an Image. It uses only **3 Parameter** and is easy to use.
The cammand can be given a Timeout Value, if this specified time is over the Command will exit and set the Timeout-Flag
and put a "0" on the TOS.

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

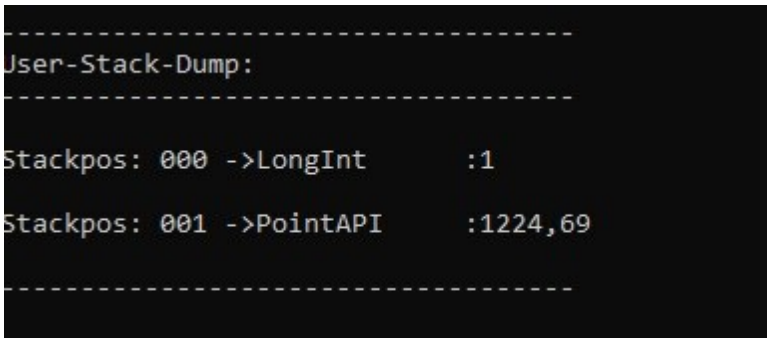
The WFP.-Command will use **additional Parameters that can be changed using the SFP.-Command.**
These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

Please see the LFP.-Commands for more Details.

1. Use WFP with 3 Parameters and default settings
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.BAct|PBWindowClass:0|JK - IDE 2.
SWP.0,0|2807,1800|T
$$LAA=?pattern\JK_8.bmp
' P1 - Pattern-File, P2 - Target-Position adjust, P3- Timeout in Seconds
WFP.$$LAA|0,50|60
MMV.
ENR.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*



If you Specify P3, then P3 is the timeout value..
On the TOS you will find all the Results.

2. Use WFP. and set the default Parameters with SFP. before

You can change more advanced Parameters that WFP. uses with the SFP.-Command.

```
STW.ct|PBWindowClass:0|JK - IDE 2.
' Set Maxmimum Results Number to 4
SFP.MaxResults|4
' Set Minimum Pixel-Hits to 63
SFP.PixelHits|63
' Set Color-Tolerance to 12
SFP.ColorTolerance|12
$$LAA=?pattern\SP_8.bmp
' P1 - Pattern-File, P2 - Target-Position adjust, P3- Timeout in Seconds
WFP.$$LAA|0,50|60
MMV.
ENR.
```

3. Use WFP. together with Image-Register and Inline-Data

You can use Inline-Data instead of pictures from files.

```
STW.ct|TFrmHelpMan|minirobot.hm
GSB.PattA
ANA.#FromVar|1|$$DTA
$$PAT=IR:1
SFP.ColorTolerance|0
SFP.PixelHits|57
SFP.DebugMode|0
' Patternfile | Point-Shift| Timeout 60 Seconds
WFP.$$PAT|0,0|60
' We take away the number of Hits from TOS
POP.$$NOH
' If no Hits, jump away to Lab_NoHits.
JIZ.$$NOH=0|Lab_NoHits1
MMV.
:Lab_NoHits1
ENR.

' You can also use Formula for the IR
WFP.IR:($$PAT+5)|0,0|60
```

© 2023 Theo Gottwald * https://www.smart-package.com

4. Use WFP. directly with Inline-Data

You can use Inline-Data instead of pictures from files.

```
STW.Act|TFrmHelpMan|minirobot.hm
GSB.PattA
$$PAT=ID:$$DTA
' P1 - Target, P2 - Pattern, P3 - Color-Tolerance, P4 - min. Hits (Pixel) maximu
SFP.ColorTolerance|0
SFP.PixelHits|57
SFP.DebugMode|1
' Patternfile | Point-Shift| Timeout 60 Seconds
WFP.$$PAT|0,0|60
' We take away the number of Hits from TOS
POP.$$NOH
' If no Hits, jump away to Lab_NoHits.
JIZ.$$NOH=0|Lab_NoHits1
MMV.
:Lab_NoHits1
ENR.

' Alternativ you can also write:
WFP.ID:$$DTA|0,0|60
```

Syntax

WFP.[!]P1[|P2][|P3]

Parameter Explanation

! **-** If the ! is specified then the Command will wait for the Patterns to disappear, ("Wait for no Pattern")

P1 - Pattern File-Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
***or Specify "ID*:$$DTA" und directly use Inline-Data as Pattern.**

P2 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.
For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.

P3 - opt. Timeout value. If omitted the command will wait "Forever".

The Command will leave a the number of finds on the TOS, followed by all finds.

The Result "0" means "nothing found", a result of -1 means "Error", while a "1" or a higher number shows the number of found matches.
The maximum Number of found Locations is limited by the "Max-Results" Setting that can be changed using the "SFP.-Command".

© 2023 Theo Gottwald * https://www.smart-package.com

The last found Position will automatically set as the "Active Point".

If the Pattern did not appear in teh given Time, then you will get a result "0" on TOS and the Timeout-Flag will be set.
The program will **not generate an Error-Message**.

Example

-

Remarks

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

3.55.7.11 WTP. - Wait For Two Pattern

MiniRobotLanguage (MRL)

WTP. Wait For Two Pattern

Wait for appearance of any of two Patterns and then get the Locations and put it on TOS.

Intention

This command will wait until at least one of two specified Pattern will appear or until none of these is found.
You will find the number of the Pattern (1 or 2) that has appeared on the TOS below the Coordinates.

It will then find the Locations where the specified Object is and locate the Coordinates immediately.

The command can be given a Timeout Value, if this specified time is over the Command will exit and set the Timeout-Flag
and put a "0" on the TOS.

This command uses internally multiple Levels (4 Levels) of Fuzzy-Logic.
It will search all of the currently localized Top-Window.

The WTP.-Command will use **additional Parameters that can be changed using the SFP.-Command.**
These are for example the **Color-Tolerance** and the number of "**needed Pixel-Hits**".
Hereby Pixel-Hits are the number of Pixels that do match the Pattern using the given Color-Tolerance.

Now you can find out which of multiple Patterns was found for example with

```
WTP.$$PAA|$$PAB|30,40|60
GFP.LastPattern|$$PAT
MBX.$$PAT
```

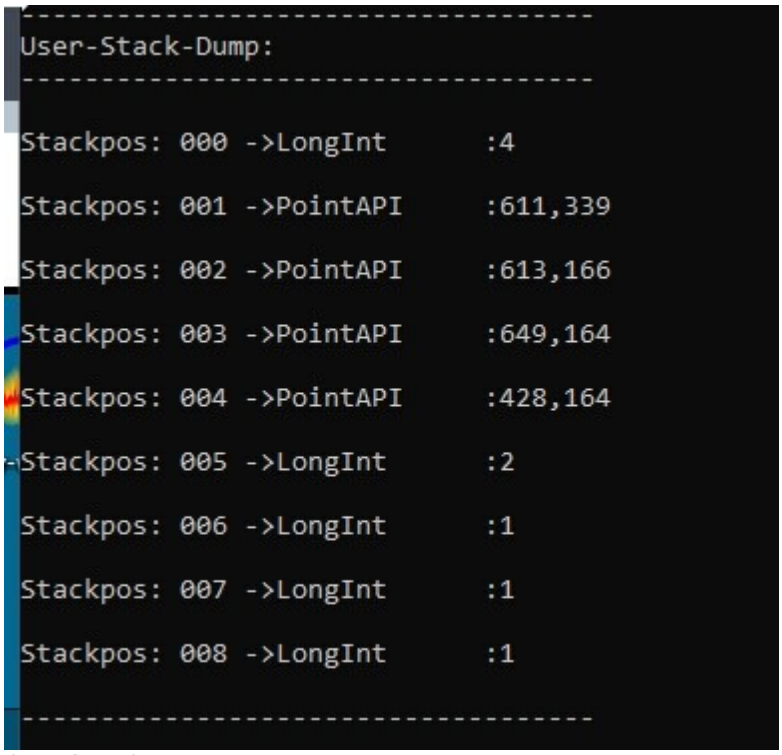
Please see the LTP.-Commands for more Details.

1. Use WTP with 4 Parameters and default settings
This will include all Screens on a Dual-Screen System. Here we search a Pattern on the complete Desktop.

```
STW.ct|Chrome_Widge|Safir - Brav
SWP.0,0|1098,668|T
VAR.$$PAA=?pattern\Py.bmp
VAR.$$PAB=?pattern\Pa.bmp
WTP.$$PAA|$$PAB|0,0|60
' You can directly ofter the WTP. Command use MMV. or MLC. etc.
MMV.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
DMP.6
MBX.!
ENR.
```



If you Specify P4, then P4 is the timeout value.
On the Stack you will find all the Results limited by "MaxResults".
On TOS is the "Number of Results".
Followed by the Results.
FInally the Pattern Number that was found as the first result (Here it was Pattern Nr.2 / $$PAB).

2. Use WFP. and set the default Parameters with SFP. before

You can change more advanced Parameters that WFP. uses with the SFP.-Command.

```
STW.ct|Chrome_Widge|Safir - Brav
SWP.0,0|1098,668|T
VAR.$$PAA=?pattern\Py.bmp
VAR.$$PAB=?pattern\Pa.bmp
SFP.ColorTolerance|0
SFP.PixelHits|0
SFP.DebugMode|1
WTP.$$PAA|$$PAB|0,0|60
' You can directly use MMV. or Mouse-Move Command directly after the WTP.
MMV.
' This will show the Stack.
DMP.6
MBX.!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

WTP.[!]P1|P2[|P3][|P4]

Parameter Explanation

! – If the ! is specified then the Command will wait for the Patterns to disappear, ("Wait for no Pattern")

P1 - Pattern File A - Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
or Specify "ID:$$DTA" und directly use Inline-Data as Pattern.

P2 - Pattern File B - Name and Path
or Specify "IR:" and Image-Register number for Pattern from an Image-Register..
or Specify "ID:$$DTA" und directly use Inline-Data as Pattern.

P3 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.
For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.
P4 - opt. Timeout value. If 0 or omitted the command will wait "Forever". If "-1" then the Command will return immediately.

The Command will leave the Pattern-Number of the first find on the TOS, followed by all finds. On the TOS is the number of finds.

The Result "0" means "nothing found", a result of -1 means "Error", while a "1" or a higher number shows the number of found matches.
The maximum Number of found Locations is limited by the "Max-Results" Setting that can be changed using the "SFP.-Command".

The last found Position will automatically set as the "Active Point".

If the Pattern did not appear in the given Time, then you will get a result "0" on TOS and the Timeout-Flag will be set.
The program will **not generate an Error-Message**.

Example

-

Remarks

Do not use ".jpg" Images or images that are compressed with Artefacts. Generally use ".bmp" or ".png" Images. Otherwise the result will be hard to predict.

Limitations:

The resolution of the Pattern-Images that can be used is limited to those resolutions that can be saved with the "Human Eye-Recorder"-Tool.

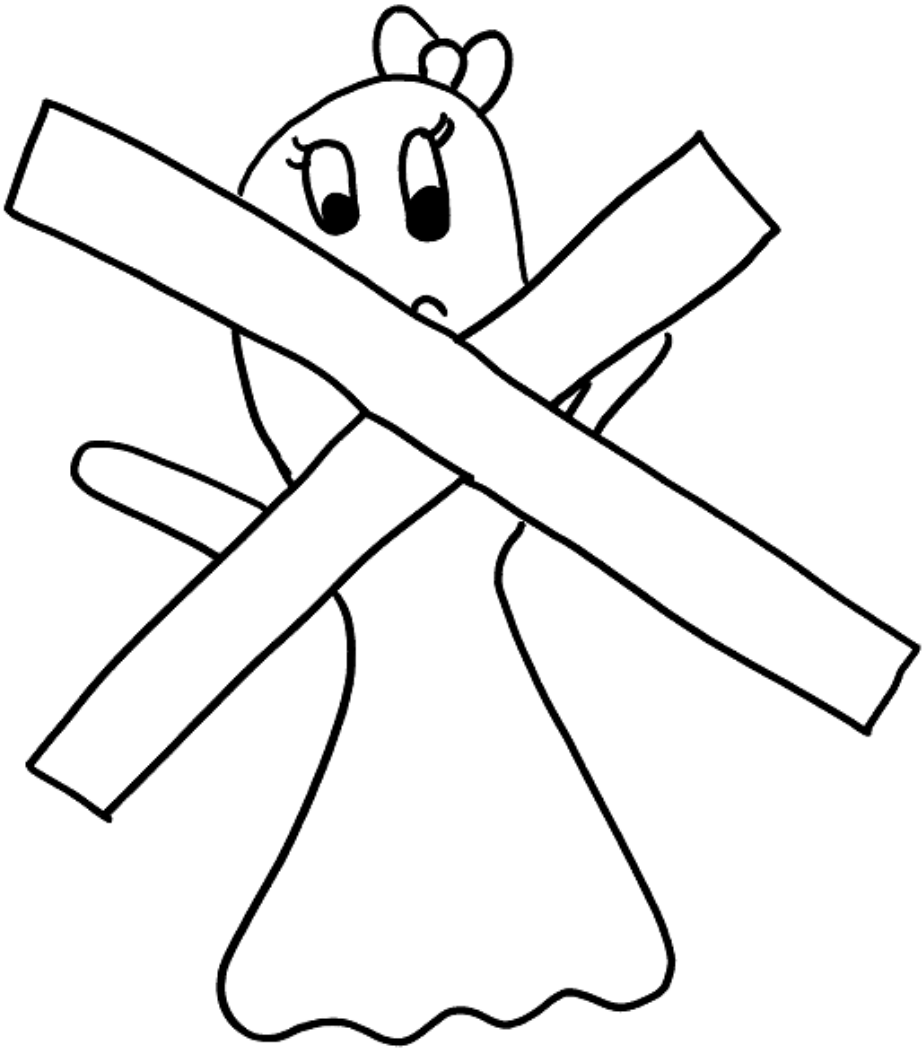
3.55.8 Undercover and Graphics

3.55.8.1 ! Smarty's Undercover Operations

Smarty's UnderCover Graphics **Previous** 3234 **Top** 41 **Next** 1914

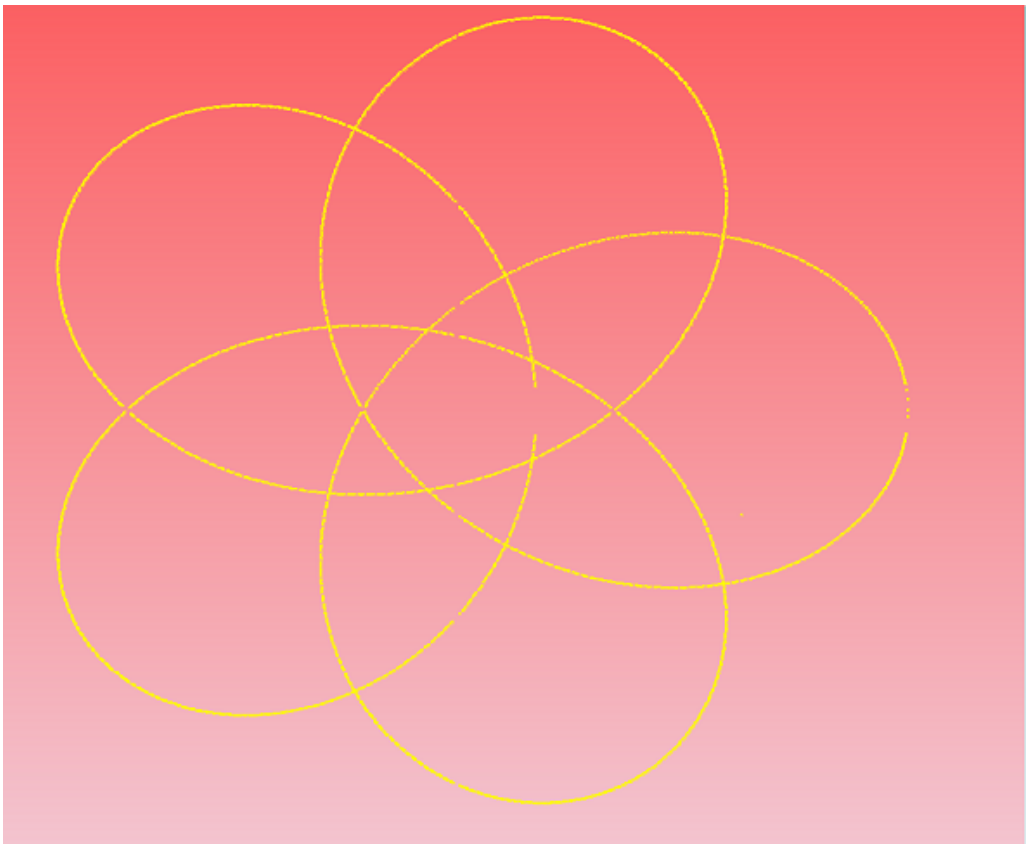
Smarty's Undercover Graphics Operations



Undercover Graphics can be used for these purposes:

1. They can protect your script from being interrupted by a User
2. They can hide your running installations/operations behind a desktop-cover
3. They can show a custom bitmap or graphic to communicate a message to the user
4. The cover "glas" can emulate a "Mouse disable" to some degree, as a user can only click onto the cover and can not disturb the setup process easily.
5. Use them to create/show mathematical figures (see below).

*© 2023 Theo Gottwald * https://www.smart-package.com*



Generally the following features (and more) are supported:

1. "**cover**" - generate a TopMost Form in front of the primary desktop
2. "**no blend**", "**no blend-in**","**no blend-out**" - optional soft fade-in and fade-out transitions
3. "**glas**" - completely invisible glas-form can prevent the user from clicking, while the user
   can see everything that happens below.
4. "**matte**" - Half Transparent cover can prevent the user from clicking, while still allowing to watch
   through it whats going on below.
5. "**desktop-copy**" - Create a desktop-Screen-Shot that is identical to the current desktop to
   completely hide all Operations below (undercover).
6. "**desktop bw**" - Create a desktop screens-hot and change it to grey (no colors).
7. "**cover**" - generate a non-transparent cover and color it with a solid background color of
   your choice
8. "**gradient**" - generate a non-transparent cover and color it with a smooth color transition of your choice
9. "**write**" - Print Text in any size, position and font on to the foreground graphic
10. "**print**" - print listings and scrolling text-messages
11. "**load image**" - load any "**.bmp**" file and resize it to fit the cover-screen.

Technical Note:

Blend-in is done generally always from the desktop. While the cover commands can be combined, it makes sense, to switch off fade-in/fade-out at some point, when combining features. Otherwise you may get unwanted blend-in effects between features.

*© 2023 Theo Gottwald * https://www.smart-package.com*

The Cover will not have any transparency or glas-effects on Windows 2000 or below, as these are not supported below Windows XP.

The Cover needs sufficient graphical resources. On heavily loaded systems with not enough graphical system resources, the cover may just not appear.If you open and close the cover too often, also the cover may just not appear anymore. Both of these issues can quickly be fixed by rebooting the computer.

Important note:
On Error: If your script runs into an Error, then the cover is removed immediately, even before the script has ended. This is to make sure that you can look for the source of the error.
The cover is removed in any error-case, even if the `USM.` (Use silent mode) command is used,

© 2023 Theo Gottwald * https://www.smart-package.com

3.55.8.2 ! UCV. - Undercover Graphics

MiniRobotLanguage (MRL)

UCV. command

Undercover graphics

Intention

Undercover Graphics can be used for these purposes:

1. They can protect your script from being interrupted by a User
2. They can hide your running installations/operations behind a desktop-cover
3. They can show a custom bitmap or graphic to communicate a message to the user
4. The cover "glas" can emulate a "Mouse disable" to some degree, as a user can only click onto the cover and can not disturb the setup process easily.

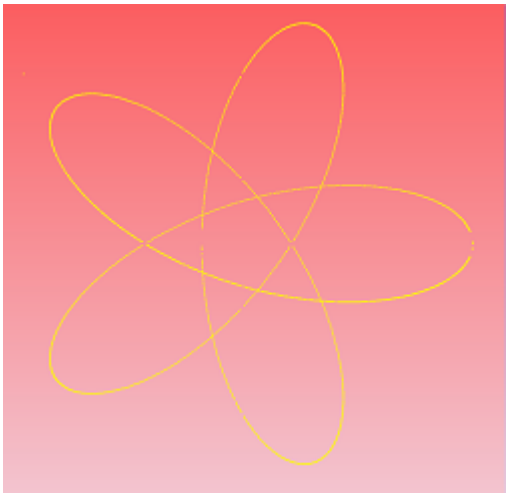
These and more features are supported:

1. "**cover**" - generate a TopMost Form in front of the primary desktop
2. "**no blend**", "**no blend-in**","**no blend-out**" - optional soft fade-in and fade-out transitions
3. "**glas**" - completely invisible galas-form can prevent the user from clicking, while the user can see everything that happens below.
4. "**matte**" - Half Transparent cover can prevent the user from clicking, while still allowing to watch through it whats going on below.
5. "**desktop-copy**" - Create a desktop-Screen-Shot that is identical to the current desktop to completely hide all Operations below (undercover).
6. "**desktop bw**" - Create a desktop screens-hot and change it to grey (no colors).
7. "**cover**" - generate a non-transparent cover and color it with a solid background color of your choice
8. "**gradient**" - generate a non-transparent cover and color it with a smooth color transition of your choice
9. "**write**" - Print Text in any size, position and font on to the foreground graphic
10. "**print**" - print listings and scrolling text-messages
11. "**load image**" - load any "**.bmp**" file and resize it to fit the cover-screen.
12. "**close**". Same like "UCV." without any Subcommand. WIll remove any cover

*© 2023 Theo Gottwald * https://www.smart-package.com*

immediately.
13. "**fillstyle**" - used to define the style (color and pattern) of the fill-operation used for the `UCV.box` and the `UCV.ellipse` command.
14. "**drawto**" - used to paint a line between two points.

As you can see, `UCV.` serves two targets:
1. You can hide your automatic script from user interaction
2. You can use the graphics commands to paint pictures and show them to your audience.



To achieve these goals, Smarty will
- create a "Cover"-Form that will be placed above all other non-TopMost Forms.
- eventually copy a desktop screenshot or anotehr graphic onto that form
- that form will prevent the user from being able to see or click anything that is below that form.*
- you can still use the Direct Engine 231 to work with Setup-Programs.
- the Compatible Engine 231 will not work if a Cover shields the desktop.

For the user this will happen completely transparent, he may not be aware what happens below the cover.

The "desktop-picture cover" is shown with the simple line:

```
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

You can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

You may set up a Cover-Script from multiple `UCV.`-commands (see Parameter Explanation below). Use them in a sequence that will:

- first specify a Modifier,
- then Generate the Cover of your choice
- then customize the Cover

Example:

```
' We use a Modifier to prevent fading
UCV.nb
' Now we start a Cover, a Gradient Cover
UCV.grd|&HFF00FF|&H00FF00
' We wait for 5 Seconds
PAU.5
' We customize the cover printing something on it
' at coordinates 10,300
UCV.write|Please wait!|10,300
PAU.5
' We close the cover
UCV.
```

* PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

Syntax

UCV.[P1][|P2...|Px]

Parameter Explanation

P1 – `(optional)` Subcommand description
.
P2 .. Px – `(optional)` Parameters depending on the used Subcommand.

© 2023 Theo Gottwald * https://www.smart-package.com

```
The following Subcommands are supported:

Cover Modifiiers:
    "no blend","nb"
    "no blend-out","nbo"
    "no blend-in","nbi"
    "transparency","tra"
    "no transparency","ntr"

Generate cover:
    "desktop-copy","dc"
    "desktop bw","dbw"
    "glas"
    "matte","mat"
    "cover","cov"
    "gradient","grd"

Customize Cover:
    "background","bgr"
    "foreground","fgr"
    "print","prt"
    "plot","spo"
    "reset font","rsf"
    "set font","sft"
    "load image","ldi"
    "write","wri"
    "close","clo"
    "box"
    "drawto","line"
    "ellipse","eli"
    "fillstyle","fst"

You may set up a Cover-Script from multiple UCV.-commands.
Use the sequence that you
- first specify a Modifier,
- then Generate the Cover of your choice
- then customize the Cover

to remove a Cover, just use:

UCV.close

or

UCV.
```

Example

```
'**********************************
' UCV.-Sample
' In this Mode, the cover will fade in slowly
' which is invisible if no on going
' changes on the desktop happen.
```

© 2023 Theo Gottwald * https://www.smart-package.com

  EIF.
NEX.
PAU.1
ENR.
```

Remarks

You can use the command `CCV.` to make calculations with the RGB-Colors.

Limitations:

The Cover will not have any transparency or glas-effects on Windows 2000 or below, as these are not supported below Windows XP.

The Cover needs sufficient graphical resources. On heavily loaded systems with not enough graphical system resources, the cover may just not appear.If you open and close the cover too often, also the cover may just not appear anymore. Both of these issues can quickly be fixed by rebooting the computer.

Important note:
On Error: If your script runs into an Error, then the cover is removed immediately, even before the script has ended. This is to make sure that you can look for the source of the error.

The cover is removed in any error-case, even if the `USM.` (Use silent mode) command is used,

PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

3.55.8.3 bgr - background

UCV.background - change color of background Previous 1914 Top 41 Next 1925

MiniRobotLanguage (MRL)

UCV.background
UCV.bgr

Change color of cover background

Intention

This command will change the background color of an existing cover and also of an cover that is soon to be created.

General usage is simple:

```
' Make a compeltely green cover
UCV.bgr|&H00FF00
UCV.cov
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&H00FFFF
' This will remove the Cover
UCV.
ENR.
```

You can print a text on the cover, like this:

```
' Make a completely red cover
UCV.bgr|&H0000FF
UCV.cov
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&H00FFFF
' Print on the cover screen
UCV.print|Hello world
' This will remove the Cover
UCV.
ENR.
```

As you can see, the "`background`" command will also influence the background of the color of the "`print`" command.

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

The desktop-cover behavior can be changed/customized using the additional features:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

WHile "Matte" is a "dark glas", you can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

* PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

Syntax

UCV.background
UCV.bgr

Parameter Explanation

P1 - Color- value, for example 16711945 or in hexadezimal: `&HFF00FF` which are both
the same values.

Important notice: You can set the color values also to these three negative values:

-1 -> the DEFAULT foreground/background color is used
-2 -> the background is just not painted, allowing the content behind to become visible
-3 -> the existing color is not changed

Example

```

3.55.8.4 box

MiniRobotLanguage (MRL)

UCV.box

Draw a box onto the cover

Intention

This command will draw a box, colored and using a custom fillstyle, with optional round corners between two diagonal pixel-coordinates onto the cover. The box-outline is been drawn in the foreground color. The "`UCV.fillstyle`" command defines the fill-style inside the box. As this is a very general graphics command, it will enable you to draw all sorts of shapes that are rectangular or even a circle (make corners 100% round for this).

General usage is simple:

```
' Set foreground color
UCV.fgr|&HFF00FF
' Draw thwe line from 600,1 to 200,100
UCV.line|600,1|200,100
```

Points that have been set using the "`set point`" command can be used as starting points for the "`Line`" command. In that case you can omit the second coordinate pair.

```
' We set a single Pixel at 1,1 which will then
' be the starting point for the line.
UCV.set pixel|1,1
' you can use mathematical inline calculations
' for all coordinates
UCV.line|($$XCO*2.5),600

' Here is a complete example
'
UCV.nbi
UCV.dbw
FOR.$$COL|0|6
  ' Set foreground color
  UCV.fgr|&HFF0000
  ' Set fillcolor and fillstyle
  UCV.fls|$$COL|&H00FFFF
  ' Make it a circle (100% round corners)
  UCV.box|10,10|500,500|100
  PAU.0.1
NEX.
PAU.1
UCV.
ENR.
```

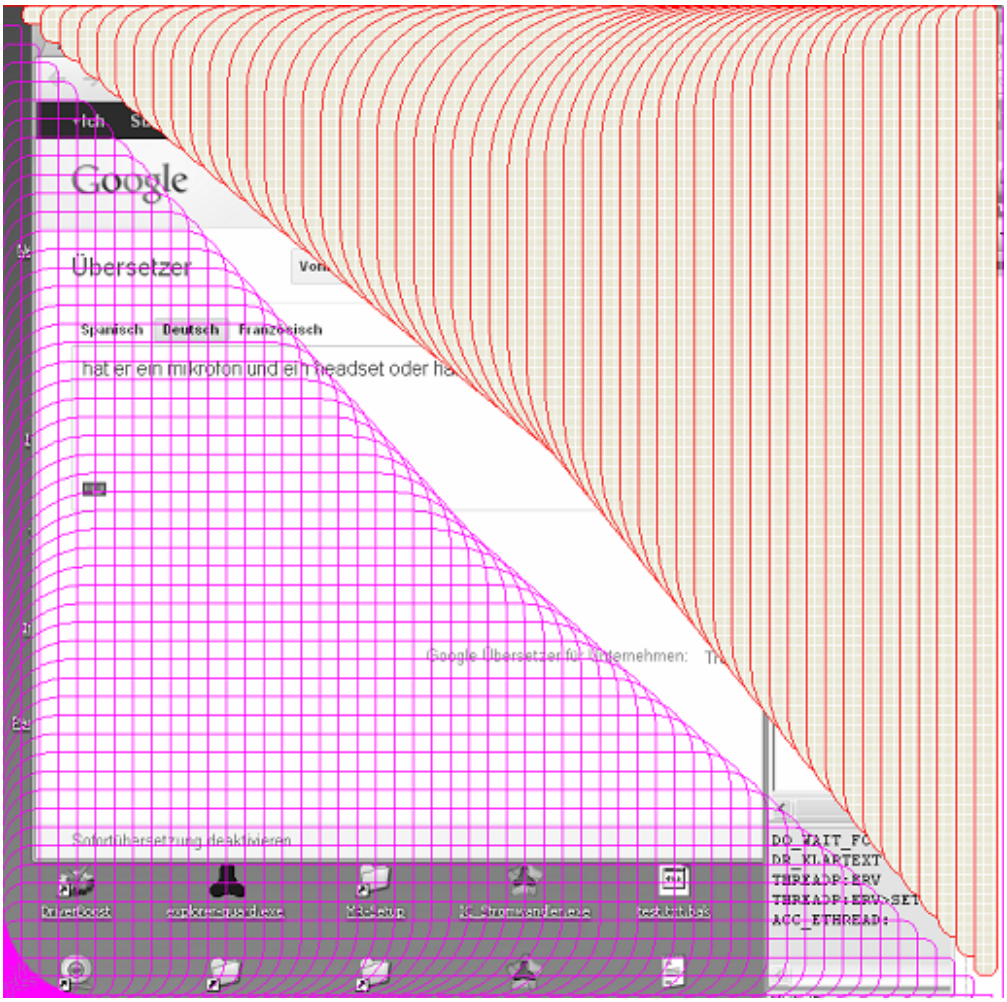
*© 2023 Theo Gottwald * https://www.smart-package.com*

```
Here is another example:

$$XMA=800
$$STP=15
UCV.nbi
UCV.dbw

FOR.$$XCO|1|($$XMA+$$STP)|$$STP
  UCV.fgr|&HFF00FF
  UCV.fillstyle|4|-2
  UCV.box|0,$$XCO|$$XCO,$$XMA|40
  UCV.fgr|&HFF0000
  UCV.fillstyle|5|-3
  UCV.box|$$XCO,0|$$XMA,$$XCO|70
NEX.
PAU.5
ENR.
```

This is the output from the above Script:



```
' This line will remove the cover
UCV.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

UCV.box|P1,P2[|P3,P4][|P5]

Parameter Explanation

P1,P2 - Screen-Pixel-Coordinates for the starting Point of the line to be drawn.

P3,P4 - (optional) Screen-Pixel-Coordinates for the ending-Point of the line to be drawn.
If omitted, the last used Coordinates are used. This way you can easily draw a figure
of lines.

P5 - (optional) Roundness of corners in percent from 0 to 100%. If you choose 100%, you may end up with a circle.

Example

```
'**********************************
' UCV.-Sample
'
'**********************************
$$XMA=800
$$STP=15
UCV.nbi
UCV.dbw
UCV.fgr|&HFF00FF

3.55.8.5 cov - cover

MiniRobotLanguage (MRL)

UCV.cover
UCV.cov

Create a unicolor, opaque and protective cover

Intention

This command will create a protective cover between the user and the desktop.
You can use it to prevent the user from seeing serial numbers, and you can prevent the user from interacting with your setup-processes.

By default the cover has a windows-button color, that could be a sort of grey.
You can however change the cover-color using the "`UCV.background`" command.

To achieve this goal, Smarty will
- create a "Cover"-Form that will be placed above all other Forms*.
- make that form half transparent and add a grey desktop picture to it.
- that form will prevent the user from being able to see or click anything that is below that form.*
- you can still use the Direct Engine 231 to work with Setup-Programs.
- the Compatible Engine 231 will not work if a Cover shields the desktop.

General usage is simple:

```
' Make a compeltely green cover
UCV.bgr|&H00FF00
UCV.cov
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&H00FFFF
' This will remove the Cover
UCV.
ENR.
```

You can print a text on the cover, like this:

```
' Make a completely red cover
UCV.bgr|&H0000FF
UCV.cov
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&H00FFFF
' Print on the cover screen
UCV.print|Hello world
' This will remove the Cover
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
UCV.
ENR.
```

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

WHile "Matte" is a "dark glas", you can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

3.55.8.6 dbw - desktop bw

UCV.desktop bw - greyscaled desktop cover **Previous** 1929 **Top** 41 **Next** 1937

MiniRobotLanguage (MRL)

UCV.desktop bw
UCV.dbw

Create a greyscaled desktop cover (fade to grey)

Intention

This command is used to prevent the user from seeing what happens on the screen. You can use it to protect serial numbers or other confidential information during automated setup processes. As the Cover is grayscaled, the user will be aware that something happens.

To achieve this goal, Smarty will
- create a "Cover"-Form that will be placed above all other Forms*.
- copy a desktop screenshot onto that form
- that form will prevent the user from being able to see or click anything that is below that form.*
- you can still use the Direct Engine 231 to work with Setup-Programs.
- the Compatible Engine 231 will not work if a Cover shields the desktop.
- Smarty will slowly fade the cover colors to grey, depending on the use of the blending commands (nb,nbi,nbo)

For the user this will happen completely transparent, he can not see what happens below the cover.

The greyscaled "desktop-picture cover" is shown with the simple line:

```
UCV.dbw
PAU.10

' This line will remove the cover
UCV.
```

If you do not want to use the "fade to grey" effect, use this script:

```
UCV.nb
UCV.dbw
PAU.3
' This line will remove the cover
PAU.5
UCV.
ENR.
```

Using the "`write`" command, you can write a text at any place into the desktop-cover. You can also change/choose the font for this text using the "`set font`" command.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
UCV.set font|futura t|100|||0
UCV.write|Hallo world!|10,200
```

You can also use the "print" command while this makes less sense, because the print command has a fixed background.

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

You can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

* PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

3.55.8.8 eli - ellipse

MiniRobotLanguage (MRL)

UCV.ellipse
UCV.eli

Draw a box onto the cover

Intention

This command will draw a elliptical, colored, filled shape, between two diagonal pixel-coordinates onto the cover. The shape-outline is been drawn in the foreground color. The "`UCV.fillstyle`" command defines the fill-style inside the shape. As this is a very general graphics command, it will enable you to draw all sorts of shapes that are circular or elliptical. If you want to end up with a perfect circle, prefer the "`UCV.box`" command and make the corners 100% round for this.

General usage is simple:

```
' Set foreground color
UCV.fgr|&HFF00FF
' Draw a black filled ellisoid
UCV.ellipse|600,1|200,100
```

Points that have been defined using the "`set point`" command can be used as starting points for the "`Line`" command. In that case you can omit the second coordinate pair.

```
' We set a single Pixel at 1,1 which will then
' be the starting point for the ellipse.
UCV.nbi
UCV.dbw
UCV.fgr|&HFF00FF
UCV.set pixel|100,100
UCV.ellipse||200,100
PAU.5
```

Here is a more complex demo program:

```
$$XMA=800
$$STP=15
UCV.nbi
UCV.dbw

FOR.$$XCO|1|($$XMA+$$STP)|$$STP
  UCV.fgr|&HFF00FF
  UCV.fillstyle|4|-2
  UCV.eli|0,$$XCO|$$XCO,$$XMA|40
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Change color of foreground Print/Pixel/Paint commands

Intention

This command will change the foreground color of any soon to be used graphic command that will draw onto the cover (print/write/pixel etc.).

General usage is simple:

```
' Make a completely green cover
UCV.bgr|&H00FF00
' Set red foreground color
UCV.fgr|&HFF0000
UCV.cov
' Print in red onto the green background
UCV.print|Hello world!
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&HFFFF00
UCV.print|Hello world!
' This will remove the Cover
UCV.
ENR.
```

You can print a text on the cover, like this:

```
' Make a completely red cover
UCV.bgr|&HFF0000
UCV.cov
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&HFFFF00
' Print on the cover screen
UCV.print|Hello world
' This will remove the Cover
UCV.
ENR.
```

As you can see, the "`background`" command will also influence the background of the color of the "`print`" command.

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

*© 2023 Theo Gottwald * https://www.smart-package.com*

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

WHile "Matte" is a "dark glas", you can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

* PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

Syntax

UCV.foreground|P1
UCV.fgr|P1

Parameter Explanation

P1 - Color- value, for example 16711945 or in hexadezimal: `&HFF00FF` which are both
the same values.

Important notice: You can set the color values also to these three negative values:

-1 -> the DEFAULT foreground/background color is used
-2 -> the background is just not painted, allowing the content behind to become visible
-3 -> the existing color is not changed

Example

3.55.8.10 glas - suppress mouse and keyboard

UCV.glas - put a glas-screen betwe Previous 1945 Top 41 Next 1953

MiniRobotLanguage (MRL)

UCV.glas

Create a completely invisible, yet protective cover

Intention

This command is used to allow the user to see what happens on screen. While its still protective to the scripted process and prevents the user from clicking or doing any action on the protected process. Its just like if you put a glas between the desktop and the user-mouse

To achieve this goal, Smarty will
- create a "Cover"-Form that will be placed above all other Forms*.
- make that form completely transparent
- that form will prevent the user from being able to see or click anything that is below that form.*
- you can still use the Direct Engine 231 to work with Setup-Programs.
- the Compatible Engine 231 will not work if a Cover shields the desktop.

General usage is simple:

```
UCV.glas
' Here comes your script, we use a PAUSE command instead
PAU.10
' This will remove the Cover
UCV.
ENR.
```

You can switch from "matte" (50% transparent/grey glas) to "glas", like this:

```
UCV.mat
PAU.5
UCV.glas
PAU.5
UCV.
ENR.
```

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

You can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

* PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

3.55.8.11 grd - gradient

UCV.gradient - fade between two colors **Previous** 1949 **Top** 41 **Next** 1958

MiniRobotLanguage (MRL)

UCV.gradient
UCV.grd

Fade between two colors on a cover

Intention

This command will change the background color of an existing cover or create an cover itself. It will paint the cover with an fading effect between two colors.
The effect can be horizontal or vertical.

Here is a simple example:

```
UCV.grd
PAU.5
ENR.
```

Below is the result, it uses the default gradient-colors.

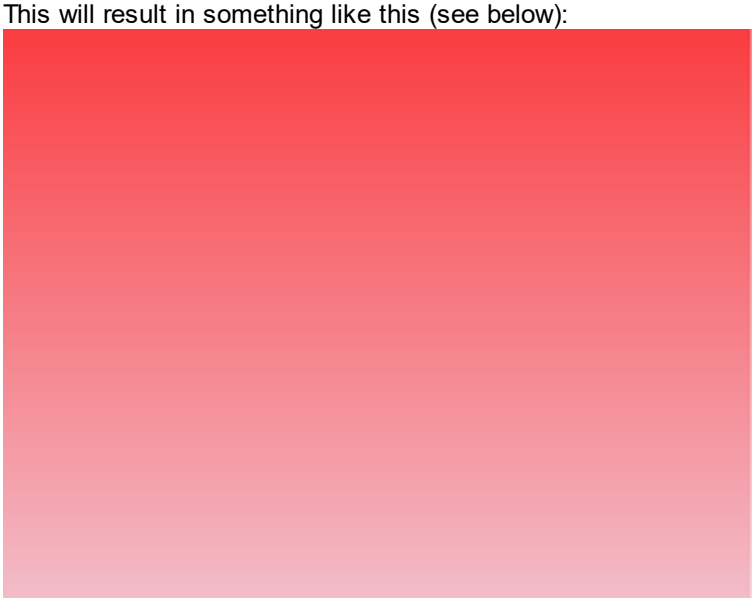
Next we will use a custom gradient color. Like this:

```
UCV.nbi
UCV.grd|&HFF0000
PAU.5
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
ENR.
```

This will result in something like this (see below):



Now we will specify a second gradient color. Lets say green:

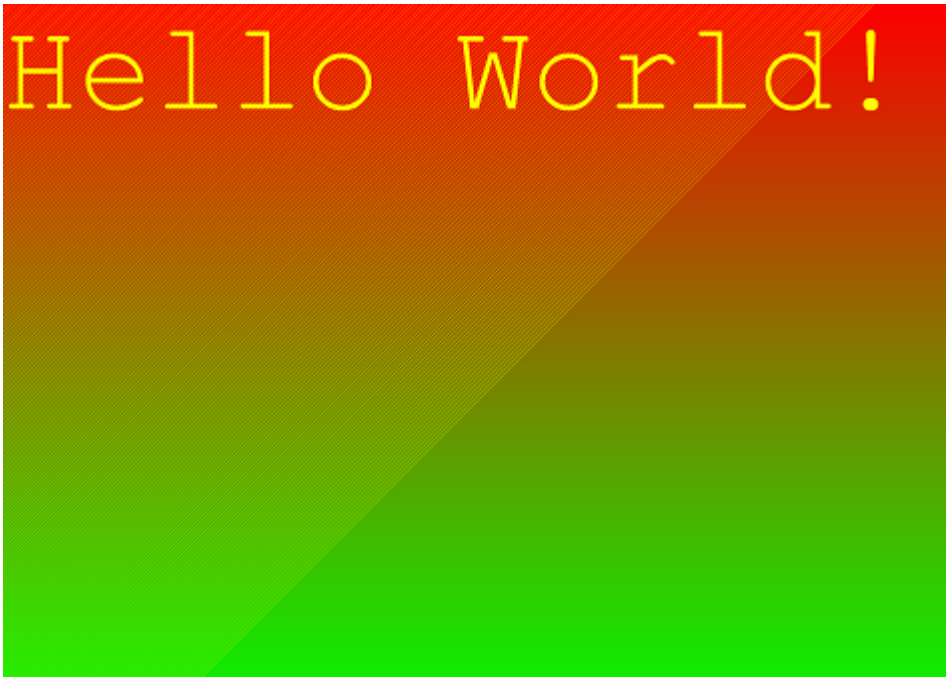
```
UCV.nbi
' red/green fading gradient
UCV.grd|&HFF0000|&H00FF00
PAU.5
ENR.
```

The following example shows that you can also write and paint on a gradient.

```
UCV.nbi
UCV.grd|&HFF0000|&H00FF00
UCV.fgr|&HFFFF00
UCV.write|Hello World!
FOR.$$XCO|1|2600|10
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  UCV.drawto|1,$$XCO|2*$$XCO,$$XCO*2
  UCV.drawto|$$XCO,1|1,$$XCO
NEX.
PAU.5
ENR.
```



If you specify a "1" as third number:

```
UCV.grd|&HFF0000|&H00FF00|1
```

then the gradient will be horizontal instead of vertical.

```
UCV.nbi
UCV.grd|&HFF0000|&H00FF00|1
UCV.fgr|&HFFFF00
UCV.write|Hello World!
FOR.$$XCO|1|2600|10
  UCV.drawto|1,$$XCO|2*$$XCO,$$XCO*2
  UCV.drawto|$$XCO,1|1,$$XCO
NEX.
PAU.5
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

UCV.gradient[|P1][|P2][|P3]
UCV.grd[|P1][|P2][|P3]

Parameter Explanation

P1 - (optional) Color-value for first gradient color.

P2 - (optional) Color-value for second gradient color.

P3 - (optional) 0/1 - switches between a horizontal and a vertical gradient.

Example

```
'**********************************
' UCV.-Sample
'
'**********************************
'
UCV.nbi
UCV.grd|&HFF0000|&H00FF00
PAU.10
UCV.
ENR.

'**********************************
' UCV.-Sample 2
'
'**********************************
'
UCV.nbi
UCV.grd|&HFF0000|&H00FF00
UCV.fgr|&HFFFF00
UCV.write|Hello World!
FOR.$$XCO|1|2600|10
  UCV.drawto|1,$$XCO|2*$$XCO,$$XCO*2
  UCV.drawto|$$XCO,1|1,$$XCO
NEX.
PAU.5
ENR.
```

3.55.8.12 ldi - load image

UCV.load image - load a BMP-Pictu Previous 1953 Top 41 Next 1962

MiniRobotLanguage (MRL)

UCV.load image
UCV.ldi

Load a BMP-Picture as cover background

Intention

This command will load an bitmap file (BMP-file) onto the cover. The file will automatically be resized to fit the cover.

General usage is simple, if the picture is in `?path\`, that is the folder, where the script itself is, you can just give the filename. Otherwise specify a complete path..

If you want to compile an executable, note that you have to include the picture file manually into the excutable using the

```
'#INC:?path\picture.bmp
```

command. There is currently no auto-include for images.

```
' this will load an image and show it with a fade-in effect
UCV.ldi|rubin.bmp
PAU.5
```

© 2023 Theo Gottwald * https://www.smart-package.com

You can also use the image as background and modify it using the `UCV.write` or other `UCV.`-commands.

```
UCV.nbi
UCV.ldi|rubin.bmp
' Paint on the picture
UCV.fgr|&HFF0000
FOR.$$XCO|1|2600|6
  UCV.drawto|1,$$XCO|2*$$XCO,$$XCO*2
  UCV.drawto|$$XCO,1|1,$$XCO
NEX.
PAU.5
ENR.
```

Syntax

UCV.load image
UCV.ldi

Parameter Explanation

P1 - variable/filename of the image that should be loaded. The image will automatically be re-sized to fit the entire cover.

Example

```
'**********************************
' UCV.-Sample
'
'**********************************
'
UCV.nb
UCV.bgr|&HFF0000
UCV.cov

3.55.8.13 lin - line / drawto

MiniRobotLanguage (MRL)

UCV.line
UCV.lin
UCV.drawto

Draw a line onto the cover

Intention

This command will draw a line between two pixel-coordinates onto the cover. The line is been drawn in the foreground color. As this is a very general graphics command, it will enable you to draw all sorts of shapes.

General usage is simple:

```
' Set foreground color
UCV.fgr|&HFF00FF
' Draw thwe line from 600,1 to 200,100
UCV.line|600,1|200,100
```

Points that have been set using the "`set point`" command can be used as starting points for the "`Line`" command. In that case you can omit the second coordinate pair.

```
' We set a single Pixel at 1,1 which will then
' be the starting point for the line.
UCV.set pixel|1,1
' you can use mathematical inline calculations
' for all coordinates
UCV.line|($$XCO*2.5),600

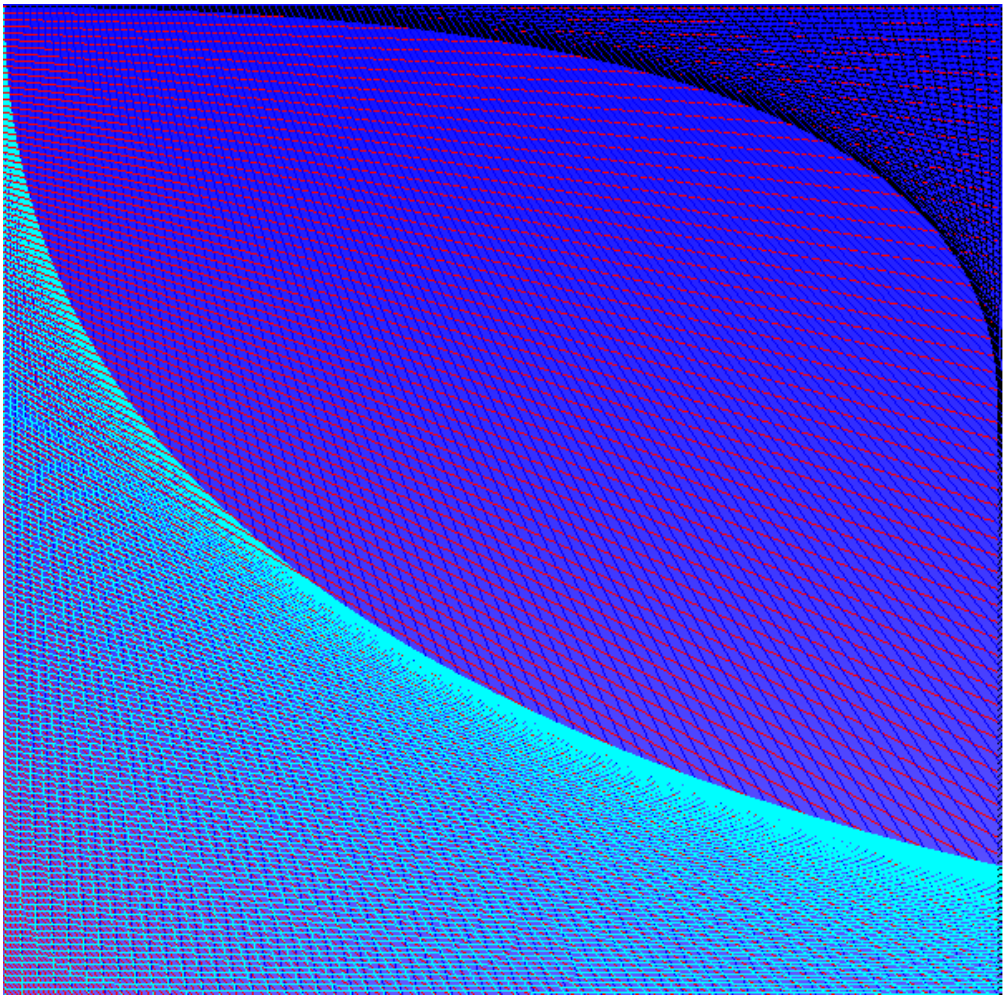
' Here is a complete example using a gradient as background.
UCV.nb
UCV.gradient
FOR.$$XCO|1|600
  UCV.fgr|&HFF00FF
  UCV.line|600,$$XCO|($$XCO*2.5),1
NEX.
PAU.4
UCV.
ENR.ENR.
```

You can draw more complex example, like this:

```
' compile before running
UCV.nb
UCV.gradient
FOR.$$XCO|1|600
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  UCV.fgr|&H0000FF
  UCV.set pixel|$$XCO,1
  UCV.line|($$XCO*2.5),600
  UCV.fgr|&HFF0000
  UCV.line|1,$$XCO|600,($$XCO*2.5)
  UCV.fgr|&H00FFFF
  UCV.line|($$XCO*2.5),600|1,$$XCO
  UCV.fgr|&HFFFF
  UCV.line|600,$$XCO|($$XCO*2.5),1
NEX.
PAU.4
UCV.
ENR.
```



Syntax

UCV.line|P1,P2[|P3,P4]
UCV.lin|P1,P2[|P3,P4]
UCV.drawto|P1,P2

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1,P2 - Screen-Pixel-Coordinates for the starting Point of the line to be drawn.

P3,P4 - (optional) Screen-Pixel-Coordinates for the ending-Point of the line to be drawn.

If omitted, the last used Coordinates are used. This way you can easily draw a figure

of lines.

Example

```
'**********************************
' UCV.-Sample
'

3.55.8.14 mat - matte, dark transparent cover

UCV.matte - put a dark glas-screen **Previous** 1962 **Top** 41 **Next** 1971

MiniRobotLanguage (MRL)

UCV.matte
UCV.mat

Create a dark, transparent yet protective cover

Intention

This command is used to allow the user to see what happens on screen. While its still protective to the scripted process and prevents the user from clicking or doing any action on the protected process. Its just like if you put a dark, half transparent glas between the desktop and the user-mouse.

To achieve this goal, Smarty will
- create a "Cover"-Form that will be placed above all other Forms*.
- make that form half transparent and add a grey desktop picture to it.
- that form will prevent the user from being able to see or click anything that is below that form.*
- you can still use the Direct Engine 231 to work with Setup-Programs.
- the Compatible Engine 231 will not work if a Cover shields the desktop.

General usage is simple:

```
UCV.matte
' Here comes your script, we use a PAUSE command instead
PAU.10
' This will remove the Cover
UCV.
ENR.
```

You can switch from glas to "matte" (50% transparent/grey glas), like this:

```
UCV.glas
PAU.5
UCV.mat
PAU.5
UCV.
ENR.
```

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

WHile "Matte" is a "dark glas", you can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

* PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

3.55.8.16 nbi - no blend-in

UCV.no blend-in - disable fading in Previous 1971 Top 41 Next 1977

MiniRobotLanguage (MRL)

UCV.no blend-in
UCV.nbi

Change fading behavior of the appearing cover

Intention

This command is used to change the fading behavior for an cover when it appears. Without this command, a cover will slowly fade-in. If this command is use, the fading-in is completely disabled.

The "desktop-picture cover" is shown immediately without fading like this:

```
UCV.nbi
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

Syntax

UCV.no blend-in
UCV.nbi

Parameter Explanation

-

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' UCV.-Sample
' In this Mode, the cover will appear immediately.
'
'**********************************
' prevent fade-in
UCV.no blend-in
' Switch cover on
UCV.desktop-copy
PAU.20
UCV.
ENR.

'**********************************
' UCV.-Sample
' We will make the existing cover to disappear
' using a transparency value of 0.
' Then we print on the cover and just
' make it visible again.
'
'**********************************
'
UCV.nbi
UCV.cov
UCV.tra|0
UCV.bgr|&HFF00FF
UCV.pri|$$TXT
UCV.tra|126
PAU.4
UCV.
ENR.
```

Remarks

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

Limitations:

-

3.55.8.17 nbo - no blend-out

UCV.no blend-out - disable fading out Previous 1974 Top 41 Next 1980

MiniRobotLanguage (MRL)

UCV.no blend-out
UCV.nbo

Change fading behavior of the disappearing cover

Intention

This command is used to change the fading behavior for an cover when it disappears. Without this command, a cover will slowly fade-out. If this command is used, the fading-out is completely disabled.

The "desktop-picture cover" is shown without fade-in and then disappear without fade-out:

```
UCV.dc
PAU.10

' This line will remove the cover
UCV.nbo
UCV.
```

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

Syntax

UCV.no blend-in
UCV.nbi

Parameter Explanation

*© 2023 Theo Gottwald * https://www.smart-package.com*

-

Example

```
'**********************************
' UCV.-Sample
' In this Mode, the cover will appear immediately.
'
'**********************************
' prevent fade-out
UCV.no blend-out
' Switch cover on
UCV.desktop-copy
PAU.20
UCV.
ENR.

'**********************************
' UCV.-Sample
' We will make the existing cover to disappear
' using a transparency value of 0.
' Then we print on the cover and just
' make it visible again.
'
'**********************************

3.55.8.18 ntr - no transparency

UCV.no transparency - make cover opaque Previous 1977 Top 41 Next 1984

MiniRobotLanguage (MRL)

UCV.no transparency
UCV.ntr

Change transparency value of Cover to opaque

Intention

This command is used to change the transparency value of the screen cover to opaque.

This command is a modifier command. It is used to modify an existing cover, or to modify an cover that is soon to be created.

Usage is simple:

```
' Tell the cover to start transparent (50%)
UCV.tra

' Choose a greyscale desktop picture cover
UCV.dbw

' Wait 5 seconds
PAU.5

' No make the cover opaque
UCV.ntr

' Wait ten seconds
PAU.10

' close the cover
UCV.

' end the script
ENR.
```

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

© 2023 Theo Gottwald * https://www.smart-package.com

You can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

A transparency value of 0 (zero) which is used after the cover has been created, will deactivate the cover while its still there. You can switch it on later just by giving another transparency value. Here is an example:

```
UCV.cov
UCV.tra|0
UCV.bgr|&HFF00FF
UCV.pri|$$TXT
UCV.tra|126
PAU.4
UCV.
ENR.
```

* PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

Syntax

UCV.no transparency
UCV.ntr

Parameter Explanation

-

Example

```
'**********************************
' UCV.-Sample
'
'**********************************
UCV.tra
UCV.dbw
PAU.5
UCV.ntr
PAU.10
UCV.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
' UCV.-Sample 2
' In this Mode, the cover will appear immediately.
'
'**********************************
' prevent fade-in
UCV.no blend-in
' Switch cover on
UCV.desktop-copy
PAU.20
UCV.
ENR.

'**********************************
' UCV.-Sample 3
' In this Mode, the cover will appear
' and then be faded to transparent.
'
'**********************************
'
UCV.dc
UCV.tra
PAU.10

' This line will remove the cover
UCV.

'**********************************
' UCV.-Sample 4
' We will make the existing cover to disappear
' using a transparency value of 0.
' Then we print on the cover and just
' make it visible again.
'
'**********************************
'
UCV.cov
UCV.tra|0
UCV.bgr|&HFF00FF
UCV.pri|$$TXT
UCV.tra|126
PAU.4
UCV.
ENR.
```

Remarks

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

-

See also:

3.55.8.19 pri - print

UCV.print - print listing Previous 1980 Top 41 Next 1987

MiniRobotLanguage (MRL)

UCV.print
UCV.pri

Print more text use vertical scrolling if needed

Intention

This command will print text in the actual foreground color. Use the "`UCV.foreground`" command to set the foreground color. "`UCV.print`" will use the font that you can set using the "`UCV.set font`" command.

General usage is simple:

```
' Make a completely green cover
UCV.bgr|&H00FF00
' Set red foreground color
UCV.fgr|&HFF0000
UCV.cov
' Print in red onto the green background
UCV.print|Hello world!
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&HFFFF00
UCV.print|Hello world!
' This will remove the Cover
UCV.
ENR.
```

You can print a text on the cover, like this:

```
' Make a completely red cover
UCV.bgr|&HFF0000
UCV.cov
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&HFFFF00
' Print on the cover screen
UCV.print|Hello world
' This will remove the Cover
UCV.
ENR.
```

As you can see, the "`background`" command will also influence the background of the color of the "`print`" command.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

Print will automatically do a "word wrap". Print will place words that do not fit into the current line, automatically into the next line. Therefore avoid words that do not fit into a line, as these may not be printed at all. Use the "`UCV.write`" for such cases.

```
' This line will remove the cover
UCV.
```

Syntax

UCV.print|P1
UCV.pri|P1

Parameter Explanation

P1 - String/variable with the text that should be printed.

Example

```
'**********************************
' UCV.-Sample
' Shows scrolling text
'**********************************
'
$$TXT=Hallo my dear, try the PRINT command also ....
STR.CLONE|$$TXT|160|$$TXT
' no fading
UCV.nb
' set foreground color
UCV.fgr|&HFF0000
' set transparent background color
UCV.bgr|-1
UCV.mat
UCV.set font|futura t|40|||0
UCV.pri|$$TXT
PAU.4
UCV.
ENR.

'**********************************
' UCV.-Sample 2
'
'**********************************
'
' Make a completely red cover
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
UCV.bgr|&H0000FF
UCV.cov
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&H00FFFF
' Print on the cover screen
UCV.print|Hello world
' This will remove the Cover
UCV.
ENR.
```

Remarks

-

Limitations:

PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

3.55.8.20 rsf - reset font

UCV.reset font - resete font for "print" and "write" Previous 1984 Top 41 Next 1990

MiniRobotLanguage (MRL)

UCV.reset font
UCV.rsf

Reset font for printing and writing to original values

Intention

This command enables you to reset the font-settings for printing and writing to the default settings. These are:

Font-Name = Courier New
Font-Size = X-Resolution/10
Font-Pitch = 0
Font-Style = 0
Font-Escapement = 0
Font-Charset = 0 (ANSI)

Once you have used the "`UCV.set font`" command, the chosen font is use for all print and write commands. Until you choose another font, or until you use this command to reset the values to the default values.
Use the "`UCV.foreground`" command to set the foreground color.

General usage is simple, here you can see an example that will set- and reset the font.

*© 2023 Theo Gottwald * https://www.smart-package.com*

It will generate a picture like the above picture.

```
UCV.nbi
' Make a completely red cover
UCV.bgr|&HFF0000
UCV.gra|&HFF00FF|&HFFFF00
' Switch writing color to yellow
UCV.fgr|&HFFFF00
' Set a font
UCV.font set|Futurat|164|18||350
UCV.write|Hello world!|350,620
' reset the font to default
UCV.rsf
' print the black shadow for a 3D Effect
UCV.fgr|&H000000
UCV.write|Hello world!|15,620
UCV.fgr|&H00FF00
UCV.write|Hello world!|17,625
PAU.5
' This will remove the Cover
UCV.
ENR.
```

Syntax

UCV.reset font
UCV.rsf

Parameter Explanation

-

Example

```
'**********************************
' UCV.-Sample
' Shows font setting and resetting
'**********************************
'
UCV.nbi
' Make a completely red cover
UCV.bgr|&HFF0000
UCV.gra|&HFF00FF|&H00FFFF
' Switch font color to yellow
UCV.fgr|&HFFFF00
UCV.font set|Futurat|164|18||350
UCV.write|Hello world!|350,620
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
UCV.rsf
UCV.fgr|&H000000
UCV.write|Hello world!|15,620
UCV.fgr|&H00FF00
UCV.write|Hello world!|17,625
PAU.5
' This will remove the Cover
UCV.
ENR.
```

Remarks

3.55.8.21 sft - set font

MiniRobotLanguage (MRL)

UCV.set font
UCV.sft

Choose alternative font for printing and writing

Intention

This command enables you to choose an alternative font for printing and writing. Once you have used the "`UCV.set font`" command, the chosen font is use for all print and write commands.

will print text in the actual foreground color. Use the "`UCV.foreground`" command to set the foreground color. "`UCV.print`" will use the font that you can set using the "`UCV.set font`" command.

General usage is simple, here you can see an example:

```
UCV.nb
' Make a completely red cover
UCV.bgr|&HFF0000
UCV.cov
' Switch font color to yellow
UCV.fgr|&HFFFF00
UCV.font set|-|164|18||-350
UCV.write|Hello world!|350,20
PAU.5
' This will remove the Cover
UCV.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

You can print a text on the cover, like this:

```
'
UCV.nbi
' Make a gradient cover
UCV.gra|&HFF00FF|&HFFFF00
' Switch font color to yellow
UCV.fgr|&HFFFF00
UCV.font set|FuturaT|164|18||350
UCV.write|Hello world!|350,620
PAU.5
' This will remove the Cover
UCV.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

UCV.set font[|P1][|P1][|P1][|P1][|P1]
UCV.sft[|P1][|P1][|P1][|P1][|P1]

Parameter Explanation

***P1 - (optional)* Fontname** - String/variable with the Font name e.g. "Arial", that should be used.

***P2 - (optional)* Fontsize** - Value/variable with the Fontsize e.g. 64. Font-Sizes should be in the Range between 4 and 260.

***P3 - (optional)* Fontstyle** - Value/variable with the Fontstyle:

0 - Normal
1 - Bold
2 - Italic
4 - Underline
8 - Strikeout
16 - Leading

You can use these values or add them and use a combination of them.

***P4 - (optional)* Fontpitch** - Value/variable with the Fontpitch:

0 - Default
1 - Fixed width font
2 - Variable width font
16 - Roman font (Times Roman...)
32 - Swiss font (Helvetica, Swiss...)
48 - Modern font (Pica, Courier...)
64 - Script font (Cursive...)
80 - Decorative (OldEnglish...)

You can use these values or add them and use a combination of them.

***P5 - (optional)* Escapement** - Value/variable with the Font-Escapement:
Specifies the angle, in tenths of degrees, between the character base line and the x axis.
Allows printing of text on an angle. If this value is not zero, any vertical scrolling is disabled.

P6 - (optional) ANSI-Charset - Value/variable with the Font-Charset.
Please use directly the number, combinations are impossible.
Here are some possible Charset-numbers.

```
0   - ANSI CharSet              162 - Turkish CharSet

1   - Default CharSet           177 - Hebrew CharSet
2   - Symbol CharSet            178 - Arabic CharSet
77  - Mac CharSet               186 - Baltic CharSet
128 - Shiftjis CharSet          204 - Russian CharSet
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
129 - Hangeul CharSet          222 - Thai CharSet
130 - Johab CharSet            238 - East Europe CharSet
136 - Chinese CharSet          255 - OEM CharSet
161 - Greek CharSet

More Infos, see here:
```

MSDN-CharSets

Any of the parameters can be omitted, in that case the previous value is been used.

Example

```
'**********************************
' UCV.-Sample
' Shows scrolling text
'**********************************
'
$$TXT=Hallo my dear, try the PRINT command also ....
STR.CLONE|$$TXT|160|$$TXT
' no fading
UCV.nb
' set foreground color
UCV.fgr|&HFF0000
' set transparent background color
UCV.bgr|-1
UCV.mat
UCV.set font|futurat|40|||0
UCV.pri|$$TXT
PAU.4
UCV.
ENR.
```

Remarks

-

Limitations:

PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

3.55.8.22 spi - plot - set pixel

MiniRobotLanguage (MRL)

UCV.plot
UCV.set pixel
UCV.spi

Paint a single pixel onto the cover

Intention

This command will paint a single pixel at a pixel-coordinate, onto the cover. The pixel is been drawn in the foreground color. As this is a very general graphics command, it will enable you to draw all sorts of shapes from pixels.

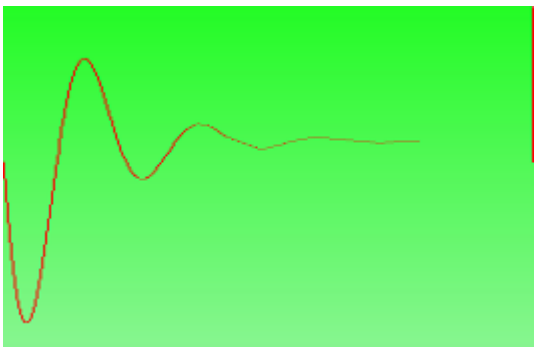
General usage is simple:

```
' Set foreground color
UCV.fgr|&HFF00FF
UCV.plot|600,1
```

Points that have been set using the "`set point`" command can be used as starting points for the "`Line`" command. In that case you can omit the second coordinate pair.

```
' We set a single Pixel at 1,1 which will then
' be the starting point for the line.
UCV.set pixel|1,1
' you can use mathematical inline calculations
' for all coordinates
UCV.line|($$XCO*2.5),600
```

You can draw more complex examples, like this:



```
' compile before running
'#SPI:Forcewrite
UCV.nb
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```

3.55.8.23 tra - transparency

UCV.transparency - make cover transparent **Previous** 1995 **Top** 41 **Next** 2005

MiniRobotLanguage (MRL)

UCV.transparency
UCV.tra

Change transparency value of Cover

Intention

This command is used to change the transparency value of the screen cover.
A value of 1 will make it completely transparent, a value of 255 will make it opaque.
All values between will change the cover visibility to any value between.

The transparency command is a modifier command. It is used to modify an existing cover, or to modify an cover that is soon to be created.

The "desktop-picture cover" is shown with the simple line:

```
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

The desktop-cover behavior can be changed/customized using the additional features:

```
UCV.transparency
UCV.no transparency
UCV.no blend
UCV.no blend-in
UCV.no blend-out
UCV.write
' this line will remove the cover
UCV.close
```

You can make the desktop-cover half transparent, by prefixing the script with:

```
UCV.tra
UCV.dc
PAU.10

' This line will remove the cover
UCV.
```

A transparency value of 0 (zero) which is used after the cover has been created, will deactivate the cover while its still there. You can switch it on later just by giving another transparency value. Here is an example:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
UCV.cov
UCV.tra|0
UCV.bgr|&HFF00FF
UCV.pri|$$TXT
UCV.tra|126
PAU.4
UCV.
ENR.
```

* PopUp-Menus and other TopMost Forms may be able to get temporarily in front of the Cover-form. This is due to windows-technical reasons and not a bug.

Syntax

UCV.transparency[|P1]
UCV.tra[|P1]

Parameter Explanation

P1 - `(optional)` transparency value between 1 and 255. If omitted 128 is used. A transparency value of 0 can only be used for a cover that already exists. In that case the cover will be deactivated. It can still be printed and painted on the cover, even though it seems not to be there. You can later make it visible just by changing the transparency value to a higher value.

Example

```
'**********************************
' UCV.-Sample
' In this Mode, the cover will fade in slowly
' which is invisible if no on going
' changes on the desktop happen.
'**********************************
' Switch cover on
UCV.desktop-copy
PAU.20
UCV.
ENR.

'**********************************
' UCV.-Sample 2
' In this Mode, the cover will appear immediately.
'
'**********************************
' prevent fade-in
UCV.no blend-in
' Switch cover on
UCV.desktop-copy
PAU.20
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
UCV.
ENR.

'**********************************
' UCV.-Sample 3
' In this Mode, the cover will appear
' and then be faded to transparent.
'
'**********************************
'
UCV.dc
UCV.tra
PAU.10

' This line will remove the cover
UCV.

'**********************************
' UCV.-Sample 4
' We will make the existing cover to disappear
' using a transparency value of 0.
' Then we print on the cover and just
' make it visible again.
'
'**********************************
'
UCV.cov
UCV.tra|0
UCV.bgr|&HFF00FF
UCV.pri|$$TXT
UCV.tra|126
PAU.4
UCV.
ENR.
```

Remarks

Any cover is been removed immediately, when the script-process ends or when the script runs into an error.

Limitations:

-

3.55.8.24 wri - write

UCV.write - write text on cover Previous 2001 Top 41 Next 3572

MiniRobotLanguage (MRL)

UCV.write
UCV.wri

Print graphical text on to the cover

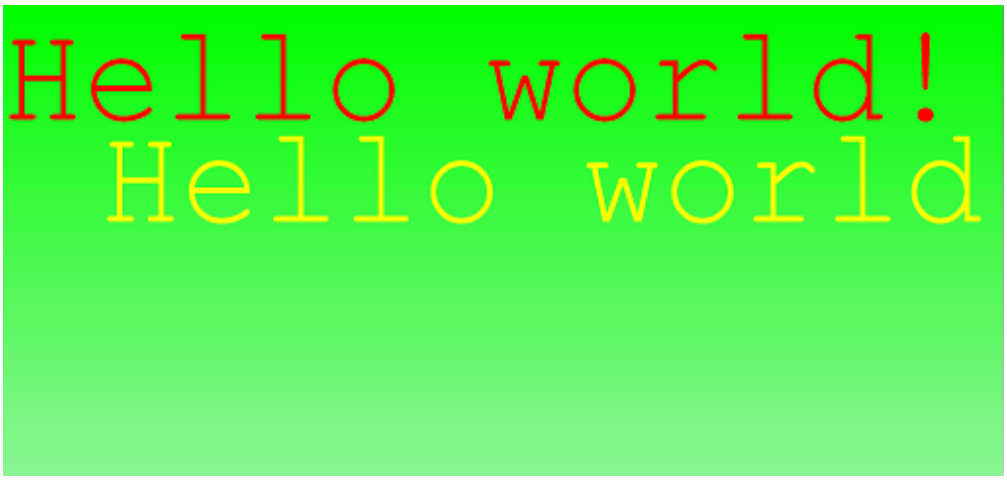
Intention

This command will print text in the actual foreground color. Use the "`UCV.foreground`" command to set the foreground color. "`UCV.write`" will use the font that you can set using the "`UCV.set font`" command.

General usage is simple:

```
UCV.nbi
UCV.grd|&H00FF00
' Set red foreground color
UCV.fgr|&HFF0000
' Print in red onto the green background
UCV.write|Hello world!
' We change color to yellow
UCV.fgr|&HFFFF00
UCV.wri|Hello world!|200,200
' This will remove the Cover
PAU.5
UCV.
ENR.
```

Will look like this:



*© 2023 Theo Gottwald * https://www.smart-package.com*

`UCV.write` will not automatically do a "word wrap". Therefore avoid words that do not fit into a line, as these may be cut off at the end otherwise. Use the "`UCV.print`" for such cases to have word wrap.

`UCV.write` will allow you to exactly specify the top,left corner of the text to print. Like this:

```
UCV.write|Hello world!|100,100
```

`UCV.write` will allow you further, to specify an alignment as a third parameter:

```
UCV.write|Hello world!|100,100|2
```

See below for details.

Syntax

UCV.write|P1[|P2,P3][|P4]
UCV.wri|P1|[|P2,P3][|P4]

Parameter Explanation

P1 - Text to write on to the Cover.

P2 - (optional) - X-Position value of the text to be printed, in pixels, screen coordinates.

P3 - (optional) - Y-Position value of the text to be printed, in pixels, screen coordinates.

P4 - (optional) - number between 1 and 4 that specifies the text-alignment. If omitted 1 is default.

```
LEFT       = 1
RIGHT      = 2
CENTER     = 3
JUSTIFY    = 4
```

Example

```
'**********************************
' UCV.-Sample
' Shows scrolling text
'**********************************
'
$$TXT=Hallo my dear, try the PRINT command also ....
STR.CLONE|$$TXT|160|$$TXT
' no fading
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
UCV.nb
' set foreground color
UCV.fgr|&HFF0000
' set transparent background color
UCV.bgr|-1
UCV.mat
UCV.set font|futura t|40|||0
UCV.wri|$$TXT
PAU.4
UCV.
ENR.

'**********************************
' UCV.-Sample 2
'
'**********************************
'
' Make a completely red cover
UCV.bgr|&H0000FF
UCV.cov
' Here comes your script, we use a PAUSE command instead
PAU.5
' Switch cover color to yellow
UCV.bgr|&H00FFFF
' Print on the cover screen
UCV.write|Hello world||2
' This will remove the Cover
UCV.
ENR.
```

3.56.2 CLP. - Clipboard - Operation

MiniRobotLanguage (MRL)

CLP. Command

Clipboard Operation

Intention

Return or set the Value of the System Clipboard(s).

Modes of operation:

```
1.    CLP.proto|$$MAIN[|$$CPT]
2.    CLP. (no parameter) put Clipboard -> TOS
3.    CLP.c - Clipboard Clear
4.    CLP.$$TXT - write Text to Clipboard
5.    CLP.r|$$RET|$$CPT
   ' read Text/Variable from Clipboard
6.    CLP.t|$$TXT|$$CPT
   ' write Variable-Content to Clipboard
7.    CLP.w|$$TXT|$$CPT
   ' wait for Clipboard-Change
```

Syntax

CLP.P1|P2[|P3]

Parameter Explanation

P1 - Type of Operation

Please specify only one prototype-letter for this command.
Successive letters will be ignored.
t - write Text to clipboard
r - read from Clipboard
c - Clear the Clipboard.
w - wait for Clipboard change.
P1 is maximum waiting-time in seconds or zero for endless.
P2 gets the new value from the clipboard.
The result can be in the original Variable P1 or if P3 is given, it will be placed in P3.

P2 - VAR with string or for result
P3 - optional: Clipboard Type to use.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Speed in Ticks:

This command uses typically around 1000 to 7000 Ticks heavily depending on Parameters.

Example

```
'**********************************
' CLP.-Sample 1
'**********************************
' Screenshot the desktop into Clipboard.

'**********************************
' CLP.-Sample 2
'**********************************
' Remove a picture from Clipboard
CLP.c||2
ENR.

'**********************************
' CLP.-DEMO
'**********************************
: §§TXT=http://www.it-berater.org

' When using no parameter, CLP. returns the Text-Clipboard-
Content on Stack
CLP.
PRT.Stack-Content:>$$000<
PRT.---------------------------
' When using one parameter, CLP. writes the String into the
Text-Clipboard
CLP.§§TXT
CLP.r|§§OUT
PRT.Clipboard: >§§OUT<
PRT.---------------------------
' Now we clear the Clipboard and use the systemvariable for
Clipboard
CLP.§§TXT
CLP.c
CLP.r|§§OUT
PRT.Clipboard: >$cpb$<>§§OUT<
PRT.---------------------------
' Starting Parallel-Robot that will change the clipboard
PRR.
  PAU.5
  CLP.t|Hallo!
  PAU.5
  CLP.t|Hey man!
  ENR.
PRE.
PRT. Waiting for Change!
CLP.§§TXT
CLP.w
PRT. Clipboard is: >$cpb$<
PRT.---------------------------
PRT. Now waiting for change with timeout 50 Seconds
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
: §§TRIM=5
CLP.w|§§TIM|§§CIP
' The Changeflag is 0 if a timeout has occured and 1 if the
clipboard has changed in time
PRT.Clipboard Change to >§§CIP< Changeflag was: §§TIM
DMP.4
MBX.Ready
END.
```

Speed in Ticks:
This command uses typically around 7000 Ticks heavily depending on Parameters.

Remarks

The following Clipboard-Types can be used as third parameter (use the number!. If you are not sure for what you need this parameter, don't use it. Default value if omitted is 7.

```
TEXT =            1
BITMAP =          2
METAFILEPICT =    3
SYLK =            4
DIF =             5
TIFF =            6
OEMTEXT =         7
DIB =             8
PALETTE =         9
PENDATA =         10
RIFF =            11
WAVE =            12
UNICODETEXT =     13
ENHMETAFILE =     14
HDROP =           15
LOCALE =          16
DIBV5 =           17
MAX =             18 ' varies by Windows version
```

Limitations:

Use the ANA.ToClipboard-Command to place Pictures in the Clipboard.
To Read Pictures from the Clipboard, use the ANA.FromClipboard-Command.

 © 2023 Theo Gottwald * https://www.smart-package.com

3.56.3 DDD. - Display Directory Dialog

MiniRobotLanguage (MRL)

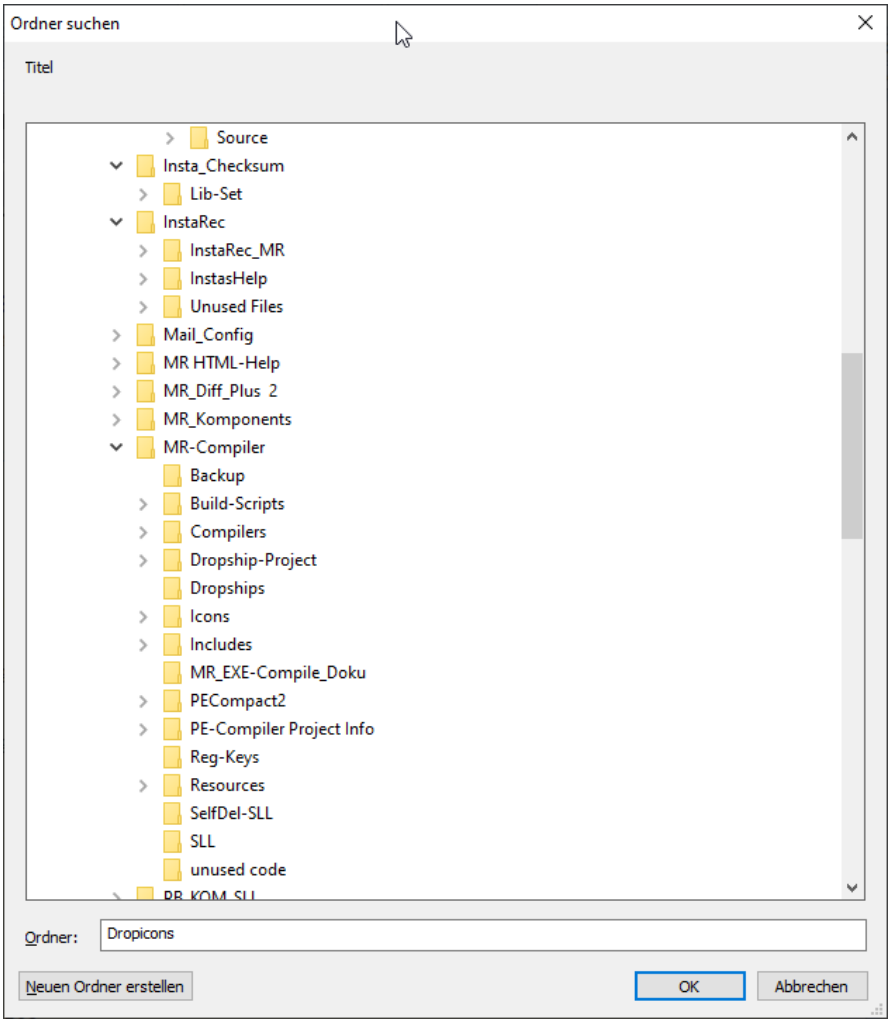
DDD. - Display Directory Dialog

Display Directory Selection Dialog-Box

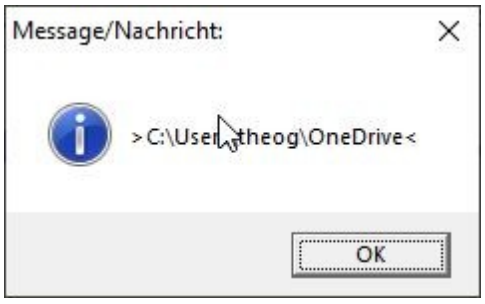
Intention

Generates a Dialog in which you can choose a Directory at Runtime of the Script.
Usage:

```
$$TIT=Titel
$$SFO=?path\
DDD.$$RET|$$TIT|$$SFO|?desktop\
MBX.>$$RET<
ENR.
```



*© 2023 Theo Gottwald * https://www.smart-package.com*



The result will be the Folder-Path without an "\" at the end.

Syntax

DDD.P1[|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - Variable to return the Folder-Path
P2 - (optional) - Titel. This Text/Explanation will be given to the User in the Dialog.
P3 - (optional) - Start-Path. The Dialog will start in this Folder.
P4 - (optional) - Default-Path. The Command will return this path, if the user hits "Cancel" or closes the Dialog.
If omitted, nothing is returned.
P5 - (optional) - Flags (add numbers to combine features)

1 Only returns file system directories. With any other selection, the OK button is grayed.
2 Does not include network folders below the domain level in the treeview control.

8 Only returns file system ancestors. With any other selection, the OK button is grayed.
16 Includes an edit control in the dialog box that allows the user to type the name of an item.
64 Provides the new user interface, a larger dialog box that can be resized. It also offers drag-and-drop capability within the dialog box, reordering, shortcut menus, new folders, delete, and other shortcut menu commands. This is the default style.
80 Use the new user interface, plus an edit box.
128 The dialog box can display URL's if 80 and 16384 are also set.
256 When this flag is combined with Flag 64, adds a usage hint to the dialog box in place of the edit box.
512 Do not include the "New Folder" button in the dialog box.
1024 When the selected item is a shortcut, return the PIDL of the shortcut itself rather than its target.
16384 The dialog box will display both files and folders.
32768 The dialog box can display shareable resources on remote systems. It is intended for applications that want to expose remote shares on a local system. Forthis, 64 flag must also be set.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' DDD.-Sample
'**********************************
' Titel
$$TIT=Titel
' Path where the Dialog starts
$$SFO=?path\
' ?desktop is the default return if the user hits "Cancel"
DDD.$$RET|$$TIT|$$SFO|?desktop\
MBX.>$$RET<
ENR.
```

3.56.4 DFD. - Display File Dialog

MiniRobotLanguage (MRL)

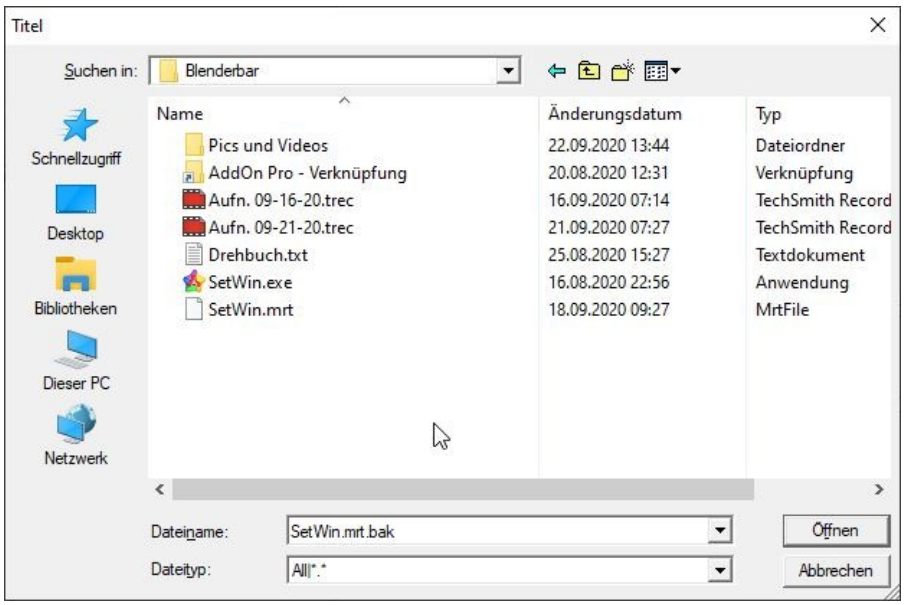
DFD. - Display File Dialog

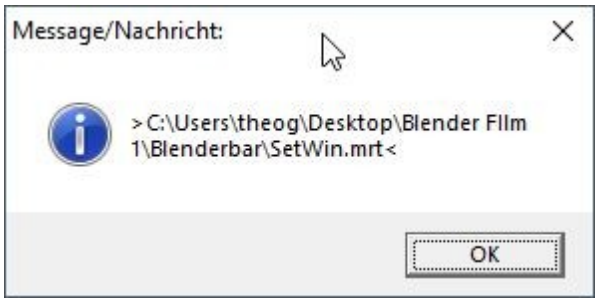
Display File Selection Dialog-Box

Intention

Generates a Dialog in which you can choose a one or more files at Runtime of the Script.
Usage:

```
$$TIT=Titel
$$SFO=?path\
DFD.$$RET|$$TIT|$$SFO|?desktop\
MBX.>$$RET<
ENR.
```

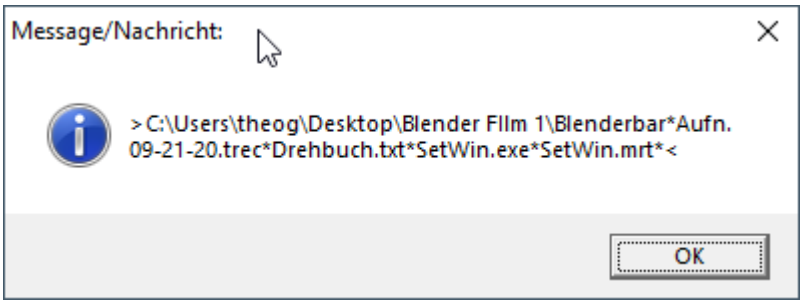




The result will be the File and -Path.
If you use "Multiselect" like this:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
$$TIT=Titel
$$SFO=?path\
' Use default style plus Multiselect
CAL.$$FLA=11081730+512
DFD.$$RET|$$TIT|$$SFO|$$FLA
MBX.>$$RET<
ENR.
```



You will get the many results like this, separated wit "*".

Syntax

DFD.P1[|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - Variable to return the FIle(s)
P2 - (optional) - Titel. This Text/Explanation will be given to the User in the Dialog.
P3 - (optional) - Start-Path. The Dialog will start in this Folder.
P4 - (optional) - **Flags** (see below, add the numbers to combine the features) set to "0" for default style.
P5 - (optional) - Default-Extension.
P6 - (optional) - Stringfilter. Sample: "BASIC|*.BAS;*.INC;*.BI|"

Flag Options:

2	Prompt for Overwriting existing Files.
8	Maintains current directory regardless of user selection.
16	The Help button is shown
256	File name not validated For invalid characters.
512 -	Allow multiple selections. Return values are "*"-terminated.
1024	Allow different Extensions
2048	Allows only valid paths and filenames.
4096 -	File name must exist.
8192 -	Allow file which does not exist.
16384	Returns network filename even if sharing violation occurs.
65536	File not created before the dialog Is closed.
131072	Hides and disables the network button.
2097152	Return Long Filenames
8388608 -	Dialog Is resizable.
524288 -	Explorer style interface (default state).
1048576	Returns name of shortcut file.

© 2023 Theo Gottwald * https://www.smart-package.com

11081730 - Default Style (%OFN_EXPLORER OR %OFN_FILEMUSTEXIST OR %OFN_LONGNAMES OR %OFN_OVERWRITEPROMPT OR %OFN_PATHMUSTEXIST OR %OFN_ENABLESIZING OR %OFN_NOTESTFILECREATE)

Example

```
'**********************************
' DFD.-Sample
'**********************************
' Titel
$$TIT=Titel
' Path where the Dialog starts
$$SFO=?path\
' ?desktop is the default return if the user hits "Cancel"
DDD.$$RET|$$TIT|$$SFO|?desktop\
MBX.>$$RET<
ENR.
```

3.56.5 DIT. - Dial Tone MFV

MiniRobotLanguage (MRL)

DIT. Command

Generate MFV-Dialtones through the Soundcard

Intention

Generates a Dial-Tone-Sound that can be attached to a telephone line to dial a number.
Together with its ability to speak (`SAY.`) and the ability to play Sound-Files (`MPA.`etc.), the Robot can call you on the phone and tell you what is going on.

Modes of operation:

1. Use `DIT.` just with the number and the default speed of 100 ms per Tone:
`DIT.1234567890`

2. Use `DIT.` and dial faster, using a shorter duration for each tone:
`DIT.1234567890|20`

3. Use `DIT.` and dial slower, using a longer duration for each tone:
`DIT.1234567890|420`

```
' You can misuse DIT. to make Music ...
' Music Mode:
FOR.$$CNT|1|2
  PRR.
    DIT.0943561954642210243|213
  PRE.
NEX.
PRR.
  DIT.094353246192210243|203
PRE.
PAU.10
ENR.
```

Syntax

DIT.P1[|P2]

Parameter Explanation

P1 - Number to dial. Following characters are supported:

 *© 2023 Theo Gottwald * https://www.smart-package.com*

0 1 2 3 4 5 6 7 8 9 * # A B C D

unsupported characters are ignored.

P2 - (optional) - if omitted, a default duration of 100 ms per Tone is used. If given, this

is the duration in ms that a Tone will stay.

Example

```
'***********************************
' DIT.-Orchestra
'***********************************

3.56.7 GUP. - Get User Password

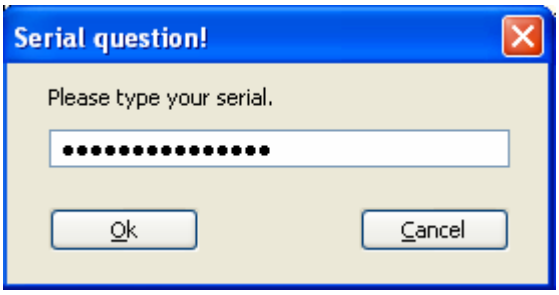
MiniRobotLanguage (MRL)

GUP. Command

Get User Password

Intention

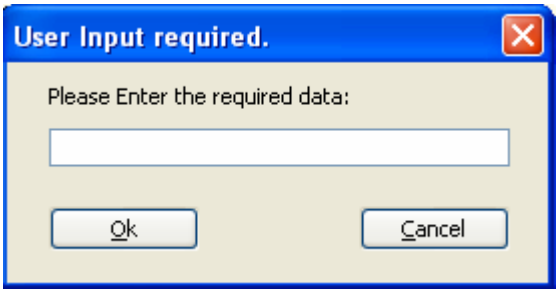
Get an input text/password from the user. The difference to GUT is, that a password-textbox is used. When the user types, it looks like this:



Usage is easy:

```
GUP.
```

will show a dialog like this:



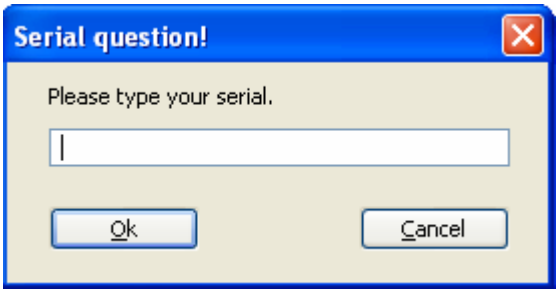
The cursor will blink, and the dialog will immediately take user input. The user can type up to 260 characters into the textbox. The result, will be place on TOS 104. You can try it using this sample script:

```
GUP.
STS.DUMP
MBX.Ready?
ENR.
```

Next you may want to change the Dialog-text and the dialog Headline.
These are parameters **P2** and **P3**:

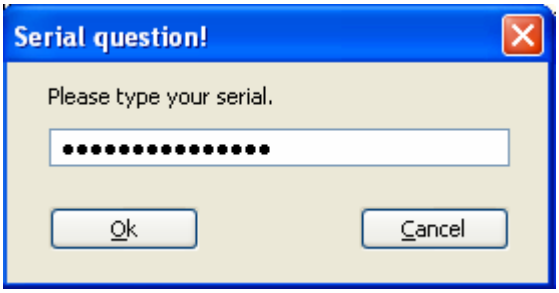
© 2023 Theo Gottwald * https://www.smart-package.com

```
GUP.Please type your serial.|Serial question!
```



You may want to add a "default text". Like the one you can see in the picture below.

```
GUP.Please type your serial.|Serial question!|email@email.com
```



And finally you can have the result in the variable, **P4**.
Here is a complete Sample:

```
' Get User Text
: $$TXT=Please enter your mailadress.
: $$HEA=
: $$DEF=yourmail@yourdomain.com
GUP.$$TXT|$$HEA|$$DEF|$$RES

' Remove Invalid characters
GFS.e|$$RES

' Display result
MBX.Your Mailadress is:$crlf$$$RES
ENR.
```

Syntax

GUP.[P1][|P2][|P3][|P4]

Parameter Explanation

P1 - ***(optional)*** Text/Explanation to the user. If omitted, the phrase "Please Enter the required data:" is used. If you really want to have no text, use a blank, like this

© 2023 Theo Gottwald * https://www.smart-package.com

```
' complete empty input-box
GUP. | |
```

P2 - (optional) Text, window title. If omitted the phrase "User Input required!" is used.

If you really want to have no text, use a blank, like this

```
GUP. |Serial question!
```

P3 - (optional) Text, default Text for the textbox. If omitted no default text is given.

P4 - (optional) Variable that will receive the user-text. If omitted, user-input is placed on TOS 104.

Example

```
'*****************************************************
'  GUT. / GUP. - Sample
'*****************************************************

' Get User Mailadress
: $$TXT=Please enter your mailadress.
: $$HEA=
: $$DEF=yourmail@yourdomain.com
GUT.$$TXT|$$HEA|$$DEF|$$MAI

' Remove Invalid characters
GFS.e|$$MAI

:again
' Get User Password
: $$TXT=Please enter your password.
: $$HEA=You MUST enter something!
: $$DEF=
GUP.$$TXT|$$HEA|$$DEF|$$RES
' Trim Spaces away
VBT.$$RES
' Convert to small letters
VTL.$$RES
' Jump back if empty string is given
IVV.$$RES=
  GTO.again
EIF.
' Display result
MBT.Your Mailadress is:$crlf$$$MAI$crlf$$crlf$Your password in
small letters is:$crlf$$$RES
ENR.
'*****************************************************
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

If you do want to have secret information to be typed in, use `GUP.` instead.

Limitations:

-

3.56.8 GUT. - Get User Text

GUT. - Get User Text **Previous** 2024 **Top** 41 **Next** 2031

MiniRobotLanguage (MRL)

GUT. Command

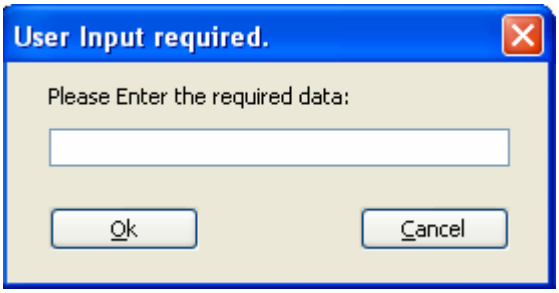
Get User Text

Intention

Get an input text from the user. Usage is easy:

```
GUT.
```

will show a dialog like this:

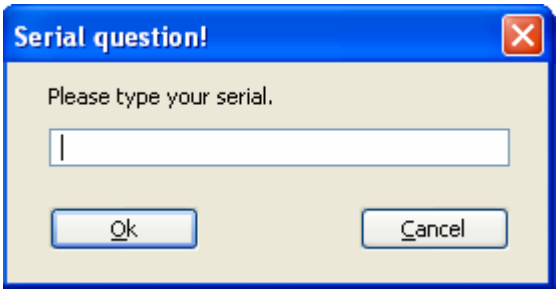


The cursor will blink, and the dialog will immediately take user input. The user can type up to 260 characters into the textbox. The result, will be place on TOS 104. You can try it using this sample script:

```
GUT.
STS.DUMP
MBX.Ready?
ENR.
```

Next you may want to change the Dialog-text and the dialog Headline.
These are parameters **P2** and **P3**:

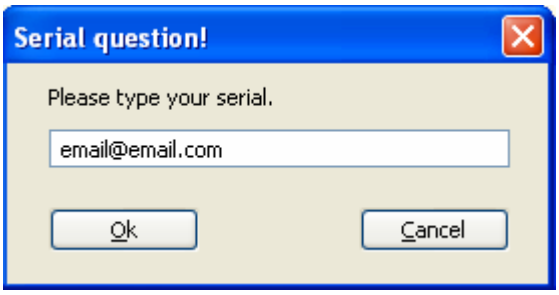
```
GUT.Please type your serial.|Serial question!
```



You may want to add a "default text". Like the one you can see in the picture below.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
GUT.Please type your serial.|Serial question!|email@email.com
```



And finally you can have the result in the variable, **P4**.
Here is a complete Sample:

```
' Get User Text
: $$TXT=Please enter your mailadress.
: $$HEA=
: $$DEF=yourmail@yourdomain.com
GUT.$$TXT|$$HEA|$$DEF|$$RES

' Remove Invalid characters
GFS.e|$$RES

' Display result
MBX.Your Mailadress is:$crlf$$$RES
ENR.
```

Syntax

GUT.[P1][|P2][|P3][|P4]

Parameter Explanation

P1 - ***(optional)*** Text/Explanation to the user. If omitted, the phrase "Please Enter the required data:" is used. If you really want to have no text, use a blank, like this

```
' complete empty input-box
GUT.
```

P2 - ***(optional)*** Text, window title. If omitted the phrase "User Input required!" is used.
If you really want to have no text, use a blank, like this

```
GUT.|Serial question!
```

P3 - ***(optional)*** Text, default Text for the textbox. If omitted no default text is given.

P4 - ***(optional)*** Variable that will receive the user-text. If omitted, user-input is placed on TOS 104.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*****************************************************
'  GUT. - Sample
'*****************************************************
' Get User Text
: $$TXT=Please enter your mailadress.
: $$HEA=
: $$DEF=yourmail@yourdomain.com
GUT.$$TXT|$$HEA|$$DEF|$$RES

' Remove Invalid characters
GFS.e|$$RES

' Display result
MBX.Your Mailadress is:$crlf$$$RES
ENR.'*****************************************************
```

Remarks

If you do want to have secret information to be typed in, use `GUP.` instead.

© 2023 Theo Gottwald * https://www.smart-package.com

3.56.9 MBT. - MessageBox Timed

MiniRobotLanguage (MRL)

MBT. Command

MessageBoX Timed

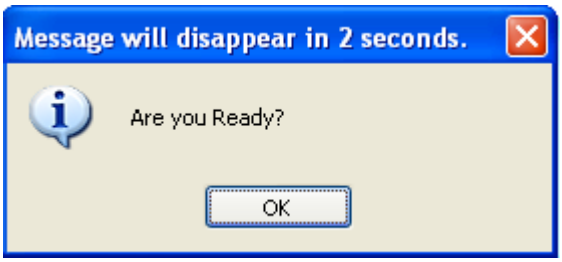
Intention

Display a message box containing a text string and optional title. This Messagebox will disappear automatically after an given amount of time.

The easiest usage is:

```
MBT.
```

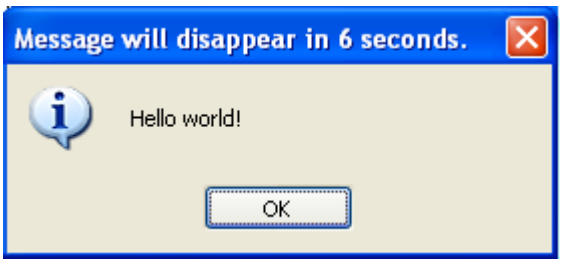
And this is the result:



You can give an Text for the Message like this:

```
MBT.Hello world!
```

And here is the result



And you can add a window title like this:

```
MBT.Hello world!|My Hello-Box will close in %t seconds.
```

which looks like this:

*© 2023 Theo Gottwald * https://www.smart-package.com*

Then you can change the number of seconds, the Messagebox will stay before it is automatically closed. In this case we choose 32 seconds:

```
MBT.Hello world!|My Hello-Box will close in %t seconds.|32
```

Next you can change the number of button or the appearance of the messagebox.

```
MBT.Hello world!|My Hello-Box will close in %t seconds.|32|48
```

And here are some results:

Flag: 32

Flag: 48

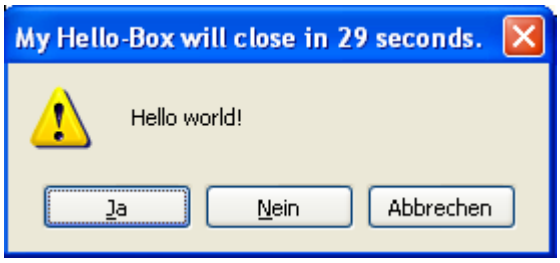
Flag: 16

© 2023 Theo Gottwald * https://www.smart-package.com

If you combine the flags, you get something like this:

```
MBT.Hello world!|My Hello-Box will close in %t seconds.|32|
(48+3)
```

Flag: 48+3



See more options below.

`MBX.` can also be used for Debugging. If you want to see the value of a variable at some place, you can just write:

```
' Check variable content
MBX.$$TXT
```

Important note: Robot-Messageboxes are always TopMost. They will be in front of all non TopMost windows. This is necessary, because the Editor can be set to TopMost, and in this case the Messageboxes must be shown on Top of the Editor to be seen.

Syntax

MBT.P1[|P2][|P3][|P4]

Parameter Explanation

P1 - ***(optional)*** Text may contain systemvariables, like for example $crlf$, which will force a newline.

P2 - ***(optional)*** - Window-Title Text. If omitted, "Message/Nachricht" is used.

P3 - ***(optional)*** numeric Value, time in seconds, before Messagebox will be automatically closed.

P4 - ***(optional)*** numeric Value, see below.

Values for P2 change the number and Text of the displayed buttons:

00 Display OK button (default)

© 2023 Theo Gottwald * https://www.smart-package.com

```
01 OK and Cancel
02 Abort, Retry and Ignore
03 YES, NO and CANCEL
04 YES and NO
05 Retry and Cancel
06 Cancel, Retry and Continue

Add this to get a additional Help-Button:
12288 Help-Button

Add this values to change the Graphic displayed:
16 Serious problem
32 Question mark
48 Exclamation mark
64 Information (default)

Add this value to set the default button:

0   Default Button is Button Nr. 1
256 Default Button is Button Nr. 2
512 Default Button is Button Nr. 3
768 Default Button is Button Nr. 4

Add this value to change the Screen-Arrangement of the
Messagebox:

0       Application Modal
4096    System-Modal
8192    Taskmodal
262144  TopMost (default and always set.)
524288  Right align Window-Text
1048576 Right align Window-Title

Add this numbers to change Focus:
32768   No Focus
65536   Set Foreground Window
131072  Desktop
```

P5 - (optional) - Variable that will contain the result of the User-Input. If omitted, TOS 104 is used.

The returned values are:

OK - 1
Cancel - 2
Abort - 3
Retry - 4
Ignore - 5
Yes - 6
No - 7
TimeOut - 0

In case of Timeout, the result is zero (0) and the **Timeout-Flag is set.**

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
' A Messagebox will appear, Text is "Hallo"
' Title is Default Title
MBT.Hallo

' A Messagebox will appear, Text is "Hallo"
' Title is "MyTitel"
MBT.Hallo||MyTitle

: $$INP=My Hello-Box will close in %t seconds.
MBT.Hello world!|$$INP|5|(48+3)|$$TXT
MBT.$$TXT
ENR.
```

Remarks

-

Limitations:

The Parameters may not have the "|" inside as it is used a Separator.

See also:

- MBX. - MessageBox 2036
- DBP - Debug Print 769
- DBV. - Debug Print Variable 771

© 2023 Theo Gottwald * https://www.smart-package.com

3.56.10 MBX. - MessageBox

MiniRobotLanguage (MRL)

MBX. Command

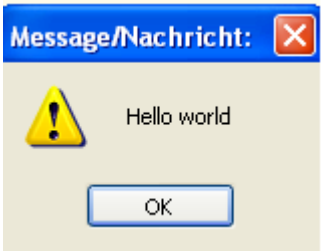
MessageBoX

Intention

Display a message box containing a text string and optional title. The easiest usage is:

```
MBX.Hello world
```

And this is the result:



Next you can add a window title like this:

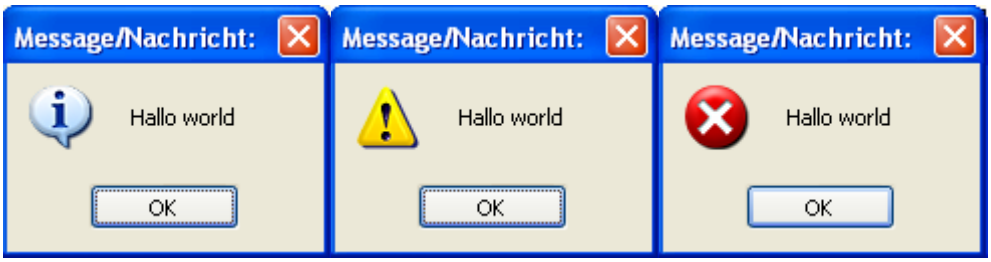
```
MBX.Hello world||Question
```

which looks like this:

Next you can change the number of button or the appearance of the messagebox.

```
MBX.Hello world|64
```

© 2023 Theo Gottwald * https://www.smart-package.com



MBX. can also be used for Debugging. If you want to see the value of a variable at some place, you can just write:

```
' Check variable content
MBX.$$TXT
```

Important note: Robot-Messageboxes are always TopMost. They will be in front of all non TopMost windows. This is necessary, because the Editor can be set to TopMost, and in this case the Messageboxes must be shown on Top of the Editor to be seen.

Syntax

MBX.P1[|P2][|P3][|P4]

Parameter Explanation

P1 **-** ***(optional)*** Text may contain systemvariables, like for example $crlf$, which will force a newline.

P2 **-** ***(optional)*** numeric Value, see below.

Values for P2 change the number and Text of the displayed buttons:

```
00 Display OK button (default)
01 OK and Cancel
02 Abort, Retry and Ignore
03 YES, NO and CANCEL
04 YES and NO
05 Retry and Cancel
06 Cancel, Retry and Continue

Add this to get a additional Help-Button:
12288 Help-Button

Add this values to change the Graphic displayed:
16 Serious problem
32 Question mark
48 Exclamation mark
64 Information (default)
```

© 2023 Theo Gottwald * https://www.smart-package.com

Add this value to set the default button:

```
0   Default Button is Button Nr. 1
256 Default Button is Button Nr. 2
512 Default Button is Button Nr. 3
768 Default Button is Button Nr. 4
```

Add this value to change the Screen-Arrangement of the Messagebox:

```
0       Application Modal
4096    System-Modal
8192    Taskmodal
262144  TopMost (default and always set.)
524288  Right align Window-Text
1048576 Right align Window-Title
```

Add this numbers to change Focus:

```
32768   No Focus
65536   Set Foreground Window
131072  Desktop
```

P3 - (optional) - Window-Title Text. If omitted, "Message/Nachricht" is used.

P4 - (optional) - Variable that will contain the result of the User--Input. If omitted, TOS[104] is used.

The returned values are:

OK - 1
Cancel - 2
Abort - 3
Retry - 4
Ignore - 5
Yes - 6
No - 7
TimeOut - 0

Example

```
' A Messagebox will appear, Text is "Hallo"
' Title is Default Title
MBX.Hallo

' A Messagebox will appear, Text is "Hallo"
' Title is "MyTitel"
MBX.Hallo||MyTitle

' Example using Variables
' Global Variable
: $$TXT=Number is
' Local Variable
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
: §§NUM=12
MBX.$$TXT§§NUM|Number is ...
```

Remarks

there are 3 Versions, depending on the Number of Parameters:

```
1. MBX.[Variable(s) or Text]
2. MBX.[Variable(s) or Text]|Variable or Value
3. MBX.[Variable(s) or Text]|Variable or Value|[Variable(s) or
Text]
```

The Result will be put on TOS.

Limitations:

The Parameters may not have the "|" inside as it is used a Separator.

See also:

- DBP - Debug Print 769
- DBV. - Debug Print Variable 771

3.56.11 MSB. - Message Beep

MiniRobotLanguage (MRL)

MSB. Command

Message Beep through PC-Speaker

Intention

Generates a Signal Beep, through the PC-Speaker. Frequency and Duration can be customized. Useful for debugging. Useful to signal errors and states without showing a text.

Modes of operation:

1. Just use it without Parameter:
```
' Will produce a short Beep-Signal
MSB.
```

2. Use with Frequency
```
' Make a 100 Hz Sound for ~ 1 Second
MSB.100
```

3. Use default frequency (thats 800 Hz) and own Duration
```
MSB.|14
```

4. Use custom Frequency and Duration
```
MSB.600|10
```

5. Use default sound patterns:

```
' Generate a siren like sound
MSB.siren|780|650|2

'  Coin bouncing, sort of
MSB.bounce|760|280

' "Falling deep" like sound
MSB.fall|1780|150

' Switch between two tones
MSB.police|170|1780
```

Syntax

MSB.[P1][|P2][|P3][|P4]

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 - (optional) - can be omitted, in that case the default frequency of 800 Hz is used, to generate a Beep Sound. If given, it can be

1.) a frequency between 1 Hz and 20000 Hz (depending on what your speaker can make that you can still hear). In that case **P2** will be a Duration in terms on 1/10 of a second.

2.) a Keyword from the following:

- **bounce** - use 2 numeric parameter
- **fall** - use 2 or 3 numeric parameter
- **siren** - use 2 or 3 numeric parameter
- **police** - use 2 or 3 numeric parameter

In this case, **P2** till **P4** will be the additional parameters for these predefined sound patterns.

P2 - (optional) - can be the duration of the frequency or a parameter for any of the above sound-patterns.

P3 - (optional) - if sound-patterns are used, this is one of their parameters.
P4 - (optional) - if sound-patterns are used, this is one of their optional parameters.

Example

```
'**********************************
' MSB. Sample
'**********************************
MSB.siren|780|650|4
MSB.police|170|1780|4
MSB.bounce|780|650
MSB.800|5
END.
```

Remarks

Use `PRR.` and `PRE.` to have your Melody play in the background.

Limitations:

-

3.56.12 OUT. - Send to Standard-Output

MiniRobotLanguage (MRL)

OUT. Command

Send String to the Standard-Output

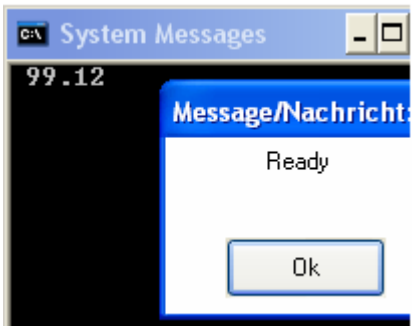
Intention

The OUT.-Command can be used to print a Line into the Debug-Console-Window or wherever Standard Output is directed to.

```
OUT. Hello World!
```

You can use variables.

```
: $$TIM=99.12
OUT.$$TIM
ENR.
```



This is the output to console window. Seethe Messagebox that prevents the console from being closed automatically, when the script ends.

Syntax

OUT.[P1]

Parameter Explanation

P1 - Variable or String

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'******************************************************
' EXAMPLE 1: PRT
'******************************************************
OUT.?path\

OUT.Hallo World

:over
MBX.Halt to read output
'******************************************************
```

Remarks

-

Limitations:

-

See also:

- DBP - Debug Print 769
- DBM. - DeBugMode 765
- MBX. - MessageBox 2036
- SAY. - Say something 2048

3.56.13 PRT. PRinT

PRT. - Print line in Debug-Console-Window **Previous** 2040 **Top** 41 **Next** 2048

MiniRobotLanguage (MRL)

PRT. Command

Print line in Debug-Console-Window

Intention

The `PRT`-Command can be used to print a Line into the Debug-Console-Window or into the Debug-window of the editor. Usage is as simple as:

```
PRT. Hello World!
```

You can use variables, or make a rounding of numbers.

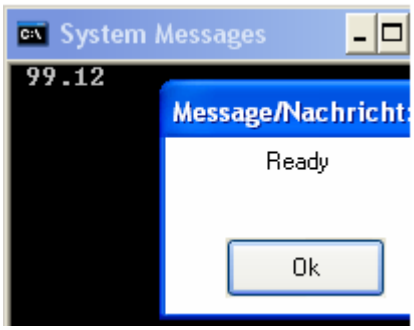
```
: $$TIM=99.123456789
PRT.$$TIM|rd
ENR.
```

This will Print the rounded value of:

```
[9]  99.12
```

into the Debug-window in the Editor. If you leave the d away, the `PRT.` will open a console window and print into this. You need a MBX.-command at the end, to prevent the console window from closing when the script ends. See this example:

```
: $$TIM=99.123456789
PRT.$$TIM|r
MBX.Ready
ENR.
```



This is the output to console window. Seethe Messagebox that prevents the console from being closed automatically, when the script ends.

Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

PRT.[P1]|P2]

Parameter Explanation

P1 **-** Variable

P2 **-** Options

```
 Possible options are:
- |a do complete Variable Substitution
- |h Print Hex-Dump (Hex values of ASC-Characters)
- |d print in Debugwindow of Editor
- |r do a rounding on numbers (e.g. 99.1234 -> 99.12)
- |n do NO Specialfolders and SYSVAR-Processing
- |ra (both options)
```

Example

```
'*****************************************************
' EXAMPLE 1: PRT
'*****************************************************
PRT.?path\

PRT.

PRT.?path\|d

:over
MBX.Halt to read output
'*****************************************************
```

Remarks

-

Limitations:

-

- DBP - Debug Print 769
- DBM. - DeBugMode 765
- MBX. - MessageBox 2036
- SAY. - Say something 2048

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.56.14 SAY. - Say something

MiniRobotLanguage (MRL)

SAY. Command

Say something

Intention

This command will make the robot speak. And More. Let's start with an easy example.

```
: $$TXT=With a couple of simple program statements, you can
add
: $$TXT=$$TXT speech to your programs.
GUN.$$USR
ALB.$$USR|$$USR
: $$TXA=Hello $$USR, $$TXT
'
SAY.Look Mum, he is talking!{BREATH}
'
' The |w makes the robot wait until he has finished talking.
' Without the |w he would talk in the background.
'
SAY. $$TXA|w
ENR.
```

Per default all Speech runs in the background, while your script continues to do its job.
We have therefore specified the "`|w`"-Flag in this example.Because otherwise the script would end and you would not hear anything. **The talking stops, when the script ends.**

Alternatively you can have the robot talk while your script is running. In this case the talking happens in the background. Here is an example that show different uses.

```
SAY. This is a countdown!
PAU.1
FOR.$$CNT|10|3|-1
  SAY.$$CNT|w
NEX.
SAY.2
SAY.1
SAY.Now things can happen.|w
ENR.
```

The `SAY.` - command has multiple options. These are:

- Speak faster or slower using the `{SPEED x}` Tag. ***x*** is a number between -10 and 10, while 0 is default, normal Speed.
- Wait until Speech has finished, using the {WAIT} Tag without a number

*© 2023 Theo Gottwald * https://www.smart-package.com*

- Wait until speech has finished or a timeout is reached using the {WAIT ***x***}-Tag. Where x is a number that specifies the timeout in seconds or fractions of a second (like 0.5).
- Stop actual Speech using the {STOP}-Tag
- Repeat parts of the Saying using the {DO} and the {REPEAT ***x***}-Tag. Where x is the number how often you want it to be repeated. DO/REPEAT can be nested to unlimited depth and can contain other tags inside the text that is to be repeated.
- Let the voice make a small rest, using the {BREATH} Tag
- Let the voice make a rest for a specified time in seconds, using the {BREATH ***x***}–Tag. Where x is a number that specifies the time to rest in seconds or fractions of a second (like 0.5).
- Set the Mode, if the voice should "dictate" comma and punctuation or not. Using the {EXPAND x}-Tag. Where x is 0 to not expand punctuation, and 1 means that anything will be dictated.
- The {VOICES}-Tag will show you all installed voices that can be selected for Speaking.
- The {VOICE x}-Tag will select the Voice that the robot will talk with.
- The {PRIO x} Tag will set the Priority of the things to say. If there are multiple sentences in the Que, Sentences with a higher Priority will be said first and"overtake" other sentences in the Que. x is a number between 0 (default) and 2 (highest Priority).
- The {FILE}-Tag will switch into "Reciting Mode". It will have the Speech to recite a file for you.
- The {LINK}- Tag will have the Robot to read a WEB- or Intranet Site for you. Better don't use this one, as it reads the source-code of the site. This does really only make sense with special designed user-sites (intranet).
- Prefer using the {RECITE}-Tag. It will really read that article on a WEB-Site that is actually located.

Here are some examples:

Example 1: Say something and wait.

```
'*****************************************************
' EXAMPLE 1: SAY.
'*****************************************************
' Choose speaker voice
SAY.{voice Sam}
'
' Make robot not to speak Punctuation
SAY.{EXPAND 0}
'
' Set Speed to 1, that is a bit faster then normal
{SPEED 1}
'
' Say something .. and wait until all speech has been
finished.
SAY. Did you get me?{wait}
'
' Take an additional Breath ....
SAY.{BREATH}
'
SAY.OK!{BREATH}OK?{WAIT}
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
ENR.
```

Example 2: Show installed voices.

This example will show you which voices are currently installed on your Computer. You find these voices inside the variable `$$TXT`.

```
'*****************************************************
' EXAMPLE 2: SAY.
'*****************************************************
' Which Voices are installed?
' Print a List with all installed voices
SAY. {voices}|$$TXT
DBP.$$TXT
ENR.
```

Example 3: Check if a specified voice is installed.

To check whether a voice is installed or nut, just use the `IVC.`-command for this variable.

```
'*****************************************************
' EXAMPLE 3: SAY.
'*****************************************************
' Check whether a defined Voice is available or not
'
SAY. {voices}|$$TXT
IVC.$$TXT=Sam
  SAY. Sam is available|w
ELS.
  SAY. Sam is not available|w
EIF.
ENR.
```

Example 4: Recite a file.

```
'*****************************************************
' EXAMPLE 4: SAY.
'*****************************************************
'  You need a file name "text.txt" containing
' an english text on your desktop
'
: $$TXT=?desktop\test.txt
'
' Choose speaker voice
SAY.{voice Sam}
'
' Make robot not to speak Punctuation
SAY.{EXPAND 0}
'
' Set Speed to 1, thats a bit faster then normal
{SPEED 1}
'
' Read the content of that file
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SAY.{FILE 1}$$TXT|w
'
' Say something .. and wait until all speech has been
finished.
SAY. Did you get me?{wait}
ENR.
```

Example 5: Repeat parts of your text.

This example shows the use of the DO/REPEAT tags. This way you can inline make the Speaker repeat things thousand times without the need to write them thousand times.
Is your computer a blue-screen sinner? Have it repeat that prayer hundred times ... using DO/REPEAT. Don't forget to let it take a {BREATH} after that!

```
'*************************************************
' SAY.-Sample 5: DO / REPEAT / BREATH Tags
'*************************************************
: $$TXT=Per default {DO}all Speech runs in the background,
{BREATH}{REPEAT 2} while your script continues to do its job.
: $$TXT=$$TXT {BREATH} Using the Tags "DO" and "REPEAT"
enables you to inline repeat things multiple times!{wait}
'
SAY.{SPEED 2}$$TXT|w
ENR.
```

Example 6: Make it important.

The following example shows you how you can stop a on going speech using the STOP-Tag.
Also it shows how a PRIO 2-Speech will be spoken before a PRIO zero speech has ended.

```
'-------------------------------------------------------
' SAY.-Sample 6: PRIO / STOP
'-------------------------------------------------------
: $$TXT=Per default {DO}all Speech runs in the background,
{REPEAT 5} while your script continues to do its job.
: $$TXT=$$TXT Using the Tags "DO" and "REPEAT" enables you to
inline repeat things multiple times!
'
SAY.{SPEED 2}$$TXT
PAU.2
SAY.{PRIO 2}We stop it now!{wait} {STOP}
ENR.
```

Example 7: Recite a text from A WEB-site or dialog.

The following example shows you how you can make the robot to read a part of a WEB-site.
You just need to set the Actual Point (see MAP. - Move Active Point 2483).
The Robot will try to read the text at that place.

© 2023 Theo Gottwald * https://www.smart-package.com

```
'-------------------------------------------------------------
' SAY.-Sample 7: RECITE
'-------------------------------------------------------------
' Will not really work because the news pages change often!
' This is just an example
'
' Locate the new-web-site in the Internet Explorer
' Don't try with Google Chrome or Opera, this will not work!
'

SCW.nct|1|Internet Explorer_Server|{&NOTEXT:}
'
' Locate the article on the WEB-Site
'
SAO.rn|42|Christian Wulff
'
' Now have the robot read it for you.
SAY.{RECITE}|w
ENR.
```

Important Hint:
The `{File}` and `{LINK}` Tag switch the Speech into the selected Mode. After completion, they will automatically be switched off.

Important:

When the Robot program ends, speech will also be stopped. Therefore use the `{wait}` tag to make the robot wait for the end of his speech.

In case you do not hear anything, check your sound hardware and system sound settings. `SAY.` will only work, if your computer has working sound-hardware and the system settings for sound output must be made that you will be able to hear something.

If you want to select between different voices and languages, see the **remarks**-section below.

Syntax

SAY.[P1][|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - (optional) Any text or variables you want the robot to say. If omitted the TOS is taken.

P2 - (optional) can be:

- **"w"**, if specified the robot will wait until things have been said. If omitted, talking will be in the background.

- **"r"**, if specified the robot will talk in RAW mode and ignore any commands in { ...}. Active Flags, Options like the speed and the selected voice will remain active.

Example

```
'*****************************************************
' EXAMPLE: SAY.
'*****************************************************

'  You need a file name "text.txt" containing
' an english text on your desktop
'
: $$TXT=?desktop\test.txt
' Choose speaker voice
SAY.{voice Sam}
' Read the textfile
SAY.{EXPAND 0}{SPEED 1}{FILE 1}$$TXT|w
SAY. Did you get me?{wait}
ENR.
```

Remarks

Internally SAY. uses the Windows TTS (Text-To Speech Engine). Per default it may support only one voice, thats the gold old "Microsoft Sam". Under Windows 7, it may be another voice. Now, how can you find out which "voices" are available on your system?

Use this script:

```
' Which Voices are installed?
SAY. {voices}|$$TXT
DBP.$$TXT
ENR.
```

What you see is maybe just one speaker/voice, for example (WinXP):

```
01  Microsoft Sam
```

and he has a pure english voice that may really sound a bit like an robot.

You can however make your computers speak german and french as well and get other voices. Amongst other offers, you can install the MS-Reader:

© 2023 Theo Gottwald * https://www.smart-package.com

1. MS-Reader Downloadlink

and then install the

2. Microsoft Text-to-Speech Package

There are multiple available for different languages. You can install all of these to get multiple additional speakers.

Now if you run the same script again, it may look somehow like this:

```
01  Microsoft Sam
02  LH Pierre
03  LH Stefan
04  LH Veronique
05  LH Anna
```

Now you can choose another voice using the voice of Stefan:

```
' Select Voice
SAY.{voice 03}
SAY."Hallo Matthias!{wait}"
ENR.
```

using the number 03 or you can choose by name:

```
' Select Voice
SAY.{voice Stefan}
SAY."Hallo Matthias!{wait}"
ENR.
```

Note that when choosing by name, that the second name is used, the first name must not be specified. "{`voice LH Stefan`} will not work. You have to drop the "`LH`" and just write `{VOICE Stefan}`.

3.56.15 SBT. - Show Bubble Text

MiniRobotLanguage (MRL)

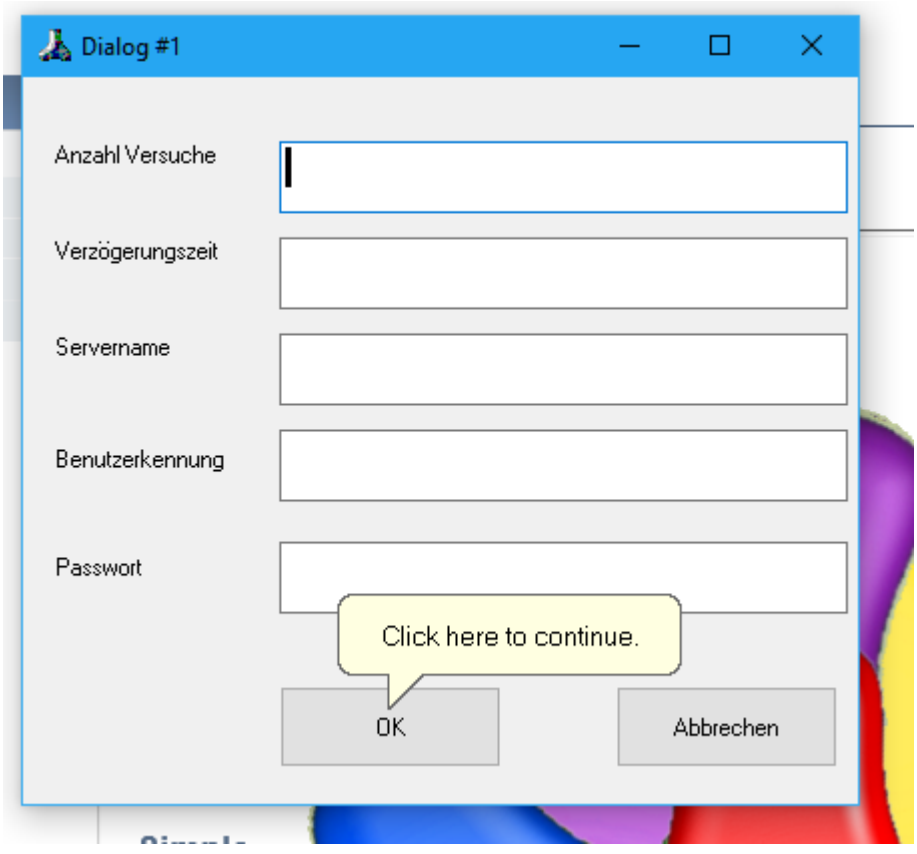
Show Bubble Text

Show Help Text "in a Bubble"

Intention

This command is used to display textual Information that can reference a control, or a point on Screen.
You can influence where the Bubble is displayed as well as the Text-Size.
You can also have that small "comic-arrow" or not. Let's see some examples.

```
' First we locate a Button
STW.ct|PBWindowClass:0|Dialog #1
SCW.nict|1|1009|Button|OK
' Next we how the Bubble-Text
SBT.Click here to continue.
' We need to rest, as the text runs in the Background
PAU.8
ENR.
```



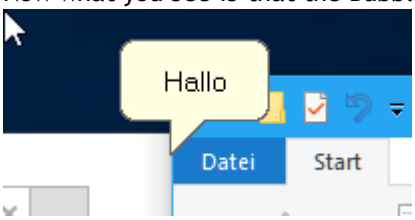
*© 2023 Theo Gottwald * https://www.smart-package.com*

Why do we need the "PAU.8" ?
It's needed because the Command - per default runs in the Background.
It starts to display the Bubble-Text, and WHILE the text is displayed the Script continues to run.
Now, if the Script ends - the Bubble will also be closed!

To prevent this you can add a second Parameter:

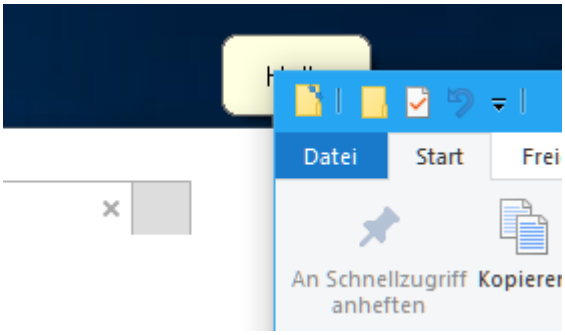
```
STW.ct|PBWindowClass:0|Dialog #1
SCW.nict|1|1009|Button|OK
SBT.Click here to continue.|#
ENR.
```

In this case you can leave away the "PAU.8" because the Bubble will stay for 6 Seconds (this is the default time, if no other time is specified).
Now what you see is that the Bubble is always "on Top". That's a default setting.



If you do not want that use that other Parameter "@":

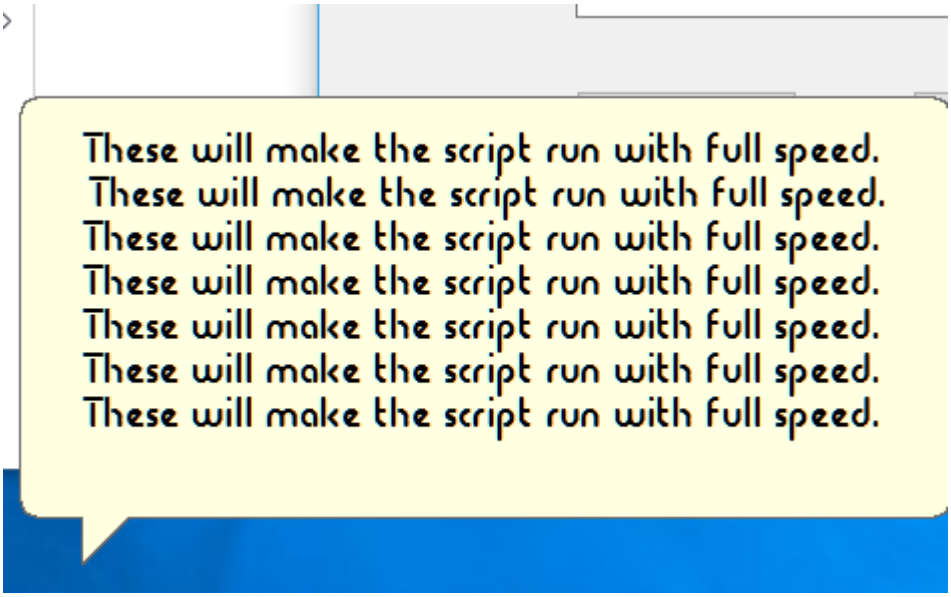
```
STW.ct|PBWindowClass:0|Dialog #1
SCW.nict|1|1009|Button|OK
SBT.Click here to continue.|#@
ENR.
```



Here is another example that uses a custom FontName:

```
$$XPO=-100
$$YPO=100
$$PAR=FS:14 t:10 cs:1 ax:$$XPO ay:$$YPO vc:1 FN:"Tomorrow People" #
```

© 2023 Theo Gottwald * https://www.smart-package.com



Following is a more complex Sample.

```
' More complex Sample
STW.ct|IEFrame| - Internet Explorer

$$TXT=These will make the script run with full speed. $crlf$
$$TXT=$$TXT $$TXT$$TXT$$TXT$$TXT$$TXT$$TXT

FOR.$$CNT|1|5

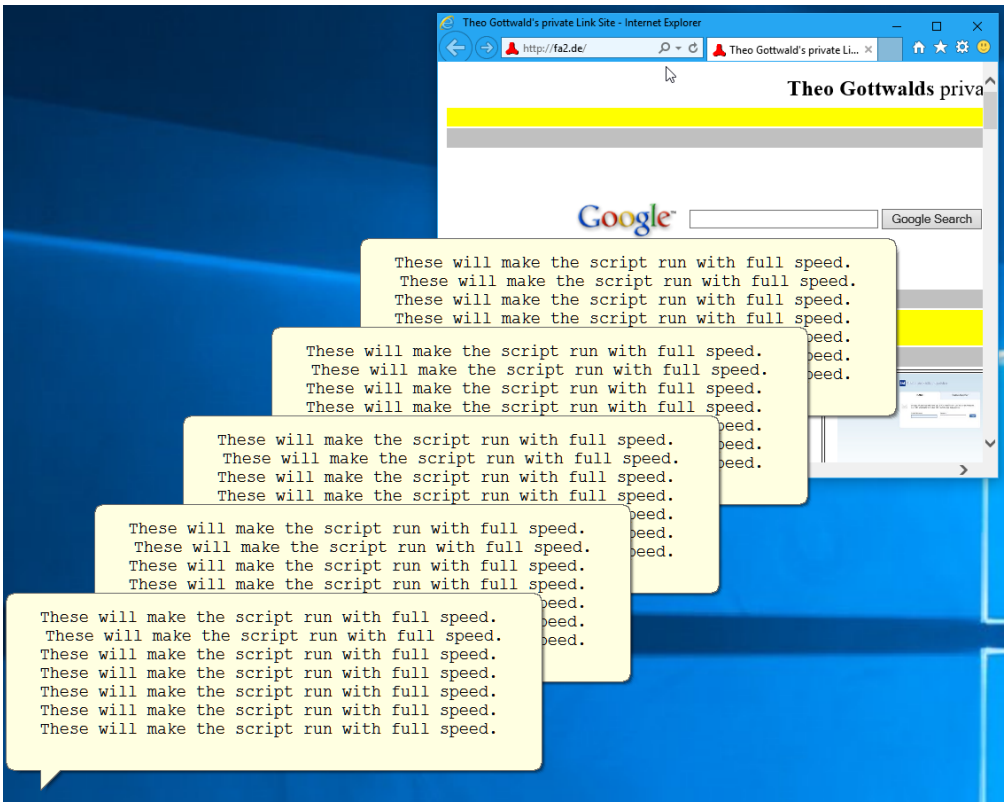
  $$PAR=FS:14 t:10 cs:1 ax:$$XPO ay:$$YPO vc:1
  SBT.$$TXT|$$PAR
NEX.

PAU.40
ENR.
```

Which will produce this picture:

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

SBT.P1[|P2][#@]

Parameter Explanation

P1 - Text to be displayed

This can be a Text or a Text-Variable that will be displayed in the Bubble-Text.
It may contain $crlf$ - these will be treated as NewLine".

P2 - (optional) Flags and Parameters

@ - will prevent the "TOPMOST-Flag".

 # - will have the Script wait until the Bubble-time is over.

`T:(NUM)` - Time in Seconds, specify how long the Bubble-Text shall be displayed. The Bubble will anyway be closed when the Script ends! If not given the default time is 6 Seconds.
`FS:(NUM)` - FontSize: An number that specifies the size of the Font that shall be used.
`FN:"FONTNAME"` - Specify any Font that is on your Computer. Notice that the Fontname must be between " ".
`VC:(NUM)` - Vertical Center. The given number can be 0,1 or 2. Each number will have a different effect. 0 is the default.
`HC:(NUM)` - Horizontal Center. The given number can be 0,1 or 2. Each number will have a different effect. 0 is the default.

© 2023 Theo Gottwald * https://www.smart-package.com

AX:(NUM) - Adjusting X-Position. This value can be negative or positive. It will move the Bubble by this number of pixels left (if negative value) or right.

AY:(NUM)- Adjusting Y-Position. This value can be negative or positive. It will move the Bubble by this

MP: - Mouse Position. If specified then the Bubble will be generated at the Position where the Mouse Pointer is.

LA: - Left Align. If not specified the Text is always Centered in the Bubble.

CS: - Center on Screen. This will Center the Bubble on Screen. Use this if you have no Window or Button.

NC: - NoCorner. Will remove the "Comic-Arrow".

WB:(NUM) - WordBreak. Switches Wordbreak on. NUM is a numerical value, for example 32.

Using 32 will make the Text to appear in a Single line without Newlines. Other values may have other effects depending on the situation.

Example

```

3.56.16 SHT. - Show Text

MiniRobotLanguage (MRL)

Show Text

Show Textual Information to user

Intention

This command is used to display textual Information. You can influence where the Bubble is displayed as well as the Text-Size and Colors.
The following Script will display a "Hello World" on the upper right side of your screen. This way you can easily message something to your users.

```
' Let's start simple
  SHT.Hello World.
  PAU.8
  ENR.
```

Why do we need the "`PAU.8`" ?
It's needed because the Command - per default runs in the Background. It starts to display the Text, and WHILE the text is displayed the Script continues to run.
Now, if the Script ends - the Bubble will also be closed!

To prevent this you can add a second Parameter:

```
' Let's start simple
  SHT.Hello World.|#
  ENR.
```

This will make the Script wait until the message goes away. The default time for the message to disappear is **6 Seconds**.
How can we change that? We add another Parameter:

```
  SHT.Hello World.|# T:12
  ENR.
```

Now the Text will disappear after 12 **Seconds.** What else can we change?
We can change: **Colors, Text-Size and Font and Boldness** and also the **Position.**

To do this, the Parameters as shown below can be given.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
SHT.Click here to continue.|DOT: t: 5 BF:4 fs:115  fn:"Tomorrow People" cs:1
```

```
SHT.Click here to continue.|DOT: t: 5 BF:4 fs:115  fn:"Tomorrow People" cs:1 bc:
PAU.10
ENR.
```

Using other colors and custom fonts will produce this result. Notice the "Dot" on the left side?
It's from the "`DOT:`" Parameter.

```
' More compelx Sample

```

Syntax

SHT.P1[|P2][#]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

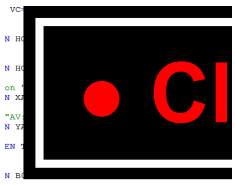
P1 - Text to be displayed

This can be a Text or a Text-Variable that will be displayed in the Bubble-Text. It may contain $crlf$ - these will be treated as NewLine".

P2 - (optional) Flags and Parameters

 # - will have the Script wait until the Bubble-time is over.

`T:(NUM)` - Time in Seconds, specify how long the Bubble-Text shall be displayed. The Bubble will anyway be closed when the Script ends! If not given the default time is 6 Seconds.
`FS:(NUM)` - FontSize: An number that specifies the size of the Font that shall be used.
`FN:"FONTNAME"` - Specify any Font that is on your Computer. Notice that the Fontname must be between " ".
`VC:` - Vertical Center. This will Center the Text vertically.
`HC:` - Horizontal Center. This will Center the Text horizontally.
`AX:(NUM)` - Adjusting X-Position. This value can be negative or positive. It will move the Text by this number of pixels left (if negative value) or right.
`AY:(NUM)` - Adjusting Y-Position. This value can be negative or positive. It will move the Text by this nu
`MP:` - Mouse Position. If specified then the Text will be generated at the Position where the Mouse Pointer is.
`CS:` - Center on Screen. This will Center the Text on Screen.
`BF:(NUM)` - **Bold-Faktor**, Number 0-9. The higher the number - the bolder the Text.
`DOT:1` - Will Paint an DOT at the left of the Text.



`BC:` - Background-Color for Text must be in Hexadezimal and in "". Format is: `BBGGRR`
Example: `BC:"000000"`
`LC:` - Line-Color for Surrounding Box must be in Hexadezimal and in "". Format is: `BBGGRR`
Example: `LC:"0000FF"`
`TC:` - Text-Color for Text must be in Hexadezimal and in "". Format is: `BBGGRR`
Example: `TC:"FFFFFF"`

3.57.2 CFU. - Copy-From-URL

MiniRobotLanguage (MRL)

CFU. Command

Copy from Url

Intention

Reads a file from a WEB-URL via http. Can be used to test WEB-Sites and downloads. Can simulate different Browsers.

You may replace special-characters by a hexadecimal code to make them better readable. Spaces would to be %20 for example. Files that are hidden behind Pearl-Scripts can not be downloaded via `CFU`.

Alternative commands are: `DLF` or `DLV` for normal usage.

Syntax

CFU.P1[|P2[|P3][|P4][|P5][|P6]

Parameter Explanation

P1 – URL to read from WEB. Must be a URL ending with a filename.
P2 – ***(optional)*** Variable for the downloaded Data. If omitted, stack is used.
P3 – ***(optional)*** Timeout in Seconds.
P4 – ***(optional)*** Referer-String.
P5 – ***(optional)*** Set Browser-Type (numeric 1... 20)
P6 – ***(optional)*** Site-URL (Example: "www.fa2.de"). Only for special usage.

```
 ' Result auf Stack
 CFU.$$URL

' Result in $$RET
 CFU.$$URL|$$RET

' Result in $$RET + Timeout von $$TIM
 CFU.$$URL|$$RET|$$TIM

' plus Referer String aus$$REF
 CFU.$$URL|$$RET|$$TIM|$$REF

' plus Browser-Identification from $$BNR
 CFU.$$URL|$$RET|$$TIM|$$REF|$$BNR

' Leave a site-URL

3.57.3 CNS. - Connect Net Share

MiniRobotLanguage (MRL)

CNS. Command

Connect Network Share

Intention

Can be used to makes a connection to a network resource and can redirect a local device to the network resource.

Just use the command and specify which Mapping you want:

```
CNS.\\MyComputer\Folder$

CNS.\\MyComputer\Folder$|MyLogin|MyPassword

' Make permanent connection
CNS.\\MyComputer\Folder$|MyLogin|MyPassword|1

' Make connection only until reboot (temporary)
CNS.\\MyComputer\Folder$|MyLogin|MyPassword|1
```

In case of error, the timeout-flag is set and the error-number is on the TOS.

Hint: Use the RDM. - Remove Drive Mapping 2112 command to remove a mapped drive.

Syntax

CNS.P1[|P2][|P3][|P4][|P5]

Parameter Explanation

P1 - Share to connect, example: ***\\computer\folder***

P2 - *(optional)* ***Username***

P3 - *(optional)* ***Password***

P4 - *(optional)*. 1/0 -If 1 is specified, the connection is permanent.
It will be restored at the next reboot.
If 0 or nothing is specified, the connection is temporary
and not saved in the user profile.

P5 - (optional). Variable that will return the result of the operation. In case of success the result will be zero. In case of error an error number is returned.

© 2023 Theo Gottwald * https://www.smart-package.com

If omitted TOS is used.

5 - ERROR_ACCESS_DENIED
The caller does not have access to the network resource.
This could also be a access-rights problem.

85 - ERROR_ALREADY_ASSIGNED
The local device specified is already connected to a network resource.

1200 - ERROR_BAD_DEVICE
The value specified is invalid.

67 - ERROR_BAD_NET_NAME
The value specified is not acceptable to any network resource provider because the resource name is invalid, or because the named resource cannot be located.

1204 - ERROR_BAD_PROVIDER
The value specified does not match any provider.

1223 - ERROR_CANCELLED
The attempt to make the connection was canceled by the user through a dialog box from one of the network resource providers, or by a called resource.

1208 - ERROR_EXTENDED_ERROR
A network-specific error occurred.

487 - ERROR_INVALID_ADDRESS
The caller passed a pointer to a buffer that could not be accessed.
This error should not appear, as it is an internal error.

87 - ERROR_INVALID_PARAMETER
This error is a result of providing wrong parameters, or the connection is to a network that requires the redirecting of a local device. Please check the variables.

86 - ERROR_INVALID_PASSWORD
The specified password is invalid.

234 - ERROR_MORE_DATA
Internal Error. If this error is returned, then no connection has been made.

259 - ERROR_NO_MORE_ITEMS
The operating system cannot automatically choose a local redirection because all the valid local devices are in use.

1202 - ERROR_DEVICE_ALREADY_REMEMBERED
The local device name has a remembered connection to another network resource.

1203 - ERROR_NO_NET_OR_BAD_PATH
The network path was either typed incorrectly, does not exist, or the network provider is not currently available. Please try retyping the path or contact your network administrator.

*© 2023 Theo Gottwald * https://www.smart-package.com*

1222 - ERROR_NO_NETWORK
The network is unavailable.

1219 - ERROR_SESSION_CREDENTIAL_CONFLICT
An attempt was made to establish a session to a network server, but there are already too many sessions established to that server.

1326 - ERROR_LOGON_FAILURE
Logon failure: user account restriction. Possible reasons are blank passwords not allowed, logon hour restrictions, or a policy restriction has been enforced.

Example

```
'-------------------------------------------------------------
' CNS. - No Pasword
'
$$PAT=\\XDRIVE\Daten$
CNS.$$PAT
ITO.
  PRT.error happend
EIF.
DMP.6
MBX.!

3.57.5 DLV. - Download-to-Variable

MiniRobotLanguage (MRL)

DLV. Command

Download to Variable

Intention

This command can be used to download a File or a WEB-Site from Internet to stack or variable. It an be used for all sorts of links.

Internally its identical to `DLF.`, just that it downloads to a variable and not to a file.

The timeout flag 334 is set according to success of operation.

Syntax

DLV.[P1][|P2[|P3][|P4]

Parameter Explanation

P1 - URL
P2 - ***(optional)*** Output Filename - if omitted is taken from TOS

3.57.6 FTP. - and more

3.57.6.1 FTP. - File Transfer Protokoll

MiniRobotLanguage (MRL)

FTP. Command

Dowload Files via FTP and More Internet Commands

Intention

This is a multi-purpose command.

This command can be used to
- download one or more File(s) via FTP to your local computer.
- test a download link if it works, without downloading the complete file.
- test a download link that uses a password, if it works, without downloading the complete file.

For a detailed description see the help pages of the subcommands.

Syntax

FTP.[Px...Px]

Parameter Explanation

Parameters depend on the used subcommand P1.
The following subcommands are available:

`"tdl","test download"`
-> Test a download-Link on any WEB-Site if it works.
For Details see here: tdl - Test Download 2078

`"tpw","test with password"`
-> Test a download-Link on a WEB-Site if it works. Using Login and Password.
For Details see here: tpw - test with password 2078

`"ftp","ftp download"`
-> Load one or many files down from a FTP-Server.
Can use a wildcard like "`*.jpg`"
For Details see here: fto - file transfer protocol 2080

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'**********************************
' FTP.-DEMO
'**********************************
$$URL=fa2.de
$$LOG=myftplogin
$$PWD=343retew&$dJ
$$PAT=site
$$FIM=*.*
$$LOC=?path\test\

FTP.ftp|$$URL|$$LOG|$$PWD|$$PAT|$$FIM|$$LOC|$$REA|$$REB|$$REC
PRT.----------------
PRT.REA=$$REA
PRT.----------------
PRT.REB=$$REB
PRT.----------------
PRT.REC=$$REC
PRT.----------------
MBX.Ready
ENR.
```

Remarks

- tpw - test with password 2078

© 2023 Theo Gottwald * https://www.smart-package.com

3.57.6.2 fto - file transfer protocol

MiniRobotLanguage (MRL)

FTP.ftp download
FTP.ftp

Dowload Files via FTP to a local folder

Intention

This command can be used to download a File or multiple files via the FTP-Protocol to your computer. You can use Login and Password and you can use wildcards to define which files you want to download.

```
' The ftp-server
$$URL=ftp-server.de

' Your Login
$$LOG=your_login
' Your Password
$$PWD=the-password
' The folder on the ftp-derver
$$PAT=site-folder

' File-Mask. Define which file(s) you want to download
' using wildcards: ?/*
$$FIM=*.*

' The local path where you want these files
' to downloaded to
$$LOC=?path\test\

FTP.ftp|$$URL|$$LOG|$$PWD|$$PAT|$$FIM|$$LOC
ENR.
```

The command does also give you a return on how things worked out.
For this you can specify three additional variables. Like this:

```
FTP.ftp|$$URL|$$LOG|$$PWD|$$PAT|$$FIM|$$LOC|$$REA|$$REB|$$REC
PRT.----------------
PRT.REA=$$REA
PRT.----------------
PRT.REB=$$REB
PRT.----------------
PRT.REC=$$REC
PRT.----------------
MBX.!
ENR.
```

The result could look like in teh picture below.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P7/$$REA shows how many files have been successfully transferred.
P8/$$REB shows you a textual Message if there were fatal Errors.
P9/$$REC contains a detailed list with all FTP transfers that were successful or not.
P9 will also list folders and files that can not be transferred due to right or other problems. Files that have been copied and counted will be in small letter and prefixed with a "OK:". Files that could not be transferred will be prefixed with a "ER:".
Folders can not be transferred, yet they are listed if there are folders.

```
----------------
REA=9
----------------
REB=Success
----------------
REC=OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\.htaccess
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\steeloverall.swf
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\steeloverall.swf_old
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\ASSETS
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\DOWNLOAD
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\favicon.ico
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\IMAGES
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\index.htm
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\index_old.php
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\logo.gif
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\MANAGER
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\ONLINE-HELP
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\robots.txt
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\TEMP
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\TEMPLATES
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\winrobots.jpg

----------------
```

If you specify an invalid remote-folder or no remote folder (leave **P4** empty), the root-folder that you have permission with you ftp-Login and Password, is used instead.
Therefore in most cases you may leave **P4** empty.

Example:
If you have on your FTP-Server this folder:

```
wrcom/site
```

and your FTP-Login and Password is for "wrcom", then you will always get the files from "wrcom" if you specify an invalid folder. To get the file4s that are inside "wrcom/site" you do have to specify "site" as remote-folder. Do not specify "wrcom/site" as this may not work.

Here is an example with just one file downloaded.

```
----------------
REA=1
----------------
REB=Success
----------------
REC=ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\CODE-CENTER_BKUP
OK:f:\00_mr\pb_minirobot\projects\ftp-test\test\favicon.ico
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\INSTALL____-----_____
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\PHPMYADMIN___-----___
ER:F:\00_MR\PB_MINIROBOT\PROJECTS\FTP-TEST\TEST\SITE

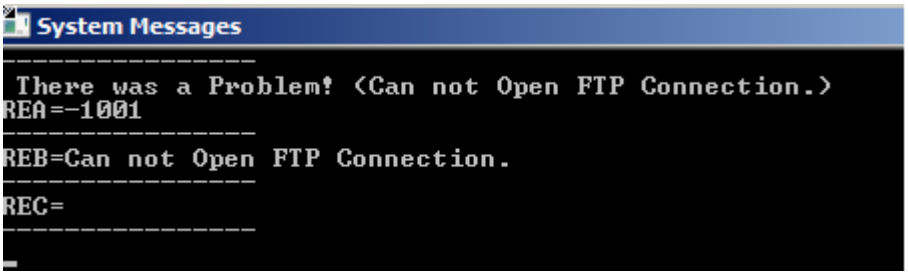
----------------
```

© 2023 Theo Gottwald * https://www.smart-package.com

Here is what you get if you specify an invalid FTP server or if your firewall blocks the connection. As you can see, **Error-Numbers are negative**, this way you can easily find out, if there was a problem, using:

```
IVV.$$REA<0
  PRT. There was a Problem! ($$REB)
EIF.
```

It will look like this:



Syntax

FTP.ftp|P1|P2|P3|P4|P5|P6[|P7][|P8][|P9]

Parameter Explanation

P1 – **URL of FTP-Server**
P2 – ***Login for FTP-Server*** (Leave empty if none)
P3 – **Password** for FTP-Server (Leave empty if none)

P4 – **remote-folder** (Folder on the ftp-server), leave empty to use root-folder.
Please read comments about P4 in the text above!

P5 – **file-name/file-mask** specify which file(s) you want to download.
You can use wildcards * and "?".

P6 – **Local path** to save the transferred files to.

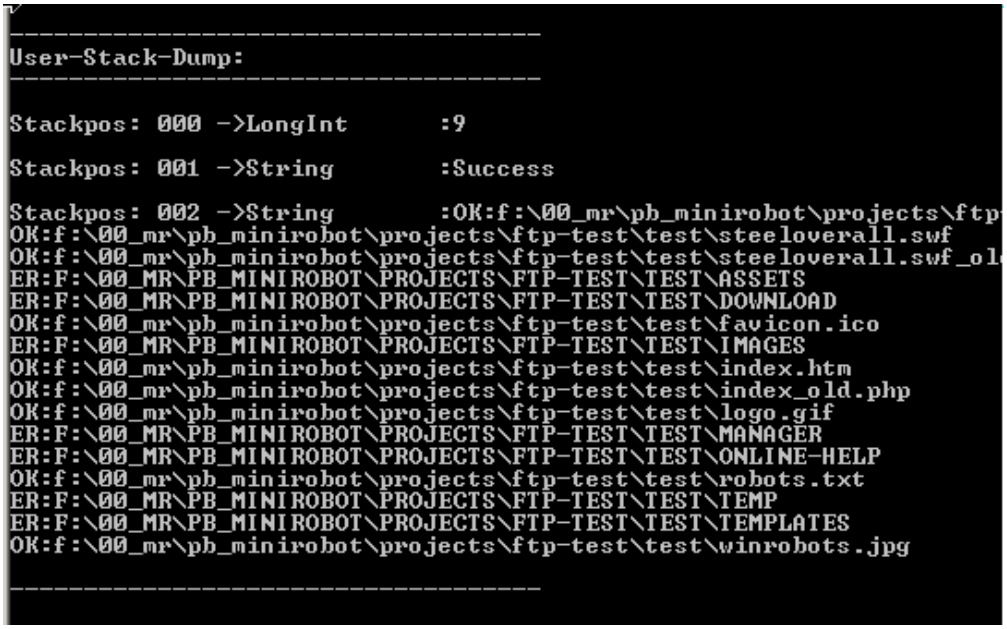
P7 – (***optional***) Returns an numeric code that shows success or failure of the operation. If omitted the number will be placed on TOS.
This numeric number will be positive in case of success and negative in case fatal of errors.
If **P7** is positive, the number is the number of files that have been transferred successfully.
if **P7** is negative, read **P8** for an explanation of the error that has happened.

P8 – (***optional***) Return the textual message that corresponds to the numerical number in **P7**.

© 2023 Theo Gottwald * https://www.smart-package.com

P9 - (***optional***) Return a `$crlf$` separated list with all files/ folders that have been processed. **P9** contains a detailed list with all FTP transfers that were successful or not.
P9 will also list folders and files that can not be transferred due to right or other problems. Files that have been copied and counted will be in small letter and prefixed with a "**OK:**". Files that could not be transferred will be prefixed with a "**ER:**".
Folders can not be transferred, yet they are listed if there are folders.

This is how the stack looks, if you do not specify **P7, P8** and **P9**.



Example

```
'**********************************
' FTP.-DEMO
'**********************************
' The ftp-server
$$URL=ftp-server.de
' Your Login
$$LOG=your_login
' Your Password
$$PWD=the-password
' The folder on the ftp-derver
$$PAT=site-folder
' File-Mask. Define which file(s) you want to download
' using wildcards: ?/*
$$FIM=*.*
' The local path where you want these files
' to downloaded to
$$LOC=?path\test\
FTP.ftp|$$URL|$$LOG|$$PWD|$$PAT|$$FIM|$$LOC|$$REA|$$REB|$$REC
PRT.----------------
PRT.REA=$$REA
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
IVV.$$REA<0
  PRT. There was a Problem! ($$REB)
EIF.
PRT.----------------
PRT.REB=$$REB
PRT.----------------
PRT.REC=$$REC
PRT.----------------
MBX.Ready
ENR.
```

3.57.6.3 tdl - Test Download

MiniRobotLanguage (MRL)

FTP.test download
FTP.tdl

Test a download link

Intention

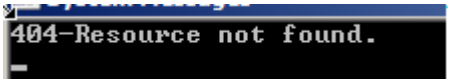
This command can be used to test a download-link, if it works or not.

Here is what we get with a valid URL:

```
$$URL=http://download.microsoft.com/download/9/2/7/927A4802-
FC1C-4A71-9A2D-2DCEAC11B266/KB2716433/SQLServer2008-KB2716433-
x86.exe
FTP.tdl|$$URL|$$RES|$$TXT
PRT.$$TXT
MBX.$$RES
ENR.
```

Here we have a valid server and an invalid link:

```
$$URL=http://download.microsoft.com/downloax/SQLServer2008-
KB2716433-x86.exe
FTP.tdl|$$URL|$$RES|$$TXT
PRT.$$TXT
MBX.$$RES
ENR.
```



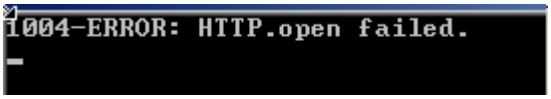
Now we will use an phantasy server and see what we get:

```
$$URL=http://download.fa2.de/download/9/2/7/927A4802-FC1C-
4A71-9A2D-2DCEAC11B266/KB2716433/SQLServer2008-KB2716433-
x86.exe
FTP.tdl|$$URL|$$RES|$$TXT
PRT.$$TXT
MBX.$$RES
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

At last we will specify an (invalid protocol) empty URL:

```
$$URL=
FTP.tdl|$$URL|$$RES|$$TXT
PRT.$$RES-$$TXT
MBX.Ready
ENR.
```



Syntax

FTP.tdl|P2[|P3][|P4]

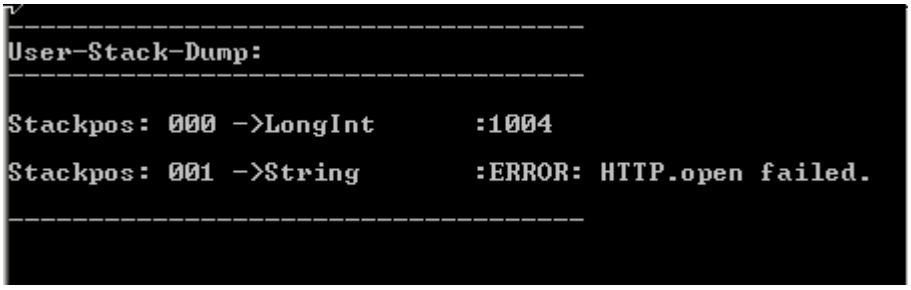
Parameter Explanation

P2 **-** URL - that shall be tested

P3 **-** (***optional***) Variable for a numerical result on success or not.
200 - is success, 404 - is resource not found, others see above.

P4 **-** (***optional***) Variable for a textual result on success or not.
Details see above.

If you omit the Stack will look somehow like this:



Example

```
'**********************************
' FTP.tdl.-DEMO
'**********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$URL=http://download.microsoft.com/download/9/2/7/927A4802-
FC1C-4A71-9A2D-2DCEAC11B266/KB2716433/SQLServer2008-KB2716433-
x86.exe
FTP.tdl$$URL|$$RES|$$TXT
PRT.$$TXT
IVV.$$RES!200
   MBX.There was a problem ($$RES)
EIF.
ENR.
RET.
```

x86.exe
FTP.tpw|$$URL|$$LOG|$$PWD|$$RES|$$TXT
PRT.$$TXT
MBX.$$RES
ENR.
```

Here we have a valid server and an invalid link:

```
$$LOG=YourLogin
$$PWD=Y?urPas-word
$$URL=http://download.microsoft.com/downloax/SQLServer2008-
KB2716433-x86.exe
FTP.tpw|$$URL|$$LOG|$$PWD|$$RES|$$TXT
PRT.$$TXT
MBX.$$RES
ENR.
```

Now we will use an phantasy server and see what we get:

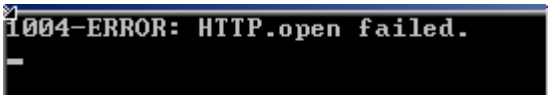
```
$$LOG=YourLogin
$$PWD=Y?urPas-word
$$URL=http://download.fa2.de/download/9/2/7/927A4802-FC1C-
4A71-9A2D-2DCEAC11B266/KB2716433/SQLServer2008-KB2716433-
x86.exe
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
FTP.tpw|$$URL|$$LOG|$$PWD|$$RES|$$TXT
PRT.$$TXT
MBX.$$RES
ENR.
```

At last we will specify an (invalid protocol) empty URL:

```
$$LOG=YourLogin
$$PWD=Y?urPas-word
$$URL=
FTP.tpw|$$URL|$$LOG|$$PWD|$$RES|$$TXT
PRT.$$RES-$$TXT
MBX.Ready
ENR.
```



Syntax

FTP.tpw|P2[|P3][|P4]

Parameter Explanation

P2 – ***Download***-URL - that shall be tested

P3 – ***Login for WEB-Server*** (Leave empty if none)

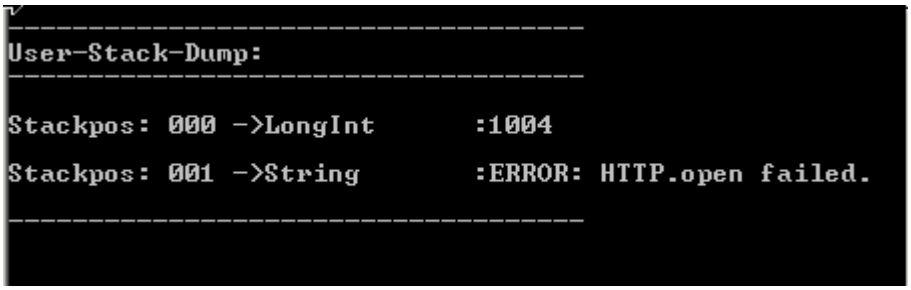
P4 – **Password *for WEB-Server*** (Leave empty if none)

P5 – (***optional***) Variable for a numerical result on success or not.
200 - is success, 404 - is resource not found, others see above.

P6 – (***optional***) Variable for a textual result on success or not.
Details see above.

If you omit the Stack will look somehow like this:

© 2023 Theo Gottwald * https://www.smart-package.com



Example

3.57.7 GCN. - Get Computer Name

MiniRobotLanguage (MRL)

GCN. Command

Get Computer Name

Intention

Can be used to get the computer name of the actuals computer we are running on. '

Can also be used to get the hostname of any other computer, if we provide the IP address. Note that a DNS may be needed for this to work.

Syntax

GCN.[P1][|P2]

Parameter Explanation

P1 - (optional) Variable for Result. If omitted result is been placed on stack. Even if provided, there is additional Information on the stack.

P2 - (optional). IP-Address of which we ant to get the Host-Name. If omitted the actual computer is been used.

```
' Will compute actual computers hostname and place
' informations on the stack.
GCN.

' Will compute actual computers hostname and place it
' in variable $$RES. There will be further informations
' on the stack.
GCN.$$RES

' Will compute another computers computers hostname and place
it
' in variable $$RES. There will be further informations
' on the stack.
' Note that a DNS may be needed for this to work.
: $$IPA=82.156.106.219
GCN.$$RES|$$IPA

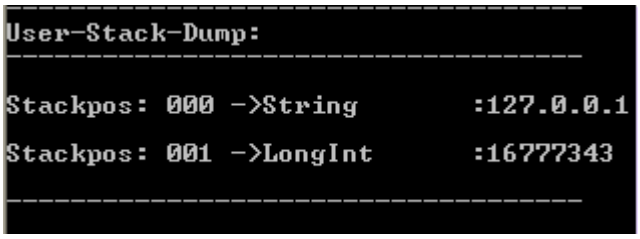
' Will compute another computers computers hostname and place
it
' in on the stack.
```

© 2023 Theo Gottwald * https://www.smart-package.com

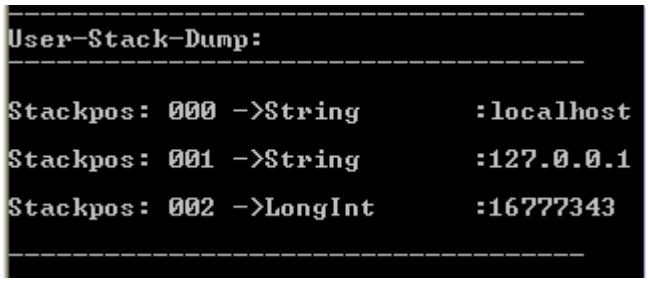
```
' Note that a DNS may be needed for this to work.
: $$IPA=82.156.106.219
GCN.|$$IPA

' Will compute another computers computers hostname and place
it
' in on the stack.
' You can provide the IP-Address in a numeric format also.
' Note that a DNS may be needed for this to work.
: $$IPA=16777343
GCN.|$$IPA
```

This is how the stack looks like, if you provide 127.0.0.1 or 16777343 as IP-Address, and also provide a variable for the hostname.



This is how the actual stack looks, if you do not provide a variable for the result. You see the hostname on TOS.



Example

```
'-------------------------------------------------------------
' GCN. - Get Computer Name
'
' Without Parameter
' Result on the stack
GCN.
DMP.6
MBX. Next with Result in variable

STS.CLEAR
GCN.$$IPA
DMP.6
MBX. The IP-Adress is $$IPA

STS.CLEAR
' Now we try to get "another" computers Name
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' from IP-Adress
: $$IPB=127.0.0.1
GCN.$$IPA|$$IPB
DMP.6
MBX. The IP-Adress is $$IPA

STS.CLEAR
' Now we try to get "another" computers Name
' from IP-Adress as number
: $$IPB=16777343
GCN.$$IPA|$$IPB
DMP.6
MBX. The IP-Adress is $$IPA

ENR.
```

Remarks

Limitations:

Depending on circumstances, a DNS-Server may be needed to get the host-name of IP addresses outside the local network.

See also:

- GIP. - Get IP Adress 2094
- GUN. - Get User Name 2103

© 2023 Theo Gottwald * https://www.smart-package.com

3.57.8 GIP. - Get IP Adress

MiniRobotLanguage (MRL)

GIP. Command

Get IP Address

Intention

Compute the IP Address of the actual computer. The code very simple:
`GIP.`

if multiple network cards, a index number can be given. Like this:
`GIP.2`

And this is how the stack will look in either case. The specific IP-numbers are just for example:

```
------------------------------------
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->String        :192.168.178.56
Stackpos: 001 ->LongInt       :951232704

------------------------------------
```

If you provide an host name/computer name, the command will translate the host name into the corresponding IP address. This can be a computer name from your network, as well as a internet resource. The code looks like this:
`GIP.www.fa2.de`

```
------------------------------------
User-Stack-Dump:
------------------------------------

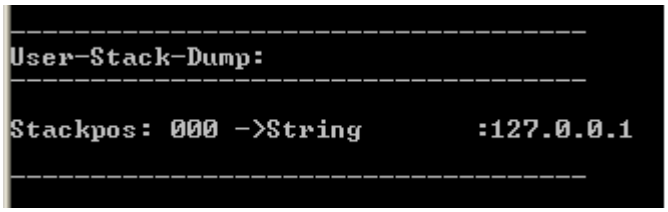
Stackpos: 000 ->String        :82.165.106.219
Stackpos: 001 ->LongInt       :-613767854

------------------------------------
```

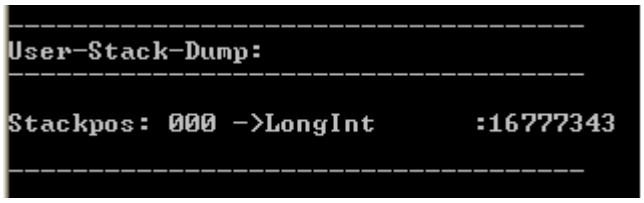
There is a second form of `GIP.` in which it can be used to translate a numeric IP address to a normal IP-address. Like this:
`GIP.>16777343`

and below you can see how the stack looks like.

*© 2023 Theo Gottwald * https://www.smart-package.com*



The opposite will also work, to translate a normal IP address to a numeric IP-address. You just write it like this:
`GIP.<127.0.0.1`



The stack now shows the IP in numeric form.

In all these cases you can provide a variable as second parameter. Like this:
```
GIP.|$$RES
GIP.2|$$RES
GIP.<127.0.0.1|$$RES
GIP.>16777343|$$RES
```

Then the value thats on the TOS will not be placed on the stack, but into the provided variable.

Syntax

GIP.[P1][|P2]

Parameter Explanation

P1 - (optional) host name, computer name or name of a internet resource that can be computed to an ip address. If omitted the ip address of the actual computer is been returned.

P2 - (optional) variable for the result

There is a second mode in which GIP. makes conversions between the numeric and the conventional form of an ip address. In these cases P1 must be prefixed with a ">" to convert a numeric IP to a standard IP. And if you prefix P1 with a "<", followed by Standard IP, this one will be translated into a numeric IP.

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' GIP. - Sample
STS.LOCAL
STS.CLEAR

GIP.
' show Actual Stack
DMP.6
MBX. Sample 1

STS.CLEAR

GIP.
' show Actual Stack
DMP.6
MBX. Sample 2

STS.CLEAR
GIP.1|$$REA
GIP.2|$$REB
' show Actual Stack
DMP.6
MBX.IP's are is $$REA-$$REB

STS.CLEAR
GIP.>16777343
DMP.6
MBX. IP Conversion done

STS.CLEAR
GIP.>16777343|$$RES
DMP.6
MBX. IP Conversion done: $$RES

STS.CLEAR
GIP.<127.0.0.1
DMP.6
MBX. IP Conversion 3 done

STS.CLEAR
GIP.<127.0.0.1|$$RES
DMP.6
MBX. IP Conversion 3 done $$RES

STS.CLEAR
GIP.www.fa2.de
DMP.6
MBX. Network Name resolved.
ENR.
```

Remarks

-

Limitations:

3.57.9 GNS. - Get Network Share

MiniRobotLanguage (MRL)

GNS. Command

Get Network Share

Intention

Can be used to retrieve the connection behind a drive-letter or specification.

```
' With a drive-letter it will retrieve the share
$$DRV=F:
GNS.$$DRV|$$ERG
' May return \\pcname\folder
DBP.$$ERG

' Without drive-letter will return all available shares
GNS.|$$ERG
DBP.$$ERG
```

In case of error, the timeout-flag is set and the error-number is on the TOS.
Otherwise the result is returned whether on TOS or in **P5.**

Hint: Use the RDM. - Remove Drive Mapping 2112 command to remove a mapped drive.

Syntax

GNS.[P1][|P2]

Parameter Explanation

P1 - ***(optional) Drive-Letter*** includes the ":" Example: `K:`
If no parameter is given, the result is a List of all shares, separated with "*".
Example:
`X:=\share1\folder*Y:=\share2\folder*Z:=\share3\folder`

P2 - (optional). Variable that will return the result of the operation. In case of success the result will be zero. In case of error an error number is returned. If omitted TOS is used.

5 - ERROR_ACCESS_DENIED
The caller does not have access to the network resource.
This could also be a access-rights problem.

85 - ERROR_ALREADY_ASSIGNED

© 2023 Theo Gottwald * https://www.smart-package.com

The local device specified is already connected to a network resource.

1200 - ERROR_BAD_DEVICE
The value specified is invalid.

67 - ERROR_BAD_NET_NAME
The value specified is not acceptable to any network resource provider because the resource name is invalid, or because the named resource cannot be located.

1204 - ERROR_BAD_PROVIDER
The value specified does not match any provider.

1223 - ERROR_CANCELLED
The attempt to make the connection was canceled by the user through a dialog box from one of the network resource providers, or by a called resource.

1208 - ERROR_EXTENDED_ERROR
A network-specific error occurred.

487 - ERROR_INVALID_ADDRESS
The caller passed a pointer to a buffer that could not be accessed.
This error should not appear, as it is an internal error.

87 - ERROR_INVALID_PARAMETER
This error is a result of providing wrong parameters, or the connection is to a network that requires the redirecting of a local device. Please check the variables.

86 - ERROR_INVALID_PASSWORD
The specified password is invalid.

234 - ERROR_MORE_DATA
Internal Error. If this error is returned, then no connection has been made.

259 - ERROR_NO_MORE_ITEMS
The operating system cannot automatically choose a local redirection because all the valid local devices are in use.

1202 - ERROR_DEVICE_ALREADY_REMEMBERED
The local device name has a remembered connection to another network resource.

1203 - ERROR_NO_NET_OR_BAD_PATH
The network path was either typed incorrectly, does not exist, or the network provider is not currently available. Please try retyping the path or contact your network administrator.

1222 - ERROR_NO_NETWORK
The network is unavailable.

1219 - ERROR_SESSION_CREDENTIAL_CONFLICT
An attempt was made to establish a session to a network server, but there are already too many sessions established to that server.

1326 - ERROR_LOGON_FAILURE

*© 2023 Theo Gottwald * https://www.smart-package.com*

Logon failure: user account restriction. Possible reasons are blank passwords not allowed, logon hour restrictions, or a policy restriction has been enforced.

Example

```
'-------------------------------------------------------------
' GNS. - No Parameters
'
GNS.
ITO.
  PRT.error happend
EIF.
DMP.6
MBX.!
ENR.

' GNS. - with Parameters
'
$$PAT=X:
GNS.$$PAT|$$ERG
ITO.
  PRT.error happend
EIF.
PRT.$$ERG
MBX.!
ENR.
```

Remarks

If the command fails, the Timeout-Flag is set, otherwise it will be cleared.

3.57.10 GUD. - Get User and Domain

MiniRobotLanguage (MRL)

GUD. Command

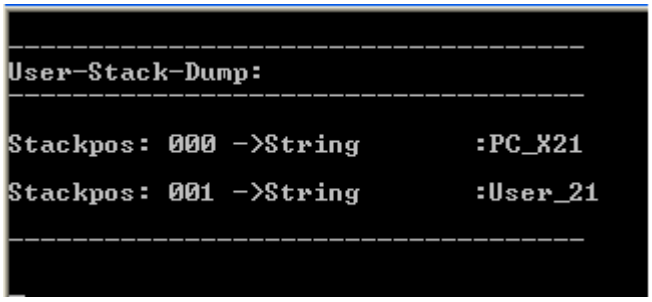
Get User and Domain Name

Intention

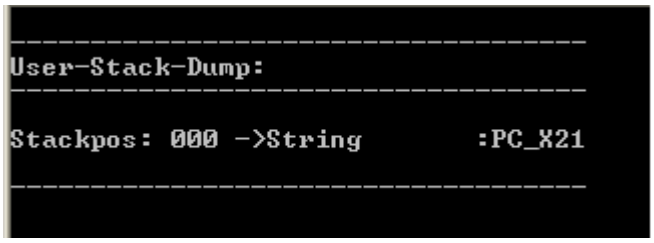
Get the name of the user that is actually running your script. When using the 1.1 '#RAU: - Run As User 271 it may be a good idea to find out, if the script really got the proper user.

`GUD.` provides you this information. It shows you, which user runs the actual script.

If you run `GUD.` without a parameter, the stack will get the information like in the picture below.



If you provide a variable for the User-Name, the damain information will be on the stack, and the user name in the provided variable. The stack will then look like this.



If you provide two variables, both values will be in the variables instead then on the stack.

Syntax

GUD.[P1][|P2]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** **(**optional) Variable for the user name. If omitted TOS is used.

P2 **-** **(**optional) variable for the domain/pc name. If omitted TOS is used.

Example

```
' Show GUN. -Get User Name Command
STS.LOCAL
STS.CLEAR

GUD.$$USR
STS.DUMP
MBX. User is: $$USR
ENR.
```

Remarks

Uses internally another system then GUN.

Limitations:

-

3.57.11 GUN. - Get User Name

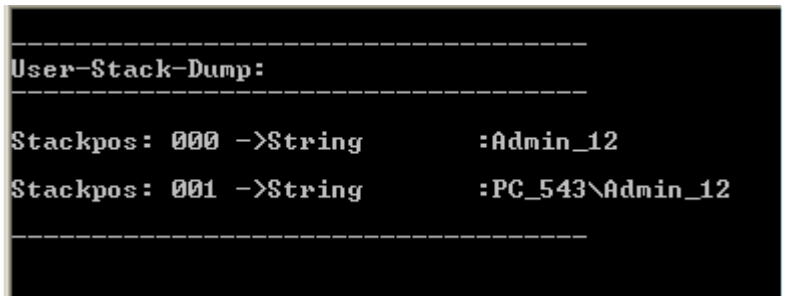
MiniRobotLanguage (MRL)

GUN. Command

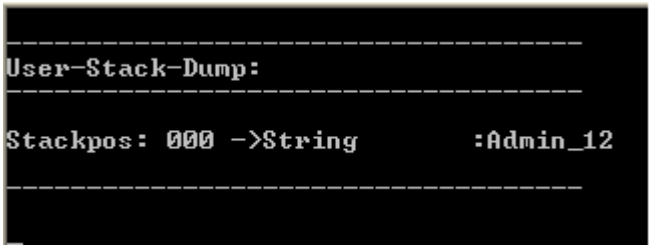
Get User Name

Intention

Get the name of the user that is actually running your script. When using the 1.1 '#RAU: - Run As User 271 it may be a good idea to find out, if the script really got the proper user.
GUN. provides you this information. It shows you, which user runs the actual script.
If you run GUN. without a parameter, the stack will get the information like in the picture below.



If you provide a variable for the User-Name, the user name will not be on the stack, but in this variable. The stack will then look like this.



Syntax

GUN.[P1][|P2]

Parameter Explanation

P1 **-** (optional) Variable for the result.

© 2023 Theo Gottwald * https://www.smart-package.com

P2 **-** **(**optional) the letter **N**, then another Algo is used.

Example

```
' Show GUN. -Get User Name Command
STS.LOCAL
STS.CLEAR

GUN.
' show Actual Stack
DMP.6
MBX. Sample 1

STS.CLEAR
GUN.$$RES
' show Actual Stack
DMP.6
MBX. Sample 2, Name is $$RES

ENR.
```

Remarks

-

Limitations:

-

3.57.12 GVL. - Get Volume List

MiniRobotLanguage (MRL)

GVL. Command

Get Volume List

Intention

Can be used to retrieve a list of all available drive-letters (Volumes). Will also place the number of available Volumes on TOS.

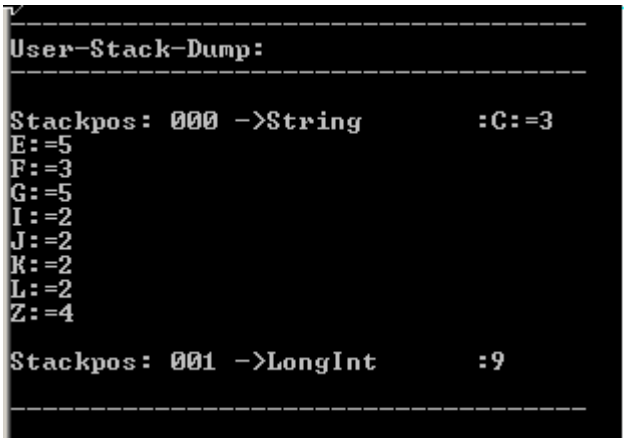
```
' Without parameter will place a list of all Volumes on the
TOS
GVL.
' Show TOS
DMP.6
MBX.!
```

This is an possible result:

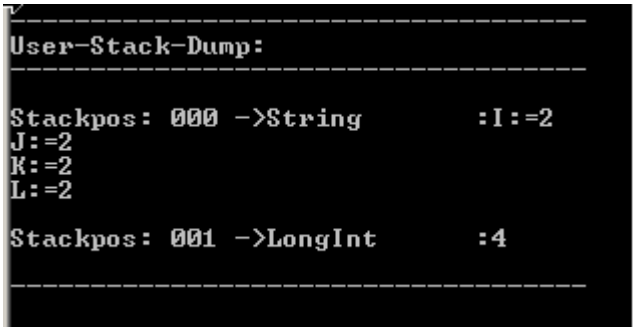
```
' Get the result in a variable
GVL.|$$ERG
DBP.$$ERG

' Change Format to numeric
GVL.n|$$ERG
DBP.$$ERG
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



```
' Only return Volumes of a defined type
GVL.n2
' Show TOS
DMP.6
MBX.!
```



In case of error, the timeout-flag is set.

The command will always count the number of results, and place this number below TOS.

Syntax

GVL.[P1][|P2]

Parameter Explanation

P1 - ***(optional)*** numeric parameter, from 1-6 .
If specified only volumes of this type is listed.
if you prefix the number with an "n", you will get an numeric output.
If no parameter is given, a List with all available Volumes is returned.
They will be separated with `$crlf$`
These are the numbers you can choose from:

© 2023 Theo Gottwald * https://www.smart-package.com

```
DRIVE_UNKNOWN     = 0
DRIVE_NO_ROOT_DIR = 1
DRIVE_REMOVABLE   = 2
DRIVE_FIXED       = 3
DRIVE_REMOTE      = 4
DRIVE_CDROM       = 5
DRIVE_RAMDISK     = 6
```

P2 - (optional). Variable that will return the result of the operation. In case of success the result will be zero. In case of error an error number is returned. If omitted TOS is used.

Example

```
'-------------------------------------------------------------
' GVL. only volumes that are removable
' Result on TOS, and numeric output
'
GVL.n2
' Show TOS
DMP.6
MBX.!
ENR.
```

Remarks

-

3.57.13 MND. - Map Network Drive

MiniRobotLanguage (MRL)

MND. Command

Map Network Drive

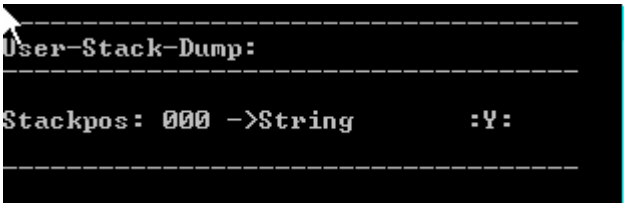
Intention

Can be used to assign a drive-letter to a network resource.
This can be done temporary, or you can specify that this is going to be connected on each reboot.

Just use the command and specify which Mapping you want:

```
' Add Mapping using automatic driveletter temporary
MND.\\MyComputer\Folder$
```

Will leave the automatically assigned driveletter on the TOS (**Y:**).



```
' Assign  Mapping for Drive F: permanent
RDM.F|1

' Remove Mapping for Drive F: permanent
' and verify it was removed
RDM.F|1|$$ERG
IVV.$$ERG=0
  MBX.Success
EIF.
```

Hint: Use the RDM. - Remove Drive Mapping 2112 command to remove a mapped drive.

Syntax

MND.P1[|P2][|P3][|P4][|P5][|P6]

Parameter Explanation

P1 - Share to connect, example: ***\\computer\folder***

© 2023 Theo Gottwald * https://www.smart-package.com

P2 - *(optional)* Driveletter, for example: Y:

P3 - *(optional)* ***Username***

P4 - *(optional)* ***Password***

P5 - *(optional)*. 1/0 -If 1 is specified, the Mapping is permanent.
It will be restored at the next reboot.
If 0 or nothing is specified, the drive mapping is temporary
and not saved in the user profile.

P6 - (optional). Variable that will return the result of the operation. In case of success the result will be zero. In case of error an error number is returned. If omitted TOS is used.

5 - ERROR_ACCESS_DENIED
The caller does not have access to the network resource.
This could also be a access-rights problem.

85 - ERROR_ALREADY_ASSIGNED
The local device specified is already connected to a network resource.

1200 - ERROR_BAD_DEVICE
The value specified is invalid.

67 - ERROR_BAD_NET_NAME
The value specified is not acceptable to any network resource provider because the resource name is invalid, or because the named resource cannot be located.

1204 - ERROR_BAD_PROVIDER
The value specified does not match any provider.

1223 - ERROR_CANCELLED
The attempt to make the connection was canceled by the user through a dialog box from one of the network resource providers, or by a called resource.

1208 - ERROR_EXTENDED_ERROR
A network-specific error occurred.

487 - ERROR_INVALID_ADDRESS
The caller passed a pointer to a buffer that could not be accessed.
This error should not appear, as it is an internal error.

87 - ERROR_INVALID_PARAMETER
This error is a result of providing wrong parameters, or the connection is to a network that requires the redirecting of a local device. Please check the variables.

86 - ERROR_INVALID_PASSWORD
The specified password is invalid.

234 - ERROR_MORE_DATA

*© 2023 Theo Gottwald * https://www.smart-package.com*

Internal Error. If this error is returned, then no connection has been made.

259 - ERROR_NO_MORE_ITEMS
The operating system cannot automatically choose a local redirection because all the valid local devices are in use.

1202 - ERROR_DEVICE_ALREADY_REMEMBERED
The local device name has a remembered connection to another network resource.

1203 - ERROR_NO_NET_OR_BAD_PATH
The network path was either typed incorrectly, does not exist, or the network provider is not currently available. Please try retyping the path or contact your network administrator.

1222 - ERROR_NO_NETWORK
The network is unavailable.

1219 - ERROR_SESSION_CREDENTIAL_CONFLICT
An attempt was made to establish a session to a network server, but there are already too many sessions established to that server.

1326 - ERROR_LOGON_FAILURE
Logon failure: user account restriction. Possible reasons are blank passwords not allowed, logon hour restrictions, or a policy restriction has been enforced.

Example

```
'-------------------------------------------------------------
' MND. - No Pasword
'
$$PAT=\\XDRIVE\Daten$
MND.$$PAT
ITO.
  PRT.error happend
EIF.
DMP.6
MBX.!
ENR.

' MND. - with Pasword
'
$$PAT=\\XDRIVE\Daten$
MND.$$PAT||Admin|Asjfds_55
ITO.
  PRT.error happend
EIF.
DMP.6
MBX.!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

If the command fails, the Timeout-Flag is set, otherwise it will be cleared.

Limitations:

-

3.57.14 RDM. - Remove Drive Mapping

MiniRobotLanguage (MRL)

RDM. Command

Remove Mapped Network Drive

Intention

Can be used to remove a mapped network drive, temporary or permanently.
Just use the command and specify which Mapping to remove:

```
' Remove Mapping for Drive F: temporary
RDM.F

' Remove Mapping for Drive F: permanent
RDM.F|1

' Remove Mapping for Drive F: permanent
' and verify it was removed
RDM.F|1|$$ERG
IVV.$$ERG=0
  MBX.Success
EIF.
```

Hint: Use the MND. - Map Network Drive 2108 to add a Mapped Drive.

Syntax

RDM.P1[|P2][|P2]

Parameter Explanation

P1 - Driveletter, for example Y or M

P2 - (optional). 1/0 -If 1 is specified, teh Mapping is permanently removed.
If 0 or nothing is specified, the drive mapping is removed, but possibly restored at next reboot.

P3 - (optional). Variable that will return the result of the operation. In case of success the result will be zero. In case of error an error number is returned.

1206 - ERROR_BAD_PROFILE
The user profile is in an incorrect format.

1205 - ERROR_CANNOT_OPEN_PROFILE

*© 2023 Theo Gottwald * https://www.smart-package.com*

The system is unable to open the user profile to process persistent connections.

2404 - ERROR_DEVICE_IN_USE
The device is in use by an active process and cannot be disconnected.

1208 - ERROR_EXTENDED_ERROR
A network-specific error occurred.

2250 - ERROR_NOT_CONNECTED
The name specified is not a redirected device, or the system is not currently connected to the device specified by the parameter.

2401 - ERROR_OPEN_FILES
There are open files. This error should not occur, as the Command uses force to break the connection.

Example

```
'-------------------------------------------------------------
' RDM. - Get Computer Name
'
RDM.F
RDM.F|0|$$RES
ENR.
```

Remarks

If the command fails, the Timeout-Flag is set, otherwise it will be cleared.

Limitations:

-

See also:

- MND. - Map Network Drive 2108
- CNS. - Connect Net Share 2070
- GIP. - Get IP Adress 2094
- GUN. - Get User Name 2103
- IVA. - If Volume available 1053

© 2023 Theo Gottwald * https://www.smart-package.com

3.57.15 SID. - Security Identifier

MiniRobotLanguage (MRL)

SID. Command

Get Security Identifier* for actual or any User Name

Intention

Get the **SID** (Security Identifier)*of the current or any given User as Text String.

Example **SID:** `S-1-5-21-435374019-1570027373-1801674531-1013`

Usage is simple:

```
' Print current user SID as Text
SID.
DBP.$$000
ENR.

' Print Guest User SID
$$NAM=MYPC\Guest
SID.$$NAM
DBP.$$000
ENR.

' Print Guest User SID, use Variable for Result
$$NAM=MYPC\Guest
SID.$$NAM|$$RES
DBP.$$RES
ENR.
```

***Security Identifier** (commonly abbreviated **SID**) is a unique, immutable identifier of a user, user group, or other security principal.
A security principal has a single SID for life, and all properties of the principal, including its name, are associated with this SID.
This allows a principal to be renamed (for example, from "UserB" to "User21", without affecting the security attributes of objects that refer to the principal.

Syntax

SID.[P1][|P2]

Parameter Explanation

 *© 2023 Theo Gottwald * https://www.smart-package.com*

P1 **-** **(**optional) Name of User to return the SID from. If omitted,
current user is taken.
P2 **-** **(**optional) Variable for the result.

Example

```
' Print Guest User SID, use Variable for Result
$$NAM=MYPC\Guest
SID.$$NAM|$$RES
DBP.$$RES
ENR.
```

Remarks

-

Limitations:

-

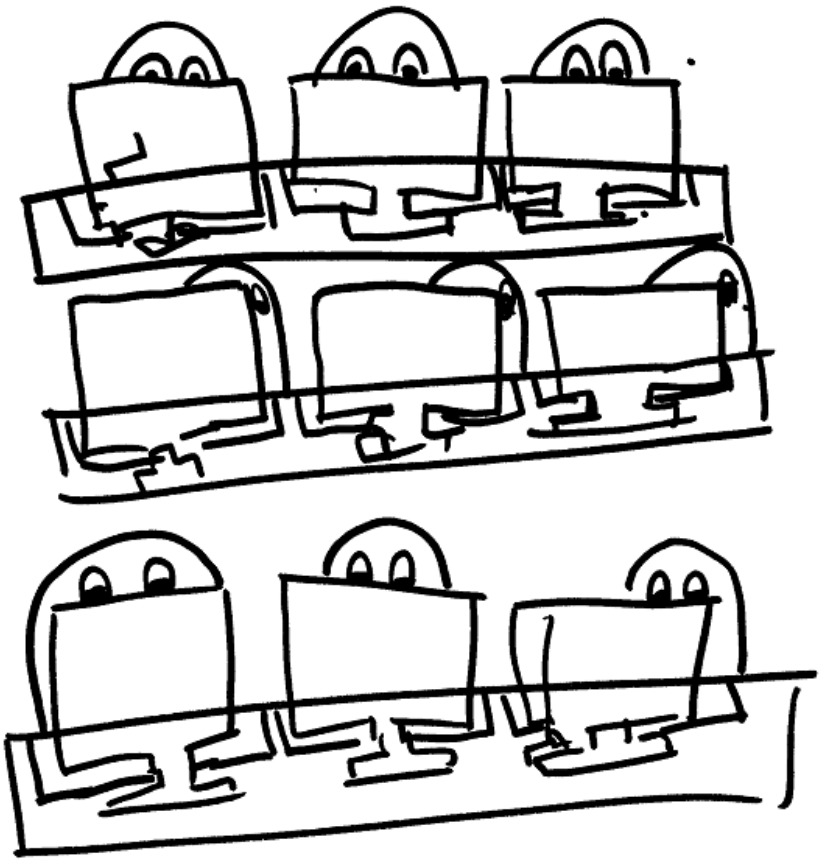
3.58 IPC, InterKOM and Exit Code

3.58.1 ! Smarty's InterKOM Technology

Smarty's InterKOM Technology



Intention

What is InterKOM good for?

The SPR System is actually a system that contains multiple components. You have one ore more robots, a Plug In, the Mini-Browser, the Editor and in the future there will be a lot more components.

All of these components need to work together in a synchronized way. They need to communicate to each other. For example, the robot may want to ask the Browser "are you ready loading that page?"

*© 2023 Theo Gottwald * https://www.smart-package.com*

Synchronization and data exchange must be done in a very fast way and also it may be necessary to communicate even through cross boundaries of rights-management. This is not possible using actual windows messaging.

That is why we invented InterKOM.
InterKOM withing the SPR-System means "**Inter Process Communication**".

For example, if your Robot is running in another session you may still want it to send a debugging message to the Editor or to another robot instance.

As a base for actual and future "Inter Process Communication, InterKOM was made.
Its the newest technological step ahead in the SPR System.
Together with the new background technology that was added recently, InterKOM will build the base for interesting developements in the future.

It can interface and synchronize any thinkable executable that should be integrated into the SPR system in a lighning fast way.
And it works system-wide, for example you can send InterKOM Messages to robots that run in another session, which will not work using regular windows messaging.

Using `GIK.` you can read a number of defined values that can be read or written by any other InterKOM program also.
Its like you have a shared pool of variables. And as InterKOM is lightning fast, this is perfect for synchronization between all components.
In the same way, you can sent InterKOM-Messages using `SIK.`

For this to be possible, each program that joins InterKOM will get a "InterKOM" handle, that is like a postal address for InterKOM. In fact its nothing complicated.

The first program that joins InterKOM receives the handle "1", the second receives the handle "2" and so on. Its a number and currently the upper limit is 16.
This may change in future versions, as InterKOM's architecture could handle a lot more.
Its is currently the maximum number of possible InterKOM users and 16 robots and Editors and browsers are enough for now.

Each program that starts up, whether its a robot, and editor or an Mini-Browser, will immediately get an InterKOM handle. And that handle is called a "CUN" which means "communication unique number". Because its unique and because its purpose is to enable communication between the programs.

What are the InterKOM Commands?

Mostly InterKOM serves two purposes: Synchronization and Messaging.
All of these use the same commands:

- `WIK.` - Wait until an InterKOM event has happened.
- `SIK.` - Set an InterKOM event or send an InterKOM Message.
- `GIK.` - Get an InterKOM State or get an InterKOM Message.
- `IIK. / NIK.` - Check if an InterKOM Event has happened

*© 2023 Theo Gottwald * https://www.smart-package.com*

Do I have special system variables for use with InterKOM?

You have the following System-Variable for use with InterKOM:

`#cun#` – CUN of the actual robot that runs this script
`#ecun#` – CUN of the Editor that has started this robot - if any.
`#fcun#` – CUN of the robot that has started a Parallel-Robot (father-CUN)
`#bcun#` – CUN of the last started Mini-Browser (`LBR.`-Command only)
`#pcun#` – CUN of the last started Parallel-Robot (`PRR.`-Command)

What are the InterKOM Sync-Bytes?

For Synchronisation purposes, Interkom offers a number of Synchronisation Bytes. These Bytes are unique for each InterKOM Member. If you have for example 3 programs that use InterKOM, then any of this programs has the full set of InterKOM-Bytes.

If a program leaves InterKOM, these Bytes are being deleted automatically.
Let's take a look which synchronization bytes we have (for each InterKOM member):

- 1-250 Byte
  Bytes can hold any value from 0 to 255

- 1-250 Long
  Longs can hold any value from -2147483648 to 2147483647

- 1-250 Quad
  A Quad can hold any value from zero to 18446744073709551615.
  Each Quad can also hold a text of 8 letters.

- 1-250 Float
  A Float can hold positive or negative values that contain a fractional part.
  For example 1.234354 or such. They use very high precision internally.
  Higher then +/-1.7976931348623157E+308#

In fact InterKOM offers more then 250 Bytes of each sort. However these last bytes are reserved for internal usage of the robot system. Do not try to use them, or you may experience unknown problems.

As each InterKOM using program has a private, full set/pool of "own Sync-Bytes", you need to specify the CUN of the Member, who's bytes you want to read or change.

Was ist ein InterKOM Typ?

Any System-Component, like for example Robot, Editor or Mini-Browser will log on to InterKOM and tell its TYPE to InterKOM.
This way InterKOM always knows the Type of any running Module, and therefore you can search a CUN by TYPE. The actually defined Types are:

```
TYP unkonwn      = 0
TYP Robot        = 1
TYP Editor       = 2
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
TYP PlugIn       = 3
TYP Aoolication  = 4
TYP Mini Browser = 5
```

In case there are multiple Instances of, for example Robots, you can specify a number to select the one you want. Example:

```
$$TYP=1
$$NUM=2
GIK.cft|$$TYP|$$NUM|$$RES
DBP.Robot CUN is: $$RES / #cun#
```

Hint: InterKOM will also be know about the **Hwnd** and the **PID** of any attached Component.

Therefore you can also search a Component **CUN** by its **Hwnd** or its **PID**.

In the other direction, you can ask InterKOM for the Hwnd of a Component, if you have

the CUN. You can get the CUN most easy using System-Variables.

How will InterKOM Handle Messages internally?

InterKOM will que all Messages to a specific CUN, until the receiver CUN will use `GIK.` to receive these Messages. To prevent the Message-Cue from Overflow, it has a maximum value of >4000 Messages that are inserted into the que.
If you retrieve a message using `GIK.` , the message is been deleted from the Message Que. There is no need to get all Messages out before shutting down a Component. However when a Component ends, all left over message are being discarded.

An Example Script

```
'*********************************
' This example uses INTERKOM to signal a second Robot to
' end running in a looping.
'*********************************
'
' Run Parallel Robot
PRR.
  ' Get InterKOM CUN of father-robot

3.58.2 GIK. - Get InterKOM

MiniRobotLanguage (MRL)

GIK. Command

Get a IPC-Message or Signal from another Component

Intention

Using `GIK.` you can read a number of defined values that can be read or written by any other InterKOM program also. Its like you have a shared pool of variables. And as InterKOM is lightning fast, synchronization will easily be possible this way.

Using `SIK.` you can write to this shared memory, and at the same time other processes can read the writings using `GIK.` or `IIK.` and react on that.

`GIK.` is a multi-purpose command that includes multiple possible subcommands. Usage is simple:

```
' Get the value of Sync-Byte "1" (lowest) from CUN(-Member) 2
' and place it in Variable $$ERG
GIK.Byte|1|2|$ERG

' Get the value of Sync-Byte "250" from our own Bytes
' and place it on TOS
GIK.Byte|250

' Get the value of Sync-Byte "127" our own Bytes
' and place it in Variable $$ERG
' zero as CUN always evaluates to our own CUN
GIK.Byte|1|0|$ERG
```

Syntax

GIK.P1|P2[|P3][|P4]

Parameter Explanation

P1 – `Subcommand`, the following Subcommands are currently supported. Note that for all of the subcommands there is a long form that is better readable, as well as a short form, that can be used to write faster.

- "Byte","B."
  `GIK.Byte|(Byte-Nr.)[|(CUN)][|$$ERG]`
  `GIK.Byte|$$BNU|$$CUN|$$RES`

© 2023 Theo Gottwald * https://www.smart-package.com

- "Long","L."
  GIK.Long|(Byte-Nr.)[|(CUN)][|$$ERG]
  GIK.Long|$$BNU|$$CUN|$$RES

- "Quad","Q."
  GIK.Quad|(Byte-Nr.)[|(CUN)][|$$ERG]
  GIK.Quad|$$BNU|$$CUN|$$RES

- "Float","F."
  GIK.Float|(Byte-Nr.)[|(CUN)][|$$ERG]
  GIK.Float|$$BNU|$$CUN|$$RES

- "Use","U." - "InUse"-Flag from a defined CUN.
  If this returns 0 then the CUN with that number is not in use.
  GIK.Use|(CUN)[|$$ERG]

- "Message any","ma."
  GIK.Message any[|$$ERG]

- "Message from","mf."
  GIK.Message from|(Sender-CUN)[|$$ERG]

- "Handle","h."
  GIK.Handle|(CUN)[|$$ERG]

- "CUN from Handle","cfh.","cfh"
  GIK.cfh|(Handle)[|$$ERG]

  GIK.cfp|(PID)[|$$ERG]

- "CUN from Type","cbt.","cbt"
  GIK.cft|(Type)[|$$NUM][|$$ERG]

Depending on the chosen Subcommand the further Parameters **P2** to **P4** differ and may be
needed or not.

P2 – Depending on the chosen Subcommand this Parameter may be the number of the synchronization element or may have another usage.

P3 – **(optional)** Depending on the chosen Subcommand this Parameter may be needed or not.

P4 – **(optional)** Depending on the chosen Subcommand this Parameter may be needed or not.

Example

```
' This example uses INTERKOM to signal a second Robot to
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' end running in a looping.
'
' Run Parallel Robot
PRR.
  ' Get InterKOM CUN of father-robot
  $$CUN=#fcun#
  ' Here is the Loop
  DOL.
    GIK.Byte|1|$$CUN|$$RES
    PRT.received: $$RES
    PAU.0.5
  OOP.$$RES=10
  MBX.Ending.
  ENR.
PRE.
' Here is the Main Robot
PAU.0.2
' Set the Pool-Byte to 10 this will make the Parallel-Robot
' end its loop.
SIK.Byte|1|10
' Receive the byte also
GIK.Byte|1||$$RES
DBP.received: $$RES
MBX.Signal sent.
ENR.
```

Remarks

-

Limitations:

Currently there are limitations to the maximum size that a message may have, using InterKOM. These are 650 kb for this release. This may change in the future.

Also the number of possible InterKOM Clients is limited to 16 at this time.

See also:

- ! Smarty's InterKOM Technology 2116
- SIK. - Set InterKOM 2131
- WIK. - Wait InterKOM 2142
- IIK. - If InterCOM Condition 2125

© 2023 Theo Gottwald * https://www.smart-package.com

3.58.3 IIK. - If InterCOM Condition

MiniRobotLanguage (MRL)

IIK.- Conditional Statement

Check if an InterKOM Condition is true

Intention

Conditional statement.

Using `IIK.` you can check if and InterKOM Condition is true or not. This can be the value of a "Pool Byte" or if a specified Message has arrived.

Using the "Alive" Option, you can also check if other InterKOM Members are alive or not.

InterKOM is like you have a shared pool of variables. As InterKOM is lightning fast, synchronization will easily be possible this way.
For more Informations on InterKOM see here ! Smarty's InterKOM Technology 2116.

`IIK.` is a multi-purpose command that includes multiple possible subcommands. Usage is simple.

```
IIK.!Alive|3
  DBP. CUN 3 is been shut down.
EIF.

' And technically the same
NIK.Alive|3
  DBP. CUN 3 is been shut down.
EIF.
```

In this more complex example we start a Parallel-Robot to set a Synchronisation Number in the shared Pool. Note that we also use a variable to define the subcommand.

```
$$SBC=Float
SIK.$$SBC|1|6.5454

$$NUM=6.5453
IIK.$$SBC|1|>$$NUM
  DBP. Yes its >$$NUM
ELS.
  DBP. No its not >$$NUM
EIF.

$$NUM=12
IIK.$$SBC|1|>$$NUM
  DBP. Yes its >$$NUM
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
ELS.
  DBP. No its not >$$NUM
EIF.
ENR.
```

Syntax

IIK.[!]P1|P2[|P3][|P4]

Parameter Explanation

[!] – If you prefix the Subcommand with a "**!**" then the Logic is negated and the given
condition is true, if its false and false if its true.

P1 – `Subcommand`, the following Subcommands are currently supported. Note that for all of the subcommands there is a long form that is better readable, as well as a short form, that can be used to write faster.

- "Byte","B."
  `IIK.[!]Byte|Nr.|cond/value[|CUN]`
- "Long","L."
  `IIK.[!]Long|Nr.|cond/value[|CUN]`
- "Quad","Q."
  `IIK.[!]Quad|Nr.|cond/value[|CUN]`
- "Float","F."
  `IIK.[!]Float|Nr.|cond/value[|CUN]`
- "Use","u."
  `IIK.[!]Use|CUN`
- "Alive","a."
  `IIK.[!]Alive||CUN`
- "Message from","mf."
  `IIK.Message from|CUN[|$$MSG]`
- "Message any","ma."
  `IIK.Message any|[$$MSG]`

Depending on the chosen Subcommand the further Parameters **P2** to **P4** differ and may be
needed or not.

© 2023 Theo Gottwald * https://www.smart-package.com

P2 – Depending on the chosen Subcommand this Parameter may be the number of the synchronization element or may have another usage.

P3 – **(optional)** Depending on the chosen Subcommand this Parameter may be needed or not.

P4 – **(optional)** Depending on the chosen Subcommand this Parameter may be needed or not.

Speed in Ticks:

This command uses typically around 550 Ticks for sending a Q-Message.

Example

```
' This example uses INTERKOM to signal a second Robot to
' end running in a looping.
'
$$SBC=Long
SIK.$$SBC|1|6
$$NUM=4
IIK.$$SBC|1|>$$NUM
  DBP. Yes its >$$NUM
ELS.
  DBP. No its not >$$NUM
EIF.
$$NUM=12
IIK.$$SBC|1|>$$NUM
  DBP. Yes its >$$NUM
ELS.
  DBP. No its not >$$NUM
EIF.
ENR.
```

Remarks

There are multiple examples on InterKOM Commands within the supplied Sample Scripts.

Limitations:

Currently there are limitations to the maximum size that a message may have, using InterKOM. These are 650 kb for this release. This may change in the future.

Also the number of possible InterKOM Clients is limited to 16 at this time.

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.58.4 SEC. - Set Exit Code

MiniRobotLanguage (MRL)

SEC. Command

Set a Return code for use by the calling programm

Intention

This command will set the Return code for the Robot-Executable only.
The Return code is also known as Error Level.
You can call this command at any place in your script to set the Return code for the "Robot-Executable", that is the "`MR01.exe`".

This command **will NOT set the Return code for compiled Scripts**. Use the `SRV.`-Command for this. Even multiple times.

Only the last call will set the finally used return code.

Usage is simple:

```
' Set a Return Code of zero (0)
SEC.

' Set a Return Code of zero (0)
SEC.0

' Set a Return Code of 10005
: $$PRO=10005
SEC.$$PRO

' Add multiple results
SEC.($$PR1+$$PR2+$$PR3)
```

Syntax

SEC.[P1]

Parameter Explanation

P1 - **`(optional)`** `NUM` ,variable or formula in (..).
if omitted, default is 0. Will be the Return code of the compiled executable.

Example

```
' Set a Return Code of zero (0)
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
SEC.

' Set a Return Code of zero (0)
SEC.0

' Set a Return Code of 10005
: $$PRO=10005
SEC.$$PRO
```

Remarks

This command will only set the Return Value for the "**MR01.exe**".
To set the Error-Level of compiled Scripts (EXE-Mode) use the `SRV.`-command.
To end a script and set a Return-code for executables, use `END`.

Limitations:

-

See also:

- 1.B Error handling 224
- SRV. - Set Return Value (Executable) 2134
- END. - End Script 2362
- ENR. - End Return 2169

© 2023 Theo Gottwald * https://www.smart-package.com

3.58.5 SIK. - Set InterKOM

MiniRobotLanguage (MRL)

SIK. Command

Set a IPC-Message or Signal for another Component

Intention

Using `SIK.` you can send a defined value that can be read by any other InterKOM program, for example using `GIK.`

Its like you have a shared pool of variables. As InterKOM is lightning fast, synchronization will easily be possible this way.

Using `SIK.` you can write to this shared memory, and at the same time other processes can read the writings using `GIK.` or `IIK.` and react on that.

`SIK.` is a multi-purpose command that includes multiple possible subcommands. Usage is simple:

```
'Here is an example using SIK. and GIK.

' Sent Byte 1 of Robots own "Pool" to 10
SIK.Byte|1|10

' Get the actual Value of "own Pool" value Nr.1
GIK.Byte|1||$$RES

' Print it
DBP.received: $$RES
```

Syntax

SIK.P1|P2[|P3][|P4]

Parameter Explanation

P1 – `Subcommand`, the following Subcommands are currently supported. Note that for all of the subcommands there is a long form that is better readable, as well as a short form, that can be used to write faster.

- "Byte","B."
  `SIK.Byte|Nr.|$$VAL[|CUN]`

*© 2023 Theo Gottwald * https://www.smart-package.com*

- "Long","L."
  `SIK.Long|Nr.|$$VAL[|CUN]`

- "Quad","Q."
  `SIK.Quad|Nr.|$$VAL[|CUN]`

- "Float","F."
  `SIK.Float|Nr.|$$VAL[|CUN]`

- "In Use","iu."
  `SIK.InUse|$$VAL[|CUN]`

- "Handle","h."
  `SIK.handle|$$VAL[|CUN]`

- "Message to","mt."
  `SIK.Message to|CUN|$$MSG`
  Technically a normal Message is a qued message, therefore this command does the same as the following command.

- "Qued Message","qms.","q-msg"
  `SIK.qued Message|CUN|$$MSG`
  Sends a Message to the Inbox of the receiver CUN. This message will be qued and the Inbox will be free for other Messages from other senders.

- "Direct Message","dms."
  `SIK.direct Message|CUN|$$MSG`
  A "Direct Message will not be qued, therefore it will block the Inbox of the receiving CUN until it is taken by the receiving CUN, using `GIK`..

Depending on the chosen Subcommand the further Parameters **P2** to **P4** differ and may be
needed or not.

P2 - Depending on the chosen Subcommand this Parameter may be the number of the synchronization element or may have another usage.

P3 - **`(optional)`** Depending on the chosen Subcommand this Parameter may be needed or not.

P4 - **`(optional)`** Depending on the chosen Subcommand this Parameter may be needed or not.

Example

```
' This example uses INTERKOM to signal a second Robot to
' end running in a looping.
'

' Run Parallel Robot
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRR.
  ' Get InterKOM CUN of father-robot
  $$CUN=#fcun#
  ' Here is the Loop
  DOL.
    GIK.Byte|1|$$CUN|$$RES
    PRT.received: $$RES
    PAU.0.5
  OOP.$$RES=10
  MBX.Ending.
  ENR.
PRE.
' Here is the Main Robot
PAU.0.2
' Set the Pool-Byte to 10 this will make the Parallel-Robot
' end its loop.
SIK.Byte|1|10
' Receive the byte also
GIK.Byte|1||$$RES
DBP.received: $$RES
MBX.Signal sent.
ENR.
```

Remarks

There are multiple examples on InterKOM Commands within the supplied Sample Scripts.

Limitations:

Currently there are limitations to the maximum size that a message may have, using InterKOM. These are 650 kb for this release. This may change in the future.

Also the number of possible InterKOM Clients is limited to 16 at this time.

See also:

3.58.6 SRV. - Set Return Value (Executable)

SRV. - Set Return Value (Error-Level) Previous 2131 Top 41 Next 2136

MiniRobotLanguage (MRL)

SRV. Command

Set a Return Error-Level Value in EXE-Mode

Intention

This command will set the Return code for compiled executable scripts. The Return code is also known as Error Level. You can call this command at any place in your script.

If called in "Exemode", `SRV.` will set a return code for a compiled executable. If not encapsuled in an executable, `SRV.` will set the Returncode like `SEC.` only for the "`MR01.exe`". If given no Parameter, a Return code of zero is used.

Even multiple times. However only the last call will set the finally used return code. Usage is simple:

```
' Set a Return Code of zero (0)
SRV.

' Set a Return Code of zero (0)
SRV.0

' Set a Return Code of 10005
: $$PRO=10005
SRV.$$PRO

' Add multiple results
SRV.($$PR1+$$PR2+$$PR3)
```

`SRV.` does NOT set a Return code for the "`MR01.exe`", use `SEC.` for this.

Syntax

SRV.[P1]

Parameter Explanation

P1 - **`(optional)`** `NUM` ,variable or formula in (..).
if omitted, default is 0. Will be the Return code of the compiled executable.

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Set a Return Code of zero (0)
SRV.

' Set a Return Code of zero (0)
SRV.0

' Set a Return Code of 10005
: $$PRO=10005
SRV.$$PRO
```

Remarks

This command will only set the Return Value for the "**MR01.exe**".
To set the Error-Level of compiled Scripts (EXE-Mode) use the `SRV.`-command.
To end a script and set a Return-code for executables, use `END`.

Limitations:

-

See also:

- 1.B Error handling 224
- SEC. - Set Exit Code 2129
- END. - End Script 2362
- ENR. - End Return 2169

© 2023 Theo Gottwald * https://www.smart-package.com

3.58.7 TWM. - Text-Window-Message

MiniRobotLanguage (MRL)

TWM. Command

Text Window Message

Intention

Send a Text-Message to another running robot instance, which must be in receiving mode, using the `WFM.` command. Usage is simple:

```
' Sent Text to last localized Window use "19" as dwdata
TWM.Text

' Sent Text to robot $$CMH, use 19 (default) as dwdata
TWM.Text|$$CMH

' Sent Text to Windowhandle in $$MYW, use 21 as dwdata
TWM.Text|$$MYW|21
```

As the `PRV.` command is much more easy to use, for "Inter-Robot Communication", its the preferred way to exchange data between robots.

The `TWM.` / `WFM.` method is more complicated, and should be used primarily to communicate with external programs.

This command can be used to communicate (send messages) to WinRobots compatible automation-systems.

Syntax

TWM.P1[|P2][|P3]

Parameter Explanation

P1 - Text/String to send to the other robot.

P2 - ***(optional)*** Receiver/Target window handle (communications handle). If omitted, last localized window is been taken as receiver.

P3 - ***(optional)*** dwData, a number, which is 19 by default. It's recommended to ignore this number and omit this parameter, unless you now what you do.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Please note that you can get the window-handle of this instance by using the #cbw# Systemvariable.

Example

```
'*******************************************
' TWM./WFM. - Sample
' Shows that the Parallel-Robot starts with
' all variables as they have been at starting-time
' of the starting robot.
' It can also use all Subroutines in this file.
'*******************************************
VAR.$$INP=0
VAR.$$CMH=#cbw#
PRT. My Name is Robbi $$CMH.
'-----------------------------------------------------------
PRR.
  PRT.I am Parallel-Robot Robbi: #cbw#
  PRT. I am going to send to: $$CMH
  PAU.2
  TWM.#This is my message!#|$$CMH
  PRT.Parallelrobot Ending.
  PAU.12
  END.
PRE.$$RET|0
PRT. I am waiting for a Message from Robbi: $$RET
'-----------------------------------------------------------
WFM.md|$$WAI|19
MBX.I got: $$WAI
END.
'-----------------------------------------------------------
```

Remarks

To implement a communication between the SPR and an external program, you can use the following Sub-Programs (BASIC-Code). The communication is done using the WM_COPYDATA-Message.

```
'#############################################################
####
'#
'#############################################################
####

3.58.8 WFM. - Wait-For-Message

MiniRobotLanguage (MRL)

WFM. Command

Wait For Message

Intention

Wait for a Text-Message sent from another running robot instance, using `TWM`.
This command is only for advanced use.

Hint: You can directly manipulate variables in other running robots, using `PRV`.

Syntax

WFM.P1|P2[|P3]

Parameter Explanation

P1 **-** Prototypes

```
t - (in) timeout in ms
d - (out) dwdata
h - (out) sender window-handle - must be variable
s - (out) 1/0 if the timeout was flagged
m - (out) Text which has been received
f - (in) filter, if used only sender with these
     communication-handle will be accepted. All other
     messages will be dropped.
```

P2 **-** Data depending on Prototypes

P3 **-** Data depending on Prototypes

```
Please note that you can get the communication-handle of the
actual robot-instance by using the #cbw# Systemvariable.
The most easy way to get the communication handle from the
parent-robot is by variable inheritance (see example below).
You can also get a commandline-parameter with the handle from
the instance which has started this instance using $cmdl$.
This is the way to go if you use a WinRobots compatible robot
as father.
```

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'*******************************************
' TWM./WFM. - Sample
' Shows that the Parallel-Robot starts with
' all variables as they have been at starting-time
' of the starting robot.
' It can also use all Subroutines in this file.
'*******************************************
VAR.$$INP=0
VAR.$$CMH=#cbw#
PRT. My Name is Robbi $$CMH.
'-----------------------------------------------------------
PRR.
  PRT.I am Parallel-Robot Robbi: #cbw#
  PRT. I am going to send to: $$CMH
  PAU.2
  TWM.#This is my message!#|$$CMH
  PRT.Parallelrobot Ending.
  PAU.12
  END.
PRE.$$RET|0
PRT. I am waiting for a MEssage from Robbi: $$RET
'-----------------------------------------------------------
WFM.md|$$WAI|19
MBX.I got: $$WAI
END.
'-----------------------------------------------------------
```

Remarks

-

Limitations:

Actually `WFM.` can not receive messages from other, for example WinRobots compatible automation systems. It will only receive messages in the proper message format.

3.58.9 WIK. - Wait InterKOM

MiniRobotLanguage (MRL)

WIK. Command

Wait for a IPC-Message or Signal

Intention

Using `WIK.` you can wait until a defined value or mesage is set/sent by any other InterKOM program, for example using `SIK.`

InterKOM is like you have a shared pool of variables. As InterKOM is lightning fast, synchronization will easily be possible this way.
For more Informations on InterKOM see here ! Smarty's InterKOM Technology 2116.

Using `SIK.` you can write to this shared memory, and at the same time other processes can read the writings using `GIK.` or wait for it using `WIK.` or `IIK.` and react on that.

`WIK.` is a multi-purpose command that includes multiple possible subcommands. Usage is simple.

```
' Wait unlimited time until our own Pool-Byte 1 contains
' a value that is >15
WIK.|Byte|1|>15

' Wait at most 15 seconds until our own Pool-Byte 1 contains
' a value that is NOT EQUAL 27
WIK.15|Byte|1|!27

' Wait at most 0.7 seconds until our own Pool-Long 1 contains
' a value that is smaller then 27012345
WIK.0.7|Long|1|<27012345

' Wait unlimited time
' until CUN from last started Parallelrobot is not more alive
$$PRR=#pcun#
WIK.|!Alive|$$PRR

' Note: This will do the same
WIK.!|Alive|$$PRR
```

In this more complex example we start a Parallel-Robot to set a Synchronisation Number in the shared Pool. Note that we also use a variable to define the subcommand.

```
$$SBC=Float
PRR.
  PAU.2
  SIK.$$SBC|1|6.5454|#fcun#
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  MBX.Signal Sent!
  ENR.
PRE.

$$NUM=6.5453
WIK.15|$$SBC|1|>$$NUM
MBX.Ende
ENR.
```

Syntax

WIK.[!]P1|P2[|P3][|P4]

Parameter Explanation

[!] – If you prefix the time-value with a "**!**" then the Logic is negated and the given condition is true, if its false..

P1 – **[optional]** If given, this is the maximum time to wait for the condition to be true. If the condition does not become true, then the command will set the timeout-flag and just continue with the script. You can check the timeout-flag to immediately after this command, to see if an timeout has occurred.

P2 – `Subcommand`, the following Subcommands are currently supported. Note that for all of the subcommands there is a long form that is better readable, as well as a short form, that can be used to write faster.

- "Byte","B."
  `WIK.[!][max time]|Byte|Nr.|cond/value[|CUN]`
- "Long","L."
  `WIK.[!][max time]|Long|Nr.|cond/value[|CUN]`
- "Quad","Q."
  `WIK.[!][max time]|Quad|Nr.|cond/value[|CUN]`
- "Float","F."
  `WIK.[!][max time]|Float|Nr.|cond/value[|CUN]`
- "Use","u."
  `WIK.[!][max time]|Use|CUN`
- "Alive","a."
  `WIK.[!][max time]|Alive||CUN`
- "Message from","mf."
  `WIK.[!][max time]|Message from|CUN[|$$MSG]`

© 2023 Theo Gottwald * https://www.smart-package.com

- "Message any","ma."
  ```
  WIK.[!][max time]|Message any|[$$MSG]
  ```

Depending on the chosen Subcommand the further Parameters **P3** to **P5** differ and may be
needed or not.
If you prefix the Subcommand or the max-time value with a "**!**" this will negate the logic of the command. If you prefix both, the logic will be unchanged.

cond - WIK. supports the following conditions:

! - NOT

= - Is Equal to

> - Larger then

< - Smaller then

Hint: Combined Operators like "**>=**" are not supported. In this case, just use ! and "<"
and switch the operators. Because **A>=B** is the same as **NOT B<A**.
Example:

```
WIK.!|Long|$$NUM|<12
WIK.|Long|4|>$$NAU
WIK.5|Long|2|=$$NAC
WIK.!30|Long|$$NUM|=$$NAC
```

P2 – Depending on the chosen Subcommand this Parameter may be the number of the synchronization element or may have another usage.

P3 – **(optional)** Depending on the chosen Subcommand this Parameter may be needed or not.

P4 – **(optional)** Depending on the chosen Subcommand this Parameter may be needed or not.

P5 – **(optional)** Depending on the chosen Subcommand this Parameter may be needed or not.

Example

```
' This example uses INTERKOM to wait until a second Robot
' has ended.

' Run Parallel Robot
PRR.
  PAU.4
  ENR.
PRE.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' This Script will wait until the Parallel-Robot has ended
WIK.!|Alive|#pcun#
MBX.Ende
ENR.
```

Remarks

There are multiple examples on InterKOM Commands within the supplied Sample Scripts.

Limitations:

Currently there are limitations to the maximum size that a message may have, using InterKOM. These are 650 kb for this release. This may change in the future.

Also the number of possible InterKOM Clients is limited to 16 at this time.

See also:

- ! Smarty's InterKOM Technology 2116
- GIK. - Get InterKOM 2122
- SIK. - Set InterKOM 2131

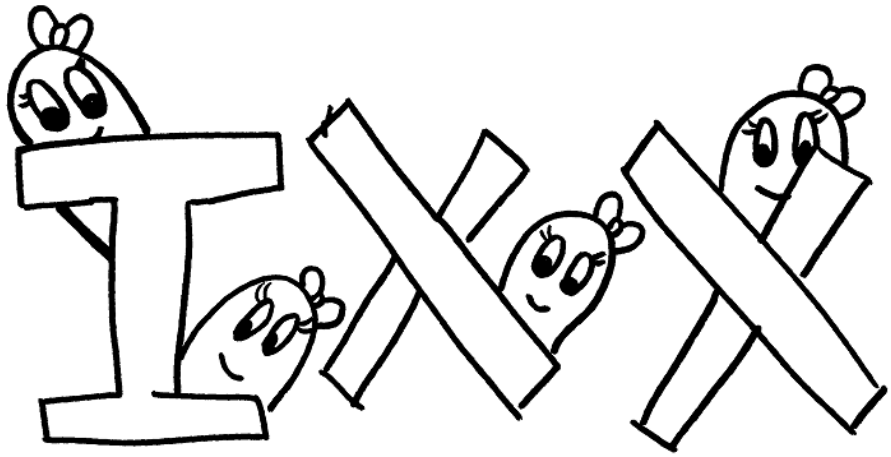
3.59 IXX. - Choose one of two cases

3.59.1 ! Smarty's IXX-Commands

Smarty's IXX-Commands

"Two sided decision". In other languages its called IF .. THEN ... ELSE ... ENDIF.
Here we have only 3 Letters so we use Ixx ... ELS. ... . Exx.

There are many more Ixx.-Commands not in this help-Chapter but in the other chapters.



Sometimes in life we have to make a decision. We must decide what we do next.
Decisions are most important because its in the moments of decision, that our life will be shaped.

The decisions we are talking about right now, are "**two-way-decisions**".

Do we choose A - or do we choose B?

Of course Smarty can also make decisions. And she likes to make decisions!
Her decisions are mostly based on what you can see on the screen.
But she can also decide based on texts, numerical values or system parameters.

Just take a look in the list of `IXX`.-commands.

There is one general thing to know. All `IXX`. Commands have a negative for that is called `NXX`.

You can learn more about decisions here:

1.6.1. Program Flow Control 121

Most of the `IXX`. are themed and therefore in the themed chapters.

*© 2023 Theo Gottwald * https://www.smart-package.com*

For example these IXX.-commands are outside the IXX-Chapter, but there are lots more.

- IEF. / NEF. - If - exist - File 1050
- ISC. - If Servic Command 2552
- ISI. / NSI. - If Service Installed 2557
- IIK. - If InterCOM Condition 2125
- IPC. / NPC. - If-Pixel-Colour 1816
- ILC. / NLC. - If Line Color 1805
- IRC. / NRC. - If Rect Color 1828
- IRA. / NRA. - If Rect altered 1824
- IAI. / NAI. - If-Application-Installed 2601
- IDC. / NDC. - If Date Condition 709
- IIK. - If InterCOM Condition 2125
- IRS. / NRS. - If Result available 434
- and much more ...

© 2023 Theo Gottwald * https://www.smart-package.com

3.59.2 EIF. - END IF

MiniRobotLanguage (MRL)

EIF. Command

End of an IF Block

Intention

Used in Conditional statements to close the statement-block.
Generally all `IXX.` commands support `ELS.` and `EIF.`

There is an more detailed explanation here: 1.6.1. Program Flow Control 121.

Syntax

EIF.

Parameter Explanation

-

Speed in Ticks:

This command uses typically around 3 to 9 Ticks.

Example

```
IEF.c:\MyFile.txt
     MBX. the file exists!
EIF.
```

Remarks

-

Limitations:

-

See also:

*© 2023 Theo Gottwald * https://www.smart-package.com*

- 1.6.1. Program Flow Control 121
- ELS. - ELSE 2150

© 2023 Theo Gottwald * https://www.smart-package.com

3.59.3 ELS. - ELSE

MiniRobotLanguage (MRL)

ELS. Command

Else in IF Block

Intention

Used in Conditional statements to separate the blocks, being executed if the condition is met from the statement-block that is being executed when the condition is not met.

```
IEF.c:\MyFile.txt
   MBX. the file exists!
ELS.
   MBX. the file does not exist!
EIF.
```

There is an more detailed explanation here: 1.6.1. Program Flow Control 121.

Syntax

ELS.

Parameter Explanation

Speed in Ticks:

This command uses typically around 5 Ticks.

Example

```
See examples in the IFX Commands
```

Remarks

-

Limitations:

 *© 2023 Theo Gottwald * https://www.smart-package.com*

-

- 1.6.1. Program Flow Control 121
- EIF. - END IF 2148

© 2023 Theo Gottwald * https://www.smart-package.com

3.59.4 IFD. / NFD. - If File Date

MiniRobotLanguage (MRL)

IFD. Conditional Statement

If File Date

Intention

Check if a filedate is older then ... or newer then whatever you specify.
Used to compare version information from files.

In ***P4*** - Options, you specify which filedate to compare

```
a - last-access
c - creation date
w - last write (default)
```

Is the installed DLL or file older or newer?
This command will help you to solve this problem.

As parameters you can use the real filenames (with path) or the version-string.

```
' Syntax 1 does need | (separator-pipe)
IFD.?path\PR01.Exe|>=|?path\u9.exe|w
  PRT. File 1 is newer or same date
ELS.
  PRT. File 2 is newer
EIF.

' Syntax 2 does not need | (separator-pipe)
' but must therefore use Variables
IFD.$$FIA>$$FIB|c
  PRT. File 1 is newer
ELS.
  PRT. File 2 is newer
EIF.
```

You can also use the negative form of this statement: `NFD.` (If Not File Date)

Syntax

IFD.P1|P2|P3|P4]

Parameter Explanation

P1 - Filename 1 or version 1

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 - compare-operation:
> < = ! => <=
P3 - Filename 2 or version 2

P4 - Options
a - last-access
c - creation date
w - last write (default, if omitted)

Example

```
''*******************************************
' IFD. - Sample
'*******************************************
'DBM.2
' Use Path to a existiing files
VAR.§§FIA=?exepath\MR01.Exe
VAR.§§FIB=?exepath\MRE.exe
PRT.=========================================
GFD.§§FIA
PRT.Date File 1: $$000
GFD.§§FIB|§§RES
PRT.Date File 2: §§RES

' Syntax 1 must use Variables
IFD.§§FIA>§§FIB|c
 PRT. File 1 is newer
ELS.
 PRT. File 2 is newer
EIF.

' Syntax 2 can use Text-Filenames
IFD.?path\PR01.Exe|>=|?path\u9.exe|w
 PRT. File 1 is newer or same date
ELS.
 PRT. File 2 is newer
EIF.

' We can compare files or File-Version
' Supported Operators:
' >,<,=,=>,<=,!
' In this case we compare date-strings
' these must have the format which is returned from
' GFD!
GFD.§§FIA|§§REA
GFD.§§FIB|§§REB
PRT. File 1: §§REA
PRT. File 2: §§REB
IFD.§§REA>§§REB|c
 PRT. Is the case
ELS.
 PRT. Is not the case
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EIF.

PRT.=========================================
DMP.4
MBX.Ready
END.
```

Remarks

If you need to get the filedate, use `GFD.`

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.59.5 IFL. / NFL. - If File Language

MiniRobotLanguage (MRL)

IFL. / NFL. Conditional Statement

If File Language

Intention

Conditional Statement. Test if a specified **file** has the specified file-language property.

You can specify the right side of the equation in one of three formats:

```
t - Text-Result
c - Codepage
k - Keyboard code

' IFL.-Example
'
' First we define the file that is been analyzed.
'
$$FIL=?exepath\catseye.dll

' Now we use GFL. to display the file-language
' Information, in the Debug-Window of the Editor.
GFL.$$FIL|$$RES|c
DBP.$$RES

GFL.$$FIL|$$RES|t
DBP.$$RES

' In this case we use two variables
$$LAN=04E4
IFL.$$FIL=$$LAN
  DBP.Language is German
EIF.

' In this case we use a variable LEFT and a
' Numeric argument on the RIGHT
' We use the default option that is "|c"
' if no option is specified
IFL.$$FIL=0409
  DBP.Language is English I
EIF.

' This is just the same, but the |c is specified.
IFL.$$FIL=0409|c
  DBP.Language is German II
EIF.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Here we use a textual compare,
' You can use 3.2 Standard-Search Pattern
IFL.$$FIL=engli|t
  DBP.Language is English III
EIF.

GFL.$$FIL|$$RES|k
DBP.$$RES
END.
```

You can use NFL.(Not File Language) as the negative Form of the command.

Syntax

IFL.P1opP2[|P3] … ELS. … EIF.

Parameter Explanation

P1 - Variable contains a valid path and filename.
Must be a Variable, you can NOT specify
a filename inline as **P1**.

P2 - Variable or file-language description,
can be a variable or a description, depending on the selected
P3.

op - ***Operator***, can be: **=** ***(equal) or*** **!** **<>** **><** ***(not equal)***

P3 - can be one of these letters:

```
t - Text-Result
c - Codepage
k - Keyboard code
```

if omitted. "c" is the default option.

Example

```
'*******************************************
' IFL.-Example
'*******************************************
' First we define the file thar is been analyzed.
'
$$FIL=?exepath\catseye.dll

' Now we use GFL. to display the file-language
' Information, in the Debug-Window of the Editor.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
GFL.$$FIL|$$RES|c
DBP.$$RES

GFL.$$FIL|$$RES|t
DBP.$$RES

' In this case we use two variables
$$LAN=04E4
IFL.$$FIL=$$LAN
  DBP.Language is German
EIF.

' In this case we use a variable LEFT and a
' Numeric argument on the RIGHT
' We use the default option that is "|c"
' if no option is specified
IFL.$$FIL=0409
  DBP.Language is English I
EIF.

' This is just the same, but the |c is specified.
IFL.$$FIL=0409|c
  DBP.Language is German II
EIF.

' Here we use a textual compare,
' You can use 3.2 Standard-Search Pattern
IFL.$$FIL=engli|t
  DBP.Language is English III
EIF.

GFL.$$FIL|$$RES|k
DBP.$$RES
END.
```

Remarks

`IFL.` and other IXX. can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or `FEX.` (Enumerations) to unlimited Depth.

Here are the numeric values for the country code:

```
0000 = Language Neutral
0400 = Process Default Language
0436 = Afrikaans
041C = Albanian
0401 = Arabic (Saudi Arabia)
0801 = Arabic (Iraq)
0C01 = Arabic (Egypt)
1001 = Arabic (Libya)
1401 = Arabic (Algeria)
1801 = Arabic (Morocco)
1C01 = Arabic (Tunisia)
2001 = Arabic (Oman)
2401 = Arabic (Yemen)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
2801 = Arabic (Syria)
2C01 = Arabic (Jordan)
3001 = Arabic (Lebanon)
3401 = Arabic (Kuwait)
3801 = Arabic (U.A.E.)
3C01 = Arabic (Bahrain)
4001 = Arabic (Qatar)
042B = Armenian. Unicode only (Windows 2000 and later).
044D = Assamese. Unicode only (Windows 2000 and later).
042C = Azeri (Latin)
082C = Azeri (Cyrillic)
042D = Basque
0423 = Belarussian
0445 = Bengali. Unicode only (Windows 2000 and later).
0402 = Bulgarian
0455 = Burmese
0403 = Catalan
0404 = Chinese (Taiwan Region)
0804 = Chinese (PRC)
0C04 = Chinese (Hong Kong SAR, PRC)
1004 = Chinese (Singapore)
1404 = Chinese (Macau)
041A = Croatian
0405 = Czech
0406 = Danish
0413 = Dutch (Netherlands)
0813 = Dutch (Belgium)
0409 = English (United States)
0809 = English (United Kingdom)
0C09 = English (Australian)
1009 = English (Canadian)
1409 = English (New Zealand)
1809 = English (Ireland)
1C09 = English (South Africa)
2009 = English (Jamaica)
2409 = English (Caribbean)
2809 = English (Belize)
2C09 = English (Trinidad)
3009 = English (Zimbabwe)

3.59.6 IFV. / NFV. If File Version

MiniRobotLanguage (MRL)

IFV. Conditional Statement

If File Version

Intention

Used to compare **version information** from files.
As parameters you can use the filenames (with path) or the version-string.

The negative Form of this statement is `NFV.`.

Syntax

IFV.P1|P2|P3

Parameter Explanation

P1 - Filename 1 or version 1
P2 - compare-operation:
> < = ! => <=
P3 - Filename 2 or version 2

Example

```
'*********************************************
' IFV. - Sample
'*********************************************
'DBM.2
' Use Path to a existiing files
VAR.$$FIA=?exepath\MR01.Exe
VAR.$$FIB=?exepath\MRE.exe
PRT.=======================================
GFV.$$FIA
PRT.Version File 1: $$000
GFV.$$FIB|$$RES
PRT.Version File 2: $$RES

' Syntax 1 must use Variables
IFV.$$FIA>$$FIB
 PRT. File 1 is newer
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
ELS.
 PRT. File 2 is newer
EIF.

' Syntax 2 can use Text-Filenames
IFV.?path\PR01.Exe|>=|?path\u9.exe
 PRT. File 1 is newer
ELS.
 PRT. File 2 is newer
EIF.

' We can compare files or File-Version
' Supported Operators:
' >,<,=,=>,<=,!
IFV.2.1.0.9|>|2.1.1.0
 PRT. Is the case
ELS.
 PRT. Is not the case
EIF.

PRT.=========================================
DMP.4
END.
```

Remarks

3.59.7 ILI. / NLI. - If LanguageID

MiniRobotLanguage (MRL)

ILI. Conditional Statement

If User or system LanguageID

Intention

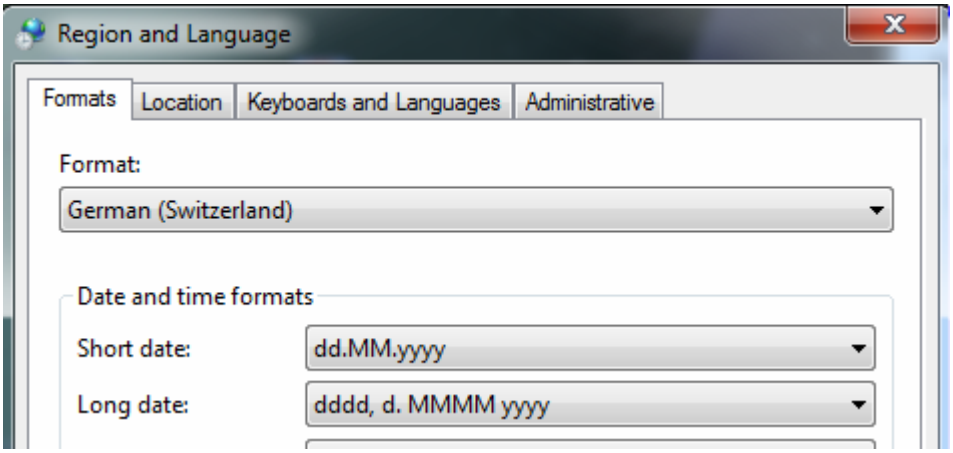
This command can be used to verify the language settings of the current user or system. Usage is simple:

```
' Try if we are running on a windows with german settings:
ILI.u|german
  DBP.We're on a german system
EIF.

' Try if we are running on a german windows:
ILI.s|german
  DBP.We're on a german system
EIF.
```

What is the difference between "u" and "s" ?

If you take a german windows and you set the Regional Format to Switzerland like this:



then you will get the following results:

```
' It uses german unicode settings
GLI.s
DBP.$$000
' result is 1031
ILI.s|1031
  DBP.True
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EIF.

' This shows you that its set to swiss
GLI.u
DBP.$$000
' result is 2055
ILI.s|2055
  DBP.True
EIF.
```

You can use any combination of Language-ID's and languages descriptors:

```
ILI.u|german,english,1055
  DBP.Is valid
EIF.

ILI.u|1031,1055,1045
  DBP.Is valid
EIF.

NLI.s|fra,dan
  DBP.Is valid
ELS.
  DBP.wrong language!
EIF.
```

Important:
To get the Language ID a a number, use the `GLI.` - command.

Syntax

ILI.[P1][|P2]

Parameter Explanation

P1 - (optioal) defines the method which is used to get the Language ID.

U - Returns the language identifier for the current user locale.That is the Format settings (for date, time, currency, etc.) of current user in Regional and Language Options in Control Panel.
This is the default option is no letter is specified.

S - Returns the Language Identifier for the system locale. In fact you get the is the "Language for Non-Unicode programs" of current user.

C - an alternative system is used to get the Language ID for user. This supports more international properties providing a more culturally appropriate user experience.

© 2023 Theo Gottwald * https://www.smart-package.com

d - an alternative system is used to get the Language ID for the system (d),
This supports more international properties providing a more culturally appropriate
user experience.

P2 - (optioal) **Language-descriptor** or Language ID('s).

P2 can be any of these:

"core"
the english-speaking "core" countries:
USA, UK, Ireland, Australia, Canada, New Zealand
with the following Language-ID's: 1033,2057,3081,4105,5129,6153

"eng","englisch","english"
multiple english speaking countries, including these:
USA, UK, Ireland, Australia, Canada, New Zealand, South Africa, Jamaica, Caribbean, Belize, Trinidad, Zimbabwe, Philippines.

"ger","german","deutsch","deu"
all european german speaking countries:
Germany, Switzerland, Austria, Luxembourg, Liechtenstein
Using these Language ID's: 1031,2055,3079,4103,5127"

"spa","span","spanish","spanisch"
includes the 20 most important spanish speaking countries, worldwide.
Using these Language-IS's:
20490,19466,18442,17418,16394,15370,14346,13322,12298,11274,
10250,9226.8202,7178,6154,5130,4106,3082,2058,1034

"fra","french","franz","französisch"
Includes France, Belgium, Canada, Switzerland, Luxembourg, Monaco. Using these Language-ID's:
1036,2060,3084,4108,5132,6156"

"danish","dan","denmark"
Denmark - 1030

"sweden","swedish","schweden","schwedisch"
Sweden, Finland - 1053,2077

"ita","italy","italienisch","italian"

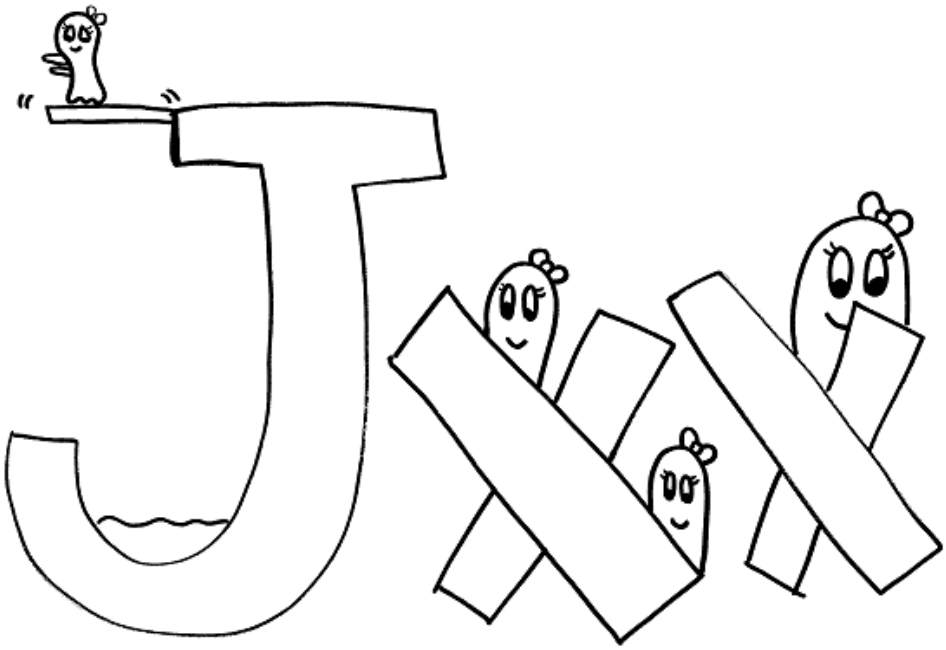
3.60 JXX. - Jump - Instructions

3.60.1 ! Smarty's JXX-Commands

Smarty's JXX-Commands



JXX. are Jump commands.They can be:

- Conditional Jump-Commands
- Unconditional Jump-Commands

While the unconditional Jump-Commands will always jump to the given Label/Target, the conditional Jumps will only jump, if the condition is met. Else they will not jump.

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.60.2 ENR. - End Return

MiniRobotLanguage (MRL)

ENR. Command

Ends a script and Return to a calling script if there was one.

Intention

Mix between `END.` and `RTS.` Will execute an `RTS.` if possible, if not en `END.` will be executed.

End script execution and return to a calling script. Or if **P1** > 1 then return to the calling-script of the calling script of the ... (and so on).

Imagine you experience an error in a deeply nested subscript. Therefore you want to jump to a global error-handler in the Main script. Then you use the `ENR.(num)` option, to immediately jump up to the highest level.

Syntax

ENR.[P1]

Parameter Explanation

P1 - (optional) NUM , default 1. Count how many levels the "Return" should jump up.

Example

```
' Simply ends a Script or returns to a calling script.
ENR.

' Ends a Script and jumps TWO JNF.-Levels up.
ENR.2
```

Remarks

To end a script and set a Return-code, use `END.`
To set a Return code without ending the script, use `SEC.` (Set Exit Code).

If you try to Jump up to many JNF-Levels 2191 then the script will just end without an Error-Message. This is wanted behavior.

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Limitations:

-

See also:

- RTS. - ReTurn from Subroutine 2233
- 1.B Error handling 224
- END. - End Script 2362
- SEC. - Set Exit Code 2129

- JNJ. - JumpNewFile-Jump to Label 2194

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.3 JIS. - Jump If String

MiniRobotLanguage (MRL)

JIS. Conditional Jump

Jump If String

Intention

This command can be used to test a string-variable against another string. Or it can be used to check if a string is empty or not. The easiest usage is like this:

```
JIS.$$TXT|Label
```

In this Mode, `JIS.` will jump to the Label, if the given string will evaluate to anything else the nothing (String-Len>0).

In Mode 2, you can compare string lexically. It looks like this:

```
' Test if the two Strings are equal
JIS.$$TXA=$$TXB|Label

' Test if the two Strings are unequal
JIS.$$TXA!$$TXB|Label

' Test if String P1 is lexically before String P3
JIS.$$TXA>$$TXB|Label

' Test if String P3 is lexically before String P1
JIS.$$TXA<$$TXB|Label
```

In this Mode **P1** and **P3** must be variables. These variables will only be resolved once. Specialfolders and Systemvariables will not be evaluated. This way the command is able to work also on binary data.

P2 must be any of the following 4 Operators.

>,<,=,!

When using the > or the < Operator, internally the strings are compared lexically.

For example, when using **>** , If the string in **P1** comes lexically before the string in **P3** then the evaluation will be true and the jump is been made.

Using **<** , If the string in **P3** comes lexically before the string in **P1** then the evaluation will be true and the jump is been made.

`JIS.` can be used as a conditional `JSR.` (Gosub like) if using ":" as a prefix to the Label). In normal Mode `JIS.` will always just make a `JMP.` (Goto like).

*© 2023 Theo Gottwald * https://www.smart-package.com*

JNS. generally evaluates to the opposite of JIS.

Hint: If you think that the evaluation is not correct, use

```
PRT.$$VAR|h
MBX.!
```

to check for invisible characters and Spaces. You will get a ASC-Dump like this, which shows all characters inside the variable with their Hex-ASC-Code.:

```
----------------------------------------
Len=7
(1)      48  61  6C  6C  6F  D  A
----------------------------------------
```

Syntax

```
JIS.P1|Label
JIS.P1|:Label

JIS.P1P2P3|Label
JIS.P1P2P3|:Label

JIS.P1|P2|P3|Label
JIS.P1|P2|P3|:Label
```

Parameter Explanation

P1 **-** variable, formula* in (..) or numeric value

P2 - condition sign: **>,<,=,!**
Use only one condition sign.

P3 - variable, formula* in (..) or numeric value

P4 – Label or variable that evaluates to a Label. If it contains the ":" a JSR./GSB. is done instead of a JMP.

Example

```
'************************************
' Simple JIS - Example
'************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
: $$TXT=
' test if String is empty or not
JIS.$$TXT|Label
END.

:Label
MBX.String is not empty
ENR.

'************************************
' Check if a variable is "empty"
'************************************
: $$TXA=
JIS.$$TXA=|Label
END.

:Label
MBX.!
ENR.
```

Remarks

The available condition signs are: **>,<,=,!**

Use only one of these condition signs.
You can not combine condition signs like ">=" or "<>" etc.

Limitations:

-

See also:

- JNS. - Jump If No String 2200

- JME. - Jump on More or Equal 2186
- JLE. - Jump on Less or Equal 2183
- JMP. - Jump to Label 2189
- JSR. - Jump SubRoutine (Label) 2218

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.4 JIT. - Jump if TimeOut

MiniRobotLanguage (MRL)

JIT. Conditional Jump

Jump If Timeout-Flag is set

Intention

This command can be used to test the TimeOut-Flag and Jump to a label if the TimeOut is set. Usage is simple:

```
STW.Xwt|0|nowi
JIT.ero
MBX.We are here
ENR.
'--------------
:ero
DBP. AN Error has happened!
END.
```

You can use a variable that contains a label (dynamic jumping). Here is an example:

```
'************************************
' JIT - Example with dynamic jumping
'************************************
IVV.$$INP=1
  $$LAB=ero
ELSE.
  $$LAB=okp
EIF.
STW.Xwt|0|nowi
JIT.$$LAB
END.
:okp
MBX.We are here
ENR.
'--------------
:ero
DBP. AN Error has happened!
END.
```

The command can be switched from default mode (**Jump Mode**) into "**Gosub Mode**" if you prefix the Label-Parameter **P3** with a **colon**. Here is an example:

```
STW.Xwt|0|nowi
JIT.:ero
MBX.We are here
ENR.
'--------------
:ero
DBP. AN Error has happened!
RET.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

JIT.P1
JIT.:P1

Parameter Explanation

P1 - Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like)
Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like)
Jump..

Example

```
'************************************
' JIT - Example
'************************************
STW.Xwt|0|nowi
JIT.ero
MBX.We are here
ENR.
'--------------
:ero
DBP. AN Error has happened!
END.

'************************************
' Advanced JIT - Example (using :Label)
' this one makes a GSB. like-Jump.
'************************************
STW.Xwt|0|nowi
JIT.:ero
MBX.We are here
ENR.
'--------------
:ero
DBP. AN Error has happened!
RET.

'************************************
' JIT - Example with dynamic jumping
'************************************
IVV.$$INP=1
  $$LAB=ero
ELSE.
  $$LAB=okp
EIF.
STW.Xwt|0|nowi
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
JIT.$$LAB
END.
:okp
MBX.We are here
ENR.
'--------------
:ero
DBP. AN Error has happened!
END.
```

Remarks

There are two Systemvariables 334, representing the state of the timeout-flag:

```
#tio#    -        Timeout-Flag
#til#    -        Timeout-Line-Number
```

Limitations:

-

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.5 JIV. - Jump-If-Variable

MiniRobotLanguage (MRL)

JIV. Conditional Jump

Jump If Variable

Intention

This command can be used to test a Variable for **>,<,=,!** against another variable or value or formula.

```
JIV.§§TAA<§§TAB|try
```

```
JIV.(§§TAA+5)<(§§TAB+3)|try
```

`JIV.` can be used as a conditional `JSR.` (Gosub like) if using ":" as a prefix to the Label). In normal Mode `JIV.` will always just make a `JMP.` (Goto like).

Syntax

```
JIV.P1P2P3|P4
JIV.P1P2P3|:P4
```

Parameter Explanation

P1 **-** variable, formula* in (..) or numeric value

P2 - condition sign: **>,<,=,!**
Use only one condition sign.

P3 - variable, formula* in (..) or numeric value

P4 – Label or variable that evaluates to a Label. If it contains the ":" a `JSR./GSB.` is done instead of a `JMP.`

```
*In case of JIV. the formula must never contain any of the
possible Sign-Operator (P2) or else the command may not be
properly interpreted.
```

Speed in Ticks:

This command uses typically around 250 Ticks.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'************************************
' Simple JIV - Example
'************************************
VAR.§§TAA=10
VAR.§§TAB=20
: §§LAB=try
:try
PRT.§§TAA
VIC.§§TAA
JIV.§§TAA<§§TAB|try
PRT.Hier
DMP.
MBX.!
END.

'************************************
' Advanced JIV - Example (using Formulas)
' as always, formulas must be in ().
'************************************
VAR.§§TAA=10
VAR.§§TAB=20
: §§LAB=try
:try
PRT.§§TAA
VIC.§§TAA
JIV.(§§TAA+5)<(§§TAB+3)|try
PRT.Hier
DMP.
MBX.!
END.
```

Remarks

The available condition signs are: **>,<,=,!**

Use only one of these condition signs.
You can not combine condition signs like ">=" or "<>" etc.

- Instead of **>=4** use **>3** instead.
- Instead of **<>** use **!**
- Instead of **<=5** use **<6**

The result is always the same.

Limitations:

JIV. does not have the Auto-Increment/ Auto-Decrement like for example JIZ.
If you need these, use JME. or JLE. instead.

© 2023 Theo Gottwald * https://www.smart-package.com

See also:

- JIZ. - Jump-If-Zero 2180
- JIN. - Jump if Not zero 2206
- JOR. - Jump On Repeat-Count 2209
- JME. - Jump on More or Equal 2186
- JLE. - Jump on Less or Equal 2183
- JMP. - Jump to Label 2189
- JSR. - Jump SubRoutine (Label) 2218

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.6 JIZ. - Jump-If-Zero

MiniRobotLanguage (MRL)

JIZ. Conditional Jump

Jump If Zero

Intention

This command can be used to test a Variable against zero and Jump to a label if the variable is zero. Here is a short example:

```
VAR.§§TST=0
:try
' just jump without other features
JIZ.§§TST|over
PRT.Hier
:over
DMP.
MBX.!
END.
```

Additionally the Command allows a "post-decrement" or alternatively a "post-increment" for easy Loop-Constructions. "Post-increment" will increment the given variable after the test inside the variable was done. Here is an example with "Post-increment":

```
' We'll count from -20 to 0
VAR.§§TST=-20
:try
JIZ.§§TST>over
PRT.Hier
JMP.try
:over
DMP.
MBX.!
END.
```

The command can be switched from default mode (**Jump Mode**) into "**Gosub Mode**" if you prefix the Label-Parameter **P3** with a **colon**. Here is an code-example:

```
' will jump to the Label "over" in Gosub-Mode
JIZ.$$NUM|:over

' we can use Labels that are in variables, too
: $$LAB=:over
JIZ.$$NUM|$$LAB
```

`JIZ.` is somehow the counterpart to JNZ. - Jump-if-not-zero 2206 .

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

JIZ.P1P2P3

Parameter Explanation

P1 - Must be a Variable, like $$AAA or §§BBB or $$001

P2 - ***can be an***
```
> increment-operator
< decrement operator or
| (Pipe Symbol) if no change of the value should happen
```

P3 - Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) (GOSUB like)
Jump is done instead of the normal JMP. - Jump to Label (GOTO like)
Jump..

Example

```
'************************************
' JIZ - Example
'************************************
VAR.§§TST=0
:try
JIZ.§§TST|over
PRT.Hier
:over
DMP.
MBX.!
END.

'************************************
' Advanced JIZ - Example (using :Label)
' this one makes a JSR.-Jump.
' Also we packed the Label into a Variable
'************************************
VAR.§§TST=0
: §§LAB=:over
:try
JIZ.§§TST|§§LAB
PRT.Here ...
DMP.
MBX.!
END.

:over
PRT.Was here first.
RET.
'************************************
' JIZ - Example with Post-Increment
'************************************
VAR.§§TST=-20
:try
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
JIZ.§§TST>over
PRT.Hier
JMP.try
:over
DMP.
MBX.!
END.

'************************************
' JIZ - Example with Post-Decrement
'************************************
VAR.§§TST=20
:try
JIZ.§§TST<over
PRT.Hier
JMP.try
:over
DMP.
MBX.!
END.
```

Remarks

-

Limitations:

-

See also:

- JIV. - Jump-If-Variable 2177

- JME. - Jump on More or Equal 2186
- JLE. - Jump on Less or Equal 2183
- JMP. - Jump to Label 2189
- JSR. - Jump SubRoutine (Label) 2218

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.7 JLE. - Jump on Less or Equal

MiniRobotLanguage (MRL)

JLE. Conditional Jump

Jump on Less or Equal

Intention

This command can be used to test a Variable for being "**less or eqal**" against another variable, formula or value.

Additionally the Command allows a "post-decrement" or alternatively a "post-increment" for easy Loop-Constructions. "Post-increment" will increment the given variable after the test inside the variable was done. This can be used to construct simple Loops.
Here is an example with "Post-increment":

```
' Start-value
: §§NUM=1
: §§TAR=5
: §§LAB=lop
:lop
PRT.§§NUM
' 5 is the Loop-End
JLE.§§NUM>§§TAR|§§LAB
DMP.
MBX.!
END.
```

If you switch variables P1 and P2 you can test for "bigger then".

The command can be switched from default mode (**Jump Mode**) into "**Gosub Mode**" if you prefix the Label-Parameter **P3** with a **colon**. Here is an example:

`JLE.` is the counterpart to JME. - Jump on More or Equal 2186.

Syntax

JLE.P1P2P3|P4

Parameter Explanation

P1 **-** must be variable

 *© 2023 Theo Gottwald * https://www.smart-package.com*

P2 - can be an

```
> increment-operator
< decrement operator or
| (Pipe Symbol) if no change of the value should happen
```

P3 - variable or formula* in (..) or numeric value

P4 - Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like)
Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like)
Jump..

*In case of JLE. the formula must never contain any of the possible Sign-Operator (P2) or else the command may not be properly interpreted.

Example

```
'************************************
' Simple JLE - Example
'************************************
' Start-value
VAR.§§NUM=1
:lop
PRT.§§NUM
' 5 is the Loop-End
' > makes an post-increment to §§NUM
JLE.§§NUM>5|lop
DMP.
MBX.!
END.

'************************************
' Another JLE - Loop-Example
' using variables
'************************************
' Start-value
: §§NUM=1
: §§TAR=5
: §§LAB=lop
:lop
PRT.§§NUM
' 5 is the Loop-End
JLE.§§NUM>§§TAR|§§LAB
DMP.
MBX.!
END.

'************************************
' Another JLE - Loop-Example
' using variables and a formula
'************************************
' Start-value
: §§NUM=1
: §§TAR=5
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
: §§LAB=lop
:lop
PRT.§§NUM
' 5 is the Loop-End
JLE.§§NUM>(§§TAR+1)|§§LAB
DMP.
MBX.!
END.
```

Remarks

-

Limitations:

-

- JME. - Jump on More or Equal 2186
- JLE. - Jump on Less or Equal 2183
- JMP. - Jump to Label 2189
- JSR. - Jump SubRoutine (Label) 2218

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.8 JME. - Jump on More or Equal

MiniRobotLanguage (MRL)

JME. Conditional Jump

Jump on More or Equal

Intention

This command can be used to test a Variable for being "more or eqal" against another variable or value. Here is a simple example that also uses the "post-decrement" option to easily construct a loop.

```
' Start-value
VAR.$$NUM=10
'-------------------------
:lop
DBP.$$NUM
' We're using the post-decrement operator as P2
JME.$$NUM<1|lop
'-------------------------
END.
```

If you switch variables P1 and P2 you can test for "smaller then".

The command can be switched from default mode (**Jump Mode**) into "**Gosub Mode**" if you prefix the Label-Parameter **P3** with a **colon**. Here is an example:

`JME.` is somehow the counterpart to JLE. - Jump on Less or Equal 2183 .

Syntax

JME.P1P2P3|P4

Parameter Explanation

P1 **-** must be variable

P2 **-** ***can be an***

```
> increment-operator
< decrement operator or
| (Pipe Symbol) if no change of the value should happen
```

P3 **-** variable or formula* in (..) or numeric value

P4 – Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like)

*© 2023 Theo Gottwald * https://www.smart-package.com*

Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like) Jump..

*In case of JME. the formula must never contain any of the possible Sign-Operator (P2) or else the command may not be properly interpreted.

Example

```
'************************************
' Simple JME - Example
' 1 is the Loop-End
' the < makes a post-decrement
'************************************
' Start-value
VAR.§§NUM=10
'-------------------------
:lop
PRT.§§NUM
JME.§§NUM<1|lop
'-------------------------
END.
```

```
'************************************
' Another JME - Loop-Example
' using variables
'************************************
' Start-value
: §§NUM=10
: §§TAR=5
: §§LAB=lop
:lop
PRT.§§NUM
' 5 is the Loop-End
VDC.§§NUM|2
JME.§§NUM|§§TAR|§§LAB
MBX.!
END.
```

Remarks

-

Limitations:

-

3.60.9 JMP./GTO. - Jump to Label

JMP. - Jump to Label Previous 2186 Top 41 Next 2191

MiniRobotLanguage (MRL)

JMP./GTO. Unconditional Jump

JuMP to label

Intention

Continues Script Execution at the given Label (**GOTO**). You can type `GTO.` instead of `JMP.` both commands are technically equal.

You can jump to variables, if they contain valid labels at runtime.

Syntax

JMP.P1[|P2]

Parameter Explanation

P1 **-** `TXT (Label)`

P2 **-** `if Option "r" is given, a previous RET.`
`- will be removed from the JSR./GSB./RET. Stack.`

`JMP. may use variables, which must evaluate to a valid Label.`

Speed in Ticks:

This command uses typically between 10 to 20 Ticks.

Example

```
'*********************************************
' Example 1 - without Parameters,
' with local and global variables
'*********************************************
' This Example shows how to use JMP.
' Please run in Single-Step Mode/Editor.

: $$AAA=0
:A0
VIC.$$AAA
GTO.A$$AAA

:A1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
DBP.LAB=A1
JMP.A0

:A2
DBP.LAB=A2
JMP.A0

:A3
MBX.Ready
```

Remarks

`JMP`. can use variables in the Parameter field.
You can type `GTO`. instead of `JMP`. both commands are technically equal.

Limitations:

There is no Limitation in the number of Labels you can Jump to. However, having thousands of Labels in your Script may slow down Script execution a bit.

- JOR. - Jump On Repeat-Count 2209
- JME. - Jump on More or Equal 2186
- JLE. - Jump on Less or Equal 2183
- JMP. - Jump to Label 2189
- JSR. - Jump SubRoutine (Label) 2218

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.10 JNF. - Jump New File

MiniRobotLanguage (MRL)

JNF. Unconditional Script-Call

Jump New File

Intention

Continues Script Execution in another File (Sub-Script).

Can use Parameters. You give the parameter separated with a | (Pipe) Symbol after the `JNF.`-call. Like this:

```
JNF.MySubscript.mrt|Param01|Param02
END.
```

In the Target script that is called, the parameters appear in:

`$$_00` -> number of given parameters (here 2)
`$$_01` -> first Parameter (here "Param01")
`$$_02` -> second Parameter (here "Param02")

You can use up to 25 Parameters in case you need them.
If you specify just Variables as Parameter, the Content is only copied,
and the Type of the Variable is preserved.

```
 ' Example
VAN.$$NUM=5.09
JNF.AddMe|$$NUM|$$NUX
ENR.

 ' File "AddME.mrt" in ?path\
VAO.$$PAA=$$_01
GVT.$$PAA|$$RES
MBX.We preserved the Variabletype: $$RES (=5, numeric)
ENR.
```

Can use script-local variables 366 that are local to each file.

`JNF.'s` can be nested to unlimited depth, even recursive.

Return to the calling Script with `RTS.`(ReTurn from Subroutine)-Command or `ENR.` (End-Return). This will restore the script-local variables of the calling script, including the parameter-variables.

If you need to leave a Sub-Program that was called with JNF. to a higher level then just the next, you can add a number behind the `RET.` Like this:

```
RET.2
```

© 2023 Theo Gottwald * https://www.smart-package.com

If you want to leave to the Top-Level in your script, just write:

```
RET.all
```

Syntax

JNF.P1[|P2..Px]

Parameter Explanation

P1 **-** Scriptfilename to call as subprogram
P2 - (optional) **-** up to 25 Parameters

Example

We need to have 2 Script Files for this simple Example.
Both need to be in the same folder.

The first Scriptfile, "First.txt" is the Main-Scriptfile.
It automatically defines ?path\ as its own path. That is, the folder where it is located.
It calls the second file "second.txt" which is also in "?path\" (in the same folder).

```
'*********************************************
' Example 1 - without Parameters,
' with local and global variables
'*********************************************
```

[First.txt]

```
: §§WHE=In First.txt
: $$GLO=1
PRT. $$WHE, Global=$$GLO
JNF.Second.txt
PRT. $$WHE, Global=$$GLO
END.
```

[Second.txt]

```
: §§WHE=In Second.txt
: $$GLO=2
PRT. $$WHE, Global=$$GLO
RTS.

'*********************************************
' Example 2 - with 2 Parameters
'*********************************************
```

[First.txt]

```
JNF.Second.txt|Hallo|$$GLO2
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
END.
```

[Second.txt]

```
PRT.§§_01 - §§_02
RTS.
```

Remarks

`§§_00` is the number of parameters given to the Script using `JNF.` or `JNJ.`
`§§_01 ... §§_25` are used for Parameters in the target Script file.

Limitations:

You can use up to 25 Parameters. If you need more, use Global variables or the Block-Commands (`SIB.` etc).

- JNJ. - JumpNewFile-Jump to Label 2194

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.11 JNJ. - JumpNewFile-Jump to Label

MiniRobotLanguage (MRL)

JNJ. Unconditional Script Call/Jump

Jump in New file and Jump to label

Intention

Continues Script Execution in another File optionally directly at a specified Label.

The second Parameter - if given - must be a Label, which is the Start-point in the other file.

Parameters P3 ..Px can be given as Parameter like in JNF. These parameters will be available in the other script file as §§_02 ...§§_25

Can use Parameters. You give the parameter separated with a | (Pipe) Symbol after the `JNJ`.-call. Like this:

```
JNJ.MySubscript.mrt|Startlabel|Param01|Param02
END.
```

In the Target script that is called, the parameters appear in:

```
Startlabel:
```

`§§_00` -> number of given parameters (here 2)
`§§_01` -> contains the Label (here "`Startlabel`")
`§§_02` -> first Parameter (here "Param01")
`§§_03` -> second Parameter (here "Param02")

You can use up to 24 Parameters in case you need them.

Can use script-local variables 366 that are local to each file.

`JNJ's and JNF.'s` can be nested to unlimited depth, even recursive.

Return to the calling Script with `RTS`.(ReTurn from Subroutine)-Command or `ENR`. (End-Return). This will restore the script-local variables of the calling script, including the parameter-variables.

Syntax

 *© 2023 Theo Gottwald * https://www.smart-package.com*

JNJ.P1[|P2][|P3..Px]

Parameter Explanation

P1 **–** Scriptfilename
P2 - (optional) Label to Start at
P3 ... ***Px*** - up to 24 Parameters

Please note, that even if the "Goto 1st Parameter" has been done, §§_01 still contains the Label.
Therefore the first "real" Parameter is in §§_02.

Example

We need to have 2 Script Files for this simple Example.
Both need to be in the same folder.

The first Scriptfile, "First.txt" that is run defines ?path, which is the folder where it is. it calls the second file "second.txt".

```
'***********************************************
' Example 1 - without Parameters,
' with local and global variables
'***********************************************

[First.txt]
JNJ.Second.txt|Laba
PRT. Resultat ist: $$GLO
END.

[Second.txt]
:Labb
: $$GLO=2
JMP.Labc
:Laba
: $$GLO=3
:Labc
RTS.

'***********************************************
' Example 2 - with 2 Parameters
'***********************************************

[Main.txt]

JNJ.Sub.txt|LabC|Parameter 1
END.

[Sub.txt]

: §§AAA=This Command wont get executed!
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
:LabC
: §§AAA=This Command will get executed!
' The following Variable will get the Parameter 1, as §§_01
contains the Label.
: §§AAB=§§_02
RTS\
```

Remarks

`§§_00` is the number of parameters given to the Script using `JNF.` or `JNJ.`
`§§_01 ... §§_24` are used for Parameters in the target Script file.

Limitations:

You can use up to 24 Parameters with JNJ. If you need more, use Global variables or the Block-Commands (`SIB.` etc).

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.12 JNR. - Jump if no Result

MiniRobotLanguage (MRL)

JNR. Conditional Jump

Jump If No Result

Intention

This command can be used to test, if an specified Background- or Parallel-Robot Operation has emitted an result or not. Usage is simple:

```
SMB.
PAU.10
JRS.|result
MBX.Error we got no Result
ENR.
:result
MBX.Result is available
ENR.
```

You can use a variable that contains a label (dynamic jumping).
Here is another example:

```
SMB.
$$TIN=$$000
PAU.4
JNR.$$TIN|noresult
MBX.Yes we got an Result
ENR.
:noresult
MBX.No Result was available
ENR.
```

The command can be switched from default mode (**Jump Mode**) into "**Gosub Mode**" if you prefix the Label-Parameter **P3** with a **colon**. Here is an example:

```
SMB.
:Retry
JNR.|:test
PAU.0.25
JNR.|Retry
ENR.
'--------------
:test
DBP. No Result yer!
PAU.0.1
RET.
```

`JRS.` is the positive version of `JNR.`

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

JNR.[P1]|P2

Parameter Explanation

P1 **-** ***(optional)*** Variable that evaluates to a valid Ticket-Number,
that is connected with a Background Operation or a Parallel Robot. If omitted
the last emitted Ticket-Number is used.

P2 **-** Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like)
Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like)
Jump..

Example

```
'************************************
' JNR - Example
'************************************
SMB.
:Retry
JNR.|:test
PAU.0.25
JNR.|Retry
ENR.
'--------------
:test
DBP. No Result yer!
PAU.0.1
RET.
```

Remarks

-

3.60.13 JNS. - Jump If No String

MiniRobotLanguage (MRL)

JNS. Conditional Jump

Jump If No String

Intention

This command can be used to test a string-variable against another string. Or it can be used to check if a string is empty or not. The easiest usage is like this:

```
JNS.$$TXT|Label
```

In this Mode, `JNS.` will jump to the Label, if the given string will evaluate to nothing (String-Len=0).

In Mode 2, you can compare strings lexically. It looks like this:

```
' Test if the two Strings are NOT equal
' If they are equal JNS. will NOT Jump
JNS.$$TXA=$$TXB|Label

' Test if the two Strings are unequal
' If they are unequal JNS. will NOT Jump
JNS.$$TXA!$$TXB|Label

' Test if String P1 is lexically after String P3
JNS.$$TXA>$$TXB|Label

' Test if String P3 is lexically after String P1
JNS.$$TXA<$$TXB|Label
```

In this Mode **P1** and **P3** must be variables. These variables will only be resolved once. Specialfolders and Systemvariables will not be evaluated. This way the command is able to work also on binary data.

P2 must be any of the following 4 Operators.

>,<,=,!

When using the > or the < Operator, internally the strings are compared lexically.

Using **>** , If the string in **P3** comes lexically before the string in **P1** then the evaluation will be true and the jump is been made.

Using **<** , If the string in **P1** comes lexically before the string in **P3** then the evaluation will be true and the jump is been made.

© 2023 Theo Gottwald * https://www.smart-package.com

JNS. can be used as a conditional JSR. (Gosub like) if using ":" as a prefix to the Label). In normal Mode JNS. will always just make a JMP. (Goto like).

JIS. generally evaluates to the opposite of JNS.

Hint: If you think that the evaluation is not correct, use

```
PRT.$$VAR|h
MBX.!
```

to check for invisible characters and Spaces. You will get a ASC-Dump like this, which shows all characters inside the variable with their Hex-ASC-Code.:

```
----------------------------------------
Len=7
(1)      48  61  6C  6C  6F  D  A
----------------------------------------
```

Syntax

JNS.P1|Label
JNS.P1|:Label

JNS.P1P2P3|Label
JNS.P1P2P3|:Label

JNS.P1|P2|P3|Label
JNS.P1|P2|P3|:Label

Parameter Explanation

P1 - variable, formula* in (..) or numeric value

P2 - condition sign: **>,<,=,!**
Use only one condition sign.

P3 - variable, formula* in (..) or numeric value

P4 – Label or variable that evaluates to a Label. If it contains the ":" a JSR./GSB. is done instead of a JMP.

Speed in Ticks:

This command uses typically around 137 Ticks.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'************************************
' Simple JNS. - Example
'************************************
: $$TXT=
' test if String is empty or not
JNS.$$TXT|Label
END.

:Label
MBX.String is empty
ENR.
```

Remarks

The available condition signs are: **>,<,=,!**

Use only one of these condition signs.
You can not combine condition signs like ">=" or "<>" etc.

Limitations:

-

See also:

3.60.14 JNT. - Jump If-No TimeOut

MiniRobotLanguage (MRL)

JNT. Conditional Jump

Jump If Timeout-Flag is Not set

Intention

This command can be used to test the TimeOut-Flag and Jump to a label if the TimeOut is **Not** set. Usage is simple:

```
STW.Xwt|0|nowi
JNT.allOk
MBX.We are with an error
ENR.
'--------------
:ero
DBP. Everything is Ok
END.
```

You can use a variable that contains a label (dynamic jumping). Here is an example:

```
'************************************
' JNT - Example with dynamic jumping
'************************************
IVV.$$INP=1
  $$LAB=ero
ELSE.
  $$LAB=okp
EIF.
STW.Xwt|0|nowi
JNT.$$LAB
END.
:okp
MBX.We are here
ENR.
'--------------
:ero
DBP. AN Error has happened!
END.
```

The command can be switched from default mode (**Jump Mode**) into "**Gosub Mode**" if you prefix the Label-Parameter **P3** with a **colon**. Here is an example:

```
STW.Xwt|0|nowi
JNT.:ero
MBX.We are here
ENR.
'--------------
:ero
DBP. Anything is Ok!
RET.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

JNT.P1

Parameter Explanation

P1 - Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like)
Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like)
Jump..

Example

```
'************************************
' JNT - Example
'************************************
STW.Xwt|0|nowi
JNT.allOk
MBX.We are with an error
ENR.
'--------------
:ero
DBP. Everything is Ok
END.

'************************************
' Advanced JNT - Example (using :Label)
' this one makes a GSB. like-Jump.
'************************************
STW.Xwt|0|nowi
JNT.:ero
MBX.We are here
ENR.
'--------------
:ero
DBP. Anything is Ok!
RET.

'************************************
' JNT - Example with dynamic jumping
'************************************
IVV.$$INP=1
  $$LAB=ero
ELSE.
  $$LAB=okp
EIF.
STW.Xwt|0|nowi
JNT.$$LAB
END.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
:okp
MBX.We are here
ENR.
'--------------
:ero
DBP. AN Error has happened!
END.
```

Remarks

There are two Systemvariables 334, representing the state of the timeout-flag:

```
#tio#    -        Timeout-Flag
#til#    -        Timeout-Line-Number
```

Limitations:

-

3.60.15 JNZ. - Jump-if-not-zero

MiniRobotLanguage (MRL)

JNZ. Conditional Jump

Jump is Not Zero

Intention

This command can be used to test a Variable for zero and Jump to a label if the variable is not zero. Here is a short example:

```
VAR.§§TST=-50
:try
VIC.§§TST
' just jump without other features
JNZ.§§TST|try
PRT.Hier
:over
DMP.
MBX.!
END.
```

Additionally the Command allows a "post-decrement" or alternatively a "post-increment" for easy Loop-Constructions. "Post-increment" will increment the given variable after the test inside the variable was done. Here is an example with "Post-increment":

```
VAR.§§TST=50
:try
DBP.Number is: §§TST
JNZ.§§TST<try
DBP.Hier
:over
DMP.
MBX.!
END.
```

The command can be switched from default mode (**Jump Mode**) into "**Gosub Mode**" if you prefix the Label-Parameter **P3** with a **colon**. Here is an example:

```
' will jump to the Label "over" in Gosub-Mode
JNZ.$$NUM|:over

' we can use Labels that are in variables, too
: $$LAB=:over
JNZ.$$NUM|$$LAB
```

`JNZ.` is somehow the counterpart to JIZ. - Jump-If-Zero 2180.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

JNZ.P1P2P3

Parameter Explanation

P1 - Must be a Variable, like $$AAA or §§BBB or $$001

P2 - increment/decrement operator or just a | .

P3 - Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like)
Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like)
Jump..

Example

```
'************************************
' JNZ - Example
'************************************
VAR.§§TST=-50
:try
VIC.§§TST
' just jump without other features
JNZ.§§TST|try
PRT.Hier
:over
DMP.
MBX.!
END.

'************************************
' Advanced JNZ - Example (using :Label)
' the second one makes a JSR.-Jump.
' Also we packed the Label into a Variable
'************************************
VAR.§§TST=10
: §§LAB=try
:try
DBP.The number is §§TST
JNZ.§§TST<§§LAB
JNZ.§§TST|:over
PRT.Hier
DMP.
MBX.!
END.

:over
DBP.Was here with §§TST
VDC.§§TST
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
RET.

'************************************
' JNZ - Example
' with Post-Increment
'************************************
VAR.§§TST=-50
:try
DBP.Number is: §§TST
' just jump without other features
JNZ.§§TST>try
DBP.Hier
:over
DMP.
MBX.!
END.

'************************************
' JNZ - Example
' with Post-Decrement
'************************************
VAR.§§TST=50
:try
DBP.Number is: §§TST
' just jump without other features
JNZ.§§TST<try
DBP.Hier
:over
DMP.
MBX.!
END.
```

Remarks

-

Limitations:

-

3.60.16 JOR. - Jump On Repeat-Count

MiniRobotLanguage (MRL)

JOR. Conditional Jump

Jump On Repeat count

Intention

This command solves a special need. It automates the "Repeat count" of an repeated action. Imagine you have a special condition in your code.Something was not found or some kind of error-condition.
For example, a file was not found, or a window did not appear.

You decide that you want to try again, checking for the missing thing.
How often do you want to try looking for it?
That is the "Repeat count". Maybe only 3 times or 5 times. Maybe 1000 times. It's up to you.

The idea behind `JOR.` is:

- first make an endless loop (that endless tries whatever)
- then add an `RRC.` immediately before the endless-loop
- finally insert an JOR. into the endless loop and hence give it a exit condition

The general Usage is:

```
' Reset the Repeat Count first
RRC.
   :Label
  ' Try something, jump away if it works
' Leave the endless loop if the number of retries is exceeded.
JOR.(number of retries)|(error-label)
JMP.Label
```

Or you can also use a endless loop instead. This is a real, working example-code:

```
RRC.
  DOL.1
  ' Try something, jump away if it works
  ' Leave the endless loop if the number of retries is
exceeded.
  JOR.5|error
OOP.
ENR.

:error
MBX.An error happened.
END.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Technical Details:
The Repeat-count is not a global counter. Instead each JOR. has its own Repeat counter and its own RRC. Just one.

JOR. must be used together with its RRC. (Reset Repeat Count).
You can Repeat count a sub-program, that also repeat counts something

```
RRC.
    RRC.
    ...
    JOR.
JOR.
```

For this to work, the RRC. must come first and the JOR. must be in a following line.
In fact RRC. - JOR. is a sort of Loop-construction, that can be nested.

Syntax

JOR.P1|P2[|P3]

Parameter Explanation

P1 – number or variable containing a number which is the maximum repeat count, before the jump is done..

P2 – Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like) Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like) Jump..

P3 – ***(optional)*** must be variable, if given, is set to one in case the Jump was done,
else is set to zero.

Example

```
'************************************
' JOR - Example
'************************************
'DBM.2
' The following RRC. sets the Repeat-Counter to zero
RRC.
  :Labb
  DBP.Repeatin 1
' The JOR. will increase the Repeat Counter
' each time its called.
JOR.3|Laba
JMP.Labb
' This is where we Jump, if the Repeat-Counter
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' becomes bigger or equal to 3
:Laba
RRC.
  :Labc
  DBP.Repeat 2
JOR.5|Labd
JMP.Labc
:Labd
DBP.We are now here.
END.
```

Remarks

The RRC. builds internally a connection with the **next** JOR.
You can not call RRC. for example with JSR. or JNF.

The Preprocessor will only connect the RRC with the next successive JOR.
Therefore the RRC. must be in teh code above the JOR.

Limitations:

The Repeat counter is limited to a maximum of ~2 Billion retries.
The RRC. and JOR. must be in the same file.

See also:

- RRC. - Reset Repeat-Counter 2227

- JSR. - Jump SubRoutine (Label) 2218

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.17 JRR. - Jump and Reset Return-Stack

MiniRobotLanguage (MRL)

JRR. Conditional Jump

Jump and Reset Returnstack

Intention

Error-handling in Subroutines. Imagine you have called a subroutine using `JSR.` Normally you would return from there using `RET.` And then continue your script. Now there is an error or special condition. You want to jump directly to the error-handler in the main-script. Or you want to just re-run the complete script from start?

If you do just that, there will be more and more useless entries on the so called "Return stack". That is the place, where each `JSR./GSB.` remembers where to jump back in case of a return (`RET.`). Now comes `JRR.`
With `JRR.` you can clear the `RET.`-Stack and make the robot forget all previous `GSB./JSR.` Usage is simple, use:

```
' This will clear the complete Return Stack
JRR.restart
```

You can also choose to remove only the the last **P2**-number of entries from the return stack if a number is given for **P2**.

```
' ... will only remove the last entry
 JRR.restart|1
```

And then you can just re-run the Script or do whatever is needed.

You can use `JRR.` on any of the following cases. Note in the case of `FEX.`-Instructions that you should prefer to use `EFX.` if you want to stop the enumeration.

- STW. - Description 3814 with the "W", or "V"-Option
- ! SCW - Search-Child-Window 3738 with the "W", or "V"-Option
- `ITW.` with the "W", or "V"-Option
- `ICW.` with the "W", or "V"-Option
- JIV. - Jump-If-Variable 2177 or
- any other of the `JIX. - Jumps`, when using the ":"-Label Option
- any of the FEX.-Enumeration Instructions, **important**: use `EFX.` in that case

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

JRR.P1[|P2]

Parameter Explanation

P1 – Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like) Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like) Jump..

P2 – if omitted the completed Return Stack is cleared. If a number is given, the number of entries is been removed from the return stack.

Example

```
'***********************************************
' Example 1 - without Parameters,
'***********************************************
: $$AAA=10
:restart
JSR.Laba
CAL.$$AAA=3+(9*$$AAA)+2.5
PRT. Resultat ist: $$AAA
END.

:Laba
IVV.$$AAA=10
  : $$AAA=9
  JRR.restart
EIF.
RET.

ENR.
```

Remarks

Alternatively you can use `JMP.retry|r`

Limitations:

-

3.60.18 JRS. - Jump if Result

JRS. - Jump If Result Previous 2212 Top 41 Next 2218

MiniRobotLanguage (MRL)

JRS. Conditional Jump

Jump If Result

Intention

This command can be used to test, if an specified Background- or Parallel-Robot Operation has emitted an result or not. Usage is simple:

```
SMB.
PAU.10
JRS.|result
MBX.Error we got no Result
ENR.
:result
MBX.Result is available
ENR.
```

You can use a variable that contains a label (dynamic jumping).
Here is another example:

```
SMB.
$$TIN=$$000
PAU.4
JNR.$$TIN|noresult
MBX.Yes we got an Result
ENR.
:noresult
MBX.No Result was available
ENR.
```

The command can be switched from default mode (**Jump Mode**) into "**Gosub Mode**" if you prefix the Label-Parameter **P3** with a **colon**. Here is an example:

```
SMB.
:Retry
JNR.|:test
PAU.0.25
JNR.|Retry
ENR.
'--------------
:test
DBP. No Result yer!
PAU.0.1
RET.
```

`JNR.` is the negative version of `JRS.`

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

JRS.[P1]|P2
JRS.[P1]|:P2

Parameter Explanation

P1 **-** ***(optional)*** Variable that evaluates to a valid Ticket-Number, that is connected with a Background Operation or a Parallel Robot. If omitted the last emitted Ticket-Number is used.

P2 **-** Label or Variable that evaluates to a Label.
If it starts with a ":" (colon) a JSR. - Jump SubRoutine (Label) 2218 (GOSUB like) Jump is done instead of the normal JMP. - Jump to Label 2189 (GOTO like) Jump..

Example

```
'************************************
' JRS - Example
'************************************
SMB.
:Retry
PAU.0.25
JRS.|out
JMP.Retry
ENR.
'--------------
:out
DBP. Result Ok!
ENR.
```

Remarks

-

Limitations:

3.60.19 JSR./GSB. - Jump SubRoutine (Label)

JSR. - Jump SubRoutine (Label) Previous 2215 Top 41 Next 2224

MiniRobotLanguage (MRL)

JSR./ GSB. Unconditional Subroutine-Jump

Jump SubRoutine / GoSub

Intention

This is a Subroutine call (`GOSUB` - like). `JSR./GSB.` invoke a subroutine at the given Label, keep the Return-line on the Return Stack. It will returns to the statement following the `JSR./GSB.` after reaching a `RET.` - Command.

What is a subroutine?
A subroutine is a Sub-program in your Main-program. Mostly subroutines encapsule an specific part of the overall job of your script.

Note that it has **two names: GSB. and JSR.**.
These two are completely equal.

Usage is easy:

```
GSB.Label
' This is where we continue after the return
ENR.

:Label
' Do something here
RET.
```

Can i use Subroutine parameters?
Yes, the variables **$$_01** ... **$$_25** are hold the Subroutine Parameters.
The number of given parameters is available in **$$_00**.

If you specify just Variables as Parameter, the Content is only copied,
and the Type of the Variable is preserved.

```
 ' Example
 VAN.$$NUM=5.09
 GSB.AddMe|$$NUM|$$NUX
 ENR.
 :AddMe
VAO.$$PAA=$$_01
GVT.$$PAA|$$RES
MBX.We preserved the Variabletype: $$RES (=5, numeric)
RET.
```

Can i just jump out of a Subroutine?

*© 2023 Theo Gottwald * https://www.smart-package.com*

If you plan to end the script anyway, then **yes**.
If you plan to invoke other subroutines later, then better **not**.
In this case use the:

- JRR. - Jump and Reset Return-Stack 2212
- RRS. - Reset Return Stack 2230

commands to clean up the Return-stack before/while jumping out.

Speed in Ticks:

This command uses typically between 30 to 60 Ticks.

You can also call Subroutines in the same way like with `JSR./GSB.` with the following commands:

- STW. - Description 3814 with the "W", or "V"-Option
- ! SCW - Search-Child-Window 3738 with the "W", or "V"-Option
- `ITW.` with the "W", or "V"-Option
- `ICW.` with the "W", or "V"-Option
- JIV. - Jump-If-Variable 2177 or
- any other of the `JIX. - Jumps`, when using the ":"-Label Option

Syntax

JSR.P1[|P2..|Px]

Parameter Explanation

P1 – `TXT (Label) or Variable containing the Label.`
P2 ... Px -(optional) `Parameters for subroutine`

Example

```
'*********************************************
' Example 1 - without Parameters,
'*********************************************

DBM.2

```

Remarks

The variables §§_01 ... §§_25 are used for Parameters.
The number of given parameters is available in §§_00.

JSR. - unlike JNF. - does NOT open a local Variables/local Stack-Space for local variables.

Therefore Variables in a Subprogram called with JSR. are currently not explicitly local.

You can also call Subroutines in the same way like with JSR./GSB. with these commands:

- STW. - Description 3814 with the "W", or "V"-Option
- ! SCW - Search-Child-Window 3738 with the "W", or "V"-Option
- ITW. with the "W", or "V"-Option
- ICW. with the "W", or "V"-Option
- JIV. - Jump-If-Variable 2177 or
- any other of the JIX. - Jumps, when using the ":"-Label Option
- any of the FEX.-Enumeration Instructions

Limitations:

There is no depth limit for Subroutine calls. recursive calls are allowed.

See also:

- RET. - RETurn 2224

- JME. - Jump on More or Equal 2186
- JLE. - Jump on Less or Equal 2183
- JMP. - Jump to Label 2189
- JNF. - Jump New File 2191
- RTS. - ReTurn from Subprogram 2233

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.20 RET. - RETurn

MiniRobotLanguage (MRL)

RET. Statement

RETurn from Gosub

Intention

Return from a Subroutine that was called using any of the statements below.

Returns to the line/statement following the Subroutine call.

A subroutine can be called with any of the following Instructions / Instruction-groups:

- JSR. - Jump SubRoutine (Label) 2218 (Same as `GSB.`)
- STW. - Description 3814 with the "W", or "V"-Option
- ! SCW - Search-Child-Window 3738 with the "W", or "V"-Option
- `ITW.` with the "W", or "V"-Option
- `ICW.` with the "W", or "V"-Option
- JIV. - Jump-If-Variable 2177 or
- any other of the `JIX. - Jumps`, when using the ":"-Label Option
- any of the FEX.-Enumeration Instructions

Syntax

RET.[P1]

Parameter Explanation

P1 - (optional) how many level you want to jump up. If omitted, the RET. Instruction will bring you just up one level. If you want to get to the Top-Level, for example in case of errors, you can write:

```
RET.all
```

this will bring you in one strike to the Top-Level of the Script. Note that all levels below have been removed from the Subprogram-Return Stack.

Speed in Ticks:

This command uses typically between 10 to 20 Ticks.

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'*********************************************
' Example 1 - without Parameters,
'*********************************************

[First.txt]
DBM.2
JSR.Laba
CAL.$$AAA=3+(9*$$AAA)+2.5
PRT. Resultat ist: $$AAA
END.

:Laba
: $$AAA=10
RET.

'*********************************************
' Example 2 - with Parameter
'*********************************************

DBM.2
: $$LAA=Laba
JSR.$$LAA|10
CAL.$$AAA=3+(9*$$AAA)+2.5
PRT. Resultat ist: $$AAA
END\

:Laba
: $$AAA=§§_01
PRT. $$AAA
RET.
```

Remarks

Please do not intermix `RET.` with `RTS`, because `RTS` is used to Return from Subprograms which are called with `JNF`.

Limitations:

There are no relevant depth limitations or limitations about recursive functions.

See also:

3.60.21 RRC. - Reset Repeat-Counter

MiniRobotLanguage (MRL)

RRC. Command

Reset Repeat Counter

Intention

`RRC.` will zero the Repeat-Count of the following/next JOR. - Jump On Repeat-Count 2209 in the code.

This command solves a special need. It automates the "Repeat count" of an repeated action. Imagine you have a special condition in your code.Something was not found or some kind of error-condition.
For example, a file was not found, or a window did not appear.

You decide that you want to try again, checking for the missing thing.
How often do you want to try looking for it?
That is the "Repeat count". Maybe only 3 times or 5 times. Maybe 1000 times. It's up to you.

The idea behind `RRC./JOR.` is:

- first make an endless loop (that endless tries whatever)
- then add an `RRC.` immediately before the endless-loop

finally insert an JOR. into the endless loop and hence give it a exit condition

The general Usage is:

```
' Reset the Repeat Count first
RRC.
   :Label
  ' Try something, jump away if it works
' Leave the endless loop if the number of retries is exceeded.
JOR.(number of retries)|(error-label)
JMP.Label
```

Or you can also use a endless loop instead. This is a real, working example-code:

```
RRC.
  DOL.1
  ' Try something, jump away if it works
  ' Leave the endless loop if the number of retries is
exceeded.
  JOR.5|error
OOP.
ENR.

:error
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
MBX.An error happened.
END.
```

Technical Details:
The Repeat-count is not a global counter. Instead each JOR. has its own Repeat counter and its own RRC. Just one.

JOR. must be used together with its RRC. (Reset Repeat Count).
You can Repeat count a sub-program, that also repeat counts something

```
RRC.
    RRC.
    ...
    JOR.
JOR.
```

For this to work, the RRC. must come first and the JOR. must be in a following line.
In fact RRC. - JOR. is a sort of Loop-construction, that can be nested.

Syntax

RRC .

Parameter Explanation

```
No parameters are required with this command.
```

Example

```
'************************************
' JOR - Example
'************************************
RRC.
  DOL.1
  ' Try something, jump away if it works
  JOR.5|error
OOP.

ENR.

:error
MBX.An error happened.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

The RRC. builds internally a connection with the **next** JOR.
You can not call RRC. for example with JSR. or JNF.

The Preprocessor will only connect the RRC with the next successive JOR.
Therefore the RRC. must be in the code above the JOR.

Limitations:

The Repeat counter is limited to a maximum of ~2 Billion retries.

See also:

- JOR. - Jump On Repeat-Count 2209
- JIV. - Jump-If-Variable 2177
- JIZ. - Jump-If-Zero 2180
- JNZ. - Jump if Not zero 2206
- JME. - Jump on More or Equal 2186
- JLE. - Jump on Less or Equal 2183

3.60.22 RRS. - Reset Return Stack

MiniRobotLanguage (MRL)

RRS. Command

Reset Return Stack

Intention

Error-handling in Subroutines, called with `GSB./JSR.` or equivalent Jump-Subroutine-Instructions, like:

- STW. - Description 3814 with the "W", or "V"-Option
- ! SCW - Search-Child-Window 3738 with the "W", or "V"-Option
- `ITW.` with the "W", or "V"-Option
- `ICW.` with the "W", or "V"-Option
- JIV. - Jump-If-Variable 2177 or
- any other of the `JIX. - Jumps`, when using the ":"-Label Option

Imagine you have called a subroutine using `JSR.`
Normally you would return from there using `RET.` And then continue your script.
Now there is an error or special condition. You want to jump directly to the error-handler in the main-script. Or you want to just re-run the complete script from start?

If you do just that, there will be more and more useless entries on the so called "Return stack". That is the place, where each `JSR./GSB.` remembers where to jump back in case of a return (`RET.`). Now comes `RRS. and JRR.`

With `RRS.` you can clear the `RET.`-Stack and make the robot forget all previous `GSB./JSR.` Usage is simple, use:

```
' This will clear the complete Return Stack
RRS.
```

You can also choose to remove only the the last **P1**-number of entries from the return stack if a number is given for **P1**.

```
' ... will only remove the last entry
 RRS.1
```

Then you can just re-run the Script or do whatever is needed.

You can use `RRS.` on any of the following cases. Note in the case of `FEX.`-Instructions that you should prefer to use `EFX.` if you want to stop the enumeration.

- STW. - Description 3814 with the "W", or "V"-Option
- ! SCW - Search-Child-Window 3738 with the "W", or "V"-Option
- `ITW.` with the "W", or "V"-Option

*© 2023 Theo Gottwald * https://www.smart-package.com*

- ICW. with the "W", or "V"-Option
- JIV. - Jump-If-Variable 2177 or
- any other of the JIX. - Jumps, when using the ":"-Label Option
- any of the FEX.-Enumeration Instructions, **important**: use EFX. in that case

Syntax

RRS.[P1]

Parameter Explanation

P1 **-** number of Entries to be removed from the Return Stack.

Example

```
'************************************
' RRS. Example
'************************************
DBM.2
$$LOP=1

:retry
DOL.$$LOP=1

JSR.suba
OOP.

MBX.?
END.

:suba
IVV.$$ERR=1
 RRS.
 JMP.retry
ELS.
 JSR.sub
EVV.
' return normal way
RET.

:sub
' Do something
RET.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

Alternatively you can use `JMP.retry|r`

Limitations:

-

See also:

- JRR. - Jump and Reset Return-Stack 2212
- JSR. - Jump SubRoutine (Label) 2218
- RET. - RETurn 2224
- JMP. - Jump to Label 2189
- JIV. - Jump-If-Variable 2177
- JIZ. - Jump-If-Zero 2180
- JNZ. - Jump if Not zero 2206
- JOR. - Jump On Repeat-Count 2209
- JME. - Jump on More or Equal 2186
- JLE. - Jump on Less or Equal 2183

© 2023 Theo Gottwald * https://www.smart-package.com

3.60.23 RTS. - ReTurn from Subprogram

MiniRobotLanguage (MRL)

RTS. Statement

ReTurn from Subprogram to calling script

Intention

Used together with JNF. - Jump New File 2191 to call Subprograms.
`RTS.` will return program flow to the calling Script.

If you need to leave a Sub-Program that was called with `JNF.` to a higher level then just the next, you can add a number behind the `RET.` Like this:

```
RTS.2
```

If you want to leave to the Top-Level in your script, just write:

```
RTS.all
```

Syntax

RTS.[P1]

Parameter Explanation

P1 **-** `Numeric, a variable or the term "all"`

Example

```
We need to have 2 Script Files for this simple Example. Both
need to be in the same folder. The first Scriptfile,
"First.txt"  that is run defines ?path, which is the folder
where it is. it calls the second file "second.txt".

[First.txt]
: $$WHE=In First.txt
: $$GLO=1
PRT. $$WHE, Global=$$GLO
JNF.Second.txt
PRT. $$WHE, Global=$$GLO
END.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
[Second.txt]
: §§WHE=In Second.txt
: $$GLO=2
PRT. $$WHE, Global=$$GLO
RTS.
```

Remarks

Please do not intermix `RTS,.` with `RET.`
`RET.` is used to Return from Subroutines which are called with `JSR./GSB.`

Limitations:

There are now relevant limitations about recursion depth.

See also:

- JNF. - Jump New File 2191

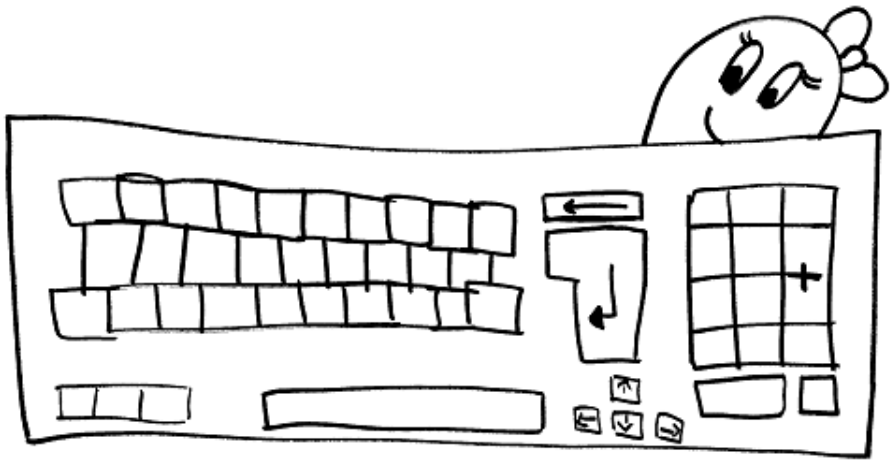
3.61 Keyboard Typing Simulation

3.61.1 ! Keyboard-Keycode-List

MiniRobotLanguage (MRL)

Keycode-List

Key Code List



Intention

These Keycodes are available with `KYD.`, `KYU.`, `SKP.` and other Compatible Engine 231 Keyboard-Typing Commands.

This is the most compatible and "Low Level" Keyboard simulation we have. Using these commands, you can even make window to bring up the Task-Manager, by simulating a Key-press:

```
' Bring Windows Task-Manager up
KYD.{STRG},{SHIFT},{ESC}
PAU.0.100
KYU.{STRG},{SHIFT},{ESC}
ENR.

' This example will open a Menu in Photoimpact
' using the SHFT-CTRL-S Key-Combination
'
STW.ct|IE3_CLASS|PhotoImpact -
SCW.nc|1|Afx:400000:0:10013:0:0
KYD.{SHIFT},{CTRL}
SKP.s
KYU.{SHIFT},{CTRL}
PAU.0.2
RET.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

3.61.2 GEK. - Get Extended Key-State

MiniRobotLanguage (MRL)

GEK. Command

Get Extended Key-State

Intention

The GEK.-Command has two modes of operation.

In **Mode 1**, it can be used to get the state of NUMLOCK, CAPSLOCK and SCROLLLOCK.
What you get is really the "**state of the keyboard**". Not "the state of the button". GEK.-returns the "real thing", not just the key-states that you will get with GKS. The keystates from GES. just show you, if actually the NUMLOCK-Key is up or down. GEK. will really get the state of the keyboard about NUMLOCK, CAPSLOCK, SCROLLLOCK etc. When choosing between GKS. and GEK. you need to understand the difference between these commands.

In **Mode 2**, it can be used to retrieve the state of the SHIFT, CTRL or the ALT-Key and others, see list below. In this case you really check whether the given Key is down or not.

Note: Even if CAPSLOCK is activated, you will get a "0" if you check for SHIFT, because that key is actually not down itself.

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

GEK.P1[|P2]

Parameter Explanation

P1 - VAR or numeric

P2 - ***(optional)*** Variable. If omitted TOS 104 is used for result.

```
Parameter-List for P1:

SHIFT          - any shift key (keyboard Shift-state)
LSHIFT         - only left Shift-Key
RSHIFT         - only right Shift-Key
STRG,CTRL      - any Ctrl key (keyboard Ctrl-state)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
LSTRG,LCTRL   - only left Ctrl-Key
RSTRG,RCTRL   - only right Ctrl-Key
MENU,ALT      - any ALT key (keyboard ALT-state)
LMENU,LALT    - only left ALT-Key
RMENU,RALT    - only right ALT-Key
NUMLOCK,NUM   - keyboard NUMLOCK-State
CAPSLOCK,CAPS - keyboard CAPSLOCK-State
SCROLLOCK,SCROL,SCROLL - keyboard SCROLLLOCK-State
```

Example

```
'*****************************************************
' EXAMPLE 1: GEK.
'*****************************************************
' Please run this script only in the editor
' Then press the SHIFT-Key (left or right) while its running.
DOL.1

3.61.3 GKS. - Get Key-State

MiniRobotLanguage (MRL)

GKS. Command

Get Key-State

Intention

The GKS.-Command can be used to find out if a specified key on the keyboard is actually pressed or released. Unlike GEK., the GKS.-Command will return the state of the physical keyboard key, and tell you if its up or down (0/1).

GKS. has three modes of operation. In the first Mode, you can specify the button using all of the Low-Level Keycodes see here:
Keyboard-Keycode-List 2235.

In the second Mode, you can type a **#** followed by a decimal number or variable that contains the number. Like this:

```
' This will check the state of the left SHIFT-Key
GKS.#160|$$RES
DBP.$$RES

' This will get the state of the left SHIFT-Key
' You can omit the {} here if you want.
GKS.SHIFT|$$RES
DBP.$$RES

' This will get the state of the left SHIFT-Key
GKS.{SHIFT}|$$RES
DBP.$$RES
```

In the third Mode, you define the key directly, using **"a"** or **"B"**. Here is an example:

```
' This will get the state of the a-Key
GKS."a"|$$RES
DBP.$$RES
```

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

GKS.P1[|P2]

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 **-** VAR or numeric, or Keycode see below.

P2 **-** ***(optional)*** Variable. If omitted TOS[104] is used for result.

For **P1**, you can use all Low-Level-Keycodes: see here:

Keyboard-Keycode-List[2235]

Example

```
'*****************************************************
' EXAMPLE 1: GKS.
'*****************************************************
' Run this example from the editor and
' press the "a" button while its running
'
DOL.1
  GKS."A"|$$RES
  DBP.$$RES
  JNZ.$$RES|out
OOP.
:out
ENR.
```

3.61.4 IEK. / NEK. - If Extended Key-State

MiniRobotLanguage (MRL)

IEK. Conditional Statement

If Extended Key-State

Intention

The IEK.-Command has two modes of operation.

In **Mode 1**, it can be used to react on the state of NUMLOCK, CAPSLOCK and SCROLLLOCK. What you get is really the "**state of the keyboard**". Not "the state of the button". IEK.-returns the "real thing", not just the key-states that you will get with IKS.

The keystates from IES. just show you, if actually the NUMLOCK-Key is up or down. IEK. will really get the state of the keyboard about NUMLOCK, CAPSLOCK, SCROLLLOCK etc. When choosing between IKS. and IEK. you need to understand the difference between these commands.

In **Mode 2**, it can be used to react on the state of the SHIFT, CTRL or the ALT-Key and others, see list below. In this case you really check whether the given Key is down or not.

Note: If CAPSLOCK is activated and if you check for SHIFT, then IEK. will evaluate "false", because that key is actually not down itself.

NEK. is the negative form of the command.

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

IEK.P1 … ELS. … EIF.

Parameter Explanation

P1 **-** VAR or numeric

Parameter-List for **P1**:

```
SHIFT          - any shift key (keyboard Shift-state)
LSHIFT         - only left Shift-Key
RSHIFT         - only right Shift-Key
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
STRG,CTRL     - any Ctrl key (keyboard Ctrl-state)
LSTRG,LCTRL   - only left Ctrl-Key
RSTRG,RCTRL   - only right Ctrl-Key
MENU,ALT      - any ALT key (keyboard ALT-state)
LMENU,LALT    - only left ALT-Key
RMENU,RALT    - only right ALT-Key
NUMLOCK,NUM   - keyboard NUMLOCK-State
CAPSLOCK,CAPS - keyboard CAPSLOCK-State
SCROLLOCK,SCROL,SCROLL - keyboard SCROLLLOCK-State
```

Example

```
'*****************************************************
' EXAMPLE 1: IEK.
'*****************************************************
' Please run this script only in the editor
' Then press the SHIFT-Key (left or right) while its running.
DOL.1
  IEK.SHIFT
     DBP.SHIFT is pressed!
  EIF.
OOP.

'*****************************************************
' EXAMPLE 2: NEK.
'*****************************************************
' Please run this script only in the editor
' Then press the NUMLOCK-Key (left or right) while its
running.

3.61.5 IKS. / NKS. - If Key-State

MiniRobotLanguage (MRL)

IKS./NKS. Conditional Statement

If Key-State

Intention

The `IKS.`-Command can be used to find out if a specified key on the keyboard is actually pressed or released. Unlike `IEK.`, the `IKS.`-Command will evaluate the state of the physical keyboard key, and tell you if its up or down and react on that.

`IKS.` has three modes of operation. In the first Mode, you can specify the button using all of the Low-Level Keycodes see here:
Keyboard-Keycode-List 2235.

In the second Mode, you can type a **#** followed by a decimal number or variable that contains the number. Like this:

```
' This will check the state of the left SHIFT-Key
IKS.#160
  DBP.$$RES
EIF.

' This will get the state of the left SHIFT-Key
' You can omit the {} here if you want.
IKS.SHIFT|
  DBP.$$RES
EIF.

' This will get the state of the left SHIFT-Key
IKS.{SHIFT}
  DBP.$$RES
EIF.
```

In the third Mode, you define the key directly, using **"a"** or **"B"**. Here is an example:

```
' This will get the state of the a-Key
IKS."a"
  DBP.$$RES
EIF.
```

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:

3.61.6 KBC. / KBI. - KeyBoard Command

MiniRobotLanguage (MRL)

KBC./KBI. Command

Keyboard Commands

Intention

The KBC.-Command can be used to simulate Keyboard typing. The Command has multiple predefined options and makes automated typing easier for you. Using KBC. you - for example - can mark all text in an Textbox. Or you can delete all Text in a Textbox.
It generally uses the compatible Engine.

The KBI.-Command works exactly as the KBC.-Command but uses another Typing-Technology that is ***faster***, yet sometimes not as compatible.
KBI. will put things directly into the Keyboard-Input Buffer so typing is faster

So possibly try using the KBI. - because its faster - and if it does not work just use KBC.

There are currently these options:

```
' This option will mark all text in the currently localized
text-control or web-control
' will work in Firefox or internet explorer
KBC.mark all

' This option will mark and delete all text in the currently
localized text-control or web-control
' will work in Firefox or internet explorer
KBC.del all

' This option will read all text in the currently localized
text-control or web-control
' will then compare to the text given as P2 (here $$TXT).
' If they do NOT match then it will delete this text and type
the text from P2
$$TXT=Password
KBC.Type If|$$TXT

The following options simulate the Keyboard:
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  KBC.Copy     -> -> strg-c
  KBC.Copy All -> strg-a strg-c
  KBC.Paste    -> strg-v[|n]   n - is a number that will specify how often to
press strg-v
  KBC.Paste Over -> strg-a strg-v
  KBC.Cut      -> strg-x
  KBC.Cut All -> strg-a strg-x
  KBC.Repeat   -> strg-y[|n]   n - is a number that will specify how often to
press strg-y
  KBC.Undo     -> strg-z[|n]   n - is a number that will specify how often to
press strg-z
  KBC.Italic   -> strg-i
  KBC.Bold     -> strg-b
  KBC.Underline  -> strg-u
  KBC.from Right[|n] -> {END} (Number of {RIGHT})
  KBC.from Left[|n] -> {HOME} (Number of {LEFT})
  KBC.Mark from Right[|n] -> {HOME}{SHIFT} (Number of {RIGHT})
  KBC.Mark from Left[|n] -> {END}{SHIFT} (Number of {LEFT})
  KBC.Mark to Right -> {HOME}{SHIFT}
  KBC.Mark to Left -> {END}{SHIFT}
```

There is a new series of `H-XXXX` Commands.
These commands use `{HOME}{SHIFT}{END}` instead of `strg-a`
to mark the complete Text in a Textbox. This is in some cases more compatible.
There are:

```
  KBC.H-Copy All
  KBC.H-Mark All
  KBC.H-Del All
  KBC.H-Cut All
  KBC.H-Paste Over
```

As it is just like if "**somebody is really typing**", it has all advantages and all limitations from that.

- The target control must have Input focus
- the target window must be in front
- you may need to wait a bit (`PAU.0.5`) after typing until the control is ready
- `KBC.` its slower then any direct engine 231 command
- but its highly compatible
- it understands special keyboard-actions like ctrl- or Shift or Alt-Key (see below).
- It can not change the text of buttons or controls like `SDT..`

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

KBC.P1[|P2]

 © 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - Prototype any of these:

- ***KBC.Type If*** *-> will read the text at the currently localized place and compare it with* **P2.**
  If they do not match it will make "del all" and type the new text just like SKP. would.
- ***KBC.Mark All*** *-> this will click into and type ctrl-a to mark the whole content of a browser-*
  or textcontrol that is currently localized.
- ***KBC.H-Mark All*** *-> this will click into and type {SHIFT} {HOME} {END} to mark the whole content*
  of a browser- or textcontrol that is currently localized.
- ***KBC.Del All*** *-> will call* ***"mark all"*** *and then type a Backspace just like* ***SKP.{BS}.***
  This should delete all content of a text-control even in a browser.
- ***KBC.H-Del All*** *-> will call* ***"h-mark all"*** *and then type a Backspace just like* ***SKP.{BS}.***
  This should delete all content of a text-control even in a browser.
- ***KBC.From Left*** *-> will click into the Textbox, type "HOME" to go to left side.*
  Then type "RIGHT" as many times, as the **P2***-Parameter specifies.*
- ***KBC.From Right*** *-> will click into the Textbox, type "END" to go to right side.*
  Then type "LEFT" as many times, as the **P2***-Parameter specifies.*
- ***KBC.Mark from Left*** *-> will click into the Textbox, type "HOME","SHIFT" to go to left side.*
  Then type "RIGHT" as many times, as the **P2***-Parameter specifies.*
- ***KBC.Mark from Right*** *-> will click into the Textbox, type "END","SHIFT" to go to right side.*
  Then type "LEFT" as many times, as the **P2***-Parameter specifies.*
- ***KBC.Copy -> strg-c***
- ***KBC.Copy All -> strg-a strg-c***
- ***KBC.H-Copy All -> like "h-mark all" and "strg-c"***
- ***KBC.Paste -> strg-v[\|n]***
- ***KBC.Paste Over -> strg-a strg-v***
- ***KBC.H-Paste Over -> like "h-mark all" and "strg-v"***
- ***KBC.Cut -> strg-x***
- ***KBC.Cut All -> strg-a strg-x***
- ***KBC.H-Cut All -> like "h-mark all" and "strg-x"***
- ***KBC.Repeat -> strg-y[\|n]***
- ***KBC.Undo -> strg-z[\|n]***
- ***KBC.Italic -> strg-i***
- ***KBC.Bold -> strg-b***
- ***KBC.Underline -> strg-u***

© 2023 Theo Gottwald * https://www.smart-package.com

- ***KBC.Mark to Left -> "SHIFT" + "Home" (no Click)***
- ***KBC.Mark to Right -> "SHIFT" + "END" (no Click)***

P2 - (optional) Depending on the Subcommand you can specify a second Parameter.
With "`Type If`" this is a Text, with other Subcommands, this will be a number "how often"
to repeat the specified Typing-Action. If **P2** is omitted, it is assumed to be 1.

Example

```
' Samples for KBC.
KBC.mark all
KBC.del all
KBC.Type If|Login-Text
KBC.Paste|5
KBC.from Left|6
END.
```

3.61.7 KYD. - Key Down

MiniRobotLanguage (MRL)

KYD. Command

Key Down Simulation

Intention

The `KYD.`.-Command can be used to simulate Keyboard button press.

It's the most compatible and "Low Level" Keyboard simulation we have. Using it, you can even make window to bring you the Task-Manager up, by simulating a Key-press:

```
' Bring Windows Task-Manager up
KYD.{STRG},{SHIFT},{ESC}
PAU.0.100
KYU.{STRG},{SHIFT},{ESC}
ENR.
```

`KYD.` understands three sorts of parameters. These are:

- Special Sequences in {..} like `{SHIFT}`
- Letters and numbers, in `"."` like `"A"` or `"B"`. There is no difference between upper- and lowecase letters, because the letter size depends on the state of the `SHIFT-Key`..
- dezimal numbers like `65` (would be the same like `"A" or "a"`)

You can NOT use multiple letters between the `"."`.

All these Parameters can be used in a single statement. They must be separated by comma. Here is an example:

```
' Open "File Open Dialog" in WordPad
STW.ct|WordPadClass|- WordPad
KYD.{STRG},"o"
KYU.{STRG},"o"
ENR.
```

Here is the same example using numbers:

```
' Open "File Open Dialog" in WordPad
STW.ct|WordPadClass|- WordPad
KYD.17,79
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' You can mix numbers and chars
KYU.17,"o"
ENR.
```

Important: Always use `KYD.` and `KYU.` paired. Otherwise you will end up with Keys pressed after your script has ended.

Advanced Hint:
If you have Problems to delete the Content in a Browser-Edit Control, you can use this combination:

```
'-----------
:mark_all
MLI.
PAU.0.1
KYD.{STRG}
SKP.a
PAU.0.1
KYU.{STRG}
PAU.0.2
RET.
'-----------
:del_all
GSB.mark_all
SKP.{BS}
RET.
'-----------
```

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

KYD.P1

Parameter Explanation

P1 - VAR or STRING

All Low-Level-Keycodes: see:
Keyboard-Keycode-List 2235

Here are **just some** often used keycodes:

Special-Sequence	Keycode	Simulates:
{BS},{BACKSPACE}	8	BACKSPACE (deletes to left side)
{TAB}	9	TAB
{DEL},{CLEAR}	12	Delete-Key (deletes to right side),

© 2023 Theo Gottwald * https://www.smart-package.com

```
                                  see also 46
{RETURN}              -  13  -    RETURN-Key
{SHIFT}               -  16  -    SHIFT-Key (general), for L/R see
                                  160,161
{CTRL},{STRG}         -  17  -    CTRL-Key (general), for L/R see
                                  162,163
{ALT},{MENU}          -  18  -    ALT-/MENU-Key (general), for L/R
                                  see 164 and 165
{POS1},{HOME}         -  36  -    HOME/POS1-Key
{LEFT}                -  37  -    Left Arrow-Key
{UP}                  -  38  -    Up Arrow-Key
{RIGHT}               -  39  -    Right Arrow-Key
{DOWN}                -  40  -    Down Arrow-Key
{INSERT}              -  45  -    INSERT-Key
{DELETE}              -  46  -    DELETE-Key
{LWIN}                -  91  -    Left Windows-Button
{RWIN}                -  92  -    Right Windows Button
{LSHIFT}              -  160 -    Left SHIFT Key
{RSHIFT}              -  161 -    Right SHIFT Key
{LCTRL},{LSTRG}       -  162 -    Left CTRL-Key
{RCTRL},{RSTRG}       -  163 -    Right CTRL-Key
{LALT},{LMENU}        -  164 -    Left ALT-Key
{RALT},{RMENU}        -  165 -    Right ALT-Key, ALT Gr.
```

Hint: To get **`ALT Gr`**, you need to use the two Keys: `165 and 162`. See example below.

```
{OEM_1},{UE},{UML_UE}     -  186 - German "Ü"-Umlaut
{OEM_3},{OE},{UML_OE}     -  192 - German "Ö"-Umlaut
{SS},{GER_SS}             -  219 - German "ß"-Umlaut
{AE},{UML_AE}             -  222 - German "Ä"-Umlaut
{PIPE}                    -  226 - the "<"-Key, below the "a",
                                   only on german keyboards.
```

Example

```
' Open Taskmanager
KYD.{LCTRL},{LSHIFT},{ESC}
PAU.0.01
KYU.{LCTRL},{LSHIFT},{ESC}
ENR.

' Open "File Open Dialog" in WordPad
STW.ct|WordPadClass|- WordPad
KYD.{STRG},"o"
KYD.{STRG},"o"
ENR.

' Internally the right ALT-Key also presses the left CTRL-Key.
KYD.{LCTRL},{RALT}
PAU.0.1
KYU.{LCTRL},{RALT}
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

-

Limitations:

You can not simulate `{STRG},{RALT},{DELETE}` to get the or you can call the Task-Manager like this Taskmanager:

```
' Open Taskmanager using Keyboard.
KYD.{LCTRL},{LSHIFT},{ESC}
PAU.0.01
KYU.{LCTRL},{LSHIFT},{ESC}
ENR.
```

3.61.8 KYU. - Key Up

MiniRobotLanguage (MRL)

KYU. Command

Key Up Simulation

Intention

The `KYU.`-Command can be used to simulate Keyboard button release.

Important: Always use `KYD.` and `KYU.` paired. Otherwise you will end up with Keys pressed after your script has ended.

It's the most compatible and "Low Level" Keyboard simulation we have. Using it, you can even make window to bring you the Task-Manager up, by simulating a Key-press:

```
' Bring Windows Task-Manager up
KYD.{STRG},{SHIFT},{ESC}
PAU.0.100
KYU.{STRG},{SHIFT},{ESC}
ENR.
```

`KYD.` understands three sorts of parameters. These are:

- Special Sequences in {..} like `{SHIFT}`
- Letters and numbers, in `"."` like `"A"` or `"B"`. There is no difference between upper- and lowecase letters, because the letter size depends on the state of the `SHIFT-Key`..
- dezimal numbers like `65` (would be the same like `"A" or "a"`)

You can NOT use multiple letters between the `"."`.

All these Parameters can be used in a single statement. They must be separated by comma. Here is an example:

```
' Open "File Open Dialog" in WordPad
STW.ct|WordPadClass|- WordPad
KYD.{STRG},"o"
KYU.{STRG},"o"
ENR.
```

Here is the same example using numbers:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Open "File Open Dialog" in WordPad
STW.ct|WordPadClass|- WordPad
KYD.17,79
' You can mix numbers and chars
KYU.17,"o"
ENR.
```

KYU. knows all keys that have been pressed by the **LAST** KYD.-Instruction.
You can release them all in the right order, by writing:

```
KYU.all
```

For example:

```
' Bring Windows Task-Manager up
KYD.{STRG},{SHIFT},{ESC}
PAU.0.100
' release Keys in order
KYU.{ESC},{SHIFT},{STRG}
ENR.
```

is exactly the same as:

```
' Bring Windows Task-Manager up
KYD.{STRG},{SHIFT},{ESC}
PAU.0.100
' release Keys in order LILO
KYU.all
ENR.
```

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

KYD.P1

Parameter Explanation

P1 - VAR or STRING

All Low-Level-Keycodes: see:
Keyboard-Keycode-List 2235

Here are **just some** often used keycodes:

Special-Sequence	Keycode	Simulates:

© 2023 Theo Gottwald * https://www.smart-package.com

```
{BS},{BACKSPACE}     -  8   -  BACKSPACE (deletes to left side)
{TAB}                -  9   -  TAB
{DEL},{CLEAR}        -  12  -  Delete-Key (deletes to right
side),
                               see also 46
{RETURN}             -  13  -  RETURN-Key
{SHIFT}              -  16  -  SHIFT-Key (general), for L/R see
                               160,161
{CTRL},{STRG}        -  17  -  CTRL-Key (general), for L/R see
                               162,163
{ALT},{MENU}         -  18  -  ALT-/MENU-Key (general), for L/R
                               see 164 and 165
{POS1},{HOME}        -  36  -  HOME/POS1-Key
{LEFT}               -  37  -  Left Arrow-Key
{UP}                 -  38  -  Up Arrow-Key
{RIGHT}              -  39  -  Right Arrow-Key
{DOWN}               -  40  -  Down Arrow-Key
{INSERT}             -  45  -  INSERT-Key
{DELETE}             -  46  -  DELETE-Key
{LWIN}               -  91  -  Left Windows-Button
{RWIN}               -  92  -  Right Windows Button
{LSHIFT}             -  160 -  Left SHIFT Key
{RSHIFT}             -  161 -  Right SHIFT Key
{LCTRL},{LSTRG}      -  162 -  Left CTRL-Key
{RCTRL},{RSTRG}      -  163 -  Right CTRL-Key
{LALT},{LMENU}       -  164 -  Left ALT-Key
{RALT},{RMENU}       -  165 -  Right ALT-Key, ALT Gr.
```

Hint: To get **`ALT Gr`**, you need to use the two Keys: `165 and 162`. See example below.

```
{OEM_1},{UE},{UML_UE}    -  186 - German "Ü"-Umlaut
{OEM_3},{OE},{UML_OE}    -  192 - German "Ö"-Umlaut
{SS},{GER_SS}            -  219 - German "ß"-Umlaut
{AE},{UML_AE}            -  222 - German "Ä"-Umlaut
{PIPE}                   -  226 - the "<"-Key, below the "a",
                                  only on german keyboards.
```

Example

```
' Open Taskmanager
KYD.{LCTRL},{LSHIFT},{ESC}
PAU.0.01
KYU.{LCTRL},{LSHIFT},{ESC}
ENR.

' Open "File Open Dialog" in WordPad
STW.ct|WordPadClass|- WordPad
KYD.{STRG},"o"
KYD.{STRG},"o"
ENR.

' Internally the right ALT-Key also presses the left CTRL-Key.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
KYD.{LCTRL},{RALT}
PAU.0.1
KYU.{LCTRL},{RALT}
ENR.
```

Remarks

-

Limitations:

You can not simulate `{STRG},{RALT},{DELETE}` to get the Taskmanager, as these Keys are intercepted below application-Level. You can however use this one:

```
' Open Taskmanager using Keyboard.
KYD.{LCTRL},{LSHIFT},{ESC}
PAU.0.01
KYU.{LCTRL},{LSHIFT},{ESC}
ENR.
```

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.61.9 RST. - Replace Selected Text

MiniRobotLanguage (MRL)

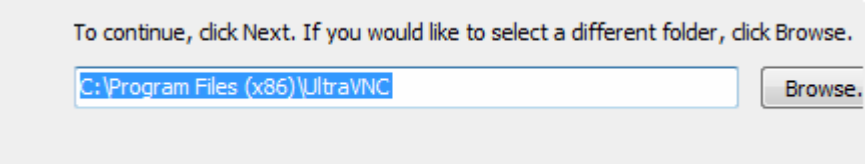
RST. Command

Replace Selected Text

Intention

The `RST.`-Command can be used to set a textbox to a specified text. It will change the Text of the actual localized Top-/or Child-window to the text that you specify.

Here is an example for a textbox.

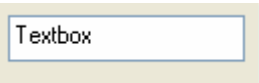


`RST.` uses the Direct engine 231 and therefore does not interpret any special Keyboard sequences like `SKP`. Using `RST.` the text is been send directly to the window and will replace the part of the text that is specified with the numeric parameters.

The command will select the Text given with the Parameters **P2**,**P3** and then replace this Text (-Part) with **P1**. The unselected Text remains as before.

To signal that all Text until the last Character should be replaced, the **P2** has to be "**-1**" which means " until End of Text".

Here is an example. This is a textbox in our Test-Application.

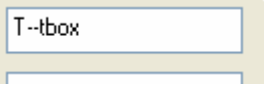


Now we start this small script:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nc|2|Edit
RST.--|1,3
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

And this is the textbox after the script:



As you can see the numeric argument is zero-based. You can use variables and formulas in (..) for the numeric arguments:

```
RST.--|1,(2+1)
```

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

RST.P1[|P2,P3]

Parameter Explanation

P1 - Text that is sent to the textbox

P2 - ***(optional) zero based*** character number, start of selection.
If omitted 0 is the default.

P3 - ***(optional)*** character number, end of selection.
If omitted, last character (-1) is the default.

Example

```
' Replace the whole Text with the new Text
RST.$$TXT|0,-1

' Replace the whole Text with the new Text
RST.$$TXT

' Clear Text
RST.

' Replace Letters 2 to 5 with the new Text
RST.$$TXT|2,5

' Replace Letters 1 to 3 with ---
RST.---|1,(2+1)

'********************************
' RST. - Sample
'********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'
EXE.?exepath\Sample Apps\TestApp_01.exe

STW.ct|PBWindowClass:0|TestApp
SCW.nc|2|Edit
RST.We can write into a  Text-box

ENR.
```

Remarks

Direct Engine command.

Limitations:

`RST.` will only work on windows. It will normally not work with WEB-based or Office-Controls.

See also:

- 1.9.1.6 Edit-Textbox Control 194
- SDT. - SenD-window-Text 2278
- SKP. Send-Key-Press 2289
- SKT. - Send-Key-Text 2293
- WNK. - Wait-No-Key 2296
-

© 2023 Theo Gottwald * https://www.smart-package.com

3.61.10 SDA. / SDU. - Send Input ANSI/UNICODE

MiniRobotLanguage (MRL)

SDA./SDU. Command

Send Keypresses using a different method that is between Direct and Compatible Engine.

Intention

Technically SDA. / SDU. places the characters directly the keyboard buffer.So they do the same.
. The only difference is that SDU. contains Optimizations for sending UNICODE-Text. It may only make sense in Applications who can receive such special Text.
This SendInput Technology is faster then other Compatible Engine Typing Commands. But its slower then the Direct-Engine Commands. So its some where in between. Use it if you can use it for your usage.

The `SDA. and the SDU.`-Command

```
STW.ct|WordPadClass|Dokument - WordPad
'SWP.2605,585|539,283|T
SCW.nc|1|RICHEDIT50W|{&NOTEXT:}

' This is our Text
$$TXT=Hallo Welt{ENTER}
' We look at the Hexdump
PRT.$$TXT|h
'  Now we make it UNICODE
ATU.$$TXT
' We look at the Hexdump
PRT.$$TXT|h
' Click into Wordpad
MLM.w|423,139
' Do the typing
SDU.$$TXT
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SDA.$$TXT
MBX.Look
ENR.
```

Then Windows will send the characters to the application that currently has the Input-focus.

Apart from normal Ascii characters, SDA. / SDU. can also handle some special characters that are unique just for these commands:

```
'
' These special Tokens are currently implemented:
{CTRL_D} + {CTRL_U}
{ALT_D} +  {ALT_U}
{SHIFT_D} +{SHIFT_U}
{WIN_D} + {WIN_U}

{CTRL}
{ALT}
{SHIFT}
{WIN}

{BACKSPACE},{ENTER},{INSERT},{DELETE}
{RIGHT},{LEFT},{UP},{DOWN}
{HOME}, {END}
{TAB}, {ESCAPE}
{PGUP},{PGDN}
{F1}, {F2}, {F3}, {F4}, {F5}, {F6}, {F7}, {F8}, {F9}, {F10

{APPS}
{NUMLOCK}

' The {.._D} are the 'key down' codes.
' The {.._U} are the 'key up' codes.
'
'Examples of use:
'SDA.This is a TEST
'SDU.12{BACKSPACE}{BACKSPACE}abcdef{ENTER}
'SDA.{CTRL_D}ac{CTRL_U}" simulates a CTRL-a  CTRL-c key co
'SDU.{CTRL}a{CTRL}c" simulates a CTRL-a  CTRL-c key combin
' You can use Variables:
' SDA.$$TXT
```

© 2023 Theo Gottwald * https://www.smart-package.com

These commands have their own specific Special Characters. And They work with an own internal System, therefore an intermixing with other such commands may not be a good idea.

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

SDA.P1
SDU.P1

Parameter Explanation

P1 – `VAR or STRING` with xharacters and Special Tokens, see above.

Example

```
' Type into Ultraedit
STW.Act|Afx:|UltraEdit-32
SCW.c|EditControl
SAW.
VAR.$$TXA=Hallo Welt{ENTER}
SDA.$$TXA{ENTER}
END.
```

Remarks

-

Limitations:

-

3.61.11 SDH. - Send Keys Hexcode

MiniRobotLanguage (MRL)

SDH. Command

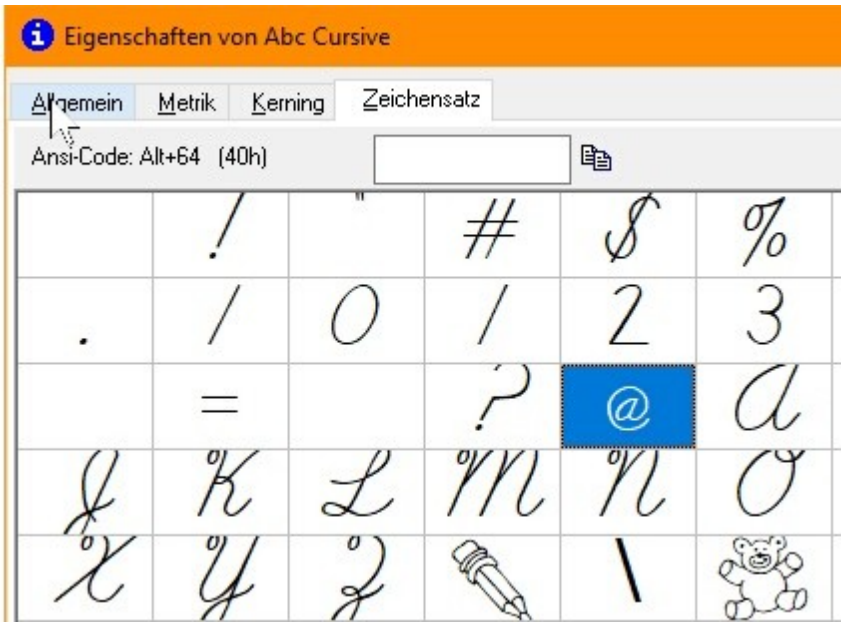
Send Keys delimited by a comma using Numbers

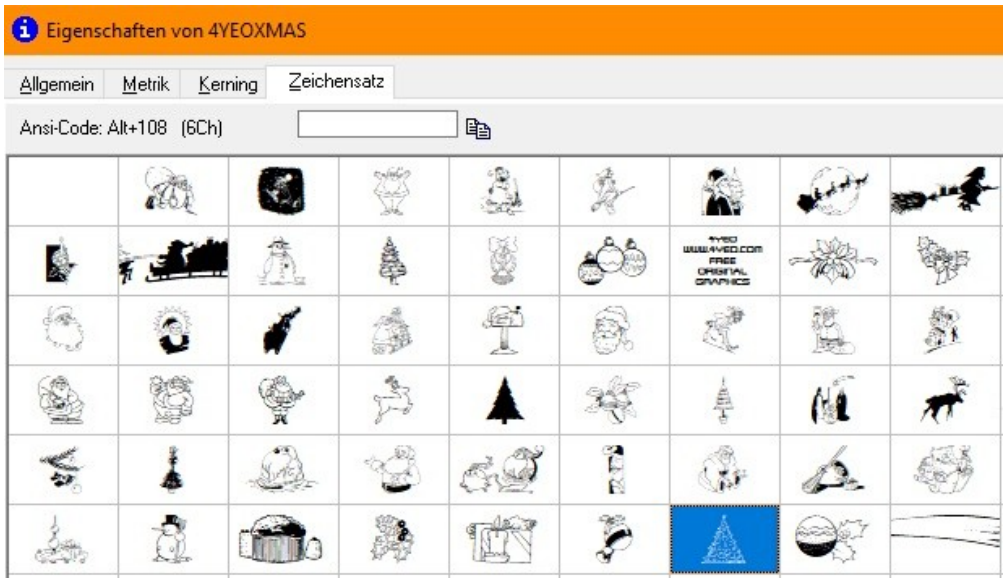
Intention

Do you remember using the Keypad to enter special characters?
In the Font-Description you find for each character the Number that you will need to type - together with the left "ALT"-Key.

Here is an example, if you hold the "Left-ALT" and then press "64"on the Num-Pad and then leave the ALT-Key, a "@" Sign will appear.
Of course the @-Sign can be found more easy, but there are other fonts and even foreign language signs where this becomes handy.

*© 2023 Theo Gottwald * https://www.smart-package.com*





The `SDH.`-Command isperfectly compatible and will accept "," so you can write:

```
SDH.144,145,165
or you can use other numeric Systems including Hexadezimal

SDH.&H89,&H54,&H3A,33,&B10101100,&O123

' Mathematical Formulas and Variables are also supported -
SDH.(143+1),(145-1),144

' using the supported ! > < = Option, you can even code "I
```

with as many characters as you need.

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

SDH.P1

Parameter Explanation

P1 – `VAR or STRING` with comma separated numbers that define the characters to type. You can use decimal numbers or other numeric Systems including Hexadezimal, Octal or Binary like this:

```
SDH.&H89,&H54,&H3A,33,&B10101100,&O123,(144+$$ZPO*(3+$$O
```

Example

```
' Type into Ultraedit
STW.Act|Afx:|UltraEdit-32
SCW.c|EditControl
SAW.
VAR.$$TXA=65,66,657
SDH.$$TXA,89,45
END.
```

Remarks

-

Limitations:

3.61.12 SDK. - SendKeys VB

MiniRobotLanguage (MRL)

SDK. Command

Send Keys with VB-Rules

Intention

The `SDK.`-Command can be used to simulate Keyboard typing. SDK. is like if you really type something into the keyboard. This makes it compatible with real typing. It is not as compatible as it is SKI. or SKP. or KYU. and KYD.
Therefore it is faster. It is not as fast as SDT. its like in between SKI. and SDT.

`SDK.` will work on any place, where you can also enter text using the keyboard.It will work also in browsers, Java- and WEB-based controls.
As it is just like if "**somebody is really typing**", it has all advantages and all limitations from that.

SDK. has a different Syntax then the other Commands as its based on another System (VB-like Sendkeys).

- The target control must have Input focus
- the target window must be in front
- you may need to wait a bit (`PAU.0.5`) after typing until the control is ready
- `SDK.` its slower then any direct engine 231 command
- but its highly compatible
- it understands special keyboard-actions like ctrl- or Shift or Alt-Key (see below).
- It can not change the text of buttons or controls like `SDT.`

`SDK.` **emulates most of the same rules as the VisualBasic Sendkeys-Command.**

```
VAR.$$TXA=abc$crlf$cba
SDK.$$TXA
```

You can send these codes Special-Codes:

```
  Generally as a Prefix:
  "+" is SHIFT
  "^" is CTRL
  "%" is ALT
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
Use "(" and ")" to GROUP Shifted Keys.
Like "+(ab)"

{ENTER}
{ESC}
{UP}  {DOWN}  {LEFT}  {RIGHT}
{BACKSPACE} or {BS}
{HOME}  {END}
{PGUP}  {PGDN}
{TAB}
{DEL} or {DELETE}
{INS} or {INSERT}
{WIN}
{PRTSC}
{CAPSLOCK}
{NUMLOCK}
{SCROLLLOCK}
{HELP}
{PAUSEKEY}
{BREAK}
{LCONTROL} {RCONTROL}
{LSHIFT}{RSHIFT}
{ATTN}
{LMENU} {RMENU}
{F1}-{F16}
{NOTHING} '  so you can use Alt etc. without any Letter: %{NOTHING}

{SLEEP 1000} <-- 1000 miliseconds Pause
{PAUSE 3.5} <-- Pauses 3.5 seconds (while processing event messages)
{App WindowName} <-- switches to this window (does NOT support any wildcards, ne
{LMOUSECLICK X Y} <-- Left button mouse click at x/y screen position
{RMOUSECLICK X Y} <-- Right button mouse click at x/y screen position
{MMOUSECLICK X Y} <-- Middle button mouse click at x/y screen position
{CHR 123} <-- Send an ascii code 123 (same as pressing Alt-123 example: {CHR 65}
{AppActivate WindowName} will switch focus to the WindowName you specify
```

Procede characters with + for Shift, ^ for Ctrl, % for Alt example: `^p` would be `Ctrl-p`

You can also group characters for shift/ctrl/alt with parentheses ( ) example: `%(fx)` would be `Alt-F Alt-X`

To send these special characters `{+^%~` (as plain characters enclose them in braces example: `{{}` would just send {

To send a key multiple times inclose it in braces with a number like `{h 3}` example: `{DEL 41}` would send DELETE key 41 times

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

SDK.P1

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** VAR or STRING

Example

```
' Type into Ultraedit
STW.Act|Afx:|UltraEdit-32
SCW.c|EditControl
SAW.
VAR.$$TXA=abc$crlf$cba
SDK.$$TXA
END.
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.61.13 SDT. - SenD-window-Text

MiniRobotLanguage (MRL)

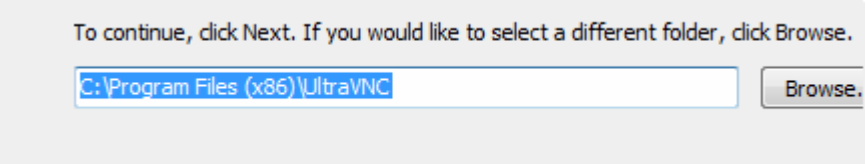
SDT. Command

SenD windowText

Intention

The SDT.-Command can be used to set a textbox to a specified text. It will change the Text of the actual localized Top-/or Child-window to the text that you specify.

Here is an example for a textbox.



SDT. uses the Direct engine 231 and is therefore much (50 times?) faster then SKP. It does not interpret any special Keyboard sequences like SKP.
Using SDT. the text is been send directly to the window and will replace the part of the text that is specified with the numeric parameters.
As it does not really simulate the keyboard like the Compatible Engine 231 commands, it can not be used to open menu's or like that. It's perfect to change the text of a Top- or child-window.

Usage is as simple as possible. To clear a Textbox write:

```
SDT.
```

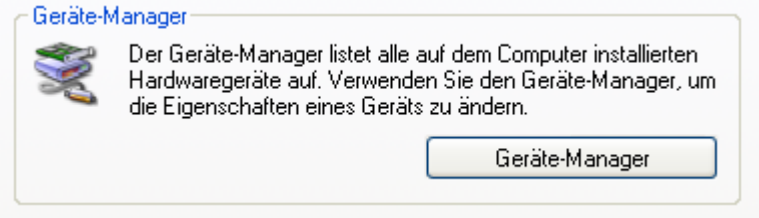
and to send a text into a textbox, write:

```
SDT.(your text)
```

SDT. can also change the text of statics or buttons as long as it finds a window control as target. Take this for example:

Before:

 *© 2023 Theo Gottwald * https://www.smart-package.com*

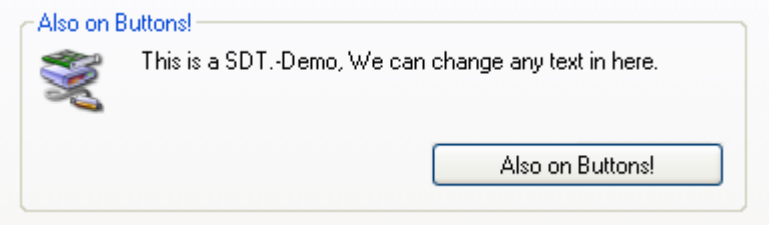


```
We use this script (german WinXP, SP3)

STW.ct|#32770|Systemeigenschaften
SCW.nct|1|#32770|Hardware
SCW.nct|1|static|Der Geräte-Manager listet.
SDT. This is a SDT.-Demo, We can change any text in here.

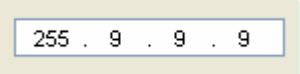
FOR.$$CNT|1|2
  SCW.ctT|#32770|Hardware
  SCW.Sct|Button|Geräte-Manager
  SDT.Also on Buttons!
NEX.
ENR.
```

And this is how it looks after:



You can set the text in a SysIP-Control directly:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|SysIPAddress32|192.168.0.1
' Set the SysIP-Control in one strike
SDT.255.9.9.9
```



Note: `SDT.` will not work in Office-, Java- or WEB-based controls.

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

SDT.P1

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** VAR or STRING

Example

```
'********************************
' SDT. - Sample
'********************************
'
EXE.?exepath\Sample Apps\TestApp_01.exe

STW.ct|PBWindowClass:0|TestApp
SCW.nc|2|Edit
SDT.We can write into a  Text-box

STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|SysIPAddress32|192.168.0.1
' Set the SysIP-Control in one strike
SDT.255.9.9.9

STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|Button|Button 2
SDT. change a button-text

STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Button|Check1
SDT.change this also
ENR.
```

Remarks

-

Limitations:

SDT. will only work on windows. It will normally not work with WEB-based or Office-Controls.

3.61.14 SEK. - Set Extended Key-State

MiniRobotLanguage (MRL)

SEK. Command

Set Extended Key-State

Intention

The SEK.-Command has two modes of operation.

In **Mode 1**, it can be used to set the state of NUMLOCK, CAPSLOCK and SCROLLLOCK.
What you set is really the "**state of the keyboard**". Not "the state of the button".

SEK.-will change the "real thing" exactly to the value that you provide in **P2**.

```
' Will set CAPSLOCK to ON
SEK.CAPSLOCK|1
```

In **Mode 2**, it can be used to set the state of the SHIFT, CTRL or the ALT-Key and others, see detailed list below. In this case you really change the state of the key, just like if you press or release the key physically.
Of course, if CAPSLOCK is activated, you will get a "1" if you check for SHIFT, even if you try to release either of the SHIFT keys.

```
' Will release the left SHIFT Button
SEK.LSHIFT|0
' Will press the right SHIFT Button
SEK.RSHIFT|1
```

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

SEK.P1[|P2]

Parameter Explanation

P1 **-** VAR or numeric

P2 **-** ***(optional) numeric,*** variable or value 0/1 . If omitted 0 is used.

Parameter-List for **P1:**

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
SHIFT          - any shift key (keyboard Shift-state)
LSHIFT         - only left Shift-Key
RSHIFT         - only right Shift-Key
STRG,CTRL      - any Ctrl key (keyboard Ctrl-state)
LSTRG,LCTRL    - only left Ctrl-Key
RSTRG,RCTRL    - only right Ctrl-Key
MENU,ALT       - any ALT key (keyboard ALT-state)
LMENU,LALT     - only left ALT-Key
RMENU,RALT     - only right ALT-Key
NUMLOCK,NUM    - keyboard NUMLOCK-State
CAPSLOCK,CAPS - keyboard CAPSLOCK-State
SCROLLOCK,SCROL,SCROLL - keyboard SCROLLLOCK-State
```

Example

```
'*****************************************************
' EXAMPLE 1: SEK.
'*****************************************************
SEK.CAPSLOCK|1
GEK.SHIFT|$$STA
DBP.$$STA
GEK.LSHIFT|$$STA
DBP.$$STA
GEK.RSHIFT|$$STA
DBP.$$STA
SEK.CAPSLOCK|0
ENR.
```

Remarks

3.61.15 SKI. - Send Key-Input

MiniRobotLanguage (MRL)

SKI. Command

Send Key Input

Intention

The `SKI.`-Command can be used to simulate Keyboard typing. SKI. is like if you really type something into the keyboard. This makes it very compatible with real typing 231.

`SKI.` uses internally `KYU.` and `KYD.` and can therefore intermixed with these Commands. It can also understand the Syntax from these Commands..
`SKI.` will work on any place, where you can also enter text using the keyboard.It will work in browsers, Java- and WEB-based controls.
Unlike with KYD. and KYU. you can type complete words into SKI. SKI. will internally format it and type it.

```
SKI.Hallo Welt
```

SKI. uses a special "Character by Character" Syntax. It will really type "Letter by letter". This is slower but it has its advantages in safety.

Here is an Example that will type something into Notepad.

As the ","-Sign is used as a delimiter for SKI. it can not be sent to the target window using SKI.
You can use the special Keycode `{OEMComma}` to send a Comma using SKI.

```
STW.ct|WordPadClass|Dokument - WordPad
SCW.nc|1|RICHEDIT50W|{&NOTEXT:}
MLM.w|423,139
SKI.This,{OEMComma},Hallo
SEK.{LALT}|1
SKI.{NUM_1},{NUM_4},{NUM_4}
SEK.{LALT}|0
ENR.

You can also use this {DN_ and {UP_ Option to just do it all in SKI.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
STW.ct|WordPadClass|Dokument - WordPad
'SWP.2605,585|539,283|T
SCW.nc|1|RICHEDIT50W|{&NOTEXT:}
MLM.w|423,139
SKI.{DN_LALT},{NUM_1},{NUM_4},{NUM_4},{UP_LALT}
ENR.

'While especially this example could have been done more easy using SDH.
'Like this:

SDH.144
```

As it is just like if "**somebody is really typing**", it has all advantages and all limitations from that.

- The target control must have Input focus
- the target window must be in front
- you may need to wait a bit (`PAU.0.5`) after typing until the control is ready
- `SKI.` its slower then any direct engine 231 command
- but its highly compatible
- it understands special keyboard-actions like ctrl- or Shift or Alt-Key (see below).
- It can not change the text of buttons or controls like `SDT.`.

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

SKI.P1

Parameter Explanation

P1 - `VAR or STRING can contain all Low-Level-Keycodes, may also contain Letters or words. All must be separated by ",". See:`

Keyboard-Keycode-List 2235

SKI. supports the prefix of `{DN_ and {UP_` for all cases where you only want to press a button down and hold it, or release a pressed button.

Note:

1.You can use this command to open Menu-Items using the Keyboard.

© 2023 Theo Gottwald * https://www.smart-package.com

2. Always use small letters. In the context of this command, letters are generally small, unless additionally the SHIFT-Key is pressed.

Example

```
STW.ct|WordPadClass|Dokument - WordPad
SCW.nc|1|RICHEDIT50W|{&NOTEXT:}
MLM.w|423,139
SKI.{DN_LALT},{NUM_1},{NUM_4},{NUM_4},{UP_LALT}
ENR.

' SKI. can be used with Variables
STW.ct|WordPadClass|Dokument - WordPad
SCW.nc|1|RICHEDIT50W|{&NOTEXT:}
MLM.w|423,139
$$TXT={DN_LALT},{NUM_1},{NUM_4},{NUM_4},{UP_LALT}
SKI.$$TXT
ENR.

SKI.$$TXT
SKI.Hallo,64,{ENTER}
```

Remarks

For easier Typing without Commas between Elements you can also try SKP. or SKT.

Limitations:

SKI. works on the lowest Level that the robot can reach. If there are windows which you can not type in, please make sure that you have Admin-Rights for the Robot-Executable/SPRE.

```
' This will not work, as SKP. internally will undo the Effects of SEK.
SEK.LALT|1
SKP.{NUM_1}{NUM_4}{NUM_4}
SEK.LALT|0

' This will work, as KYD. and KYU. are specially made for this.
KYD.{LALT}
KYD.{NUM_1}
PAU..1
KYU.{NUM_1}
PAU..1
KYD.{NUM_4}
PAU..1
KYU.{NUM_4}
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PAU..1
KYD.{NUM_4}
PAU..1
KYU.{NUM_4}
KYU.{LALT}

' OR USE
' This will also work
SEK.LALT|1
SKI.{NUM_1},{NUM_4},{NUM_4}
SEK.LALT|0
```

3.61.16 SKP. Send KeyPress

MiniRobotLanguage (MRL)

SKP. Command

Send Key Press

Intention

The `SKP.`-Command can be used to simulate Keyboard typing. SKP. is like if you really type something into the keyboard. This makes it very compatible with real typing 231.
Please note that for Safety-of-Typing-Consideration SKP. can not be intermixed with - for example SEK.-Command.
There might be some some cases that will require the use of KYU. / KYD. and SDI.-Command. Use these if it will not work with SKP.

`SKP.` will work on any place, where you can also enter text using the keyboard.It will work also in browsers, Java- and WEB-based controls.

As it is just like if "**somebody is really typing**", it has all advantages and all limitations from that.

- The target control must have Input focus
- the target window must be in front
- you may need to wait a bit (`PAU.0.5`) after typing until the control is ready
- `SKP.` its slower then any direct engine 231 command
- but its highly compatible
- it understands special keyboard-actions like ctrl- or Shift or Alt-Key (see below).
- It can not change the text of buttons or controls like `SDT.`.

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

SKP.P1

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 - VAR or STRING can contain all Low-Level-Keycodes: see:

Keyboard-Keycode-List 2235

SKP. understands **additionally** to these commands some special commands. To understand this better, let's see an example.

```
SKP.A{RETURN}
```

In this example, the SKP. will technically press each of the buttons and then release each of the buttons. Like this:

1. Press A
2. Release A
3. Press {RETURN}
4. Release {RETURN}

Now you may want to just press and hold a button down. And not release it immediately.

For example the SHIFT or the ALT-Button. This is done, by prefixing ANY of the Low-Level Key-code with a

```
{DN_...}   -  only push that button down
{UP_...}   -  only release that button
```

for example:

```
SKP.{DN_SHIFT}abc{UP_SHIFT}
```

will type:

```
ABC
```

in large letters, as we are holding down the SHIFT-Key in this example.
In the same way, you can open Menus or select menu-items.

Note:

1. To call Menu-Items using the Keyboard, prefer KYD. and KYU. especially if the CTRL, or ALT-Key is needed..

2. When combining Keys with SHIFT, always use small letters. Large letters will automatically be SHIFTED when typed.

3. When **combining Keys with CTRL or ALT,** things **may not work as expected** because safety of typing* will internally interfere with pre-pressed keys.
   Use KYD. and KYU. for such Combinations. .

4. SKP. will switch off CAPSLOCK and NUMLOCK before it starts typing. It will restore the previous state of CAPSLOCK and NUMLOCK when its ready with typing..

© 2023 Theo Gottwald * https://www.smart-package.com

5. SKP. will do a complete variable-resolution. It will resolve Specialfolders as well as Systemvariables before it starts typing.

---
* Safety of typing. Internal process to make sure that no CTRL and other keys are pressed on the physical keyboard, while we are simulating keystrokes.

Example

```
SKP..$$TXT
SKP. Hallo
```

Remarks

If you need more control over the keyboard, you can use KYD. and KYU.

Limitations:

SKP. will generally type into the window that has the Input-Focus. Also the state of the SHIFT-Key or the SCROLLLOCK or the NUMLOCK-Key can influence SKP. Therefore don't type while SKP. is at work.

```
' Some things may not work with SKP.
' For example:

' This will not work, as SKP. internally will undo the Effects of SEK.
SEK.LALT|1
SKP.{NUM_1}{NUM_4}{NUM_4}
SEK.LALT|0

' This will work, as KYD. and KYU. are specially made for this.
KYD.{LALT}
KYD.{NUM_1}
PAU..1
KYU.{NUM_1}
PAU..1
KYD.{NUM_4}
PAU..1
KYU.{NUM_4}
PAU..1
KYD.{NUM_4}
PAU..1
KYU.{NUM_4}
KYU.{LALT}

' OR USE
' This will also work
SEK.LALT|1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SDI.{NUM_1},{NUM_4},{NUM_4}
SEK.LALT|0
```

3.61.17 SKT. - Send - Key-Text

MiniRobotLanguage (MRL)

SKT. Command

Send Key Text

Intention

The `SKT.`-Command can be used to simulate Keyboard typing. SKP. is like if you really type something into the keyboard. This makes it very compatible with real typing 231.

`SKT.` will work on any place, where you can also enter text using the keyboard.It will work also in browsers, Java- and WEB-based controls.

As it is just like if "**somebody is really typing**", it has all advantages and all limitations from that.

- The target control must have Input focus
- the target window must be in front
- you may need to wait a bit (`PAU.0.5`) after typing until the control is ready
- `SKT.` its slower then any direct engine 231 command
- but its highly compatible
- it understands special keyboard-actions like ctrl- or Shift or Alt-Key (see below).
- It can not change the text of buttons or controls like `SDT.`.

`SKT.` - unlike `SKP.` does NOT understand any Special-Sequences like `{RETURN}` or `{SHIFT}` . It will just try to type whatever it gets. SKT. will not interpret any systemvariables or specialfolders. It will jut resolve a given variable and then start typing.

You can not make a "`NEWLINE`" with `SKT.` using `{RETURN}`. But you can make a NEWLINE like this:

```
VAR.$$TXA=abc$crlf$cba
SKT.$$TXA
```

Because `$crlf$` will be converted to `ASCII` using the `VAR.`-Command and `SKT.` will just type it. In some editors you will even get two newlines, one for the `$cr$` and one for the `$lf$`.

*© 2023 Theo Gottwald * https://www.smart-package.com*

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

SKT.P1

Parameter Explanation

P1 **-** VAR or STRING (NO specialfolders, NO systemvariables)

Example

```
' Type into Ulktraedit
STW.Act|Afx:|UltraEdit-32
SCW.c|EditControl
SAW.
VAR.$$TXA=abc$crlf$cba
SKT.$$TXA
END.
```

3.61.18 WNK. - Wait-No-Key

MiniRobotLanguage (MRL)

WNK. Command

Wait until No Key is pressed

Intention

The `WNK.`-Command can be used to wait until the user has stopped typing. If you specify a time, then the user must not press any key for that time, before `WNK.` will let the robot continue.

You can read more about Keyboard-Simulation and Text-Boxes in the chapter:
1.9.1.6 Edit-Textbox Control 194

Syntax

WNK.[P1]

Parameter Explanation

P1 **-** `optional VAR or numeric,`

`WNK.1.5 for examples, will wait until the user has not pressed any key for maximum 1.5 seconds.`

Example

```
'*****************************************************
' EXAMPLE 1: WNK
'*****************************************************
WNK.
WNK.0.2
```

3.62.2 DOL. - OOP. - Conditional Loop

MiniRobotLanguage (MRL)

DOL. ... OOP. Commands

DO ... LOOP, WHILE ... WEND or REPEAT ... UNTIL

Intention

Repeat a group of instruction in different ways. Lets start with the endless loop.

```
' Endless loop
DOL.1
...
OOP.
:exit
```

You can construct a "WHILE ... WEND" Loop.

```
' WHILE ... Loop
DOL.($$CON=1)
...
OOP.
```

This loop will be repeated WHILE ($$CON=1). In fact the formula in the condition is calculated. If the result is not zero, the loop continues running. Otherwise the loop is been left. Think of it as a "WHILE cond ... WEND" Loop.
This type of loop will never be entered, when the condition is not met. It will continue running, while the condition is not zero.

You can make a "REPEAT UNTIL" loop. Just write the condition at the bottom, after the OOP. Like this:

```
' REPEAT ... UNTIL - Loop
DOL.
...
OOP.($$CON=0)
```

This loop will run UNTIL the condition is met. The condition formula is been calculated. If the result is not zero, the loop execution continues. This type of loop will run UNTIL the condition is not zero. Also its guaranteed that the loop inside is executed at least once.

Technically you can even combine both loops and give two exit conditions. One at the top, and one at the bottom. While this special loop does not make much sense, in real life.

Syntax

 *© 2023 Theo Gottwald * https://www.smart-package.com*

DOL. ... OOP.
DOL.P1 ... OOP.
DOL. ... OOP.P1

Parameter Explanation

P1 - Condition of loop execution

```
' You can make an endless loop like this
DOL.1
...
OOP.

' Condition on Top of Loop, prevents entering of Loop if not
met.
' Condition at top is WHILE ... WEND condition.
DOL.$$AAA<9
...
OOP.

' Condition on Bottom of Loop, guarantees
' loop is entered at least once.
' condition at bottom is "REPEAT ... UNTIL cond"
' when condition is true, loop is left!
DOL.
...
OOP.$$AAA<9

' You can have cond at Top and Bottom, too.
DOL.$$AAA<9
...
OOP.$$AAA<9
```

Speed in Ticks:

This command uses around 19 Ticks for a simple "DOL.1". With difficult to calculate Conditions as Parameters its a bit more.

Example

```
VAR.§§FIA=?pfad\myfile1.txt
VAR.§§FIB=?pfad\myfile2.txt
' This variable will be set to 1 if the file is found
: §§XIT=0
' Here is our endless loop
DOL.§§XIT=0
  PRT. I am here!
' We test for File1
  IEF.§§FIA
    : §§XIT=1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  EIF.
' We test for File2
  IEF.§§FIB
    : §§XIT=1
  EIF.
  ' We'll give the CPU a tenth of a second sleep time
  ' always do this in endless loops to save CPU time.
  ' for other running programs
  PAU.0.1
OOP.
:exit
MBX. A file appeared!
ENR.
```

Remarks

While technically not needed, its recommend that you put the condition in formula brackets (..).

Limitations:

There are **no limitations** about nesting of Loop and other constructs in any way. The condition formula can be as complex as you want. It will be calculated using the same rules like in the CAL. - Instruction.

3.62.3 FOR. - NEX. Counting Loop

MiniRobotLanguage (MRL)

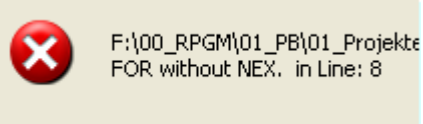
FOR. Command

For NEX Counting Loop

Intention

If you don't know the terms "Loop" and have no idea what a "FOR ... NEXT" Loop is, please read the section: 1.6.2. Looping around 126.
This section describes the basics of Loops and the `FOR ... NEX` - Loop.

The `FOR. ... NEX.` commands belong together and need to be paired in your script.
For each FOR. there must be a matching `NEX.` If that is not the case, you will get this error:



There are basically 2 Modes of operation for the `FOR. ... NEX.` – command.

Mode 1: Floating Point-Mode:
Imagine you want to count from 0.1 to 0.5 in steps of 0.02. Let's try that:

```
' The 80-bit Floating Point Loop
FOR.$$CNT|0.1|0.5|0.01
  DBP.$$CNT
NEX.
ENR.
```

```
[9] .45
[9] .46
[9] .47
[9] .48
[9] .49
[9] .5
MRE: Robot ended:
```

You see that its easy.

Once the robot finds a "**0.x**" or a variable, anywhere in your FOR. - line, he will choose internally an 80-Bit IEE Floating Point variable with highest precision.
You get up to 16 significant digits.
It has a theoretical range of: +/- 3.4*10^-4932 to 1.2*10^4932.

This happens automatically, you do not need to think about it.

© 2023 Theo Gottwald * https://www.smart-package.com

Mode 2 - 64 bit INTEGER Mode:
In case the robot finds a line like this:

```
FOR.$$CNT|1|13
```

or like this:

```
FOR.$$CNT|1000000000000|1000000000010
```

He will choose the 64-bit Integer mode. In this Mode you have Integers in the range of: **-2^63 to 2^63 -1 that is +/- 64 bit.**

In any of the twi Modes, you can specify a negative step.

```
FOR.$$CNT|13|1|-1

FOR.$$CNT|0.1|0.3|-.001
```

both are completely valid.

Can you jump out of a loop before it has ended?
Yes, you can. Generally jumping out of loops anytime is completely legal.

However this specific Loop will keep the loop-variable an will not reinitialize it, because the loop did not yet end.

Therefore, in case you want to use that specific loop again, you have to add one line of code. It's not more then a simple variable assignment. Do it, then jumping out is completely legal. Here is an example that shows the needed manual loop-variable initialization.

```
:again
: $$CNT=13
FOR.$$CNT|13|1|-1
JMP.out
NXT.
JMP.again
```

This way, you manually reset the Loop-Variable. And that's all to know about jumping around.

How about some speed considerations?

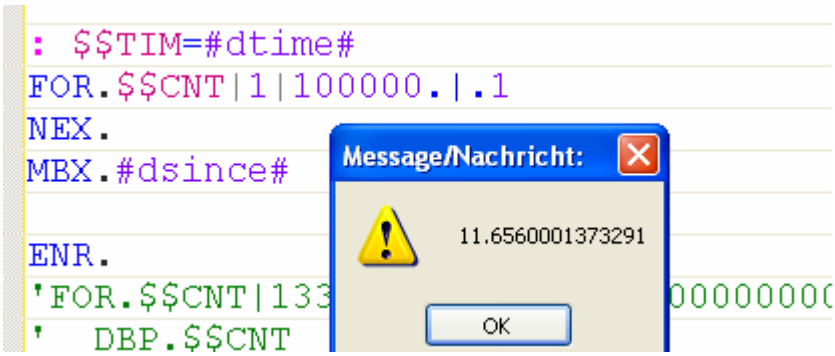
Now lets take a quick look on execution speed. How fast are such loops processed?

Let's try the floating point loop with **1 Million iterations**!
We use this script:

```
: $$TIM=#dtime#
FOR.$$CNT|1|100000.|.1
NEX.
MBX.#dsince#
```

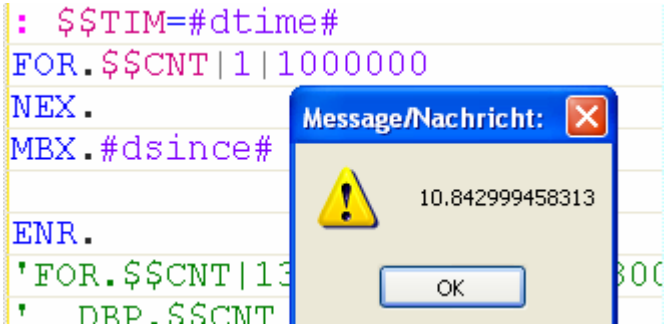
© 2023 Theo Gottwald * https://www.smart-package.com

Of course we need to "compile" the script to get full speed.



It runs in **11.6 seconds!***

Let's see the Integer Mode-Loop.



It needs **10.8 seconds for 1 Million iterations*.** This will show you, that Looping comes to you at a very low price in terms of speed!

*These numbers depend heavily on your PC-system. We give them just as an example.

Syntax

FOR.P1|P2[|P3][|P4]

Parameter Explanation

P1 - counter-variable - VAR
P2 - start-number - NUM
P3 - end-number - NUM
P4 - ***(optional)*** step - NUM

Speed in Ticks:

This command uses typically around 250 Ticks.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************************
' EXAMPLE 1: CTI. Write INI-File
'*****************************************************
'DBM.2
JNF.Move-Console.txt

IVV.§§RES=1
PRT. Ini was written with success!
ELS.
PRT. Ini was NOT written with success!
EIF.
' Now we write without check
CTI.§§FIL|§§SEC|§§KEY|§§VAL

' Now we read the file
EXO.§§FIL

MBX. Now we delete this key!
CTI.§§FIL|§§SEC|§§KEY
MBX. Now we delete the whole section!
CTI.§§FIL|§§SEC

END.'*************************************
' Sample 1: FOR. / NEX
'*************************************
FOR.§§AAA|1|100
' Loops from 1 to 100
NEX.

FOR.§§AAA|1|100|2
' Loops from 1 to 100 with increment 2
NEX.

FOR.§§AAA|100|1
' Loops from 100 to 1 step -1 can be omitted
NEX.

: $$TAR=100
FOR.$$AAA|$$TAR|1|-0.5
' Loops from 100 to 1 step -0.5
NEX.

FOR.§§AAA|$$STA|$$TAR|§§STP
' Loops from $$STA to $$TAR step §§STP
NEX.
END.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

FOR. ... NEX. can be nested to unlimited depth.
There is 1:1 paired connection between each FOR ... and the corresponding NEX.

If you do not leave a FOR.-Loop at the NEX.-Command, then the LOOP will stay "active". For example, if you jump out of a FOR.-Loop during the Loop-Run.
If you go into this Loop later, the Robot may be irritated and not reset the Loop-Variable because he thinks "That Loop is still active".
This is normal behvior, because you can also call Subprogrammes or Sub-Skripts from inside a FOR.-Loop.

Therefore in such cases i recommend to add a Initialization to any FOR.-Loop where you want to jump out before the end of the loop. Like this:

```
' Loop Initilization
VAR.$$LOP=1
FOR.$$LOP|1|99
```

Limitations:

If you **jump out** of a FOR...NEX-Loop **before it has ended**, the Loop-Counter Variable will keep the last value in case you call that same loop again.

In this case, the loop will not start, like normal, but just continue Looping from where it left of, when you jumped out.

Therefore, if you jump out of a FOR. ... NEX:-Loop. And if you want to call that same Loop again, you have to manually initialize the Loop-Variable, immediately before the loop.

Do not jump out of a FOR. - NEX. Loop using JMP. or any Jump, unless you make a manual Loop-initialization. Like in the example below.

```
'****************************************
' Sample Jump out of FOR. / NEX
' before End
'****************************************
: §§PAR=Teststring

' The following Line is necessary if you want to
' jump out of the Loop using JMP. or such commands.
' Otherwise the FOR. would not initialize the
' variable the next time it is used.
'
' This is the needed line:
: §§LOP=1
FOR.§§LOP|1|§§EIM
 ' This command will jump to Label "eoa"
 SAO.nrToN|§§PAR|&H028|eoa|§§LOP
 MMV.
NEX.
:eoa
```

© 2023 Theo Gottwald * https://www.smart-package.com

Doing like this, it is completely legal to jump out of as many Loops as you want.

3.62.4 NEX. - Bottom of FOR.-Loop

MiniRobotLanguage (MRL)

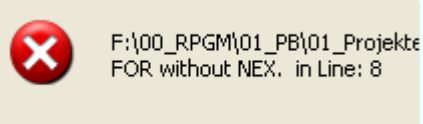
NEX. Command

End of Loop

Intention

Used only together with the FOR. command.

The `FOR. ... NEX.` commands belong together and need to be paired in your script.
For each FOR. there must be a matching `NEX.` If that is not the case, you will get this error:



If you don't know the term "Loop" and have no idea what a "FOR ... NEXT" Loop is, please read the section: 1.6.2. Looping around 126.
This section describes the basics of Loops and the `FOR ... NEX` - Loop.

There are basically 2 Modes of operation for the `FOR. ... NEX.` – command.

Mode 1: Floating Point-Mode:
Imagine you want to count from 0.1 to 0.5 in steps of 0.02. Let's try that:

```
' The 80-bit Floating Point Loop
FOR.$$CNT|0.1|0.5|0.01
  DBP.$$CNT
NEX.
ENR.
```

```
[9] .45
[9] .46
[9] .47
[9] .48
[9] .49
[9] .5
MRE: Robot ended:
```

You see that its easy.

Once the robot finds a "**0.x**" or a variable, anywhere in your FOR. - line, he will choose internally an 80-Bit IEE Floating Point variable with highest precision.

© 2023 Theo Gottwald * https://www.smart-package.com

You get up to 16 significant digits.
It has a theoretical range of: +/- 3.4*10^-4932 to 1.2*10^4932.

This happens automatically, you do not need to think about it.

Mode 2 - 64 bit INTEGER Mode:
In case the robot finds a line like this:

```
FOR.$$CNT|1|13
```

or like this:

```
FOR.$$CNT|1000000000000|1000000000010
```

He will choose the 64-bit Integer mode. In this Mode you have Integers in the range of: **-2^63 to 2^63 -1 that is +/- 64 bit.**

In any of the two Modes, you can specify a negative step.

```
FOR.$$CNT|13|1|-1

FOR.$$CNT|0.1|0.3|-.001
```

both are completely valid.

Can you jump out of a loop before it has ended?
Yes, you can. Generally jumping out of loops anytime is completely legal.

However this specific Loop will keep the loop-variable an will not reinitialize it, because the loop did not yet end.

Therefore, in case you want to use that specific loop again, you have to add one line of code. It's not more then a simple variable assignment. Do it, then jumping out is completely legal. Here is an example that shows the needed manual loop-variable initialization.

```
:again
: $$CNT=13
FOR.$$CNT|13|1|-1
JMP.out
NXT.
JMP.again
```

This way, you manually reset the Loop-Variable. And that's all to know about jumping around.

How about some speed considerations?

Now lets take a quick look on execution speed. How fast are such loops processed?

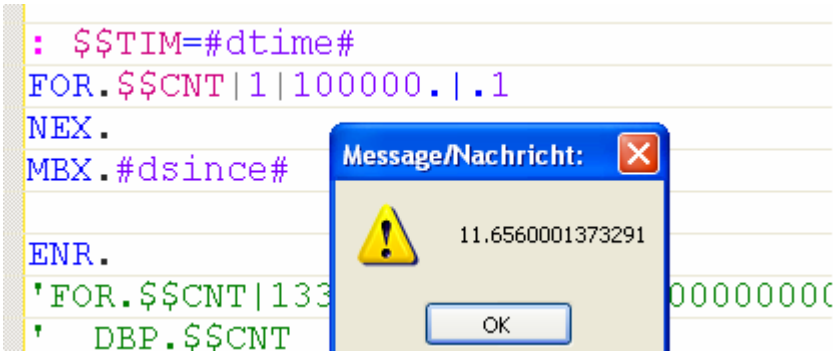
Let's try the floating point loop with **1 Million iterations**!
We use this script:

```
: $$TIM=#dtime#
```

© 2023 Theo Gottwald * https://www.smart-package.com

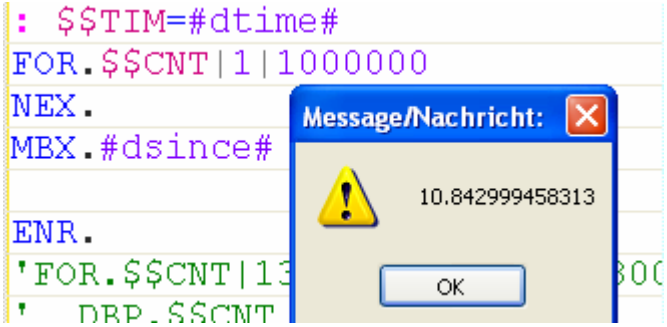
```
FOR.$$CNT|1|100000.|.1
NEX.
MBX.#dsince#
```

Of course we need to "compile" the script to get full speed.



It runs in **11.6 seconds!***

Let's see the Integer Mode-Loop.



It needs **10.8 seconds for 1 Million iterations*.** This will show you, that Looping comes to you at a very low price in terms of speed!

*These numbers depend heavily on your PC-system. We give them just as an example.

Syntax

NEX .

Parameter Explanation

Speed in Ticks:

This command uses typically around 5 Ticks.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
: $$TIM=#dtime#
FOR.$$CNT|1|1000000
NEX.
MBX.#dsince#
```

Remarks

See the suggested Links below to get more information on `FOR .. NEX.` and Loops.

3.62.5 OOP. - Bottom of DOL.-Loop

MiniRobotLanguage (MRL)

OOP. Command

Bottom of DOL.-Loop

Intention

The OOP. is a Loop-Comand. It can construct all sorts of Loops, depending if you add a conditional parameter or not..
Used in conjunction with the `DOL.` command. For Details see here:
DOL. - OOP. - Conditional Loop 2299

Syntax

```
OOP.[P1]
```

Parameter Explanation

Speed in Ticks:
This command uses typically around 20 Ticks.

Example

```
See examples in the DOL Command
```

Remarks

-

Limitations:

-

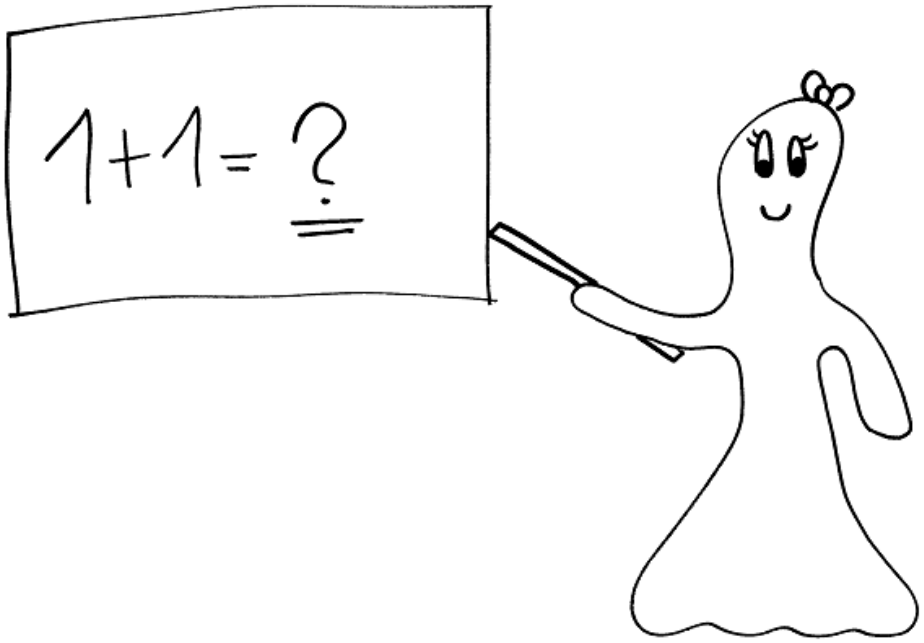
3.63 Mathematical and algorithmic operations

3.63.1 ! Smarty's mathematical commands

Smarty's mathematical commands Previous 2312 Top 41 Next 2315

Smarty's mathematical and algorithmic operations



*© 2023 Theo Gottwald * https://www.smart-package.com*

3.63.2 CAL. - mathematical CALculation

MiniRobotLanguage (MRL)

CAL. Command

mathematical CALculation

Intention

Solve mathematical calculations. With the `CAL.` Command, you can assign a Variable the result of a mathematical Calculation. And it can help you to prepare complicated decisions. Here is a simple example:

```
CAL.$$RES=3+9
MBX. The result of 3+9 is: $$RES
```

The `CAL.` command knows how to solve (..). You can also do this:

```
CAL.$$RES=3+(9*5)+(8+3/3)
MBX. The result is: $$RES
```

What is the result of this last calculation?
Is it 57 or is it 51.66666 ?

The correct answer is 57. Because calculations with * or / have precedence before + or -.
In fact this is calculated:

```
CAL.$$RES=3+(9*5)+(8+(3/3))
```

And that is the reason, why the correct result is 57. As you can see CAL. knows that. It will calculate mathematically correct.Here are some more advantages of CAL.

- You can use as complicated formulas as you want.
- you can use as many nested brackets as you like.
- get extended precision in all calculation
- include decisions into your calculations
- custom rounding of results
- very fast (~10000 calculations per second)

`CAL` includes a mechanism to embed decisions into the formula. Here is an example:

```
: $$MAA=12
: $$MAB=9
' Calculate an unlimited complicated decision into just one
result:
CAL.$$RES=($$MAA>9)+($$MAB<5)
' Here you get an result in $$RES that is 0,1 or 2
' Now you can make a decision:
IVV.$$RES=0
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
     ' Do something
ELS.
     ' Do something else
EIF.
```

CAL uses "Operator Precedence" and understands negative or positive signed numbers.

Syntax

CAL.P1=[N/V][Operator][...][|P2]

Parameter Explanation

[N/V] = Numerical Value or variable containing a numerical value

[Operator] = **+ - * / \ ^ %**

+ Addition
- Subtraction
* Multiplication
/ Division
\ Integer-Division
% is the "Modulo Operator"
^ power

The result of these numeric operations is a always a Floating-Point Number.

The following Operators enable you to **include decisions** into the formula.
! unequal -Operator
= Equal-Operator
< smaller then
> greater then

The Result of these logical operation is always 0 or 1.
Unlike elsewhere, the Operators do NOT work binary, but on decision true (1) or false (0). See Examples.
P2 - optional Options. Using these Options, you can round or truncate the result of the calculation to an integer. Using this Options, you can use the CAL-Command to round one variable into another one.

CAL uses "Operator Precedence" as follows:

1. The logical Decisions: =!<> are calculated first with equal priority.
2. The ^ Operator is been calculated before any other numerical calculation.
3. The "*/\%" Operators are calculated with equal precedence each after the other next.

© 2023 Theo Gottwald * https://www.smart-package.com

4. Finally the "+-" are calculated.

Custom rounding of results:

CAL. without any Option specified uses 80 bit Extended Precision for all Calculations.
Using the Options, you can manipulate the result of the operation:

```
- i (INTEGER)
- c (CEIL)
- x (FIXPOINT)
- f (FRACTIONAL)
- a (ABSOLUTE)
- r (ROUND) - makes a rounding to 2 decimal places (money ...)
- s (SIGN)
- t (SQR - Square Root)
- u (SIN)
- v (COS)
- w (LOG) - in this special case, the function checks
internally, if the result is not zero. Only then the LOG will
be calculated. Otherwise the result is zero.
```

In Detail:
- "**r**" Rounding is done according to the "banker's rounding" principle: if the fractional digit being rounded off is exactly five, with no trailing digits, the number is rounded to the nearest even number. This provides better results, on average, than the simple "round up at five" approach.
- "**x**" FIX strips off the fractional part of its argument, and returns the integer part. Unlike INT, FIX does not perform any form of rounding or scaling.
- "**i**" INT rounds numeric_expression to the largest integer-class value that is less than or equal to result.
- "**c**" The CEIL function rounds upward, returning the smallest integer value that is greater than or equal to result. For example, CEIL with 1.5 would places the value 2 into Result.
- "**f**" FRAC returns the number after the decimal point of a floating-point number or expression. FRAC rounds the result of fit the precision of the target h, as per IEEE specifications.
- "**a**" The absolute value of a number is its non-negative value. For example, the absolute value of -3 is 3, and the absolute value of +3 is also 3. The absolute value of 0 is 0.
- "**s**" If numeric_expression is positive, SGN returns 1. If numeric_expression is zero, SGN returns 0. If numeric_expression is negative, SGN returns -1.

Speed in Ticks:
This depends heavily on teh used Formula. A rather simple Formula with additional rounding to Integer uses around 260 Ticks.

Example

```
Eval-Example:
' The variable contains a formula now.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$FOM=3*5+9
CAL.$$RES=$$FOM

VAR.$$BBB=0.5
CAL.$$AAA=123.5*$$BBB+0.9|iar

'Example 2:
' Please note that the second part ($$BBB+.5)*($$AAA=1)
' evaluates to zero, when $$AAA=0 because of the use of
' the "=" Operator.
VAR.$$BBB=-5
CAL.$$AAA=(3^-19)+($$BBB+.5)*($$AAA=1)
PRT.L-RESULT:$$AAA

CAL.(4^19)+($$BBB+.5)|i
POP.$$AAA
PRT.Q-RESULT:$$AAA

CAL.(4^19)+($$BBB+.5)
POP.$$AAA
PRT.RESULT:$$AAA

CAL.(4^19)+($$BBB+.5)|r
POP.$$AAA
PRT.RESULT:$$AAA
DMP.

END.
```

Remarks

Depending on complexity of the formula, the CAL.-Command can calculate several thousands of calculations each seconds. The typical speed is between 4000 to 10000 formulas per second on a 3.00 GHz machine.

Limitations:

Does it have limitations? Lets see ...
Doing this:

```
CAL.$$RES=3+(9*5)+((8+3)/3)
```

we get this result:

```
51.6666666666667
00.1234567890ABC
```

We have extended precision. As you can see, we get 12 significant numbers after the "." and a last one that is rounded. My other scientific calculator just gives me 7.

CAL. calculates Formulas of unlimited complexity, there is **no** Limitation in:

© 2023 Theo Gottwald * https://www.smart-package.com

- total Length of the Formula
- How many () are used and nested.
other then the normal 2 GB Limit for total variable storage.

`CAL` works internally with Extended precision (FPU-Registers). They have a range of approximately **+/- 3.4x10^-4932 to 1.2x10^4932**, and offer between a total of 16-18 digits of precision.

3.63.3 CAX. - Calculate Extended

MiniRobotLanguage (MRL)

CAX. Command

extended scientific CALculations

Intention

Solve scientific mathematical calculations. With the `CAX.` Command, you can assign a Variable the result of a mathematical Calculation. Unlike `CAL.`, `CAX.` is a full featured scientific calculator.

Here are some of the features:

- Using extended precision, 16 to 18 digits of precision is obtained.
- get extended precision in all calculation
- custom rounding of results
- fast (~500 calculations per second)
- in case of errors, Error-Messages on TOS 104
- Large set of trigonometric functions
- Large set of scientific constants and conversions already built in (see below).
- Input of angles can be in degrees or radians.
- Trigonometric output using the ARC functions will always be in radians.
- You can transform angles to radians and vice versa using the built-in conversions.
- You can use as complicated formulas as you want.
- you can use as many nested brackets as you like.
- finally: Factorials can be calculated up to 1754! without overflow!

Supported Operators and expressions:

`+ - * / \ ^ ! ( ) < = > <> >= <=`

Operator precedence:
The Operator Precedence follows as closely as possible the common standards.
The only exception is the unary negation operator which does not have a special priority
following exponentiation.
Operations inside parentheses always have the highest priority and are always evaluated first. Thus by using parentheses in the right places you can always obtain the operator precedence you need for your calculation.

The following operator precedence is used in the program:

```
1. parentheses ( )
2. unary operators (Factorials (!) )
3. one argument functions
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
4. exponentiation (^) (power expressions)
5. multiplication (*) and floating-point division (/)
6. integer division (\)
7. modulo (MOD)
8. addition (+), subtraction (-)
9. relational operators (<, <=, =, >=, >, <> )
10. NOT, ISFALSE and ISTRUE
11. AND
12. OR and XOR (exclusive OR)
13. EQV (equivalence)
14. IMP (implication)
```

Trigonometric functions:

```
"ARCSINH() - Arc (Inverse) Hyperbolic Sine"
"ARCCOSH() - Arc (Inverse) Hyperbolic Cosine"
"ARCTANH() - Arc (Inverse) Hyperbolic Tangent"
"ARCSECH() - Arc (Inverse) Hyperbolic Secant"
"ARCCSCH() - Arc (Inverse) Hyperbolic Cosecant"
"ARCCOTH() - Arc (Inverse) Hyperbolic Cotangent"
"ARCSIN()  - Arc (Inverse) Sine"
"ARCCOS()  - Arc (Inverse) Cosine"
"ARCSEC()  - Arc (Inverse) Secant"
"ARCCSC()  - Arc (Inverse) Cosecant"
"ARCCOT()  - Arc (Inverse) Cotangent"

"SECH()    - Hyperbolic Secant"
"CSCH()    - Hyperbolic Cosecant"
"COTH()    - Hyperbolic Cotangent"
"SEC()     - Secant"
"CSC()     - Cosecant"
"COT()     - Cotangent"
"SIN()     - Sine","COS() - Cosine"
"TAN()     - Tangent"
"ATN()     - Arc (Inverse) Tangent"
"LN()      - Natural Log (base E)"
"EXP2()    - Exponentiation of 2 or Antilog 2"
"EXP10()   - Exponentiation of 10 or Antilog 10"
"EXP()     - Exponentiation of E or Antilog E"
"SQR()     - Square Root","LOG10() - Common Log (base 10)"
"ABS()     - Absolute Value"
"LOG2()    - Log (base 2)"
"LOG()     - Natural Log (base E)"
```

Logical Operations:

```
"AND"       - Logical AND
"XOR"       - Logical XOR (Exclusive OR)
"OR"        - Logical OR
"MOD"       - MOD (Modulo)
"IMP"       - Logical IMP (Implication)
"EQV"       - Logical EQV (Equivalence)
"NOT"       - NOT
"ISTRUE"    - Logical Truth
"ISFALSE"   - Logical Falsity
"CEIL()"    - Ceiling
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  "FRAC()"    - Fractional Part
  "FIX()"     - Truncate To Integer
  "SGN()"     - Sign
```

Important:

While FALSE is always zero, Logical **TRUTH** is been flagged with **-1.**

Usage example:

```
: $$NUA=36
CAX.$$NUM=SIN($$NUA)+5
DBP.Result is $$NUM in Radians

: $$NUA=36
CAX.$$NUM=SIN($$NUA)+5|#
DBP.Result is $$NUM in Degree
```

Know Constants:

A number of constants and conversions are available, making this math evaluator an advanced scientific calculator.

Let us start with PI and Euler:

```
 "PI#"
3.14159..
 "E#"
2.71828..
```

Known Conversion Constants:

```
 "Foot_TO_meter"                          = "*1/

Input of angles can be in degrees or radians, depending if you specify the "#" as an additional flag. However, trigonometric output using the ARC functions will always be in radians. You can transform angles to radians and vice versa.

Here is a simple example:

```
CAX.$$RES=3+9
MBX. The result of 3+9 is: $$RES
```

In case of errors, the result will be zero and you will find an error-message on the TOS[104]. Also the Timeout-Flag will be set to show you there was an error. Here is an example:

```
CAX.$$NUM=SIN((9)
DBP.Result is $$NUM

ITO.
  DBP.There was an Error:$$000
EIF.
ENR.
```

```
Stackpos: 000 ->String      :   Error in Expression: Parentheses mismatch
--------------------------------
```

Important:
Expressions and functions should be entered strictly according to standard algebraic syntax rules.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

CAX.P1=[N/V][Operator][...][|P2]

Parameter Explanation

[N/V] = Numerical Value or variable containing a numerical value

[Operator] = **+ - * / \ ^ %**

```
+ Addition
- Subtraction
* Multiplication
/ Division
\ is the "Modulo Operator"
^ power
! Factorial
```

The result of these numeric operations is a always a Floating-Point Number.

The following Operators enable you to **include decisions** into the formula.

```
<>  unequal -Operator
=   Equal-Operator
<   smaller then
>   greater then
<=  smaller then
>=  greater then
```

The Result of these logical operation is always 0 or -1.

Logical Operations:

```
"AND"       - Logical AND
"XOR"       - Logical XOR (Exclusive OR)
"OR"        - Logical OR
"MOD"       - MOD (Modulo)
"IMP"       - Logical IMP (Implication)
"EQV"       - Logical EQV (Equivalence)
"NOT"       - NOT
"ISTRUE"    - Logical Truth, anything else
              then 0 will result in -1
"ISFALSE"   - Logical Falsity, only 0 will result in -1
"CEIL()"    - Ceiling
"FRAC()"    - Fractional Part
"FIX()"     - Truncate To Integer
"SGN()"     - Sign
```

Important:

While **FALSE** is always **zero**, Logical **TRUTH** is been flagged with **-1.** This is different to the CAL.-command which flags truth with 1. Example:

© 2023 Theo Gottwald * https://www.smart-package.com

```
CAX.$$NUM=(5>1)
DBP.Result is $$NUM
' Result is -1

CAL.$$NUM=(5>1)
DBP.Result is $$NUM
' Result is 1
```

P2 - optional Rounding Options. Using these Options, you can round or truncate the result of the calculation to an integer in many way.

Custom rounding of results:

`CAX.` without any Option specified uses 80 bit Extended Precision for all Calculations.
Using the Options, you can manipulate the result of the operation:

```
- i (INTEGER)
- c (CEIL)
- x (FIXPOINT)
- f (FRACTIONAL)
- a (ABSOLUTE)
- r (ROUND) - makes a rounding to 2 decimal places (money ...)
- s (SIGN)
- # (Radian to Degree switch), if omitted Radian is default
```

In Detail:
- "**r**" Rounding is done according to the "banker's rounding" principle: if the fractional digit being rounded off is exactly five, with no trailing digits, the number is rounded to the nearest even number. This provides better results, on average, than the simple "round up at five" approach.
- "**x**" FIX strips off the fractional part of its argument, and returns the integer part. Unlike INT, FIX does not perform any form of rounding or scaling.
- "**i**" INT rounds numeric_expression to the largest integer-class value that is less than or equal to result.
- "**c**" The CEIL function rounds upward, returning the smallest integer value that is greater than or equal to result. For example, CEIL with 1.5 would places the value 2 into Result.
- "**f**" FRAC returns the number after the decimal point of a floating-point number or expression. FRAC rounds the result of fit the precision of the target h, as per IEEE specifications.
- "**a**" The absolute value of a number is its non-negative value. For example, the absolute value of -3 is 3, and the absolute value of +3 is also 3. The absolute value of 0 is 0.
- "**s**" If numeric_expression is positive, SGN returns 1. If numeric_expression is zero, SGN returns 0. If numeric_expression is negative, SGN returns -1.

Example

```
'#####################################
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' CAX. - Examples
'#####################################
'
CAX.$$NUM=PI#|c
DBP.Result is $$NUM
' Result is 4
'
CAX.$$NUM=PI#|i
DBP.Result is $$NUM
' Result is 3
'
CAX.$$NUM=SGN(-0.43)
DBP.Result is $$NUM
' Result is -1
'
CAX.$$NUM=ISFALSE(-0.43)
DBP.Result is $$NUM
' Result is 0

END.
```

Remarks

Depending on complexity of the formula, the CAX.-Command can calculate several hundreds of calculations each seconds. The typical speed is between 100 to 500 formulas per second on a *3.00 GHz* machine.

Note that the MOD Operator (`\,%`) is different, and the result of logical operations are different (-1/1) in `CAX.` and `CAL`. Therefore be careful when switching formulas over.

Limitations:

`CAX` works internally with Extended precision (FPU-Registers). They have a range of approximately **+/- 3.4x10^-4932 to 1.2x10^4932**, and offer between a total of 16-18 digits of precision.

Coordinate System Transform

Intention

The `CST`-Command can transform Coordinates between different coordinate systems.

Currently we can use three coordinate systems:

```
1. Screen Coordinates
2. Window Coordinates (these include the Non-Client Area)
3. Client Area Coordinates
```

For more details on these coordinate systems see here: 3.6 Using Quadrant-Coordinates 356

Using `CST.` you can transfer Point Coordinates like:

```
120,100
```

as well as Rectangle-Coordinates, like

```
120,100,200,400
```

from any of the three above coordinate systems to any of the three coordinate systems.
Here are some examples:

```
' Use Coordinates from Stack, Store Result on Stack
' Window handle is in $$MYW
' Transform Client -> Window Coordinates
CST.cw||$$MYW

' Use actual window as reference
' Transform Screen -> Client Coordinates
CST.s to c|$$REC

' Use Coordinates from Stack, Store Result on Stack
' Transform Window -> Screen Coordinates
CST.w_to_s

And some more examples:

CST.sc|$$REC|$$MYW

CST.cw|$$REC|$$MYW
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
CST.s to c|$$REC|$$MYW

CST.c_to_w|$$REC|$$MYW

CST.sc|$$REC|$$MYW
```

Syntax

CST.P1[|P2][|P3]

Parameter Explanation

P1 **-** Prototype that describes which transformation to do: The following are available:

```
"s to w","sw","s_to_w" - Screen Coordinates to Window coordinates
"s to c","sc","s_to_c" - Screen Coordinates to Client coordinates
"c to s","cs","c_to_s" - Client Coordinates to Screen coordinates
"c to w","cw","c_to_w" - Client Coordinates to window coordinates
"w to c","wc","w_to_c" - Window Coordinates to Client coordinates
"w to s","ws","w_to_s" - Window Coordinates to Screen coordinates
```

Any of the three possible prototypes for each transformation is valid, you can choose how much you want to type.

P2 **-** ***(optional)*** Variable that contains whether Point- or Rectangle Coordinates. They have to be in one of these formats:.

a) `x1,y1`

b) `x1,y1,x2,y2`

If you omit **P2**, the command will try to get the coordinates from the TOS.

P3 **-** ***(optional)*** Variable that contains the handle of the window, that should be used for the transformation. If you omit **P3** then the actual window-handle will be taken. If there is no valid actual window, the desktop-window (Screen coordinates) will be used.

Example

```
' Use the Testapplication
' for this Sample Script
STW.ct|MyClassName|Sample Application
HTV.$$MYW
SCW.nct|1|Edit|{&NOTEXT:}
MMV.
GAR.$$REC
DBP.$$REC
' Convert Screen->Client
CST.sc|$$REC|$$MYW
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Client->Window
CST.cw|$$REC|$$MYW
DBP.$$REC
' Window->Client
CST.wc|$$REC|$$MYW
' Client -> Screen
CST.cs|$$REC|$$MYW
DBP.$$REC
ENR.
```

3.63.5 FZC. - Fuzzy Compare

MiniRobotLanguage (MRL)

FZC. Command

Fuzzy Compare

Intention

Compare two strings with one of two alternative fuzzy logic algorithms.

`FZC.` in Mode 1 uses a percentage from 0 to 100.
`FZC.` in Mode 2 (use P3, "m"-Flag) calculates a error number starting from 0 if two strings are equal.

In both modes, you will find the internally calculated "Match-value" on TOS.
The firs example will evaluate to 95% and therefore leave a 95 on the TOS.

```
$$TXB=ABCDEFGHIJK
$$TXA=ABCEFGHIJK

FZC.$$TXA|$$TXB
DBP.$$000
ENR.
```

In Mode 2 we deal with "typing errors". Take this example:

```
$$TXB=ABCDEFGHIJK
$$TXA=ABCEFGHIJK

FZC.$$TXA|$$TXB|m
DBP.$$000
ENR.
```

Will drop a "`1`" on TOS. It indicates that if you type one character at the right place, these strings could be equal. Note that a missing or deleted char is always one typing error.

If you want to base a decision on the result of the comparison, prefer
IFC. - If Fuzzy Compare 2340 .

Syntax

FZC.P1|P2[|P3]

Parameter Explanation

*© 2023 Theo Gottwald * https://www.smart-package.com*

P1 **-** Variable A to compare

P2 **-** Variable B to compare

P4 **-** ***(optional)*** can be omitted or can be "m". In that case another algorithm is used to compare **P1** and **P2**.

In detail the difference is:

- Algorithm 1 (no "m"-Flag):
  Result on TOS is a percentage number from **0%** to **100%**.
  P1 matches P2 for the given percentage.

- Algorithm 2 ("m"-Flag, **P4** is used):
  Result is a error number, similar to wrong letter,
  or missing letter. If Algorithm 2 is chosen, then
  P1 matches P2 taking into account the resulting
  number of "typing errors".

Example

```
'**********************************
' FZC.-Test, Algo 1
'**********************************
$$TXB=ABCDEFGHIJK
$$TXA=ABCEFGHIJK

FZC.$$TXA|$$TXB
DBP.$$000
ENR.

'**********************************
' FZC.-Test, Algo 2
'**********************************
$$TXB=ABCDEFGHIJK
$$TXA=ABCEFGHIJK

FZC.$$TXA|$$TXB|m
DBP.$$000
ENR.
```

Remarks

3.63.6 GRM. - Get Rect Middle-Point

GRM. - Get Rectangle Middle-Point Previous 2334 Top 41 Next 2340

MiniRobotLanguage (MRL)

GRM. Command

Get Rect Middlepoint

Intention

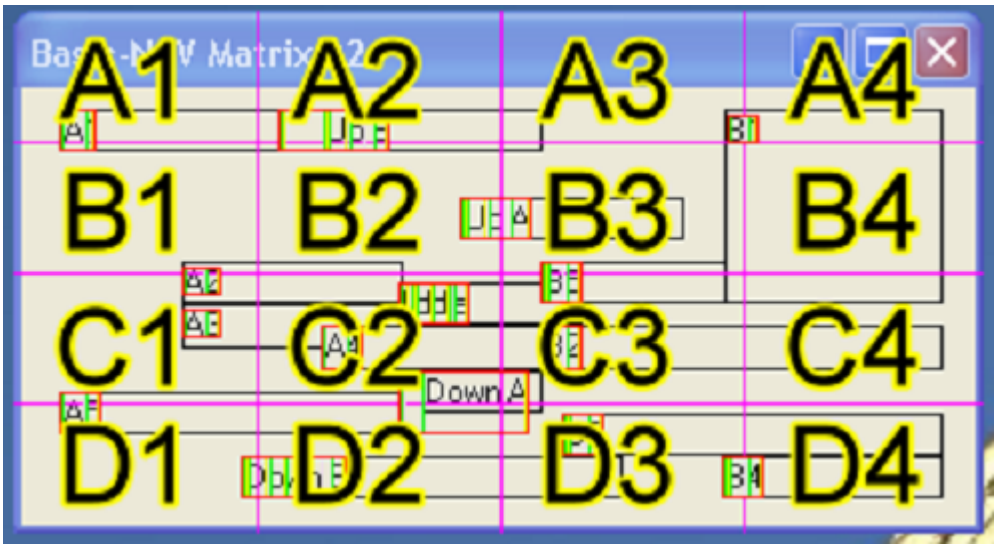
The GRM-Command will simply take any Rectangular Area, and calculate the Middle-Point of it, so you can move the Mouse there.

```
$$REC=120,200,220,300
GRM.$$REC|$$MID
DBP.$$MID
' Result is 170,250
```

GRM. understands Quadrant Coordinates, see 3.6 Using Quadrant-Coordinates 356. It will take the last localized Object as base for the Quadrants. This way, you can split any type of objects or control in an resolution independent way into 16 Quadrants!

Here is an example for the whole window:

```
STW.ct|MyClassName|Sample Application
' We use the actual window-Rect and get the
' Quadrant D1 Middle-Point this way.
GRM.{D1}
' Show TOS
DBP.$$000
ENR.
```



*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

GRM.[P1][|P2]

Parameter Explanation

P1* - *(optional) Input-Rectangle. Format is: `x1,y1,x2,y2` if omitted,
`GRM.` uses the rectangle on TOS, or if this not an Rectangle in the above format,
it will use the actual window rectangle.

`GRM.` understands the 3.6 Using Quadrant-Coordinates 356. Quadrant Coordinates.
It will take the last localized Object as base for the Quadrants.

P2* - *(optional) Variable that will receive the result of the operation in the format:
`x1,y1`
If you omit **P2**, the command will store the coordinates on the TOS.

Example

```
' Use the Testapplication
' for this Sample Script
$$REC=120,200,220,300
GRM.$$REC|$$MID
DBP.$$MID
ENR.
```

3.63.7 IFC. - If Fuzzy Compare

MiniRobotLanguage (MRL)

IFC. Conditional Statement

If Fuzzy Compare

Intention

Conditional Statement.
Test if a specified string evaluates true with a given other String. having regard to one of two alternative fuzzy logic algorithm.

`IFC.` in Mode 1 uses a percentage from 0 to 100.
`IFC.` in Mode 2 (use P4, "m"-Flag) uses a maximum error number starting from 0.

In both modes, you will find the internally calculated "Match-value" on TOS.

```
' Example that will NOT match
' change the percentaqe value so that it will match.
'
$$TXB=ABCDEFGHIJK
$$TXA=ABCDEFGH

IFC.$$TXA|$$TXB|90
  DBV.Yes, we match.
ELS.
  DBP. This matches only to $$000 percent.
EIF.
ENR.
```

In Mode 2 we deal with "typing errors". Take this example:

```
$$TXB=ABCDEFGHIJK
$$TXA=ABCEFGHK

IFC.$$TXA|$$TXB|2|m
  DBV.Yes, we match.
ELS.
  DBP. This matches only to $$000 errors.
EIF.
ENR.
```

Note that a missing or deleted char is always one typing error.
Using algo 2, you will always find the internally calculated number of typing errors on the TOS.

`NWC.` is the negative Form of this statement.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

IFC.P1|P2|P3 … ELS. … EIF.

Parameter Explanation

P1 - Variable A to compare

P2 - Variable B to compare

P3 - numerical argument, depends on used algorithm.

P4 - ***(optional)*** can be omitted or can be "m". In that case another algorithm is used to compare **P1** and **P2**.

In detail the difference is:

- Algorithm 1 (no "m"-Flag):
  P3 is a percentage number from **0%** to **100%**.
  If Algorithm 1 is chosen, then
  P1 must match P2 for the given percentage.

- Algorithm 2 ("m"-Flag, **P4** is used):
  P3 is a maximum error number, similar to wrong letter,
  or missing letter.
  If Algorithm 2 is chosen, then
  P1 must match P2 taking into account the given
  maximum number of "typing errors".

IFC.'s can be nested to unlimited Depth, and they can also enclose Sub-Programm Calls or FEX. (Enumerations) to unlimited Depth.

Example

```
'***********************************
' IWC.-Test, Algo 1
'***********************************
$$TXB=ABCDEFGHIJK
$$TXA=ABCDEFGH

IFC.$$TXA|$$TXB|90
  DBV.Yes, we match.
ELS.
  DBP. This matches only to $$000 percent.
EIF.
ENR.

'***********************************
' IWC.-Test, Algo 1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
' Will match to 90%
$$TXB=ABCDEFGHIJK
$$TXA=ABCDEFGHI

IFC.$$TXA|$$TXB|90
  DBV.Yes, we match.
EIF.

'**********************************
' IWC.-Test, Algo 2
'**********************************
'
' This will NOT match
$$TXB=ABCDEFGHIJK
$$TXA=ABCEFGHK

IFC.$$TXA|$$TXB|2|m
  DBV.Yes, we match.
ELS.
  DBP. This matches only to $$000 errors.
EIF.
ENR.
```

Remarks

3.63.8 IVN. - If Variable Numeric

MiniRobotLanguage (MRL)

IVN./NVN. Conditional Statement

Test if Content of a Variable is numeric or not

Intention

Conditional Statement.
Test if a Variable has numeric content or not. This Conditional Statement has 4 Options.

Mode 1:

`IVN.` in Mode 1 the Parameters get prefixed with a "#".
Doing so, the IVN.uses a Simple character Compare. It will check if the Variable contains only allowed numerical characters, these are: "0123456789".
In this mode IVN. will only accept pure decimal numeric numbers as valid.
Sample:

```
$$TXA=099
IVN.#$$TXA
  MBX.Its numeric!
ELS.
  MBX.Its Not numeric!
EIF.
ENR.
```

Using

```
$$TXA=#099
IVN.$$TXA
```

will not work as the # is part of the Command. Otherwise it would compromise the commands safety.

Mode 2:

`IVN.` in Mode 1 the Parameters get prefixed with a "@".
Doing so, the IVN.uses a Simple character Compare. It will check if the Variable contains only allowed numerical characters, these are: "0123456789.".
In this mode IVN. will only accept pure decimal numeric numbers as valid.
Sample:

```
$$TXA=0.099
IVN.@$$TXA
  MBX.Its numeric!
ELS.
  MBX.Its Not numeric!
EIF.
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Using

```
$$TXA=#1.099
IVN.$$TXA
```

will not work as the @ is part of the Command. Otherwise it would compromise the commands safety.

Mode 3:

`IVN.` in Mode 1 the Parameters get prefixed with a "*".

Doing so, the IVN.uses a Simple character Compare. It will check if the Variable contains only allowed numerical characters, these are: "0123456789." and you can prefix the number with + or −.

In this mode IVN. will only accept pure decimal numeric numbers as valid.

Sample:

```
$$TXA=*-0.99
IVN.*$$TXA
  MBX.Its numeric!
ELS.
  MBX.Its Not numeric!
EIF.
ENR.
```

Using

```
$$TXA=*+19.099
IVN.$$TXA
```

will not work as the * is part of the Command. Otherwise it would compromise the commands safety.

Mode 4: Tolerance Mode - interpret as number.

`IFC.` in Mode 4, you do not use any Prefix. In this Mode the Robot will try to interpret the variable content as a number.

In this mode all sorts of numbers, Floating Point, Hexadecinmal, Octal, Binary ... and even Formulas in (. .) will be recognized.

```
$$TXA=&H09A9
IVN.$$TXA
  MBX.Its numeric!
ELS.
  MBX.Its Not numeric!
EIF.
ENR.

' Floating Point Number
$$TXA=1.1E09
IVN.$$TXA

' Hexadecimal Numbers prefixed with "&H"
$$TXA=&H3A9
IVN.$$TXA
```

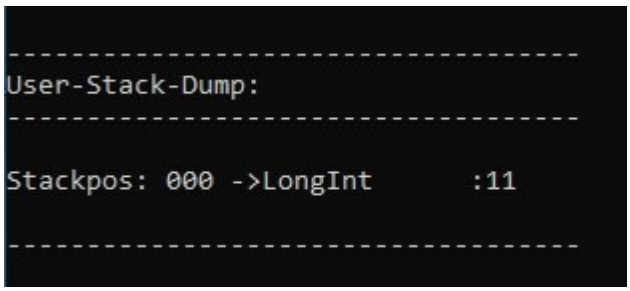
© 2023 Theo Gottwald * https://www.smart-package.com

```
' Octal Numbers prefixed with "&O"
$$TXA=&O371
IVN.$$TXA

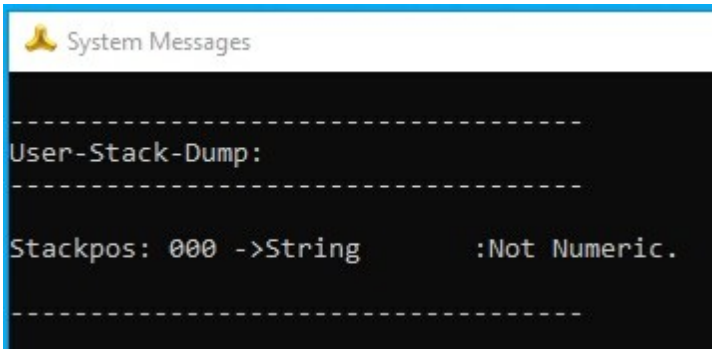
' Binary Numbers prefixed with "&B"
$$TXA=&B1011
IVN.$$TXA

' Even Formulas can be used:
$$TXA=(&H9+&O2)
IVN.$$TXA
  MBX.Its numeric!
ELS.
  MBX.Its Not numeric!
EIF.
DMP.6
MBX.$tos$
ENR.
```

In both modes, you will find the internally calculated "Match-value" on TOS.
This is the TOS after the Script above.



You will find the resulting Number on TOS.



If no number was found you will find "Not Numeric" on TOS.

Speed-Consideration:

© 2023 Theo Gottwald * https://www.smart-package.com

```
047 0000000000000045 0001 VAR.$$MSG=3. Teste IVN. "If Variable Numeric @4".

051 0000000000000017 0121 ELS.
052 0000000000000000 0000 GTO.Lab_failed
053 0000000000000004 0121 EIF.
054 0000000000000007 0122 NEX.
055 0000000000000000 0001 DMP.Speed
056 0000000000000000 0000 MBX.!
```

IVN. and NVN are really fast and use only 54 to 170 Ticks to execute. Therefore you can execute >250.000 of these commands in one second.

NVN. is the negative Form of this statement.

Syntax

IVN.[#/@/*]P1 … ELS. … EIF.
NVN.[#/@/*]P1 … ELS. … EIF.

Parameter Explanation

\# - ***optional Prefix*** If this Prefix is used then the Content of the Variable will only be checked against "0123456789". The condition will evaluate false if any other characters are inside the variable.
@ - ***optional Prefix*** If this Prefix is used then the Content of the Variable will only be checked against "0123456789.". The condition will evaluate false if any other characters are inside the variable.
* - ***optional Prefix*** If this Prefix is used then the Content of the Variable will only be checked against "0123456789." and Prefix of + and − will be allowed.. The condition will evaluate false if any other characters are inside the variable.

P1 - Variable to check if its numeric.

After the Operation you will find the numeric value on TOS. If no value could be found, you will find "Not Numeric." on TOS.

Please note that a leading "#","@" or "*" inside the Variable will not be interpreted as a Prefix but will lead to the result being "not numerical" as it should be.
IVN.'s can be nested to unlimited Depth, and they can also enclose Sub-Programm Calls or FEX. (Enumerations) to unlimited Depth.

3.63.9 RND. - RandDom Number

MiniRobotLanguage (MRL)

RND. Command

RaNDom number

Intention

This command can be used to get random numbers within a known range.
Using `RND.` without any parameter will Re-Seed the internal `RND`-Generator.

The internal Random number generator will always return the same sequence of random numbers. If you do not want this, just add a

RND.
at the start of your script. This will re-seed the random number generator and start a new practically unpredictable random number sequence.

Syntax

RND.[P1][|P2][|P3]

Parameter Explanation

P1 **-** `minimum value (can be negative), variable or formula in (..).`

P2 **-** `Maximum Value (can be negative), variable or formula in (..).`

P3 **-** `Variable to return the Random-Value.If omitted Value is been placed on` TOS 104.

Example

```
'************************************
' RND - DEMO
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
'************************************
' Re-Seed the RND-numbers generator
' do this to prevent to always get the same sequence of
' random numbers.
RND.
FOR.$$AAA|1|20
' Generate Random Numbers between 1 and 9
  RND.1,9,$$REB
  PRT.[$$AAA]->$$REB|d
NEX.
END.

'************************************
' RND - DEMO 2
'************************************
'DBM.2
FOR.$$AAA|1|20
  RND.-3|-1|$$REB
  PRT.[$$AAA]->$$REB|d
NEX.
END.
```

Remarks:

The Parameter **P1** can be **negative**, for example, if you want Random-Numbers between 5 and 5.

Limitations:

This is not a cryptographic/scientific random number generator.

3.63.10 VDC. - Variable Decrement

MiniRobotLanguage (MRL)

VDC. Command

Variable DeCrement

Intention

Decrement the Value inside any specified Global or Local Variable or Stack.

"Decrement" means that the number is decreased by 1 or if specified, the number in **P2**.

Syntax

VDC.P1[|P2]

Parameter Explanation

P1 **-** `Variable containing any NUM`

P2 **-** `optional, value that is subtracted from Variable, default is 1.`

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAR.$$NUM=50
VDC.$$NUM
VDC.$$NUM|15
END.
```

3.63.11 VIC. - Variable Increment

VIC. - Variable Increment Previous 2350 Top 41 Next 2354

MiniRobotLanguage (MRL)

VIC. Command

Variable InCrement

Intention

Increment the Value inside any local or Global Variable or Stack.

"Increment" means that the number is increased by 1 or if specified, the number in **P2**.

Syntax

VIC P1[|P2]

Parameter Explanation

P1 **-** `Variable containing any NUM`

P2 **-** `optional, value that is added to P1, default is 1.`

Speed in Ticks:

This command uses typically around 170 Ticks.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAR.$$NUM=50
VIC.$$NUM
VÎC.$$NUM|15
END.
```

Remarks

3.63.12 VTB. - Variable to Binary

VTB. - Variable To Binary Previous 2352 Top 41 Next 2356

MiniRobotLanguage (MRL)

VTB. Command

Variable To Binary

Intention

Convert a numeric value into the Binary number-System, optional you can specify the length of the output string.

This very simple example

```
$$NUM=655345
VTB.$$NUM
DBP.$$NUM
```

Will give the result: "1001111111111110001"

In this example we say that we want the output to be formatted to 40 digits.

```
$$NUM=655345
VTB.$$NUM||40
DBP.$$NUM
ENR.
```

Therefore the result is "0000000000000000000010011111111111110001"

In both cases, we did not specify **P2** (Target variable, therefore the result was placed in the source variable.

For details on how to prefix Hexadecimal, Octal or Binary numbers, see
3.5 Hexadezimal, Decimal and Binary and more 352

Syntax

VTB.P1[|P2][|P3]

Parameter Explanation

P1 - Variable containing any NUM

P2 - (optional) Variable for the result, if omitted result is been stored in Source variable.

P3 - (optional) optional, value that is used as a fix length of the output string.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Empty places are filled with "0"'s.
If you specify less digits then needed, the number will be clipped from the right side,

Example:

```
$$NUM=655345
VTB.$$NUM|$$TAR|2
```

will give you "01" as result (instead of 1001111111111110001)

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
' Binary to hexadecimal
$$NUM=&B1001111111111110001
VTH.$$NUM
DBP.$$NUM

' Hexadecimal to decimal (unsigned)
$$NUM=&H0$$NUM
VTN.$$NUM|$$TAR|6
DBP.$$TAR
ENR.
```

Remarks

-

Limitations:

- VAN. - Variable Numeric 3553

© 2023 Theo Gottwald * https://www.smart-package.com

3.63.13 VTH. - Variable to Hexadecimal

MiniRobotLanguage (MRL)

VTH. Command

Variable To Hexadecimal

Intention

Convert a numeric value into the Hexadecimal-System, optional you can specify the length of the output string.

This very simple example

```
$$NUM=655345
VTH.$$NUM
DBP.$$NUM
```

Will give the result: `"9FFF1"`

In this example we say that we want the output to be formatted to 15 digits.

```
$$NUM=655345
VTH.$$NUM||15
DBP.$$NUM
ENR.
```

Therefore the result is `"00000000009FFF1"`

In both cases, we did not specify **P2** (Target variable, therefore the result was placed in the source variable.

For details on how to prefix Hexadecimal, Octal or Binary numbers, see
3.5 Hexadezimal, Decimal and Binary and more 352

Syntax

VTH.P1[|P2][|P3]

Parameter Explanation

P1 - Variable containing any NUM

P2 - (optional) Variable for the result, if omitted result is been stored in Source variable.

P3 - (optional) optional, value that is used as a fix length of the output string.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Empty places are filled with "0"'s.
If you specify less digits then needed, the number will be clipped from the right side,

Example:

```
$$NUM=655345
VTH.$$NUM|$$TAR|2
```

will give you "F1" as result (instead of 9FFF1)

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
' Binary to hexadecimal
$$NUM=&B10011111111111110001
VTH.$$NUM
DBP.$$NUM

' Hexadecimal to decimal (unsigned)
$$NUM=&H0$$NUM
VTN.$$NUM|$$TAR|6
DBP.$$TAR
ENR.
```

Remarks

-

Limitations:

-

3.63.14 VTN. - Variable Numeric

VTN. - Variable To Numeric (Decimal) **Previous** 2356 **Top** 41 **Next** 2361

MiniRobotLanguage (MRL)

VTN. Command

Variable To Numeric (Dezimal)

Intention

Convert a numeric value into the Decimal number-System, optional you can specify the length of the output string.

This very simple example

```
$$NUM=&B1001111111111110001
VTN.$$NUM
DBP.$$NUM
```

Will give the result: `"655345"`

In this example we say that we want the output to be formatted to 15 digits.

```
$$NUM=&H09FFF1
VTN.$$NUM||15
DBP.$$NUM
ENR.
```

Therefore the result is `"000000000655345"`

In both cases, we did not specify **P2** (Target variable, therefore the result was placed in the source variable.

For details on how to prefix Hexadecimal, Octal or Binary numbers, see
3.5 Hexadezimal, Decimal and Binary and more 352

Syntax

VTN.P1[|P2][|P3]

Parameter Explanation

P1 - Variable containing any NUM

P2 - (optional) Variable for the result, if omitted result is been stored in Source variable.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P3 - (optional) optional, value that is used as a fix length of the output string.
Empty places are filled with "0"'s.
If you specify less digits then needed, the number will be clipped from the right side,

Example:

```
$$NUM=655345
VTN.$$NUM|$$TAR|2
```

will give you "45" as result (instead of `655345`)

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
' Binary to hexadecimal
$$NUM=&B10011111111111110001
VTH.$$NUM
DBP.$$NUM

' Hexadecimal to decimal (unsigned)
$$NUM=&H0$$NUM
VTN.$$NUM|$$TAR|6
DBP.$$TAR
ENR.
```

Remarks

Please always use the proper prefix for non-decimal numbers.
More details on this, see here:
3.5 Hexadezimal, Decimal and Binary and more 352

Limitations:

-

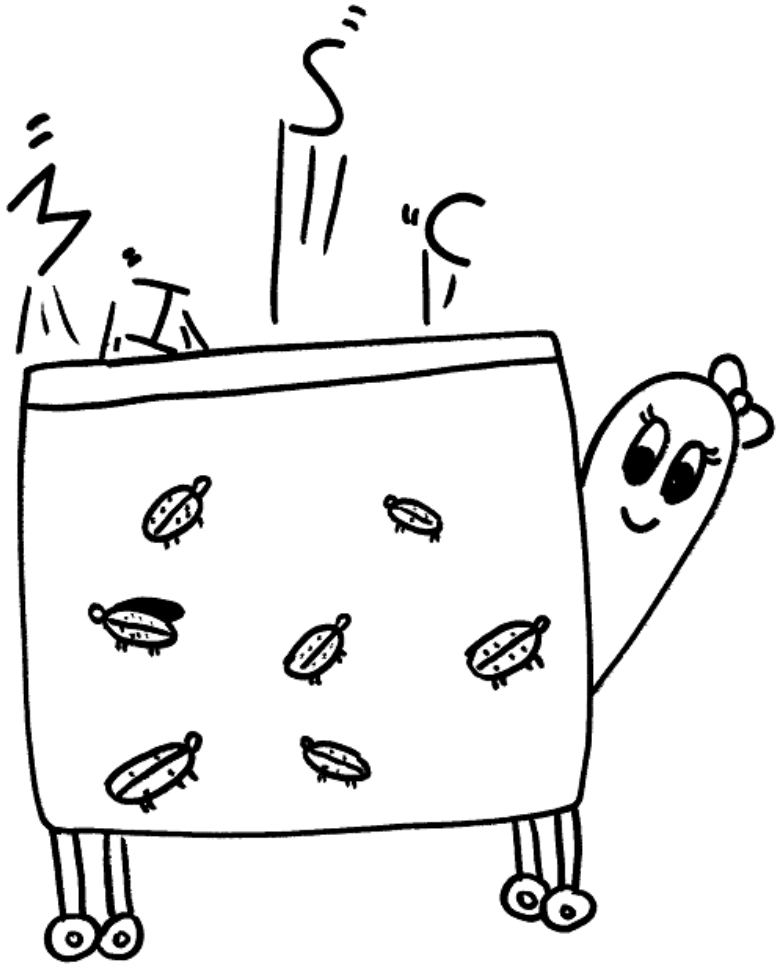
3.64 Miscellaneous commands

3.64.1 ! Smarty's MISC-Operations

Smarty's MISC-Operations



*© 2023 Theo Gottwald * https://www.smart-package.com*

3.64.2 END. - End Script

MiniRobotLanguage (MRL)

END. Command

Ends a script

Intention

End script execution immediately and optionally set a return-code.

If given a Parameter, and called in "Exemode", End will set a return code for a compiled executable. If given a parameter not encapsuled in an executable, `END.` will set the Returncode like `SEC.` only for the "`MR01.exe`".

Syntax

END.[P1]

Parameter Explanation

P1 – NUM containing the return-value (Error-Code) for the calling application.

Example

```
' Simply ends a Script
END.

' Ends a Script and gives a return-code of 10
' for compiled executables
END.10
```

Remarks

To set a Return code without ending the script, use `SEC.` (Set Exit Code).
If no Return code is given, the return code is zero (0) or the last code that was given to an `SEC.`-command.
Use the `ENR.` (End Return) command if you plan to call the script from another script using `JNF.`

Limitations:

*© 2023 Theo Gottwald * https://www.smart-package.com*

- SEC. - Set Exit Code 2129

© 2023 Theo Gottwald * https://www.smart-package.com

3.64.3 UNI. - Universal Command

MiniRobotLanguage (MRL)

UNI. Command

Name for multiple Subprogrammes that are currently in testing

Intention

You can use these commands but there is no warranty that they will be working in the same way in the future.
They are "subject to Improvement". Some of the Examples below are in "MPR-Skript", they use a "\" instead of the "." so they may need be changed to SPR-Skript in parts.
Many of the commands are already implemented in native SPR-Commands.

Syntax

UNI.subcommand|[Parameters]

Parameter Explanation

Paramenter - the Parameters depend on the used Subcommand

B E T A

GRN - Dokumentation

Das UNI.- Mnemonic ist als Universal-Mnemonic angelegt und eröffnet eine Reihe von fortschrittlichen neuen Möglichkeiten.
Die Hauptaufgabe ist dabei die graphische Erkennung von Objekten in Fenstern, wie dies typischerweise in JAVA-Programmen und JAVA-Setups erforderlich ist.
Darüberhinaus implementiert UNI. auch noch ergänzende Möglichkeiten im Umfeld der Bedienung solcher Programme.

Die Syntax ist generell wie folgt:

UNI.[Command-Name][..|Parameter1][..|Parameter2][..|Parameter3][>Variable]

Dabei sind die Command-Names in unterschiedliche Gruppen eingeteilt:

g_ ... graphische Commands

 *© 2023 Theo Gottwald * https://www.smart-package.com*

s_ ... String (Zeichenketten-Befehle)
d_ ... Befehle, die neue Datenklassen implementieren
m_ ... mathematische und Datums-Befehle

```
/*****************************************************************************************************
*****************************/
```

Beispiel: UNI.s_unwrap

```
'? VAR=Variable
VAR\$$STR=a<end>c
UNI.s_unwrap|$$STR|ac>$$RES
' $$RES wäre nun "<end>" da die "linke Klammer 'a'
'                   und die rechte Klammer 'b"' entfernt wurden.
'? MBX=MessageBoX
MBX\$$RES
```

```
/*****************************************************************************************************
*****************************/
```

```
/*****************************************************************************************************
*****************************/
```

Beispiel: UNI.m_calc

```
UNI.m_calc|13/2|x>$$RES
MBX\$$RES
```

```
/*****************************************************************************************************
*****************************/
```

```
#############################################################################
###############################################
#############################################################################
###############################################
#############################################################################
###############################################
```

```
'*****************************************************************************
Graphical Recognition Commands
'*****************************************************************************
```

Diese Befehle dienen dazu, in einem Setup oder einer anderen Programm-Maske Elemente zu lokalisieren oder auf das Erscheinen dieser Elemente zu warten.
Falls dazu Text verwendet wird, wird dazu in zwei Schritten verfahren:
1. Analyze (Parameter)
2. Locate Object

Alternativ kann auch zusätzlich navigiert werden. Hierbei wird ein Objekt lokalisiert und dann mittels der "g_navigate" Anweisung ein Objekt angefahren.
Dabei wäre die Verfahrensweise dann so:

© 2023 Theo Gottwald * https://www.smart-package.com

1. Analyze
2. Locate
3. Navigate ...

Unabhängig davon, was lokalisiert wurde, stehen die Koordinaten der Kanten des lokalisierten Elementes jeweils auch über die WinRobots-Spezialvariablen zur Verfügung:
il = Linkskoordinate (ItemLeft),
it = Obenkoordinate (ItemTop),
ir = Rechtskoordinate (ItemRight),
ib = Untenkoordinate (ItemBottom),
iw = Breite (ItemWidth),
ih = Höhe (ItemHeight),
(Siehe Hilfe "Spezialordner")

Wird eine Farbdifferenz oder ein Farbkontrast verlangt, ist die übliche Reichweite 0-765.
0 - wäre die genau gleiche Farbe, während die Maximaldifferenz bzw. der Maximalkontrast (also weiss-schwarz) 765 ist.

****
"ana.","g_analyze"
****

Dieser Befehl analysiert die Fensteroberfläche. Dies ist notwendig zur Vorbereitung späterer Suchbefehle.
Der Befehl teilt die Oberfläche des lokalisierten Fensters in Quadranten ein, und ermöglicht die Angabe in welchen der Quadranten gesucht werden soll.
Zudem ermöglicht der Befehl eine graphische Anzeige, welche Objekte mit den späteren Suchbefehlen lokalisiert werden können.

Der Befehl benötigt dazu eine Anzahl Parameter:
' TF:Textfarbe, Defaultwert ist 0 = schwarz - optional
' TL:Toleranzwert, Defaultwert 150
' PD:Pixeldistanz, 4-48, Defaultwert 6 - optional
' WH:Window Handle - optional, Default ist das zuletzt lokalisierte Fenster
' MS:Feldmaske, Default 0 - keine Einschränkung
' FL:Flags 0/1 - Picture-Mode Rest, s.u.
' UNI.g_analyze|[TF:0][,PD:4-48][,TL:150][,WH:32423][,MS:Feldmaske]

Dabei wird die Maske wie folgt in 16 Felder eingeteilt:
A1,A2,A3,A4
B1,B2,B3,B4
C1,C2,C3,C4
D1,D2,D3,D4

Damit kann man angeben, in welchen Feldern später gesucht werden soll.
Ebenso kann man angeben, ob Objekte vollständig oder nur überwiegend in den angegebenen Feldern liegen müssen oder ob es genügt, wenn das Objekt partiell im Feld liegt.
Diese Angaben macht man bei der Vorbereitung der Maske mittels "g_mask".

© 2023 Theo Gottwald * https://www.smart-package.com

Beim Parameter MS: hat man die Wahl, die Felder entweder direkt anzugeben, dazu müssen Klammern wie folgt verwendet werden:
' UNI.g_analyze|MS:(A1,A2,A3,p)

oder man kann eine vordefinierte Maske aus einer Variablen benutzen, die zuvor mittels "g_mask" vorbereitet wurde.
Dieses Verfahren erlaubt es diverse Masken in Variablen vorzuhalten.
VAR\$$ARS=A1,A2
' Feldmaske vorbereiten und in $$TXT ablegen
UNI.g_mask|$$ARS|p>$$TXT
UNI.g_analyze|PD:8,FL:12,TL:50,MS:$$TXT

Beispiele:

' Direktangabe der Maske
' UNI.g_analyze|MS:(A1,A2,A3,p),TL:100

' repeat last analyze run with same parameters
' UNI.g_analyze|R
' or
' UNI.g_analyze|Repeat

' Komplettes Beispiel
' Diese Felder werden durchsucht
VAR\$$ARS=A1,A2
' Feldmaske vorbereiten und in $$TXT ablegen
UNI.g_mask|$$ARS|p>$$TXT

STW\shimgvw:cpreviewwnd\
UNI.g_analyze|PD:8,FL:12,TL:50,MS:$$TXT
UNI.fba.|Summen
MMV\

Flags - Bedeutung:
' 1 - Win7-Mode
' 2 - ToGrey
' 4 - Cleartype Mode
' 8 - Debug Mode, Draw Letterboxes
' 16 - Invert Boxes
' 32 - Draw Fields

****
"msk.","g_mask"
****

Mit diesem Befehl kann man den Suchbereich in der Maske auf bestimmte Felder einschränken.
Dabei wird die Maske/das Suchfenster wie folgt in 16 Felder eingeteilt:
A1,A2,A3,A4
B1,B2,B3,B4
C1,C2,C3,C4

© 2023 Theo Gottwald * https://www.smart-package.com

D1,D2,D3,D4

Man kann nun angeben welche Felder für die spätere Suche initialisiert werden sollen, alle anderen werden ignoriert.
Dazu kommt eine Angabe, ob Objekte vollständig, überwiegend oder nur teilweise in den angegebenen Feldern liegen müssen.
Es genügt dazu die Angabe eines Buchstabens, dieser gilt immer für alle Felder:

p - partiell, f - full, m - much (bedeutet mehr als die Hälfte muss "inside" des Feldes sein.

Für die Spezifikation der Felder gibt es prinzipiell zwei Möglichkeiten. Die additive und die subtraktive.

Die additive Maskenangabe:
Hierbei werden einfach die Felder aufgelistet, die durchsucht werden sollen.

Beispiel:
' gesucht wird in A1 und A2, die Objekte müssen nur "p"artiell in den Feldern enthalten sein.
VAR\$$ARS=A1,A2
UNI.g_mask|$$ARS|p>$$TXT

Die subtraktive Maskenangabe:
Hierbei werden nur die Felder aufgelistet, die NICHT durchsucht werden sollen. ALLE anderen werden durchsucht.
Wird ein Feld als "subtraktiv" angegeben, sind automatisch alle weiteren Angaben auch subtraktiv!

Beispiel:
' gesucht wird in allen Feldern außer A1 und A2, die Objekte müssen vollständig in den Feldern enthalten sein (wegen des "f").
VAR\$$ARS=!A1,A2
UNI.g_mask|$$ARS|f>$$TXT

****
"usp.","g_use_place"
****
Mit diesem Befehl kann ein beliebiger Punkt in der Maske spezifiziert werden, von wo aus dann mit dem "g_navigate" Befehl ein Element angefahren werden kann.
Die Angaben erfolgen in fensterrelativen Koordinaten, die aus dem Windows Analyzer ermittelt werden können.

Beispiel:
' Element "Standardmappe" lokalisieren
UNI.g_use_place|389,292
UNI.g_navigate|RA|1

Beispiel:
VAR\$$ARS=!D1
UNI.g_mask|$$ARS|p>$$TXT
STW\shimgvw:cpreviewwnd\

© 2023 Theo Gottwald * https://www.smart-package.com

UNI.g_analyze|FL:6,PD:6,PM:6,TL:10
UNI.g_use_place|389,292
UNI.g_navigate|RA|1
MMV\

****
"nav.","g_navigate"
****
Dieser Befehl dient dazu, von einem lokalisierten Objekt aus ein danebenliegendes anderes Objekt anzufahren.
Dies ist sinnvoll, um auch solche Objekte anzufahren, die man anders nicht sicher lokalisieren kann.
g_navigate berücksichtigt intern den Abstand zwischen dem aktuell lokalisierten Element und den in Frage kommenden Elementen.
Daher kann man auch noch eine number angeben, die angibt das wievielte Element (rechts, links etc.) man anfahren will.
Dies kann zum Beispiel genutzt werden, um in Tabellen Elemente zu überspringen.

UNI.g_navigate|[Richtung]|[number][|cc-Wert]

Für die Richtung gibt es folgende Parameter:
A - All (jede Richtung)
R - rechts
L - links
U - Oben
D - Unten
Sowie Kombinationen:
LA, RA, UA, DA.

Der Unterschied liegt darin, dass ein Feld bei der Angabe von L,R,U,D innerhalb der jeweiligen Kante liegen muss um berücksichtigt zu werden.
Wird zusätzlich ein "A" angegeben, dann kann das Element "irgendwo" auf der jeweiligen Seite liegen.
In diesem Fall wird nur noch der absolute Abstand der Elemente (Kante zu Kante) berücksichtigt.

Beispiel:
' Das nächstliegende Element rechts vom aktuellen wird angefahren
UNI.g_navigate|RA

' Das viert-nächstliegende Element (A(ll) = Umkreis) wird lokalisiert
UNI.g_navigate|A|4

****
"fba.","g_find_bap"
****
Der Befehl g_find_bap dient dazu, in der Anwendung "Bank ArbeitsPlatz" (Fiducia) Elemente zu lokalisieren.
Die Schriftgröße kann dabei zwischen 7 und 14 Punkte variieren. Es wird direkt der jeweilige Text angegeben, der angefahren werden soll.

*© 2023 Theo Gottwald * https://www.smart-package.com*

UNI.g_find_bap|Suchbegriff|No.|Toleranzzahl für Textvergleich

Die numbernangabe ist dann wichtig, wenn man nicht den ersten passenden, sondern einen anderen passenden Begriff finden will.
Die "Toleranzzahl für Textvergleich" ist per default 2 und je höher (max. 8) desto toleranter ist der Textmustervergleich. Dieser Wert ist unabhängig von der Farbtoleranz, die bei "g_analyze" verwendet wird.

Beispiel:
```
UNI.g_find_bap|Standardmappe
MMV\
```

Beispiel mit Angabe eine alternativen Font-Namens:

```
UNI.fba.|Cancel01|1|4|Courier New
ITO\
  OPR\0,0
  SBT\2|Not found.
ELSE
  MMV\
ETO\

MBX\!
@
```

****
"wba.","g_wait_find_bap"
****
Dieser Befehl dient dazu, auf das Erscheinen eines Suchbegriffes in der Maske zu warten.

UNI.g_wait_find_bap|Suchbegriff|No.|Toleranzzahl für Textvergleich|Maximale Wartezeit in Sekunden

Es kann eine maximale Wartezeit in Sekunden angegeben werden; fehlt diese Angabe wird 30 angenommen.

Beispiel:
```
' Es wird 6 Minuten auf das Erscheinen eines bestimmten Textes gewartet.
UNI.g_wait_find_bap|Übersicht|1|2|360
' bewirkt das Gleiche
UNI.g_wait_find_bap|Übersicht|||360
```

****
"set.","g_settings"
****
Dieser Befehl dient dazu interne Parameter zu setzen. Bei Angabe von:
TE:0 oder TE:1
wird zur Textfindung mittels "fba." oder "ftx." jeweils ein anderes Vergleichsverfahren verwendet.
Es ist denkbar dass zukünftig andere Verfahren dazukommen.
Das Standardverfahren ist derzeit TE:0.

© 2023 Theo Gottwald * https://www.smart-package.com

Dieses Verfahren kann bei Fenstern mit vielen graphischen Mustern fälschlicherweise kleinen Text finden.
TE:1 arbeitet viel exakter, findet evtl. jedoch Text der nicht ganz genau übereinstimmt nicht.

Beispiel:
STW\shimgvw:cpreviewwnd\
UNI.g_analyze|PD:4,FL:1,TL:1,TF:&H0,MS:$$TXT

UNI.set.|TE:1
UNI.fba.|Bestellung
MMV\

UNI.set.|TE:0
UNI.fba.|Belegübersicht ein
MMV\

eine weitere Option ist "RC:". Dieses Setting bestimmt die Auswahl der zu lesenden Zeichen für den "rab." Befehl.
Es stehen folgende Subsets und jede Kombination daraus zur Auswahl:

US-Letters_small: 1
US-Letters_big: 2
german Umlauts: 4
Zahlen: 8
Signs: 16
Kernings: 32

' 39 = Kernings + Umlauts + small Letters + big Letters
UNI.set.|RC:39
UNI.rab.
MMV\

Der defaukt Wert für RC ist 39. Sollten in einem Block zum Beispiel NUR Zahlen gelesen werden, kann man das Setting auf "8" setzen.

Eine weitere Option ist "FA:" - "Font Attributes". man kann hier auswählen ob auch Text der:
1 - Normal
2 - Bold
4 - Kursiv
6 - Bold und Kursiv
7 - Normal, Bold und Kursiv
in die Suche mit einbezogen werden soll. Dies kann Einfkluss auf die Rechenzeit der Lesebefehle haben.

Die Option: "SS:" - "smallest Size" ermöglicht die Angabe einer minimalen Font-Suchgröße.
Intern ist die minimale Suchgröße auf den Wert "6" beschränkt. Kleinere Werte werden nicht berücksichtigt.

© 2023 Theo Gottwald * https://www.smart-package.com

Die Option: "LS:" - "Largest Size" ermöglicht die Angabe einer maximalen Font-Suchgröße.
Intern ist die maximale Font-Suchgröße auf den Wert "22" festgelegt. Größere Werte werden nicht berücksichtigt.

****
"gfa.","g_get_found_size"
****
Dieser Befehl kann erst angewendet werden, nachdem ein Textsuch-Befehl wie afb. oder ftx. verwendet wurde.
Er gibt als Rückgabewert eine interne Schriftgröße zurück, in zwei verschiedenen Skalierungen, unter der der jeweilige Text lokalisiert wurde.
Zudem eine dritte Zahl zurückgegeben, dabei handelt es sich um einen Bold-Wert.

```
VAR\$$ARS=!A1

UNI.g_mask|$$ARS|p>$$TXT
STW\shimgvw:cpreviewwnd\
'GCW\\1\shimgvw:czoomwnd\*|w74994
UNI.g_analyze|PD:6,FL:2,TL:10,TF:0,MS:$$TXT
UNI.fba.|Abbrechen||1
NTO\
  UNI.gfa.>$$TXT
  MBX\$$TXT
ETO\
@
```

****
"ftx.","g_find_text","graphic find text"
****
Dient zum Finden von Texten in JAVA-Setup-Programmen.

****
"wtx.","g_wait_find_text"
****

UNI.wtx.|(zu suchender Text[optional: number bei mehreren][|optional Toleranz]

****
"rab.","g_read_actual_block"
****
Dieser Befehl dient dazu den Text im aktuell lokalisierten Block zu lesen. Der Text wird dabei in einer Variable oder in $v1$ zurückgegeben.
Dieser Befehl setzt vorraus, dass ein Block lokalisiert wurde, egal mit welchen Befehlen (Beispiel: "g_find_by_number", oder "g_navigate" oder zum Beispiel g_scan_object_right).

Der Befehl wird im einfachsten Fall so aufgerufen:

```
' Es wird die interne Standardschrift verwendet
UNI.rab.>$$TXT
```

© 2023 Theo Gottwald * https://www.smart-package.com

MBX\$$TXT

Man kann das Ergebnis des Lesenbefehls mit den Patternmatch-Funktionen (wie "s_wildcard_compare") gegen einen gesuchten Text "matchen", und so fehlertolerant lesen.
Dabei sollten sowohl normal,bold,kursiv als auch beides einigermassen erkannt werden.

Es ist möglich ein alternatives "Schriftarten-Set" anzugeben. Dabei kann man entweder den Namen einer Schriftart oder einfach eine number angeben.
Diese numbern bedeuten dabei folgendes:

"1" = Standardfont
"2" = "Arial"
"3" = "Times New Roman"
"4" = "OCR-A"
"5"= "Verdana"
"6" = "Symbol"

Beispielskript 1:
' Es wird die Schriftart 2 (Arial) verwendet
UNI.rab.|2>$$TXT
MBX\$$TXT

Jeweils beim ersten Aufruf des Befehls mit einem bestimmten "Font" erzeugt der Befehl eine Datendate in "?exepfad\".
So eine Datei ist für jeden Font der gelesen werden soll erforderlich.
Dies kann bis zu 10 Sekunden dauern, diese Datei ist zwischen 1 MB und 3 MB groß je nach Font.
In dieser Zeit wird auf dem System (im Installationsverzeichnis (Zugriff muss erlaubt sein!) ein Datenfile erzeugt, welches für den Befehl notwendig ist. Es hat ca. 1.3 MB.
Wenn Sie das Datenfile haben, muss es nicht mehr neu erzeugt werden.
Sie können das Datenfile auch kopieren und mittels
'#INC:?exepfad\Catseye_4233042457.dat
In die EXE einfügen.

Dadurch ersparen Sie sich die 6 Sekunden Wartezeit beim allerersten Aufruf des Befehl.
Kurz: Diese Datei wird zum Lesen von BAP benötigt, falls sie nicht da ist wird sie erzeugt.

Noch in wichtiger Hinweis für die Tester:
Dieses Datenfile enthält Daten zu den zu lesenden Zeichen.
Sie müssen dieses Datenfile (bis zur Finalen Version) bei jedem Update NEU erzeugen, da es sein kann dass jeweils Zeichen dazukommen.

Beispielskript 2:
VAR\$$ARS=!D1,C1,B1

UNI.g_mask|$$ARS|p>$$TXT
STW\shimgvw:cpreviewwnd\
'GCW\\1\shimgvw:czoomwnd*|w74994

UNI.rab.>$$TXT
MBX\$$TXT
@

****
"fbn.","g_find_by_number"
****
Dieser Befehl kann zum Lokalisieren von Ojekten verwendet werden, die derzeit nicht gelesen werden können, jedoch als Blöcke angezeigt werden.
Dazu wählt man den erwarteten Quadranten aus und gibt die Blocknumber an.

UNI.fbn.|(Nr. zu suchendes Element)

Beispiel:
VAR\$$ARS=D3,D4
UNI.g_mask|$$ARS|p>$$TXT
STW\shimgvw:cpreviewwnd\
UNI.g_analyze|PD:6,FL:12,TL:10,TF:0,MS:$$TXT
UNI.fbn.|10
MMV\

****
"wbn.","g_wait_find_by_number"
****
Dieser Befehle entspricht "fbn." in der Version mit "wait".
Man kann damit zum Beispiel auf das Erscheinen von Buttons warten.

UNI.wbn.|(Nr. zu suchendes Element)|(Timeout in Sekunden)

****
"gqn.","get_quadrant_rect_by_name"
****
Dient zum Ermitteln des Rechtecks (Koordinaten) eines Feldes.
Das Kommando lokalisiert das Feld, der aktuelle Punkt wird in die Mitte des Feldes gelegt.
Die Koordinaten der Kanten des Feldes stehen dann über die WinRobots-Spezialvariablen zur Verfügung:
il = Linkskoordinate (ItemLeft),
it = Obenkoordinate (ItemTop),
ir = Rechtskoordinate (ItemRight),
ib = Untenkoordinate (ItemBottom),
iw = Breite (ItemWidth),
ih = Höhe (ItemHeight),
(Siehe Hilfe "Spezialordner").

Beispiele:
UNI.get_quadrant_rect_by_name|A1
MMV\

© 2023 Theo Gottwald * https://www.smart-package.com

```
UNI.get_quadrant_rect_by_name|D4
MMV\
```

****
"sco.","g_scan_object_at_point"
****
Dieser Befehl ermittelt das umschreibende Rechteck und den Mittelpunkt eines Objektes, typischerweise einer Textbox.
Dazu wird ein beliebiger Punkt innerhalb des Objektes angegeben, sowie optional eine Farbe und eine Farbtoleranz.
Wird als Farbe -1 angegeben, wird die Farbe an dem angegebenen Punkt als Referenzfarbe verwendet, wird die Farbtoleranz weggelassen, wird 180 als Defaultwert verwendet.
Der Befehl benötigt vorweg ein "g_analyze".

Beispiel:

```
STW\shimgvw:cpreviewwnd\
UNI.g_analyze|PD:5,FL:1,TL:1,TF:&H8C5317

' Hier ist Weiss die Referenzfarbe, die Farbtoleranz ist 180
UNI.sco.|&HFFFFFF|333,242
MMV\

' Hier wird die Referenzfarbe ermittelt und die Farbtoleranz beträgt 100
UNI.sco.|-1,100|333,242
MMV\
```

****
"scr.","g_scan_object_right"
"scl.","g_scan_object_left"
"scd.","g_scan_object_down"
"scu.","g_scan_object_up"
****
Die Befehle dienen dazu, rechts/links/oben/unten liegende Textboxen zu lokalisieren.

Diese Lokalisierung erfolgt anders als die reguläre Lokalisierung der Texte.Daher ist eine Navigation mittels "g_navigate" nur von diesen Objekten zu anderen Objekten möglich.
Eine Navigation zu diesen Objekten ist nur mittels dieser Befehle möglich, nicht mittels "g_navigate".
Ausgenommen davon ist jeweils das zuletzt lokalisierte Objekt.
Es nimmt einen Sonderstatus ein, damit von diesem Objekt aus zu einem Textobjekt navigiert werden kann.

Der Befehl scannt nach rechts/links/oben/unten bis er ein Objekt/Punkt/Linie findet, die einen Farbkontrast zum Hintergrund in der angegebenen Stärke aufweist.
Er versucht dann den Umfang des Objektes zu ermitteln.

© 2023 Theo Gottwald * https://www.smart-package.com

UNI.scr.|(Kontrastwert beim Rechts-Scan]|[inside/outside]|[Farbtoleranz für Objekterkennung]|[Scanweite in Pixel oder 0]

+ Kontrastwert beim Scan - Wertbereich: 1-765, wird 0 angegeben, so wird der Defaultwert von 180 verwendet.
+ inside/outside Point - Wertebereich 0/1...10 - Falls die Objekte eine Umrandung haben, kann man durch Angabe von "1" erreichen, dass ein Punkt innerhalb des Objektes zur Ermittlung des Umfangs herangezogen wird.
Dies ist bei Tabellen erforderlich, da ein Scan des Randes dann die gesamte Tabelle erfassen wird.
Navigiert man Checkmarks, kann ein Wert von 2 hilfreich sein, da damit der Rand übersprungen wird.
+ Farbtoleranz für Objekterkennung - es ist möglich hier eine Farbtoleranz zwischen 0 und 765 anzugeben. Dadurch werden auch Objekte, die Farbübergänge enthalten, korrekt ermittelt.
Default ist der gleiche Wert wie beim Kontrastwert.
+ Scanweite: Default ist 1/2 der Bildbreite. Die Zahl rechnet ab Außenkante des aktuell lokalisierten Elementes.
Der Befehl benötigt ein g_analyze und ein lokalisiertes aktuelles 9er-Element.

Beispiel:

```
VAR\$$ARS=!B4
UNI.g_mask|$$ARS|p>$$TXT

STW\shimgvw:cpreviewwnd\
UNI.g_analyze|PD:5,FL:1,TL:1,TF:&H8C5317,MS:$$TXT

'*****************************************************************************
Datentypen
'*****************************************************************************
Der Stapel / Stack

****************************
d_init_stack
****************************
Um verschachtelte Ausdrücke zu parsen, ist ein Stapel-Datentyp sehr hilfreich.

Der "Stack", zu Deutsch "Stapel", ist ein sogenannter LIFO-Datentyp. Das bedeutet
"Last-In-First-Out".
Dasjenige Element, welches man zuletzt hinzugefügt hat, ist dasjenige, das man
zuerst wieder zurückbekommt.
Vergleichbar mit den Karten auf einem Kartenspiel. Die oberste Karte ist die letzte
Karte (Last IN), die auf den Kartenstapel gepackt wurde,
so ist sie automatisch die erste Karte (first out), die man von OBEN auch wieder
herunternehmen kann.

Wir alle kennen solche Stapel aus dem täglichen Arbeitsleben: das Ein- und
Ausgangskörbchen in jedem Büro ist solch ein Stapel.
Um solche Vorgänge script-technisch nachzubilden gibt es nun den Stapel-Datentyp.
Es gibt also nicht nur einen Stapel, sondern viele Stapel.
Um das Scripting damit übersichtlich zu gestalten, bekommen diese Stapel vom User
jeweils Namen, damit diese vom System ansprechbar werden.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Hinweis: Wenn man sich z.B. vom Spielkartenstapel die oberste Karte herunternimmt, so ist diese EXKLUSIV in der Hand und auf dem Stapel steht die nächste Karte zur Verfügung. Das ist das normale Verhalten, das wir alle kennen.
Mit dem Parameter "N", kann man dafür sorgen, dass man einen Blick auf die oberste Karte erhält, diese bleibt aber liegen.
Somit hat man quasi eine Kopie der Karte vor Augen.
Um nun wirklich an die nächste Karte vom Stapel zu bekommen, muss man nun manuell dem System sagen, dass die oberste Karte gelöscht werden soll (d_del_stack_item).

Wenn man einen Stapel verwenden möchte, muss man diesen zunächst benennen. Dazu dient der folgende Befehl:

UNI.d_init_stack|(Name des Stapels)|(Autodeletefunktion an/aus) durch N oder weglassen

Ab dann steht ein Stapel mit diesem Namen zur Verfügung.
Es gibt die Möglichkeit, als weiteren Parameter das "N" wie "NoAutoDelete" anzugeben.
Ist dieser Parameter gesetzt, dann wird beim Abheben eines Elementes von diesem Stack dieses Element nicht automatisch gelöscht.
Existiert ein Stack dieses Namens bereits, löscht der Befehl den Stack und setzt das "N"-Bit neu.
Nach dem Erzeugen eines Stapels, wird dieser Stapel automatisch selektiert. Das bedeutet, dass "Push" und "Pop" Befehle dann auf diesen Stapel angewendet werden.
Beispiel:

```
UNI.d_init_stack|Loops

' Im folgenden Beispiel wird die "N" Option verwendet.
' Bei diesem Stack werden beim Abheben die Elemente nicht automatisch gelöscht.
' Dies muss man dann explizit mit "d_del_stack_item" tun, da die N Option aktiv ist.
UNI.d_init_stack|Loops|N
```

****
d_select_stack
****
Zum Beispiel beim Parsen von XML genügt ein Stack nicht, man benötigt mehrere Stacks.
Um nun festzulegen, welchen der Stacks man aktuell verwendet, wird dieser Befehl benötigt.
Beispiel:

```
UNI.d_init_stack|Loops
' Der neuerliche "d_init_stack" selektiert automatisch den Stack "Ferz"
UNI.d_init_stack|Ferz
' Nun benötigt man den Loops-Stack; also selektiert man diesen
UNI.d_select_stack|Loops

' Löscht das oberste Item von dem gerade selektierten Stack.
UNI.d_del_stack_item
```

© 2023 Theo Gottwald * https://www.smart-package.com

' Löscht die obersten 4 Items von dem gerade selektierten Stack.
UNI.d_del_stack_item||4

****
d_push_on_stack
****
Und wie kommen die Items nun auf den Stack? Mit "d_push_on_stack" natürlich.
Die Syntax lautet:
UNI.d_push_on_stack|(Item-String)[|(Item-String 2) ...

Beispiel:
UNI.d_init_stack|Loops
' Wir legen drei Items auf den neu erstellten Stapel
UNI.d_push_on_stack|Line 150|Line 160|Line 170

****
d_pop_from_stack
****
Sinn macht das Ganze natürlich erst, wenn wir die Items auch wieder vom Stack zurückbekommen. Das geht mit:

UNI.d_pop_from_stack>$$ITM

Man hat die Möglichkeit hier noch den Namen eines Stapels anzugeben:

UNI.d_pop_from_stack|Loops>$$ITM

Dann wird das Item von diesem Stapel genommen. Der Stapel wird aber nicht selektiert.
Ein nachfolgender

UNI.d_pop_from_stack>$$ITM

wird also das Item vom derzeit selektierten Stapel nehmen.

****
d_del_stack_item
****
Will man Items vom Stapel entfernen, zum Beispiel weil die Option "N" beim Deklarieren des Stacks (siehe: d_init_stack) verwendet wurde, so ist dies der Befehl der Wahl. Man kann optional noch den Namen eines Stacks und die Anzahl der Items, die gelöscht werden sollen, angeben.

' Löscht das oberste Item vom aktuellen Stack
UNI.d_del_stack_item

' Löscht das oberste Item vom Stack "Loops"
UNI.d_del_stack_item|Loops

' Löscht die obersten 5 Items vom Stack "Loops"
UNI.d_del_stack_item|Loops|5

© 2023 Theo Gottwald * https://www.smart-package.com

' Löscht die obersten 5 Items vom aktuell selektierten Stack
UNI.d_del_stack_item||5

Der Befehl gibt auf Wunsch die Anzahl der noch auf dem Stack verbleibenden Elemente zurück.
UNI.d_del_stack_item||5>$$CNT

****
d_get_stack_count
****
Gibt die Anzahl der Elemente auf dem jeweiligen Stapel zurück. Gibt man keinen Stapelnamen an, wird der aktuelle Stapel verwendet.
Gibt man den Namen eines Stapels an, wird dieser verwendet.

' Hier bezieht sich der Befehl auf den selektierten Stack
UNI.d_get_stack_count>$$CNT
' Hier bezieht sich der Befehl auf den Stack mit Namen "Loops"
UNI.d_get_stack_count|Loops>$$CNT

****
d_erase_stack
****
Diese Funktion löscht den Stack und zwar auch den Stack-Namen. Er kann danach für einen neuen Stack erneut mit "d_init_stack" verwendet werden.
Beim Beenden des Scripts werden alle Stackspeicher sowieso freigegeben, dies ist also nicht unbedingt manuell erforderlich.
Bitte bei diesem Befehl den Namen des zu löschenden Stacks stets explizit angeben.

UNI.d_erase_stack|Loops

' Im Folgenden erhält $$STK die Anzahl noch deklarierter Stacks.
UNI.d_erase_stack|Loops>$$STK

##
##
##
##
##
##

'**
' String-Befehle
'**
****
s_unwrap,unw
****
"Unwrap" auf Deutsch "Auspacken".
Entfernt linke und rechte Klammer. Diese müssen angegeben werden.
Folgt ein weiterer Parameter "a" oder "a", dann wird sichergestellt, dass an beiden Seiten jeweils alle Klammern entfernt werden.
Das Ergebnis wird als String zurückgegeben.

© 2023 Theo Gottwald * https://www.smart-package.com

UNI.s_unwrap|$$STR|()>$$RES
UNI.s_unwrap|$$STR|{}>$$RES
UNI.s_unwrap|$$STR|<>>$$RES

****
s_wrap,unw
****
"wrap" auf Deutsch "Einpacken".
Fügt linke und rechte Klammer zu einem String hinzu. Diese müssen angegeben werden.
Folgt ein weiterer Parameter "n" oder "no doubles", dann wird sichergestellt, dass an beiden Seiten jeweils nur eine Klammer ist.
In diesem Fall werden evtl. bereits vorhandene Einklammerungen entfernt, bevor diese Klammer hinzugefügt wird.
Das Ergebnis wird als String zurückgegeben.

UNI.s_wrap|$$STR|()>$$RES
UNI.s_wrap|$$STR|{}|no doubles>$$RES
UNI.s_wrap|$$STR|<>|n>$$RES

****
s_replace_word
****
Word-Replace Funktion. Ersetzt nur ganze Wörter (abgetrennt mit Leerzeichen), keine Wörter in Wörtern.
Falls der Zusatz "colon" als 4. Parameter gegeben wurde, werden Wörter innerhalb von " " (Gänsefüsschen / ASC 34) ignoriert.

Beispiele:
VAR\$$STR=Halleluja in der Halle. Er rief "Halleluja in der Halle".
UNI.s_replace_word|$$STR|Halle|Raum|colon
UNI.s_replace_word|$$STR|Halle|Raum
' Ergebnis in $v1$
UNI.s_replace_word|$$STR|Halle|Raum|colon>$$RES
UNI.s_replace_word|$$STR|Halle|Raum>$$RES
' Ergebnis in $$RES

****
s_no_case_instr
****
Diese Funktion sucht eine Zeichenkette in einer größeren Zeichenkette. Dabei wird Groß-/Kleinschreibung ignoriert.
Es gibt die Möglichkeit, die Suchrichtung durch Angabe von "back" als drittem Parameter umzukehren.
In einem vierten Parameter kann eine Startposition angegeben werden.

Beispiele:
' Diese beiden sind identisch in der Wirkung, Ergebnis jeweils in $v1$
UNI.s_no_case_instr|$$STR|findme|f|1
UNI.s_no_case_instr|$$STR|findme
' Ergebnise hier in Variable
UNI.s_no_case_instr|$$STR|findme|back|5>$$RES

© 2023 Theo Gottwald * https://www.smart-package.com

UNI.s_no_case_instr|$$STR|findme|forward|88>$$RES

****
s_equalcase_replace
****
Diese Funktion ersetzt das erste oder alle (Parameter 5) Vorkommen von (Parameter 2) in der Zeichenkette (Parameter 1) ab Position (Parameter 4) durch (Parameter 3). Dabei spielt Groß- und Kleinschreibung keine Rolle. Die originale Groß- und Kleinschreibung der Angaben wird in dem Ersetzungsvorgang trotzdem beibehalten.
Die Angaben der Zeichenketten geschehen wie folgt:
UNI.s_equalcase_replace|(String, in dem ersetzt werden soll)|(String, der ersetzt werden soll)|(String, der ersatzweise eingefügt wird)[|optional Startposition][|optional all]

Beispiele:
VAR\$$STR=Hallo Peter.
VAR\$$IST=Peter
VAR\$$SOL=Franz
UNI.s_equalcase_replace|$$STR|$$IST|$$SOL>$$TAR
UNI.s_equalcase_replace|$$STR|$$IST|$$SOL|1|all>$$TAR
UNI.s_equalcase_replace|$$STR|$$IST|$$SOL|5>$$TAR
UNI.s_equalcase_replace|$$STR|$$IST|$$SOL|15|all
' Im letzteren Fall ist das Ergebnis in $v1$, in den anderen Beispielen ist es in der Zielvariablen $$TAR.

****
s_case_sensitive_replace
****
Diese Funktion ersetzt das erste oder alle (Parameter 5) Vorkommen von (Parameter 2) in der Zeichenkette (Parameter 1) ab Position (Parameter 4) durch (Parameter 3). Dabei werden Groß- und Kleinschreibung beachtet. Die originale Groß- und Kleinschreibung der Angaben wird in dem Ersetzungsvorgang stets beibehalten.
Die Angaben der Zeichenketten geschehen wie folgt:
UNI.s_case_sensitive_replace|(String, in dem ersetzt werden soll)|(String, der ersetzt werden soll)|(String, der ersatzweise eingefügt wird)[|optional all]

Beispiele:
VAR\$$STR=Hallo Peter.
VAR\$$IST=Peter
VAR\$$SOL=Franz
UNI.s_case_sensitive_replace|$$STR|$$IST|$$SOL>$$TAR
UNI.s_case_sensitive_replace|$$STR|$$IST|$$SOL|all>$$TAR
UNI.s_case_sensitive_replace|$$STR|$$IST|$$SOL>$$TAR
UNI.s_case_sensitive_replace|$$STR|$$IST|$$SOL|all
' Im letzteren Fall ist das Ergebnis in $v1$, in den anderen Beispielen ist es in der Zielvariablen $$TAR.

****
s_generate_rnd_string
Transfered to STR.GENERATE
****

© 2023 Theo Gottwald * https://www.smart-package.com

Diese Funktion erzeugt einen Zufallsstring aus den Zeichen in Zeichenkette (Parameter 1) mit der Länge (Parameter 2) oder (Defaultwert) 32.
Dabei kann man (Parameter 1) auch weglassen. Dann werden alle Groß- und Kleinbuchstaben sowie das "-" verwendet.
Alternativ kann man als (Parameter 1) folgende Angaben machen:
- (beliebige Zeichenkette - diese Zeichen werden verwendet)
- leer - es werden Klein- und Großbuchstaben und das "-" verwendet
- "A" die Zeichenkette wird nur aus Großbuchstaben gebildet.
- "a" die Zeichenkette wird nur aus Kleinbuchstaben gebildet.
- "A-" die Zeichenkette wird nur aus Großbuchstaben und dem "-" Zeichen gebildet.
- "a-" die Zeichenkette wird nur aus Kleinbuchstaben und dem "-" Zeichen gebildet.

Beispiele:
' Es werden Klein- und Großbuchstaben und das "-" verwendet, Ergebnis in $$RES mit Länge 32
UNI.s_generate_rnd_string||>$$RES

' Es werden nur die Zeichen aus $$LET verwendet, die Länge des Ergebnisstrings ist hier 45
VAR\$$LET=%&_ABCDefgh
UNI.s_generate_rnd_string|$$LET|45>$$RES

' Es werden hier Großbuchstaben und das "-" Zeichen verwendet. Die Länge des Ergebnisstrings ist hier 8000 Zeichen
VAR\$$LET=A-
UNI.s_generate_rnd_string|$$LET|8000>$$RES

****
s_scan_for_number
****
Diese Funktion ermittelt die erste Ziffer in einer Zeichenkette (Parameter 1), beginnend bei Position (Parameter 2).
Rückgabe ist die Position der ersten Ziffer (0-9).

Beispiele:
VAR\$$STR=<Fontsize123>
UNI.s_scan_for_number|$$STR>$$POS
' $$POS enthält nun die Position der "1" also 10.

' Im Folgenden startet der Scan ab Position 6:
UNI.s_scan_for_number|$$STR|6>$$POS

****
s_fuzzy_compare
****
Diese Funktion vergleicht zwei Zeichenketten. Dabei wird ein gradueller Vergleich angewendet, der entweder:
- eine Übereinstimmung von 0% bis 100% zurückliefert (als Zahl 0 bis 100)
- oder (wenn Parameter 3 = "mistakes") die Anzahl der Tippfehler (Mistakes) zwischen den beiden Strings zurückgibt.

© 2023 Theo Gottwald * https://www.smart-package.com

Beispiele:
VAR\$$TXA=MyCommands
VAR\$$TXB=MyCummands
UNI.s_fuzzy_compare|$$TXA|$$TXB|mistakes>$$RES
' $$RES ist nun 1, da sich der Schreiber einmal vertippt hat.

UNI.s_fuzzy_compare|$$TXA|$$TXB>$$RES
' $$RES ist nun 90, da die Übereinstimmung zwischen den beiden Strings 90% beträgt.

****
s_wildcard_compare
****
Texte einfach nach dem Schema "A = B ?" zu vergleichen, erfordert nicht besonders viel Intelligenz.
Oftmals will man wissen, ob Dinge ähnlich sind, oder bestimmte Bestandteile enthalten sind.
Dazu können Wildcards herangezogen werden.

Die Vergleichsfunktion s_wildcard_compare vergleicht einen Wildcard-String (Parameter 1) mit einem zweiten String (Parameter 2).
Das Ergebnis ist 1 (das bedeutet Übereinstimmung) oder 0 (die Strings stimmen nicht überein).

Es gibt drei verschiedene Wildcard-Sets.

Set 1:

Als Wildcards werden in diesem Fall primär die zwei Joker-Zeichen aus DOS-Zeiten verwendet.
 * - ersetzt beliebige Zeichen
 ? - ersetzt ein Zeichen

Beispiel:
VAR\$$TXA="Jan?a*"
VAR\$$TXB="Januar"
UNI.s_wildcard_compare|$$TXA|$$TXB>$$RES

' Man kann in allen Fällen JIZ\ (Jump-If-Zero) verwenden, um das Resultat auszuwerten.
JIZ\$$RES:Label
' $$RES wäre hier 1, da der Vergleich erfolgreich ist. Andernfalls ist das Ergebnis 0.

Set 2:

Falls der Zusatz "numeric" (Parameter 3) angegeben wird, dann wird zusätzlich das Zeichen
 # - ersetzt eine Ziffer
ausgewertet.

' der Zusatz "numeric" bewirkt, dass auch das # Zeichen ausgewertet wird.

© 2023 Theo Gottwald * https://www.smart-package.com

UNI.s_wildcard_compare|$$TXA|$$TXB|numeric>$$RES
JIZ\$$RES:Label

Set 3:

' der Zusatz "all" bewirkt, dass die AGR\-Stringpatterns verwendet werden. Diese sind unten aufgeführt.
Beispiel:

VAR\$$TXA="{Janner&TOLERANT:&DOCAPS:60}"
UNI.s_wildcard_compare|$$TXA|$$TXB|all>$$RES
JIZ\$$RES:Label

Pattern	Abkürzung	Beispiel	
{&DOCAPS:}	{&0:}	{&DOCAPS:ExPE}	-> Groß-/Kleinschreibung beachten.
{&OR:}	{&1:}	{Text1&OR:Text2}	-> A oder B oder beides
{&XOR:}	{&2:}	{Text1&XOR:Text2}	-> A oder B
{&AND:}	{&3:}	{Text1&AND:Text2}	-> A und B; Reihenfolge beliebig
{&ANDTHEN:}	{&4:}	{Text1&ANDTHEN:Text2}	-> A dann B
{&FUZZY:}	{&5:}	{{Text1}&FUZZY:[value]}	-> ungefähr A
{&TOLERANT:}	{&6:}	{{Text1}&TOLERANT:[value]}	-> A zu min. X%
{&NOT:}	{&7:}	{&NOT:{Text1}}	-> darf nicht vorkommen
{&EXACT:}	{&8:}	{&EXACT:Text1}	-> genau A (Ohne Groß/Klein)
{&NOTEXT:}	{&9:}	{&9:}	
{&t:}			-> Always True
{&f:}			-> Always False

Alle Pattern können auch mit der Abkürzung verwendet werden, also statt &EXACT: kann man einfach &0: schreiben.
Die einfachen Operatoren (&OR, &XOR, &AND, &ANDTHEN) können beliebig oft wiederholt werden, also
{Text1&OR:Text2&OR:Text3&OR:Text4&OR:Text5... usw.}
ist möglich.

Der &NOT: Operator bezieht sich auf das Nichtvorhandensein von Text; er dient nicht dazu, Pattern-Berechnungen zu negieren. Also

&NOT:{text1&AND:text2}

funktioniert so nicht, allerdings kann man die aufgelöste Variante verwenden:

{&NOT:text1}&AND:{&NOT:text2}&AND:{&NOT:text3} ... etc.

Dies funktioniert mit allen einfachen Operatoren.

© 2023 Theo Gottwald * https://www.smart-package.com

Es gibt keine Beschränkung auf 2 Operatoren wie ansonsten bei den WinRobots-Suchmustern, also beispielsweise AFO\(?), STW\ etc. Dadurch sind beliebig viele Internationalisierungen im gleichen Script denkbar.

Das {&EXACT:Text1}-Pattern ersetzt das WinRobots Standard-Suchmuster "Text1&&" (&& am Ende).

Prinzipiell sind auch Verschachtelungen möglich, solange die Klammern korrekt gesetzt werden, also zum Beispiel:

{{{Text1&ORText2}&ANDTHEN:{Text1&ORText4}}&ANDTHEN:Text2}

Neu hinzugekommen ist der fortschrittliche "Tippfehler-Operator"; Beispiel:

{Text1&FUZZY:5}

Die Zahl hinter dem "&FUZZY:" gibt an, wie oft man sich vertippen darf, so dass der Text trotzdem erkannt wird.

Ebenso neu hinzugekommen ist der "&TOLERANT" Operator. Hierbei wird eine %-Zahl angegeben, die die Wortähnlichkeit angibt, ab der der Text der Bedingung entspricht.

Beispiel:
{text1&TOLERANT:89}

{text1&TOLERANT:&DOCAPS:89}

Achtung: Folgendes funktioniert nicht (und macht auch keinen Sinn)
{{text1&OR:text2}&TOLERANT:&DOCAPS:89}
da der "&TOLERANT" Operator nur Texte auswerten kann.

Bei allen Operatoren kann jeweils das "&DOCAPS:" verwendet werden. Dadurch wird die jeweilige Klammerebene auf Groß-/Klein-Schrift umgeschaltet, berücksichtigt dann also Groß- und Kleinschreibung.

##
##
##
##
##
##

****
m_calc
****

Diese Funktion ermöglicht das Berechnen von beliebigen, geklammerten Ausdrücken. Ebenso werden die üblichen Rechenregeln berücksichtigt (Punkt vor Strich etc.). Zusätzlich kann das Ergebnis auf vielfache Art und Weise gerundet werden.

Es gibt die folgenden Operatoren (Auflistung in der Reihenfolge der Priorität):

© 2023 Theo Gottwald * https://www.smart-package.com

' Logische Operatoren - Allerhöchste Priorität
> Größer als
< Kleiner als
= Gleich
! Nicht gleich

^ Hoch - Zweithöchste Priorität

* Multiplikation
% Modulo-Division
/ Division
\ Rest von Division ermitteln

+ Addition
- Subtraktion

Beispiel:
UNI.m_calc|13\2>$$RES
MBX\$$RES

Das Ergebnis des Befehls kann nun auf vielfache Weise nachbearbeitet werden.
Dazu stehen unter anderem folgende Möglichkeiten zur Verfügung:

|i - Integer, rundet auf die nächste Ganzzahl, die gleich oder größer als das Ergebnis ist
|c - rundet auf die nächst kleinere Ganzzahl, die gleich oder kleiner als das Ergebnis ist
|x - schneidet einfach alle Nachkommastellen ab
|f - fractiona, gibt nur die Nachkommastellen zurück
|a - Absolutwert: Schneidet ein evtl. negatives Vorzeichen weg.
|r - rundet auf 2 Dezimalstellen
|s - Sign, gibt 1,0 oder -1 zurück, je nachdem welches Vorzeichen das Ergebnis hatte

Die Zeichen können auch kombiniert werden und werden dann der Reihe nach verarbeitet.

Beispiele:
UNI.m_calc|13\2|x>$$RES
MBX\$$RES

UNI.m_calc|-13\2|fa>$$RES
MBX\$$RES

UNI.m_calc|-13\2|xa>$$RES
MBX\$$RES

VAR.$$NAM=10
VAR.$$FOR=(100*$$NUM)+20
UNI.m_calc\$$FOR|ia>$$ERG
MBX.Das Ergebnis ist: $$ERG

© 2023 Theo Gottwald * https://www.smart-package.com

****
m_eval
****

Dieser Befehl implementiert einen wissenschaftlichen Formel-Rechner, der relativ langsam arbeitet aber kaum Wünsche offen lässt.
Der Rechner ist derzeit nur in englisch implementiert.
Im Fehlerfall erhält man eine aussagekräftige Fehlermeldung, statt des Ergebnisses.

[englisch]
Using extended precision, 18 digits of precision is obtained. Factorials are computed up to 1754! without overflow.

Expressions and functions should follow strictly to standard algebraic syntax rules.
Operators and expressions which can be used are:

+ - * / \ ^ ! ( ) < = > <> >= <=

The Operator Precedence follows algebraic rules.
The only exception is the unary negation operator which in this program does not have a special priority following exponentiation.

However, operations inside parentheses always have the highest priority and are always evaluated first.
Thus by using parentheses in the right places you can always obtain the operator precedence you need for your purpose.

The following operator precedence is used in the program:
1. parentheses ( )
2. unary operators (Factorials (!))
3. one argument functions
4. exponentiation (^) (power expressions)
5. multiplication (*) and floating-point division (/)
6. integer division (\)
7. modulo (MOD)
8. addition (+), subtraction (-)
9. relational operators (<, <=, =, >=, >, <>)
10. NOT, ISFALSE and ISTRUE
11. AND
12. OR and XOR (exclusive OR)
13. EQV (equivalence)
14. IMP (implication)

These are the implemented trigonometric functions:

"ARCSINH() - Arc (Inverse) Hyperbolic Sine"
"ARCCOSH() - Arc (Inverse) Hyperbolic Cosine"
"ARCTANH() - Arc (Inverse) Hyperbolic Tangent"
"ARCSECH() - Arc (Inverse) Hyperbolic Secant"
"ARCCSCH() - Arc (Inverse) Hyperbolic Cosecant"
"ARCCOTH() - Arc (Inverse) Hyperbolic Cotangent"
"ARCSIN() - Arc (Inverse) Sine"

© 2023 Theo Gottwald * https://www.smart-package.com

```
"ARCCOS() - Arc (Inverse) Cosine"
"ARCSEC() - Arc (Inverse) Secant"
"ARCCSC() - Arc (Inverse) Cosecant"
"ARCCOT() - Arc (Inverse) Cotangent"
"SINH() - Hyperbolic Sine","TANH() - Hyperbolic Tangent"
"SECH() - Hyperbolic Secant"
"CSCH() - Hyperbolic Cosecant"
"COTH() - Hyperbolic Cotangent"
"SEC() - Secant"
"CSC() - Cosecant"
"COT() - Cotangent"
"SIN() - Sine","COS() - Cosine"
"TAN() - Tangent"
"ATN() - Arc (Inverse) Tangent"
"LN() - Natural Log (base E)"
"EXP2() - Exponentiation of 2 or Antilog 2"
"EXP10() - Exponentiation of 10 or Antilog 10"
"EXP() - Exponentiation of E or Antilog E"
"SQR() - Square Root","LOG10() - Common Log (base 10)"
"ABS() - Absolute Value"
"LOG2() - Log (base 2)"
"LOG() - Natural Log (base E)"
"AND - Logical AND"
"XOR - Logical XOR (Exclusive OR)"
"OR - Logical OR"
"MOD - MOD (Modulo)"
"IMP - Logical IMP (Implication)"
"EQV - Logical EQV (Equivalence)"
"NOT - NOT","ISTRUE - Logical Truth"
"ISFALSE - Logical Falsity"
"CEIL() - Ceiling"
"FRAC() - Fractional Part"
"FIX() - Truncate To Integer"
"SGN() - Sign"
"PI# - Constant (3.14159..)"
"E# - Constant (2.71828..)"
```

A number of constants and conversions are available, making this math evaluator an advanced scientific calculator.
These "known constants" include:

```
"Foot_TO_meter"                 = "*1/ 3.28084"
"Meter_TO_foot"                , "* 3.28084"
"Inch_TO_centimeter"             , "* 2.54"
"Centimeter_TO_inch"             , "*1 / 2.54"
"Kilometer_TO_mile"              , "*1 / 1.609344"
"Mile_TO_kilometer"              , "* 1.609344"
"Inch_TO_foot"                  , "*1 / 12"
"Foot_TO_inch"                  , "* 12"
"Yard_TO_meter"                  , "*1 / 1.093613"

Input of angles can be in degrees or radians, depending if you specify the "#" as an additional flag.
However, trigonometric output using the ARC functions will always be in radians.
You can transform angles to radians and vice versa.

Beispiel:

```
VAR\$$FOR=SIN(1)*Inch_TO_centimeter
' Die Angabe des |# bewirkt Winkelgerechnungen in "Degree" statt "Radian"
UNI.m_eval|$$FOR|#
VAR\$$RES=$v1$
MBX\$$RES

VAR\$$FOR=(5*Inch_TO_centimeter)*Acceleration_of_gravity_(m/sec²)
UNI.m_eval|$$FOR|#>$$RES
MBX\$$RES
```

****
m_is_leapyear
****
Die Funktion ermittelt, ob das angegebene Jahr (im Bereich 0 bis 5000) ein Schaltjahr ist oder nicht.
Die Rückgabe ist dementsprechend 1 oder 0.
Fehlt die Jahresangabe, dann wird das aktuell auf dem PC eingestellte Datum zugrunde gelegt.

Beispiel:

```
UNI.m_is_leapyear|1968>$$RES
UNI.m_is_leapyear|2015
VAR\$$RES=$v1$
' Im Folgenden wird das aktuelle Jahr zugrunde gelegt, da die Jahresangabe fehlt:
UNI.m_is_leapyear>$$RES
```

****
m_get_time
****
Die Funktion "m_get_time" ermittelt Zeit und/oder Datum. Darüber hinaus können auch Datumsberechnungen ausgeführt werden.
Da es hierbei wichtig ist, dass man genau das gewünschte Format erhält, unabhängig von den jeweiligen Ländereinstellungen, kann man hier das Format selbst angeben.
Dies geschieht unter Verwendung der folgenden Buchstaben:
y - Jahr
m - Monat

© 2023 Theo Gottwald * https://www.smart-package.com

d - Tag
h - Stunde
n - Minute
s - Sekunde
t - Tick (Mikrosekunde)
Ein einfacher Aufruf der Funktion sieht so aus:
UNI.m_get_time|dd>$$RES
Ergebnis: 23 - wenn gerade der 23.te des Monats ist.

UNI.m_get_time|dddd>$$RES
Ergebnis: In diesem Fall 0023 da vier "d" angegeben wurden.

' Ein komplettes Datum erhält man so:
UNI.m_get_time|dd/mm/yyyy>$$RES
Ergebnis in $$RES ist hier zum Beispiel: 03/02/2011

Auf die gleiche Weise kann man die Zeit ermitteln:
UNI.m_get_time|nn>$$RES
Ergebnis wäre zum Beispiel 03 (falls es gerade 7:03 ist).

UNI.m_get_time|nn-ss-tttt>$$RES
' Hier erhält man zum Beispiel Minuten, Sekunden und Ticks.

' Zeitpunkt in 4 Jahren in einem User-definierten Format
UNI.m_get_time|dd/mm/yyyy|AY:4>$$RES

Die Funktion bietet außerdem die Möglichkeit, ausgehend von der jetzigen Zeit Datums-Berechnungen auszuführen.
Dazu kann man als zweiten Parameter angeben, welcher Betrag von Tag, Monat, Jahr etc. abgezogen oder hinzuaddiert werden soll.
Diese Angabe erfolgt durch Buchstabenkombinationen von "A" (Add) oder "S" (Subtract) und dem jeweiligen Zeitbuchstaben wie folgt:

AY:(Zahl) ' Jahre hinzuzählen
SY:(Zahl) ' Jahre abziehen

AM:(Zahl) ' Monate hinzuzählen
SM:(Zahl) ' Monate abziehen

AD:(Zahl) ' Tage hinzuzählen
SD:(Zahl) ' Tage abziehen

AH:(Zahl) ' Stunden hinzuzählen
SH:(Zahl) ' Stunden abziehen

AN:(Zahl) ' Minuten hinzuzählen
SN:(Zahl) ' Minuten abziehen

AS:(Zahl) ' Sekunden hinzuzählen
SS:(Zahl) ' Sekunden abziehen

AT:(Zahl) ' Ticks hinzuzählen

© 2023 Theo Gottwald * https://www.smart-package.com

ST:(Zahl) ' Ticks abziehen

Beispiele:
UNI.m_get_time|yy-mm-dd|AH:200,SN:400>$$RES
' Es werden zum aktuellen Datum 200 Stunden hinzugezählt und dann 400 Sekunden abgezogen.
' Das Ergebnis wird im gewünschten Format ausgegeben.

UNI.m_get_time|dd;mm;hh|AD:50,SH:90>$$RES
' Es werden zum aktuellen Datum 50 Tage hinzugezählt und dann 90 Stunden abgezogen.
' Das Ergebnis wird im gewünschten Format ausgegeben in die Variable $$RES.

Der Befehl kann auch für Datumsberechnungen verwendet werden.
Dazu wird die Startzeit mit den folgenden Optionen geändert:

NY: (geänderte Jahreszahl 0 ... 5000)
NM: (Monatszahl: 1 ... 12)
ND: (Tag: 1 ... 31)
NN: (Minute: 0 ... 59)
NS: (Sekunde: 0 ... 59)
NT: (Millisekunde: 0 ... 999)

Beispiel:
UNI.m_get_time|yy-mm-dd|NY:2013,NM:5,ND:5,AH:200,SN:400>$$RES

Man kann so auch einfach ein Datum formatieren (ohne Berechnung):
UNI.m_get_time|yy-mm-dd|NY:2013,NM:5,ND:5>$$RES

****
"dtn.","m_date_to_number"
****
Der Befehl wandelt ein Datum in eine 32 bit-Zahl um. Dadurch können Datumsvergleiche einfach mittels IVB\ erfolgen.

Beispiel 1:
UNI.dtn.|15-03-2005
VAR\$$DAT=$v1$
UNI.ntd.|$$DAT
MBX\$v1$

Beispiel 2:
UNI.dtn.|15-03-2005
VAR\$$DAA=$v1$

UNI.dtn.|19-04-2005
VAR\$$DAB=$v1$

UNI.dtn.|20-04-2005
VAR\$$DAC=$v1$

IVB\$$DAC|$$DAA|$$DAB

© 2023 Theo Gottwald * https://www.smart-package.com

```
  MBX\Datum ist innerhalb des Zeitraumes
ELSE
  MBX\Datum ist nicht innerhalb des Zeitraumes
EVB\
```

Beispiel 3:

```
' Lässt man das Datum weg, wird das heutige "Local Time" Datum verwendet.
UNI.dtn.|
VAR\$$DAA=$v1$

UNI.dtn.|17-04-2011
VAR\$$DAB=$v1$

CAL\$$DIF=$$DAB-$$DAA
MBX\$$DAA-$$DAB--$$DIF
```

****
"ntd.","m_number_to_date"
****
Der 15-03-2011 ergibt zum Beispiel 149823.
Der 16-04-2011 ist 32 Tage später ergibt also 149855.
Auf diese Weise kann man auch leicht DAtumsberechnungen ausführen, auf Tagesbasis.
Mit der "number_to_date" Funktion kann man dann die berechneten Werte wieder in Reale Daten zurückumwandeln.

****
"rdi.","m_return_date_info"
****
Returns Date-Info (Systemunabhängig). Je nach Angabe eines Zahlenparameters werden unterschiedliche Informationen zum aktuellen Zeitpunkt ermittelt und zurückgegeben:

0 - dayname,
1 - Monthname,
2 - Datenum,
3 - yearnum,
4 - time,
5 - Time + Milliseconds,
6 - DayOfWeek (as number 0-6),
7 - Datum (deutsche Schreibweise),
8 - Wochentag (immer Englisch!),
9 - Wochetag (nur 2 Buchstaben, gross)
10 - Zeit - nur Stunde und Minute

Beispielskript Datumsfunktionen:

```
' Diese Angabe könnte in einer INI-Datei stehen.
' Sie sagt aus in welchen zeiträumen ein Unterskript ausgeführt werden soll (oder nicht)
VAR\$$INT=Mo*7:00-12:00,Di*9:00-10:00
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
FEM\1,|$$INT|DoIt|$$INA
MBX\Fertig
@

:DoIt
' Heutiger Tag als Zahl
UNI.m_return_date_info|6>$$DAN

' Erste Zwei Buchstaben aus Ini-Zeile sind der Tag
GSS\1,2|$$INA>$$DAY

RET\
```

****
"vdf.","m_verify_date_format"
****

Der Befehl stellt sicher, dass ein String das notwendige deutsche Datumsformat DD-MM-YYYY hat.
Es wird auch geprüft ob die Zahlen im erforderlichen Bereich sind.
Der String wird falls erforderlich um führende "0" ergänzt und so zurückgegeben.

Beispiel:

```
UNI.vdf.|41-2-99
MBX\$v1$

' Da 41 keine gültige Datumsangabe wirde der Wert auf 31 reduziert.
Ausgabe: 31-02-0099
```

****
"vtf.","m_verify_time_format"
****

Der Befehl stellt sicher, dass ein String das notwendige deutsche Zeitformat HH:MM:SS hat.
Es wird auch geprüft ob die Zahlen im erforderlichen Bereich sind.
Der String wird falls erforderlich um führende "0" ergänzt und so zurückgegeben.

Beispiel:

```
UNI.vtf.|24-1-9
MBX\$v1$
@
```

Rückgabe: 23:01:09

****
"ttn.","m_time_to_number"
****

Erzeugt eine Zahl, die die Anzahl der Dekunde nseit Mitternacht angibt.

© 2023 Theo Gottwald * https://www.smart-package.com

Dadurch lassen sich Zeitabfragen leicht via IVB\ ausführen.
Ebenso werden Zeitberechnungen mit Sekunden vereinfacht.

Beispiel:

```
UNI.ttn.|10:09:00
VAR\$$DAT=$v1$
MBX\$$DAT
' Ausgabe: 36540

UNI.ntt.|$$DAT
MBX\$v1$
' Ausgabe: 10:09:00
@
```

****
"ntt.","m_number_to_time"
****
Gegenfunktion zu "m_time_to_number". Nach einer Zeitberechnung läßt sich damit die Anzahl der Sekunden wieder in die Tageszeit umrechnen.

Beispiel:

```
UNI.ttn.|10:09:00
VAR\$$DAT=$v1$
MBX\$$DAT
' Ausgabe: 36540

UNI.ntt.|$$DAT
MBX\$v1$
' Ausgabe: 10:09:00
@
```

##
##
##
##
##
##
Mit diesen Befehlen können die Robots untereinander kommunizieren.

****
"csi.","c_create_alive_signal"
****
Erzeugt ein systemweites Signal, das von einem anderen Robot via "c_try_signal" abgefragt werden kann.
Signale werden automatisch entfernt, wenn der Robot, der das Signal gesetzt hat beendet wird.
Die Rückgabe ist der Name des Signals, falls ein Name angegeben wurde, dieser.
Falls kein Signal erstelltw erden konnte, ist die Rückgabe ein Minuszeichen/Bindestrich "-".

****

© 2023 Theo Gottwald * https://www.smart-package.com

"tsi.","c_try_alive_signal"
****
Fragt ob ein systemweites Signal gesetzt wurde. Rückgabe ist 1/0 je nach dem ob das Signal von irgendwoher gesetzt wurde oder nicht.

****
"rsi.","c_remove_alive_signal"
****
Entfernt ein systemweites Alive-Signal. Rückgbae ist 0/1 je nach dem ob das Signal entfernt werden konnte oder nicht.
ACHTUNG: Ein globales "Alive Signal" kann NUR von der robot-Instanz gelöscht werden, die es erzeugt hat.
Wenn der Robot sich beendet (egal wie) wird automatisch auch das "Alive Signal" gelöscht.

****
"wsi.","c_wait_alive_signal"
****
Wartet bis das angegebene Signal erzeugt wird oder verschwindet.
Es kann als weiterer Parameter ein Timeout angegeben werden.
Falls das Timeout erreicht wird, wird das ITO\ (Timeout-Flag) gesetzt, ansonsten ist die Rückgabe "1".
Falls auf das Verschwinden eines Signals gewartet wird, muss das Signal beim Aufruf des Befehls bereits vorhanden sein,
sonst ist die Bedingung sofort erfüllt.

Beispiele:

```
' Signalname "RUN", 10 Sekunden Timeout ob Signal erscheint
UNI.c_wait_alive_signal|RUN|10
ITO\
  MBX\Signal nicht erschienen!
ETO\
@

' Signalname "RUNX", 360 Sekunden Timeout ob Signal verschwindet
UNI.c_wait_alive_signal|!RUNX|360
ITO\
  MBX\Signal nicht verschwunden!
ETO\
@
```

****
"csf.","c_create_signal_flag"
****
Erzeugt ein systemweites Flag, das von einem anderen Robot via "c_try_signal_flag" abgefragt werden kann.
Anders als Signale, werden Flags nicht automatisch entfernt, wenn der Robot, der das Flag gesetzt hat beendet wird.
Ausserdem kann ein Flag von jedem Robot gelöscht werden, nicht nur von dem, der es erzeugt hat.

© 2023 Theo Gottwald * https://www.smart-package.com

Die Rückgabe ist der Name des Signals, falls ein Name angegeben wurde, dieser.
Falls kein Signal erstellt erden konnte, ist die Rückgabe ein Minuszeichen/Bindestrich "-".

```
' Robot 1
UNI.csf.|Theo
TDL\500
UNI.rsf.|Theo
CAS\2
@

' Robot 2
UNI.wsf.|Theo
UNI.wsf.|!Theo
@
```

****
"tsf.","c_try_signal_flag"
****
Fragt ob ein systemweites Flag gesetzt wurde. Rückgabe ist 1/0 je nach dem ob das Flag von irgendwoher gesetzt wurde oder nicht.

****
"rsi.","c_remove_alive_signal"
****
Entfernt ein systemweites Flag-Signal. Rückgbae ist 0/1 je nach dem ob das Signal entfernt werden konnte oder nicht.
Ein globales "Flag Signal" kann von jeder Robot-Instanz gelöscht werden.
Ein "Flag Signal" ist permanent und besteht auch weiter, wenn der Robot sich beendet, der das "Flag Signal" gesetz hat.

****
"wsf.","c_wait_signal_flag"
****
Wartet bis das angegebene Flag Signal erzeugt wird oder verschwindet. Es kann als weiterer Parameter ein Timeout angegeben werden.
Falls das Timeout erreicht wird, wird das ITO\ (Timeout-Flag) gesetzt, ansonsten ist die Rückgabe "1".
Falls auf das Verschwinden eines Signals gewartet wird, muss das Signal beim Aufruf des Befehls bereits vorhanden sein, sonst ist die Bedingung sofort erfüllt.

Example

```
STW.ct|applicationframewindow|fotos
SPC.c|applicationframeinputsinkwindow
UNI.g_analyze|PD:8,FL:12,TL:50
ENR.
```

3.64.4 IEM. / NEM. - If Execution-Mode

MiniRobotLanguage (MRL)

IEM. Conditional Statement

If Execution Mode

Intention

Conditional Statement.

Use this statement to test if:

- if the Robot is running as a compiled executable.
- if the robot is been started as a parallel-robot.
- if the robot is running under Editor control.

`NEM.` - is the negative form of this statement.

Syntax

IEM.[P1]

Parameter Explanation

P1 - (optional) Condition to test for. If omitted, "1" is used.

Can be any of these:

"1","exe","executable"
Evaluate TRUE if the script is running as a compiled executable. This is the default value.

"2","editor"
Evaluate TRUE if the script is running from inside and under control of the Editor.

"3","father","sub-robot","subrobot"
Evaluate TRUE if the script is running as a Parallelrobot, using the PRR./PRE. Commands.

Example

```
'**********************************
' IEM.-Sample
'**********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'
IEM.1
  $$PAT=?exeloc\

3.64.5 ITO. / NTO. - If TimeOut

MiniRobotLanguage (MRL)

ITO. Conditional Statement

If TimeOut-Flag set

Intention

Conditional Statement.

Test if the Timeout-Flag #tio# 334 has been set by the previous command.

A command may set the timeout flag under error conditions, or when it runs into a *TimeOut*. Here is an example:

```
' The following STW. will run into an TimeOut
STW.Xwt|0|no-such-window
ITO.
  DBP.The last command ran into an timeout!
EIF.
ENR.
```

If you run the script, this is what you see in the Debug-window of the editor.

Many other commands also set the TimeOut-Flag in case of error-conditions. As well, mos commands clear the TimeOut-Flag if there are no error-conditions, and no timeout. Therefore always check the TimeOut-Flag immediately after the command that you want to test for success.

You can call ITO. with a parameter. In this case the value will overwrite the TimeOut-Flag and force (1) true or (0) false evaluation.
A value of 2 or if the variable is empty will make ITO. to do its normal job and check the TimeOut-Flag..

ITO. will always leave the TimeOut-Flag cleared after it has been called.

There are two Systemvariables 334, representing the state of the timeout-flag:

```
#tio#    -        Timeout-Flag
#til#    -        Timeout-Line-Number
```

NTO. is the negative Form of ITO.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

ITO.[P1]

Parameter Explanation

P1 - (optional) variable that evaluates to "1" or "0". In this case the value will overwrite the TimeOut-Flag and force (1) true or (0) false evaluation.
A value of 2 or if the variable is empty will make `ITO.` to do its normal job and check the TimeOut-Flag.

Example

```
'**********************************
' ITO.-Sample
'**********************************
' The following STW. will run into an TimeOut
STW.Xwt|0|no-such-window
ITO.
  DBP.The last command ran into an timeout!
EIF.
ENR.
```

3.64.6 OPT. - Optional Settings

MiniRobotLanguage (MRL)

OPT. Command

Optional Settings

Intention

The OPT-Command enables you, to set, reset or retrieve general system-wide settings.
The three Modes of Operation are:

1. Change Settings:

```
OPT.HM|25
```

2. Reset Setting to default value:

```
OPT.HM|reset
```

3. Retrieve actual Setting to TOS 104:

```
OPT.HM|show
```

Here is an example-script

```
OPT.HM|show
MBX.The Human MouseMove Flag is: $$000
ENR.
```

In the same way, you can change that value and turn "Human Mouse Move" off:

```
OPT.HM|0
ENR.
```

or reset it to its default value:

```
OPT.HM|reset
ENR.

' Another example

OPT.FIF|128
ENR.

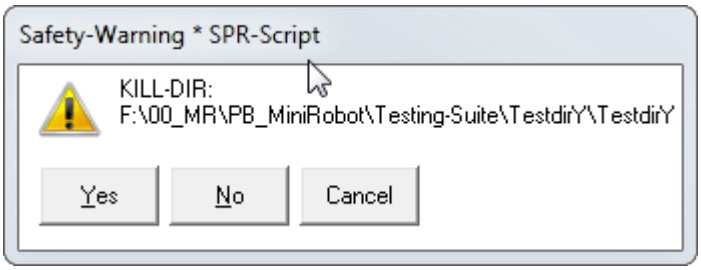
' Or reset to default value
OPT.FIF|reset
ENR.
```

Using the

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
OPT.SAFEFILE|1
```

will bring up such a Messagebox for destructive File-Operations like `DEL.`, `RMD.` `REN.` and `DCP.`



You can choose between

- "**Yes**" - this will start the requested file-operation
- "**No**" - this will prevent the requested file-operation and set the Timeout-Flag
- "**Cancel**" - this will prevent the requested file-operation and set the Timeout-Flag and end the script.

Syntax

OPT.P1|P2

Parameter Explanation

```
P1 -  1 - HM  = "Human Mousemove", value 0 (off) to 45 (very
strong)
      2 - WII = "Wait for Input Idle" Value, in seconds.
      3 - MaxVarRes = Maximal Number of variable resolutions;
          default = 255.
      4 - STSZ = Standard Searchtime for Top-Windows in
seconds,
           default = 60 Sec.
      5 - SCSZ = Standard Searchtime for Child-Windows in
seconds,
          default = 30 Sec.
      6 - WS  =  Standard-Fenstergröße bei EXE-Starts.
      7 - ERN = Last Error Number and Text. Using the "Set"-
Mode
          with this, will only set the error-number. The error
          text will be "Synthetic Error"
      8 - SILENT = Internal Number that shows the actual
"silent"
          state. Changing this number will change the "Silent-
Mode"
          behavier, details see USM. 786
      9 - DIP, the acual DIP-value. CHanging this number will
          override the last setting with the DIP. 773-command.
     10 - Default ExitCode. Changing this value will override
the
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
          last setting with SEC. - Set Exit Code2129 and other
commands.
     11 - REG64 - Switch 64 bit Registry on
     12 - REG32 - Switch 64 bit Registry off
     13 - FIF - Set maximum Search Pattern Size for the FIF.-
Command
          default = 256.
    14 - ENCRYPT .Standard Strenght (Rounds) for TEA-
 Encryption/Decryption
    15 - SPLITCOMP - Setting for FIL.SPLIT-Command. If set,
 command will use encryption and compression.
    16 - SAFEFILE - Setting for RMD. and DEL. etc. If set, a
 WARNING Messagebox will appear
         before any such destructive file-Operation.
    17 - PWSWAIT - Waiting time for Powershell, default is 60
 Seconds.
```

Example

```
'***********************************
' OPT.-Demo
'***********************************
' "show" will place the result on the TOS
OPT.HM|show
MBX.The Human MouseMove Flag is: $$000
ENR.
'***********************************

'***********************************
' OPT.-Demo
'***********************************
' "show" will place the result on the TOS
OPT.FILESAFE|1
' Now before the folder is been deleted, a warning MSGBOX will
appear.
RMD.d:\folder
ENR.
'***********************************
```

Remarks

Be careful when using this command. If you set wrong values here, your scripts will fail without visible errors.

Limitations:

3.64.7 STF. - Set TimeOut Flag

MiniRobotLanguage (MRL)

STF. Command

Set TimeOut Flag

Intention

The `STF.`-Command can be used to manually set the timeout flag to simulate a timeout condition.

```
' This will set the timeout-flag
STF.1

' This will clear the timeout-flag
STF.0
```

There are two Systemvariables 334, representing the state of the timeout-flag:

```
#tio#    -        Timeout-Flag
#til#    -        Timeout-Line-Number
```

Syntax

STF.P1

Parameter Explanation

P1 **-** ***(optional)*** VAR or number.If omitted, the timeout-flag will be cleared.

Example

```
' This will set the timeout-flag
STF.1

' This will clear the timeout-flag
STF.0
```

Remarks

*© 2023 Theo Gottwald * https://www.smart-package.com*

There are two Systemvariables 334, representing the state of the timeout-flag:

```
#tio#    -        Timeout-Flag
#til#    -        Timeout-Line-Number
```

3.65 Mouse-Operations

3.65.1 ! Smarty's Mouse-Operations

Smarty's Mouse-Operations Previous 2410 Top 41 Next 2431

Smarty's Mouse-Operations

Mouse-Positioning Engine Prototypes (Options for all Mouse-Mov

The use of the Mouse Positioning Engine is Simple. Just type `MMV.MLC.` or whatever you want to do.
This may be enough in 90% of all cases.

Then there may be a few advanced cases where you need more Features to "hit the point".
For these cases where you need more fine-tuning, you do get a lot of Options through the use of the following Prototypes (detailed Explanation see below!):
Generally in any Mouse-Command you can specify one or more Prototypes. And additionally you can specify coordinates or Quadrant-Coordinates.
This system was developed over the years to give you maximum flexibility. Here is an example.

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dua

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning, these 3 can not be combined with themselves:

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and y
"b" - last mouse-position, before last Move.
"p" - relativ to current "Active Point". (Default)
"l" - Last "Active Point".
```

Normally these commands just "Act" on the current "Active Point", but they do NOT Move the current "Active Point".
If you want to do so, just add the `"x"`-Prototype.

```
"x" - Set Active Point at this position.

Example:
 MMV.oex|-20,90 {A2-B4}
```

There is no rule about the order of the prototypes. Therefore:

```
 MMV.oex|-20,90 {A2-B4}
```

and

```
 MMV.xeo|-20,90 {A2-B4}
```

are both functionally equal.

Following is a more "in detail" Description:

Mouse-Positioning Engine

Generally the Location where the Mouse will do its next Action is called the "Activity Point" or in short: "Active Point".
The "Active Point" is normally set by other commands that localize a window or object.
In each of these cases, the Active Point is the Middle-point of these rectangular Areas.
Therefore a Mouse Operation will normally start with the Selection of an Application-Window (called "Top-Windows").

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.t|Title
```

This will "Locate the Window". Internally the Coordinates of the Window are stored, and the Point in the Middle of the Window becomes the "Active Point".
Now we can choose a Button. For example with:

```
SCW.c|Button
```

Next we can Move the Mouse there:

```
MMV.
```

This is the general Principle how the Mouse-Position Engine works.

1. Choose the Application-Window (`STW.`)
2. Choose the Button/Control etc. (`SCW./AGR.` etc.)
3. Move the Mouse or Click at that Place.

Now so far the easy part. You can do that in 90% of all cases this is all you need.
For the rest of cases,we have added superior possibilities to fine-tune Mouse-Positioning and Clicks.

You can use `LBO.` or `RBO.` to select a side of the target-Rectangle.
In case you do not want to click in the Middle, but rather left side, or right side.

```
STW.At|TestApp
AGR.43|Button 2
' Will change the RECT to the Left Side
LBO.
MMV.o|{A1}
ENR.
```

As `LBO.` will change the RECT, it can be combined with all fine-tuning Options, like numeric Input or Quadrant-Coordinates.
In such a case, the Engine will first calculate the Quadrant and then add the numeric input to the Quadrant-Middlepoint.

```
STW.At|TestApp
AGR.43|Button 2
' Will change the RECT to the Left Side
LBO.
MMV.o|-20,10{G4}
ENR.
```

Let's take a look on this line in detail:

```
MMV.o|-20,10{G4}
```

We use the Option "`o`" this says "use the rectangle from the last object". The last Object was the Button, that we have localized using "`AGR.`"
If we would not write anything, the Mouse would drive to 0,0 - which is the upper left corner of the Button.
Now we fine-tune the Position relative to the upper-left-corner. We user a Quadrant-Coordinate `{G4}`.
For this the current Rectangle is been split into 8 pieces. They get Names from "`A1`" to "`H8`".

© 2023 Theo Gottwald * https://www.smart-package.com

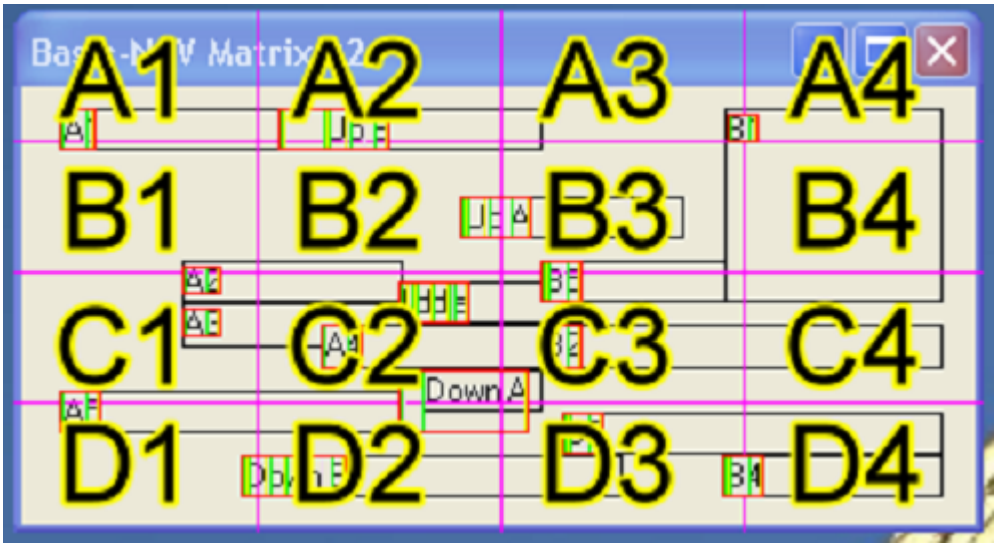
They are sorted like in the picture below. And the Mouse will drive to the Centerpoint of this Rectangle "G4".
And now the numeric coordinates are added to this Position in the last step.

You can use Quadrant-Coordinates for fine-tuning.

All Quadrant-Coordinates in the Mouse-Position Engine are 1/8 th Quadrants.

They go from **A-H** and from **1-8**

This is different from the Standard-Quadrants which are 1/4 Quadrant (see below).



Here is an Example:

```
STW.At|TestApp
AGR.43|Button 2
MMV.o|{H7}
ENR.
```

Where it all started: Screen-Coordinates

Generally a Computer--Screen is made up of "Pixels". Depending on your Screen-Resolution, you may have for example

1920 Pixels horzontally and
1080 Pixels in vertical direction.
which would make your Screen to be build from a total of 1920x1080=2073600 Pixels.

Now you can Simply move the mouse by giving it the Coordinates of an Pixel.
For example, if you want the Mouse to drive to the Center of the Screen, you can just type:

```
' This will Move the Mouse to these Screen Coordinates
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MMV.960,540
' This will just end the Script
ENR.
```

This will Move the Mouse-pointer to these "Screen Coordinates".

Please note that in all Examples, you can just replace the Command `MMV.(Mouse Move)` with the Command `MLC. (Mouse Left Click)`
to make the Robot Click to that place, instead of just Moving there.

```
' This will Move the Mouse to these Screen Coordinates and make a Left Mouse-Cli
MLC.960,540
' This will just end the Script
ENR.
```

Depending on your Screen-Resolution, this place "`960,540`" may, or may not be the Centerpoint of your Screen.

Most often we do not use Screen-Coordinates, because we do not know the Screen-Resolution,
and we do not know "where on the Screen" our "Button" (or whatever we want to click) really is.

So whats the next step?

Better: Window-Coordinates

If we tell the Robot which "Window" we like to click into, we can use "Window-Coordinates".
Unlike Screen-Coordinates, these start at the upper left corner of the window.

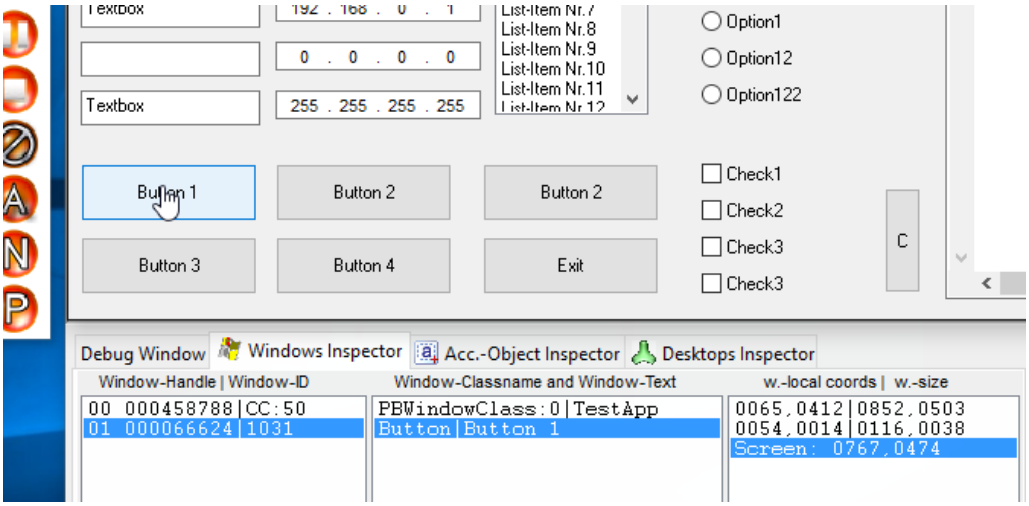
And therefore the window can be anywhere on the Screen, we will always be right.
As long, as the Button we want to click did not move or change its size.

Now what you need to know that we deal with many sorts of "windows" here.
A window is the Application window itself - we call it a "Top-Level Window".
Another windows is any of the Control or buttons here.

Not every Button must be a window. But if it is a window you will see it in the "Windows-Inspector",
see picture below. The "Windows-Inspector" also shows you the "Window-Coordinates" (right side:
- 65,412 - for the Application "Top-Level-Window" and
- 54,14 for the "Button-Control-Window"
below are the Screen coordinates (767,474).

On the right side of these coordinates you can see the size of these windows in X-Pixel,Y-Pixel.

© 2023 Theo Gottwald * https://www.smart-package.com



You can Move the Mouse using Window-Coordinates like this:

```
STW.t|TestApp
MMV.w
ENR.
```

This will move the Mouse to the upper left corner (0,0 - Position) of the last localized (Top- or Child-)Window.
You can specify own Window Coordinates as well:

```
STW.t|TestApp
MMV.w|213,200
ENR.
```

Then the Mouse will move to these "Window-relative Coordinates". There is more. You can do inline Calculations with Mouse-Coordinates:

```
STW.t|TestApp
MMV.w|(22+8),(33-5)
ENR.
```

You can also use Variables and Formulas inline, for example to paint something:

```
STW.t|TestApp
FOR.$$LOP|1|29
  MMV.w|($$LOP+8),($$LOP*2-5)
NEX.
ENR.
```

In Addition to the "w"-Prototype there are the two Prototypes "t" and "k". These will work with the last localized
"w"- Any Window (Last localized)
"t" - Top-Window
"k" -Child-Window (Button or GUI-Control)

There is one Extension to these Prototypes, that is the
"c" - Client-Area

© 2023 Theo Gottwald * https://www.smart-package.com

If you specify the "c" additionally, the Mouse will take the Client Area as Origin. That excludes the blue Part (see Picture below) for Client-Area and Non-Client-Area.
Try this and see where the Mouse goes.

```
STW.t|TestApp
MMV.wc|
ENR.
```

Client-Area, Mouse-Position, Mouse-Click and the Active Point

Generally when you select an Application-Window, the Program will internally "locate" the window and remember its coordinates.

In this picture you can see the 3 important Elements:

1. (red) The rectangle around the whole Window
2. (blue) then "Non-Client Area" that is the Area that is occupied by the Title-bar, Scrollbar and resizing gadgets.
   This part is different depending on Settings and windows-version.
3. The Centerpoint of the Window.

Simply by using the Command `STW.` - here by example

```
STW.t|Testform
```

you select an Window, and the Robot will automatically "locate it". The robot will find the window and "internally calculate the Centerpoint".
This point in the center of an located window (or object) is called the "Active Point".
You can not see the "Active Point", its just the Point where the Mouse is going to drive, or where you will Click next time.

At this time, when you use `STW.`, the Mouse does not move. The robot just internally "locates" the window and calculates the Centerpoint.

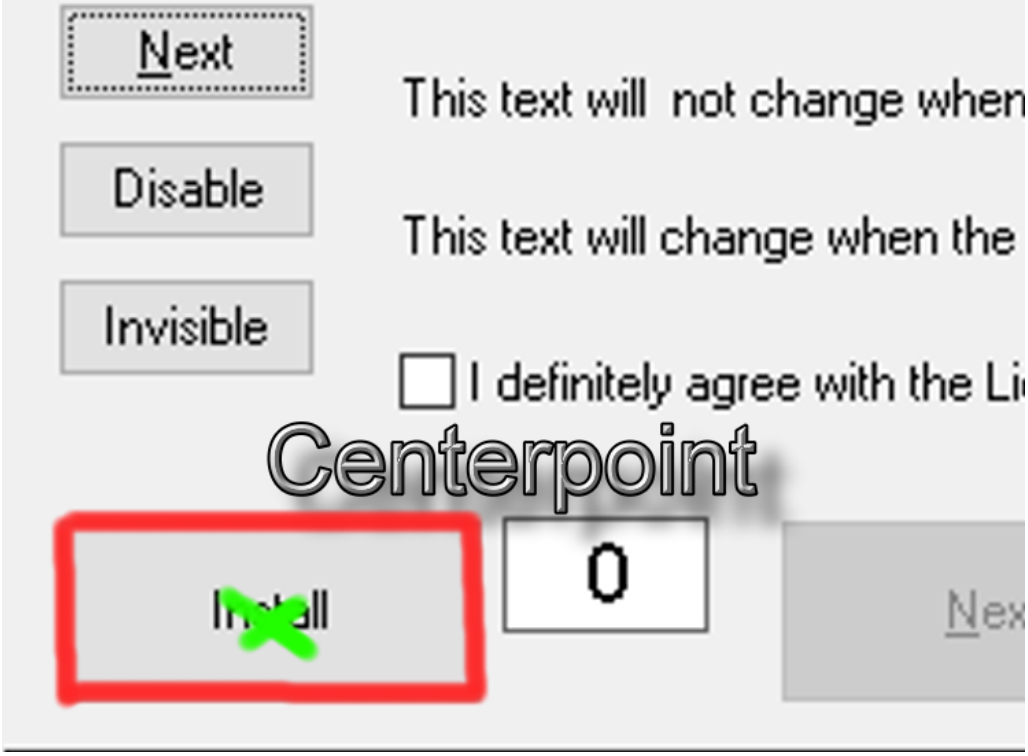
© 2023 Theo Gottwald * https://www.smart-package.com

The same is possible with a button or othe GUI-Elements. Any such Element has a surounding rectangle.
And a Centerpoint.

Using for example:

```
SCW.ct|Button|Button 1
```

you will locate this Button, and the Robot will localize its coordinates and calculate the Centerpoint.
Which is then the"Active Point".



Now you can just write

```
MMV.
```

and the Mouse will drive to the "Active Point", that is the Point in the Center of the last "localized Object".

Alltogether the Script will look as simple as this:

```
STW.t|TestApp
SCW.ct|Button|Button 1
MMV.
```

This will Move the Mouse over the Button-Centerpoint. Now there are more Options. Remember, if you use:

```
STW.t|TestApp
SCW.ct|Button|Button 1
MMV.w|10,10
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

this will move the Mouse 10,10 Points below and right the Origin (Upper,Left Corner) of the localized Button.

Move around the Centerpoint using "r"

What if you want to move 10,10 right and down of the Centerpoint?
Then you specify the "r"-Option.

```
STW.t|TestApp
SCW.ct|Button|Button 1
MMV.wr|10,10
ENR.
```

And if you want to go "Left and up"?
Then use negative Coordinates:

```
STW.t|TestApp
SCW.ct|Button|Button 1
MMV.wr|-10,-10
ENR.
```

Move Active Point using "x"

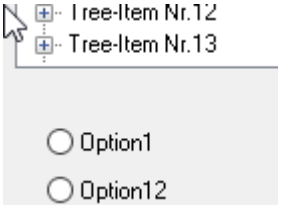
Normally when you do that, the Mouse drives there and also makes a Click if you say so,
but it does not Move the Active Point - that is the Point where the next Mouse-Action occurs.

If you want to Move the "Active Point" to that Location, specify the
"x" . Option - Move Active Point to th specified Location.

Checkmark-Position using "d" and "e"

Sometimes you do not want the Centerpoint of your Rectangle. For example see the Treeview and Checkmark below.
To click the Checkmark, you may want to click on the Left side in the vertical Middle of the Rectangular Area.
To get the Mouse there use the
- "d" Checkmark-Position Left Side
- "e" Checkmark-Position Right Side

Options.



Note the Options: "d","e","r" can not be combined.
Also these options require an Base-Rect from "w","t","k" (or "o","g","a" see below) and will not work without these.

© 2023 Theo Gottwald * https://www.smart-package.com

Other Rectangular Object

You can locate other rectangular Objects, using "Accessibilty"-Commands (called "E8") or graphical Commands (called "E9").
For these there are also Prototypes available.

"a" - last localizes Accessible Object
"g" - last localized graphical Object
"o" - any Object of these Two or the last localized window-object

Usage and Options are the same as with the window-Objects before:

```
STW.t|TestApp
AGR.43|Button 1
MMV.
ENR.
```

Also you can use the options "r","d" and "e" for these Objects. For eaxmple:

```
STW.t|TestApp
AGR.43|Button 1
MMV.ar
PAU.1
MMV.ar|10,122
ENR.
```

Point-based Objects

Unlike the Objects above, these "Sources" are not rectangular, but just "points" on the Screen.
Because they are not rectangular, there is no way to calculate an Centerpoint or to use the "d" or "e" Options.
You can anyway still correct these points with your own additional Coordinates.

These "Point-based Objects" are:

"m" - actual Mouse-Position
"b" - last Mouse-Position
"p" - Active Point
"l" - Last Active Point
and special:
"x" - set Active Point

You can not combine these with each other and also not mix these with the other Prototypes above.

```
STW.t|TestApp
AGR.43|Button 1
' Move Mouse to the Button
MMV.
' Now you have 3 Seconds time to move the mouse anywhere
PAU.3
MMV.m|10,100
' Now again you have 3 Seconds to move the Mouse around
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PAU.3
MMV.b
ENR.
```

The "m"-Option makes sense, if you want to act from the Point "where the mouse is".
It may be there from a robot- or from a User mouse move.

The "b"-Option is similar. It remembers the last Position, where the Robot has moved the Mouse to.
If the user moves the mouse away, you can revert it to the "last robot-position" using the "b"-Option.

The "p"-Option is the same like if you write nothing. The Mouse will just move to the current "Active Point".
The "l"-Option is the previous "Active Point". The one before the actual.
Here is an example-Skript. The Mouse will move to the Button 2, and then move into the Window-Center,
because that is the place where the last Active Point was.

```
STW.At|TestApp
AGR.43|Button 2
' Move Mouse to the Button
MMV.p
PAU.3
MMV.l
ENR.
```

All possible Mouse-Parameters:

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dua

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning. These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and y
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".
```

Normally these commands just "Act" on the current "Active Point", but they do NOT Move the current "Active Point".
If you want to do so, just add the `"x"`-Prototype.

```
"x" - Set Active Point at this position.
```

Important to know:

Moving the Mouse to a Point does not automatically move the actual Point.
To do this, use additionally the "x" Parameter. This is different from earlier versions.

```
Example:

STW.At|TestApp
MPO.o|57,415
MLI.
```

This does not make sense because, if you want to Click at 57,415 in the Topwindow, you would simply write:

```
STW.At|TestApp
MLI.o|57,415
```

In earlier versions this would have clicked at 57,415 - in Top-Window-Coordinates anyway.

From now, it will do what the Script says:
- Locate the Top-Window and set the actual Point in the Center of the Top-Window.
- Move the Mouse to that Coordinate
- Click into the Actual Point (that is still in the Center of the Top-Window)

If you depend on using an not needed `MMV.` or `MPO.` you can then add the "x"-Option.
This will move the "Active Point" and have the desired effect.

```
STW.At|TestApp
MPO.ox|57,415
MLI.
```

The `MPO.` and `MMV.` does only "Move the Mouse-Pointer" it does not move the actual point.
For this use the `MAP.` - Command or the "x"-Option with `MMV./ MPO.`.

3.65.2 CPC. - Convert Pixel Coordinate

MiniRobotLanguage (MRL)

CPC. Command

CPC. - Convert Pixel Coordinate

Intention

The CPC.-Command helps you to convert between Coordinates that are scalend or unscaled due to Windows Size-Settings.
As you can see in the picture below, the Setting is "125%".
This will lead to a shift of Pixel-Coordinates in some dpi-aware Applications.
Generally if you make things by 125% larger, the virtual Screen-Resolution is decreased.
To get back from 125% to normal, you could use the formula: `X=X/100*125`
This is what the "Scale-Command" does internally.
To Unscale the formula is as simple: `X=X/125*100`
This is done under the hood if you choose an Unscale-command.

The robot detects the current dpi-/scaling settings at the start of the script.
Therefore changing the DPI-Scaling while the script is running may prevent the script from correct scaling.

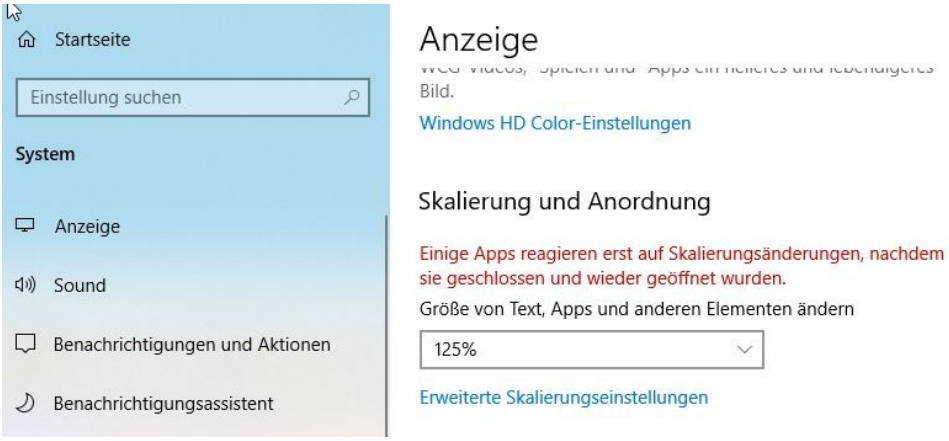
To get nearly the same effect you could just choose a lower Screen Resolution. This will make less problems with pixel-based automations.

The robot tries to automatically scale/unscale the situation, but if this does not work, you will need to manually correct the coordinates using the `CPC.` Commands.
CPC. will use scaled or unscaled input in multiple ways and scale/unscale it with the current settings.

Possible Uses are:
- Coordinate based Script was recorded in scaled Mode and now is going to be played in unscaled mode
- Coordinate based Script was recorded in 100% and is now going to be played on a Client with Scaled coordinates

As said, in many cases it will just work, buit in some cases you may need to correct the coordinates.

© 2023 Theo Gottwald * https://www.smart-package.com



What is the "Active Point"?
The "active Point" is the "Focus Point" of the robot. It is the point "On screen", where the next robot action - for example a mouse-click - will happen.

The CPC.-command can move the active point in the conversion process. For this use the "x" option.
The CPC.-command can also convert Point- and Rect-Coordinates (Variables) in one step.

A complete sequence could look like this:

```
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.nc|1|TcxButtonEdit
' This will just move the active point and put also the new
coordinates on the stack
CPC.uax
MMV.
ENR.
```

Syntax

CPC.[P1][|P2][|P3]...

Parameter Explanation

P1 – (optional) Prototype-String with any of the following options

a - Use actual Point for input coordinate
s - Scale Operation (you have the coordinate from 100% and want the coordinate from for example 125%)
u - UnScale-up Operation (you have the coordinate from for example 125% and want the coordinate from 100%)

*© 2023 Theo Gottwald * https://www.smart-package.com*

p - use Point Input Variable. This is one Variable with both coordinates separated by "," e.g. see VAP. 3560 command

r - use RECT as Input. Will also use a RECT for Output. if specified together with "a" then "Actual Rect" (from last window or object) will be taken, otherwise RECT in Variable **P2**.

x - If specified, the result of the Operation will be set as active Point/active Rect. Using Prototype "arx" for example

f - just get the scaling factor, if one Variable P" is given, result is Point-Format, if two variables are there, P2 is X and P3 is Y-Factor

Generally the Command looks how many Output and Input Variables are there and tries to find out, if the result should be given as Point or in two variables as coordinates.

Using the "r"-Rect Option, you can also specify 4 variables to get each coordinate in one variable (left,top,right,bottom).

P2 .. PX – (optional) Depending on the used Prototypes, **P2 ... P5** may be Input or Output-Variables.

3.65.3 Automated Clicks

3.65.3.1 BCS. - Button Click Special

MiniRobotLanguage (MRL)

BCS. Command

Button Click Special

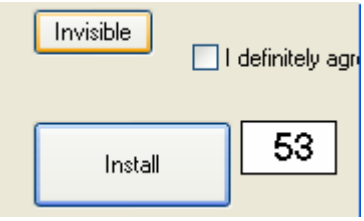
Intention

These command simulates a Left-Click with the Mouse in one of several ways.
The most important difference from BSC. to other Commands is, that it will watch if the Click "will do something".
And will click again if it did not do something. It's a Click in an built in Loop.
By default, BCS. want the Button or Window that we are clicking, to disappear.
To be closed, to have an invalid Window-Handle. As it happens when you close a Window.

`BCS.` will click, then wait a short time.
Next the Target button/window is checked on a reaction to the Mouse-click.
If there is no reaction, `BCS.` will click again, until there is an reaction.
Here is an example:

```
' Start the BCS.-Testapp from your Sample-Apps folder
STW.wct|45|PBWindowClass:0|BCS - Testform
SCW.wctid|45|Button|Install|1012|1
SFW.
BCS.
```

This is what you get:



`BCS.` just keeps clicking on "Install". Because the window does not disappear.
The counter on the right side increases each time, when the button is clicked, in this case it shows 53 and `BCS.` will not stop if we don't stop it.

For example, the Target window should disappear shortly after the Mouse-Click.
Or the text on a button can change after a mouse-click.

If the specified reaction of the window does not occur, BCS. will repeat the action.
`BCS.`is somehow a "Mouse-click in a Loop".

*© 2023 Theo Gottwald * https://www.smart-package.com*

BCS. is used in automated Software installations, to make sure things work as reliable as possible.

To test the features of BCS. you can use a provided BCS.-Testapplication in the "TestApps folder" in the installation folder.

Syntax

BCS.[Prototype ...][|Params ...]

Parameter Explanation

Prototype - (optional) prototype values

```
Prototype - (optional) prototype coordinates
Parameter - (optional) Parameter/timeout
```

```
   Prototype can be omitted. Alternatively you can use these:
   a - Button must become invisible or disabled
   e - Button must become disabled
   h - Parameter is Window-handle
   p - clicks until Topwindow disappears
   t - timeout in ms [+PARAMETER]
   v - Button must become invisible
   s - Button-Text must change (works only with Buttons where
   CFW. can read
        the text.)
   n - Max-Count of Clicks before Timeout is generated.
        [+PARAMETER]
   w - time between clicks in ms. Default is 100 ms

   l - MLE. - Mouse Left Event Click is used
   o - MLC.
   i - MLI. - Like MLC. but much faster
   c - CLW. - Close Window is used (Window-Message)
   r - MRM. - Compatible right Click.
   m - MLM. - Compatible like MLC. but faster due to a Jump.
   u - MDC. Double Click
   Mixed:
   q - MLM. and MLE. Clicks are used.

   Adding multiple Prototypes, all of the choosen Clicks were
   used.
   Example: BCS.lr will do all two Clicks at the same time.
   Option "q" will do exchange the two Click-Types and do one
   after the other.
```

Parameter - (optional) Parameter/timeout

© 2023 Theo Gottwald * https://www.smart-package.com

Some Prototypes needs a Parameter, they are marked with [+PARAMETER].

Example

```
'*********************************************
' BCS.-Sample
'*********************************************
' This will create some messageboxes in the background.
FOR.§§LOP|1|8
PRR.
:ag
MBX.!
PRT.Ending.
END.
PRE.
NEX.
PAU.1
'-------------------------
' Here comes the BCS.
' This will click away the generated Msg.-Boxes
FOR.§§LOP|1|8
STW.t|Message
SCW.c|button
BCS.
' BCS.pw|250
NEX.
MBX.Ende
END.
'*********************************************
```

Remarks

BCS. is provided to make automated tasks as reliable as possible. If you experience problems in automated Setup tasks, especially, that buttons are clicked too often. Look if there are BCS. involved and replace them with MLE. or use other options.

BCS. can be used best, when the window that is clicked will and must disappear after the click. If this is not the case, BCS. may click a button to often and should maybe not used at that place.

Limitations:

-

3.65.3.2 BSC. - Button Special Click

MiniRobotLanguage (MRL)

BSC. Command

Button Special Click

Intention

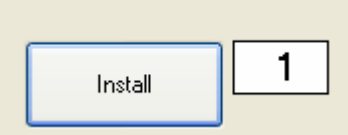
These command simulates a Left-Click with the Mouse in one of several ways.
The most important difference from BSC. to other Commands is, that it will watch if the Click "will do something".
And will click again if it did not do something. It's a Click in an built in Loop.
By default, BSC. will watch, if the Button or Window changes its Text, gets invisible, gets disabled or will disappear.

BSC. will click, then wait a short time.
Next the Target button as well as the target window, is checked on a reaction to the Mouse-click.

If there is no reaction, BSC. will click again, until there is an reaction.
Here is an example:

```
' Start the BCS.-Testapp from your Sample-Apps folder
STW.wct|45|PBWindowClass:0|BCS - Testform
SCW.wctid|45|Button|Install|1012|1
SFW.
BSC.
```

This is what you get:



BCS. just clicked one time on "Install". While the window did not disappear, the counter on the right side changed. and that made BSC. to stop clicking.

BSC. will react on changes in the text of the target form. As well as on anything that BCS. would react to.

If the specified reaction of the window does not occur, BSC. will repeat the action.
BSC.is somehow a "Mouse-click in a Loop".

BSC. is used in automated Software installations, to make sure things work as reliable as possible.

To test the features of BSC. you can use a provided BCS.-Testapplication in the "TestApps folder" in the installation folder.

*© 2023 Theo Gottwald * https://www.smart-package.com*

You can also use it on the normal TestApp_01.exe and see the results.

Syntax

BSC.[Prototype ...][|Params ...]

Parameter Explanation

Prototype - (optional) prototype values

```
Prototype - (optional) prototype coordinates
Parameter - (optional) Parameter/timeout

   Prototype can be omitted. Alternatively you can use these:
   a - Button must become invisible or disabled
   e - Button must become disabled

3.65.4 Compatible Engine

3.65.4.1 GMP. - Get-Mouse-Position

MiniRobotLanguage (MRL)

GMP. Command

Get Mouse Position

Intention

Returns the position of the Mouse-Pointer or of the internal "Actual Point" which is not equal.
Depending on the used prototypes the command gives the coordinates in screen or window relative.

P1 is mostly two letter. First specify if you want the Mousepointer-Position or the "actual point".

Example:

```
GMP.mw|$$RET
```

or if you specify "k" then this command requires two variables for holding the resulting `x` and `y` data.

```
GMP.mwk|$$REX,$$REY
```

In case you want the "actual point" instead of the "Mouse pointer position", just use the "a" directive instead of the "m".

Syntax

GMP.P1|P2[,P3]

Parameter Explanation

P1

```
These are the source-prototypes

 a - get "actual point" in Screencoords if no "c" or "t"
Option is used
 m - get mouse-position
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

If whether "a" nor "m" is specified, "m" is the default.
the following prototypes define the coordinate system being used for the result:

```
 s - screen coordinates (default)
 t - get point in actual Top-window coordinates
 c - get point in actual window coordinates
 w - last (whatever) window-coordinates
```

Additional you can specify

```
 r - client coordinates of the selected window
 k - output to 2 variables instead of one
```

P2 **-** Variable for result or if "k" is used, for result #1, the x-coordinate
P3 **-** Variable for result #2, the y-coordinate

Example

```
'**********************************
' Example 1
' with 2 data variables for result
'**********************************
' Get Mousepointer
GMP.km|§§XPO,§§YPO
PRT. Mouse is at: §§XPO,§§YPO
DMP.

:over
MBX.Halt to read output
END.

'**********************************
' Example 2
'**********************************
' Get Mousepointer
GMP.§§MPO
PRT. Mouse is at: §§MPO
DMP.
END.
```

Remarks

3.65.4.2 MDC. - Mouse Double-left Click (Invinsible)

MiniRobotLanguage (MRL)

MDC. Command

Mouse Double Click (compatible engine with move)

Intention

`MDC.` simulates a Mouse-Move to, and a Double-Click at the target Position.

This Command simulates a Left-Double Click with the Mouse, using the Compatible Engine 231.
This command will simulate a real Mouse-Move, even with a "Human touch", if this is been set, using

```
OPT.HM|35
```

This is a are very realistic Mouse Move and a Mouse Double-Click at the target.

`MDC.` has therefore all the strong and all the weak sides of a typical Compatible Engine 231 command.

Then the mouse pointer will move to the current "Active Point" and do the Click.
In most cases the "Active Point" is been set, by localizing a button or control or object.
In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Some Hints:
If you need just one Compatible Engine 231 click, use `MLC.`
If you prefer the mouse to "Jump" instead of slowly moving to the target, use `MDI.`
In case you can use the Direct Engine 231, `MDE.` is the command for you..

Syntax

```
MDC.[P1|][P2,P3]
```

Parameter Explanation

*© 2023 Theo Gottwald * https://www.smart-package.com*

P1 **-** (optional) prototype coordinates

Prototype can be omitted or any of:
GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".
```

Normally these commands just "Act" on the current "Active Point", but they do NOT
Move the current "Active Point".
If you want to do so, just add the `"x"`-Prototype.

```
"x" - Set Active Point at this position.

If prototype is omitted, Screen-Coordinates are taken.
```

P2, ***P3*** **-** (optional) x,y - coordinates

```
     numeric coordinates, separated by comma. You can use
     variable and Formula in (..). You can also use a
     Point-Variable instead of two coordinates.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' MDC.-Demo
'**********************************
STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|Button|Button 2
MDC.p|(11*5),(-1*5)
ENR.
END.
```

Remarks

Mostly you do not need to specify the coordinates with `MMV.` or `MLI.` but you can directly write the coordinates into `MLC.`, `MLI.`, `MRC.` and MRI. Please see also `BCS.`

Limitations:

-

See also:

3.65.4.3 MDI. - Mouse Double-Click Invisible

MiniRobotLanguage (MRL)

MDI. Command

Mouse Double Click Invisible (compatible engine with jump)

Intention

`MDI.` simulates a Mouse-Jump to, and a Double-Click at the target Position.

This Command simulates a Left-Double Click with the Mouse, using the Compatible Engine 231.
This command will simulate a Mouse-Jump. In opposite to a Mouse-Move, the Mouse will jump to the target, click and then jump back to the previous position.

`MDI.` uses the Compatible Engine 231 for the Mouse-Click. It's faster then `MDC.` as the Mouse will not move slowly but Jump to the target.

Using `MDI.` the mouse pointer will jump to the current "Active Point" and do the Double-Click. In most cases the "Active Point" is been set, by localizing a button or control or object. In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here: MAP - Move Active Point 2483.

Some Hints:

- If `MDI.` seems not to work on your target window, try `MDC.` `MDC.` is a bit more compatible, for those applications that need a Mouse-move at the target position before the click.
- In case you can use the Direct Engine 231, `MDE.` is the command for you..

Syntax

```
MDI.[P1|][P2,P3]
```

Parameter Explanation

P1 – (optional) prototype coordinates

```
Prototype can be omitted or any of:
```

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.
```

P2, ***P3*** - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

Example

```
'**********************************
' MDI.-Demo
'**********************************
STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|Button|Button 2
```

3.65.4.4 MLC. - Mouse-Left-Click (Invisible)

MiniRobotLanguage (MRL)

MLC. Command

Mouse Left Click (compatible engine with move)

Intention

`MLC.` simulates a Mouse-Move to, and a Left-Click at the target Position.

This Command simulates a Left-Click with the Mouse, using the Compatible Engine 231.

The usage of the command is simple, you can just write:

```
MLC.
```

Then the mouse pointer will move to the current "Active Point" and do the Click.
In most cases the "Active Point" is been set, by localizing a button or control or object.
In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

This command will simulate a real Mouse-Move, even with a "Human touch", if this is been set, using

```
OPT.HM|35
```

This is a are very realistic Mouse Move and a Mouse Left-Click at the target.

`MLC.` has therefore all the strong and all the weak sides of a typical Compatible Engine 231 command.

`MLC.` is a real Mouse-Click, which need the window to be on top of other windows.
Also it will need a mouse-pointer and a desktop.

You can find some more details on the "r"-prototype here: MAP - Move Active Point 2483.

Syntax

 *© 2023 Theo Gottwald * https://www.smart-package.com*

MLC.[P1|][P2,P3]

Parameter Explanation

P1 - (optional) prototype coordinates

Prototype can be omitted or any of:

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.

"x" - Set Active Point to the Command-position.

Example:
' Move Mouse and Active Point
MLC.wrx|-358,207
```

3.65.4.5 MLD. - Mouse left down

MiniRobotLanguage (MRL)

MLD Command

Mouse Left Down (compatible engine with move)

Intention

For Drag'n Drop operations, you may need to just press a mouse-button down.
Then move the mouse and release later it.

There are two commands for this purpose:

- `MLD.` - Compatible Engine 231
- `MLU.` - Compatible Engine 231

These command should only be used paired, as otherwise you may end up with a "pressed left mouse-button". Using `MLD.` the left Mouse-Button will be pressed until you physical press and release it again, or until you make another left mouse-click.

You can use `MLD.` and `MLU.` for Drag'n Drop operations in programs or on your desktop.

Using `MLD.`, Then the mouse pointer will move to the current "**Active Point**" and do the click-down using thew the left mouse-button.
In most cases the "Active Point" is been set, by localizing a button or control or object.
In these cases, the "Active Point" is in the center of the rectangular button/window/object.
For Drag'n Drop operations, you may want to move the "Active Point" manually. You can doi that easily, using the provided prototypes.

You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Syntax

MLD .

Parameter Explanation

3.65.4.6 MLI. - Mouse Left Click quIckly (Invinsible)

MLI. - Mouse-Left-click quIckly (Invisible) **Previous** 2492 **Top** 41 **Next** 2457

MiniRobotLanguage (MRL)

MLI. Command

Mouse Left Click Invisible (compatible engine with jump)

Intention

`MLI.` simulates a Mouse-Jump to, and a Left-Click at the target Position.
The mouse-pointer will then jump back to where it was before the click.

This Command simulates a Left-Click with the Mouse, using the Compatible Engine 231.
This command will simulate a Mouse-Jump. In opposite to a Mouse-Move, the Mouse will jump to the target, click and then jump back to the previous position.

`MLI.` uses the Compatible Engine 231 for the Mouse-Click. It's faster then `MLC.` as the Mouse will not move slowly but Jump to the target.

Using `MLI.` the mouse pointer will jump to the current "Active Point" and do the Left-Click. In most cases the "Active Point" is been set, by localizing a button or control or object. In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Some Hints:

- If `MLI.` seems not to work on your target window, try `MLC.` or `MLM. MLC.` and `MLM.` are a bit more compatible, for those applications that need a Mouse-move at the target position before the click.
- In case you can use the Direct Engine 231, `MLE.` is the command for you..

Syntax

MLI.[P1|][P2,P3]

Parameter Explanation

3.65.4.7 MLM. - Mouse Left Click Move (Invinsible)

MiniRobotLanguage (MRL)

MLM. Command

Mouse Left click Move (compatible engine with jump and small move)

Intention

`MLM.` simulates a Mouse-Jump to, and a Left-Click at the target Position.
Unlike `MLI.` the mouse-pointer will not jump back to where it was before the click.

`MLM` is somehow like an `MLI.` with a small Mouse-Move at the target position.
It can be used where `MLC.` works. but `MLI.` does not.

This Command simulates a Left-Click with the Mouse, using the Compatible Engine 231.
This command will also simulate a Mouse-Jump. In opposite to a Mouse-Move, the Mouse will jump to the target, click and remain in the target position.

`MLM.` uses the Compatible Engine 231 for the Mouse-Click. It's faster then `MLC.` as the Mouse will not move slowly, but Jump to the target.

Using `MLM.` the mouse pointer will jump to the current "Active Point" and do the Left-Click. In most cases the "Active Point" is been set, by localizing a button or control or object. In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Some Hints:

- For automated installations use `BSC. and BCS.` where possible.
- In case you can use the Direct Engine 231, `MLE.` is the command for you..

Using `MLM.` you get a real Mouse-Click, which needs the window to be on top of other windows, unlike if you use Mouse-Events (See `MLE.`).

Syntax

```
MLM.[P1|][P2,P3]
```

Parameter Explanation

3.65.4.9 MLU. - Mouse left up

MiniRobotLanguage (MRL)

MLU Command

Mouse Left Up (compatible engine with move)

Intention

For Drag'n Drop operations, you may need to just press a mouse-button down. Then move the mouse and release later it.

There are two commands for this purpose:

- `MLD.` - Compatible Engine 231
- `MLU.` - Compatible Engine 231

These command should only be used paired, as otherwise you may end up with a "pressed left mouse-button". Using `MLD.` the left Mouse-Button will be pressed until you physical press and release it again, or until you make another left mouse-click.

You can use `MLD.` and `MLU.` for Drag'n Drop operations in programs or on your desktop.

Using `MLU.`, Then the mouse pointer will move to the current "**Active Point**" and do the release the left mouse-button.
In most cases the "Active Point" is been set, by localizing a button or control or object. In that case, the "Active Point" is in the center of the rectangular object. For Drag'n Drop operations, you may want to move the "Active Point", which is easy using the provided prototypes. You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Syntax

MLU .

Parameter Explanation

`Prototype can be omitted or any of:`

GROUP I (based on rectangular Area) Prototypes

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.
```

P2, ***P3*** - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

Example

```
'****************************
' Drag'n Drop Sample
'****************************
' This script will drag an desktop-
' Icon named "Furmark" to the right
' and drop it then
STW.ct|Progman|Program Manager
SCW.nct|1|SHELLDLL_DefView|{&NOTEXT:}
SCW.nct|1|SysListView32|FolderView
SAO.rn|34|FurMark
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MLD.
MMV.p|300,100
MLU.
ENR.
```

Remarks

The alternative to this command is `MUM.` which uses the Direct Engine[231]. It can not be used for Drag'n Drop operations.

Limitations:

-

3.65.4.10 MMV. - Mouse MoVe

MiniRobotLanguage (MRL)

MMV. Command

Mouse MoVe (compatible engine and direct engine with move)

Intention

This Command move the mouse from the current position to the current "active point".

What is the "Active Point"?
The "active Point" is the "Focus Point" of the robot. It is the point "On screen", where the next robot action - for example a mouse-click - will happen.

How do i set the "active point"?
Normally you locate a button, window or object. These are all rectangular areas. The robot will set the "active point" to the mIdpoint of these areas.

Can i influence the "active point" in any way?
This is where `MMV.` enters the game. Using `MMV.` or `MPO.` or `MAP.` you can set or move the "**active point**". In case you use `MMV.` with parameters, `MMV.` will not only move the mouse, but also move the "Active Point".

The difference between these commands is, that

- `MAP.` will only move the "active point"
- `MPO.` will also jump with the mouse to the new "active point"
- `MMV.` will make a mouse-move to the new "active point"

`MMV.` will use the "Human mouse move" feature if it is activated. In that case it will not move the mouse in a straight way, but simulate a "human like" mouse move. To switch this feature off, use the **OPT. - Optional Settings** 2406 command.

In most cases the "Active Point" is been set, by localizing a button or control or object.
In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

MMV.[P1|][P2,P3]

Parameter Explanation

P1 - (optional) prototype coordinates

Prototype can be omitted or any of:

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.
```

P2, P3 - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' MMV./MPO. -Demo
'**********************************
STW.ct|PBWindowClass:0|BCS - Testform
SCW.nct|1|Button|Install
MMV.
END.
```

Remarks

Mostly you do not need to specify the coordinates with MMV2466. because you can directly write the coordinates into the Mouse-Click commands, like these following:
MLC - Mouse-Left-Click (Invisible)2448
MLI - Mouse Left Click qulckly (Invinsible)2454
MRC. / MRI. - Mouse-Right-Click2472
MLM - Mouse Left click Move (Invinsible)2457
and others.

MMV. is also good for debugging, as it will just move the Mouse to the target area, and will not click any button.

Limitations:

3.65.4.11 MPO. - MousePosition

MiniRobotLanguage (MRL)

MPO. Command

Mouse Position Move

Intention

This Command will make the mouse jump immediately from the current position to the current "active point".

What is the "Active Point"?
The "active Point" is the "Focus Point" of the robot. It is the point "On screen", where the next robot action - for example a mouse-click - will happen.

How do i set the "active point"?
Normally you locate a button, window or object. These are all rectangular areas. The robot will set the "active point" to the mIdpoint of these areas.

Can i influence the "active point" in any way?
This is where `MPO.` enters the game. Using `MMV.` or `MPO.` or `MAP.` you can set or move the "**active point**". In case you use `MPO.` with parameters, `MPO.` will not only move the mouse, but also move the "Active Point".

The difference between these commands is, that

- `MAP.` will only move the "active point"
- `MPO.` will also jump with the mouse to the new "active point"
- `MMV.` will make a mouse-move to the new "active point"

In most cases the "Active Point" is been set, by localizing a button or control or object.
In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Syntax

```
MPO.[P1|][P2,P3]
```

Parameter Explanation

P1 **-** (optional) prototype coordinates

Prototype can be omitted or any of:

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.
```

P2, ***P3*** **-** (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

Speed in Ticks:
This command uses typically around 900.000 Ticks.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
' MMV./MPO. -Demo
'**********************************
STW.ct|PBWindowClass:0|BCS - Testform
SCW.nct|1|Button|Install
MPO.
END.
```

Remarks

Mostly you do not need to specify the coordinates with MPO. because you can directly write the coordinates into the Mouse-Click commands, like these following:
MLC - Mouse-Left-Click (Invisible) 2448
MLI - Mouse Left Click qulckly (Invinsible) 2454
MRC. / MRI. - Mouse-Right-Click 2472
MLM - Mouse Left click Move (Invinsible) 2457
and others.

Limitations:

-

3.65.4.12 MRC. - Mouse-Right-Click

MiniRobotLanguage (MRL)

MRC. Command

Mouse Right Click (Invinsible)

Intention

`MRC.` simulates a Mouse-Move to, and a Right-Click at the target Position.

This Command simulates a Right-Click with the Mouse, using the Compatible Engine 231.
It can be used to call all sorts of PopUp-Menus. To answer the upcoming popup-menus, see the SMH. - Set Menu Hook 660 command.

The usage of the command is simple, you can just write:

```
MRC.
```

Then the mouse pointer will move to the current "Active Point" and do the Click.
In most cases the "Active Point" is been set, by localizing a button or control or object.
In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here: MAP - Move Active Point 2483.

This command will simulate a real Mouse-Move, even with a "Human touch", if this is been set, using

```
OPT.HM|35
```

This is a are very realistic Mouse Move and a Mouse Right-Click at the target.

`MRC.` has therefore all the strong and all the weak sides of a typical Compatible Engine 231 command.

`MRC.` is a real Mouse-Click, which needs the window to be on top of other windows.
Also it will need a mouse-pointer and a desktop.

You can find some more details on the "r"-prototype here: MAP - Move Active Point 2483.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

MRC.[P1|][P2,P3]

Parameter Explanation

P1 **-** (optional) prototype coordinates

Prototype can be omitted or any of:

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.
```

P2, ***P3*** **-** (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use
variable and Formula in (..). You can also use a

© 2023 Theo Gottwald * https://www.smart-package.com

```
     Point-Variable instead of two coordinates.
```

Mostly you do not need to specify the coordinates with MRC. or MRI. but you locate the position with STW., SCW., SAO. or MPO. etc.

Example

```
'*****************************************
' SMH./MRC._Sample
'*****************************************
' Select the TestApp
STW.ct|PBWindowClass:0|TestApp

' Select the Textbox
SCW.nc|3|edit

' Tell Hook that soon a Menu will pop up, he should click
' Einfügen (engl. "Paste")
SMH.Einfügen

' Now we move the Mouse to the Textbox and click the
' right Mousebutton
MRC.

' This Pause is needed, because if the script ends, the SMH.
' will also end, before the Menu is been clicked!
PAU.2

ENR.
```

Remarks

MRC / MRI. is the right Command to open a PopUp-Menu, because this may not work in all cases with MRE as expected.

Limitations:

See also:

- 1.C Direct Engine and Compatible Engine 231

3.65.4.13 MRI. - Mouse Right Click Invisible

MiniRobotLanguage (MRL)

MRI. Command

Mouse Right Click Invinsible

Intention

`MRI.` simulates a Mouse-Jump to, and a Right-Click at the target Position. After the Click, the Mouse jumps back to her original position where she was before the `MRI.`.

In short MRI. does this:

1. Jump to target (active point)
2. Click left mouse button via Compatible Engine 231
3. Jump back to original position

`MRI.` is somehow between the `MRC.` that does a "slow" mouse-move, and the fast `MRE.` which does not use the mouse.

`MRI.` simulates a Right-Click with the Mouse, using the Compatible Engine 231.

It can be used to call all sorts of PopUp-Menus. To answer the upcoming popup-menus, see the SMH. - Set Menu Hook 660 command.

The usage of the command is simple, you can just write:

```
MRI.
```

Then the mouse pointer will move to the current "Active Point" and do the Click.
In most cases the "Active Point" is been set, by localizing a button or control or object.
In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

This command will simulate a real Mouse-Move, even with a "Human touch", if this is been set, using

```
OPT.HM|35
```

This is a are very realistic Mouse Move and a Mouse Right-Click at the target.

`MRI.` has therefore most the strong and all the weak sides of a typical Compatible Engine 231 command.

*© 2023 Theo Gottwald * https://www.smart-package.com*

MRI. is a real Mouse-Click, which needs the window to be on top of other windows.
Also it will need a mouse-pointer and a desktop.

You can find some more details on the "r"-prototype here: MAP - Move Active Point2483.

Syntax

MRI.[P1|][P2,P3]

Parameter Explanation

P1 **-** (optional) prototype coordinates

Prototype can be omitted or any of:

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)
"u" - Move down by the size of the Windows-Titlebar
"v" - Move up by the size of the Windows-Titlebar

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

© 2023 Theo Gottwald * https://www.smart-package.com

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.
```

P2, P3 - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

Mostly you do not need to specify the coordinates with MRC. or MRI. but you locate the position with STW., SCW., SAO. or MPO. etc.

Example

```
'**********************************
' MRC.-Demo
'**********************************
' Click inside Internet Explorer
STW.ct|ieframe|microsoft
MRI.
END.
```

Remarks

MRC / MRI. is the right Command to open a PopUp-Menu, because this may not work as expected in all cases with MRE..

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.65.4.14 MWR. - Mouse Wheel Roll

MiniRobotLanguage (MRL)

MWR. Command

Mouse Wheel Roll (compatible engine)

Intention

`MWR.` simulates a Mouse-Wheel Scroll forward or backward.
This Command simulates the Mouse Wheel using the Compatible Engine 231.
Therefore the Mouse must be positioned over the target application window.

The usage of the command is simple, you can just write:

```
MPO.
MWR.120
or
MWR.-120
```

Then the mouse wheel will do the scroll either forward (120) or backward (-120).

In most cases the "Active Point" is been set, by localizing a button or control or object.
In that case, the "Active Point" is in the center of the rectangular object.

You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

This command will simulate a real Mouse-Wheel.
Therefore the Mouse pointer needs to be over the target window.

`MWR--.` has therefore all the strong and all the weak sides of a typical Compatible Engine 231 command.

`MWR.` is a real Mouse-Roll, therefore it need the window to be on top of other windows. Also it will need a mouse-pointer and a desktop.

You can find some more details on the "r"-prototype here: MAP - Move Active Point 2483.

Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

MWR.P1

Parameter Explanation

P1 **-** (optional) Variable or Value

Generally **P1** is a number that is either positive or negative.

Positive numbers scroll the Mouse wheel forward (away from the user)
negative numbers scroll the Mouse wheel backwards (direction to the user).

You can scroll in very fine steps.
A normal Mouse-Wheel scroll with a standard Mouse is 120.
If you want to simulate two steps with a Mouse Wheel, therefore you would scroll by 240.

Example:

```
' Scrol the Mouse one Step forward
MWR.120
' Scrol the Mouse one Step backward
MWR.-120
' Tile the Mouse one Step right
MWT.120
' Tile the Mouse one Step left
MWT.-120
```

Example

```
'**********************************
' MWR.-Demo
'**********************************
STW.ct|IEFrame|Facebook - Internet Explorer
SCW.ct|Internet Explorer_Server|{&NOTEXT:}
' Scroll IE nach oben
MPO.
MWR.120
' Scroll IE nach unten
MWR.-120
PAU.1
ENR.
END.
```

3.65.5 Direct Engine

3.65.5.1 MAP. - Move Active Point

MiniRobotLanguage (MRL)

MAP. Command

Move active point (direct engine)

Intention

To understand this command, you need to know the term "Active Point".

What is the "Active Point"?
The "active Point" is the "Focus Point" of the robot. It is the point "On screen", where the next robot action will happen.

How do i set the "active point"?
Normally you locate a button, window or object. These are all rectangular areas. The robot will set the "active point" to the point in the middle of these rectangular areas.

Can i influence the "active point" in any way?
This is where `MAP.` enters the game. Using `MAP.` you can set or move the "**active point**".

`MAP.` is somehow ike `MPO.` with the option "x".
But even if the "x" is not specified, `MAP.` will set the Active Point and NOT move the Mouse.
`MAP.` does only move the "**active Point**", it does not move the mouse cursor.
The most important usage is **to move the AP relative to where its right now.**

Relative moves do not count from 0,0, but from where the AP is. This way, you can locate a button and then move the AP 10 pixel to the right from the button center.
Here is an example-script:

```
STW.ct|PBWindowClass:0|TestApp
' We locate Button 2
SCW.nct|2|Button|Button 2
' We move the AP from the button center 100 points to the left
MAP.p|-100,0
' We move the Mouse to the AP
MMV.
' We move the AP from the current position 200 points to the
right
MAP.p|200
MMV.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Move the AP 100 up, and 100 left
MAP.p|-100,-100
MMV.
' Move AP for 100 points down, we are back in the button
center!
MAP.p|0,100
MMV.
ENR.
```

The next thing that is often used, is a "window relative coordinate". It counts from the upper left corner of the actually located button/Top- or Child-window.
The advantage over screen coordinates is, that these coordinates move with the window, if the window moves. The Editor will sometimes record "window local coordinates".
Here is an example:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|Button|Button 2
MAP.w|10,10
MLC.
ENR.
```

Note that you can use Formulas in (..) as parameters:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|Button|Button 2
VAR.$$NUM=5
MLC.p|(15*$$NUM),(-23*$$NUM)
```

Syntax

MAP.[P1|][P2,P3]

Parameter Explanation

P1 **-** (optional) prototype coordinates

Prototype can be omitted or any of:

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.
```

P2, P3 - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

Important:
In case you use `MAP.` without any Parameter, then `MAP.` will try to get the TOS-Content (Top of Stack). If it is a Single Point, like
`100,200`
then `MAP.` will locate that point (as Screen coordinates). In case on the Stack is a RECT, like this: `100,200,150,400`
then the Middle-Point of that RECT (in Screen coordinates) is been calculated and located as actual point.

This way you can more easily use MAP. together with `GRM.` and `GAR.` commands.
And immediately Move the Mouse there.

```
STW.ct|MyClassName|Sample Application
GAR.
GRM.
MAP.
MMV.
ENR.
```

Example

```
'*********************************
' MMV./MAP. - Sample
'*********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Please start the Testapp
'
STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|Button|Button 2
MAP.p|-100
MMV.
MAP.p|200
MMV.
MAP.p|-100,-100
MMV.
MAP.p|0,100
MMV.
ENR.
```

Remarks

This Command has been changed.

3.65.5.2 MDE. - Mouse Double Click Event

MiniRobotLanguage (MRL)

MDE. Command

Mouse Double-Click Event (direct engine)

Intention

`MDE.` simulates a Double-Click Event at the target Position. It does not move or even use the mouse-pointer.

This Command simulates a "Mouse-Double Click Event", using the Direct Engine 231.

`MDE.` has therefore all the strong and all the weak sides of a typical Direct Engine 231 command.

`MDE.` supports all the prototypes which are useful for Mouse- and "Active Point"-positioning.
You can find some more details on the "r"-prototype here: MAP - Move Active Point 2483.

Some Hints:

- If `MDE.` seems not to work on your target window, try `MDI.`
- or in case you want a mouse move, use `MDC.`

Syntax

MDE.[P1|][P2,P3]

Parameter Explanation

P1 – `(optional) prototype coordinates`

`Prototype can be omitted or any of:`

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.

"x" - Set Active Point to the Command-position.

Example:
' Double Click Event and Active Point Move
MDE.wrx|-358,207
```

P2, P3 - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

Example

```
'*********************************
' MDC.-Demo
'*********************************
STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|Button|Button 2
MDC.p|(11*5),(-1*5)
ENR.
```

3.65.5.3 MDM. - Mouse Down Message

MiniRobotLanguage (MRL)

MDM. Command

Mouse Down Message (direct engine)

Intention

For few operations, you may need to just press a mouse-button down and release it later.

There are two commands for this purpose:

- `MDM.` - Direct Engine 231
- `MLD.` - Compatible Engine 231

`MDM.` has all the strong and all the weak sides of a typical Direct Engine 231 command.

`MDM.` can simulate all the three mouse buttons, depending on parameter **P1**.

The `MDM.` Event will take place at the position of the current "Active Point".
You can find some more details on the "Active Point" here: MAP - Move Active Point 2483.

Some Hints:

- If `MDM.` seems not to work on your target window, try `MLD.`
- You can not use `MDM.` for Drag'n Drop operation, as the direct engine does not support that.
- For Drag'n Drop operations, always use: `MLD.`, `MMV./MPO.` and `MLU.`

Syntax

MDM.[P1]

Parameter Explanation

P1 - Prototypes:

```
1 = left mouse button will be pressed
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  m = then middle button will be pressed (press on wheel)
  r = right button will be pressed
```

Example

```
' Will click the right Mouse-Button
' on the WinXP-Desktop
' on an Icon with the name "Furmark"
STW.ct|Progman|Program Manager
SCW.nct|1|SHELLDLL_DefView|{&NOTEXT:}
SCW.nct|1|SysListView32|FolderView
SAO.rn|34|FurMark
MDM.r
MUM.r
ENR.
```

3.65.5.4 MLE. - Mouse-Left-Click Event

MiniRobotLanguage (MRL)

MLE. Command

Mouse-Left-Click Event (direct engine)

Intention

This Command is the standard clicking command in automated software-installations.

MLE. will simulate a Left-Click (MLE.) with the Mouse using the direct engine 231.

The MLE. Command will not really move the mouse and do the click. It will instead tell the the target application "that there was a mouse-click".

Therefore the target window does not need to be on top. It can even be hidden or outside of the area where the mouse can move. MLE. can click buttons which are disabled, and it can even click on invisible controls.

Using MLE. then the mouse pointer will not be used. However the "action" will take place at the current "Active Point". In most cases the "Active Point" is been set, by localizing a button or control or object. In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Hints:

- Like all direct engine 231 commands, MLE. depends on the cooperation of the target application. In some - especially JAVA-based) applications, the MLE. will not work.
- In those cases where MLE. do not works as expected, use MLC.or MLI. or MLM. .
- If you have the problem that MLE. seems to be eaten by the target application sometimes, use BSC. or BCS.
- MLE. may not work on Buttons, when you have just located the Top-Window. This is normal Application behavior.

Syntax

 *© 2023 Theo Gottwald * https://www.smart-package.com*

MLE.[P1|][P2,P3]

Parameter Explanation

P1 - (optional) prototype coordinates

Prototype can be omitted or any of:

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.

"x" - Set Active Point to the Command-position.

Example:
' Left Click Event and Active Point Move
MLE.wrx|-358,207
```

P2, P3 - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use

© 2023 Theo Gottwald * https://www.smart-package.com

```
variable and Formula in (..). You can also use a
Point-Variable instead of two coordinates.
```

Example

```
'**********************************
' MLE.-Demo
'**********************************
STW.ct|PBWindowClass:0|TestApp
SCW.nct|2|Button|Button 2
MLE.
MLE.r|(11*5),(-1*5)
ENR.
```

Remarks

For automated Installations prefer `BSC.` where possible.

Limitations:

-

3.65.5.5 MRE. - Mouse-Right-Click Event

MiniRobotLanguage (MRL)

MRE. Command

Mouse-Right-Click Event

Intention

`MRE.` will simulate a Right-Click with the Mouse using the direct engine 231.

The `MRE.` Command will not really move the mouse and do the click. It will instead tell the the target application "that there was a mouse-click".

Therefore the target window does not need to be on top. It can even be hidden or outside of the area where the mouse can move. `MRE.` can click buttons which are disabled, and it can even click on invisible controls.

When using `MRE.`, the mouse pointer will not be used. However the "action" will take place at the current "Active Point". In most cases the "Active Point" is been set, by localizing a button or control or object. In that case, the "Active Point" is in the center of the rectangular object.
You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Hints:

- Like all direct engine 231 commands, `MRE.` depends on the cooperation of the target application. In some - especially JAVA-based) applications, the `MRE.` may not work.
- In those cases where `MRE.` does not works as expected, use `MRC.`or `MRI.`

Syntax

MRE.[P1|][P2,P3]

Parameter Explanation

P1 – `(optional) prototype coordinates`

`Prototype can be omitted or any of:`

 *© 2023 Theo Gottwald * https://www.smart-package.com*

GROUP I (based on rectangular Area) Prototypes

```
"w" - choose RECT from last located Window (Child-/ or Top-Window)
"t" - choose RECT from last located Top-Window
"k" - choose RECT from last located Child-Window

"a" - choose RECT from last located Accessible Object (E8) (using SAO.,AGR.,NAV.
"g" - choose RECT from last located graphical Object (E9) (using QFR,, ANA., UNI.
"o" - choose RECT from last located Object/Window (any sort of)
"s" - use Screen-Coordinates, these will go over the whole Screen, including Dual

for these "Base-Prototypes" you can specify additionally fine-tuning using:
 - Quadrant coordinates like:
 MMV.o|{A2-B4}
 - numeric numbers (positive and negative)
 MMV.o|-20,90
and you can combine this:
 MMV.o|-20,90 {A2-B4}
```

also there are three Prototypes that will do sort of "left-right" or "Mid" Positioning.
These 3 can not be combined with each other.

```
"d" - Sort of LBO. - Positioning on the Left side of the current Rectangle.
"e" - Sort of RBO. - Positioning on the Right side of the current Rectangle.
"r" - Midpoint of the last RECT (default)

' Example (Combination):
 MMV.oe|-20,90 {A2-B4}
```

GROUP II (based on Point) Prototypes

```
"m" - actual mouse-position. Usefull if the user moves the mouse somewhere and yo
"b" - last mouse-position, before last Move.
"p" - current "Active Point". (Default)
"l" - Last "Active Point".

If prototype is omitted, Screen-Coordinates are taken.

"x" - Set Active Point to the Command-position.

Example:
' Right Click Event and Active Point Move
MRE.wrx|-358,207
```

P2, P3 - (optional) x,y - coordinates
numeric coordinates, separated by comma. You can use variable and Formula in (..). You can also use a Point-Variable instead of two coordinates.

Example

```
'*********************************
' MRE.-Demo
'*********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.ct|ieframe|microsoft
MRE.

END.
```

Remarks

Mostly you do not need to specify the coordinates with `MMV.`or `MLI.` but you can directly write the coordinates into `MRE.`, `MRI.`, and `MRC.`.

Limitations:

-

3.65.5.6 MUM. - Mouse Up Message

MiniRobotLanguage (MRL)

MUM. Command

Mouse Up Message

Intention

For few operations, you may need to just press a mouse-button down and release it later.

There are two commands for this purpose:

- `MDM.` - Direct Engine 231
- `MLD.` - Compatible Engine 231

`MUM.` has all the strong and all the weak sides of a typical Direct Engine 231 command.

`MUM.` can simulate all the three mouse buttons, depending on parameter **P1**.

The `MUM.` Event will take place at the position of the current "Active Point".
You can find some more details on the "Active Point" here: MAP - Move Active Point 2483.

Some Hints:

- If `MUM.` seems not to work on your target window, try `MLU.`
- You can not use `MUM.` for Drag'n Drop operation, as the direct engine does not support that.

For Drag'n Drop operations, always use: `MLD.`, `MMV./MPO.` and `MLU.`

Syntax

MUM.[P1]

Parameter Explanation

P1 - Prototypes:

```
l = left mouse button will be pressed
m = then middle button will be pressed (press on wheel)
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
r = right button will be pressed
```

3.65.5.7 MWE. - Mouse Wheel Event

MiniRobotLanguage (MRL)

MWE. Command

Mouse-Wheel Event (direct engine)

Intention

This Command is the standard command to scroll the Mouse Wheel.
It can scroll in any direction, either forward/backward, or left/right.

`MWE.` will simulate a the Mouse Wheel Event using the direct engine 231.

The `WME.` Command will not really move the mouse and do the Scrolling.
It will instead tell the the target application "that there was a mouse-wheel movement".

Therefore the target window does not need to be on top. It can even be hidden or outside of the area where the mouse can move.
`MWE.` can scroll in Windows that are disabled, and it can even work on invisible windows.

Using `WME.` then the mouse pointer will not be used. However the "action" will take place at the current "Active Point". In most cases the "Active Point" is been set, by localizing a button or control or object. In that case, the "Active Point" is in the center of the rectangular object.

You will definitely need to localize an active application/window before using this command.

You can find some more details on the "Active Point" and how to move it, here:
MAP - Move Active Point 2483.

Hints:

- Like all direct engine 231 commands, `MWE.` depends on the cooperation of the target application. In some - especially JAVA-based) applications, the `MWE.` will not work.
- In those cases where `MWE.` does not works as expected, use `MWR.` or `MWT.`

Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

MWE.[P1]

Parameter Explanation

P1 **-** (optional) Variable or Value

Generally **P1** is a number that is either positive or negative.
Additionally, you can prefix P1 with the following letters to change the functionality:

H – Switch to Horizontal Mode, Tile Mouse-Wheel instead of scrolling.
Negative numbers will tile left, Positive numbers will tile right.

A – First XButton is pressed while the Wheel is rotated
B – Second XButton is pressed while the Wheel is rotated
C – ctrl (strg) is pressed on the Keyboard while the Wheel is rotated
D – Left Mouse Button is pressed while the Wheel is rotated
E – Right Mouse Button is pressed while the Wheel is rotated
F – Middle Mouse Button is pressed while the Wheel is rotated

Note that it does not make any difference whether you prefox the number with the letter, or if you use the letter as suffix.

```
MWE.H120
MWE.120H
```

is both completely equal.

Positive numbers scroll the Mouse wheel forward (away from the user)
negative numbers scroll the Mouse wheel backwards (direction to the user).

You can scroll in very fine steps.
A normal Mouse-Wheel scroll with a standard Mouse is 120.
If you want to simulate two steps with a Mouse Wheel, therefore you would scroll by 240.

Example:

```
' Scrol the Mouse one Step forward
MWE.120
' Scrol the Mouse one Step backward
MWE.-120
' Tile the Mouse one Step right
MWE.H120
' Tile the Mouse one Step left
MWE.-120H
```

Example

```
'***********************************
' MWE.-Demo
'***********************************
' Scroll Google Chrome Browser
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.ct|Chrome_WidgetWin_1|- Google Chrome
MWE.120H
PAU.1
ENR.
```

3.65.6 IMO. / NMO. - If Mouse Option

MiniRobotLanguage (MRL)

IMO. Conditional Statement

If Mouse Option

Intention

Conditional Statement. Test several parameters about the mouse. You can test the following states:

- Is Mouse installed in the current system?
- Does the Mouse have a Mouse Wheel?
- Is the Left Button of the Mouse Up / Down?
- Is the Middle Button of the Mouse Up / Down?
- Is the Right Button of the Mouse Up / Down?

To make these tests, you specify a number or a keyword behind the `IMO.`-command.

Example:

```
IMO.IsMouse
  DBP.Yes we have a mouse
ELS.
  DBP.No we have no mouse
EIF.
```

In the same way you could have specified a number instead, which would do just the same:

```
IMO.1
  DBP.Yes we have a mouse
ELS.
  DBP.No we have no mouse
EIF.
ENR.
```

To test for a Mousewheel, you would similarly write:

```
IMO.iswheel
  DBP.Yes we have a mouse-wheel
ELS.
  DBP.No we have no mouse-wheel
EIF.
```

and you can even combine all the tests like this:

```
IMO.iswheel,ismouse
  DBP.Yes we have a mouse+wheel
ELS.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  DBP.No we have no mouse+wheel
EIF.
```

or use the numeric way - please always use the (...) for formulas:

```
IMO.(1+4)
  DBP.Yes we have a mouse+wheel
ELS.
  DBP.No we have no mouse+wheel
EIF.
```

or add the numbers yourself:

```
IMO.5
  DBP.Yes we have a mouse+wheel
ELS.
  DBP.No we have no mouse+wheel
EIF.
```

or separate them by comma:

```
IMO.1,4
  DBP.Yes we have a mouse+wheel
ELS.
  DBP.No we have no mouse+wheel
EIF.
```

Which will al do the same. Below you will find a list with the keywords and Options you can test for.

Syntax

IMO.P1[,P2...PX] … ELS. … EIF.

Parameter Explanation

P1 - Parameter that specifies one or more conditions to test for.
You can either specify the keyword or the number. You can
also specify multiple keywords or numbers, separated by comma. You can also add the numbers when you specify the condition.

```
"ismouse"       1   - TRUE if Mouse installed.
"nomouse"       2   - TRUE if no Mouse installed.
"iswheel"       4   - TRUE if Mouse Wheel installed.
"nowheel"       8   - TRUE if no Mouse Wheel installed.
"islmbdown"     16  - TRUE if Left Mouse Button (LMB) down.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
      "islmbup"       32  - TRUE if Left Mouse Button (LMB)
up.
      "ismmbdown"     64  - TRUE if Middle Mouse Button (MMB)
down.
      "ismmbup"       128 - TRUE if Middle Mouse Button (MMB)
up.
      "isrmbdown"     256 - TRUE if Right Mouse Button (RMB)
down.
      "isrmbup"       512 - TRUE if Right Mouse Button (RMB)
up.
```

Example

```
'**********************************
' IMO.-Sample
'**********************************
IMO.iswheel,ismouse
  DBP.Yes we have a mouse+wheel
ELS.
  DBP.No we have no mouse+wheel
EIF.
END.
```

Remarks

This command may get additional options in future updates.

Limitations:

-

3.65.7 LBO. - Left Border

MiniRobotLanguage (MRL)

LBO. Command

Left Border Checkmark Operation

Intention

See the Checkmark left of the Text.

In cases where they can not be directly located, you can locate them using the LBO. command.

What is the "Active Point"?
The "active Point" is the "Focus Point" of the robot. It is the point "On screen", where the next robot action - for example a mouse-click - will happen.

The `LBO.`-command will not move the mouse but just set the active point.

A complete sequence could look like this:

```
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.nct|1|TcxPageControl|{&NOTEXT:}
SCW.nct|1|TcxTabSheet|EDOC
SCW.nc|1|TcxButtonEdit
LBO.
MMV.
ENR.
```

Using `LBO.` without any parameter will address a rectangular Button **on the leftt side inside** the last located rectangle. To address the checkmark in teh picture above you will need to specify "**A**" as an additional second parameter **P2.**

If you specify a number as **P1** , `LBO.` will move the active point to inside the rectangular area.

X-Position = Number x height

For example:

```
LBO.5
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

would be nearly in the center of the Text-Control.
If you specify an additional Parameter like this:

```
LBO.1|A
```

the active point will be moved at the right side to outside of the control.
For example to press that checkmark on the picture above.

You can finetune the X-Position if you specify additionally "Q" (Quarter) and "H" (Half) as third parameter. They will increase the Position just a bit.

As this Method works relative to the height of the control, it is safer then to move the mouse using point coordinates.

Syntax

LBO.[P1][|P2]

Parameter Explanation

P1 – ***(optional)*** Number of "height units" to step inside or outside of the selected rectangle/control. If omitted, "1" is used as default value.

P2 – ***(optional)*** One of these letters:
A - change direction to outside, if missing direction is to inside of the rectangle.
H - Half, add just a few points to the position
Q - Quarter, add just a few points to the position

Example

```
'**********************************
' MMV./MPO. -Demo
'**********************************
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.nct|1|TcxPageControl|{&NOTEXT:}
SCW.nct|1|TElButtonEdit|{&NOTEXT:}
LBO.1|A
MMV.
RBO.3
END.
```

Remarks

You can use multiple `RBO.`'s and `LBO.`'s to find your desired, final target position.

3.65.8 MOS. - Mouseless Object Select

MiniRobotLanguage (MRL)

MOS. Command

Mouseless Object Select (direct engine / Accessibility / focussless technology)

Intention

The `MOS` -Command can be used to simulate a many different actions, like a mouse-click and other actions without really using or moving the mouse.

It is based on accessibility and will preferably work with objects that have been located using `SAO.`, `NAV.` or `AGR.`, like in this example:

```
STW.ct|PBWindowClass:0|BCS - Testform
AGR.43|Install
MOS.
```

`MOS.` is perfect for clicking for example Links in the WEB-Browser, even if they are actually not visible.

To use `MOS.`, you need to locate these elements first for example, using the `SAO.`, `NAV.` or `AGR.` Command.

`MOS.` understands a "subscript" that can be given as command-line. For example:

```
STW.ct|PBWindowClass:0|BCS - Testform
AGR.43|Install
MOS.WIN.MPO.DMO.WII.
ENR.
```

You can find a list with these "Subscript-commands" below. In our example the following will happen:

```
MOS.WIN.MPO.DMO.WII.
```

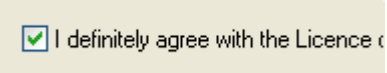
`WIN.` - we set the internal value for `WII.` to infinte
`MPO.` - the mouse jumps to the target position (it will jump back later!)
`DMO.` - we'll click two times (mouse-less - its just a demo)
`WII.` - we will wait until the application is ready again for new actions

You can try this script with the supplied BCS-Testapplication.

*© 2023 Theo Gottwald * https://www.smart-package.com*

MOS. has a special feature for checkmarks. We'll now use it on our BCS-Testform. This feature comes with the two "sub-commands" BTC. and BTS. Please do not intermix these "sub-commands" with the real BTC. command.
They have just the same name, but are different things..In this case, BTC. - means "Button clear" and BTS. means "Button Set". These two wubcommands are specially to have a checkmark or radio button SET or CLEARED.
The BTC. sub-command must be followed by a mouse-click-sub-command to be complete.
This way you can choose which kind if mouse-click you want to do. It will look like this:

```
STW.ct|PBWindowClass:0|BCS - Testform
AGR.44|agree
MOS.BTS.MLE.
ENR.
```



And to have that checkmark cleared, you would use:

```
' direct engine click
MOS.BTC.MLE.
```

or as alteranatice

```
' compatible engine click.
MOS.BTC.MLI.
```

Note that in case its a real child-window and not an web-based object, you can also use SCW. instead of AGR. or SAO. to locate it like this:

```
STW.ct|PBWindowClass:0|BCS - Testform
SCW.ct|button|agree
MOS.BTS.MLE.
ENR.
```

Using any kind of mouse clicks,.this will also work as expected. However if you want to use the MOS. (mouseless operation) sub-command, you need to have the target located using AGR. or SAO. or NAV. Anything else may not work. Especially SCW. would not work in this case.

```
STW.ct|PBWindowClass:0|BCS - Testform
AGR.44|agree
'This will also work
MOS.BTC.MOS.
ENR.
```

After execution, the MOS. - Command will drop a 0 or 1 onto the stack, to show if the command was successful (1) or not (0). If the command was not successful then a possible reason is that the control does internally not support the used interface.

MOS. has a lot of options/sub-commands, see below. The options from "**a**" to "**i**" and "**k**", are mostly for selecting items in List-controls. The other sub-commands are Mouse-operations and Waiting operations.

© 2023 Theo Gottwald * https://www.smart-package.com

Using our TestApp_01.exe, here is an example that shows how to use the sub-commands to select the items: 4,5 and 8:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|ListBox|List-Item Nr.1
SAO.rn|34|List-Item Nr.4
MOS.TAS.
SAO.rn|34|List-Item Nr.5
MOS.CCS.
SAO.rn|34|List-Item Nr.8
MOS.CCS.
ENR.
```

In Listboxes, the items must not be visible to become selected.
You can also select item 18, which will then get visible.

```
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|ListBox|List-Item Nr.1
SAO.rn|34|List-Item Nr.4
MOS.TAS.
SAO.rn|34|List-Item Nr.5
MOS.CCS.
SAO.rn|34|List-Item Nr.18
MOS.CCS.
ENR.
```

Note that `CCS.` will extend (add items to) an existing selection, while `TAS.` will remove all current selections and start with a new selection. `MOS.` may also be useful with other controls to select and unselect items.

Syntax

MOS.P1

Parameter Explanation

P1 - Optional subscript (inline)-commands:

```
 "TAF" - "a" ' Take Focus
 "TAS" - "b" ' Take Selection
 "ESE" - "c" ' Ext. Select
 "ASE" - "d" ' Add to Selection
 "RSE" - "e" ' Remove Selection
 "SSE" - "f" ' Strong Select
 "SHC" - "g" ' Shift-Click
 "CCS" - "h" ' ctrl-click - select
 "CSE" - "i" ' ctrl-click cancel selection
 "MER" - "j" ' MER at Pos.
 "MSE" - "k" ' do Multiselect
 "MOS" - "m" ' Mouseless Operation Select
 "DMO" - "n" ' Double Mouseless Operation Select
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
"MLI" - "o" ' MLI at place
"DMR" - "p" ' Double Mouseless Operation Select with rest
"MPO" - "q" ' Mousepointer Position Set
"MSO" - "r" ' Mouse Operation
"MDO" - "s" ' Mouse Double Operation
"WIN" - "t" ' Set Wait-Input Idle- Time to infinte
"MDC" - "u" ' MDC at place
"MRC" - "v" ' MRC at place
"WII" - "w" ' Wait-for-Input-Idle (max. 5 Seconds)
"MLE" - "x" ' MLE.
"SMP" - "y" ' Set Mousepos Mode
"BTP" - "z" ' Set Left-ControlPosition like for Checkmark
"BTC" - "0" ' check State before click and click
              if actually state=0 (check it)
"BTS" - "1" ' check State before click and click if actually
              state=1 (uncheck it)
```

Example

```
'----------------------------------------
' MOS-Example 1
' This example Script will click a
' button in the BCS-Testapp
'----------------------------------------
DBM.2
STW.ct|PBWindowClass:0|BCS - Testform
AGR.43|Install
MOS.WIN.MPO.DMO.WII.
ENR.
END.
```

Remarks

You can use these sub-commands to make extended selections in List-Objects like Listview or Listbox.

Limitations:

Please note that not all List-Controls support this command, while most other elements in windows or IE-Browser support `MOS`..

3.65.9 MWC. - Mouse Window Click

MiniRobotLanguage (MRL)

MWC. Command

Mouse Window Click

Intention

This command will do nearly the same like `MLE.` Internally it uses a special method that will work, even if a Standard `MLE.` would fail. It is only for very special use.
If you use the numerical parameters, note that these are experimental and therefore undocumented, unlike
0 - `MLE.` and
15 - `MLC.`

```
' Start the BCS.-Testapp from your Sample-Apps folder
STW.wct|45|PBWindowClass:0|BCS - Testform
SCW.wctid|45|Button|Install|1012|1
MWC.
```

Syntax

MWC.[P1]

Parameter Explanation

P1 - (optional) - number to specify details on how to click.

```
1 - check                  5,9 - 1+
2 - button HILITE          6,10 - 2+
3 - Button DE              7,11,14 - 3+  13 -DoubleLCLick
4 - Click                  8,12 - 4+

0  - MLE. - like
15 - MLC - like
```

Example

```
'*****************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Demo for MWC.
'****************************************
' Start the BCS.-Testapp from your Sample-Apps folder
STW.wct|45|PBWindowClass:0|BCS - Testform
SCW.wctid|45|Button|Install|1012|1
MWC.
END.
```

Remarks

-

Limitations:

Currently this method is experimental and only implemented for x32. Under x64 the `MWC.` will make a normal mouse-click, like the other Mouse-clicks.

3.65.10 MWT. - Mouse Wheel Tile

MiniRobotLanguage (MRL)

MWT. Command

Mouse Wheel Tile (compatible engine)

Intention

`MWT.` simulates a Mouse-Wheel Scroll left or right.
This Command simulates the Mouse Wheel using the Compatible Engine 231.
Therefore the Mouse must be positioned over the target application window.

The usage of the command is simple, you can just write:

```
MPO.
MWT.120
or
MWT.-120
```

Then the mouse wheel will do the scroll either forward (120) or backward (-120).

In most cases the "Active Point" is been set, by localizing a button or control or object.
In that case, the "Active Point" is in the center of the rectangular object.

You can find some more details on the "Active Point" and how to move it, here: MAP - Move Active Point 2483.

This command will simulate a real Mouse-Wheel.
Therefore the Mouse pointer needs to be over the target window.

`MWR--.` has therefore all the strong and all the weak sides of a typical Compatible Engine 231 command.

`MWT.` is a real Mouse-Roll, therefore it need the window to be on top of other windows. Also it will need a mouse-pointer and a desktop.

You can find some more details on the "r"-prototype here: MAP - Move Active Point 2483.

Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

MWT.P1

Parameter Explanation

P1 **-** (optional) Variable or Value

Generally **P1** is a number that is either positive or negative.

Positive numbers scroll the Mouse wheel forward (away from the user)
negative numbers scroll the Mouse wheel backwards (direction to the user).

You can scroll in very fine steps.
A normal Mouse-Wheel scroll with a standard Mouse is 120.
If you want to simulate two steps with a Mouse Wheel, therefore you would scroll by 240.

Example:

```
' Scrol the Mouse one Step forward
MWR.120
' Scrol the Mouse one Step backward
MWR.-120
' Tile the Mouse one Step right
MWT.120
' Tile the Mouse one Step left
MWT.-120
```

Example

```
'**********************************
' MWT.-Demo
'**********************************
STW.ct|IEFrame|Facebook - Internet Explorer
SCW.ct|Internet Explorer_Server|{&NOTEXT:}
' Scroll IE nach oben
MPO.
MWT.120
' Scroll IE nach unten
MWT.-120
PAU.1
ENR.
END.
```

Remarks

-

Limitations:

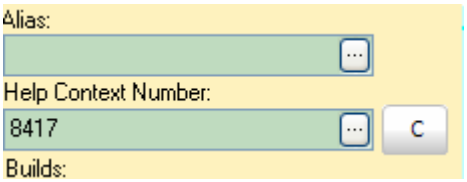
3.65.11 RBO. - Right Border

MiniRobotLanguage (MRL)

RBO. Command

Right Border Operation

Intention



See the Buttons inside the Text-Box, on the right side.
Also see the Button on the right of the Text-Box below.

In cases where they can not be directly located, you can locate them using the `RBO.` command.

What is the "Active Point"?
The "active Point" is the "Focus Point" of the robot. It is the point "On screen", where the next robot action - for example a mouse-click - will happen.

The `RBO.`-command will not move the mouse but just set the active point.

A complete sequence could look like this:

```
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.nct|1|TcxPageControl|{&NOTEXT:}
SCW.nct|1|TcxTabSheet|EDOC
SCW.nc|1|TcxButtonEdit
RBO.
MMV.
ENR.
```

Using `RBO.` without any parameter will address a rectangular Button **on the right side inside** the last located rectangle (in this cas the Text-Box). For example the upper button in the picture above.

If you specify a number as **P1** , `RBO.` will move the active point to inside the rectangular area.
X-Position = Number x height

For example:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
RBO.5
```

would be nearly in the center of the Textbox-Control.
If you specify an additional Parameter like this:

```
RBO.1|A
```

the active point will be moved at the right side to outside of the control.
For example to press that "C"-Button on the picture above.

You can finetune the X-Position if you specify additionally "Q" (Quarter) and "H" (Half) as third parameter. They will increase the Position just a bit.

As this Method works relative to the height of the control, it is safer then to move the mouse using point coordinates.

Syntax

RBO.[P1][|P2]

Parameter Explanation

P1 – ***(optional)*** Number of "height units" to step inside or outside of the selected rectangle/control. If omitted, "1" is used as default value.

P2 – ***(optional)*** One of these letters:
A - change direction to outside, if missing direction is to inside of the rectangle.
H - Half, add just a few points to the position
Q - Quarter, add just a few points to the position

Example

```
'**********************************
' MMV./MPO. -Demo
'**********************************
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.nct|1|TcxPageControl|{&NOTEXT:}
SCW.nct|1|TElButtonEdit|{&NOTEXT:}
RBO.1|A
MMV.
RBO.3
END.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

You can use multiple `RBO.`'s and `LBO.`'s to find your desired, final target position.

Limitations:

-

See also:

- LBO. - Left Border 2506
- MLE. - Mouse-Left-Click Event 2492
- MLM - Mouse Left click Move (Invinsible) 2457
- MLI - Mouse Left Click qulckly (Invinsible) 2454

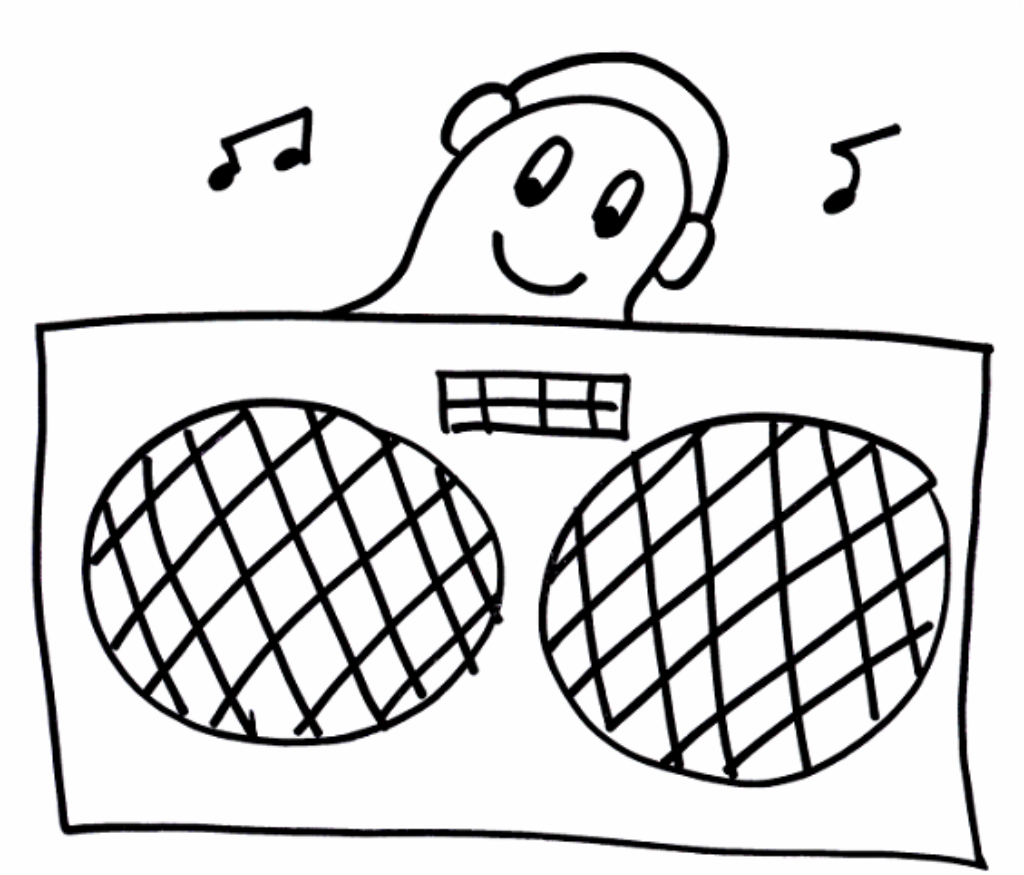
3.66 Multimedia Commands

3.66.1 ! Smarty's Multimedia Commands

Smarty's Multimedia Commands



*© 2023 Theo Gottwald * https://www.smart-package.com*

3.66.2 MPA. - Music Player

MiniRobotLanguage (MRL)

MPA. Command

Music Player

Intention

`MPA.` is a "Music Player". You give it a piece of Sound, and it will play it.

Simple Example:

```
MPA.MySong.mp3
```

`MPA.` can also accept a List of Audio Files (Play-List).
The Songs must be separated using a "**>**" Sign. Example:

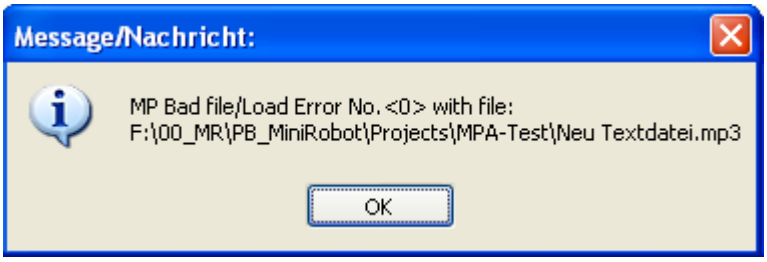
```
MPA.MySong.mp3>MySong2.mp3>MySong3.mp3
```

Of course this makes more sense using a variable:

```
$$PLI=MySong.mp3>MySong2.mp3>MySong3.mp3
MPA.$$PLI
```

You can add a third parameter to test if a file can be played or not.
Example:

```
$$LID=?pfad\Neu Textdatei.mp3
MPA.$$LID|$$RES
STS.DUMP
MBX.$$RES
```



The Music-Player will not pop up any error-messages, instead place all errors whether in this variable or on TOS, if no variable is given.

Some Hints:

- Use `MPB.` in case the Music should play in the background
- Use `SVL.` to change the Overall Volume and the Mute-State
- Use `MPC.` and `MPB.` for Sound effect like faster or slower Playback rate etc.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

MPA.[P1][|P2]

Parameter Explanation

P1 **-** Filename or Playlist (=Filenames, separated with ">")

P2 **-** (optional) Variable, receives Error-Messages if there are Errors during playback.

Example

```
'**********************************
' MPA.-Sample
'**********************************
' Repeat a Song endless
DOL.1
  MPA.MySong.mp3
OOP.
END.
```

Remarks

-

Limitations:

This command makes use of the Windows "**Direct Show**" **API**. If Direct X / Direct Show is not installed on the target PC, these commands will not work. If you have a working Windows Media Player,on the system, then everything will work as expected. Generally all Audio-Formats, that are supported with the Windows Media Player, should work with this command also.

See also:

- SVL. - Set Volume 2539
- MPB. - Music Play Background 2526
- MPC. - Music Player Command 2530

© 2023 Theo Gottwald * https://www.smart-package.com

3.66.3 MPB. - Music Play Background

MiniRobotLanguage (MRL)

MPB. Command

Music Play Background

Intention

The `MPB.` command acts as a "Background Audio Player". It is part of a set of commands that includes `MPC.` - Music Player Commands. These commands enable you to play music or any audio in the background. For instance, you can use it to play music during an automated installation process.

However, its uses aren't limited to music playback. For instance, you can use it to play a "police siren" sound during alarm conditions.

To utilize the `MPB.`, you need to feed it an audio file. As it operates in the background, a separate command is required to check if it's ready to play the audio. If we neglect to do so, we won't hear any audio because when the script concludes, `MPB.` also terminates any ongoing playback

Simple Example:

```
' Start the PLayback, here we assume that the song is located
' in ?path\, that is where the scriptfile is.
MPB.MySong.mp3
' Now we wait until the sound was played
WRS.
' We drop the result
DRS.
' We end the script.
ENR.
```

`MPB.` can also accept a list of Audio Files (Play-List).

The Songs must be separated using a "**>**" Sign. Example:

```
MPB.MySong.mp3>MySong2.mp3>MySong3.mp3
```

Of course this makes more sense using a variable:

```
$$PLI=MySong.mp3>MySong2.mp3>MySong3.mp3
MPA.$$PLI
```

You can add a third parameter to get the "Ticket-Number" of the background task.
Using the "Ticket Number" you can control the background task.
More details on how to work with a "Ticket number" and background tasks, see:

"Ticket Numbers" and Background Tasks 2632

*© 2023 Theo Gottwald * https://www.smart-package.com*

Using the ticket number and the `MPC.` - command, you can influence the behavior of the playing song.

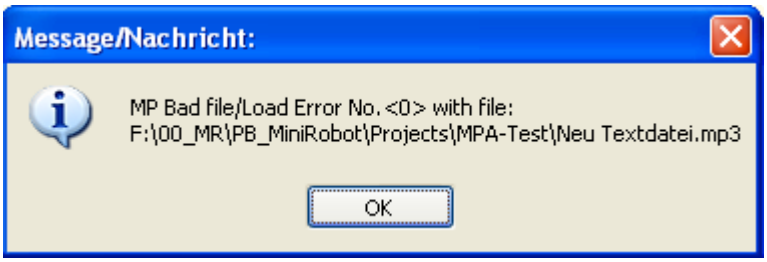
```
' Start the Playback
MPB.$$LIB
' Set the Playback speed to double speed
MPC.|setrate|2
' Decrease the volume a bit (Range is from 100 - loud, to zero
' - sound off)
MPC.|svol|90

' Now we wait until the sound was played
WRS.
' We drop the result
DRS.
' We end the script.
ENR.
```

If there was an error during Playback, you will get it as a result of the background task.
Use `GRS.` for that purpose.

Example:

```
$$LID=?pfad\Neu Textdatei.mp3
MPB.$$LID|$$RES
WRS.
GRS.|$$RES
MBX.$$RES
```



The Music-Player will not pop up any error-messages, instead give the error back as a result.

Some Hints:

- Use `MPA.` in case the Music should play in the background
- Use `SVL.` to change the Overall Volume and the Mute-State
- Use `MPC.` and `MPB.` for Sound effect like faster or slower Playback rate etc.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

MPB.[P1][|P2]

Parameter Explanation

P1 – Filename or Playlist (=Filenames, separated with ">")

P2 – (optional) Variable, receives Ticket-Number for Result (`GRS.`)

Example

```
'**********************************
' MPB.-Sample
'**********************************
' Start the PLayback
MPB.MySong.mp3
GSB.Fade
' Now we wait until the sound was played
WRS.
' We drop the result
DRS.
' We end the script.
END.
:Fade
' Fade Balance from left to right
FOR.$$CNT|-10000|10000|100
  MPC.|sbal|$$CNT
NEX.
' Reset Balance
MPC.|sbal|0
RET.
```

Remarks

-

Limitations:

This command makes use of the Windows "**Direct Show**" **API**. If Direct X / Direct Show is not installed on the target PC, these commands will not work. If you have a working Windows Media Player,on the system, then everything will work as expected. Generally all Audio-Formats, that are supported with the Windows Media Player, should work with this command also.

3.66.4 MPC. - Music Player Command

MiniRobotLanguage (MRL)

MPC. Command

Music Player Commands

Intention

MPC. functions as a companion to the MPB. command. It allows you to modify the playback parameters once the audio is playing through MPB.
Therefore, prior to using MPC., it's crucial that you're familiar with the workings of MPB.
The first parameter needed for using MPC. is the "Ticket Number".
By using the "Ticket Number", you gain control over the associated background task.
More information on handling "Ticket Numbers" and managing background tasks can be found at:

"Ticket Numbers" and Background Tasks 2632

Using the ticket number and the MPC. - command, you can influence the behavior of the playing song.

```
' Start the Playback
MPB.$$LIB
' Set the Playback speed to double speed
MPC.|setrate|2.5
' Decrease the volume a bit (Range is from 100 - loud, to zero
' - sound off)
MPC.|svol|90

' Fade Balance from left to right
FOR.$$CNT|-10000|10000|100
  MPC.|sbal|$$CNT
NEX.
' Reset Balance
MPC.|sbal|0

' Now we wait until the sound was played
WRS.
' We drop the result
DRS.
' We end the script.
ENR.
```

You can change values dynamically to achieve Sound effects.
Note that such effects may be different on different fast computers.

```
$$LIB=?path\Lied.mp3
' Start the Playback
MPB.$$LIB
' Now we wait until the sound was played
```

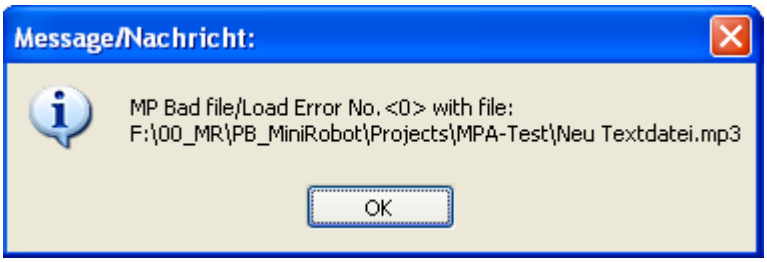
© 2023 Theo Gottwald * https://www.smart-package.com

```
MPC.|setrate|1.3
MPC.|svol|90
MPC.|gd|$$RET
' Change position and volume dynamically
FOR.$$CNT|0|$$RET|1000
  MPC.|sp|$$CNT
  FOR.$$VOL|100|77|-1
    MPC.|sv|$$VOL
  NEX.
NEX.
MPC.|stop
' Reset Balance
MPC.|sbal|0
ENR.
```

If there was an error during Playback, you will get it as a result of the background task.
Use `GRS.` for that purpose.

Example:

```
$$LID=?pfad\Neu Textdatei.mp3
MPB.$$LID|$$RES
WRS.
GRS.|$$RES
MBX.$$RES
```



The Music-Player will not pop up any error-messages, instead give the error back as a result.

Some Hints:

- Use `MPA.` in case the Music should play in the background
- Use `SVL.` to change the Overall Volume and the Mute-State
- Use `MPC.` and `MPB.` for Sound effect like faster or slower Playback rate etc.

Syntax

MPC.[P1][|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **-** Sub-Command. Out of the following:

"Stop" - Stops Playback from the selected background task immediately.

"Pause" - Pauses Playback from the selected background task immediately.
Continue playing using the "Play" Sub-Command.

"Play" - Start Playback of a loaded or Paused Audio-File, from the
selected background task.

"setrate","set rate","set playback rate","sr"
Change the Playback Rate/Speed of the currently selected background task.
The playback rate is expressed as a ratio of the normal speed. Thus, 1.0 is normal
playback speed, 0.5 is half speed, and 2.0 is twice the original speed..

"setpos","set position","sp"
Change the Playback Position of the currently selected background task.
The playback Position is expressed is a 64-bit integer value. To obtain the
maximum absolute position, use the "get duration" command.

"set end position","setend","setendpos","se"
Change the Playback-End Position of the currently selected background task.
The playback End-Position is expressed is a 64-bit integer value. To obtain the
maximum absolute position, use the "get duration" command.

"move","from here","mv"
Change the Playback-Current Position relative to the current position,
of the currently selected background task.
The playback Current-Position is expressed is a 64-bit integer value. To obtain the
maximum absolute position, use the "get duration" command.
Example:

```
MPC.$$TIN|mv|1000
```

"moveend","move end","end from here","me"
Change the Playback-End Position relative to the current position,
of the currently selected background task.
The playback End-Position is expressed is a 64-bit integer value. To obtain the
maximum absolute position, use the "get duration" command.
Example:

```
MPC.$$TIN|mv|1000
```

"get duration","gd","gdur"
Get the Playback-Duration of the currently selected background task.

© 2023 Theo Gottwald * https://www.smart-package.com

The playback Duration is a 64-bit integer value.
Example:

```
MPC.$$TIN|gd|$$RET
DBP.$$RET
```

"get position","gpos","gp"

Get the Playback-Duration of the currently selected background task.
The playback Duration is a 64-bit integer value.
Example:

```
MPC.$TIN|gp|$$RET
DBP.$$RET
```

"load"

"set volume","svol","setvolume","sv"

Set the Playback-Volume in a Range from 0 to 1000, of the currently selected background task. The volume steps are not linear, this way you can set very soft music / sounds more accurate and have less steps for loud sounds.
Example:

```
MPC.$TIN|sv|100
```

"set balance","sbal","setbalance","sb"

Set the Playback-Balance in a Range from -10000 to 10000, of the currently selected background task.
The Balance (left/right speaker) is equal when you set the value to zero.
If you set it to -10000 then only the right speaker is used. If you set it to 10000 then only the left speaker is used. Example:

```
MPC.$TIN|sb|10000
MPC.$TIN|sb|-10000
```

"get volume","gvol","gv"

Get the Playback-Volume in a Range from 0 to 1000, of the currently selected background task. The volume steps are not linear, this way you can set very soft music / sounds more accurate and have less steps for louder sounds.
Example:

```
MPC.$TIN|gv|$$RES
DBP.$$RES
```

"get balance","gbal","gb"

Get the Playback-Balance in a Range from -10000 to 10000, of the currently

© 2023 Theo Gottwald * https://www.smart-package.com

selected background task.
The Balance (left/right speaker) is equal when you set the value to zero.
If you set it to -10000 then only the right speaker is used. If you set it to 10000
then only the left speaker is used. Example:

```
MPC.$TIN|gb|$$RES
DBP.$$RES
```

P2 – (optional) Variable, receives or contains values, depending on the chosen Sub-Command.

Example

```
'**********************************
' MPB. / MPC.-Sample
'**********************************
' Start the PLayback
MPB.$$LIB
' Now we wait until the sound was played
MPC.|setrate|1.3
MPC.|svol|90
MPC.|gd|$$RET
' Change position and volume dynamically
FOR.$$CNT|0|$$RET|500
  MPC.|sp|$$CNT
  FOR.$$VOL|100|70|-1
    MPC.|sv|$$VOL
  NEX.
NEX.
MPC.|stop

RET.
```

Remarks

-

Limitations:

This command makes use of the Windows "**Direct Show**" **API**. If Direct X / Direct Show is not installed on the target PC, these commands will not work. If you have a working Windows Media Player,on the system, then everything will work as expected. Generally all Audio-Formats, that are supported with the Windows Media Player, should work with this command also.

3.66.5 MPS. - Music Play Speaker

MiniRobotLanguage (MRL)

MPS. Command

Music Play through PC-Speaker

Intention

Note-setting command. Did you ever had the idea to compose a melody on your own? This is the way you can start.

The `MPS.`-command generates Beep-like Music-Signals, through the PC-Speaker. Frequency and Duration can be customized using musical symbols.

Its also useful for debugging. and to signal errors and system states without showing a text.

You have some sort of musical notation to input the sound.
Here is an example:

```
' Octave 1, Play a note, make a Pause, Play another Note
MPS.O1 A+ P A-

' Octave 4, Play a note, make a Pause, Play another Note,
Octave 1
MPS.O4 A+ P A-
```

Here is a larger example:

```
$$TOA=mnt120o4d7d9g9g9b9b9>d6<b5p9>
$$TOA=$$TOA+d7e9d9c9<b9>d9c6<a5p9d7d9f#9f#9a9a9>c6<a9a5p9
$$TOA=$$TOA+>d7e9d9c9<b9a9g3d9d9d9g6b5d9d9d9g6b5p9g7g9f#9f#
$$TOA=$$TOA+9e9e9d5d9d9d9f#6a7d9d9d9f#6a5p9>d7e9d9c9<b9a9g7p7d
$$TOA=$$TOA+9d9d9g6b7d9d9d9g6b5p9g7g9f#9f#9e9e9d5d9d9d9f#6a7d
$$TOA=$$TOA+9d9d9f#6a5p9>d7e9d 9c9<b9a9g3
MPS.$$TOA
ENR.
```

Some musical settings (`T,O,<,>,L,MN,MS,ML`) will stay persistent between multiple calls to the command as long as the script is running.

Syntax

MPS.P1

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 - (optional) - Sequence of musical notes and dates that form a melody.

Use these letters:

```
A,A+,A#
B-,B
C, C+, C#
D-, D, D+,D#
E-,E
F,F+,F#
G,G+,G#

P - fixed Pause
```

and the special letters

```
N - followed by value between 1 and 90 (Note)
T - followed by value between 32 and 255
(Takt)
L - followed by value between 1 and 64
(Length)
O - followed by value between 0 and 6 (Oct)
< - decrease Oct by following number
> - increase Oct by following number
```

and these symbols

```
MN,MS,ML
```

to write you own compositions.

Some musical settings (`T,O,<,>,L,MN,MS,ML`) will stay persistent between multiple calls to the command as long as the script is running.

Example

```
'**********************************
' MPS. Sample "Joy to the world"
'**********************************
$$TAO=mst255O2L2>DL4C#.L8<BL2A.L4GL2F#ED.
$$TAO=$$TAO+L4AL2B.L4B>L2C#.L4C#L2D.L4DDC#<BAA.
$$TAO=$$TAO+L8GL4F#>DDC#<BAA.L8GL4F#F#F#F#L8F#GL
$$TAO=$$TAO+2A.L8GF#L4EEEL8EF#L2G.
$$TAO=$$TAO+L8F#EL4D>L2DL4<BA.L8GL4F#GL 2F#EL1D
MPS.$$TAO
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
END.
```

Remarks

Use `PRR.` and `PRE.` to make your Melody play in the background.

Limitations:

-

3.66.6 SVL. - Set Volume

MiniRobotLanguage (MRL)

SVL. Command

Set the Soundcard/Mixer Volume (OS independent)

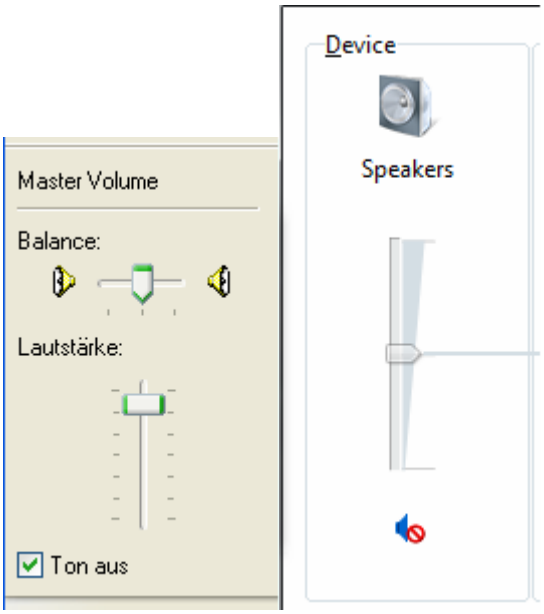
Intention

Get/Set the Soundcard/Mixer Master-Volume.
Get/Set the Mute-State of the Master- Volume.

Modes of operation:

1. Mute Master Volume

```
SVL.Set Mute|1
```



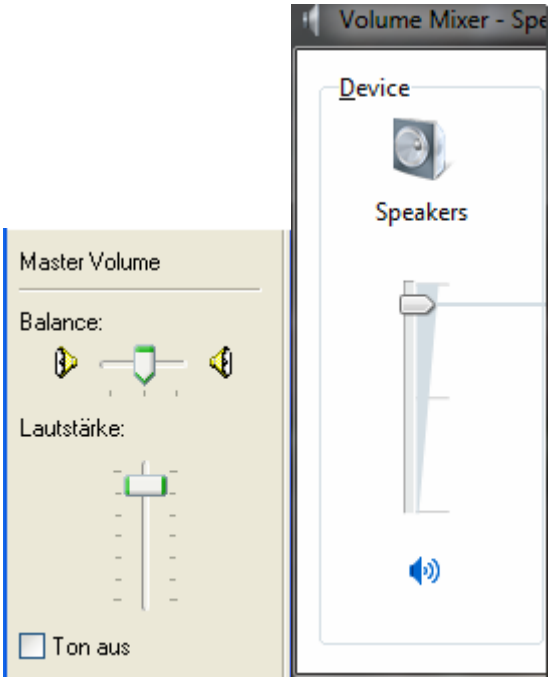
These two pictures show the result under XP (left picture) and Windows 7/x64 (right picture).
You will also get an `OK` on TOS. In case the operation would fail, you will get an error-message on TOS instead, and you will get the timeout-flag set, which is cleared otherwise.

```
------------------------------------
User-Stack-Dump:
------------------------------------
Stackpos: 000 ->String       :OK
------------------------------------
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

Now lets go the opposite way and UnMute the sytem.

```
SVL.Set Mute|0
```



And voila' the Sound is back!

2. You can find out, if a system is muted or not.

```
SVL.Get Mute|$$RES
DBP.$$RES
```

If you get a "`1`" back, the system is muted, otherwise you'll get a "`0`" in `$$RES`. And that means that the system is not muted, sound is ON.

3. You can get the Master Volume.

```
' Get the Master Volume
SVL.get master volume|$$RES
DBP.$$RES
```

No matter, if its XP or Windows 7, the result is always a number in the range from 0 to 100. About these numbers, 100 is always the maximum volume, and 0 is total silence.

4. Set/change the Master Volume:

```
' Set Master Volume to 95 (Range is 0 to 100)
SVL.Set Master Volume|95
```

as always you will get a "`OK`" on the TOS if the operation succeeds.

© 2023 Theo Gottwald * https://www.smart-package.com

So far, all commands are perfectly transparent between different windows OS.

The following commands may show different results between different OS.

5. Find out how many channels we can control:

```
SVL.get channel count|$$RES
DBP.$$RES
ENR.
```

The result may be different between XP and higher Windows versions.

For Windows XP, I get the following Results. This may be slightly different on your actual system, depending on the availability of such Sound-Hardware.

```
Channel 1: Master Volume
Channel 2: Wave Volume
Channel 3: CD Volume
Channel 4: SW Synthesizer
Channel 5: Front Speaker
```

In Vista/Windows 7 and higher you should actually avoid these functions, as the result is unpredictable.

6. Get Channel Volume

```
' Get Volume from Channel No. 2
SVL.Get Channel Volume|2|$$RES
DBP.$$RES
```

7. Set Channel Volume

```
' Set Volume from Channel No. 2
SVL.Set Channel Volume|2|55
DBP.$$000
```

8. Get Channel Mute

```
SVL.Get Channel Mute|2|$$RES
DBP.$$RES
```

9. Set Channel Mute

```
SVL.Set Channel volume|2|1
DBP.$$RES
```

"1" will Mute the Sound-Channel, while "0" will UnMute the Sound-Channel.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

SVL.P1|P2[|P3][|P4]

Parameter Explanation

P1 - Subcommand - choose any of the following Subcommands. This will specify what to do:

"gm","get mute" - use P2 for the Result (Variable)
"sm","set mute" - use P2 for the Value (1 - Mute / 0 - UnMute)

"gmv","get master volume" - use P2 for the Result (Variable)
"smv","set master volume" - use P2 for the Volume Value

"gc","get channel count" - use P2 for the Return Value (Variable)

' Avoid the following Subcommands under Vista and higher OS.

"gcv","get channel volume" - use **P2** for the channel number and
P3 for the Return Value (Variable)

"scv","set channel volume" - use **P2** for the channel number and
P3 for the Volume Value.

"gcm","get channel mute" - use **P2** for the channel number and
P3 for the Return Value (Variable)

"scm","set channel mute" - use **P2** for the channel number and
P3 for the Mute State (1 - Mute / 0 - UnMute)

P2 - (optional) - additional Parameter, depending on the used Subcommand.
P3 - (optional) - additional Parameter, depending on the used Subcommand.

Example

```
'**********************************
' Mute Volume-Sample
'**********************************
' Mute the PC
SVL.Set Mute|1

' UnMute the PC
SVL.Set Mute|0
END.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

The major functions like "**Mute/UnMute**", "Set Master Volume" etc. are expected to work transparently on any windows OS. From Windows 2000 to Windows 8. If the operation succeeds, you will find an "OK" on TOS. Otherwise an error message.

Limitations:

See the comments about which functions to avoid, if using an Vista or higher windows version.

3.67 NT Service commands

3.67.1 !Service Commands

NT Service Command codes Previous 2539 Top 41 Next 2550

MiniRobotLanguage (MRL)

Service Command codes

Manage NT Services

General Information about the Service commands

The service command(s) need a service name to specify the service we want to deal with.
A service has two names:

1. the "display name" (dn:) - that is the name you see in the service manager console

2. the "service name" (sn:) - that is the name you can see in the service properties, only.

You can see an example in the picture below.

© 2023 Theo Gottwald * https://www.smart-package.com

Generally we are using the "service name" for all service commands.
If you prefer to specify a "display name" 8or a part of it), prefix it with a "dn:".

Then the command will internally try to find the matching service name for that service.

You do not need to specify the full "service-name" or "display-name". You can use the
3.2 Standard-Search Pattern 341
to specify the name of the service.

To make clear, which service name you are using, you can prefix it with:

"**dn:**" if the "display-name" is been specified
or
"**sn:**" if you have specified the "service name".

As noted, all commands use the "Standard search patterns", therefore you can just give a unique part of the service name or specify a pattern. Here are some examples:

If you use:

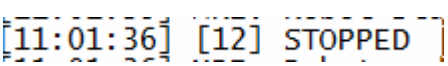
```
SER.grs|bitlock
DBP.$$000
```

the service will place an error message on TOS, that is "`Error: No such service.`".
You can see the Error-Message in the Debug-Output of the Editor. The reason is, that "bitlock" is a part of the "display name" of the service, but generally we search for the "service name". And for the "Bitlocker Service", the proper "service name" is "`BIDESVC`" as you can see above.

Therefore we could specify:

```
SER.grs|BDESVC||$$RES
DBP.$$RES
```

and would get the proper result:



if that service is available and actually stopped. Of course we could also use the "display name", if we prefix it with a "dn:" and write:

© 2023 Theo Gottwald * https://www.smart-package.com

```
SER.grs|dn:bitloc||$$RES
DBP.$$RES
```

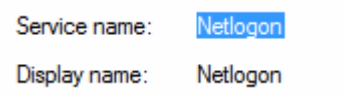
which will also get the expected result ("STOPPED").

As you can see, there is no need to type the whole, complete service name, as we can use the Search Pattern Engine here. That is why "bitloc" in the above example will work just fine.

Here are two things you should take care for:

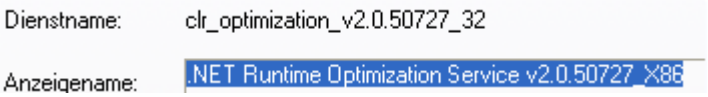
1. On international computers the "display name" of a service may differ from country to country. For example, the "Netlogon" Service shows up on a german computer as

where it shows up on a english system as expected:



Therefore prefer to use the "service name" whenever your script may touch international clients computers.

2. Make sure that the search pattern, that you specify will really hit the proper service. Therefore specify the target service as close as possible. The good thing about the Pattern Engine is, that you can omit version information that are really obsolete, for example, see the picture below.



You could use "`clr_optim&ANDTHEN:v2.`" to specify such a service using a pattern. Like this:

```
SER.dnf|clr_optim&ANDTHEN:v2.||$$RES
DBP.$$RES
```

and you will get the expected result.

To verify if a service is available or running is one thing, and it will most often be done using the `ISC.` command. To change service attributes or to restart a service is the main job of the `SER.` command.

What about "state groups"?

© 2023 Theo Gottwald * https://www.smart-package.com

Imagine you want to start a service and therefore you want to check if the service is already running. You can do that in several ways. Now you check if the state of the service is "run" and its not. Are you going to run that service next?
What if the state of the service was "start pending" which is as good as "run" but is in fact another state?

To solve this issue, we have so called state groups for some instructions.
These have only 3 states, which are represented by 3 numeric values:

```
"stop","stopped","stop pending"                                  =
1
"running","run","start pending","continue pending"          = 4
"pause","paused","pause pending"                                 = 7
```

Using these you can easily check, if you really need to start or stop or continue a service.

"Run States" to set using

```
SER.set run state|(Service name)|(target state number)

START SERVICE                = 0
STOP SERVICE                 = 1
PAUSE SERVICE                = 2
CONTINUE SERVICE             = 3
UPDATE SERVICE MANAGER       = 4
```

"Run States" as in return from

```
SER.get run state numeric|(Service name)|$$RES

STOPPED          = 1
STARTING         = 2
STOPPING         = 3
RUNNING          = 4
CONTINUE PENDING = 5
PAUSE PENDING    = 6
PAUSED           = 7
UNKNOWN          = any other number
```

Some commands, like ISC. / NSC. support textual state, these are:

```
"stop","stopped"       = 1
"start pending"        = 2
"stop pending"         = 3
"running","run"        = 4
"continue pending"     = 5
"pause pending"        = 6
"pause","paused"       = 7
```

Some commands support textual state and a "state group":

```
"stop","stopped","stop pending"                                  =
1
"running","run","start pending","continue pending"          = 4
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
"pause","paused","pause pending"                              = 7
```

Possibly Actions to take an Service failure:

```
SC_ACTION_NONE                = 0
SC_ACTION_RESTART             = 1
SC_ACTION_REBOOT              = 2
SC_ACTION_RUN_COMMAND         = 3
```

Service-Types

```
SER.gst|rasaut|$$RES

SERVICE_KERNEL_DRIVER                = 1
SERVICE_FILE_SYSTEM_DRIVER           = 2
SERVICE_ADAPTER                      = 4
SERVICE_RECOGNIZER_DRIVER            = 8
SERVICE_DRIVER                       = 11
SERVICE_WIN32_OWN_PROCESS            = 16
SERVICE_WIN32_SHARE_PROCESS          = 32
SERVICE_WIN32                        = 48
SERVICE_INTERACTIVE_PROCESS          = 256
SERVICE_TYPE_ALL                     = 319
```

Service Start Modes

```
SERVICE_AUTO_START      (Automatisch)      = 2
SERVICE_DEMAND_START    (Manuell)          = 3
SERVICE_DISABLED        (Deaktiviert)      = 4

also these two states which are in the SM not available,
and may not work with most services:

SERVICE_BOOT_START                         = 0
SERVICE_SYSTEM_START                       = 1
```

Textual Service Start Modes

```
(parsing is NOT case-sensitive)

"Auto","Auto Start","Automatisch"          = 2
"Demand","on Demand Start","Manuell"       = 3
"dis","Disabled","Deaktiviert"             = 4
"boot","Boot Start"                        = 0
"system","System Start"                    = 1
```

Example

```
'*********************************
' SER.
'*********************************
SER.dnf|yaho||$$RES
DBP.$$RES
SER.snf|yaho||$$RES
DBP.$$RES
```

3.67.2 FES. - For Each Service

MiniRobotLanguage (MRL)

FES. Enumeration Command

For each Service

Intention

Enumerate system services. Using `FES.` your Skript can go "through all services" and check them "one by one" for whatever conditions you want.

Syntax

FES.P1|P2[|P3][|P4][|P5]

Parameter Explanation

P1 - Label where the for each will jump "for each element"
P2 - Temp. Variable, updated by FEX each round.
P3 - ***(optional)*** Flags:
"a" - enum and pattern by display name, else use service name
"b" - enum **SERVICE_RUNNING**
"c" - enum **SERVICE_STOPPED**
"d" - enum **SERVICE_PAUSED**
"e" - enum ***SERVICE_CONTINUE_PENDING***
"f" - enum ***SERVICE_STOP_PENDING***
"g" - enum ***SERVICE_PAUSE_PENDING***
"h" - enum ***SERVICE_START_PENDING***

You can use any combination of the above flags. The flags can be given in any order.

P4 - ***(optional)*** optional Standard Search Pattern
P5 - ***(optional)*** PC-Name, if omitted local machine is used.

Example

```
'*********************************************
' FES. usingtwo flags
'*********************************************
'
FES.doit|$$TXT|ac
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.

:doit
DBP.$$TXT
RET.
ENR.
```

Remarks

`FEM.` is a Member of the FEX-Family "For Each X". They are used for easy enumeration

Limitations:

-

3.67.3 ISC. - If Servic Condition

MiniRobotLanguage (MRL)

ISC. Conditional Statement

If Service Condition

Intention

This command can be used to manage System Services. You can check almost all conditions of system services. If they are installed, running or not. You can check the Starting Mode of a service and much more.

To specify a service you will need to give the "service name". Please see
How to get the proper service name 2544
on which choices you have to specify the service you want to deal with, in a way that it will really work for you, as expected.

ISC. / NSC. support textual state, these are:

```
"stop","stopped"        = 1
"start pending"         = 2
"stop pending"          = 3
"running","run"         = 4
"continue pending"      = 5
"pause pending"         = 6
"pause","paused"        = 7
```

If you use textual Run-States please do only specify one Run-State.
If you use numeric run-states, you can specify multiple Run-States.
For example:

```
   ISC.sta|dn:yah||2,4,3
but
   ISC.sta|dn:yah||running
```

Syntax

ISC.P1|P2[|P3][|P4][|P5]

Details of the parameters depend on the used Subcommand, see below.

Parameter Explanation

P1 - Subcommand

' Check the "running state" of a service
`"sta" or "state" or "any state"`

© 2023 Theo Gottwald * https://www.smart-package.com

Evaluate, if the "running state" of the service **P2 (you must specify the service name)**
is equal to the state given in **P4**. For P4, you can specify a numeric value or a textual
parameter like these: !Service Commands 2544
You can specify multiple values if they are separated with ",", like this:

```
 ISC.sta|dn:yah||2,4,3

' Example:
ISC.sta|dn:yah||stop
   DBP.Service is stopped.
ELS.
   DBP.Service is not stopped
EIF.

ISC.sta|dn:yah|||2,4
```

' Check the "running state group" of a service
"stg" or "state group"
Evaluate, if the "running state" of the service **P2 (you must specify the service name)**
is equal to the state given in **P4**. For **P4**, you can specify a numeric value or a textual
parameter, details see !Service Commands 2544

```
' Examples:
ISC.stg|dn:yah||stop
   DBP.Service is stopped or stop is pending.
ELS.
   DBP.Service is not stopped, and stop is not pending
EIF.
```

' Check for multiple "running state" of a service
"ans" or "any state"
Evaluate, if the "running state" of the service **P2 (you must specify the service name)**
is equal to the state given in **P4**. For P4, you can specify a numeric value or a textual
parameter like these: !Service Commands 2544

```
' Examples:
' Service may not have any of these states
NSC.ans|dn:yah||2,3,4
   DBP.Here
EIF.

' Service should have any of these states
ISC.ans|dn:yah||2,3,RUN
   DBP.Here
EIF.
```

' Check the start mode of a service

© 2023 Theo Gottwald * https://www.smart-package.com

```
  "sm" or "start mode"
```
Evaluate the "Start Mode" of a specified service and compare with a specified start-Mode **P4**. **P4** can be a number from 2 to 4 or a phrase.
See a list of all numbers, phrases and their meanings here: !Service Commands 2544

```
  ' Examples:
ISC.sm|dn:yah||demand
   DBP.Start Mode is "on demand"
ELS.
   DBP.Start Mode is not "on demand"
EIF.
DBP.$$000
ENR.
```

Further tests:

```
"run","running"
Test if Run State is 4 (RUN)
ISC.run|NetLog

"stop","stopped"
Test if Run State is 1 (STOP)
ISC.stop|bdsvc

"pau","paused"
Test if Run State is 7 (PAUSE)
ISC.pau|servicename

"dis","disabled","deaktiviert"
Test if Start-Mode is 4 (disabled)
ISC.dis|Logon

"auto","automatisch","autostart"
Test if Start-Mode is 2 (AUTO)
ISC.auto|sn

"manuell","demand","on demand"
Test if Start-Mode is 3 (on demand)
ISC.demand|sn

"pen","pending"
Test if the service Run State is in any
"Pending State". These are any of the states:
 "Start pending", "Stop pending", "Continue pending" or
"Pause pending".
ISC.pen|sn

"pen-sta","start pending"
Test if the service is "Start pending" or "Continue pending"
ISC.pen-sta|sn

"pen-sto","stop pending"
Test if the service is "Stop pending" or "Pause pending"
ISC.pen-sto|sn
```

***P2* - Service-Name**

© 2023 Theo Gottwald * https://www.smart-package.com

P3 - Computer-Name or empty. In that case the local computer is used.

P4 - (optional) Meaning of P4 depends on used Subcommand.

What happens in case of an error?
If the specified service is not found, the Error-Message "Error: No such service." is been placed on TOS and the condition is evaluated to FALSE..
In case there are other errors during the processing of the command, the error-message is been placed on TOS and the condition is evaluated to FALSE.
The error-message will always be prefixed with an "Error: " to indicate that it is an error from the services-engine.
Here is an example for such an error-message:
"Error: The requested access to the services database was denied."

Example

```
'*********************************
' ISC.
'*********************************
ISC.sm|dn:yah||demand
   DBP.State is
ELS.
   DBP.State is not
EIF.
' Display Error if we got one
DBP.$$000
ENR.END.
'*********************************

'*********************************
' ISC.
' Error - will be displayed
'*********************************
ISC.sm|dn:yahs||demand
  DBP.State is
ELS.
  DBP.State is not
EIF.
' We'll see the error that the service does not exist.
DBP.$$000
ENR.
```

3.67.4 ISI. / NSI. - If Service Installed

MiniRobotLanguage (MRL)

ISI. Conditional Statement

If Service installed

Intention

This command can be used to verify if a System Services is installed. You can check if a service is available on a specified (local?) computer system.

To specify a service you will need to give the "service name". Please see
How to get the proper service name 2544
on which choices you have to specify the service you want to deal with, in a way that it will really work for you, as expected.

```
ISI.wsearch|mypc
   DBP.service is available
ELS.
   DBP.no such service on mypc
EIF.
' Display Error if we got one
DBP.$$000
ENR.
```

To uninstall a Service use the
`SER.uni|sn|pc-name`
command.

Syntax

```
ISI.P1[|P2]
NSI.P1[|P2]
```

Parameter Explanation

P1 **- Service-Name**

P2 **-** ***(optional) Computer-Name*** or empty. In that case the local computer is used.

What happens in case of an error?

*© 2023 Theo Gottwald * https://www.smart-package.com*

If the specified service is not found, the Error-Message "Error: No such service." is been placed on TOS and the condition is evaluated to FALSE..
In case there are other errors during the processing of the command, the error-message is been placed on TOS and the condition is evaluated to FALSE.
The error-message will always be prefixed with an "Error: " to indicate that it is an error from the services-engine.
Here is an example for such an error-message:
"Error: The requested access to the services database was denied."

Example

```
'*********************************
' ISI.
'*********************************
ISI.dn:yah
   DBP.service is available
ELS.
   DBP.no such service
EIF.
' Display Error if we got one

3.67.5 SER. - Service Command

MiniRobotLanguage (MRL)

SER. Command

Manage NT Services

Intention

This command can be used to manage System Services. You can start and stop services.
You can install and uninstall a Service. And you can check if they are running or not.
To specify a service you will need to give the "**service name**" (sn). You can also specify the "display name" (dn), if you prefix it with "**dn:**". Please see
How to get the proper service name 2544
on which choices you have to specify the service you want to deal with, in a way that it will really work for you, as expected.

Using the `SER.` - command, you can:

```
' Get the display-name of a service
 SER.dn from sn|sn|pc-name[$$RES]

' Get the service-name from the display name (or a part of it)
SER.sn from dn|sn|pc[|$$RES]

' Get the "Run-State" of a service
' See if its running, stopped or whatever.
' Result in Textform.
SER.get run state|sn|pc|$$RES

' Get the "Run-State" of a service
' See if its running, stopped or whatever.
' Result is numeric.
SER.get run state numeric|sn|pc|$$RES

' Set the "Run-State" of a service
' Start it, Stop it etc.
SER.set run state|sn|pc|$$RST

' Stop service "All"
' This command will stop a service and - if needed -
' all "dependend services", which could prevent the service
' from beeign stopped.
' This is very useful, in case you want to unistall a service.
SER.stop service all|sn|pc[|$$RES]

' Get "Start-Mode" of a service
' For a list of possible "Start Modes"
' see here:  !Service Commands 2544
SER.get start mode|sn|pc|$$RET
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Set "Start Mode" of a service
' For a list of possible "Start Modes"
' see here:  !Service Commands 2544
SER.set start mode|sn|pc|sm[||$$RES]

' Get "Service Type", get a technical Info on the type of a
service
' For a list of possible "Service Types"
' see here:  !Service Commands 2544
 SER.get_service_type|sn|pc[||$$RET]

' Restart a service
' On a "Restart", a service is been stopped first
' and then started again.
'
SER.restart service|sn|pc[||$$RES]

' Install a service
SER.inst|Apple2|$$PAT|appl

' Uninstall a service
' internally also stops the service and all dependend services
' like a SER.stop service all|sn|pc
SER.uninstall|sn:Apple2
```

Syntax

SER.P1|P2[|P3][|P4][|P5]

Details of the parameters depend on the used Subcommand, see below.

Parameter Explanation

P1 - Subcommand

' Evaluate the display name of a service
"dnf" or "dn from sn"
Evaluate the "display name" of the service **P2 (you must specify the service name)**
into variable **P3.**

```
' Examples:
 SER.dnf|sky
 SER.dnf|sky||$$RES
```

' Evaluate the service name of a service
"snf" or "sn from dn"
Evaluate the "service name" of the service **P2 (you must specify the display name)**
into variable **P3.**

```
' Examples:
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SER.snf|ya&AND:update
SER.snf|ya&AND:update||$$RES
```

' Evaluate the run state of a service with textual result

```
"grs" or "get run state"
```

Evaluate the "run state" of a specified service. You will get a result like "STOPPED" or "RUNNING". See a list of all states here:
!Service Commands 2544

```
' Examples:
SER.grs|BDESVC
SER.grs|BDESVC||$$RES
```

' Evaluate the run state of a service with numerical result

```
"grn" or "get run state numeric"
```

Evaluate the "run state" of a specified service. You will get a numeric result, that is a number from 1 to 7. See a list of all numbers and their meanings here:
!Service Commands 2544

```
' Examples:
SER.grn|BDESVC
SER.grn|BDESVC||$$RES
```

' Stop a service, and stop all dependend services

```
"sta" or "stop service all"
```

This command will stop (halt) a service.
If the service can not be stopped because there are dependant services still running, they will also be stopped.
This is your command for safely stopping a service.
It will be called internally before uninstalling a service, using "uninstall", to make sure the serivce is not running before Uninstallation.

```
SER.stop service all|sn|pc[||$$RES]
```

' Set the run state of a service, using a number (from list below)

```
"srs" or "set_run_state"
```

This command will stop or start a service. Use the value 0 to start a service.
The command will take care internally if a service is disabled, and do whatever is needed to start or stop the service, yet keeping it disabled. Means: Using this command, you can start a service, even though if its disabled.

```
' Start a service
SER.srs|dn:ya&AND:update||0
' Stop a service
SER.srs|dn:update||1
```

' Evaluate the start mode of a service with numerical result

```
"gsm" or "get start mode"
```

Evaluate the "Start Mode" of a specified service. You will get a numeric result, that is a number from 0 to 4. See a list of all numbers and their meanings here:
!Service Commands 2544

```
' Examples:
SER.gsm|dn:ya&AND:update
SER.gsm|dn:ya&AND:update||$$RES
```

© 2023 Theo Gottwald * https://www.smart-package.com

' Set the start mode of a service with numerical result

"ssm" or "set start mode"

Set the "Start Mode" of a specified service. Use a numeric code, that is a number from 0 to 4 to specify the startmode.See a list of all numbers and their meanings here:

!Service Commands 2544. The operation may provide a result of 0 = failure, or 1 = success.

```
' Examples:
' Disable the service
SER.ssm|dn:ya&AND:update||4
' Set startmode to AUTOMATIC START
' and get result of operation in Variable $$RES
SER.ssm|dn:ya&AND:update||2|$$RES
```

' Evaluate the service type of a service with numerical result

"gst" or "get service type"

This command will provide you with a technical info on the selected service.
The result will be in textual form. The example:

```
SER.gst|dn:ya&AND:update
```

will provide this: "SERVICE_WIN32_OWN_PROCESS".
See here for a list of possible results: !Service Commands 2544.

' Restart a service

"rst" or "restart service"

This command will end and then restart the selected service.
The result will be on TOS or in teh given variable. Here is an example:

```
SER.rst|dn:Netlog
SER.rst|dn:Netlog||$$RET
```

will restart the service like if you choose "restart" in the Menu of the service-management console. Using this command, you can restart a service, even if its *disabled*.

' Uninstall a service

"uni" or "uninstall"

This command will try to uninstall/kill the service with that name.
It will first try to stop the service and all dependend services.
This is a special feature. Use with caution and try usage first in a safe environment.

```
SER.uni|sn|pc-name
```

' Install a service

"inst" or "install"

This command will try to install the service with that name and executable.
This is a special feature, and there is no warranty that this will work as expected.
Use with caution and try usage first in a safe environment.
You can remove a installed service using the above "Uninstall service".
Therefore the command is somehow safe.
The newly installed service does not start automatically, use the SER. command to set its proper parameters.

© 2023 Theo Gottwald * https://www.smart-package.com

```
SER.inst|Service Display Name|Path of Service Exercutable|
Service Name[|PC-Name]
```

P2 **- Service-Name**

P3 **-** ***Computer-Name*** or empty. In that case the local computer is used.

P4 **-** ***(optional)*** `Variable for Result of Operation, if omitted TOS is used.`

What happens in case of an error?
If the specified service is not found, the Error-Message `"Error: No such service."` is been placed on TOS.
In case there are other errors during the processing of the command, the return variable will be empty and the error-message is been placed on TOS.
The error-message will always be prefixed with an "`Error: `" to indicate that it is an error from the services-engine.
Here is an example for such an error-message:
`"Error: The requested access to the services database was denied."`

Example

```

```

Remarks

-

Limitations:

In some cases the SER.-Command will lead to a program crash. In this case you can fix the problem using

```
SER.srs|WEBZES_SERVER_NODE_01||0
```

instead use

```
EXC.?path\Service_start.bat|?path\
WPT.#pid#
```

Inside the batch file use

```
net start servicename
```

or

```
sc config servicename start= auto
```

3.67.6 WSC. - Wait Service Command

MiniRobotLanguage (MRL)

WSC. Wait for Command

Manage NT Services

Intention

This command can be used to manage System Services. You can wait until they are running or stopped. You can even wait for the Starting Mode of a service and much more.

To specify a service you will need to give the "service name". Please see
How to get the proper service name 2544
on which choices you have to specify the service you want to deal with, in a way that it will really work for you, as expected.

Syntax

WSC.P1|P2[|P3][|P4][|P5]

Details of the parameters depend on the used Subcommand, see below.

Parameter Explanation

P1 - Subcommand

' Wait for a specified "running state" of a service
"sta" or "state"
Wait until a service is paused, started or stopped. The command checks if the service
has the "running state" that is specified in **P4**. For **P4**, you can specify a numeric value
or a textual parameter like these: !Service Commands 2544
You can specify multiple values if they are separated with "," like this:

```
WSC.sta|dn:yah|||stop,stop pending
```

```
 ' Examples:
' Wait unlimited time until service is stopped
 WSC.sta|dn:yah||stop

' Wait 60 seconds time until service is started
 WSC.sta|dn:yah||start
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Check timeout flag
  JIT.error
```

' Wait for a specified "running state group" of a service
"stg" or "state group"
Evaluate, if the "running state" of the service **P2 (you must specify the service name)**
is equal to the state given in **P4**. For **P4**, you can specify a numeric value or a textual
parameter, details see !Service Commands 2544

```
' Examples:
WSC.stg|dn:yah|||stop
```

' Wait for any of multiple "running state" of a service
"ans" or "any state"
Evaluate, if the "running state" of the service **P2 (you must specify the service name)**
is equal to the state given in **P4**. For P4, you can specify a numeric value or a textual
parameter like these: !Service Commands 2544

```
' Examples:
' Service may not have any of these states
WSC.ans|dn:yah|!|2,3,4

' Service should have any of these states
WSC.ans|dn:yah||2,3,RUN
```

' Wait for a specified start mode of a service
"sm" or "start mode"
Evaluate the "Start Mode" of a specified service and compare with a specified start-Mode **P4**. **P4** can be a number from 2 to 4 or a phrase.
See a list of all numbers, phrases and their meanings here: !Service Commands 2544

```
' Examples:
WSC.sm|dn:yah|||demand
```

Further tests:

```
"run","running"
Wait until  Run State is 4 (RUN)
WSC.run|NetLog

' Wait until service is NOT running
WSC.run|yah||!

"stop","stopped"
Test if Run State is 1 (STOP)
WSC.stop|bdsvc

"pau","paused"
Test if Run State is 7 (PAUSE)
WSC.pau|servicename
```

© 2023 Theo Gottwald * https://www.smart-package.com

"dis","disabled","deaktiviert"
Test if Start-Mode is 4 (disabled)
WSC.dis|Logon

"auto","automatisch","autostart"
Test if Start-Mode is 2 (AUTO)
WSC.auto|sn

"manuell","demand","on demand"
Test if Start-Mode is 3 (on demand)
WSC.demand|sn

"pen","pending"
Test if the service Run State is in any
"Pending State". These are any of the states:
"Start pending", "Stop pending", "Continue pending" or
"Pause pending".
WSC.pen|sn

"pen-sta","start pending"
Test if the service is "Start pending" or "Continue pending"
WSC.pen-sta|sn

"pen-sto","stop pending"
Test if the service is "Stop pending" or "Pause pending"
WSC.pen-sto|sn

***P2* - Service-Name**

P3* - *Computer-Name or empty. In that case the local computer is used.

P4* - *(optional) Waiting time in seconds, if prefixed with a "!", the command will wait for NOT the given condition.

```
' Wait 10 seconds for service to become disabled
WSC.sm|yah||10|dis

' Wait 10 seconds for service to NOT be disabled
WSC.sm|yah||!10|dis
```

P5* - *(optional) Meaning of P4 depends on used Subcommand.

What happens in case of an error?
If the specified service is not found, the Error-Message "Error: No such service." is been placed on TOS and the condition is evaluated to FALSE..
In case there are other errors during the processing of the command, the error-message is been placed on TOS and the condition is evaluated to FALSE.
The error-message will always be prefixed with an "Error: " to indicate that it is an error from the services-engine.
Here is an example for such an error-message:
"Error: The requested access to the services database was denied."

© 2023 Theo Gottwald * https://www.smart-package.com

If an timeout occurs, the timeout flag will be set and the script will continue its operation.
You can check the timeout-flag with the `ITO./NTO.` or the `JIT./JNT.` commands, or use the `#tio#` System-Variable 334.

Example

```
'*********************************
' WSC.
'*********************************
WSC.sm|dn:yah|30|demand
ITO.
   DBP.Timeout occured
ELS.
   DBP.things happened in time
EIF.
' Display Error if we got one
DBP.$$000
ENR.END.
'*********************************
```

Remarks

3.68.2 ADV. - Get Advanced Operator Privilege

MiniRobotLanguage (MRL)

ADV. Command

Get ADVanced Operator Privilege

Intention

This command gives and releases advances (systemcritical!) Privileges to the Robot.

Use command „CPR“ together with command „ADV“ to be able to close every process, including critical system-processes.
Please **be careful by using** this command, or else you may crash the system and damage files on your harddisk, or loose them forever.

Syntax

ADV.[Privilege]

Parameter Explanation

P1 - Privilege(s)
If P1 is omitted (empty) then the Privileges to close any Process are given (same as "k").
otherwise P1 must be a String of these letters:

```
b - Backup/read all files
c - Changenotify
d - ShutDown
e - remote Shutdown
f - Increase Quota
g - Systemtime "SeSystemtimePrivilege"
h - TimeZone "SeTimeZonePrivilege"
i - SystemEnvironment "SeSystemEnvironmentPrivilege"
j - "SeCreateSymbolicLinkPrivilege"
k - Killprocess "SeDebugPrivilege"
r - "SeRestorePrivilege"
s - "SeSecurityPrivilege"
t - "SeTakeOwnershipPrivilege"
u - "SeRelabelPrivilege"
v - "SeManageVolumePrivilege"
```

Example

```
'**********************************
' ADV.-Demo
'**********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Takeover Backup Privileges
ADV.b
' Result of the Operation is on the stack 0/1
DMP.6
MBX.Ready

'-------------------------------------------------------------
ENR.

'**********************************
' ADV.-Sample 2
'**********************************
' Takeover multiple Privileges in one command
ADV.brts
' Result of the Operation is on the stack 0/1
DMP.6
MBX.Ready

'-------------------------------------------------------------
ENR.
```

Remarks

Using this command you will be able to close any, even critical system-processes.
Please do not experiment with this command, as it may damage files on your harddisk and crash your system.
This command removes system-critical windows-protections and should only be used where you are sure you have to do.

3.68.3 CPL. - Control-Panel

MiniRobotLanguage (MRL)

CPL. Command

Control Panel

Intention

This command will start Applets from System's Control panel.

Syntax

CPL.[P1]

Parameter Explanation

There are three way to use CPL.

1. CPL. without any parameter calls the System Control Panel itself.
2. CPL. #XY (XY= any Number from 1 to 111) calls System-Applets.
3. CPL. Name-of-Aplett

Not all CPL's which are accessible via numeric parameter are also accesible via string-parameter nd vice versa.

Possible string parameters include following german and english words.
The interpreter tries to find the closest match in case you misspelled a word.

```
CPL. my computer

- "my computer","arbeitsplatz"
- "audio","audio"
- "screensaver","bildschirmschoner"
- "borland","borland"
- "appearence","darstellung"
- "date/time","Datum/Zeit"
- "dun","DFUE"
- "printer","Drucker"
- "accessibility","Eingabehilfen"
- "settings","Einstellungen"
- "exchange","exchange"
- "hardware","hardware"
- "background","Hintergrund"
- "infrared","Infrarot"
- "internet","internet"
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
- "joystick","joystick"
- "sounds","Klaenge"
- "countries","Laender"
- "mouse","maus"
- "midi","midi"
- "modem","modem"
- "multimedia","multimedia"
- "music cd","Musik Cd"
- "network","Netzwerk",
- "odbc","odbc"
- "folder",ordner"
- "pcmcia","pcmcia"
- "power","energie"
- "scanner","scanner"
- "systemfonts","Schriftarten"
- "scsi","scsi"
- "setup","setup"
- "software","software"
- "system","system"
- "keyboard","Tastatur"
- "phone","Telefon"
- "video","video"
- "manager","manager"

3.68.4 GEN. - Get-EXE-Number

MiniRobotLanguage (MRL)

GEN. Command

Get Exe Number

Intention

Get the number of times an EXE-File is actually being executed.

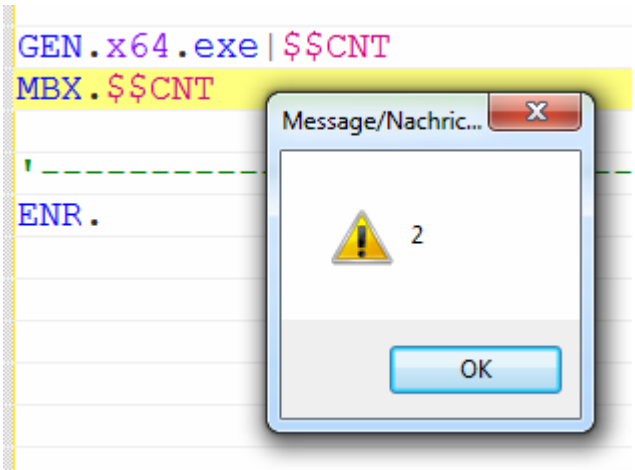
Assume there are two x64.exe running. The task-manager will show them:

x64.exe	1768	Admin	00	1.764 K	x64
x64.exe	1780	Admin	00	1.760 K	x64

Then you call the script:

```
GEN.x64.exe|$$CNT
MBX.$$CNT
ENR.
```

and you get this result (see picture below).



Syntax

GEN.[P1][|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **-** Filename with or without path, pattern possible
P2 **-** Variable to return the result

Example

```
'***********************************
' GEN.-Demo
'***********************************
GEN.x64.exe|$$CNT
MBX.$$CNT
END.
```

Remarks

x64 tested.

Limitations:

-

3.68.5 GEP. - Get-Executable-Path

MiniRobotLanguage (MRL)

GEP. Command

Get Executable Path

Intention

Returns the Path of Applications for registered File-Extensions like ".txt" or ".doc" etc.
The given parameter is a filename, however the file does not need to exist.
The given filename needs an valid three letter File-Extension at its end.

Usage is as simple as:

```
: §§FIL=?desktop\MyWord.doc
GEP.§§FIL|§§PAT
DBP.The executable Path for .DOC-files is:$crlf$ §§PAT
ENR.
```

The result will look somehow like this:

```
[22:01:44] [15] The executable Path for .DOC-files is:
 C:\Programme\Microsoft Office\OFFICE11\WINWORD.EXE
[22:01:44] MRE: Robot ended: test.mrt
```

This way you can find out, which program is registered on a target system to a file-extension. Try this on your system:

```
: §§FIL=MyWord.html
GEP.§§FIL|§§PAT
DBP.The executable Path for .html-files is:$crlf$ §§PAT
' You can use the result with other commands.
EXE.§§PAT|www.fa2.de
ENR.
```

Syntax

GEP.P1[|P2]

Parameter Explanation

P1 - Document-Filename (can't be a hyperlink)
P2 - Variable for Executable-Path. If omitted Result
will be put on TOS

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'************************************************
' Example 1 - GEP.
'************************************************
GEP.?desktop\MR.txt
' Write output in Editor-Debug Area
DBP.The executable Path for Text-files is: $crlf$
$tos$
MBX.Ready
END.
'************************************************
' Example 2 - GEP.
'************************************************
' Variables and specialfolder can be used
: §§FIL=MyWord.html
GEP.§§FIL|§§PAT
DBP.The executable Path for .html-files is:$crlf$
§§PAT
EXE.§§PAT|www.fa2.de
ENR.
```

Remarks

3.68.6 GII. - Get-Installation-Information

MiniRobotLanguage (MRL)

GII. Command

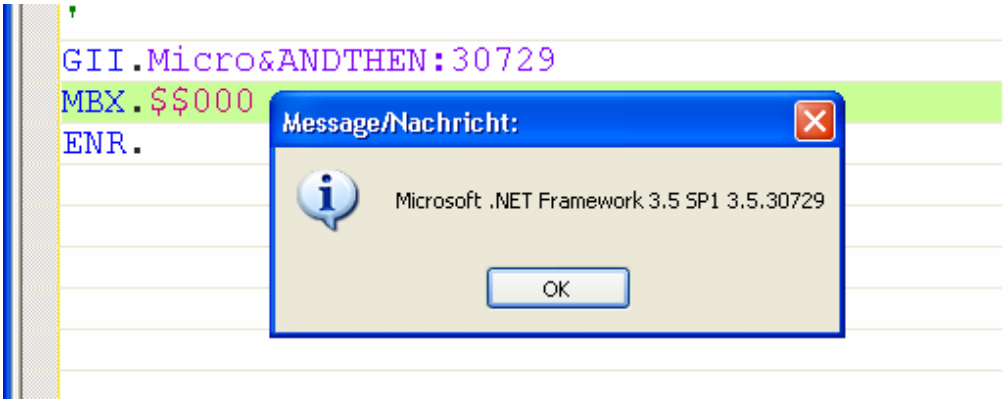
Get Installation Information

Intention

This command can be used to get the Uninstall-String for a specified application.

To find out if the application is installed, use `IAI.` See `IAI.` for more details.

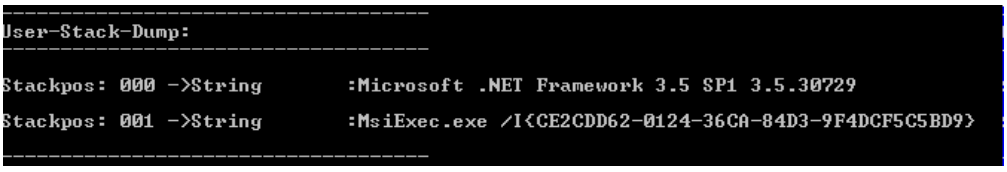
It will retrieve the complete Application name or the requested uninstall information, if they are available.



The following Script will retrieve the "modify String" of the MS Framework with the given Version-Number:

```
GII.Micro&ANDTHEN:30729|m
DMP.6
ENR.
```

This is the result on the Stack:



If we try this (note the "`|s`" at the end:

```
GII.Micro&ANDTHEN:30729|s
DMP.6
```

the the stack will be empty, because there is no silent Uninstallation for this patch. We can use a variable instead of the stack.

© 2023 Theo Gottwald * https://www.smart-package.com

```
GII.Micro&ANDTHEN:30729|$$RES|u
DBP.$$RES
ENR.
```

Andthe result is:

```
[12] Microsoft .NET Framework 3.5 SP1 3.5.30729
```

while the uninstall string itself will be on the stack.

```
-----------------------------------
User-Stack-Dump:
-----------------------------------
Stackpos: 000 ->String       :MsiExec.exe /I{CE2CDD62-0124-36CA-84D3-9F4DCF5C5BD9}
-----------------------------------
```

The command works transparently with both x32 and x64 applications.

Standard-Search Pattern 341 can be used.

Syntax

GII.P1[|P2][|P3]

Parameter Explanation

P1 – Application to test if installed
P2 – Variable for Result if found.
P3 - letter specifies what to look for.

s - return command-line for silent Uninstallation
u - return command-line for standard Uninstallation.
m - return command-line for standard Modify-Path (Add-/Remove Setup)
a - return Standard Application Name

Example

```
'*********************************************
' IAI./GII. - Sample
'*********************************************
'DBM.2
PRT.=================================================
IAI.office
 VAR.§§APP=$$000
 PRT. §§APP is installed.
ELS.
 PRT. No such Application installed.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EIF.
PRT.=====================================================
IAI.office|m
  VAR.§§APP=$$000
  PRT. §§NAM can be modified like this:$crlf$ §§APP
ELS.
  PRT. Application is not installed or cannot be modified.
EIF.
PRT.=====================================================
END.
```

Remarks

The command works transparently with both x32 and x64 applications.
Technically the command reads the registry:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Uninstall\
```

to get these information.

`IAI.` as well as `GII.` as well as "InstaRec" build the Name of the Program using a Combination of the "`DisplayName`" and the "`DisplayVersion`" Properties. Therefore you can more easily separate which Software you want to deal with.

Limitations:

This command looks for standard information details at:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Uninstall\
```

If the application being tested for installation did not register this information, the command will not be able to retrieve installation information.

See also:

GEP. - Get-Executable-Path 2582

3.68.7 GLI. - Get Language ID

MiniRobotLanguage (MRL)

GLI. Command

Get User or system LanguageID

Intention

This command will get the language settings of the current user or system. Usage is simple:

```
' Will place the current users language settings on the TOS
GLI.
DBP.$$000
```

May print something like this:

```
12:14:14] [9] 1031
```

In the Editors debug window, if you are running on a german system.
To get deeper into international settings, you can supply parameters.
In fact, what is a german system?

You can supply a variable for the result:

```
GLI.u|$$RET
DBP.$$RET
ENR.
```

If you need a very detailed locale, prefer using options `c` or `d`.

Where is the difference between these settings?

If you take a german windows and you set the Regional Format to Switzerland like this:

 © 2023 Theo Gottwald * https://www.smart-package.com

then you will get the following results:

```
' It uses german unicode settings
GLI.s
DBP.$$000
' result is 1031

' This shows you that its set to swiss
GLI.u
DBP.$$000
' result is 2055
```

Here is a table with some language-id's.

1025	Arabic	1041	Japanese
1028	Chinese - Traditional	1042	Korean
1029	Czech	1043	Dutch
1030	Danish	1044	Norwegian
1031	German	1045	Polish
1032	Greek	1046	Portuguese - Brazilian
1033	English	1049	Russian
1034	Spanish	1053	Swedish
1035	Finnish	1054	Thai
1036	French	1055	Turkish
1037	Hebrew	2052	Chinese - Simplified
1038	Hungarian	2070	Portuguese
1040	Italian	3076	Chinese - Hong Kong SAR

You can find a more complete list with Language-ID's here:
Language-ID's

Important:
To check if a system is of a specified language,
`ILI.`
is the command of your choice.

Syntax

GLI.[P1][|P2]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - (optioal) defines the method which is used to get the Language ID.

U - Returns the language identifier for the current user locale.That is the Format settings (for date, time, currency, etc.) of current user in Regional and Language Options in Control Panel.
This is the default option is no letter is specified.

S - Returns the Language Identifier for the system locale. In fact you get the is the "Language for Non-Unicode programs" of current user.

C - an alternative system is used to get the Language ID for user. This supports more international properties providing a more culturally appropriate user experience.

d - an alternative system is used to get the Language ID for the system (d), This supports more international properties providing a more culturally appropriate user experience.

P2 - (optioal) Variable for the result. If omitted, TOS is used.

Example

```
'-----------------------------
'
'-----------------------------
GLI.d|$$RET
DBP.$$RET
ENR.
```

Remarks

You can find a more complete list with Language-ID's here:

3.68.8 GOS. - Get OS Information

MiniRobotLanguage (MRL)

GOS. Command

Get Operation System Information

Intention

Get numerical and textual information about the Operating System on which the script is actually running.

```
GOS.
STS.DUMP
MBX.Ready
```

will leave the following Information on the TOS if it runs on Windows XP:

```
------------------------------------
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->String       :Windows XP

Stackpos: 001 ->String       :Service Pack 3

Stackpos: 002 ->String       :01-16-2012     09:47:58
OsString =      Windows XP
OsLong =       9
     dwMajorVersion =       5
     dwMinorVersion =       1
OsFamilyString =      Windows NT, 3 = NT 3/3.1, 4 = NT, 5 = 2000/XP/2003 Server, 6 = Vista and Windows 7
OsFamilyLong =       2
     dwPlatformId =       2
dwBuildNumber =       2600
Build Name =
Service Pack =      Service Pack 3
Os Is 64 bit =       0

Stackpos: 003 ->LongInt      :9

------------------------------------
```

If the same script runs on **Windows 7/x64** the stack 369 will look like this:

```
------------------------------------
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->String       :Windows 7

Stackpos: 001 ->String       :

Stackpos: 002 ->String       :01-17-2012     22:46:21
OsString =      Windows 7
OsLong =       12
     dwMajorVersion =       6
     dwMinorVersion =       1
OsFamilyString =      Windows NT, 3 = NT 3/3.1, 4 = NT, 5 = 2000/XP/2003 Server, 6 = Vista and Windows 7
OsFamilyLong =       2
     dwPlatformId =       2
dwBuildNumber =       7600
Build Name =
Service Pack =
Os Is 64 bit =       1

Stackpos: 003 ->LongInt      :12

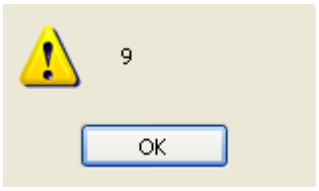
------------------------------------
```

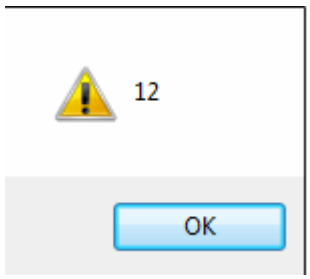
You can specify variables as parameters. In that case some of the information will be placed in these variables instead. Here is an example script:

```
GOS.$$NUM
STS.DUMP
MBX.$$NUM
```

© 2023 Theo Gottwald * https://www.smart-package.com

Again for windows XP, SP3 the stack will look just like before. However you get a value of 9 into the variable $$NUM. Now lets run the same script under Windows 7/x64. Again the stack is the same as before but you get a value of 12 (see right picture below) as numeric OS information.

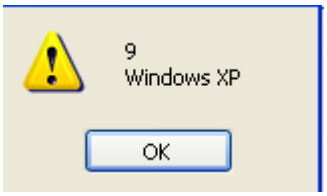


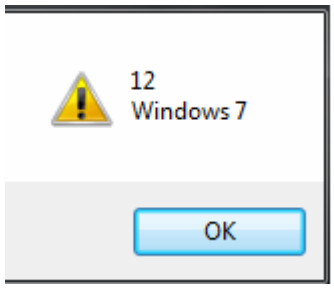


Lets see the last mode of operation, this is when we give two variables to GOS.

```
GOS.$$NUM|$$TXT
STS.DUMP
MBX.$$NUM$crlf$$$TXT
```

This is what we get for windows XP. And the picture on the right shows the result for Windows 7.





As we can see, the second variable contains the textual name of the operating system.

Syntax

GOS.[P1][|P2]

Parameter Explanation

P1 - Variable to take numeric OS-Information

You get these Numbers on the Stack/Var or in **P1:**

1 - Windows 3.1
2 - Windows 95
3 - Windows 98
4 - Windows ME

© 2023 Theo Gottwald * https://www.smart-package.com

```
 5  - Windows NT 3
 6  - Windows NT 3.1
 7  - Windows NT 4
 8  - Windows 2000
 9  - Windows XP
 10 - Windows 2003
 11 - Windows Vista
 12 - Windows 7
 13 - Windows 8
 14 - Windows 9
 15 - Windows 10

P2  - Variable to take textual OS-Information
```

Example

```
'*********************************************
' GOS-Example
'*********************************************
'
GOS.
PRT. OS-Version: $$000

GOS.$$NUM
PRT.numeric OS-information: $$NUM

GOS.-|$$TXT
PRT.Textual OS-information:$crlf$$$TXT

GOS.$$NUM|-
PRT.Textual OS-information:$crlf$$$000
PRT. Numerical Info: $$NUM

MBX.Klick me.
'-------------------------
END.
```

Remarks

To test if your script runs under a 64-bit OS, you can use the `IOS.x64` statement.

Limitations:

-

3.68.9 GSD. - Get Session Data

MiniRobotLanguage (MRL)

GSD. Command

Get Session Data (name and Info)

Intention

This command will get information about running OS Sessions. It may be of use especially for Windows Terminal servers. `GSD.` can return the number of sessions, as well as the name and state of a specified session ID.

`GSD.` may return one of these states for a given session ID:

```
0 -   User logged on to WinStation
1 -   WinStation connected to client
2 -   In the process of connecting to client
3 -   Shadowing another WinStation
4 -   WinStation logged on without client
5 -   Waiting for client to connect
6 -   WinStation is listening for connection
7 -   WinStation is being reset
8 -   WinStation is down due to error
9 -   WinStation in initialization
```

There are four way to use GSD.

1. `GSD.` without any parameter will place two values on TOS:

- the session identifier of the current physical console session on TOS.
- the number of sessions below TOS. Example:

```
GSD.
DBP.$$000
DBP.$$000
```

will return:under Windows XP (run from Editor)

```
0 - current Session ID
1 - total sessions on this machine
```

will return:under Vista and higher, for example (run from Editor):

```
1 - current Session ID
1 - total sessions on this machine
```

2. GSD. with one parameter, like this: `GSD.$$NUM`

© 2023 Theo Gottwald * https://www.smart-package.com

will return the session number in the given variable. Example:

```
GSD.$$NUM
DBP.$$NUM
```

3. `GSD.` with two parameters. Like this:

```
  GSD.session ID|$$RET
```

will return the run-state of the session with the given session id. Example:

```
GSD.0|$$RST
DBP.$$RST
```

4.GSD. with 3 parameters, like this:

```
GSD.session ID|$$RET|$$NAM
```

Will return the run-state as well as the session name of the session with the given session ID.

Syntax

GSD.[P1][|P2][|P3]

Parameter Explanation

P1 - ***(optional)*** **- Session ID,** if omitted the Session ID for the current session is been evaluted and placed on TOS. See examples above.

`GSD.` may return one of these states for a given session ID:

```
     0 -   User logged on to WinStation
     1 -   WinStation connected to client
     2 -   In the process of connecting to client
     3 -   Shadowing another WinStation
     4 -   WinStation logged on without client
     5 -   Waiting for client to connect
     6 -   WinStation is listening for connection
     7 -   WinStation is being reset
     8 -   WinStation is down due to error
    9 -   WinStation in initialization
```

P2 - ***(optional)*** - Variable for Result. For Details see examples above.

P3 - ***(optional)*** - Variable for Result. For Details see examples above.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'
GSD.
DBP.$$000
END.
```

Remarks

-

Limitations:

-

3.68.10 GUS. - Get Usage State

MiniRobotLanguage (MRL)

GUS. Command

Get Desktop name and Info if script runs without user logged on

Intention

This command will get the current desktop of the script as well as the current input-desktop of the user.
This way the command can find out, if a user is logged on or not.

There are 3 ways to use GUS.

1. `GUS.` without any parameter will place a values on TOS:

0 - the user is currently logged on
1 - the script runs at logon screen
technically: the input-desktop is NOT the desktop which the script runs on.

2. `GUS.` with one parameter. Like this:

will return the result of the operation on TOS. Example:

```
GUS.log-off state
DBP.$$000
```

3.GUS. with 2 parameters, like this:

```
GUS.log-off state|$$RET
```

Will return the result of the operation in the given variable. Example:

```
GUS.log-off state|$$RET
DBP.$$RET
```

Hint:
To find out, if a user has just locked his client, you can use `IEP.` to check if a process "`explorer.exe`" is currently running.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

GUS.[P1][|P2]

Parameter Explanation

P1 - (optioal) Subcommand, one of the following:

"acs-id","ai"
returns The session identifier of the session that is attached to the physical console. If there is no session attached to the physical console, (for example, if the physical console session is in the process of being attached or detached), the return value is a value that is not one of the valid session-id's which you can get using the GSD.- command.

"ir","is
The return code to this subcommand consists of two parts:
Part I: If the calling process is associated with a Terminal Services client session, the return value is 1. If the calling process is associated with the Terminal Services console session, the return value is 0.
Part II: is used in a Terminal Services environment to determine if the current Terminal Server session is being remotely controlled. Its value is 1 if the current session is remotely controlled; otherwise, 0.

"dn","desktop name"
Returns the name of the desktop which is the desktop of the current running script.

"id","input desktop"
Returns the name of the desktop that is currently connected with the mouse and screen.

"log-off state","los"
Checks if the two desktops have the same name - or not. In that case, its possible that the station is logged off. Note that this will only work as long as the user and the script run in the same session. If that is not the case, both could use desktops with the same name, while being different desktops. If necessary, check the session ID also, using GSD.

P2 - (optioal) Variable for the result. If omitted, TOS is used.

Example

```
'-----------------------------
'
'-----------------------------
GUS.log-off state|$$RET
DBP.$$RET
END.

'-----------------------------
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'
'-----------------------------
SER.restart|dn:interactiv
DOL.1
  GUS.los
  PRT.los=$$000
  GUS.id
  PRT.id=$$000
  GUS.dn
  PRT.dn=$$000
  PAU.3
OOP.
ENR.
```

Remarks

There are huge differences about the handling of desktops and sessions, before and after windows Vista.
After Vista, all system services run in session 0, that does not have a interactive desktop. The user desktop is in session 1.
Before Vista, services and user-desktop were in session 0. Desktops will always have different names, unless they are not in the same session. Mostly there is a desktop named "default" and a desktop named "WinLogon" in each session.
If no user is logged on, then the Input-Desktop will possibly be the "WinLogon".

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.68.11 IAI. / NAI. - If-Application-Installed

MiniRobotLanguage (MRL)

IAI. Conditional Statement

If Application Installed

Intention

This command can be used to find out if a specified application is installed. It can also be used, to find out if an program has a specified "Uninstall-Option" like "silent Uninstall" or "Modify/Repair" or not. Standard-Search Pattern 341 can be used.

The most important usage is, to find out, if a specified application is installed.
The following script will do that:

```
IAI.mozil&ANDTHEN:Fire
  VAR.$$APP=$$000
  DBP. $$APP is installed.
ELS.
  DBP. No such Application installed.
EIF.
```

May result in this output:

```
[8]  Mozilla Firefox 9.0 (x86 en-GB) is installed.
```

if that program is really installed on that particular PC. You can keep it simple. You can just give a part of what you want.

```
IAI.firefo
  STS.DUMP
ELS.
  DBP. No such Application installed.
EIF.
MBX.!
```

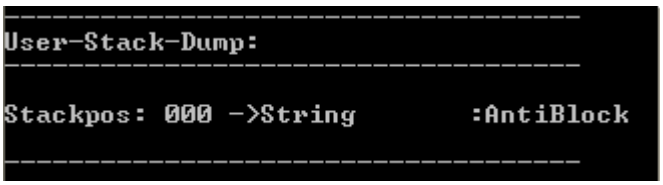
Take a look at these programs:

They both contain the term "block". Lets search them. If we just write:

```
' Without any option we search for a program NAME
IAI.block
  STS.DUMP
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

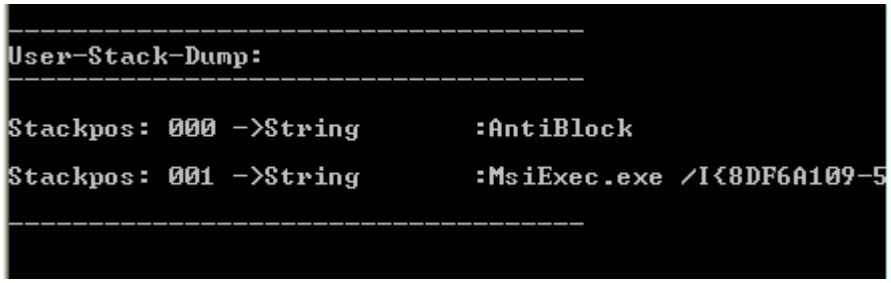
We search for ANY program with that term "block" in name. Thats the way how we check, if a program is installed. See the result in the picture below.



Now we want to know **if that program has a option to be uninstalled**. We just add an "`|u`" for this.

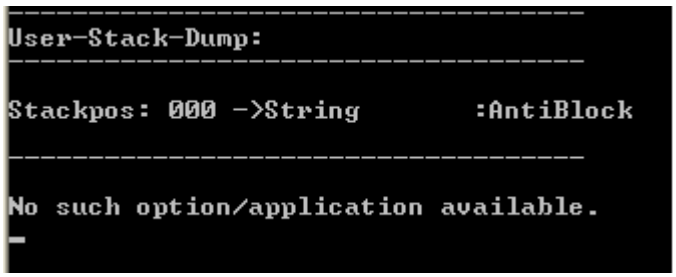
```
IAI.block|u
  STS.DUMP
EIF.
```

The result is as expected. Because that option is available.



Now we add a check, if an option for a silent uninstall is available.

```
IAI.Antiblock
' $$000 is the same as $tos$
  IAI.$$000|s
    STS.DUMP
  ELS.
    STS.DUMP
    PRT.No such option/application available.
  EIF.
EIF.
```



This way you can check, if an application is installed, and also if it has an option to be uninstalled.

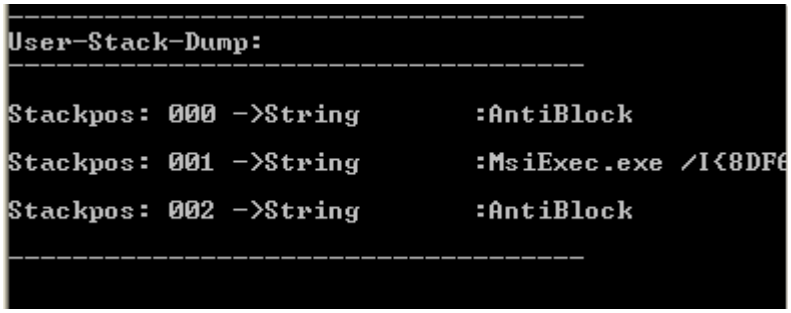
You can dig more deep using `IAI`. You can say "Tell me if there is ANY available Uninstall Option" for this program. We use the "`|a`" Option for this.

```
IAI.Antiblock
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
  IAI.$tos$|a
    STS.DUMP
  ELS.
    STS.DUMP
    PRT.No such option/application available.
  EIF.
EIF.
```

Now the robot looks if there is a
- silent-uninstall available.
- a normal uninstall-string available.
- a repair/modify string available
if any of these is found (in that order!), it is returned.



You can also say "look only for the silent and the uninstall string". Like this:

```
IAI.$tos$|su
```

Then it will only return the silent or the uninstall string. Or evaluate to FALSE (jump to ELS.) if they are not available.

Note that there is a priority, if more then one of these strings is available.
The order of search is always the same: silent,uninstall,modify. The first found will be returned.

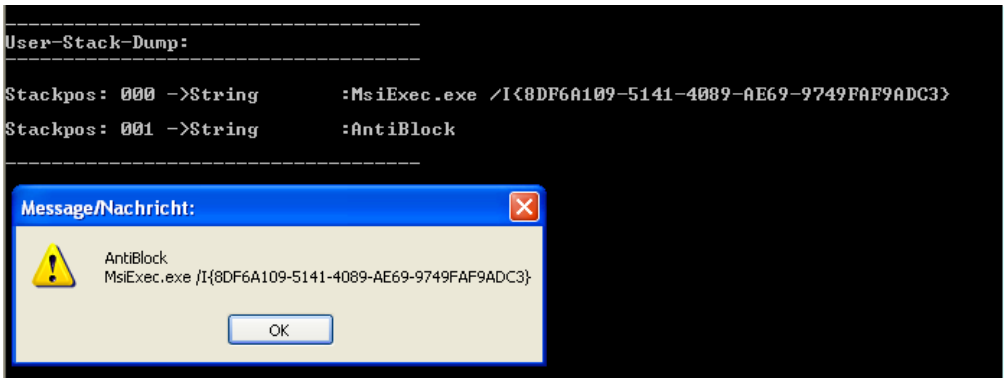
If you specify one of the flags u,m or s, then the specified "uninstall-string" must be available to be TRUE. Otherwise `IAI.` will decide FALSE, even if the application itself is installed.

There is one more thing here. Watch this script, and the result.

```
IAI.Antiblock
  IAI.$$000|$$TXT|a
    STS.DUMP
    MBX.$$TXT+$crlf$+$tos$
  ELS.
    STS.DUMP
    PRT.No such option/application available.
  EIF.
EIF.
```

As you can see in the picture below, the name of the found application can be directly returned to a variable, instead of the TOS (Top of Stack).

© 2023 Theo Gottwald * https://www.smart-package.com



NAI. is the negative form of this statement.

```
NAI.Antiblock
  GII.Antiblock
  STS.DUMP
  MBX.Ready
EIF.
END.

++++++++++++++++++++++++++++++++++++++++++++++++
```

IMPORTANT:

To verify, if a specified Patch is installed, you can not use IAI.
Instead use this Skript

```
$$HOT=KB4016871
$$TXT=?path\$$HOT
$$VAR=wmic qfe get hotfixid | find "$$HOT" > "$$TXT"
$$ZIE=?path\$$HOT.bat
CTF.$$ZIE|$$VAR
EXC.$$ZIE
$$PID=#pid#
WPT.$$PID
FIL.Length|$$TXT|$$RES
IVV.$$RES!0
  MBX.Patch $$HOT installiert.
ELS.
  MBX.Patch $$HOT ist nicht installiert.
EIF.
ENR.
```

Syntax

IAI.P1[|opt]
IAI.P1|P2[|opt]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** Application to test if installed
P2 **-** Variable for Result if found.

opt
```
 s - try command-line for silent Uninstallation
 u - try command-line for standard Uninstallation
 m - try command-line for Modify/Repair

 a - (any) get the first uninstall string available.
     this option will try the availability of the
     uninstall-Information in this order:
     - silent
     - uninstall
     - modify/repair
     It will return the first available uninstall string
     on the TOS.
```

Example

```
'*********************************************
' IAI./NAI. - Sample
'*********************************************
'DBM.2
PRT.=================================================
IAI.{office&ANDTHEN:Prof&ANDTHEN:2003}&AND:{&NOT:Visio}
 VAR.§§APP=$$000
 PRT. §§APP is installed.
ELS.
 PRT. No such Application installed.
EIF.
PRT.=================================================
NAI.office
 PRT. No such Application installed.
ELS.
 VAR.§§APP=$$000
 PRT. §§APP is installed.
EIF.
PRT.=================================================
END.
```

Remarks

The `IAI.` command works transparently with both x32 and x64 applications.
Technically the command reads the registry:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\U
ninstall\
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

to get these information.

`IAI.` as well as `GII.` as well as "InstaRec" build the Name of the Program using a Combination of the "`DisplayName`" and the "`DisplayVersion`" Properties. Therefore you can more easily separate which Software you want to deal with.

Limitations:

This command looks for standard information details at:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Uninstall\
```

If the application being tested for installation did not register this information, the command will not be able to retrieve installation information.

© 2023 Theo Gottwald * https://www.smart-package.com

3.68.12 IOS. / NOS. - If-Operating System

MiniRobotLanguage (MRL)

IOS. Conditional Statement

If Operating System

Intention

Conditional Statement. Test if the actual system meets the OS criteria you can specify. This way you can tell your script to do something else on different OS. Usage is very simple. You just write IOS. and the OS you want to test for.

```
IOS.Win7
  DBP. We are in Windows 7!
EIF.
```

Also, you can specify multiple OS you want to support. In this case you just write them all separated by a comma.

```
IOS.WinXP,Vista,Win2K
  DBP. We are here.
EIF.
```

But life is not always so simple. Maybe your script will only run on anything below Windows Vista? In this case you just write

```
IOS.<Vista
  DBP. We are below Windows Vista
EIF.
```

And if Windows Vista is included, you can add a "=".

```
IOS.<=Vista
  DBP. We are below Windows Vista or in Vista.
EIF.
```

All of these features can be combined, for those seldom cases when needed. In this case Windowx XP and WIndows Vista would not be served.

```
IOS.=>Win7,<Win2K
  DBP. We are not in WinXP.
EIF.
```

Also instead of writing a OS-Name, you can use the OS number (below) and prefix it with a #Sign. Like this.

```
IOS.<#11
  DBP. We are below Windows Vista
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

You can also use the command to check if the OS is x64 or not. Please do not combine this with other features:

```
IOS.x64
  DBP. Yes its x64
EIF.
```

The negative Form of this statement is `NOS.`

Syntax:

```
IOS.P1
 ' Block is executed if condition is met.
ELS.
 ' Block is executed if condition is not met.
EIF.
```

Parameter Explanation:

P1 - (optional) can be:

```
For Windows 2000:
    "windows 2000","w2k","win2000","win2k","w2000"

For Windows XP:
    "winxp","wxp","xp","windows xp","win xp"

For Window 2003:
    "windows 2003 server","ws2003","w2003"

For Windows Vista
    "windows vista","vista"

For Windows 7:
    "windows 7","w7","win7"

For Windows 8:
    "windows 8","w8","win8"

For Windows 9:
    "windows 9","w9","win9"

For Windows 10:
    "windows 10","w10","win10"

For Windows 3.1:
   "windows 3.1","w31"

For Windows 95:
    "windows 95","win95","w95"
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
For Windows 98:
    "windows 98","win98","w98"

For Windows ME:
    "windows me","winme","me"

For Windows NT 3:
    "windows nt 3","win nt3","nt3"

For Windows NT 3.1:
    "windows nt 3.1","win nt31","nt31"

For Windows NT 4:
    "windows nt 4","nt4","win nt4"

For any Windows NT:
    "windows nt","nt","win nt"

For any Windows 9x:
    "windows 9x","win9x","9x","w9x"

You can prefix the OS version with these Signs:

> - later then
= - equal
< - earlier then
```

to specify that all OS versions before or after an specified OS version are Ok.

```
IOS.<=Win7
  DBP. We are under Win7 or below!
EIF.
```

You can also specify a number for the OS. In that case prefix the number with a "#". Do not use spaces between the number and the "#".The syntax is #**(number of OS)**. Here are the numbers for the OS-versions.

1 - Windows 3.1
2 - Windows 95
3 - Windows 98
4 - Windows ME
5 - Windows NT 3
6 - Windows NT 3.1
7 - Windows NT 4
8 - Windows 2000
9 - Windows XP
10 - Windows 2003
11 - Windows Vista
12 - Windows 7
13 - Windows 8
14 - Windows 9
15 - Windows 10

For example: **#9** will be Windows XP.
#12 would be Windows 7.

```
' You could write
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
 IOS.#12,#9
  PRT. We're running Windows 7 or WinXP!
 EIF.

' which is functional the same like if you write
 IOS.Win7,XP
  PRT. We're running Windows 7 or WinXP!
 EIF.
```

You can use this special feature to check if you are running under `WOW64` (x64 Windows)

```
IOS.x64
  DBP. We are running on a x64 OS.
EIF.
```

Example:

```
'*********************************************
' IOS-Example
'*********************************************
'
 IOS.VISTA,XP
  MBX. We're running VISTA or WinXP!
 EIF.

'-------------------------
END.

'*********************************************
' IOS-Example
'*********************************************
'
GOS.x64
DBP.$$000
DBP.$$000
IOS.x64
  DBP.Ja
EIF.
ENR.
```

3.68.13 IUA. / NUA. - If User is Administrator

MiniRobotLanguage (MRL)

IUA. / NUA. Conditional statement

Check if User is Admin

Intention

Can be used to verify that the current running script had admin privileges. Internally the command will check, if the current user is a member of the Administrator group.

Syntax

```
IAU. ... ELS. ... EIF.
```

Parameter Explanation

This command does not support any parameters.

Example

```
'-------------------------------------------------------
' IUA.
'
' Without Parameter!
'-------------------------------------------------------
'
IUA.
   DBP. User is Admin.
ELS.
   DBP. User is not Admin.
EIF.
ENR.
```

3.68.14 LIB. - Library

MiniRobotLanguage (MRL)

LIB. Command

LIBrary

Intention

Multiple Usage Command.

Runs a lot of system Applets, Wizzards etc. see List below.
You can use the phrase or the number as **P1**.

Example:

```
LIB.HotPlug
```

will do the same as

```
LIB.19
```

Syntax

LIB.P1[|P2][|P3]

Parameter Explanation

P1 **-** [VAR with] command-number or Command-name
P2 **-** optional, VAR with parameter, depends on command number.
P3 **-** optional, VAR with parameter, depends on command number.

```
  1  -  Control-Panel          -> Run Control-Panel
  2  -  Add-Printer            -> Run Add Printer Wizard
  3  -  View Printers          -> Open Printers CPL (XP,Win 7)
  4  -  Exchange-Profiles      -> Run Microsoft Exchange
Profiles
  5  -  Postoffice-Admin       -> Run  Microsoft Workgroup
                                  Postoffice Admin

  6  - Open With               -> Open-With Dialog, you can
choose
       the File Associations for a file. Filename as parameter
P2.
  7  - Run-Registered          -> Filename as parameter P2.
       Will run a file with the registered application.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  8  - View-Fonts              -> Open FONTS Folder (XP,Win 7)
  9  - About-Windows           -> Open "About Window Window"

  10 - Time-Zone               -> Pick a Time Zone Dialog
  11 - Time-Set                -> Set-Time Dialog
  12 - Lock-Computer           -> Lock the Workstation
  13 - Diskcopy                -> Diskcopy Dialog, only W2k,XP
  14 - System-Properties       -> Open "System Properties"
Dialog
  15 - Stored-Passwords        -> opens Dialog: "Stored
usernames
                                  and passwords"
  16 - INF-Install (filename)  -> Install INF-File P2
                                  Filename inkl. Path
  17 - Install-INF-Section     -> Install INF-Section P2
  18 - Default-Printer         -> Set Standard-Printer P2
  19 - HotPlug                 -> Shows "Safely remove
Hardwae"
                                  Dialog
  20 - Action-Center           -> Opens the security (XP) or
                                  "Action Center" (Win7)
  21 - Flip-3D                 -> Start Flip-3D (Only Vista
                                   and Win7)
  22 - Install-SCR             -> Install Screensaver P2
(untested)
  23 - Tired-PC                -> Suspend PC, P2 can be  0 or
1
  24 - Print-Html              -> Print HTML-File P2
  25 - New-Briefcase           -> Create new briefcase, uses
                                   Parameters P2 and P3 (XP
only)
  26 - Aero-ON                 -> Switch AERO-GLAS On (Vista
only)
  27 - Aero-OFF                -> Switch AERO-GLAS Off (Vista
only)
  28 - Format-Drive            -> Show "Format Drive" Dialog,
                                  XP only
  29 - Software-CPL            -> Show "Add remove programs"
dialog
  30 - ODBC-Settings           -> Show"ODBC-Data Source
                                  Administrator" Dialog
  31 - Open-URL                -> Open URL P2 in default
browser

  32 - Open-Scrap (filename)   -> Open a scrap document -
                                  1 Parameter. only XP.

There are more Options (till No. 68) but not yet documented.
```

Example

```

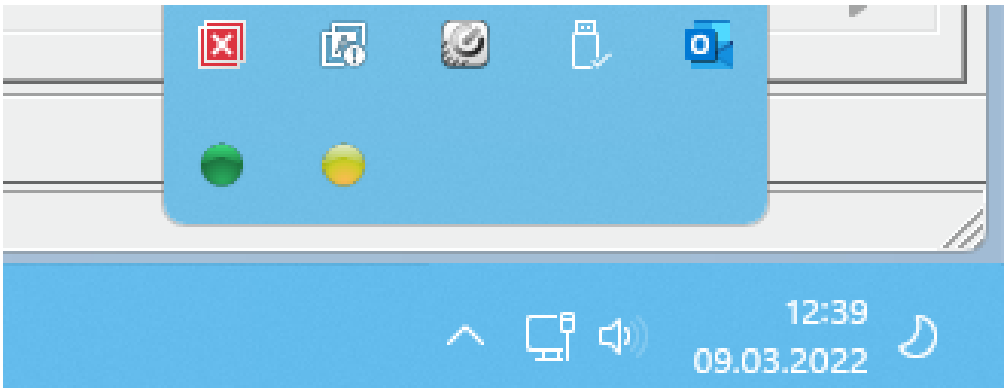
3.68.15 Systray-Icon Commands

Using Systray-Icon Commands, you can give your Script an Systray Icon or change the Icon to show a changed State.



© 2023 Theo Gottwald * https://www.smart-package.com

3.68.15.1 SYT.Add Icon To

MiniRobotLanguage (MRL)

SYT.Add Own Icon

Add a Tooltip-Icon to your Script and bind it to another window-handle

Intention

This Command will Add an Icon in the Systray for your running Script.
The Icon will be registered to another window-Handle.
This way you can have multiple Icons within your Script.

Example:

```
$$ICA=?path\Blue.ico
' Locate any other window
STW.ct|ThunderRT6FormDC|Screenshot
' Get the Window-Handle
$$MYW=#hwn#
' Bind the Icon
SYT.ai|$$MYW|$$ICA
```

The Icon will automatically disappear when your Script ends. You can only bind Icons to valid Window-Handles.

Syntax

SYT.Add Icon To|P1|P2

Parameter Explanation

P1 **-** [VAR with] Window-Handle of the target Window. This can be any valid Window-Handle.
P2 **-** Filename of the Icon (.ico)

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
'
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
$$ICC=?path\Green.ico
$$ICD=?path\Yellow.ico
SYT.oi|$$ICA
' Need to localize an Application window here
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.68.15.2 SYT.Add Own Icon

MiniRobotLanguage (MRL)

SYT.Add Own Icon

Add a Tooltip-Icon to your Script

Intention

This Command will Add an Icon in the Systray for your running Script.

Example:

```
$$ICA=?path\Blue.ico
SYT.oi|$$ICA
```

The Icon will automatically disappear when your Script ends.

Syntax

SYT.Add Own Icon|P1

Parameter Explanation

P1 **-** [VAR with] Icon-Filename

Example

```
'*******************************************************
' EXAMPLE 1:
'*******************************************************
'
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
$$ICC=?path\Green.ico
$$ICD=?path\Yellow.ico

3.68.15.3 SYT.Change Any Icon

MiniRobotLanguage (MRL)

SYT.Change Any Icon

Change the Tooltip-Icon of your Script

Intention

This Command will change an Icon in the Systray to another Icon, for your running Script.
It will work for the Icons that have bin bound to another Window-Handle.
It will only work for Icons that have been created using the SYT.-Commands..

Example:

```
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
' Locate any Target-Window
STW.c|iexplore
' Get Handle
$$HWN=#hwn#
' Start with a Blue Icon
SYT.ai|$$HWN|$$ICA
PAU.1
'Change to Red-Icon
SYT.ca|$$HWN|$$ICB
```

The Icon will automatically disappear when your Script ends.

Syntax

SYT.Change Any Icon|P1|P2

Parameter Explanation

P1 **-** [VAR with] valid Window-Handle
P2 **-** [VAR with] Icon-File

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
'
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$ICC=?path\Green.ico

3.68.15.4 SYT.Change Own Icon

MiniRobotLanguage (MRL)

SYT.Change Own Icon

Change the Tooltip-Icon for your Script

Intention

This Command will change an available Icon to another Icon in the Systray for your running Script.

Example:

```
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
' Start with a Blue Icon
SYT.oi|$$ICA
PAU.1
'Change to Red-Icon
SYT.co|$$ICB
```

The Icon will automatically disappear when your Script ends.

Syntax

SYT.Change Own Icon|P1

Parameter Explanation

P1 **-** [VAR with] Filename of Icon-File

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
'
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
$$ICC=?path\Green.ico
$$ICD=?path\Yellow.ico
SYT.oi|$$ICA
' Need to localize an Application window here

3.68.15.5 SYT.Has Icon

MiniRobotLanguage (MRL)

SYT.Has Icon

Verify if a Window-Handle has an Icon from our Script.

Intention

This Command will just check the internal Data to find out if an Window Handle has been used to bind an Icon to it from our Script.
The result will be zero if there is no Icon, or if the Window-Handle is invalid.
If there is a valid Icon under the given Handle, the result will be >0.

Example:

```
SYT.hi|6554616|$$RES
DBP.Own Icon: $$RES
```

Syntax

SYT.Has Icon|P1|P2

Parameter Explanation

P1 **-** [VAR with] valid Window-Handle
P2 **-** Variable that will take the result. You can also specify "-" to have the result on TOS.

```
SYT.hi|6554616|$$RES
SYT.hi|6554616|-
```

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
'
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
$$ICC=?path\Green.ico
$$ICD=?path\Yellow.ico
SYT.oi|$$ICA
' Need to localize an Application window here

3.68.15.6 SYT.Own Tooltip

MiniRobotLanguage (MRL)

SYT.Own Tooltip

Add a Tooltip to your Systray Icon.

Intention

This Command will Add an Tooltip to the Systray Icon that has been created using the SYT.-Command.

Example:

```
$$ICA=?path\Blue.ico
SYT.oi|$$ICA
SYT.ot|Here is my Tooltip.
```

The Icon will automatically disappear when your Script ends.

Syntax

SYT.Own Tooltip|P1

Parameter Explanation

P1 **-** [VAR with] Text for Tooltip.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
'
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
$$ICC=?path\Green.ico
$$ICD=?path\Yellow.ico
SYT.oi|$$ICA
' Need to localize an Application window here

3.68.15.7 SYT.Tooltip

MiniRobotLanguage (MRL)

SYT.Tooltip

Add a Tooltip to your Systray-Icon

Intention

This Command will Add an Toolltip to the Systray Icon for your running Script.

Example:

```
$$ICA=?path\Blue.ico
' Locate any other window
STW.ct|ThunderRT6FormDC|Screenshot
' Get the Window-Handle
$$MYW=#hwn#
' Bind the Icon
SYT.ai|$$MYW|$$ICA
SYT.tp|$$MYW|Zhis is a Icon Tooltip.
```

The Icon will automatically disappear when your Script ends.

Syntax

SYT.Tooltip|P1|P2

Parameter Explanation

P1 - [VAR with] Valid Window Handle
P2 - optional, VAR with parameter, depends on command number.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
'
$$ICA=?path\Blue.ico
$$ICB=?path\Red.ico
$$ICC=?path\Green.ico
$$ICD=?path\Yellow.ico
SYT.oi|$$ICA
' Need to localize an Application window here
STW.c|explorer
$$MYW=#hwn#
SYT.ai|$$MYW|$$ICB
```

© 2023 Theo Gottwald * https://www.smart-package.com

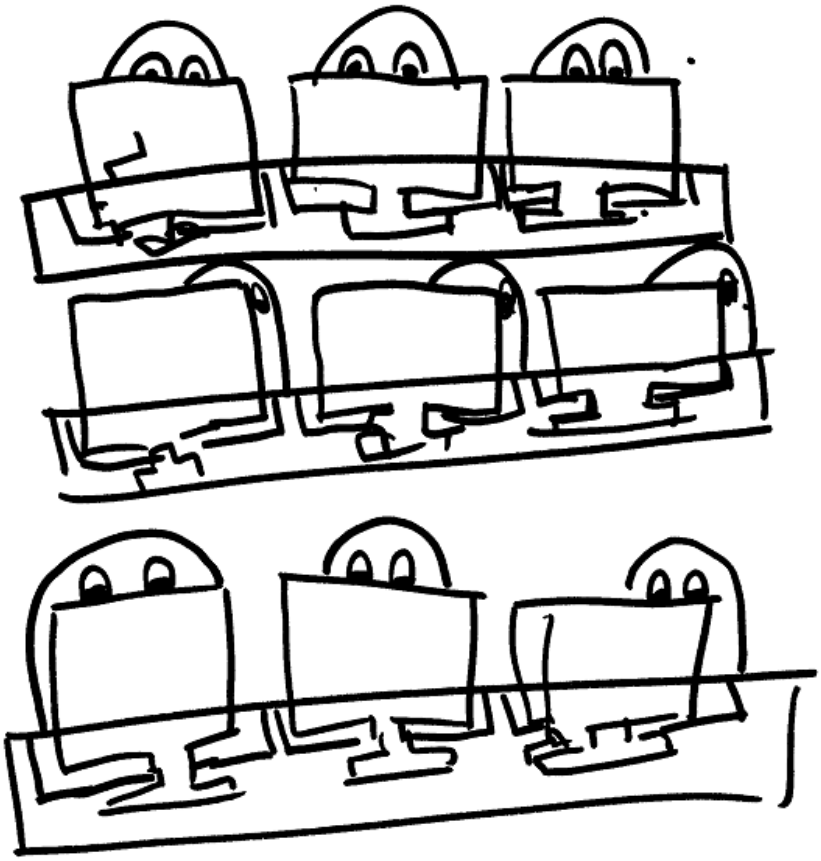
3.69 Parallel-Robot Operations

3.69.1 ! Smarty's Parallel Robot Operations

Smarty's Parallel Robot Operations



Intention

What are Parallel-Robot Operations and Background Processing good for?

Take a look at the picture above. As you can see, many "Smarty's" work at the same time.
Having several "Smarty's" work at the same time can save you processing time.

Especially if you have a Multi-Core-CPU, then each of the Tasks uses his own CPU-Core and therefore makes perfect use of your hardware.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Using the Parallel-Robot feature, you can run a lot of things in the background. Some examples are:

- start large applications in the background
- check and handle complicated pop-up-windows in the background (prefer `DBC.`)
- split large scripts in smaller portions that run parallel
- use all cores of your computer (Multi-Core/CPU usage)
- have things done in shorter time

Is there a difference between a Parallel-Robot and a Background Operation?

Yes, there is a technical difference. A Parallel Robot will run as a new process with an own PID. It will be visible in the Windows Task Manager as a separate process.
A Background Operation starts as a so called "thread" and therefore has the same `PID`.
Background Operations are more efficient in terms of resources.
There is no problem to have 100, 200 or 400 and maybe more Background Operations running at the same time.
Parallel running robots need more system resources therefore you will not use so many under normal circumstances. The main difference is this:
A Background Operation is already defined and somehow "hard-wired". Therefore it will give you an Operation Result - or not.
A Parallel Robot is not hard-wired, it will do just what you want it to do. It will only give you an Operation Result, if you use the `PRS.`-command. We'll come back on this topic later.

How can i start a Parallel-Robot?

It's easy. Technically it is just a pair of `PRR.` and `PRE.` A short example could look like this:

```
PRR.
  ' Script that the parallel-robot will execute
  ' This is the necessary END for the Parallel robot
  END.
PRE.$$RET
' Here the Main-Robot continues with his script
' $$RET contains the window-handle of the Parallel-Robot
```

There are different sorts of Background-Jobs and Parallel Robots. For most of them, you can use the commands:

- `WRS.` - Wait until the Process has ended / is ready.
- `GRS.` - Get the Result of that Bavkground process, if there is any.
- `DRS.` - Drop the result of a Background-Operation.
- `IRS. / NRS.` - Check if an Result is waiting for you
- `JRS. / JNS.` - Jump if an Result is/not available
- `PRS.` - Set the Result of an Parallel-Robot Operation.

Can i receive an result from calculations inside parallel running Robots?

Yes - you can!

© 2023 Theo Gottwald * https://www.smart-package.com

Second answer: In case of an Parallel-Robot you have to sent it your self - of course. In case of other Background-Operations, (like `SMB.`) the command will sent the result of the operation by itself automatically.

You can receive a calculation Result from a Parallel-Robot, using the Ticket-Number and the commands `WRS. / GRS.` etc. See this example:

```
' We start the Parallel Robot
PRR.
  ' This is the Result the Parallel-Robot sends back to us.
  ' Note that we did not specify an ticket number in P1,
  ' because it will be sent to his "father-robot" in this
case.
  PRS.|Hallo!
  ENR.
PRE.
' This is the Stack after the Parobot was started
STS.DUMP
' We wait for the Parobot to end.
WRS.
' And get the calculation result
GRS.
' This is the Stack after the Parobot sent his result
STS.DUMP
MBX.!
ENR.
```

To see, how you get an Result from a Background-Operation, take a look at

SMB. - Send Mail Background 799

or

MPB. - Music Play Background

Can i receive an result from multiple parallel running Robots?

Yes, here is an example:

```
PRR.
  GUT.Please give Result for Robot 1
  PRS.|Result from Robot 1 is: $$000
  ENR.
PRE.
$$ROA=$$001
PRR.
  GUT.Please give Result for Robot 2
  PRS.|Result from Robot 2 is: $$000
  ENR.
PRE.
$$ROB=$$001
STS.DUMP
WRS.$$ROA,$$ROB
GRS.$$ROA
GRS.$$ROB
STS.DUMP
MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

You will need to put some text in the two input-boxes, when you run that example.

Important Note:

The parallel-robot will inherit all variables that the starting robot knows at the starting time.

In other words:
All variables and Stack-content will be available on the Parallel-Robot immediately. But from then each robot continues his work in his own address-space and with its own variables. Technically it looks like this:

```
$$MYA=1001
PRR.
  ' Script that the parallel-robot will execute
  ' This is the END for the Parallel robot
  MBX.$$MYA = 1001
  $$MYA=99
  END.
PRE.$$RET
' Here the Main-Robot continues with his script
' Result will be 1001
MBX.MYA
```

The Main Robot will not execute anything that is between the `PRR.` and the `PRE.`

And how do i know that the operation was finished and there is an Result available?

There are several ways to find that out. The easiest is to simply wait for the background Operation to finish, using the `WRS.`-command (Wait for Result). You can also use the `IRS. / NRS.` - Conditional statement.
And theoretically you could call `GRS.` and check the timeout-flag after that. If it was set, there was no such result available.

Important Note:
Any result behind an "ticket-number" is stored as long, until you drop it using `DRS.` You do not need to wait until the Operation is finished, to drop a result. If you do not need the result of an Operation, you can drop it immediately after you started the background-task. In this case, the robot will internally note that the result is been dropped and drop it immediately when it becomes available.

There is an exception:
Of course you only need to drop the Result of an Parallel-Robot (started with `PRR. / PRE.`) , if you use the `PRS,`-command to return a Result. If no Result is returned, it does not need to be dropped.

Use these commands together with any Background Operation or Parallel-Robot Operation:

- `GRS.` - Get Result of Operation
- `WRS.` - Wait until (one or more) Operation(s) is/are finished

© 2023 Theo Gottwald * https://www.smart-package.com

- DRS. - Drop Result of Operation if you do not need it.
- IRS. / NRS. Check if an Result is available
- JRS. / JNS. - Jump if an Result is/not available

Use this command:
- PRS. - Set the Result of an Parallel-Robot Operation.

only for Parallel Robots, to set the Operation Result..

Background Operation Example, using SMB.:

```
' Assume that a file "?path\MailConfig.dat"
' is available
SMP.
' It makes mostly sense with attachements
' SMP.attachment=?path\Send-Mail.zip
' Send the Mail, get the ticket number
SMB.
' If we do not specify a ticket number,
' WRS. will automatically remember the last ticket number
' and use it.
WRS.
' If we do not specify a ticket number,
' GRS. will automatically remember the last ticket number
' and use it.
GRS.
DBP.$$000
' If we do not specify a ticket number,
' DRS. will automatically remember the last ticket number
' and use it.
' DRS. free's the Memory location that was used to hold the
' Result of the background operation.
DRS.
ENR.
```

Here is an Sample that shows a Parallel-running Script on a "Private Desktop".
Please note that each PD has its own address space.
Therefore an Robot can not easily communicate with another Robot on a PD.
Several communications features may not work on a PD.
However the ! Smarty's InterKOM Technology 2116 should work.

```
 ' This Script will create Desktop and start a
 ' new Script on that Desktop using the PRR.-Command
 '
 PDC.Create Desktop with Explorer|DTF
 PDC.Switch to Desktop|DTF
 PRR.0|DTF
   MBX.I am on the DTF-Desktop
   PDC.Goto Default
 PRE.
 MBX.End the Script
 ENR.
```

Limitations

© 2023 Theo Gottwald * https://www.smart-package.com

The Parallel-Robot does NOT inherit the E-Mail Configuration for `SMA./SMB`.
Remember that you can send E-Mails in the background using `SMB.` without explicit starting a Parallel Robots.

There are no limitations about Parallel-Robots starting other Parallel Robots, or Background-Tasks.

There are limitations, running Parallel-running Script's on a "Private Desktop".
Each PD has its own address space.
Therefore an Robot can not easily communicate with another Robot on a PD.
Several communications features may not work on a PD.
However the ! Smarty's InterKOM Technology 2116 should work.

See also:

- PRR. - Parallel-Robot-Run 2642

- GRS. - Get Result 799
- SMB. Send Mail Background 799

© 2023 Theo Gottwald * https://www.smart-package.com

3.69.2 PRE. - Parallelrobot-Run-End

MiniRobotLanguage (MRL)

PRE. Command

Parallel Robot run End

Intention

The command PRR. can be used to start a parallel running robot. For this purpose it starts a block containing the script for the new robot. The PRE. command will end this script-block.
PRR. and PRE. must always be used in Pairs. They can be nested, a Parallel-Robot can start another parallel robot and so on.
The parallel-robot will knows all variables that the starting robot knows at the starting time.
From that time each robot works in his own address-space and with its own variables.
Technically it looks like this:

```
PRR.
  ' Script that the parallel-robot will execute
  ' This is the END for the Parallel robot
  END.
PRE.$$RET
' Here the Main-Robot continues with his script
```

The Main Robot will not execute anything that is between the PRR. and the PRE.

The PRE. is not an END.-command for the Parallel-Robot.
The PRE. just tells the Main robot where to continue, and it gives the communication handle of the parallel-robot to the main-robot.If you want the Parallel-Robot to end at the PRE., place an END. command there. If you do not place an END. command there, the parallel-robot will walk over the PRE. into the Main-robots-script and continue running it.

In fact the Parallel-Robot starts with a 1:1 copy of the full script including all subroutines. The parallel robot will also start with a copy of all variables that the main robot had at this time. In fact he is more a "Clone" then a brother to the main-robot. As a result, a parallel robot can call all subroutines in the script, because he has a complete 1:1 copy of the script..

More Infos:
You can send variables to another running robot using PRV. Unless the Robot is on another "Private Desktop".
You can wait for a variable from another running robot using WFV.
You can set a global Signal that multiple running Robots will see, using SGS. and check if such a signal exist, using IGS.

Here is an Example that shows how you can wait for 5 Parallel Processes to end.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Click on the 5 Messageboxes and see what happens.

```
VAO.$$TIB=
FOR.$$LOP|1|5
' Run 5 Robots
  PRR.0
    MBX.!
    END.
  PRE.$$TIC
'$$TIC is the Window-Handle of the new Robot for use with PRV.
' The Kom-Handle is on TOS for use with WRS.
  VAR.$$TID=$tos$
    ' Collect the Tickets separated with ","
  $$TIB=$$TIB,$$TID
  PRT.$$TIB
NEX.
' Wait until they end
WRS.!$$TIB
ENR.
```

Syntax

PRE.[P1][|P2]

Parameter Explanation

P1 - (out) - will be given the WIndow-Handle of the started Robot. Which is the same as a window-handle. The Communicationshandle will be placed on TOS for use with WRS..

P2 - (in) - Timeout in sec. to wait for the robot to start.

```
-----------------------------------
User-Stack-Dump:
-----------------------------------
Stackpos: 000 ->LongInt      :658028
Stackpos: 001 ->String       :H658028
-----------------------------------
```

You will also find these values on the Stack:
1. Window-Handle-New Robot.
2. On the second stack place is the "Ticket-Number" for use with WRS. / GRS. / IRS.
technically, its the same number, but prefixed with a "H".

Example

PAU.0.5
RET.
'-------------------------------------------------------------
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

The Parallel-Robot starts with the full script. Therefore do not forget the `END.` before the `PRE.` Otherwise the Parallelrobot will just walk over the `PRE.` into the Script of the starting robot. Then both will try to do the same script at the same time.

Limitations:

It is possible to start more then one Parallel-running robot, **actually up to 8**.
Each robot uses quite some system resources/memory therefore you should not run too many, depending on your CPU number and memory capacity.
Each robot runs independently from the moment he starts with his script.

It may or may not be possible to use this feature to install multiple software products at the same time. This depends on the used installer and the setup-program.

3.69.3 PRR. - Parallel-Robot-Run

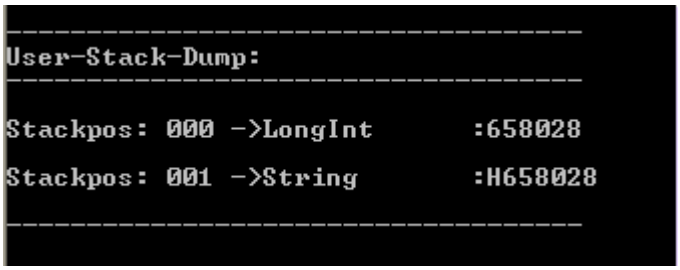
MiniRobotLanguage (MRL)

PRR. Command

Parallel Robot Run

Intention

The command `PRR.` can be used to start a parallel running robot. For this purpose it starts a block containing the script for the new robot. The `PRE.` command will end this script-block.
`PRR.` and `PRE.` must always be used in Pairs. They can be nested, a Parallel-Robot can start another parallel robot and so on.



This is the stack, after a successful call to `PRR. / PRE.`
At the top-level it contains the Window-Handle of the just started Robot.
Below is a valid "Ticket-Number" that can be used together with `GRS. / WRS. / IRS. / PRS / JRS. etc..`

Parameters:
Setting **P1** to 0 (end or 1 (survive), tells the Parallel running robot if he should end, if his father dies, or if he should survive anyway. If you omit **P1**, the parallel-robot will also end, when the robot that started it, ends.

More Infos:
You can send variables to another running robot using `PRV`.
You can wait for a variable from another running robot using `WFV`.
Both of these may NOT work if the Robot runs on another Desktop.

You can set a global Signal that multiple running Robots will see, using `SGS.` and check if such a signal exist, using `IGS.`

Here is an Sample that shows a Parallel-running Script on a "Private Desktop".
Please note that each PD has its own address space.
Therefore an Robot can not easily communicate with another Robot on a PD.
Several communications features may not work on a PD.
However the ! Smarty's InterKOM Technology 2116 should work.

```
' This Script will create Desktop and start a
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' new Script on that Desktop using the PRR.-Command
'
PDC.Create Desktop with Explorer|DTF
PDC.Switch to Desktop|DTF
PRR.0|DTF
  MBX.I am on the DTF-Desktop
  PDC.Goto Default
PRE.
MBX.End the Script
ENR.
```

Here is an Example that shows how you can wait for 5 Parallel Processes to end.
Click on the 5 Messageboxes and see what happens.

```
VAO.$$TIB=
FOR.$$LOP|1|5
' Run 5 Robots
  PRR.0
    MBX.!
    END.
  PRE.$$TIC
  ' Collect the Tickets separated with ","
  $$TIB=$$TIB,$$TIC
NEX.
' Wait until they end
WRS.!$$TIB
ENR.
```

Syntax

PRR.[P1][|P2]

Parameter Explanation

P1 **-** `(in) - 1/0 shall parallel-Robot survive when the starting robot ends?`

P2 **-** `(in/optional)` - Name of the existing "Private Desktop" where the Script shall be started.
if omitted, the Script will always start on the Desktop where the "Father-Script" is running.

VAN.$$INP=0
PRV.$$RET|$$INP
PAU.8
DMP.
END.
'-------------------------------------------------------------
:wait
PAU.0.1
RET.
```

Remarks

The Parallel-Robot starts with the full script. Therefore do not forget the END. before the `PRE.` Otherwise the Parallel robot will just walk over the `PRE.` into the Script of the starting robot.
Then both will try to do the same script at the same time. Depending on the Setting in the `PRR.` command,the parallel running robots will automatically be killed when the main-script that started the robot, ends.

Limitations:

It is possible to start more then one Parallel-running robot, actually up to 8.

Each robot uses quite some system resources/memory therefore you should not run too many, depending on your CPU number and memory capacity.

Each robot runs independently from the moment he starts with his script.

When using `PRR.` the Parallel-Robot will not inherit the e-Mail Configuration (for use with `SMA.`) from the Starting Robot. To send Mails in the Background, use `SMB.` instead.

3.69.4 PRS. - Parallel Robot Set Resukt

MiniRobotLanguage (MRL)

PRS. - Parallel Robot Set Result

Set the Result from a Parallel Running Robot Operation

Intention

Using `PRR.` and `PRE.` you can start multiple Robots to do several things at the same time.
It's just like you have a business and several employees working at the same time for you.

Now comes the time that you want to know what they were doing the whole day. You want the "Results". How do they tell you the results of their jobs?

There are two ways, a parallel running robot can send his results to the Main Script. First can use `PRV.` to simply change a variable in the Main Script to whatever value you want.
Second you can place a "Result" with your "Ticket Number" in the Main Script, and that is what `PRS.` is good for.

The system works like this:

1. Start a Parallel Robot using `PRR.` and `PRE.` and get a "ticket number"
2. keep the ticket number in a variable
3. do whatever you want ...
4. The Parallel Robot will process its script and get a Result.
5. And call `PRS.` this will transfer the Result to the Main Script
6. The Mainscript will call `WRS.` with that "ticket number" as parameter
7. `WRS.` will wait until the background Operation has finished
8. and then call `GRS.` to get the result of the Parallel Robot

Hint: If you have just one Parallel-Robot running, you do not need to specify an ticket number. The system always remembers the and uses the ticket number from the last background operation.

Example:

```
' We start a Parallel Robot
PRR.
   ' Do any Calculation or whatever here
   VAL.$$CAL=9*99
   PRS. My Result is $$CAL
   ENR.
PRE.
' If we do not specify a ticket number,
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' WRS. will automatically remember the last ticket number
' and use it.
WRS.
' If we do not specify a ticket number,
' GRS. will automatically remember the last ticket number
' and use it. Here we get the Result from the Parallel Robot.
GRS.
DBP.$$000
' If we do not specify a ticket number,
' DRS. will automatically remember the last ticket number
' and use it.
' DRS. free's the Memory location that was used to hold the
' Result of the background operation.
DRS.
ENR.
```

How do i send / collect results from multiple parallel running robots/operations?

Here is an example:

```
PRR.
  GUT.Please give Result for Robot 1
  PRS.|Result from Robot 1 is: $$000
  ENR.
PRE.
$$ROA=$$001
PRR.
  GUT.Please give Result for Robot 2
  PRS.|Result from Robot 2 is: $$000
  ENR.
PRE.
$$ROB=$$001
STS.DUMP
WRS.$$ROA,$$ROB
GRS.$$ROA
GRS.$$ROB
STS.DUMP
MBX.!
ENR.
```

You will need to put some text in the two input-boxes, this text is the result from each of the two parallel robot operations.

As you can see, the `WRS.` will wait until both Results are available. And then present them to you.

Syntax

PRS.[P1][|P2]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - ***(optional)*** Variable that contains the own "Ticket-Number". In most cases, you can omit this parameter, then the own Ticket-Number is used.

P2 - ***(optional)*** Variable that contains the Result of the background job, that is to be
sent to the Main Script..

Example

```
'**********************************
' PRS.-Sample
'**********************************
'
PRR.
  GUT.Please give Result for Robot 1
  PRS.|Result from Robot 1 is: $$000
  ENR.
PRE.
$$ROA=$$001
PRR.
  GUT.Please give Result for Robot 2
  PRS.|Result from Robot 2 is: $$000
  ENR.
PRE.
$$ROB=$$001
STS.DUMP
WRS.$$ROA,$$ROB
GRS.$$ROA
GRS.$$ROB
STS.DUMP
MBX.!
ENR.
```

Remarks

If you use `PRS.`, always drop the result later in the Main-Script, using `DRS.`.
Otherwise it will be kept in Memory until the Script ends.

Limitations:

There is no technical limit in the size of the result, other then available Memory and System Resources.

3.69.5 PRV. - Parallel-Robot send Variable

MiniRobotLanguage (MRL)

PRV. Command

Parallel Robot send Variable

Intention

This command can be used to send variables to another running robot.

Its best if the parallel robot has been started using the `PRR./PRE.` command, because then you have his *communication-Handle*.

However parallel robots can be started anyway, as long you get his communication handle. The communication handle of a particular robot instance is inside the system-variable: #cbw# 334 .

Advanced technical note: If you have the PID 137 of a parallel-robot, you can locate his (invisible) window using `STW.` and the the "p" flag and then use the window-handle as *communication-handle*.

More Infos:
You can wait for a variable from another running robot using the command `WFV.` However, this is not necessary. A running robot will receive the value of a variable that is sent to him with or without `WFV.`, anyway. This processing takes place in the execution time between two command-lines.

Here is a very simple example, which looks larger then it is, because its heavily documented.

```
' We set the variable $$NUM to 1 in the Main-Robot
' The Parallel robot will inherit all variables from the Main
' Robot on start this way he knows that $$NUM=1 also.
: $$NUM=1
' Here we start the Parallel-Robot
PRR.
 ' This is an endless-loop (condition 1 is always true)
  DOL.1
    ' We make a small rest (variables are received in resting
time)
    PAU.0.1
' We check if the variable $$NUM changes its value to "0",
' if so we leave
    JIZ.$$NUM|out
' As long as $$NUM is not "0", we PRINT something and
' continue Looping.
    PRT.Running until i get zero ...
  OOP.
  ' Here we go when we got zero
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  :out
  ' Then you get a Message-Box
  MBX.Got a zero, leaving
  ' ANd we end the parallel robot
  END.
PRE.$$CMH
' This the way of the Main-Robot
' We let him rest for 2 seconds, then signal the Parallel
robot
' to end
PAU.2
' Now we have the Robot-Communication handle insde $$CMH
: $$CON=0
' We set $$NUM on the Parallel Robot to zero
PRV.$$CMH|$$NUM|$$CON
' We wait for 3 seconds and then
PAU.3
' End the script
END.
```

Syntax

PRV.P1|P2[|P3]

Parameter Explanation

P1 **-** (in) Window/Communicationhandle of a another Robots-Instance

P2 **-** (in) Name of a Variable which shall be sent to the other robot.

P3 **-** (in) Content which shall be sent to the other robot to be placed inside the given VAR-Name **P2**. If omitted content of **P2** is sent.

If only two parameters are given, the second parameter will be taken as variable-name and as content.

Therefore:
PRV.$$RET|$$INP
is equal to:
PRV.$$RET|$$INP|$$INP

Important: Please note that **P2 is taken "as is"**, it can not be inside another variable!

Alternatively use this:
PRV.$$WHN|$$NAM|$$CON

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*******************************************
' PRR./PRE./PRV. - Sample 1

© 2023 Theo Gottwald * https://www.smart-package.com

3.69.6 WFV. - Wait-For-VariableChange

MiniRobotLanguage (MRL)

WFV. Command

Wait For Variablechange

Intention

This command can be used to wait for receipt of variables from another running robot.
It can also be used to synchronize running robots.

`WFV.` will use the name of the variable it has as got, as a reference. And then wait until anything is sent to this variable. It does not just wait for any variable, and it does not matter, if the variable value changes or not.

Think a moment, what can happen. If your script runs in a loop, with a `WFV.` and the message for that particular variable comes while your script is outside `WFV.` then your `WFV.` may wait forever for that `PRV.`-message.

Therefore use `WFV.` only if you really need it, and be sure that your parallel robot is inside the `WFV.` when the `PRV.` is done.
Using `WFV.` without such care can lead to a hanging script. If you are not sure, use the timeout-option **P2**. This will prevent a script from hanging.

Important:
`WFV.` **is not needed for a robot to receive variables from another robot.** Any robot receives variables that have been sent to him anyway, also without `WFV.`. This is done between the processing of the commands (code-lines).

More Infos:
You can send variables to another running robot using `PRV.`
You can wait for a variable from another running robot using `WFV.`
You can set a global Signal that multiple running Robots will see, using `SGS.` and check if such a signal exist, using `IGS.`

Syntax

WFV.P1[|P2]

Parameter Explanation

P1 **-** `(in) - Name of a Variable which shall be received from the other robot.`

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 **-** (in) - Timeout time in seconds. If omitted or 0, endless time is used.

Please note that P1 is taken "as is" and not resolved.

Example

```

3.70 PDC. - Private Desktop Commands

3.70.1 !PDC. - Private Desktop Command

MiniRobotLanguage (MRL)

PDC. - Manage private Desktops

Used to start the Automation on a private Desktop (Hidden Desktop)

Intention

Generally the **PDC.** - command is used to manage the "Private Desktops" from Script.
You can add or remove "Private Desktops". You can switch to - or from a "Private Desktop".

Using PDC. The SPR can do some things with PD's, these are:
1. Create PD's
2. Destroy PD's
3. Switch between PD's
4. Run Programs or Scripts on any PD, also with "Run as User"
5. Check if a PD exists or not

The SPR can NOT work itself on PD's. It will always stay with the desktop where it was run. This is due to Limitiations in windows.
To do this you will need to start a dedicated SPR on this PD using:

```
PDC.Run on Desktop WFI|PD Name|compiled Script.exe
```

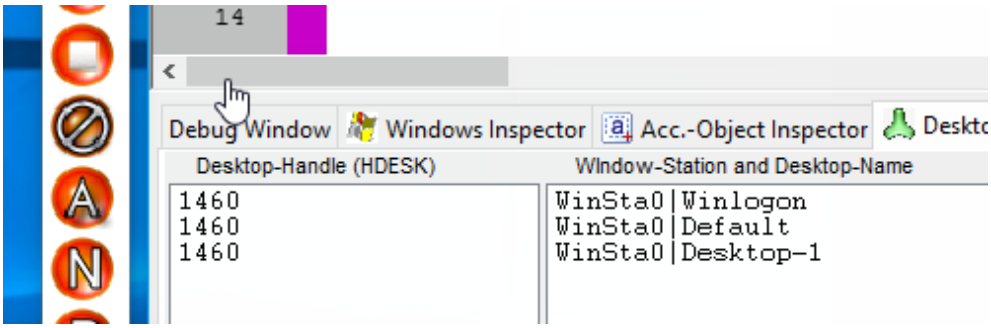
Aside of the PDC. - Command, you have the new **'#HID:** 283 Compiler Directive to start compiled executables on the private Desktop. Also the Command PRR. - Parallel-Robot-Run 2642 has been enhanced to start Scripts on PD's.

Even if you Switch to a PD, all Robot-Commands will be executed on the Desktop where the Robot was originally started.

Do i have "Private Desktops"?
If you have created private Desktops, these will be displayed in the SPR-Editor, in the "Desktops-Inspector". In this Example, you can see a "private Desktop" named "Desktop-1".

The Desktop with the name "Default" is always the "Normal User Desktop".
Its the Desktop which Windows will give you when it starts.
Its the Desktop where you work normally and where everything works as expected.

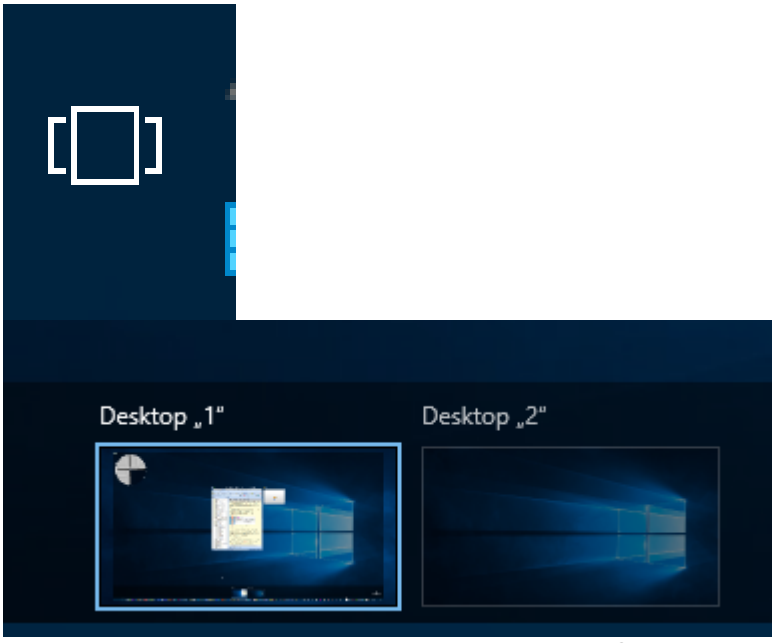
*© 2023 Theo Gottwald * https://www.smart-package.com*



The SPR-Editor shows a new private Desktop with the name "Desktop-1".

What are "private Desktops" good for?
You can run Scripts on "private Desktops". These Scripts can use the Mouse-Pointer.
And while these Scripts run, you - or an other User - can still work and use the Computer.

What is the difference to "Windows virtual Desktops" ?
Theoretically you can also use "private Desktops" like the new "virtual Desktops" that are built into Windows 10. But for this we recommend to prefer the Windows 10 Desktops, as you can move Windows
from one "virtual Desktop" to another. This is not possible with "Real Desktops". Therefore for human use the "virtual Desktops" may be best.



Virtual Desktops are built into Windows 10. These are NOT the Desktops we use for the SPR.

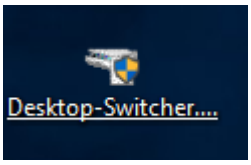
On the other side, these "virtual Desktops" do not support running independent Scripts.
You can not run a Script that uses the Mouse on such a "virtual Desktop".
It will not work due to the nature of these "virtual Desktops".

Do NOT intermix our "Real Private Desktops" with these "virtual Desktops".

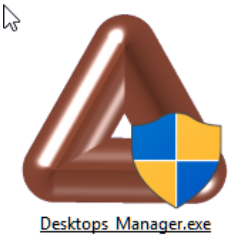
*© 2023 Theo Gottwald * https://www.smart-package.com*

These are more like "Desktop simulations". As said, the reason is that you can move windows
from one Desktop to another. This is not possible with "Private Desktops".
They are technically separated from each other.
Private Desktops have an own Mousepointer and own "Input Focus".

How can i manage "private Desktops" aside from Scripts?
To take a look on an private Desktop - for example to check for error-Messages - as well, as to Switch back from an "private Desktop" to the "Default Desktop",
you may need to use the "Switch Desktop"-Tool that is provided together with this SPR-Release.



You will find the Tool "Desktop-Switcher.exe" in the Startmenu.



Also you will find the Tool "Desktops Manager.exe" in the Startmenu.

Both Tools provide you with the ability to manage "private Desktops".
For example you can
- add a private Desktop,
- or remove a private Desktop.
You can also start an Executable "on a private Desktop".

Here is an Sample-Script that will switch to a private Desktop and then after 5 Seconds switch back to the "Default Desktop".

```
PDC.Create Desktop with Explorer|Desktop-1
PDC.Switch to Desktop|Desktop-1
PAU.5
PDC.Goto Default
ENR.
```

Important: You may not always be able to delete a private Desktop after Usage.
The "Private Desktop" will be gone after the next reboot.

Windows itself provides two Standard-Desktops, these are:

```
Default
  Winlogon
```

neither of these can be closed.

© 2023 Theo Gottwald * https://www.smart-package.com

Additional to the PDC-Commands there are two Query-Commands:
ICD./NCD. - If/Not Current Desktop 2666
IPD./NPD. - If/Not Private Desktop 2669

Syntax:

PDC.P1[|P2][|P3]

Parameter Explanation:

P1 - Subcommand, this can be any of the following:

```
"create desktop with explorer","cde"
"create desktop no explorer","cdn"
"switch to desktop","swd"
"set user","su"
"reset user","ru"
"run on desktop wfi","ruda"
"run on desktop wfo","rudb"
"close desktop","cld"
"get current desktop name","gdn"
"goto default","gd"
```

The Abbreviations like "gd" for "Goto Default" are functionally equal to the original command.

P2 - ...

Example:

```
'----------------------------------------
' This script will create a PD
' and destroy it later
'----------------------------------------
'
VAR.$$PRO=?progs\Smart Package Robot\Desktops_Manager.exe
PDC.Create Desktop with Explorer|DTA
PDC.Run on Desktop WFI|DTA|$$PRO
PDC.Switch to Desktop|DTA
' The following Bubble-Text appears on the original Desktop
SBT.Waiting a bit ...|FS:24 CS:1 T:15
PAU.5
PDC.Goto Default
PAU.10
' Close PD
PDC.Close Desktop|DTA
MBX.!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'----------------------------------------
' Create Desktop / Switch to Desktop
'----------------------------------------
 PDC.Create Desktop with Explorer|Desktop-1
 PDC.Switch to Desktop|Desktop-1
 PAU.5
 PDC.Goto Default
 ENR.

'----------------------------------------
' Compile-Time Commands
'----------------------------------------
'
' The following line will make the compiled
' executable start up on the private Desktop "Desktop-2".
' It will only work if the Script has full admin-rights.
' The command will switch to the private Desktop.
' After you click the Messagebox, the private Desktop will be
removed.
'
'#HID:2|scn
'
MBX.I am the Smart Package Robot on Desk 2!
END.
```

Remarks:

'#HID: does work with '#RAU:.

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops.
To start SPR Scripts on a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.
This feature needs Admin-Rights!
This feature is currently a bit experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops.
For Limitations in the Windows-Explorer itself, not all Actions will be possible on "private Desktops".
Sometimes System-Windows - like the Start-Menu - will not open on the "private Desktop" but on the Default Desktop.

DANGER: Using the "Close Desktop"-Option will forcefully terminate all processes that are bound to the Desktop that is to be closed!

Also note: Before the new created Desktop can be closed, the Script switches to the new Desktop.
When the new Desktop has been closed, the Script switches to the Default desktop.

3.70.2 HDC. - Hidden Desktop Control

MiniRobotLanguage (MRL)

HDC. - Hidden Desktop Control

Enable or Disable Hidden Desktop Access

Intention

The HDC.-Command can be used to manually enable or disable the possibility to switch to the "Hidden Desktop".
The "Hidden Desktop" is the System-Desktop. Its not a "private Desktop".

```
' This will enable the Access to the Hidden Desktop
HDC.1

' This will disbale the possibility to access the Hidden
Desktop
' Robot Executables can still work on the Hidden Desktop.
HDC.0
```

Syntax

HDC.[P1]

Parameter Explanation

P1 - (optional) can be one of the following options:

e - "e"nable Hidden Desktop Access. You can also write "1" instead.

d - "d"isable Hidden Desktop Access. You can also write "0" instead.
Use this Option in your Client-Script to prevent the User from being able
to enter the "Hidden Desktop".

r - "r"estart. This is the same like "e" but stronger but can be slow!
Internally the "UI0Detect" service is restarted. You can also write "2" instead.

f - "f"orbid. This will totaly disable the option to use the Hidden Desktop.
We recommend to not use this option as it can also influence Robot-Scripts.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
HDC.disable
HDC.d
HDC.0

or

HDC.e
HDC.1
HDC.enable
```

Remarks

Internally it will start or stop the "`UI0Detect`" Service.

Limitations:

See also:

- EXV. - Execute via System-Desktop 912
- 1.0.1 '#EXV: - Execute on Hidden Desktop 280

© 2023 Theo Gottwald * https://www.smart-package.com

3.70.3 ICD./NCD. - If/Not Current Desktop

MiniRobotLanguage (MRL)

ICD./NCD. - If/Not Current Desktop

Used to verify if the current Script runs on the specified Desktop or not

Intention

This Command will find out, if the running Script runs on the specified "private Desktop" (PD) or not.
For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

Usage is easy. You can just check whether your runs on that PD or not.

```
ICD.DTB
  MBX.Running on DTB.
ELS.
  MBX.Not running on DTB.
EIF.
```

Its possible to specify more then one Desktop-name (no limit).
In this case "OR" logic is applied. If the Script runs on "any of" these Desktops, the condition evaluates to true for ICD. and to false for NCD.

```
' Test if the Script runs whether on Desktop "DTA" or "DTB"
or on "Default"
ICD.DTA,DTB,Default
  MBX.Running on DTB.
ELS.
  MBX.Not running on DTB.
EIF.
```

Windows itself provides two Standard-Desktops, these are:

```
Default
Winlogon
```

Important:
Even if you Switch to a PD, all Robot-Commands will still be executed on the Desktop where the Robot was originally started. See below for an example on how to start a Script on a PD.

Syntax:

```
ICD.[P1][,P2][,Px]
```

© 2023 Theo Gottwald * https://www.smart-package.com

NCD.[P1][,P2][,Px]

Parameter Explanation:

P1 - The name of the private Desktop that we want to check for..

Example:

```
'----------------------------------------
' This script will create a PD
' and demonstrate the ICD.-Query on and not on
' the new desktop.
'
GSB.Test
PDC.Create Desktop no Explorer|DTB
PRR.0|DTB
  GSB.Test
  ENR.
PRE.
MBX.!
ENR.
'----------------------------------------
:Test
ICD.DTB
  MBX.Running on DTB.
ELS.
  MBX.Not running on DTB.
EIF.
RET.
ENR.
```

Remarks:

-

Limitations:

This Feature may require Windows Vista or higher.

3.70.4 IPD./NPD. - If/Not Private Desktop

MiniRobotLanguage (MRL)

IPD./NPD. - If/Not Private Desktop

Used to verify if a private Desktop exist or not

Intention

This Command will find out, if a "private Desktop" (PD) exists or not.
For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

To check if the PD "MyPD" exists, you can simply type:

```
$$DSK=MyPD
IPD.$$DSK
  MBX.$$DSK exists.
ELS.
  MBX.$$DSK not exists.
EIF.
ENR.
```

Syntax:

```
IPD.[P1]
NPD.[P1]
```

Parameter Explanation:

P1 - (in) The name of the private Desktop. If omitted, the name "Default" is taken.

Example:

```
'============================================================
' This Script will verify if a specified Private Desktop
' exists or not
'
VAR.$$DSK=DTX
GSB.Test
PDC.Create Desktop no Explorer|$$DSK
GSB.Test
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
ENR.
'----------------------------------------
:Test
IPD.$$DSK
  MBX.$$DSK exists.
ELS.
  MBX.$$DSK not exists.
EIF.
RET.
ENR.
```

Remarks:

-.

Limitations:

This Feature may require Windows Vista or higher.

3.70.5 PDC.Close Desktop

MiniRobotLanguage (MRL)

PDC.Close Desktop

Used to destroy a private Desktop and all programs running on that PD (Hidden Desktop)

Intention

Generally we do not recommend to use this command, unless you have reasons to remove the PD.
In any normal use, you can just leave the PD, it will be removed at the next reboot anyway.

Desktops can not be closed if there are programs running.
Therefore the command will try to close all programs on that Desktop.
Using this command will close all Programs running on a "Private Desktop" without further notice.
Even then, it may not be possible to close a "Private Desktop".

Using this Command may close a"private Desktop" (PD) if possible.
If not, a "empty Desktop" without anything will remain until the next reboot of the PC.

For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

To create and destroy a PD you can simply type:

```
PDC.Create Desktop with Explorer|Desktop-1
MBX.Private Desktop created
PDC.close desktop|Desktop-1
MBX.Private Desktop destroyed
ENR.
```

The changes will be visible in the SPR-Editor's "Desktop Inspector".

Important:

When trying to close a PD, the Skript will need to switch to this PD and then close all Processes that are connected to the PD!
This command may have therefore unexpected side-effects! Also the Screen may flicker.
Under special circumstances this comamnd may also close programs that run on another desktop.

Windows itself provides two Standard-Desktops, these are:

```
Default
Winlogon
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

neither of these can be closed.

Syntax:

PDC.Close Desktop|P1
PDC.CDL|P1

Parameter Explanation:

P1 - The name of the private Desktop that shall be closed.

Example:

```
'---------------------------------------
'
PDC.Create Desktop with Explorer|Desktop-1
MBX.Private Desktop created
PDC.close desktop|Desktop-1
MBX.Private Desktop destroyed
ENR.
```

Remarks:

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops.
To create or destroy a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.

3.70.6 PDC.Create Desktop no Explorer

MiniRobotLanguage (MRL)

PDC.Create Desktop no Explorer

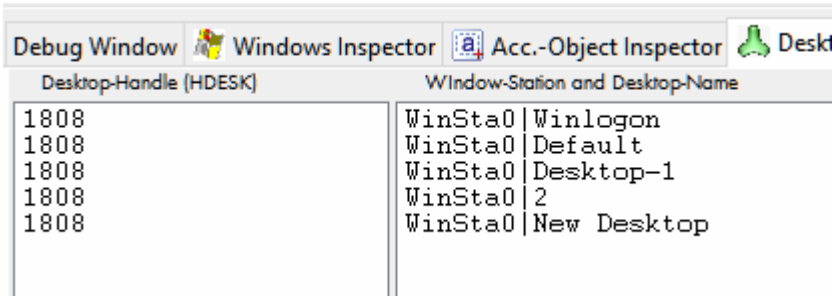
Used to create a private Desktop (Hidden Desktop)

Intention

This Command will create e a new "private Desktop" (PD) without running the windows Explorer on this new desktop.
It only makes sense, to start a Program on that PD, immediately after its creation.
.
For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.
Here is a Sample-Script.

```
VAR.$$PRO=?progs\Smart Package Robot\Desktops_Manager.exe
PDC.Create Desktop no Explorer|DTA
PDC.Run on Desktop WFI|DTA|$$PRO
PDC.Switch to Desktop|DTA
PAU.5
PDC.Goto Default
PDC.Close Desktop|DTA
MBX.!
ENR.
```

The result will be visible in the SPR-Editor's "Desktop Inspector".



Important:

PD's that are created without an "Explorer" may automatically close after the Script (and otehr Tasks running there) have ended!
Therefore they will only be visible as long as the Script is running.

Syntax:

*© 2023 Theo Gottwald * https://www.smart-package.com*

PDC.Create Desktop no Explorer|P1
PDC.CDN|P1

Parameter Explanation:

P1 - The name of the new private Desktop.

Example:

```
'---------------------------------------
'
VAR.$$PRO=?progs\Smart Package Robot\Desktops_Manager.exe
PDC.Create Desktop no Explorer|DTA
PDC.Run on Desktop WFI|DTA|$$PRO
PDC.Switch to Desktop|DTA
PAU.5
PDC.Goto Default
PDC.Close Desktop|DTA
MBX.!
END.
```

Remarks:

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops. To create a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.

3.70.7 PDC.Create Desktop with Explorer

MiniRobotLanguage (MRL)

PDC.Create Desktop with Explorer

Used to create a private Desktop (Hidden Desktop)

Intention

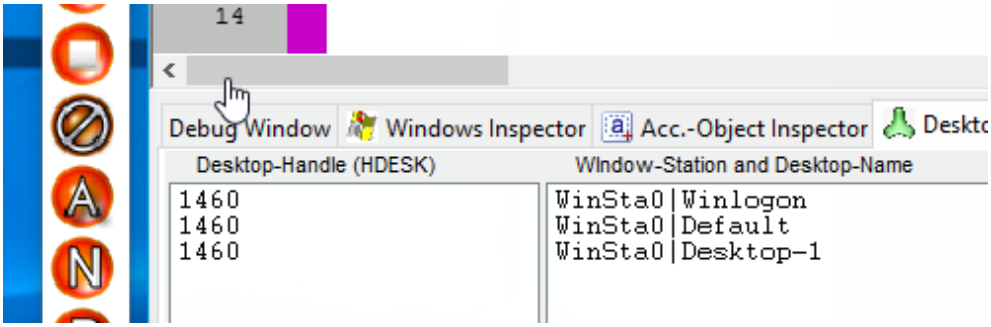
This Command will create e a new "private Desktop" (PD).
The creation of the Private Desktop is rather fast, while the loading of the Explorer will take some time.
This can continue even after the command was ready.
Even though an Explorer was loaded on the "Private Desktop", it may not work in all parts as expected.
That's due to the fact that the Explorer itself is not prepared to work with PD's.

For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

To just create a PD you can simply type:

```
PDC.Create Desktop with Explorer|Desktop-1
```

The result will be visible in the SPR-Editor's "Desktop Inspector".



Syntax:

PDC.Create Desktop with Explorer|P1

© 2023 Theo Gottwald * https://www.smart-package.com

PDC . CDE | P1

Parameter Explanation:

P1 - The name of the new private Desktop.

Example:

```
'----------------------------------------
'
PDC.Create Desktop with Explorer|New Desktop
END.
```

Remarks:

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops. To create a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.

See also:

- PRR. - Parallel-Robot-Run 2642

- 2.1.8 '#INC: - Include Files and Folders into the Executable 290

© 2023 Theo Gottwald * https://www.smart-package.com

3.70.8 PDC.Get current Desktop Name

PDC.Create Desktop no Explorer Previous 2677 Top 2658 Next 2682

MiniRobotLanguage (MRL)

PDC.Get current Desktop Name

Used to get the Name of the Desktop where a Script is running

Intention

This Command will find out the Name of the "private Desktop" (PD) where the Script is running.
For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

There are two way to use this command::

```
PDC.Get Current Desktop Name
MBX.$tos$
ENR.

' Or

PDC.Get Current Desktop Name|$$NAM
MBX.$$NAM
ENR.
```

Important:

Switching to a desktop using `PDC.Switch to Desktop|(PD-Name)`
will not change the value that is returned with `PDC.Get Current Desktop Name`

The reason is, that the Script itself ist always running at the desktop where it was started,
In fact the return of this command is "The desktop where the Script was started."

```
PDC.Create Desktop with Explorer|DTA
PDC.Switch to Desktop|DTA
PDC.Get Current Desktop Name
MBX.$tos$
ENR.
```

Switching the "View" does not make the Script to do things on another Desktop.

To do this you need to run a Script on that other Desktop.
You can do this for example using `'#HID:` or using the new enhanced `PRR./PRE.-` command.

Syntax:

© 2023 Theo Gottwald * https://www.smart-package.com

PDC.Get current Desktop Name[|P1]
PDC.GDN[|P1]

Parameter Explanation:

P1 - The name of the private Desktop where the Script is running. If omitted, the result is placed on TOS.

Example:

```
'---------------------------------------
'
PDC.Get Current Desktop Name|$$TXT
MBX.The name of the PD where the Script was started is: $$TXT
END.
```

Remarks:

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops. To create a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.

© 2023 Theo Gottwald * https://www.smart-package.com

3.70.9 PDC.Goto Default

MiniRobotLanguage (MRL)

PDC.Goto Default

Used to switch View from a private Desktop (Hidden Desktop) to the Default Desktop

Intention

This Command is similar to `PDC.Switch to Desktop`, just that the Destination of the Switch is fixed, and is the "Default Desktop". This is the Original Desktop that was created by the OS on Startup.

For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

```
PDC.Create Desktop with Explorer|DTA
PDC.Switch to Desktop|DTA
PAU.3
PDC.Goto Default
ENR.
```

Important:

You can switch to the "Default Desktop" using this command, even when the Script was run on another PD.
However all commands that the Script executes will always be executed on the desktop where the Script was originally started.
Switching the "View" does not make the Script to do things on another Desktop.
To do this you need to run a Script on that other Desktop.
You can do this for example using `'#HID:` or using the new enhanced `PRR./PRE.-` command.

Syntax:

```
PDC.Goto Default
PDC.GD
```

Parameter Explanation:

-

Example:

```
'----------------------------------------
PDC.Create Desktop with Explorer|DTA
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
PDC.Switch to Desktop|DTA
PAU.3
PDC.Goto Default
ENR.
```

Remarks:

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops. To create a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.

© 2023 Theo Gottwald * https://www.smart-package.com

3.70.10 PDC.Run on Desktop WFI/WFO

MiniRobotLanguage (MRL)

PDC.Run on Desktop WFI/WFO

Used to start a program on a private Desktop (Hidden Desktop)

Intention

This Commands will start a program on an existing "private Desktop" (PD).
The PD must exist, if the Desktop does not exist, the Program will not start the executable.
For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

There are two versions of this command:

```
PDC.Run on Desktop WFI|DTB|?path\Desktops_Manager.exe
```
and
```
PDC.Run on Desktop WFO|DTB|?path\Desktops_Manager.exe
```

In most cases there will be no big difference between either of these.
Technically the "WFI"-Version makes an "Wait for Input Idle" after the executable was started.
While the "WFO"-Version makes an "Wait for Single Object".
Depending on the Type of program you are starting any of these may be the perfect System,
to get the Moment, when the Program is really running.
In most cases you can choose the "WFO"-Version, and if it will block or not be like you want, choose the WFI-Version.

To run an executable on a PD you can simply type:

```
PDC.Create Desktop no Explorer|DTB
PDC.Run on Desktop WFO|DTB|?path\Desktops_Manager.exe
PDC.Switch to Desktop|DTB
PRR.1|DTB
  MBX.Click to proceed
  PDC.Goto Default
  ENR.
PRE.
ENR.
```

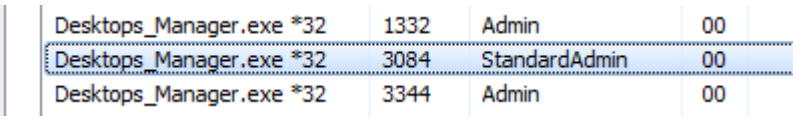
To run an executable on a PD with another User you can simply type:

```
'---------------------------------------
' We are starting a ParallelRobot on the "new Desktop"
' to make the Switchback more easy.
' Here we use the PDC.Setuser to start something with another
User
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'
PDC.Create Desktop no Explorer|DTB
PDC.Set User|StandardAdmin|Pass2
PDC.Run on Desktop WFO|DTB|?path\Desktops_Manager.exe
PDC.Switch to Desktop|DTB
PRR.1|DTB
  MBX.Click to proceed
  PDC.Goto Default
  ENR.
PRE.
ENR.
```

In the Task-Manager you can see the success:



Desktops_Manager.exe *32	1332	Admin	00
Desktops_Manager.exe *32	3084	StandardAdmin	00
Desktops_Manager.exe *32	3344	Admin	00

This will also work on the "Default" Desktop.

```
PDC.Set User|StandardAdmin|Pass2
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe
```

Syntax:

PDC.Run on Desktop WFI|P1|P2[|P3]
PDC.Ruda|P1|P2[|P3]

PDC.Run on Desktop WFO|P1|P2[|P3]
PDC.Rudb|P1|P2[|P3]

Parameter Explanation:

P1 - (in) The name of the new private Desktop.
P2 - (in) The name and path of the executable.
P3 - (in,optional) a number >0 that specified a waiting time in ms.
This waiting-time is applied after the executable was started.

Example:

```
'---------------------------------------
' We are starting a ParallelRobot on the "new Desktop"
' to make the Switchback more easy.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'

```

Remarks:

The `PDC.SetUser`-Feature is supported.

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops. To create a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.

3.70.11 PDC.Set User / Reset User

MiniRobotLanguage (MRL)

PDC.SetUser / Reset User

Used to choose another User for Running a Executable using the PDC.-Commands

Intention

This Command will only work together with
PDC.Run on Desktop WFI/WFO 2684

For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

Here is an example.

```
' This command will jsut close all running "Desktop-Managers"
' on this Desktop.
CAW.FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager

' Here we choose a User called "StandardAdmin" with a Password of "Pass2"
PDC.Set User|StandardAdmin|Pass2

' New we start 3 Instances of a executable that must be available
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe

' Here we reset the User to the User that started the Script
PDC.Reset User
' This waiting time is only needed to get things in the
' Task Manager in the right order.
PAU.1
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe
ENR.
```

The result is visible in the Task-Manager.

Desktops_Manager.exe...	1056	StandardAdmin	00
Desktops_Manager.exe...	1364	StandardAdmin	00
Desktops_Manager.exe...	3352	StandardAdmin	00
Desktops_Manager.exe...	3820	Admin	00

Syntax:

PDC.SetUser|P1|P2[|P3]
PDC.SU|P1|P2[|P3]

*© 2023 Theo Gottwald * https://www.smart-package.com*

PDC.ResetUser
PDC.RU

Parameter Explanation:

P1 - (in) Username
P2 - (in) Password
P3 - (in,optional) Domain - if omitted the PC-name is used internally

Example:

```
'----------------------------------------
'
$$LOG=(your Username)
$$PAS=(your Password)
$$DOM=(selected Domain)
CAW.FORM_DESKTOPS_MANAGER_FRMMAIN_CLASS:0|Desktops-Manager
(c) 2016 Theo Gottwald
PDC.Set User|$$LOG|$$PAS|$$DOM
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe
PDC.Reset User
PAU.1
PDC.Run on Desktop WFO|Default|?path\Desktops_Manager.exe
ENR.
VAR.$$DSK=DTX
GSB.Test
PDC.Create Desktop no Explorer|$$DSK
GSB.Test
ENR.
```

Remarks:

Some tasks may not work without the selected User having Admin-Rights.

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops. To create a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.

3.70.12 PDC.Switch to Desktop

MiniRobotLanguage (MRL)

PDC.Switch to Desktop

Used to switch the View to a private Desktop (Hidden Desktop)

Intention

This Command will switch the View to a "private Desktop" (PD).
This way you can see whatever happens on that PD.

IMPORTANT:
Even if you Switch the View to a PD, all Robot-Commands will be executed on the Desktop where the Robot was originally started. This command does only switch the View.

For more Details on "Private Desktops" (PD) see here: PDC - General Information 2658
.

To just create a PD and Switch there you can simply type:

```
PDC.Create Desktop no Explorer|Desktop-1
PDC.Switch to Dektop|Desktop-1
PAU.2
PDC.Goto Default
ENR.
```

Here is another example that will switch to and back from a new created Desktop.

```
PDC.Create Desktop with Explorer|DTF
PDC.Switch to Desktop|DTF
PRR.0|DTF
  MBX.I am on the DTF-Desktop
  PDC.Goto Default
PRE.
MBX.End the Script
ENR.
```

Syntax:

```
PDC.Switch Desktop|P1
PDC.swd|P1
```

Parameter Explanation:

P1 - The name of the private Desktop.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example:

```
'----------------------------------------
' This Script will creat e Desktop and start a
' new Script on that Desktop using the PRR.-Command
'
PDC.Create Desktop with Explorer|DTF
PDC.Switch to Desktop|DTF
PRR.0|DTF
  MBX.I am on the DTF-Desktop
  PDC.Goto Default
PRE.
MBX.End the Script
ENR.
```

Remarks:

This feature is currently experimental, therefore not all features of the SPR and the SPR-Editor may work as expected on private Desktops. To create a private Desktop, the Executable needs Admin-Rights.

Limitations:

This Feature may require Windows Vista or higher.

3.71.2 PIL. - PlugIn Launch

MiniRobotLanguage (MRL)

PIL. Command

PlugInLaunch

Intention

The `PIL`-Command launches a PlugIn. A PlugIn is (for example) a button-bar like the one in this picture:

A PlugIn is a separate Program which communicates with the robot.

There may be multiple PlugIn's running at the same time

At the moment of this writing the only Plugin avaiable is PlugIn_01.exe - thats a sort of button-bar.

Syntax

PIL.P1|P2

Parameter Explanation

P1 - `variable which becomes the PlugIn Index-No`
P2 - `PlugIn typ-number, actually always 01`

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```

Remarks

You can use up to 5 Plugins. Just start them, each will get another Index.

Limitations:

-

See also:

- PIL. - PlugIn Launch 2702
- PIS. - PlugIn Send 2749
- PIW. - PlugInWait 2706

© 2023 Theo Gottwald * https://www.smart-package.com

3.71.3 PIW. - PlugInWait

MiniRobotLanguage (MRL)

PIW. Command

Plug In Wait

Intention

The `PIW.`-Command waits for a Message from a specified PlugIn.
Thats a separate Program which communicates with the robot.
There may be different PlugIns.

At the moment of this writing the only Plugin avaiable is PlugIn_01.exe - thats a sort of button-bar.

The `PIW.` waits till a button is pressed or a mouseover event happened then gives the result back in **P2**. **P1** contains the PlugIn Index from `PIL`

Syntax

```
PIW.P1|P2[|P3]
```

Parameter Explanation

P1 **-** variable with the the PlugIn Index-No. from **PIL**.

P2 **-** Variable which holds the number of the event that happened
to the PlugIn.

P3 **-** ***(optional)*** Timeout-Value. After this time in seconds PIW. is left (without any Event) and the Timeout-Flag is set.

PIW. returns a number of Messages in **P2** from the PlugIn:

```
' 12345 represents the window to which the Plugin has been
attached using PIS.$$PIN|attach

' Close is returned when the window which the Plugin is
attached to has been closed/does not respond.
 12345 !Closed!
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' Iconic is returned, when the window which the Plugin is
attached to has been iconized.
 12345 !Iconic!

' When the window becomes normal sized from being iconized,
the Plugin reports
 12345 !nsize!

' invisible is returned the window which the Plugin is
attached to has been made invisible using MWI*.
 12345 !invisible!

' When the window becomes visible from being invisible, the
Plugin reports
 12345 !visible!

' disabled is returned the window which the Plugin is attached
to has been made disabled using MWE*.
 12345 !disabled!

' When the window becomes visible from being invisible, the
Plugin reports
 12345 !enabled!

' normal is returned, if the window which has been iconized or
made invisible or was disabled becomes "usable" again. Usable
is a window which is enabled, visible and not iconized.
 12345 !normal!

' "D"ouble-"P"ressed is been returned on a Doubleclick on that
Button
' The number 5 represents in this case the number for the
button
' which has been pressed.
 5 !P!D!

' "P"ressed is been returned on a Click on that Button with
left Mousebutton
' The number 5 represents in this case the number for the
button
' which has been pressed.
 5 !P!

' "R"ight is been returned on a Click on that Button with
Right Mousebutton
' The number 5 represents in this case the number for the
button
' which has been pressed.
 5 !R!

' Mouse Over is been returned if the Mouse is over the
specified
' button. In fact the Message is returned once the Mouse
enters the
' button area.
' The number 5 represents in this case the number for the
button
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' which area has been entered.
 5 !M!O!

' Mouse Left is been returned if the Mouse has left the
specified
' button area with a mouse move. In fact the Message is
returned
' once the Mouse leaves the button area.
' The number 5 represents in this case the number for the
button
' which area has been left.
 5 !M!L!

' The OK Message is been sent in Response to commands given to
' the PlugIn as a Reply.
' OK
```

Additionally there custom responses from the PlugIn depending on the command being sent.
With **PIS.** for example **"gethandle"**.

---
* not implemented at the time of this writing.

3.71.4 PIS. - PlugIn Send

3.71.4.1 ! Buttonbar for Blender-Sample Code

MiniRobotLanguage (MRL)

Buttonbar for Blender-Sample Code

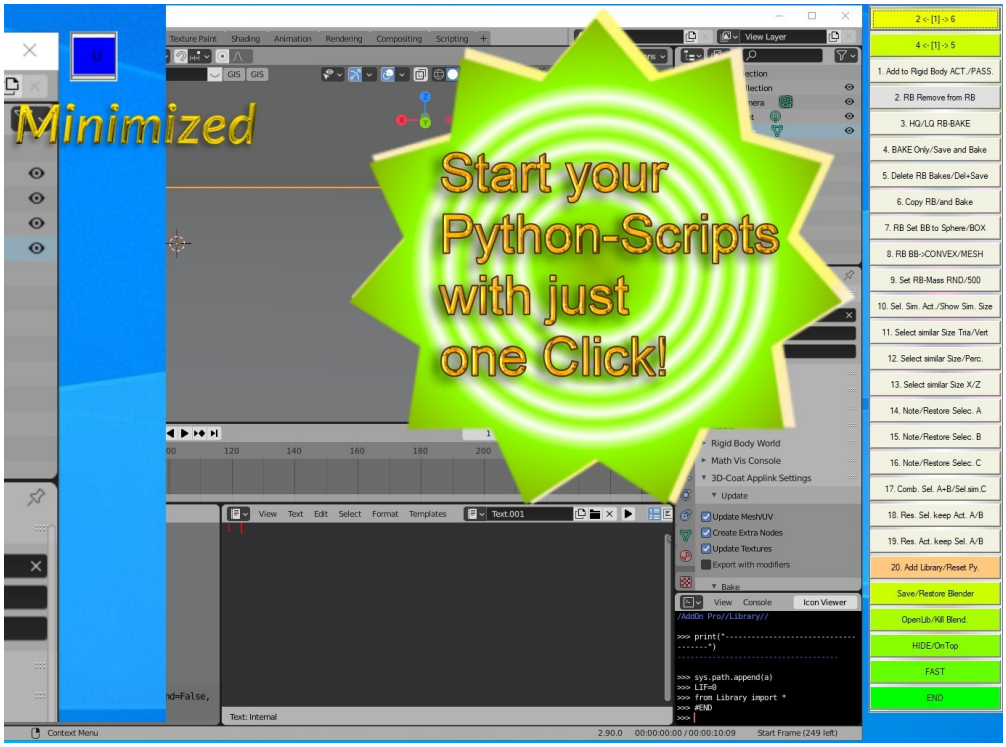
This Script is a commercial Blender AddOn

Intention

Using the SPR and its PlugIn we can realize a "Companion" for any Software that accepts Mouse and Keyboard Input.
The Code below realizes the Blenderbar Pro AddOn.It was developed over time so it does not yet use all the new Features for Textfiles.
However the idea to implement them has to do with these tasks.

The AddOn is available at Blendermarket here:
https://blendermarket.com/products/blender-quickbuttons-buttonbar

but as you have the SPR you can just compile it yourself.



*© 2023 Theo Gottwald * https://www.smart-package.com*

3.71.4.2 ! Buttonbar for HM8-Sample Code

MiniRobotLanguage (MRL)

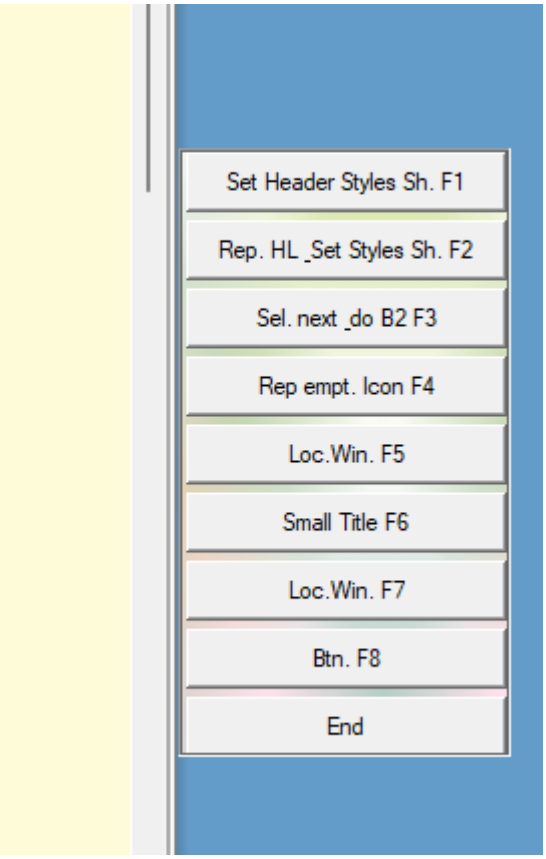
Buttonbar for Blender-Sample Code

This Script is a commercial Blender AddOn

Intention

Using the SPR and its PlugIn we can realize a "Companion" for any Software that accepts Mouse and Keyboard Input.

The Code below realizes an AddOn Buttonbar for "Help and Manual 8".
The functions may mostly be very special to my usage, but you can clearly see the general structure.



ButtonBar attached to the HM8 Window

Code Explanation

 *© 2023 Theo Gottwald * https://www.smart-package.com*

-

Example

```
'
'#################################################################
##########
' Button-Bar for Help and Manual 8

3.71.4.3 ! PIS. - PlugIn Send

MiniRobotLanguage (MRL)

PIS. Command

PlugInSend

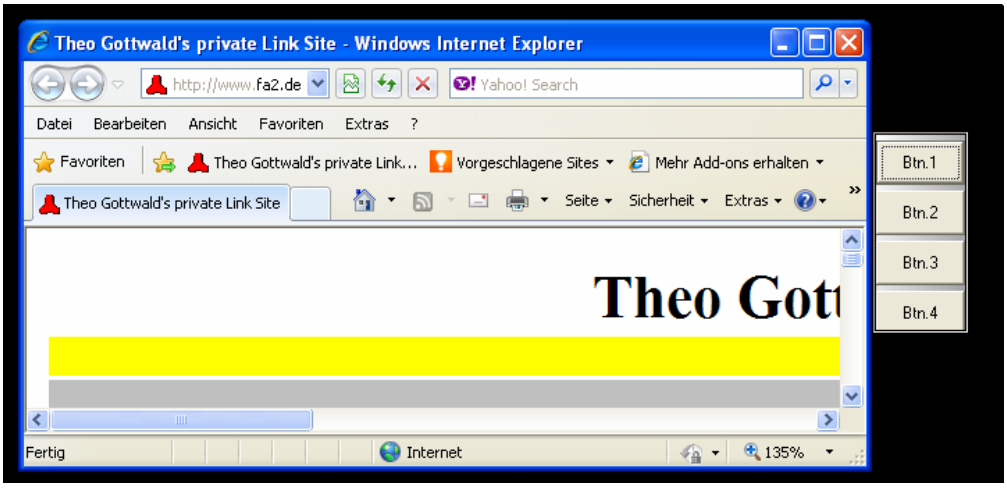
Intention

The PIS-Command sends Commands to a PlugIn.

Using `PIS.` you can

- change the Text on the Buttons,
- attach a picture to the buttons,
- resize the Plugin or
- attach the PlugIn to any window
- and much more.

You can also decide whether the PlugIn Buttons should be arranged vertical or horizontal.



This is a vertical PlugIn 01. It will be arranged vertical, using:

```
' Plugin vertical
PIS.$$REA|sv
```

And in the picture below you see a horizontal PlugIn.
The code for a horinzontal PlugIn is:

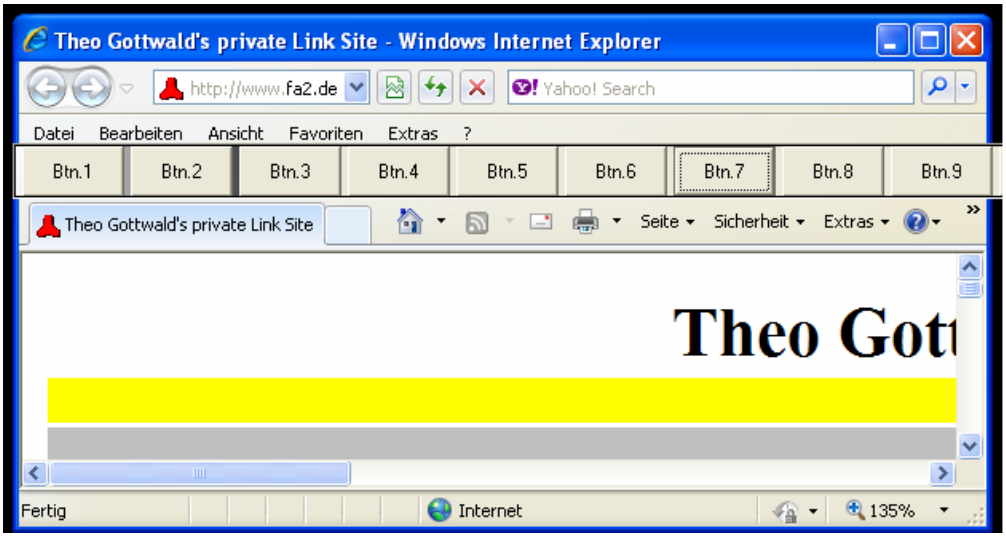
```
' Plugin horizontal
PIS.$$REA|sh
```

Important note:

Select the arrangement (horizontal/vertical) immediately after the PlugIn Launch.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Then add all needed Buttons. If you need to change the arrangement later, reduce the button-number to 1 and then after changing, add additional buttons.



Syntax

PIS.P1|P2[|P3...Px]

Parameter Explanation

P1 - variable which contains the PlugIn Index-No.

P2 - Command which shall be sent to the PlugIn

All commands are specific for the type of PlugIn used.
Following PlugInCommands are supported by the actual
PlugIn_01.exe:

```
"at","attach"
' $$I06 attach the Plugin to the window,
' 2 - right side, 1 - on Top
' §§I05
' 1 - Left side outside; 2 - Right side outside;
' 3 - left side inside, 4 - right side inside;
' 5  - left side inside bündig, 6 - right side inside bündig
'
PIS.$$PIN|attach|$$ULT|$$I05|$$I06
```

' Set Distance between buttons (vertical in Points)
PIS.$$REA|sbvd|4

PIS.$$REA|sbn|1

' This double Loop will Show more or less buttons
FOR.$$LOA|1|2
  FOR.$$LOP|1|20
    PRT.->$$LOP
    PIS.$$REA|sbn|$$LOP
    PAU..2
  NEX.
NEX.

PAU.2
:enz
END.
```

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.

© 2023 Theo Gottwald * https://www.smart-package.com

To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
```
PIS.$$PIN|sbt|all|Button %n
```
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-
-

See also:

- PIL. - PlugIn Launch 2702
- PIS. - PlugIn Send 2749

3.71.4.4 PIS.attach/detach

MiniRobotLanguage (MRL)

PIS.attach/detach Command

PlugInSend attach/detach

Intention

The `PIS.attach`-Command will attach a Buttonbar to a Target Window.
The `PIS.detach`-Command will detach a Buttonbar from the Target Window. After that the Buttonbar can be moved around.

"at","attach"
```
PIS.$$PIN|attach|$$ULT|0|0
```

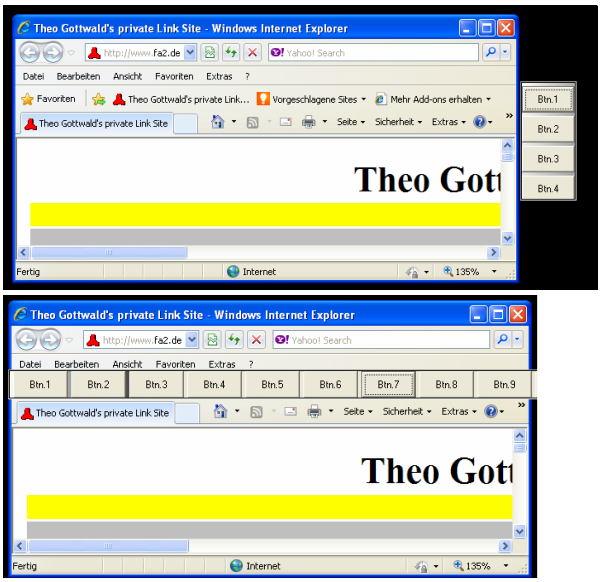
"dt","detach"
```
PIS.$$PIN|detach
```

Using the "attach/detach" Subcommand, you can define whether and where a Plugin is attached to an existing window.
To clearly specify the Position of the Plugin, you need to decide whether the PlugIn Buttons should be arranged vertical or horizontal.
This is the first step. For this you use the "sv" or the "sh" Subcommand.

This is a vertical PlugIn 01. It will be arranged vertical, using:
```
' Plugin vertical
PIS.$$REA|sv
```

And in the picture below you see a horizontal PlugIn.
The code for a horinzontal PlugIn is:
```
' Plugin horizontal
PIS.$$REA|sh
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

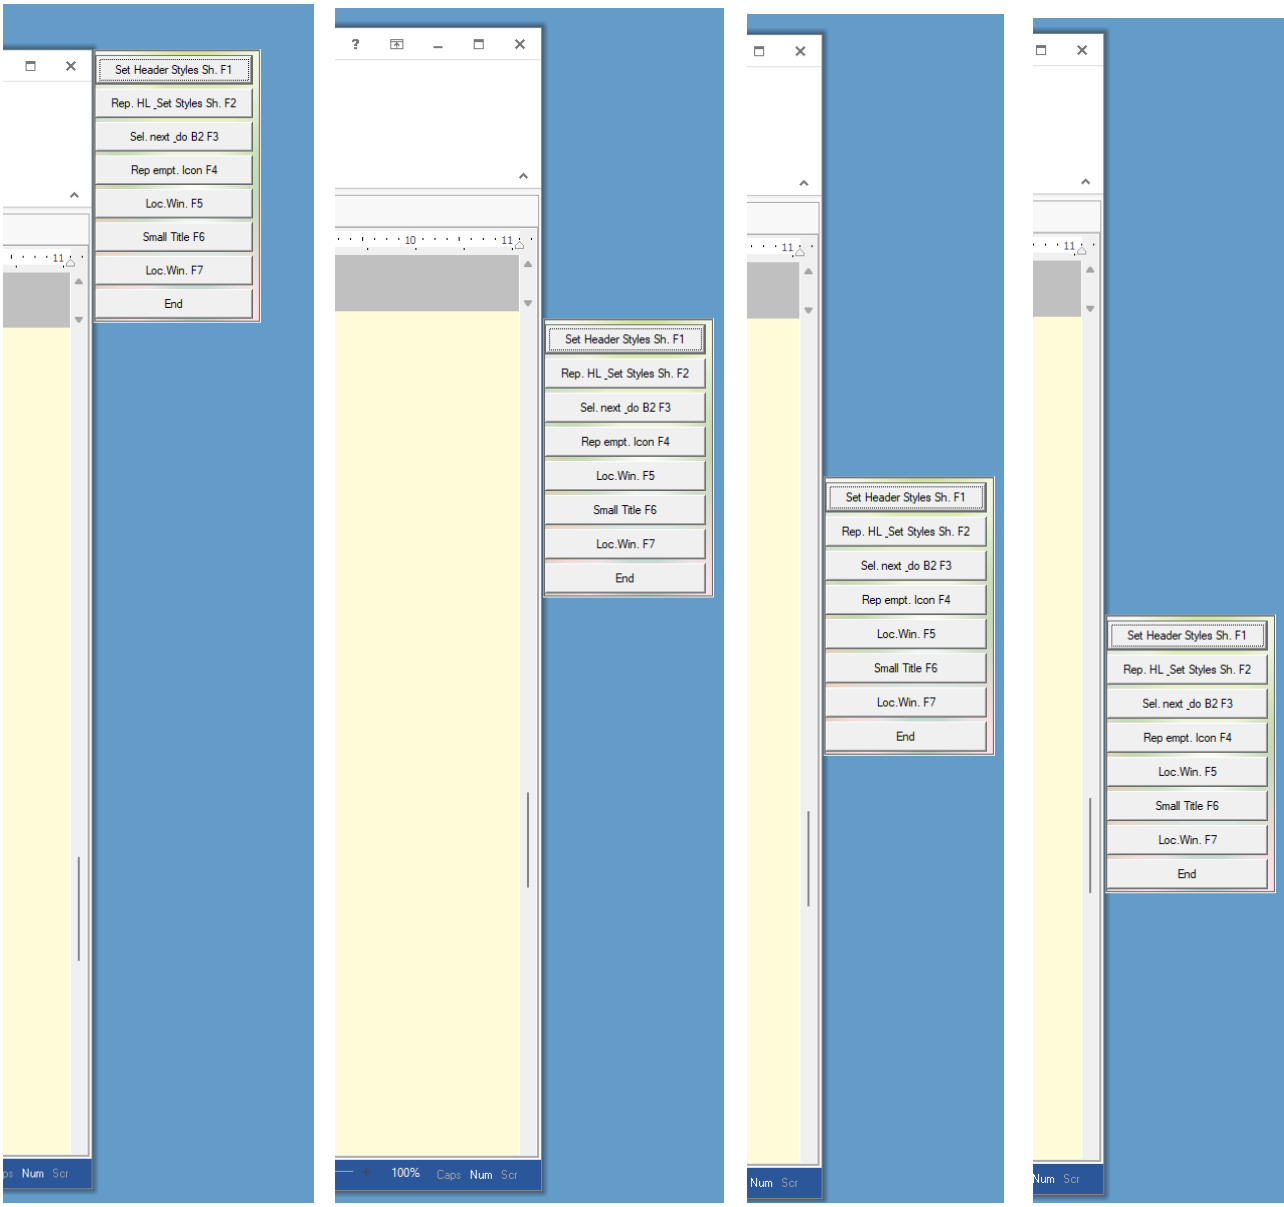


Here you can see a vertical and horizontal Plugin-Buttonbar. Below you will find more Samples.

The following are Samples using a vertical Buttonbar:

The vertical Positions are calculated depending on the PlugIn-Size, and the Target-Window Size.

*© 2023 Theo Gottwald * https://www.smart-package.com*



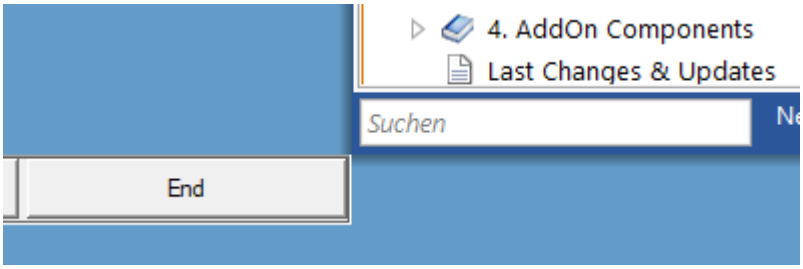
X= 1 2 3 4

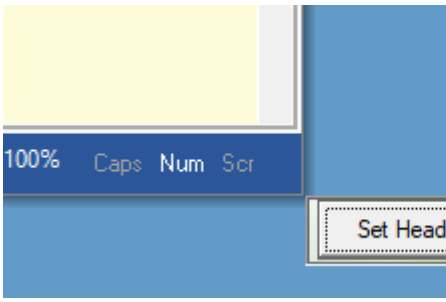
```
PIS.$$PLG|sv
PIS.$$PLG|attach|$$HWN|2|X
```

The following are Samples using a horizontal Buttonbar:

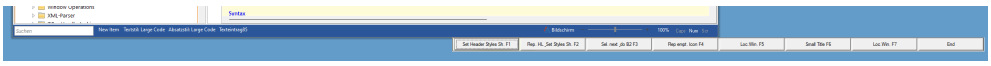
```
PIS.$$PLG|sh
PIS.$$PLG|attach|$$HWN|X|6
below you find the Values for "X"
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



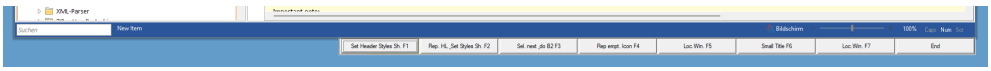


X= 1 2



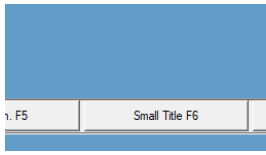
X= 4

X= 5

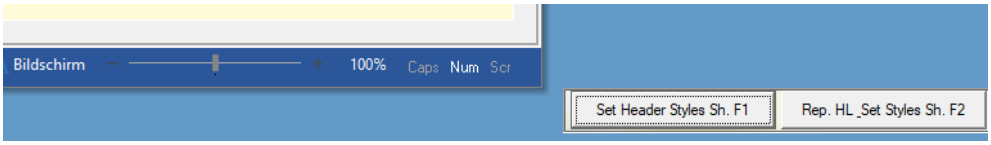


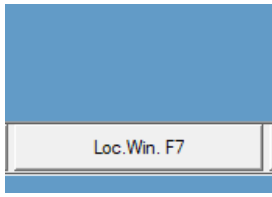
X= 6

X= 8

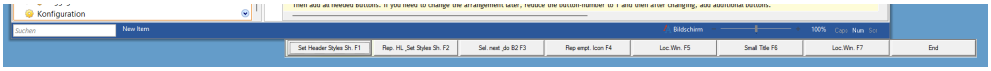


X= 10



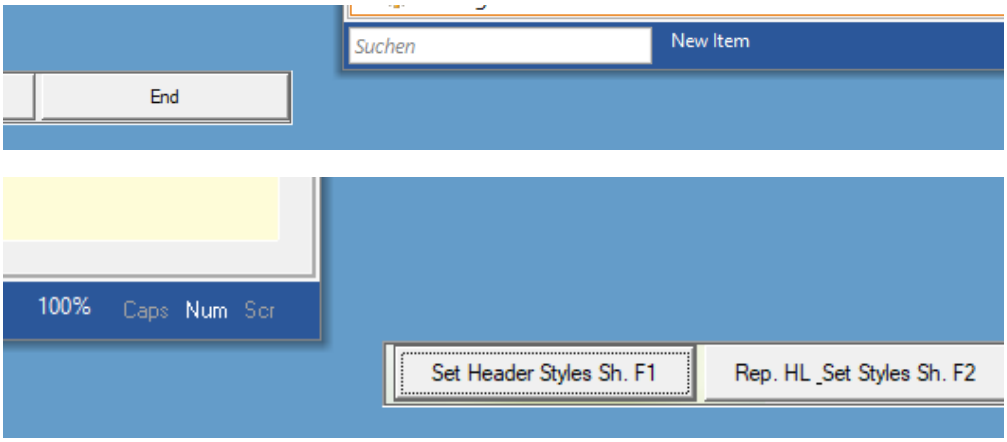


X= 12 -> 16 Pixel Distance to the right Border



X= 14 (right Anchor)

© 2023 Theo Gottwald * https://www.smart-package.com



X= 15 -> 32 Pixel Distance to the right Border

Important note:
Select the arrangement (horizontal/vertical) immediately after the PlugIn Launch. Then add all needed Buttons. If you need to change the arrangement later, reduce the button-number to 1 and then after changing, add additional buttons.

Syntax

PIS.P1|attach|P2|P3|P4
PIS.P1|at|P2|P3|P4

PIS.P1|detach
PIS.P1|dt

Parameter Explanation

P1 - Variable which contains the PlugIn Index-No.
P2 - Window-Handle of Target Window
P3 - Position of Buttonbar relative to Target-Window
1 - Left Side Outside the Window
2 - Right Side Outside the Window (default value, if omitted or zero)
3 - Left Side Inside the Window with Distance
4 - Right Side Inside the Window with Distance
5 - Left Side Inside the Window
6 - Right Side Inside the Window
... 16 (see above)

P4 - X/Y-Position of Buttonbar relative to Side

© 2023 Theo Gottwald * https://www.smart-package.com

```
1 - Top-Side, Inside
2 - Top Quarter
3 - Middle
4 - Lower Middle
5 - Down-Side Inside
6 - Down-Side Outside
7 - Top-Side Outside
... 15  (see above)
```

Some of the values set The anchor on the left side of the Target Window, some set the Anchor on the right side.

Example

```
'*********************************
' Vertical Plugin-Sample
'*********************************
'VAR.$$PIC=24_about.bmp
EXO.iexplore
PIL.$$REA|01
' use any window to attach the plugin
STW.t|explorer
' Store the window handle in a variable
HTV.$$ULT

PIS.$$REA|sbhd|4

' Plugin vertikal anordnen
PIS.$$REA|sv
' Make the PlugIn visible
PIS.$$REA|show

' attach the Plugin to the window
PIS.$$REA|attach|$$ULT|0|0

' Set text on Button 1
FOR.$$CNT|1|20
  PIS.$$REA|sBt|$$CNT|Btn.$$CNT
NEX.

' Show a picture on Button 2
'PIS.$$REA|sp|2|$$PIC

' Set Distance between buttons (vertical in Points)
PIS.$$REA|sbvd|4

PIS.$$REA|sbn|1

' This double Loop will Show more or less buttons
FOR.$$LOA|1|2
  FOR.$$LOP|1|20
    PRT.->$$LOP
    PIS.$$REA|sbn|$$LOP
    PAU..2
  NEX.
NEX.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PAU.2
:enz
END.
```

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Technically the Anchoring Points are defined like this:

```
x,y - size of Plugin-Buttonabar
nleft means the Anchor is on the left side of the Target Window, nRight mean

CASE 1:xt=r2.nleft-x ' links ausserhalb des Fensters
CASE 2:xt=r2.nright+1 ' rechts ausserhalb des fenster
CASE 3:xt=r2.nleft+(x/2) ' links mitte
CASE 4:xt=r2.nright-(x/2) ' rechts mitte
CASE 5:xt=r2.nleft ' links innerhalb
CASE 6:xt=r2.nright-x ' rechts innerhalb
CASE 7:xt=r2.nright-(x/4) ' rechts mitte
CASE 8:xt=r2.nright-((x/4)*3) ' rechts mitte
CASE 9:xt=r2.nleft+(x/4) ' rechts mitte
CASE 10:xt=r2.nleft+((x/4)*3) ' rechts mitte
CASE 7:xt=r2.nright+(x/4) ' rechts mitte
CASE 8:xt=r2.nright+((x/4)*3) ' rechts mitte
CASE 9:xt=r2.nleft-(x/4) ' rechts mitte
CASE 10:xt=r2.nleft-((x/4)*3) ' rechts mitte
CASE 11:xt=r2.nleft-((x/8)*7)
CASE 12:xt=r2.nright+16
CASE 13:xt=r2.nleft-x-16
CASE 14:xt=r2.nright-((x/8)*7)
CASE 15:xt=r2.nleft-x-32
CASE 16:xt=r2.nright+32

CASE 1:yt=r2.ntop ' Fenster oben anlegen, innerhalb
CASE 2:yt=r2.ntop+(T08/4) ' oberes viertel
CASE 3:yt=r2.ntop+(T08/2)-(y/2) ' mitte anlegen
CASE 4:yt=r2.ntop+(T08/2) ' mitte unten anlegen
CASE 5:yt=r2.nbottom-y ' unten ausserhalb
CASE 6:yt=r2.nbottom ' unten ausserhalb anlegen
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
CASE 7:yt=r2.ntop-(y+1) ' Fenster oben anlegen, ausserhalb
CASE 8:yt=r2.ntop+(T08/4)-(y/2) ' oberes viertel minus Pluginsize
CASE 9:yt=r2.ntop+(T08/8) ' oberes achtel
CASE 10:yt=r2.ntop+(T08/8)-(y/2) ' oberes achtel-Plugin-Size

3.71.4.5 PIS.ButtonEnable / ButtonDisable

PIS.ButtonEnable / ButtonDisable - be/bd Previous 2702 Top 41 Next 2706

MiniRobotLanguage (MRL)

PIS.ButtonEnable Command
PIS.ButtonDisable Command

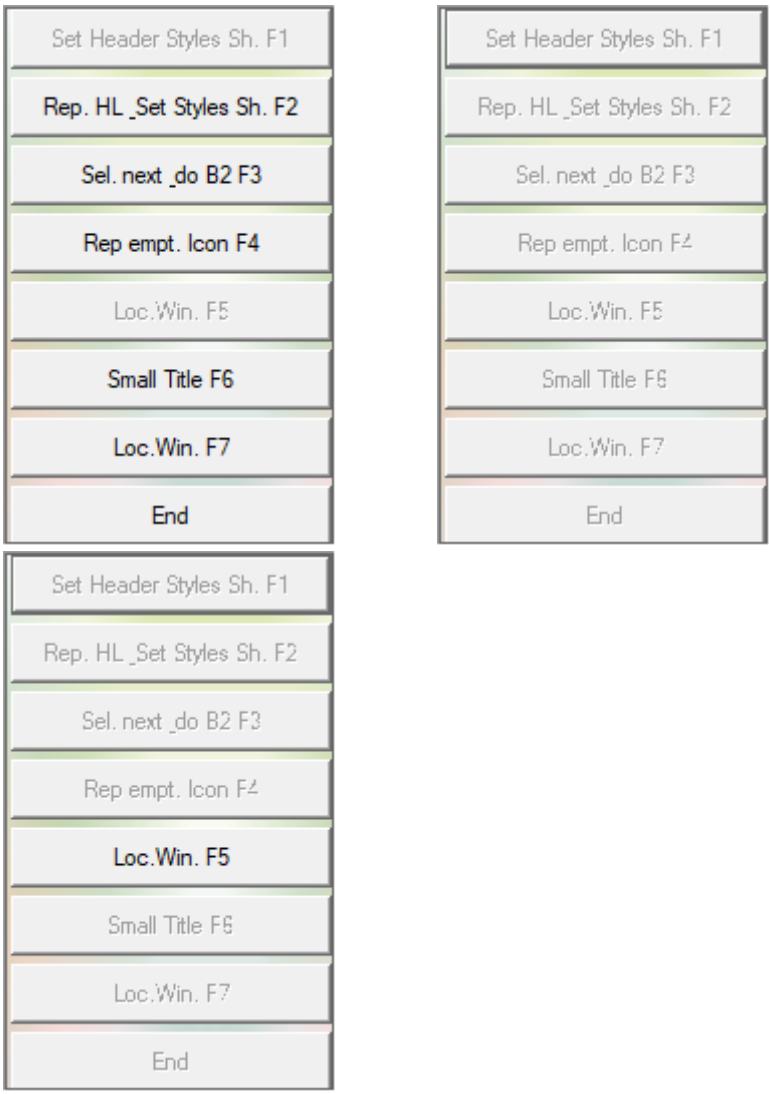
Enable or disable Buttons of the specified Buttonbar

Intention

The `PIS.ButtonEnable / ButtonDisable` -Command will enable or disable the specified button.
If you specify "all" instead of a Button-Number, then all Buttons will be enabled or disabled.

```
PIS.$$REA|ButtonDisable|1
PIS.$$REA|ButtonDisable|5
PIS.$$REA|ButtonDisable|all
PIS.$$REA|ButtonEnable|5
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



Buttonbar with enabled, and disabled Buttons.

Syntax

```
PIS.P1|ButtonEnable|P2
PIS.P1|be|P2

PIS.P1|ButtonDisable|P2
PIS.P1|bd|P2
```

Parameter Explanation

P1 - Variable which contains the *PlugIn Index-No.*

© 2023 Theo Gottwald * https://www.smart-package.com

P2 **-** value (0-255)- the transparency Values range from 0 to 255,
where 0 is completely transparent (invisible) and 255 is solid (not transparent).

All commands are specific for the type of PlugIn used.

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-

-

3.71.4.6 PIS.GetHandle

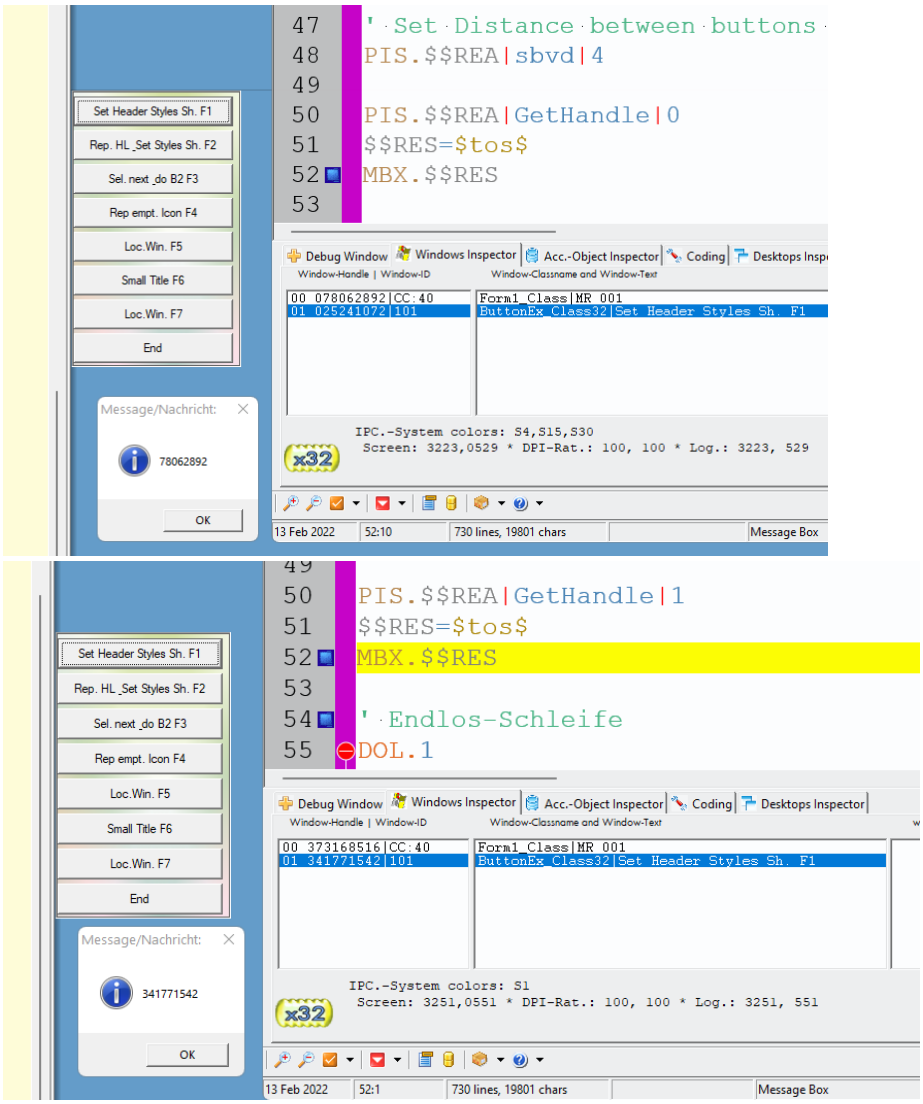
MiniRobotLanguage (MRL)

PIS.GetHandle Command

Get the Window-Handle from the Buttonbar

Intention

The `PIS.GetHandle` -Command will return the Window-Handle from the specified Buttonbar.
Using **P2** you can specify a number from 1 to (number of buttons) to get the Windowhandle from that Button.
The result is always placed on TOS.



Get Windowhandle from Buttonbar (Tophandle)
Get Windowhandle from Buttonbar (Handle from Button 1)

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

PIS.P1|GetHandle|P2
PIS.P1|gH|P2

Parameter Explanation

P1 - `Variable` which contains the *`PlugIn Index-No.`*

P2 - *`Button Number`*, starting with "1" to get the Button-Windowhandle, if omitted or 0, the returned handle is from the Top-Window of the Buttonbar

The result is always placed on TOS.

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-

-

3.71.4.7 PIS.GetMouseButton

MiniRobotLanguage (MRL)

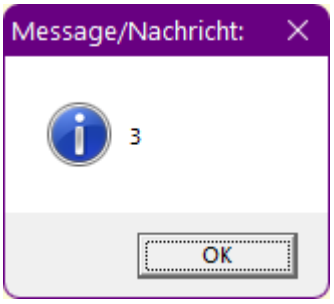
PIS.GetMouseButton Command

Get the Number of the Button where the Mouse is (Mouseover)

Intention

The `PIS.GetHandle` -Command will return the Window-Handle from the specified Buttonbar or the Button where the Mouse is currently over.
It can be used to react to Mouse-Over Commands.
If the Mouse is not over a Buttonbar-Button, the result is "0" The result is always placed on TOS.

```
PIS.$$REA|GetMouseButton
$$RES=$TOS$
```



Syntax

```
PIS.P1|GetMouseButton
PIS.P1|gmb
```

Parameter Explanation

P1 – `Variable` which contains the *`PlugIn Index-No.`*

Will return the number of the Button over which the Mouse is currently.
If the Mouse is not over a Buttonbar-Button, the result is "0" The result is always placed on TOS.

Example

```
'*********************************
' Vertical Plugin-Sample
'*********************************

Remarks

*© 2023 Theo Gottwald * https://www.smart-package.com*

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
```
PIS.$$PIN|sbt|all|Button %n
```
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-
-

3.71.4.8 PIS.GetMouseButtonHandle

MiniRobotLanguage (MRL)

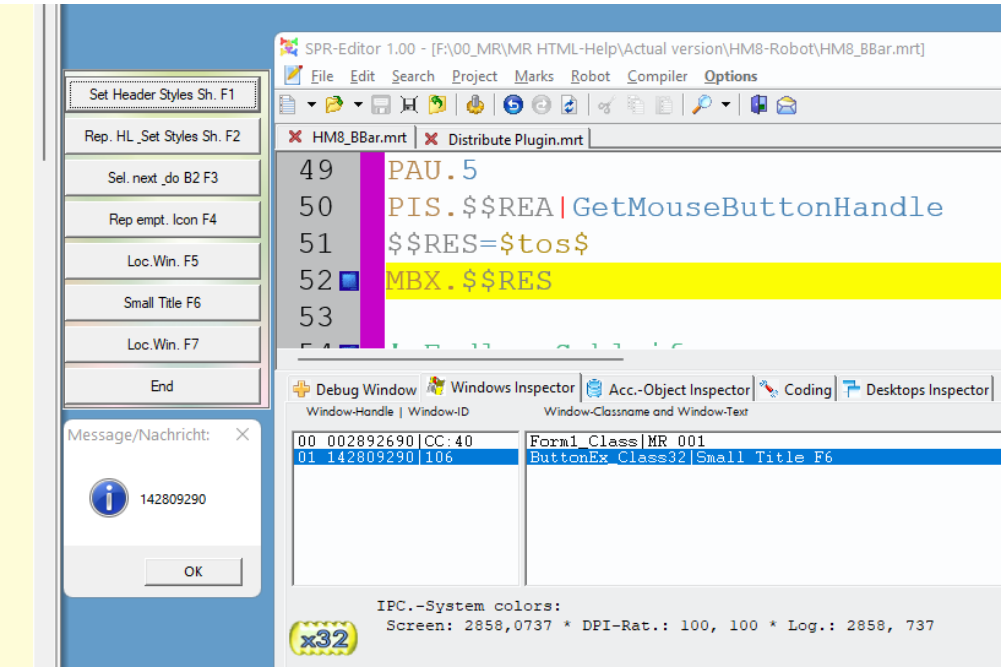
PIS.GetMouseButtonHandle Command

Get the Handle of the Plugin-Button where the Mouse is (Mouseover)

Intention

The `PIS.GetHandle` -Command will return the Window-Handle from the specified Buttonbar.
Using **P2** you can specify a number from 1 to (number of buttons) to get the Windowhandle from that Button.
The result is always placed on TOS.

```
PIS.$$REA|GetMouseButtonHandle
$$RES=$TOS$
```



Syntax

```
PIS.P1|GetMouseButtonHandle
PIS.P1|gmbh
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Parameter Explanation

P1 - `Variable` which contains the *`PlugIn Index-No.`*

The result is always placed on TOS. It will be "0" if the Mouse is not over any of the Buttons, otherwise the number of the Button is returned.

Example

3.71.4.9 PIS.MouseMessageFilter

MiniRobotLanguage (MRL)

PIS.MouseMessageFilter Command

Set/Change which Mouse-Messages you get inside of PIW. for each Button.

Intention

The `PIS.MouseMessageFilter` -Command will let you decide for each Button, which Mouse-Messages you want to get - or not.
Generally a "Mouse-Event" can be a Button-Click, left or right Mousebutton, or it can just be an Mouseover, see the `PIW.-Command` for Details on which Mouse-Events the Robot supports.
Now each Mouse-Event needs your programs attention. Therefore you can now filter which Mouse-Event should be sent or not.
This is done, using the `PIS.MouseMessageFilter` -Command.
You define the filter once and then you will only get those messages that you really want.

0 - receive alle Messages (reset Filter)
1 - No Messages for Autorun-Executable-Events
2 - No DoubleClick-Messages
4 - No Singleclick Messages
8 - No Mouseover Messages
16 - No Mouse-Left-Messages (Mouse leaving the Button = End of Mouse-Over)

You just add the Numbers that you want to filter out, and call the

```
PIS.$$REA|MouseMessageFilter|8|(8+16+1)
' or add the numbers yourself:
PIS.$$REA|MouseMessageFilter|8|25
```

Command.

If you want to reset the filter to get all Messages, use:

```
PIS.$$REA|MouseMessageFilter|8|0
```

Here is an example:

```
  $$PAT=?path\Hallo.exe
PIS.$$REA|MouseMessageFilter|8|1
PIS.$$REA|setautorunsynchron|8|$$PAT

' Endlos-Schleife
DOL.1
  PIW.$$REA|$$BTN|4
  ITO.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
    PAU.0.1
    GTO.MLop
  EIF.
' Button wurde geklickt oder Mouseover
  GSB.react
  :MLop
OOP.
PAU.2
:enz
END.
```

Syntax

PIS.P1|MouseMessageFilter|P2|P3
PIS.P1|Mmf|P2|P3

Parameter Explanation

P1 - Variable which contains the *PlugIn Index-No.*

P2 - *Button Number*, starting with "1" to 40

P3 - ***value for the Filter*** **(0 to 31) see description above.**

All commands are specific for the type of PlugIn used.

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:

© 2023 Theo Gottwald * https://www.smart-package.com

```
PIS.$$PIN|sbt|all|Button %n
```

The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

3.71.4.10 PIS.SetAutoHide

MiniRobotLanguage (MRL)

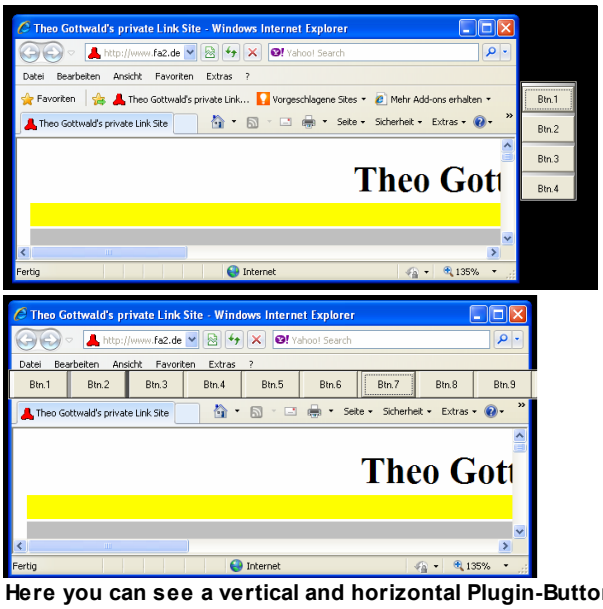
PIS.SetAutoHide Command

PlugInSend Set Autohide on/off

Intention

The `PIS.SetAutoHide`-Command will set the Behavior of the Buttonbar, in case the Target-Window becomes unavailable.
If the Target Window gets disabled, invisible or is minimized, then the Buttonbar will automatically become invisible.
In this case it will automatically return to visibility when the target window is back.
This Behavior can be influenced with the command "`PIS.$$PIN|SetAutoHide|0/1`" Command.

```
' Will switch off the Autohide-Feature
PIS.$$PIN|SetAutoHide|0
' Will switch on the Autohide-Feature
PIS.$$PIN|SetAutoHide|1
```



Here you can see a vertical and horizontal Plugin-Buttonbar. Below you will find more Samples.

Important note:
If you use `PIS.$$PIN|Hide` to make the Buttonbar invisible, the AutoHide Feature will NOT make it visible.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

PIS.P1|SetAutoHide|P2
PIS.P1|Sah|P2

Parameter Explanation

P1 **-** `Variable which contains the PlugIn Index-No.`
P2 **-** `0/1 - Switch on(off the AutoHide-Feature`

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

3.71.4.11 PIS.SetAutoRunSynchron / SetAutoRunASynchron

PIS.SetAutoRunSynchron / SetAutoRunASynchron Previous 2702 Top 41 Next 2706

MiniRobotLanguage (MRL)

PIS.SetAutoRunSynchron PIS.SetAutoRunASynchron Command

PlugInSend Run Executable on Button-Press (deactivate Button for the time)

Intention

Using the `PIS.SetAutoRunSynchron / SetAutoRunASynchron`, you can make the Buttonbar
directly start an executable. You will still be notified in the `PIW.`-Command that the Button has been pressed,
this will happen after the executable has been started.

So what is the difference between running an executable ASynchron or Synchron?
If you run it "ASynchron" the Plugin will just run the executable and immediately continue what its doing,
NOT waiting for the executable to end its task.
If you run it "Synchron" the Plugin will run the executable and wait for the executable to end its task.
In that time, the Button will be disabled.

```
$$PAT=?path\Hallo.exe
' Define Button 7 to start the Hallo.exe "ASynchroneous"
PIS.$$REA|SetAutoRunASynchron|7|$$PAT
' Define Button 8 to start the Hallo.exe "Synchroneous"
PIS.$$REA|setautorunsynchron|8|$$PAT
```

Syntax

PIS.P1|SetAutoRunSynchron|P2|P3
PIS.P1|Sas|P2|P3

PIS.P1|SetAutoRunASynchron|P2|P3
PIS.P1|Saa|P2|P3

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **-** Variable which contains the PlugIn Index-No.
P2 **-** ***Value,*** Button Number
P3 **-** Variable with the complete Path of the Executable to start on the press of the Button.

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-

-

See also:

- PIL. - PlugIn Launch 2702

- PIW. - PlugInWait 2706
-

© 2023 Theo Gottwald * https://www.smart-package.com

3.71.4.12 PIS.SetAutoRunSynchronNoDisable / SetAutoRunASynchronNoDisable

MiniRobotLanguage (MRL)

PIS.SetAutoRunSynchronNoDisable PIS.SetAutoRunASynchronNoDisable

PlugInSend Run Executable on Button-Press (do NOT deactivate Button for the time)

Intention

Using the `PIS.SetAutoRunSynchronNoDisable / SetAutoRunASynchronNoDisable`,
you can make the Buttonbar directly start an executable. You will still be notified in the
`PIW.`-Command that the Button has been pressed, this will happen after the executable has been started.

So what is the difference between running an executable ASynchron or Synchron?
If you run it "ASynchron" the Plugin will just run the executable and immediately continue what its doing,
NOT waiting for the executable to end its task.
If you run it "Synchron" the Plugin will run the executable and wait for the executable to end its task.
In that time, the Button will NOT be disabled.

```
$$PAT=?path\Hallo.exe
' We do not want a Mousemessage in PIW. for Button 8 so we
PIS.$$REA|MouseMessageFilter|8|1

' Define Button 7 to start the Hallo.exe "ASynchroneous"
PIS.$$REA|SetAutoRunASynchronNoDisable|7|$$PAT
' Define Button 8 to start the Hallo.exe "Synchroneous"
PIS.$$REA|setautorunsynchronNoDisable|8|$$PAT
```

Generally a Mouse-Message will be sent to the PIW.
If you do not want to get a Message that the Button was pressed, then you can use the

```
PIS.$$REA|MouseMessageFilter|8|1
```

Command to decide which messages you want or not.
Value "1" means "No messages for Running Executables".
Value "0" will clear the filter and then you will get all messages.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

PIS.P1|SetAutoRunSynchron|P2|P3
PIS.P1|Sas|P2|P3

PIS.P1|SetAutoRunASynchron|P2|P3
PIS.P1|Saa|P2|P3

Parameter Explanation

P1 **-** Variable which contains the PlugIn Index-No.
P2 **-** ***Value,*** Button Number
P3 **-** Variable with the complete Path of the Executable to start on the press of the Button.

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-

-

3.71.4.13 PIS.SetButtonForeColor / SetButtonBackColor

MiniRobotLanguage (MRL)

PIS.SetButtonForeColor Command
PIS.SetButtonBackColor Command

PlugInSend Set Color of of Buttons

Intention

The `PIS.SetButtonForeColor / SetButtonBackColor`-Command will set the color of the Buttons.

Using `PIS.SetButtonForeColor` you can specify the color in which the Text will appear on the Button.
Using `PIS.SetButtonBackColor` you can specify the Background color of the Button.
The color is generally specified as a decimal or hexadecimal number like "`&h123456`".
On this number the Order is:"`&HRRGGBB`" each of the pairs is 0-FF (hex).
For any of these commands, you can specify "`default`" instead, then the Windows-default color will be chosen.

```
PIS.$$REA|SetButtonForeColor|4|&Hffa0b3
PIS.$$REA|SetButtonForeColor|5|default

PIS.$$REA|SetButtonBackColor|4|&HF0A0B3
PIS.$$REA|SetButtonBackColor|5|default
```

```
:Again

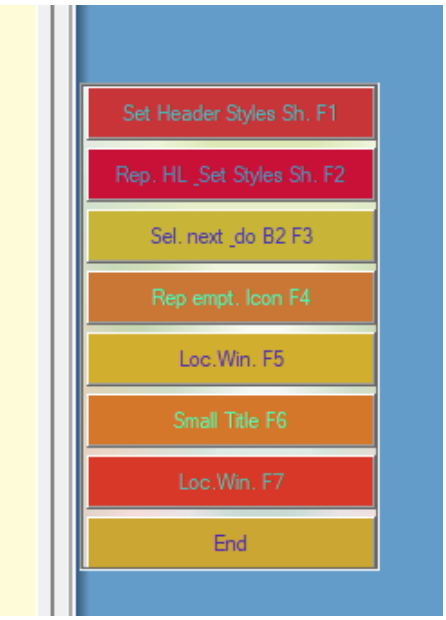
  ANA.Complementary_Color|$$BGC|$$FOR
  PIS.$$REA|SetButtonForeColor|$$BTN|$$FOR
  PAU.0.01
NEX.
MBX.!1
GTO.Again
```

Samples for Colored Buttons, using the Script above.

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

```
PIS.P1|SetButtonForeColor|P2|P3
PIS.P1|Sbfc|P2|P3

PIS.P1|SetButtonBackColor|P2|P3
PIS.P1|Sbbc|P2|P3
```

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** `Variable which contains the PlugIn Index-No.`
P2 **-** `value - Button-Number of the Button the color should be changed.`
P3 **-** `value - Color-Value "&Hffa0B1" in Format "&HRRGGBB" or the text: "default"`

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.

3.71.4.14 PIS.SetButtonNumber

MiniRobotLanguage (MRL)

PIS.SetButtonNumber Command

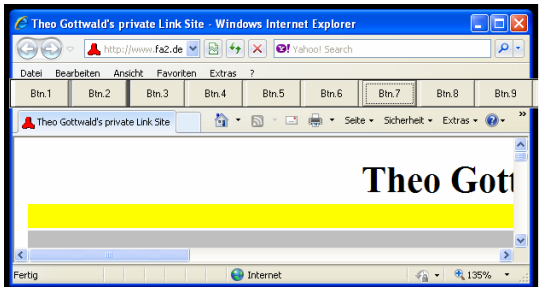
PlugInSend Set Number of Buttons

Intention

The `PIS.SetButtonNumber`-Command will set the number of visible Buttons. Generally the Plugin has 40 Buttons, but only the specified Number of buttons will be available to the User.

```
' Will set the number of visible Buttons to 4
PIS.$$PIN|SetButtonNumber|4
```

```
' Will set the number of visible Buttons to 9
PIS.$$PIN|SetButtonNumber|9
```



Syntax

PIS.P1|SetButtonNumber|P2
PIS.P1|Sbn|P2

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** `Variable which contains the PlugIn Index-No.`
P2 **-** `value - number of visible Buttons (1-40)`

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.

3.71.4.15 PIS.SetButtonsHDist / SetButtonsVDist

MiniRobotLanguage (MRL)

PIS.SetButtonsHDist Command
PIS.SetButtonsVDist Command

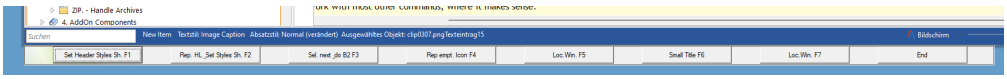
Set/Change Picture on Plugin-Buttons

Intention

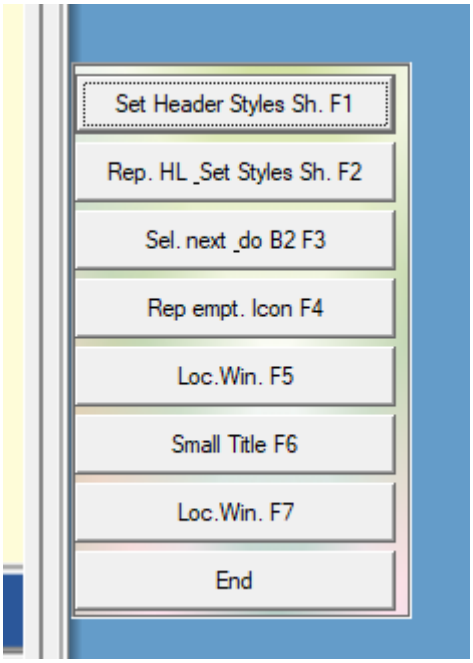
The `PIS.SetButtonHDist` -Command will set or change the horizontal distance between the Buttons on a horizontal Buttonbar.
Please do not use values smaller then 4 to avoid painting problems.

```
PIS.$$REA|SetButtonsHDist|4
```

```
PIS.$$REA|SetButtonsHDist|50
```

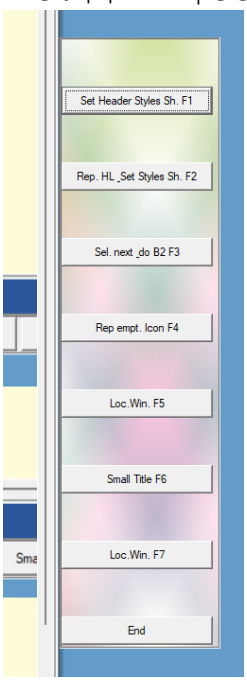


```
PIS.$$REA|SetButtonsVDist|4
```



*© 2023 Theo Gottwald * https://www.smart-package.com*

PIS.$$REA|SetButtonsVDist|50



Syntax

PIS.P1|SetButtonsHDist|P2
PIS.P1|sbhd|P2

PIS.P1|SetButtonsVDist|P2
PIS.P1|sbvd|P2

Parameter Explanation

P1 - Variable which contains the *PlugIn Index-No.*

P2 - ***Distance between*** *Button in Pixel, if 0, the Value will not be changed.*
Values below 4 are not recommended because these can lead to optical painting problems.

All commands are specific for the type of PlugIn used.

Example

-

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.

3.71.4.16 PIS.SetButtonsHVSize

PIS.sbhvs - SetButtonsHVSize, sbhs, sbvs Previous 2702 Top 41 Next 2706

MiniRobotLanguage (MRL)

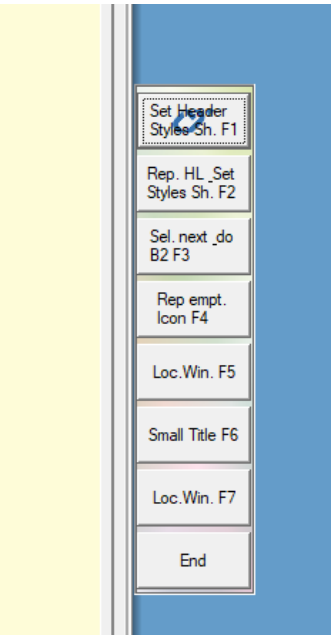
PIS.SetButtonsHVSize Command
PIS.SetButtonsHSize Command
PIS.SetButtonsVSize Command

Set/Change Size of all Plugin-Buttons

Intention

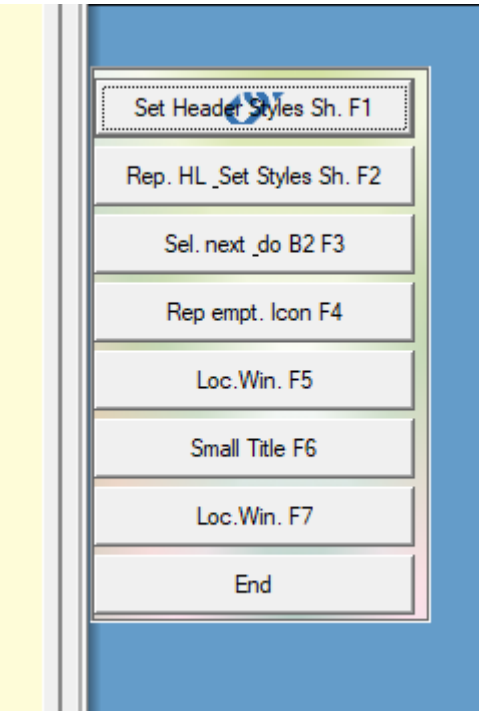
The `PIS.SetButtonsHVSize` -Command will set or change the Size of the Buttons from the specified Buttonbar.
You can Re-Size the Buttons any time.

```
PIS.$$REA|SetButtonsHVSize|80|40
' Here we size the Buttons 80x40
```



```
PIS.$$REA|SetButtonsHVSize|160|30
' Here we size the Buttons 160x30
```

© 2023 Theo Gottwald * https://www.smart-package.com



```
' If you specify a "0" as Size-Parameter, the value is not
PIS.$$REA|SetButtonsHVSize|80|0
```

Syntax

PIS.P1|SetButtonsHVSize|P2|P3
PIS.P1|sbhvs|P2|P3

PIS.P1|SetButtonsHSize|P2
PIS.P1|sbhs|P2

PIS.P1|SetButtonsVSize|P2
PIS.P1|sbvs|P2

Parameter Explanation

P1 - Variable which contains the *PlugIn Index-No.*

© 2023 Theo Gottwald * https://www.smart-package.com

***P2* - *Value*, first Size-Parameter in Pixel, if this value is "0" Size is not changed**

only for the "sbhvs" - Command:
***P3* - *Value*, second Size-Parameter in Pixel, if this value is "0" Size is not changed**

All commands are specific for the type of PlugIn used.

Example

```
' This code is just a Syntax-Sample and will not run
PIS.$$REA|SetButtonsHVSize|80|40
PIS.$$REA|SetButtonsHVSize|270|90
PIS.$$REA|SetButtonsHSize|270
PIS.$$REA|SetButtonsVSize|90
```

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:

3.71.4.18 PIS.SetcorrectionFactor

MiniRobotLanguage (MRL)

PIS.SetcorrectionFactor Command

Set/Change Picture on Plugin-Buttons

Intention

The `PIS.SetcorrectionFactor` -Command will set or change the exact Position of the Border of the specified Buttonbar.

This is the Buttonbar-PlugIn without any corrections. If it does not look like this, you can make Corrections to the Form-Borders.

`PIS.$$PIL|SetcorrectionFactor|-10` will make the Buttonbar shorter.

`PIS.$$P` will make the Buttonbar larger.

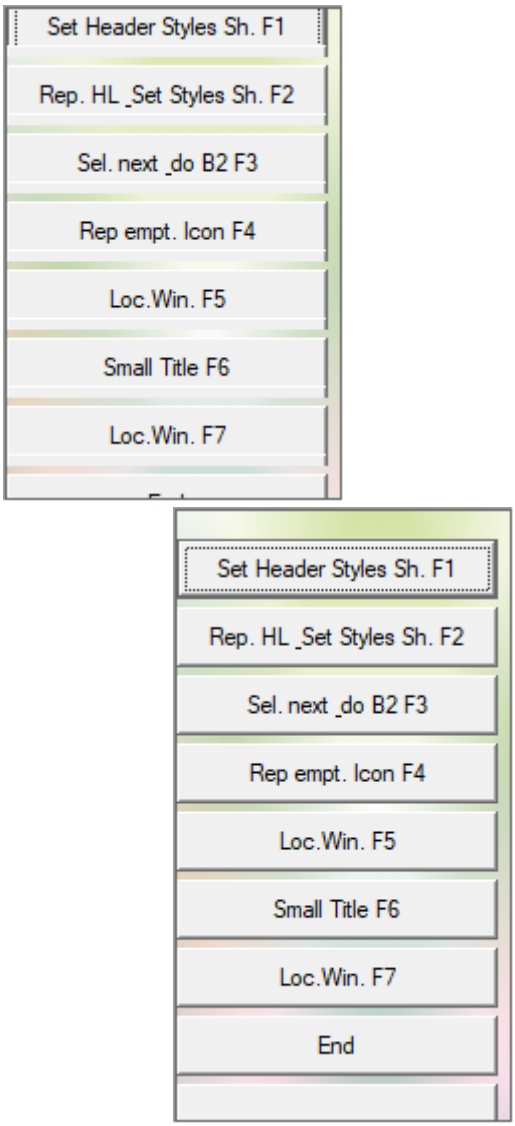
*© 2023 Theo Gottwald * https://www.smart-package.com*

`PIS.$$PIL|SetcorrectionFactor|0|-20` `PIS.$$PI`

will make the Buttonbar shorter.

will make the Buttonbar larger. Hidden Buttons may get visible (there is a total of 40 Buttons).

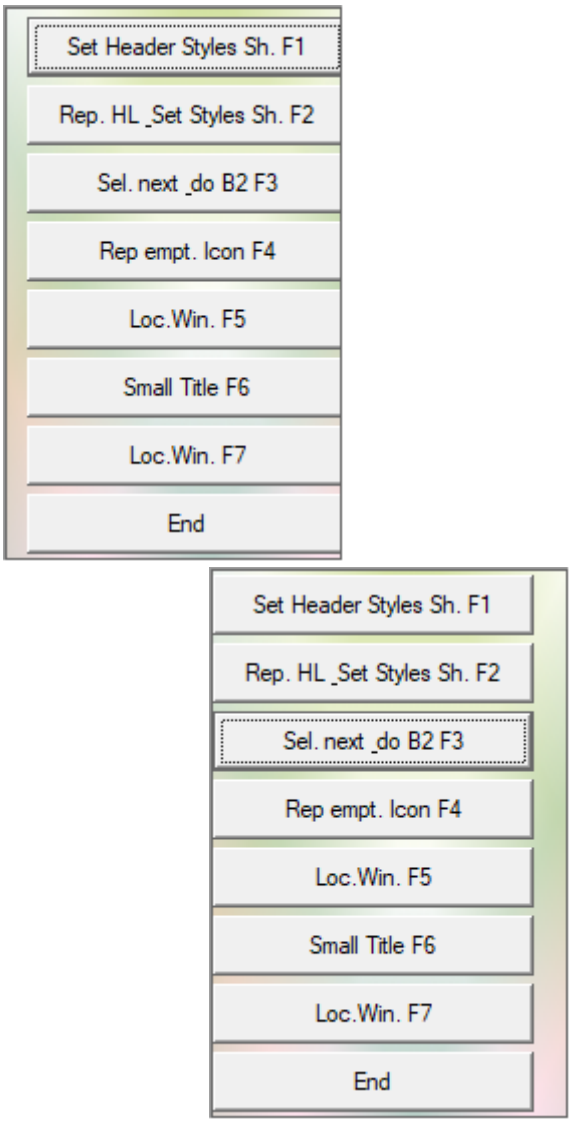
© 2023 Theo Gottwald * https://www.smart-package.com



`PIS.$$REA|SetcorrectionFactor|0|0|-10|0` will make the Buttonbar smaller to the right side.

`PIS.$$REA|S` will make the Buttonbar larger to the right side.

© 2023 Theo Gottwald * https://www.smart-package.com

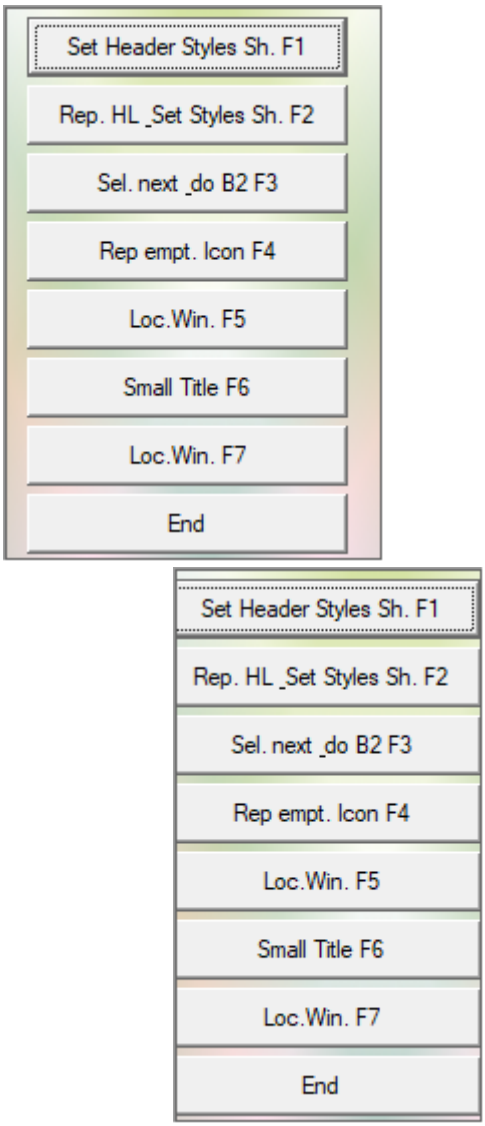


`PIS.$$REA|SetcorrectionFactor|0|0|0|20` `PIS.$$REA|S`

will make the Buttonbar smaller.

will make the Buttonbar larger.

© 2023 Theo Gottwald * https://www.smart-package.com



Hint:
Its recommended, to set the Correction-Factor only once after the PlugIn was created. Setting it multiple times may sometimes bring the Plugin-System internally into disorder.

Syntax

```
PIS.P1|SetcorrectionFactor|P2[|P3][|P4][|P5]
PIS.P1|scf|P2[|P3][|P4][|P5]
```

Parameter Explanation

P1 - Variable which contains the *PlugIn Index-No.*

© 2023 Theo Gottwald * https://www.smart-package.com

P2 *- Buttons-Position - Upper Border Space Correction, can be negative.*
All Buttons will move up or down by this number of Pixels. The normal range is between -10 and +10."0" is the default.

P3 *- Buttons-Position - Upper and Bottom Border Space Correction, can be negative.*
All Buttons will move up or down by this number of Pixels. The normal range is between -10 and +10."0" is the default.

P4 *- Buttons-Position - Left Border Space Correction, can be negative.*
All Buttons will move left or right by this number of Pixels. The normal range is between -10 and +10."0" is the default.

P5 *- Buttons-Position - Left and Right Border Space Correction, can be negative.*
All Buttons will move left or right by this number of Pixels. The normal range is between -10 and +10."0" is the default.

All commands are specific for the type of PlugIn used.

Example

```
' Button Bar with only very small Borders
PIS.$$REA|SetcorrectionFactor|-2|-4|4|-4
```

Remarks

You can use up to 5 Plugins at the same time.

© 2023 Theo Gottwald * https://www.smart-package.com

Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

3.71.4.19 PIS.SetPicture

MiniRobotLanguage (MRL)

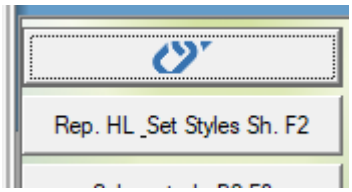
PIS.SetPicture Command

Set/Change Picture on Plugin-Buttons

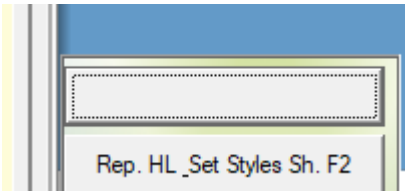
Intention

The `PIS.SetPicture` -Command will set or change the Picture that is displayed on a Button from the specified Buttonbar.
It can also Re-Size a picture during the loading to any size you specify.

```
$$FIX=?path\PA_32x16.bmp
PIS.$$REA|SetPicture|1|$$FIX|32|5
```



```
PIS.$$REA|SetPicture|1|
```
will remove the Picture.



For this Command, only the following File-Formats are supported:

- `.BMP.`
- `.ICO`
- `.CUR`

Syntax

PIS.P1|SetPicture|P2|P3[|P4|P5]
PIS.P1|sP|P2|P3[|P4|P5]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** Variable which contains the *PlugIn Index-No.*

P2 **-** *Button Number*, starting with "1"

P3 **- Filename (incl. Path) of the Picture to load.**

P4 - if 0 this Parameter is unused. Otherwise the X-Size of the Picture. (Resize-X)

P5 - if 0 this Parameter is unused. Otherwise the Y-Size of the Picture. (Resize-Y)

All commands are specific for the type of PlugIn used.

Example

```
' This code is just a Syntax-Sample and will not run
$$FIX=?path\PA_32x16.bmp
PIS.$$REA|SetPicture|1|$$FIX
' Remove Picture from Button
PIS.$$REA|SetPicture|1|
' Remove Text from Button
PIS.$$REA|sBt|1|
```

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

3.71.4.21 PIS.SetTopMost

MiniRobotLanguage (MRL)

PIS.SetTopMost Command

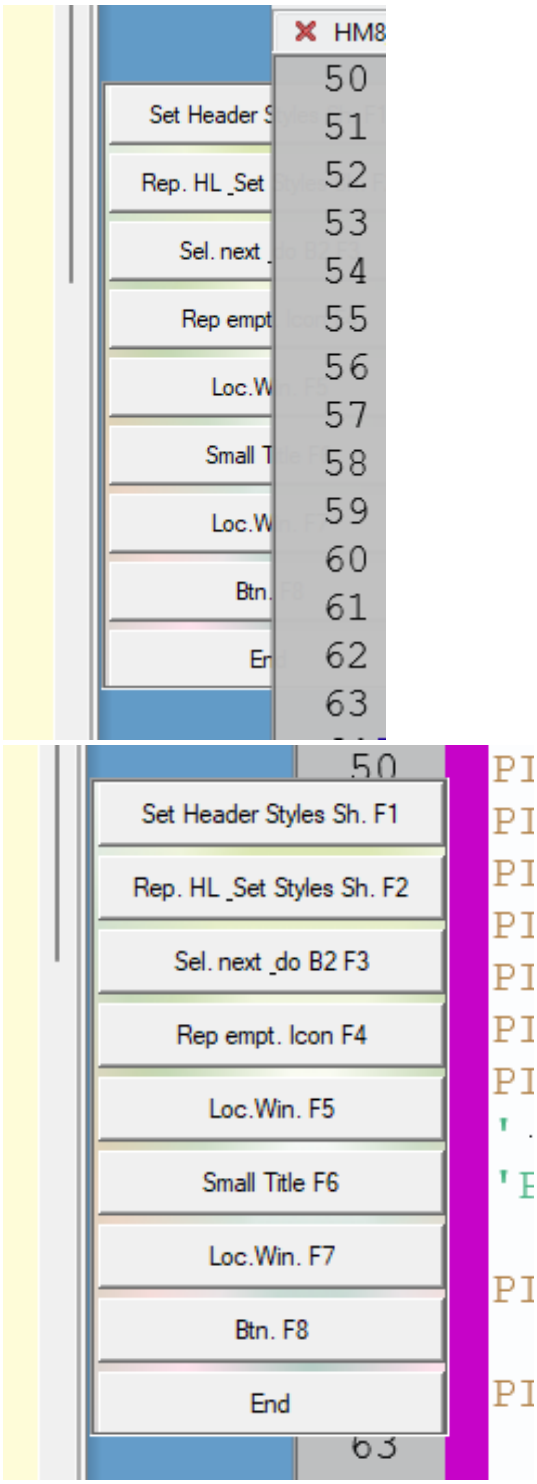
Set the Buttonbar to TopMost or not

Intention

The `PIS.SetTopMost` -Command will change the way, the Buttonbar is reacting if overlapped from other windows.
Generally the Buttonbar can be "TopMost" which is always above all other windows (unless they are also TopMost).
You can switch this TopMost Behavior on or Off using this Command.

```
PIS.$$REA|SetTopMost|0          PIS.$$REA|SetTopMost|1
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

```
PIS.P1|SetTopMost|P2
PIS.P1|stm|P2
```

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** `Variable` which contains the *`PlugIn Index-No.`*

P2 **-** `value 0 or 1. 1- TopMost, 0 - On Top but NOT TopMost`

Example

```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:

```
PIS.$$PIN|sbt|all|Button %n
```

The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-

-

See also:

- PIL. - PlugIn Launch 2702
- PIS. - PlugIn Send 2749

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.71.4.22 PIS.SetTransparent

MiniRobotLanguage (MRL)

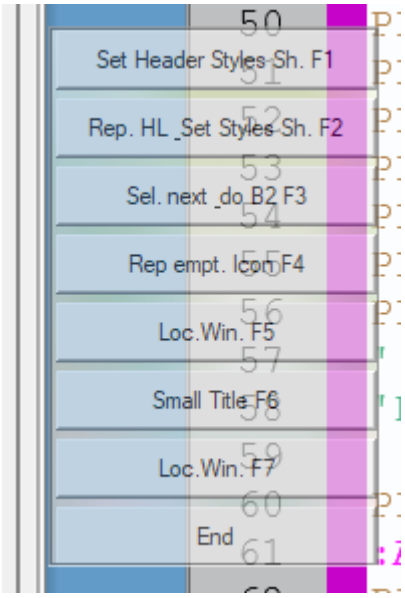
PIS.SetTransparent Command

Set/Change Transparency Level of Buttonbar

Intention

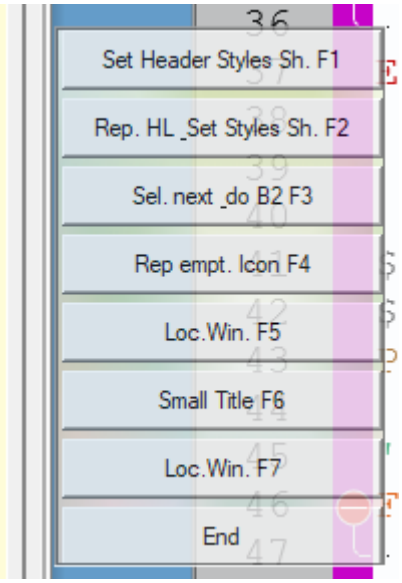
The `PIS.SetTransparent` -Command will set or change the Level of Transparency for the specified Buttonbar.
It can not make single Buttons Transparent, the value will always affect the whole Buttonbar.
The Transparency Values range from 0 to 255, where 0 is completely transparent (invisible) and 255 is solid (not transparent).
You can use Transparency and change the Buttons Background color.

```
PIS.$$PIL|SetTransparent|165
```



```
PIS.$$PIL|SetTransparent|210
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

PIS.P1|SetTransparent|P2
PIS.P1|str|P2

Parameter Explanation

P1 **-** Variable which contains the *PlugIn Index-No.*

P2 **-** value (0-255)- the transparency Values range from 0 to 255,
where 0 is completely transparent (invisible) and 255 is solid (not transparent).

All commands are specific for the type of PlugIn used.

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

3.71.4.23 PIS.SetWindowAlert

MiniRobotLanguage (MRL)

PIS.SetWindowAlert Command

Set an Alarm, if a window with the same class comes in front

Intention

The `PIS.SetWindowAlert` -Command will set the Plugi to send an "`!Foreground!`" Message to the "`PIW.`" Command,
if a Topwindow with the specified Window-Class will get in Front.

What is it good for?
Assume you are working in a Chrome-Sort of Browser, and while you are working another Browser pops up in front.
To prevent the robot to work "in the wrong window", you will now get an "Alert Message".
Then you can react and possibly minimize that window, or do whatever you want with it.

```
' This will activate the Alert
PIS.$$PIL|SetWindowAlert|1|Chrome_Widget_Win

' This will deactivate the Alert
PIS.$$PIL|SetWindowAlert|0
```

Syntax

```
PIS.P1|SetWindowAlert|P2[|P3]
PIS.P1|swa|P2[|P3]
```

Parameter Explanation

P1 - `Variable` which contains the *`PlugIn Index-No.`*

P2 - `value 0 or 1. 1 -> Enable Alert, 0 -> Disable Alert`

P3 - `Window-Class - can use all sorts of Standard-Search Patterns, needed to enable the Alert.`

`In case of Alert you will get a Message in the PIW.-Command.`

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-

-

See also:

- PIL. - PlugIn Launch 2702
- PIS. - PlugIn Send 2749
- PIW. - PlugInWait 2706
-

3.71.4.24 PIS.Show/Hide

MiniRobotLanguage (MRL)

PIS.Show/Hide Command

PlugInSend Show/Hide

Intention

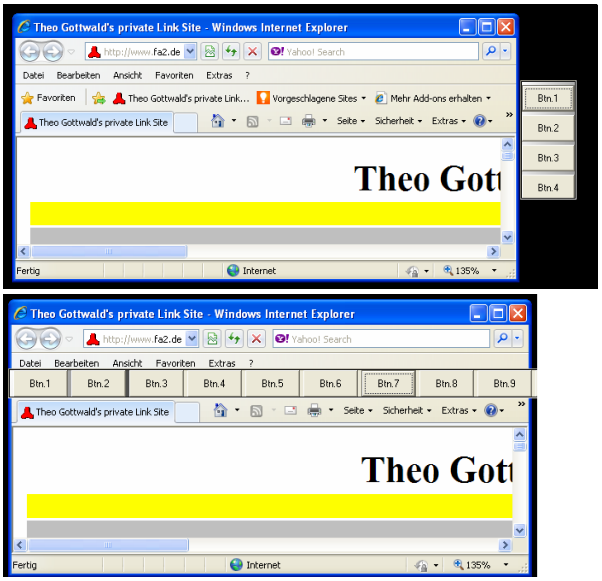
The `PIS.Show`-Command will make the Buttonbar visible.
The `PIS.Hide`-Command will make the Buttonbar invisible.

`"sho","Show"`
`PIS.$$PIN|Show`

`"Hid","Hide"`
`PIS.$$PIN|Hide`

Using the "Show/Hide" Subcommand, you can make the Buttonbar invisible.
For example, to prevent the user from pressing Buttons.

If the Target Window gets disabled, invisible or is minimized, then the Buttonbar may automatically become invisible.
In this case it will automatically return to visibility when the target window is back.
This Behavior can be influenced with the command "`PIS.$$PIN|SetAutoHide|0/1`" Command.



Here you can see a vertical and horizontal Plugin-Buttonbar. Below you will find more Samples.

© 2023 Theo Gottwald * https://www.smart-package.com

Important note:
If the Target Window is minimized, the Buttonbar will also disappear. Once the Target Window comes back, the Buttonbar will also come back.
This Behavior can be influenced with the command "`PIS.$$PIN|SetAutoHide|0/1`" Command.

Syntax

```
PIS.P1|Show
PIS.P1|Sho

PIS.P1|Hide
PIS.P1|Hid
```

Parameter Explanation

P1 **-** `Variable which contains the PlugIn Index-No.`

Example

-

Remarks

You can use up to 5 Plugins at the same time.
Just start them, each will get another Index.
To communicate with each PlugIn, you just give the PlugIn-Index to each command.

Button-Colors and transparency:
Please note that if you set Buttons transparent, that they can not have a background-color at the same time.

To set multiple Buttontext at once you can use:
`PIS.$$PIN|sbt|all|Button %n`
The "%n" is replaced with the number of that button.
The "all" and %n-scheme will also work with most other commands, where it makes sense.

Limitations:-

-

3.72 PopUp - Handling

3.72.1 DBC. - Do-Button-Clicks

DBC. - Do-Button-Clicks Previous 2706 Top 41 Next 2881

MiniRobotLanguage (MRL)

DBC. Command

Do Button Clicks

Intention

DBC. is a Parallel running Button-Clicker Robot.

It will click on PopUp-Messageboxes that may or may not appear during automated installations.

Imagine a automated Setup-Script. Sometimes a Messagebox appears "This folder already exists". The problem in such cases is, that you have to deal with Messageboxes, which:

- appear but not always
- can appear more often then once (10 or 100 times?)
- may not appear at all
- may have slightly varying texts
- must be clicked or closed

The solution to this problem is the DBC.-command.

It runs in the background and when a specified message box appears, the DBC. will click or close it. If the Messagebox will not appear, the DBC. will have no effect on the running script.

If the messagebox will come 100 time, it will be clicked 100 times.

DBC. is a special sort of background-task and can only be accessed with the DBC. - command.

Syntax

```
DBC.P1|P2|P3|P4[|P5|P6..|P10]
```

Parameter Explanation

Leave unneeded Parameters empty.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
P1 - a  = add DBC: start DBC. task
     r  = remove DBC: remove DBC. task

P2 - Variable: returns the DBC.-Handle for later removing

P3 - Title-Text of the Top-Window of the messagebox

P4 - Button-Text of the button to click on

P5 - Text of a static text inside the Messagebox

P6 - PID - Process ID of Process behind the Messagebox

P7 - action-code, normally
     1 = MLE. (Direct Engine Click)
     2 = close TopWindow
     4 = MLM. (compatible Engine)
     8 - MLI. (compatible Engine)
    16 - Close spezial

P8 - class of the Top-Window, if omitted "#32770" is default

P9 - class of the button-control, if omitted "button" is
default

P10 - class of the static-text. If omitted, "static" or
"syslink" is default
```

Example

```
'***********************************************
' DBC.-Sample 1
'***********************************************
' This will create some messageboxes in the background.
FOR.$$LOP|1|10
  PRR.
:ag
    MBX.This is a Text.
    END.
  PRE.
NEX.
PAU.1
'-------------------------------------------------------------
' Here we start the DBC.
DBC.a|$$RUK|remote&OR:Nachricht|Ok|This is a||1|#32770|button
PAU.2
MBX.Ende
END.

'***********************************************
' DBC.-Sample 2
'***********************************************
' This will create some messageboxes in the background.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRR.
FOR.§§LOP|1|180
MBX.Hallo||Nachricht-§§LOP
NEX.
END.
PRE.
'-------------------------
DBC.a|$$UK|remote&OR:Nachricht|Ok
PRT.My ID is:$$RUK
PAU.15
MBX.Ende
END.
'*********************************************
```

Remarks

`DBC.` ist not the "Mouseclick".-Command. If you just want to click on a button, use `MLC.`,`MLE.`,`MLM.`, or `MLI.`

The `DBC.`-Command is a background-Task for suddenly appearing Messageboxes.

The Action Parameter 16 (`MLM.`) generates a small Move on the target button, before the Click (`MLI.`). This way the command is more compatible, with few difficult application.

Limitations:

There is no limit in the number of `DBC.`-commands that can be active at the same time.

      Break                     Exit a program loop
```

C

```
     Catch                      Handle a terminating error within a scriptblock
   Set-Location  cd/chdir/sl    Set the current working location
   Get-ChildItem   dir/ls/gci   Get child items (contents of a folder or registry
     Clear-Host    clear/cls    Clear the screen
     Clear-Item          cli    Remove content from a variable or an alias
       Get-Command       gcm    Retrieve basic information about a command
   Measure-Command              Measure running time
     Trace-Command              Trace an expression or command
        Add-Computer            Add a computer to the domain
 Checkpoint-Computer            Create a system restore point (XP)
     Remove-Computer            Remove the local computer from a workgroup or dom
    Restart-Computer            Restart the operating system on a computer
    Restore-Computer            Restore the computer to a previous state
       Stop-Computer            Stop (shut down) a computer
Reset-ComputerMachinePassword   Reset the machine account password for the comput
 Test-ComputerSecureChannel     Test and repair the secure channel to the domain
     Add-Content          ac    Add to the content of the item
     Get-Content cat/type/gc    Get content from item (specific location)
     Set-Content          sc    Set content in the item (specific location)
   Clear-Content         clc    Remove content from a file/item
         Continue               Skip just this iteration of a loop
     Get-Command         gcm    Get basic information about cmdlets
  Invoke-Command         icm    Run command
   Enable-ComputerRestore       Enable System Restore on a drive
   Disable-ComputerRestore      Disable System Restore on a drive
  Get-ComputerRestorePoint      Get the restore points on the local computer
 Test-Connection                Ping one or more computers
   ConvertFrom-CSV              Convert object properties (in CSV format) into CS
   ConvertTo-CSV                Convert .NET Framework objects into CSV variable-
   ConvertTo-Html               Convert the input into an HTML table
   ConvertTo-Xml                Convert the input into XML
   ConvertFrom-SecureString     Convert a secure string into an encrypted standar
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
   ConvertTo-SecureString     Convert an encrypted standard string into a secur
   Copy-Item     copy/cp/ci   Copy an item from a namespace location
   Export-Counter             Export Performance Counter data to log files
      Get-Counter             Get performance counter data
   Import-Counter             Import performance counter log files
   Get-Credential             Get a security credential (username/password)
   Get-Culture                Get region information (language and keyboard lay
```

D

```
   Get-ChildItem   Dir/ls/gci Get child items (contents of a folder or registry
   Get-Date                   Get current date and time
   Set-Date                   Set system time on the host system
   Remove-Item  Del/erase/rd/rm/rmdir   Delete an item
   Compare-Object diff/compare   Compare the properties of objects
   Do                         Loop while a condition is True
     Get-DscConfiguration     Get the current config. of a node
     Get-DscLocalConfigurationManager   Get Local Config Manager settings
     Get-DscResource          Get Desired State Config. resources from a comput
     New-DSCCheckSum          Create checksum files for DSC docs/resources
   Start-DscConfiguration     Apply Desired State config to nodes
```

E

```
         End                  Function END block
      Get-Event               Get events in the PowerShell event queue
      New-Event               Create a new event
   Remove-Event               Delete events from the event queue
  Unregister-Event            Cancel an event subscription
     Wait-Event               Wait until a particular event is raised
   Clear-EventLog             Delete all entries from an event log
     Get-Eventlog             Get event log data (2003)
   Limit-EventLog             Limit the size of the event log
     New-Eventlog             Create a new event log and a new event source
   Remove-EventLog            Delete an event log
    Show-EventLog             Display an event log
   Write-EventLog             Write an event to an event log
     Get-WinEvent             Get event log data (Vista+)
   Get-EventSubscriber        Get event subscribers
Register-EngineEvent          Subscribe to PowerShell events
Register-ObjectEvent          Subscribe to .NET events
   Register-WmiEvent          Subscribe to a WMI event
   Get-ExecutionPolicy        Get the execution policy for the shell
   Set-ExecutionPolicy        Change the execution policy (user preference)
   Export-Alias         epal  Export an alias list to a file
   Export-Clixml              Produce a clixml representation of PowerShell obj
   Export-Console             Export console configuration to a file
   Export-Csv          epcsv  Export to Comma Separated Values (spreadsheet)
   Exit-PSSession       Exit  Exit PowerShell (or exit a script)
```

F

```

© 2023 Theo Gottwald * https://www.smart-package.com

3.73.2 PWS. - Powershell-Script Start

MiniRobotLanguage (MRL)

PWS. Command

Powershell Script Start

Intention

This command is used to start a block with VB-Script. It is always used paired with `VBE.`

The statements between a `VBS.` and a `VBE.` are ignored by the SPR-Preprocessor. They are also ignored by the "Pretty-Printer" in the Editor.

`VBS.` and `VBE.` enable you, to include a VB-Script or Java-Script Code inline into the SPR-Script. You can use it to check for System-Objects (See Sample 2 below), or you can use it to call WMI-Functions.

You can also transfer Variable-Content into `VB-Script`-Variables (see example 1 below). And use them in your VB-Script.

And with `VBE.` you can get a single result value from the VB-Script back into your SPR-Script (see example 2 below).

This Sample-Script shows how to get Parameters into the Powerscript and how to get the result out to the SPR.

```
' This is the Powershell-Call with the Parameters
PWS.||Theo|Peter und Franz|Ralf|Heribert|Jürgen

param ($var1, $var2, $var3, $var4, $var5)
Write-host "var1 =" $var1
Write-host "var2 =" $var2
Write-host "var3 =" $var3
Write-host "var4 =" $var4
Write-host "var5 =" $var5

PWE.$$OUT
' Display the Output from the Powershell in a Messagebox
MBX.$$OUT
ENR.
```

Syntax

PWS.P1|P2[|P3...|Px]

...

*© 2023 Theo Gottwald * https://www.smart-package.com*

PWE.

Parameter Explanation for VBS

P1 - (optional,in) Addition to Powershell call. Could be something like
"-ExecutionPolicy Undefined ". Normally leave just empty.

P2 - (optional,in) Reserved for STDIN. Currently unused, leave empty.

P3-Px - (in) - these are the Parameters to transfer into the Powershell-Script. You can use up to 30 KB for all Parameters together.
In case you need more, use temporary files.

Example

```
'*********************************************
' PWS./PWE. - Sample
' with Parameters
'*********************************************
' This is the Powershell-Call with the Parameters
PWS.||Theo|Peter und Franz|Ralf|Heribert|Jürgen
param ($var1, $var2, $var3, $var4, $var5)
Write-host "var1 =" $var1
Write-host "var2 =" $var2
Write-host "var3 =" $var3
Write-host "var4 =" $var4
Write-host "var5 =" $var5
PWE.$$OUT
' Display the Output from the Powershell in a Messagebox
MBX.$$OUT
ENR.
```

```
'*********************************************
' PWS./PWE. - Sample
' Get and say the BIOS-Version 2 times.
'*********************************************
PWS.
param( [string]$strComputer = "." )
$colItems = get-wmiobject -class "Win32_BIOS" -namespace
"root\CIMV2" -computername $strComputer
foreach ($objItem in $colItems)
          {
write-host "Name : "       $objItem.Name
write-host "Version : "    $objItem.Version
write-host "BiosVersion: " $objItem.BiosVersion
write-host "SMBIOSBIOS Version : " $objItem.SMBIOSBIOSVersion
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
write-host "Caption: "      $objItem.Caption
write-host "Manufacturer : " $objItem.Manufacturer

Add-Type -AssemblyName System.speech
$speak = New-Object System.Speech.Synthesis.SpeechSynthesizer
$speak.Speak($objItem.SMBIOSBIOSVersion)
$speak.Speak($objItem.SMBIOSBIOSVersion)
}
PWE.$$OUT
MBX.$$OUT
ENR.
```

Remarks

-

Limitations:

The Powershell-Scripts will be written to the harddisk prior to execution. Therefore they are not permanently crypted together
with the SPR-Script when using the `'#CRY:`-Option.

There are no Limitations about Multithreading here.

Powershell Inline

PWE. - Powershell-Script-End Previous 2866 Top 41 Next 2874

MiniRobotLanguage (MRL)

PWE. Command

Powershell Script End

Intention

This command is used to end a block with VB-Script. It is always used paired with `VBS.`
The statements between a `VBS.` and a `VBE.` are ignored by the SPR-Preprocessor. They are also ignored by the "Pretty-Printer" in the Editor.

`VBS.` and `VBE.` enable you, to include a VB-Script or Java-Script Code inline into the SPR-Script. You can use it to check for System-Objects (See Sample 2 below), or you can use it to call WMI-Functions.

You can also transfer Variable-Content into `VB-Script`-Variables (see example 1 below). And use them in your VB-Script.

And with `VBE.` you can get a single result value from the VB-Script back into your SPR-Script (see example 2 below).

This Sample-Script shows how to get Parameters into the Powerscript and how to get the result out to the SPR.

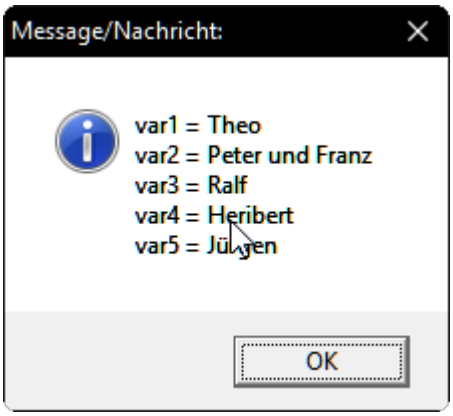
```
' This is the Powershell-Call with the Parameters
PWS.||Theo|Peter und Franz|Ralf|Heribert|Jürgen

param ($var1, $var2, $var3, $var4, $var5)
Write-host "var1 =" $var1
Write-host "var2 =" $var2
Write-host "var3 =" $var3
Write-host "var4 =" $var4
Write-host "var5 =" $var5

PWE.$$OUT
' Display the Output from the Powershell in a Messagebox
MBX.$$OUT
ENR.
```

The Output from the Script looks like this:

 © 2023 Theo Gottwald * https://www.smart-package.com



Syntax

```
PWS.
...
PWE.[P1][|[P2]
```

Parameter Explanation for VBE

P1 **-** (out,optional) - will hold to the result of the Powerscript (STDOUT).
P2 **-** (out,optional) - will Get some Error-Information as far as its not in **P1**.
Like Commandline-Errors.

This is a Errormessage like you can get it in **P2**.

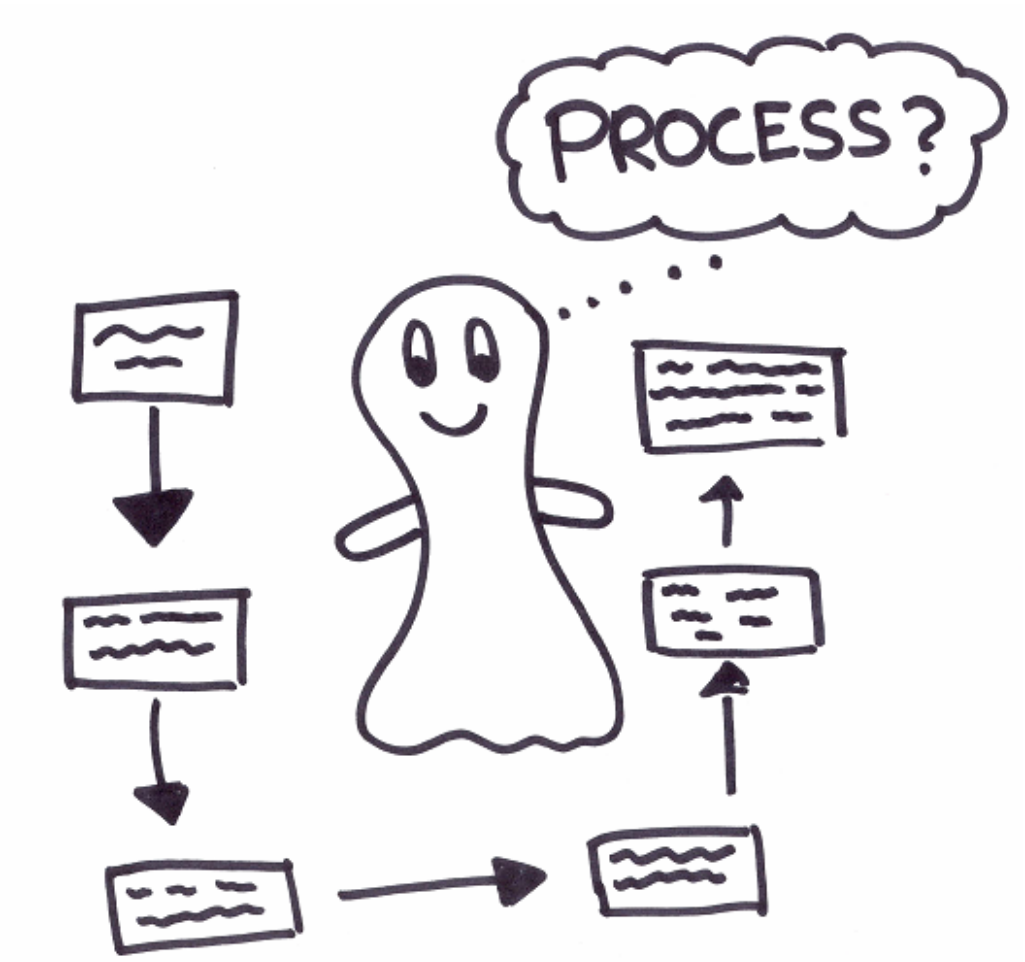
3.74 Process Operations

3.74.1 ! Smarty's Process Commands

Smarty's Process Commands



*© 2023 Theo Gottwald * https://www.smart-package.com*

3.74.2 CPR. - Close-PRocess

MiniRobotLanguage (MRL)

CPR. Command

Close Process

Intention

Close Process by Process-ID (#pid#). This command will end a running process.
This is done in 2 stages.
First the command first tries to send a "Close-Message" to the Process-Mainwindow.
It then waits for a specified time.
Second, if the process does not end within the given waiting time, (if it hangs), the process is forcefully closed.

CPR. can be use in three ways:

```
' This will close the process from the last localized window
CRP.

' This will close process with PID in $$PID and a
' waiting time of 1 second (default waiting time).
' CPR.$$PID

' This will close the process from the last localized window
' with a waiting time of $$WAT milliseconds.
' CPR.|$$WAZ

' This will close the process with the given PID ($$PID)
' with a waiting time of $$WAT milliseconds.
' CPR.$$PID|$$WAZ

' This will immediately, forcefully close the process
' with the given PID ($$PID)
' CPR.$$PID|0
```

Syntax

CPR.P1|P2

Parameter Explanation

P1 - PID of the process to close

P2 - Waiting time in ms before forcefully closing the process.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'**********************************
' CPR.-Demo
'**********************************
DBM.2
' Get the PID using IEP.command
IEP.Testapp_01.exe
' Close the App with 5 Seconds waiting time
  CPR.#pid#|5000
ELS.
  MBX. That Application is not running!
EIF.
ENR.
```

Remarks

Tested: XP, Win7/x64

Limitations:

3.74.3 CTR. - Close-ThRead

MiniRobotLanguage (MRL)

CTR. Command

Close Thread

Intention

Close Thread. Parameter Thread-ID (#tid#) is optional.
Otherwise #tid# is taken.

Will end a running Thread immediately and forcefully

Syntax

CTR.[P1]

Parameter Explanation

P1 – ThreadID (#tid#)

Example

```
'**********************************
' CTR.-Demo
'**********************************
' Internet Explorer must be started
: §§LNK=http://www.fa2.de/
EXS.iexplore
STW.c|ieframe
' #tid# is set automatically by the STW.
' Be shure to use VAR. and not : because of
Specialfolder/Systemvariable-Substitution
VAR.§§TID=#tid#
DBP.Thread-ID is: §§TID
SWP.0,0
DBP.We'll kill the IE-Thread in 3 Seconds.
PAU.3
CTR.§§TID
MBX.Ready
END.
```

Remarks

3.74.4 FPI. - Filepath to PID

MiniRobotLanguage (MRL)

FPI. Command

File-Path to PID and reverse

Intention

If you specify a File-path, the command will give you the corresponding PID 137.

```
VAR.$$FIL=?exepath\Sample Apps\TestApp_01.exe
FPI.$$FIL|$$PID
DBP.PID is:$$PID
```

You can provide a File-path or not. And just specify a filename. In all cases, you can use 3.2 Standard-Search Pattern 341, see this valid example:

```
VAR.$$FIL=Testapp&AND:01.exe
FPI.$$FIL|$$PID
DBP.$$PID
ENR.
```

In case you prefer to use the good old WIldcards, ***** and **?**, do it like this:

```
VAR.$$FIL=&WILDC:Testapp*01.exe
FPI.$$FIL|$$PID
DBP.$$PID
ENR.
```

If there are multiple Instances of this program running, you can additionally specify a Instance number:

```
VAR.$$FIL=?exepath\Sample Apps\TestApp_01.exe
' Will get the PID of the second Instance of that program
FPI.$$FIL|2|$$PID
DBP.PID is:$$PID
```

You can also go the opposite direction and get the File-Path of a PID. Like this:

```
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Static|This is a Text in the TestApp.
VAR.$$PID=#pid#
FPI.>$$PID|$$FIL
DBP.$$FIL
ENR.
```

This example will Print the Path to the Sample Application.

Note: This command duplicates a function from `GDF`. We made this as extra command, to make working with processes easier to use and understand.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

FPI.P1[|P2][|P3]

Parameter Explanation

P1 - Filename (with or without path). If it starts with a ">" then
a numeric **PID** must follow. You can use variables and also a
formula in (..).

P2 - ***(optional)*** Variable for the result, if two parameters are specified. If three parameters are given, this is the number of the executable to search for, and P3 is the variable for the result.

P3 - ***(optional)*** Variable for the result.

Example

```
'**********************************
' FPI.-Demo
'**********************************
' STW. will automatically set #pid#
' to the PID of the program that created the window.
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Static|This is a Text in the TestApp.
VAR.$$PID=#pid#
' Get the Path of a program
FPI.>$$PID|$$FIL
DBP.$$FIL
ENR.
```

3.74.5 GDF. - Get-Data-From

MiniRobotLanguage (MRL)

GDF. Command

Get Data From

Intention

When your scripts get more advanced, then its time to understand this command. Understanding how to use GDF. can add wings to your scripting abilities.

Be sure that you have read and understand the chapter about 1.7. Application and PID 137.

The most often used case for GDF. is to find out which process opened a window. Here is Sample Script that will show the executable behind the localized window,

```
STW.c|Chrome_WidgetWin_1
GDF.af|$$EXE
MBX.$$EXE
```

GDF. converts your scripting resources between each other. Just give it what you have, and you get what you need. Whatever you have, window handles, PID's or DLL names.
Feed it to GDF. and get what ever you need.

What is the EXE-Filepath od file with PID 123?
What is the PID of the Program that own the window we have localized?
What is the EXE-File-Path of the program that has the window handle number 12345?
What is the window handle of a program with PID 1234?

GDF. is the answer to all these questions. GDF. uses the prototype parameter system 73.
Be sure that you have read that chapter and understood how it works..

Imagine a box where you put in any information you have (PID, Path, handle ...) and you can get out any information you want. That is GDF.

GDF. deals with: Window-Handle, Process-ID and EXE-File-Path. The window handle must be a valid handle of an existing window. The file-path must be from an process or module (DLL) that is currently running. When asking for a DLL, the filename must end with ".dll". You can use the 3.2 Standard-Search Pattern 341 for the filename on the source side. You can add a ">2" to the filename if you want the second fitting result.Of course any other number after the ">" will also do what you expect.

GDF. takes what you provide and calculates the rest you need. It can calculate multiple results at one time at the destination side. For example:

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$FIL=?exepath\MR01.exe
GDF.fph|$$FIL|$$PID|$$HWN
MBX.$$FIL - $$PID - $$HWN
ENR.
```

The first letter is always the source. Thats what you put in. All following letters in the prototype field are destination prototypes. In this example we have provided the "f" as source. We have given the filepath. `?exepath\` is the 3.3 Specialfolders 345 shortcut to the installation directory. Therefore `$$FIL` leads to the actual running robot itself. This is what we put in. And the following two prototypes, these are "p" and "h" is what we expect to get back. "p" - is the Process ID (PID). And "h" is the window handle - or zero if the process has no window. For this we add two variables to be filled with these values.
`$$PID` for the PID and `$$HWN` for the window handle.

`GDF.` works with any process in the Task-Manager, no matter if that process has a window or not. If its running on a server OS, the program must start with sufficient rights to collect these information.

If you add prototypes and you do not give variables to put them in, the result will be placed on the actual stack.

If you want the PID from the actual localized window, you just write:

```
' We want the PID of the actual localized window(-prozess)
' into $$PID
GDF.ap|$$PID

' You can take a PID and localize a window with it!
: $$PID=1234
GDF.pa|$$PID
```

Syntax

GDF.P1|P2[|P3]..[|PX]

Parameter Explanation

Possible prototype-letters **for source:**

```
' a - the actual lokalized window is been used,
'     needs no input parameter therefore.
'
' f - filepath (Exe-Path or DLL Path), needs Parameter in
source.
'     When used in source, you can add a ">" Sign to tell
which of
'     many files with the same name you want.
'
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' h - window handle (Child- or Top-Window), needs input
parameter.
'
' p - Process ID (PID), needs input parameter.
'
' q - Process ID (PID) is taken from #pid#,
'     needs no parameter therefore.
```

Possible prototype-letters **for destination:**

```
' a - the window is been localized internally
'     like with SCW.h|$$HWN.
'
' f - filepath (Exe-Path or DLL Path). You can give a
parameter
'     with a variable then the variable will be filled with
'     the filepath. If you omit the variable, the filepath is
'     been place on the actual stack.
'
' h - window handle (Child- or Top-Window), you can
'     give a parameter with a variable. In that case
'     the variable will be filled with the window handle.
'     If you omit the variable, the window handle
'     is been place on the actual stack.
'
' p - Process ID (PID), you can give a parameter with
'     a variable. In that case the variable will be filled
'     with the Process ID (PID). If you omit the variable,
'     the Process ID (PID) is been place on the actual stack.
'
' q - Process ID (PID) that is actually in #pid#, needs no
'     parameter. If used as destination, #pid# is set with
'     the result.
```

P1 - Prototype field. First letter is source prototype, all following letters are destination-prototypes

P2 ... PX – Input- and output variables according to prototype

Example

We'll look at some scenarios when using `GDF`. Think there are two application, named "x64.exe".We want the the `PID`'s int two variables `$$PIA` and `$$PIB`.
To do this we need the information, that we can add a ">" Sign and a number behind a filename-parameter. This way we can decide which of multiple executable with the same name we want to get the PID for.

Lets go. Here is our Script.

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$FIA=x64.exe>1
VAR.$$FIB=x64.exe>2
GDF.fp|$$FIA|$$PIA
GDF.fp|$$FIB|$$PIB
DBP.$$PIA and $$PIB
MBX.Ready
```

and this is the result in the Editor-Debug Area:

```
[12:20:39] MRE: File saved as: 'C:\Program Files (x86)\MiniRc
[12:20:39] MRE: Robot start: IEP.mrt (On line #1)
[12:20:39] [15] 2768 and 2084
```

We got the PID's of both executables. No matter that they had the same filename. The [15] is from the `DBP.` command. It shows us that it was "Line 15" in the script that sent us this message. This information is useful for debugging. You will immediately know which `DBP.` sent you a message.

Remarks

x64 tested.

Limitations:

3.74.6 GPI. - Get Process Information

MiniRobotLanguage (MRL)

GPI. Command

Get Process Information

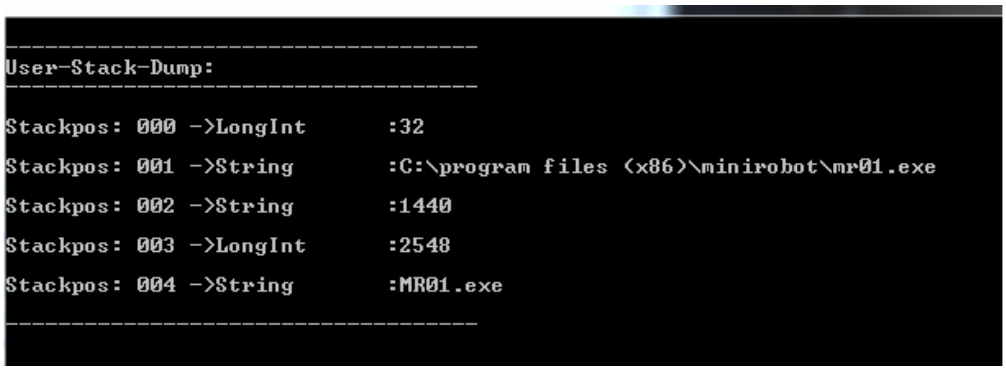
Intention

This command will provide you with informations about a specified process.

If you just call it without any parameters, it will examine the robot program itself. The code is very simple:

```
GPI.
```

And as result, the stack will look like this:



The order of the information is:

- 32 - shows you the process is an x32 process. if it would be a 64, it would be a x64 process.
- c.\ ... - thats the complete path of the examined process
- 1440 - this is the PID of the parent process. This is the process that has started the executable.
- 2548 - this is the PID of the examined process itself
- MR01.exe - this is just the process name. Like you see it in the task manager.

Now lets examine another process.The code is:

```
STS.CLEAR
STS.LOCAL

GPI.x64.exe
MBX. Process ID is: #pid#

ENR.
```

Now this is the stack:

 © 2023 Theo Gottwald * https://www.smart-package.com

```
------------------------------------
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->LongInt       :64
Stackpos: 001 ->String        :C:\users\admin\desktop\x64.exe
Stackpos: 002 ->String        :1804
Stackpos: 003 ->LongInt       :2768
Stackpos: 004 ->String        :x64.exe

------------------------------------
```

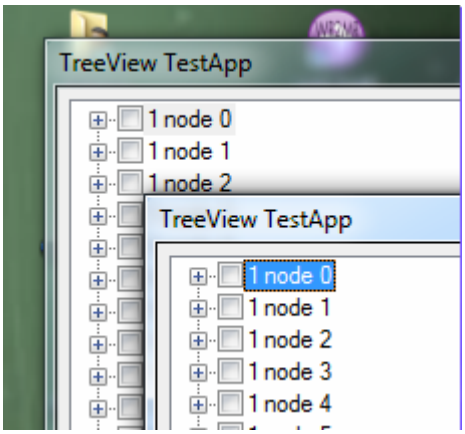
Again, the order of the information is:

- 64 - shows you the process is an x64process.
- c.\ ... - thats the complete path of the examined process
- 1804 - this is the PID of the parent process. This is the process that has started the executable. In fact its the "explorer.exe", see picture below.
- 2768 - this is the PID of the examined process itself
- x64.exe - this is just the process name. Like you see it in the task manager.

explorer.exe	1804	Admin	02	12.852 K	Windov
MRE.exe *32	1440	Admin	00	8.768 K	Mini-Ro
process.exe *32	1172	Admin	00	620 K	process

If you have multiple EXE running with the same name, you can specify a number.

For example, if you have two equal x64.exe applications.



```
STS.CLEAR
STS.LOCAL
GPI.x64.exe|1
GPI.x64.exe|2
DMP.6
MBX.Sample 1

You will get this stack:
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->LongInt      :64
Stackpos: 001 ->String       :C:\users\admin\desktop\x64.exe
Stackpos: 002 ->String       :1804
Stackpos: 003 ->LongInt      :2084
Stackpos: 004 ->String       :x64.exe
Stackpos: 005 ->LongInt      :64
Stackpos: 006 ->String       :C:\users\admin\desktop\x64.exe
Stackpos: 007 ->String       :1804
Stackpos: 008 ->LongInt      :2768
Stackpos: 009 ->String       :x64.exe

-----------------------------------
```

The Systemvariable **#pid#** is always set to the EXE's Process-ID. Please note that **#tid#** is always set to zero.

You can specify a full path, or only the filename or a part of it.

If a process is found, valuable information is placed on the actual stack. These include the full name and path of the executable.

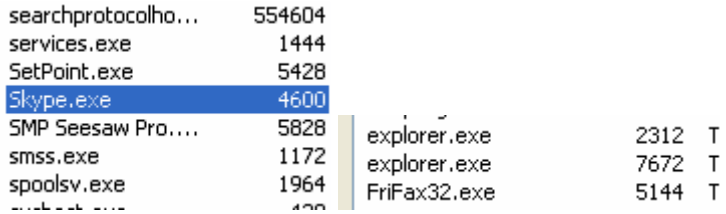
Below are two snapshots of the windows-taskmanager. The executable "Skype.exe" has the PID (process-id) 4600. Its on the stack on position 02 in the picture above.

The 2312 which is on position 01 (picture above) is the parent-process, that is the process which has started "skype.exe".

In the task manager, we can see that this is the PID of the windows-explorer. This way you can find out which process has started another process.

If you give GPI. a variable as third parameter, then the stack will not get the full path of the found file. You will find it in the given variable instead.

Please note that the stack organization (see 2.4 The global and local Stack 369) as Que or as Stack will influence the sequence in which the items appear on the stack.



You can also use `GPI.` to get information about a process, if you just have the PID. For this you have two choices. Here is the first:

```
GPI.>4600
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
------------------------------------
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->LongInt       :32
Stackpos: 001 ->String        :C:\programme\skype\phone\skype.exe
Stackpos: 002 ->LongInt       :4600
------------------------------------
```

Alternative there is a slower, yet more in depth method. Like this:

```
GPI.<4600
```

```
------------------------------------
User-Stack-Dump:
------------------------------------

Stackpos: 000 ->LongInt       :32
Stackpos: 001 ->LongInt       :4600
Stackpos: 002 ->String        :C:\programme\skype\phone\skype.exe
Stackpos: 003 ->String        :skype.exe
Stackpos: 004 ->String        :C:\windows\explorer.exe
Stackpos: 005 ->String        :2312
------------------------------------
```

The stack shows you the following information:

- 32 - its a x32 process. Otherwise it would be a 64 if its a x64 process.
- 4600 - the PID of the examined process
- c:\... the full path of the process.
- skype.exe - just the name of the process
- the name and .path of the parent process that started this process
- the PID of the parent process

You can read more details on how Applications and PID's in the chapter 1.7. Application and PID 137.

Syntax

GPI.P1[|P2][|P3]

Parameter Explanation

There are three Usage Mods.
"process name mode"
P1 - Variable or Exe-Filename, with or without path. Pattern can be used.

© 2023 Theo Gottwald * https://www.smart-package.com

P2 **-** Variable/Number/Formula - Number of result (take fist, second etc. fitting result)
P3 **-** Variable if given gets the full path of the found exe

"PID Info Mode 1": Get basic infos about a process.
P1 **-** Starting with a ***">"***-Sign this indicates that we are in this Mode. Now follows a PID. Description see above.

"PID Info Mode 2": Get detailed Infos about a process.
P1 **-** Starting with a ***"<"***-Sign this indicates that we are in this Mode. Now follows a PID. Description see above.

Example

```
'***********************************
' GPI.-Demo
'***********************************
STS.CLEAR
STS.LOCAL

GPI.
DMP.6
MBX.Sample 1
```

Remarks

x64 tested.

Limitations:

no Limitations.

3.74.7 GPU. - Get Process User

MiniRobotLanguage (MRL)

GPU. Command

PID to User-Login Information (User-Name and Domain)

Intention

If you specify a PID 137, the command will provide you with the user-name and Domain information of the user that started the program. This command can be used to find out, which user has locked a workstation.

```
VAR.$$FIL=?exepath\Sample Apps\TestApp_01.exe
FPI.$$FIL|$$PID
DBP.PID is:$$PID
' Now we get the Username and Domain from the user that
started
' the program with that PID
GPU.$$PID
' Its all on the stack
STS.DUMP
MBX.!
ENR.
```

You can provide variables then the results will be in these variables. See this example:

```
VAR.$$FIL=Testapp&AND:01.exe
FPI.$$FIL|$$PID
GPU.$$PID|$$USR|$$DOM
DBP. Username is: $$USR
DBP.Domain is: $$DOM
ENR.
```

Hints:

1. Use the `FPI.`-command to get the `PID` from a filename.
2. To find out if a user is loged in and has just "Locked" his workstation, you can get the `PID` from "Explorer.exe", using `FPI.` and if you get one, find out which user is still logged on using `GPU.`.

Syntax

GPU.P1[|P2][|P3]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - PID of the process to analyze

P2 - (optional) Variable for the resulting Username. If omitted,
TOS is used.

P3 - (optional) Variable for the resulting Domain information.
If omitted, TOS is used.

Example

```
'**********************************
' GPU.-Demo
'**********************************
' STW. will automatically set #pid#
' to the PID of the program that created the window.
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Static|This is a Text in the TestApp.
VAR.$$PID=#pid#
' Get the Path of a program
FPI.>$$PID|$$FIL
GPU.$$PID|$$USR|$$DOM
DBP. Username is: $$USR
DBP.Domain is: $$DOM
ENR.
```

Remarks

-

Limitations:

-

See also:

- 1.7. Application and PID 137
- FPI. - Filepath to PID 2886
- GPI. - Get Process Information 2893
- IEP. / NEP. - If-Exists-Process 2900
- FEP. - For-Each-Process 932
- GDF. - Get-Data-From 2889
- WPT. - Wait-Process-Termination 2913

© 2023 Theo Gottwald * https://www.smart-package.com

3.74.8 IEP. / NEP. - If-Exists-Process

MiniRobotLanguage (MRL)

IEP. Conditional Statement

If Exist Process

Intention

Conditional Statement. Test if a specified process is running.

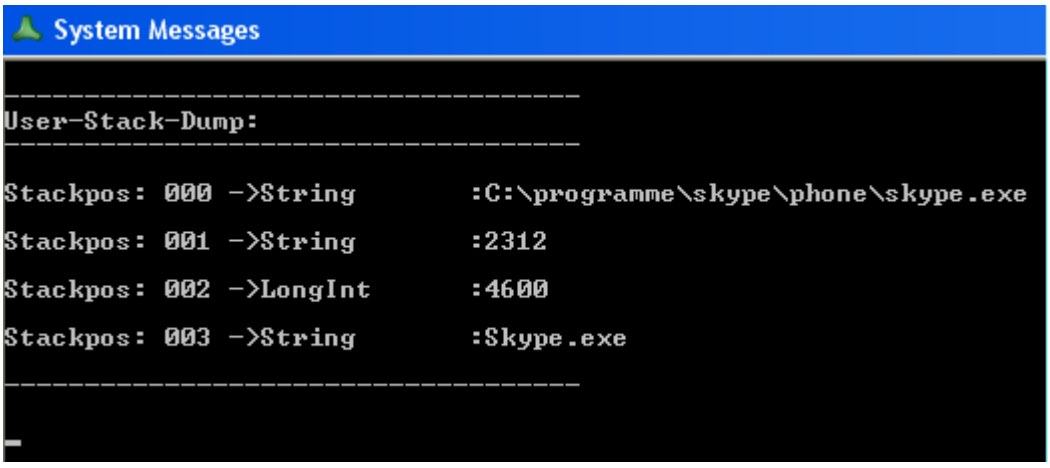
```
IEP.x64.exe
   MBX. Process ID is: #pid#
EIF.
```

If you have multiple EXE running with the same name, you can specify a number. If the EXE is found, the #pid# is set to the EXE's Process-ID. Please note that #tid# is always set to zero.

You can specify a full path, or only the filename or a part of it. If you search for a dll, then the extension ".dll" must be included in the pattern.

You can use `NEP.`, the negative Form of this command (`NEP.` - Not Exists Process).

If a process is found, valuable information is placed on the actual stack. These include the full name and path of the found executable.

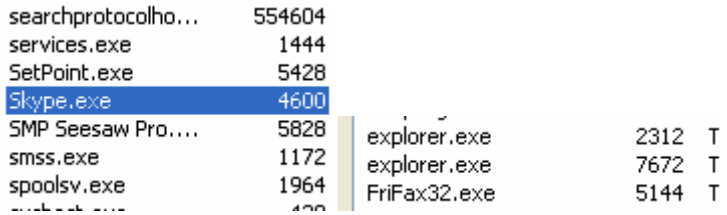


Below are two snapshots of the windows-taskmanager. Skype.exe has the PID (process-id) 4600. Its on the stack on position 02 in the picture above.
The 2312 which is on position 01 (picture above) is the parent-process, that is the process which has started skype.exe.
In the task manager, we can see that this is the PID of the windows-explorer. This way you can find out which process has started another process.

*© 2023 Theo Gottwald * https://www.smart-package.com*

If you give IEP. a variable as third parameter, then the stack will not get the full path of the found file. You will find it in the given variable instead.

Please note that the 2.4 The global and local Stack 369 as Que or as Stack will influence the sequence in which the items appear on the stack.



You can also use IEP. to verify, if a process with a specified **PID is alive** or not.
To do this, the Syntax is:

```
STS.GLOBAL
IEP.>1234
   MBX.PID 1234 (Filename=$$000) is alive!
EIF.
```

You can use IEP. also to check if one or one of many PID's is alive or is not alive. There two Modes where you can give a PID as parameter and test if this process is alive.

You can read more details on how IEP works in the chapter 1.7. Application and PID 137.

Syntax

IEP.P1[|P2][|P3] ... ELS. ... EIF.

Parameter Explanation

There are two Usage Mods.

"If_exist_Process-Mode":
P1 – Variable/Exe-/DLL-Filename, with or without path. Pattern can be used.

P2 - Variable/Number/Formula - Number of result (take fist, second etc. fitting result)

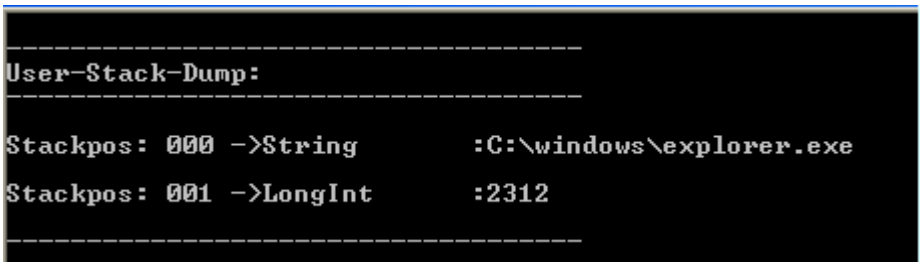
P3 - Variable if given gets the full path of the found exe/dll

"Is_Process_Alive-Mode":
P1 – Starting with a ***">"***-Sign this indicates that we are in this Mode. Now follow one or more PID's separated by ",". The rule is: if ONE of these PID's is alive, the data of this process is been place on stack, and the condition evaluates to true. Only if none of the given PID's is alive the condition evaluates to false.

© 2023 Theo Gottwald * https://www.smart-package.com

In this Mode you'll find some information about the process that is alive on the stack. See following picture. On TOS you see the full path of the process. And below you see the PID of the process. Also `#pid#` is set to the alive process.

```
' Example "Is process alive Mode"
IEP.>$$PIA,$$PIB,$$PIC
...
EIF.
```



"Is_Process_Dead-Mode":

P1 – Starting with a ***"<"***-Sign this indicates that we are in this Mode. Now follow one or more PID's separated by ",". The rule is: if ONE of these PID's is NOT alive, then the PID of this process is been place on stack, and the condition evaluates to true. Only if all of the given PID's are alive then the condition evaluates to false. Also #pid# is set to the last process that was found alive. If multiple PID's given and the first one is dead, `#pid#` is not changed.

```
' Example "Is process dead Mode"
IEP.<$$PIA,$$PIB,$$PIC
...
EIF.
```

The negative Form of `IEP.` is `NEP.` **`NEP.` is available for all Modes above.**

Example

```
'**********************************
' IEP.-Demo (IsProcess Alive)
'**********************************
' This first IEP. Shows the normal Mode, we ask for
' a specified process to exist
' we will get the PID of that process into #pid#
IEP.Explorer.exe
  ' Now we have a valid PID
  : $$PID=#pid#
  ' Now we can test if the PID is "alive"
  IEP.>$$PID
    DBP. The Process $$000 is alive
  EIF.
EIF.
ENR.

'**********************************
' IEP.-Demo (IsProcess dead)
'**********************************
' We use a Search-Pattern this time
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
IEP.{{Ex&THEN:rer.exe}&OR:Explo}
  : $$PID=#pid#
  ' Now we have a valid PID
  ' Now we can test if the PID is not alive
  IEP.<$$PID,99,45,34,222
    DBP. At least one of the Processes 99,45,34,222 is not
alive
    DBP.Its PID:$$000
  EIF.
EIF.
ENR.
```

Remarks

The command works transparently with both x32 and x64 applications.

`IEP.` and other `IXX.` can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or `FEX.` (Enumerations) to unlimited Depth.

Limitations:

no Limitations.

3.74.9 KPN. - Kill Process by Name

KPN. - Kill Process by Name Previous 2900 Top 41 Next 2907

MiniRobotLanguage (MRL)

KPN. Command

Kill Process by Name

Intention

This command is used to kill all processes with a specified name. For example, if you want to kill the "Internet Explorer" you could use:

```
' will close one IE
KPN.iexplore.exe

' Will close all IE's
KPN.iexplore.exe|a
```

Here is an complete working example.

```
KPN.iexplore.exe|a
WII.5000
FOR.$$CNT|1|20
  EXS.iexplore|www.fa2.de
NEX.
MBX.Click Me to Close all IE's
' Here we do NOT use background Mode
KPN.iexplore.exe|a
PAU.5
ENR.
```

KPN. has a **background mode**. In this Mode, the script will continue running while KPN. will close these processes in the background, while your script continues.. In short it looks like this.

```
KPN.iexplore.exe|ab
' Give it a bit time to work in the background
PAU.4
```

A complete working example looks like this:

```
KPN.iexplore.exe|a
WII.5000
FOR.$$CNT|1|20
  EXS.iexplore|www.fa2.de
NEX.
MBX.Click Me to Close all IE's
' Here we use background Mode
KPN.iexplore.exe|ab
PAU.5
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

You can also specify PID's that will be ignored (not closed). This would look like this:

```
KPN.iexplore.exe|ax=123,$$PID,2134
KPN.iexplore.exe|abx=123,345,$$PID
```

Syntax

KPN.P1[|P2]

Parameter Explanation

P1 **-** Processname:
  name or part of a name or path of a process.
  You can use the standard search patterns.
  You can give a full path or just the process name or a part of it.

P2 **-** Options:
  Generally the first process fitting that name will be ended.
  If you have more processes with the same name and you want to end
  them all, use the
       a - Flag: End All processes fitting that name

  You can add exceptions which will NOT be killed using the
       x= option.
  For this, just give all the PID's (Process ID's) of the processes
  that should not be killed.

  You can use the GDF. - command to get a PID from a window.

Important Notice: If you use KPN. at the end of your script, you may need to add a PAU. - command because KPN. works in the background!
If the script ends, the KPN.-background process would also end before its finished.

See this example:

```
KPN.iexplore.exe|a
CAW.ieframe
WII.5000
FOR.$$CNT|1|20
  EXS.iexplore|www.fa2.de
  STS.DUMP
  PAU..1
NEX.
STS.DUMP
MBX.Click to CLose all IE's
KPN.iexplore.exe|a
```

© 2023 Theo Gottwald * https://www.smart-package.com

ENR.

Example

```
'*********************************************
' KPN. Examples
'*********************************************
' close all Internet explorers
KPN.iexplore.exe|a

STW.c|ieframe
GDF.hp|$$PID

' close all Internet explorers except the one we localized
above
KPN.iexplore.exe|ax=$$PID

'*********************************************
```

Remarks

Prefer CLW. and CAW. before using KPN. While KPN. is faster, its also more violent. CLW. is less violent to the process and makes sure that all process resources are properly freed. KPN. is similar then if you "shoot a process" using the windows task manager. If you can't shoot a process using the windows task manager, KPN. may also fail.

Limitations:

-

3.74.10 MRK. - MiniRobotKill

MiniRobotLanguage (MRL)

MRK. Command

Mini Robots Kill

Intention

These command is used to kill all processes with the name "`MR01.exe`" that may be currently running on that system, except the actual running robot.

This command will make sure that no Instances of the Robot-Executable are leftover on the system.

Syntax

MRK.

Parameter Explanation

no parameters

Example

```
'************************************************
' MRK.
'************************************************

' Kill all running robots
MRK.

'************************************************
```

Remarks

-

Limitations:

-

3.74.11 WII. - Wait-for-Input-Idle

MiniRobotLanguage (MRL)

WII. Command

Wait for Input Idle

Intention

Halts script execution until a specified Process is ready to process Input.
This Command can be seen as a dynamic Pause-Statement, unlike a fixed statement which waits always for a fixed time.

If this process is a console application or does not have a message queue, **WaitForInputIdle** returns immediately.

Syntax

WII.[P1][|P2]

Parameter Explanation

P1 **-** time to pause (maximum) in seconds

P2 **-** (optional) Process-ID of the process to wait for.
If omitted, actual window-process is taken.

Please note that some old programs do not support WII. and therefore may hang if WII. is used on them.

Example

```
'************************************
' WII - Demo
'************************************
'DBM.2
: §§LNK=http://www.fa2.de/
EXH.index.html|$$HWA|§§LNK
PRT.Handle No. 1 is $$HWA
STW.h|$$HWA
WII.
:over
END.
```

3.74.12 WPR. - Wait-Process-Running

MiniRobotLanguage (MRL)

WPR. Command

Wait Process Running

Intention

Halts script execution until a specified process has been started.

See: 1.7. Application and PID 137

Syntax

WPR.[P1][|P2]

Parameter Explanation

P1 - Filename (with or without path) of the EXE which shall be monitored

P2 - Timeout (0 = infinite) if omitted 0 is taken

Example

```
'**********************************
' WPR.-Demo
'**********************************
DBM.2
' First closing all IE's
:retry
IEP.iexplore.exe
 CPR.0|#pid#
 JMP.retry
EIF.
MBX. Please click Ok. then start the Internet Explorer
WPR.iexplore.exe
MBX.IE running!
'**********************************
' WPR.-Demo 2 with Timeout of 3 Seconds
'**********************************
' First closing all IE's
:retrb
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
IEP.iexplore.exe
 CPR.0|#pid#
 JMP.retrb
EIF.
MBX. Please click Ok. then start the Internet Explorer
WPR.iexplore.exe|3
MBX.IE running or Timeout!
:over

3.74.13 WPT. - Wait-Process-Termination

MiniRobotLanguage (MRL)

WPT. Command

Wait Process Termination

Intention

Halts script execution until a specified process has been ended.

See: 1.7. Application and PID 137

Syntax

WPT.[P1][|P2]

Parameter Explanation

P1 – PID

P2 – Timeout (0 = infinite) if omitted 0 is taken

Example

```
'************************************
' WPT - Demo
'************************************
'DBM.2
: $$LNK=http://www.fa2.de/
EXH.index.html|$$HWA|$$LNK
PRT.Handle No. 1 is $$HWA
STW.h|$$HWA
MBX. Please click Ok. then close the Internet Explorer
WPT.#pid#
MBX. Next please do it again within 5 Seconds
EXH.index.html|$$HWA|$$LNK
PRT.Handle No. 1 is $$HWA
STW.h|$$HWA
WPT.#pid#|5
PRT.Closed or timeout happened
:over
MBX.!
END.
```

3.75.1 ! Smarty's Registry Commands

Smarty's Registry Commands

Previous 2913 Top 41 Next 2916

Smarty's Registry Commands

© 2023 Theo Gottwald * https://www.smart-package.com

3.75.2 DID. - Decode (MS-)Product-ID

MiniRobotLanguage (MRL)

DID. Command

Decode (MS-) product-ID

Intention

Find and decode MS-Product-ID from Registry. Decoded Product-ID's follow the Pattern XXXX-XXXX-XXXX-XXXX. In the registry they are stored in an encrypted way. The parameter is a Registry part that is searched for a Key named "DigitalProductId" and "ProductName".
If the given Product and the Product-ID to that Product can not be found in registry, then the command will return the next reachable Pruduct-ID.

Syntax

DID.[P1][|P2]

Parameter Explanation

When no parameter is given then the value will be read from the stack and the result will be placed on the stack (TOS)

P1 - ***(in)*** Registry Key to read.
P2 - ***(out)*** Variable that will take the result-key.

Example

```
'*******************************************
' DID. - Sample
'*******************************************
PRT.=========================================================
=====
' Using the full path from RegEdit
: $$KEY=HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Internet
Explorer\Registration
DID.$$KEY
PRT.$$000
PRT.=========================================================
=====
Using a half-Path without HKLM works, too.
: $$KEY=SOFTWARE\Microsoft\Windows NT\CurrentVersion
DID.$$KEY
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
PRT.From Stack: $$000
PRT.============================================================
=====
' in this case we specify only the relevant part.
: §§KEY=Windows NT\CurrentVersion
DID.§§KEY|§§RES
PRT.In Variable: §§RES
PRT.============================================================
=====
' Office-Reg (Example)...
: §§KEY=Office\11.0\Registration\
DID.§§KEY|§§RES
PRT.In Variable: §§RES
PRT.============================================================
=====
DMP.4
END.
```

Remarks

-

Limitations:

`DID.` is currently limited to 32 bit applications.

See also:

- RER. - Registry Entry Read 2925

© 2023 Theo Gottwald * https://www.smart-package.com

3.75.3 IER. / NER. - If-Exist-Registry

MiniRobotLanguage (MRL)

IER. Conditional Statement

If Exist Registry

Intention

This command can be used to find out, if a specified registry Key, Entry or Value is available. Standard-Search Pattern can not be used.

You can use this statement on x64 systems. In this case, you have the 32- and the 64-bit registry. You can choose which to use with the `OPT.` - command.

```
' Switch access to x64-registry
OPT.reg64|1
```

or

```
' Switch access to x32-registry on x64 systems
OPT.reg32|1
```

Syntax

IER.P1[|P2][|P3][|P4]

Parameter Explanation

P1 - Registry-path as if you copy it from a ".reg"-file.
P2 - Entry-name if given
P3 - Value if given.
P4 - Type of Entry - if given.

```
Type of Entry is a numeric argument as follows:
'  0 - REG_NONE    ' No value type
'  1 - REG_SZ   ' Unicode nul terminated string
'  2 - REG_EXPAND_SZ ' Unicode nul terminated string plus
Environment-Var
'  3 - REG_BINARY    ' Free form binary
'  4 - REG_DWORD   ' 32-bit number
'  4 - REG_DWORD_LITTLE_ENDIAN' 32-bit number (same as %
REG_DWORD)
'  5 - REG_DWORD_BIG_ENDIAN ' 32-bit number
'  6 - REG_LINK              ' Symbolic Link (unicode)
'  7 - REG_MULTI_SZ         ' Multiple Unicode strings
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'  8 - REG_RESOURCE_LIST ' Resource list in the resource map
'  9 - REG_FULL_RESOURCE_DESCRIPTOR
' 10 - REG_RESOURCE_REQUIREMENTS_LIST
' 11 - REG_QWORD      ' 64-bit number
' 11 - REG_QWORD_LITTLE_ENDIAN  ' (same as %REG_QWORD)
```

Example

```
''*****************************************
' IER. - Sample

© 2023 Theo Gottwald * https://www.smart-package.com

3.75.4 RDI. - Registry-Delete-Item

MiniRobotLanguage (MRL)

RDI. Command

Registry Delete Item

Intention

Delete Registry Items. Depending on parameters this can be a Registry Key or Value. Registry Keys with Subkeys return an API-Error number 372 on Stack.

Therefore this command is less sensitive to script errors compared to `RDT.`, which would delete whatever it can get, in case the parameters are like that.

In case of success, the number 0 is been placed on stack, otherwise an API-Error is placed on stack.

For a list of API-Errors see API-Errors 372.

Syntax

RDI.P1[|P2]

Parameter Explanation

P1 - (in) Registry Key to delete

P2 - (in) Registry Entry-Name to remove

```
When P2 is given the P1 Parameter changes his function to:
     (in) Registry Key from which the registry entry-name to
remove
```

Example

```
'*********************************************
' REW./RDI. - Sample
'*********************************************
'DBM.2
PRT.=========================================
' First we write some Keys ...
:
$$REG=HKEY_LOCAL_MACHINE\SOFTWARE\A_registry_test\Subkey03\A\B
\C
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
REW.§§REG|MYTestItem|Test-Value
MBX.!
' Now we delete the Entry
:
§§REG=HKEY_LOCAL_MACHINE\SOFTWARE\A_registry_test\Subkey03\A\B
\C
RDI.§§REG|MYTestItem
' Now we delete the Key
:
§§REG=HKEY_LOCAL_MACHINE\SOFTWARE\A_registry_test\Subkey03\A\B
\C
RDI.§§REG
DMP.4
END.
```

Remarks

-

Limitations:

This command is currently limited to the x32-Registry.

See also:

- 1.6.1. Program Flow Control 121
- IER. / NER. - If-Exist-Registry 2918

- RDI. - Registry-Delete-Item 2921
- RDT. - Registry-DelTree 2923

© 2023 Theo Gottwald * https://www.smart-package.com

3.75.5 RDT. - Registry-DelTree

MiniRobotLanguage (MRL)

RDT. Command

Registry Delete Tree

Intention

Delete Registry Items, and any subitems.

Please use RDT. with extreme caution and on your own danger.

In case of success 0 is been placed on stack, otherwise an API-Error 372 is placed on stack.

For safety reasons, prefer `RDI.` where possible to delete single Items from Registry.

Syntax

RDT.P1

Parameter Explanation

P1 **-** `(in) Registry Key to delete`

Example

```
'*********************************************
' REW./RDT. - Sample
'*********************************************
'DBM.2
PRT.=========================================
' First we write some Keys ...
:
$$REG=HKEY_LOCAL_MACHINE\SOFTWARE\A_registry_test\Subkey03\A\B
\C
REW.$$REG
' Now we delete them
: $$REG=HKEY_LOCAL_MACHINE\SOFTWARE\A_registry_test\Subkey03
RDT.$$REG
DMP.4
END.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Remarks

-

Limitations:

This command is currently limited to the x32-Registry.

© 2023 Theo Gottwald * https://www.smart-package.com

3.75.6 RER. - Registry Entry Read

MiniRobotLanguage (MRL)

RER. Command

REgistry entry Read

Intention

Read Registry Entries and values of any datatype..

If this command fails, it will return a API-Error number on the stack.
If the command succeeds, the value on the stack is zero.

```
VAR.$$REG=HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\Curren
tVersion\Uninstall\Adobe Acrobat 5.0\
RER.$$REG|DisplayName|$$RES
DBP. Result: >$$RES<
' Now we read a value and get its Type...
RER.$$REG|DisplayName|$$RES|$$TYP
DBP. Result: >$$RES<$$TYP>
END.
```

You can use this command on x64 systems. In this case, you have the 32- and the 64-bit registry. You can choose which to use with the `OPT.` - command.

```
' Switch access to x64-registry
OPT.reg64|1
```

or

```
' Switch access to x32-registry on x64 systems
OPT.reg64|1
```

Syntax

RER.P1|P2|P3[|P4]

Parameter Explanation

P1 **-** (in) Registry Key to read

P2 **-** (in) Name of Reg - Entry which is been read.

P3 **-** (out) Result: Content Value of Reg-Entry which is been read.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
P4 -  (out) numeric value which shows the Datatype of value
which
      is been read. Details  see below.

Here is the numeric code for the datatype-value (P4):
 0 - 'REG_NONE No defined value type.
 1 - 'REG_SZ A null-terminated string.
      It will be a Unicode or ANSI string, depending on
whether
      you use the Unicode or ANSI functions.
 2 - 'REG_EXPAND_SZ A null-terminated string that contains
      unexpanded references to ' environment variables (for
example, "%PATH%").
      It will be a Unicode or ANSI string depending on
      whether you use the Unicode or ANSI functions.
 3 - 'REG_BINARY Binary data in any form.
 4 - 'REG_DWORD A 32-bit number.
 5 - 'REG_DWORD_BIG_ENDIAN A 32-bit number in big-endian
format.
      In big-endian format,
      ' the most significant byte of a word is the low-order
byte.
 6 - 'REG_LINK A Unicode symbolic link.
 7 - 'REG_MULTI_SZ An array of null-terminated strings,
      terminated by two null characters.
 8 - 'REG_RESOURCE_LIST A device-driver resource list.
```

Example

```
DBP.=========================================================
=====
' First we read a value ...
:
$$REG=HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVer
sion\Uninstall\Adobe Acrobat 5.0\
RER.$$REG|DisplayName|$$RES
DBP. Result: >$$RES<
DBP.=========================================================
=====
' Now we read a value and get its Type...
RER.$$REG|DisplayName|$$RES|$$TYP
DBP. Result: >$$RES<$$TYP>
DBP.=========================================================
=====
END.
```

3.75.7 REW. - Registry-Entry-Write

MiniRobotLanguage (MRL)

REW. Command

REgistry entry Write

Intention

Creates Registry Keys to unlimited depth, creates Entries of any Datatype and value.

If this command fails, it will return a API-Error number on the stack.
If the command succeeds, the value on the stack is zero.

You can use this command on x64 systems. In this case, you have the 32- and the 64-bit registry. You can choose which to use with the `OPT.` - command.

```
' Switch access to x64-registry
OPT.reg64|1
```

or

```
' Switch access to x32-registry on x64 systems
OPT.reg64|1
```

Syntax

REW.P1[|P2][|P3][|P4]

Parameter Explanation

P1 - Registry Key to create

P2 - Name of empty Reg - Entry which is been created.

P3 - Content Value of Reg-Entry which is been created.

P4 - Datatype of value which is been created. This is numeric see below.

```
here is the numeric code for the datatype-value:
 0 - 'REG_NONE No defined value type.
 1 - 'REG_SZ A null-terminated string.
      It will be a Unicode or ANSI string, depending on
      whether you use the Unicode or ANSI functions.
 2 - 'REG_EXPAND_SZ A null-terminated string that
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
       contains unexpanded references to
       ' environment variables (for example, "%PATH%").
       It will be a Unicode or ANSI string depending on
       whether you use the Unicode or ANSI functions.
  3 - 'REG_BINARY Binary data in any form.
  4 - 'REG_DWORD A 32-bit number.
  5 - 'REG_DWORD_BIG_ENDIAN A 32-bit number in big-endian
 format.
       In big-endian format,
       ' the most significant byte of a word is the low-order
 byte.
  6 - 'REG_LINK A Unicode symbolic link.
  7 - 'REG_MULTI_SZ An array of null-terminated strings,
       terminated by two null characters.
  8 - 'REG_RESOURCE_LIST A device-driver resource list.
```

Example

```
'*******************************************

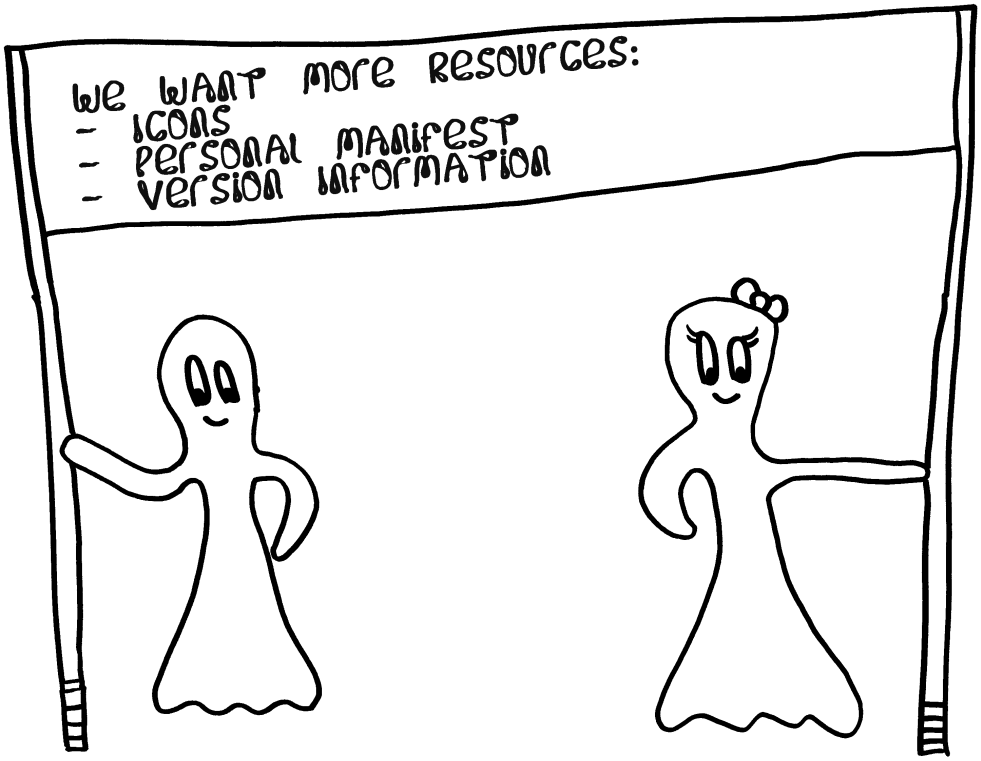
3.76 RES. - EXE-Resourcen managen

3.76.1 ! Resourcen Commands

Smarty's Ressourcen-Commands Previous 937 Top 41 Next 946

Smarty's Ressourcen Commands



Ressources in our sense are:

- Custom Icons
- personal Manifest
- Changing or adding Version-Info

While developing this task, we found that even some other commercial tools produce incorrect results.
We have therefore added the worldwide best we could find::

*© 2023 Theo Gottwald * https://www.smart-package.com*

This engine is doing all the complicated tasks internally.
You don't need to care for the details.

Anyway, handling Resources is a direct change in an executable file.
You will need to know what you are doing.

IMPORTANT TIPPS:
Please take care of these points.

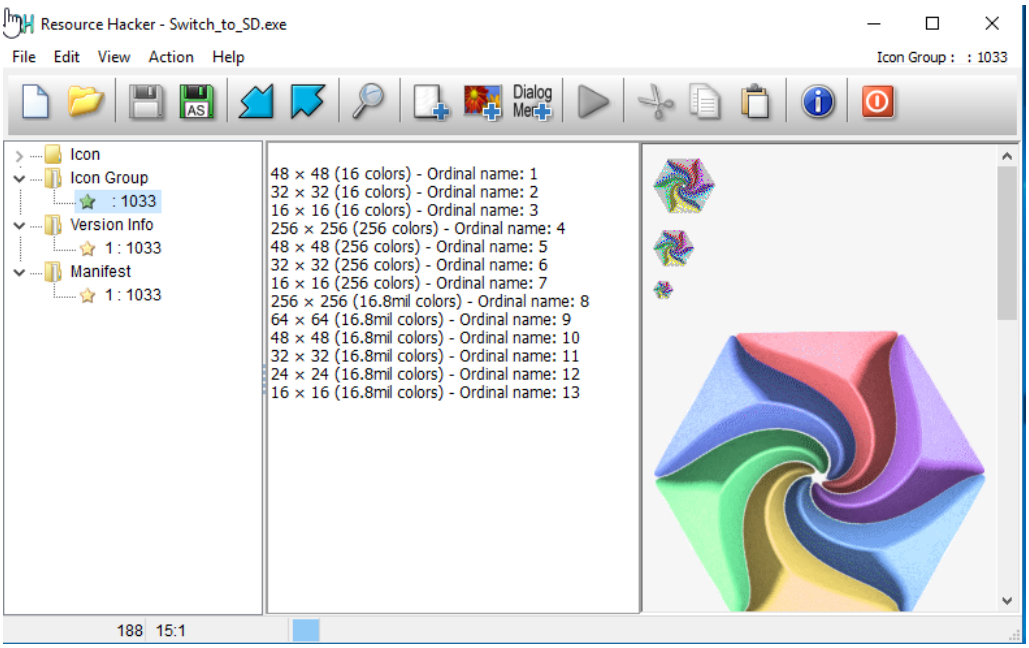
1. Files may be protected or copyrighted
2. Signed files may loose their signature (but you may sign them yourself after the process)
3. If the process fails for whatever reason (Antivirus .. etc.) the result may be an unusable file!
Especially for this reason, always work on a copy of the original file!
4. Using the File-Version changing Commands will remove all file-version information that have been there before,
and replace them with your given data.

To make manual changes on your Resources without using an SPR-Script, you can take a look on this Freeware-Tool:
Resourcehacker(TM) by Angus Johnsen

We may use some Screenshots from this Tool, in this help-file. Here is one:

On the left side you can see that we have three types of Resources:
- The Icons
- The Manifest
- The Version-Information

© 2023 Theo Gottwald * https://www.smart-package.com



Using the `RES.`-Command, you can:

- extract Resources from EXE and DLL-Files:
- extract Icons
- extract Version-Information in all languages
- extract the used Manifest

- change Resources in an EXE or DLL-File:
- change the used Icon
- replace the used Manifest
- replace the Version-Information

- And finally, if there is no resources attached to an executable, you can attach your own Ressources
- attach an Icon
- attach a Manifest
- add Version Information

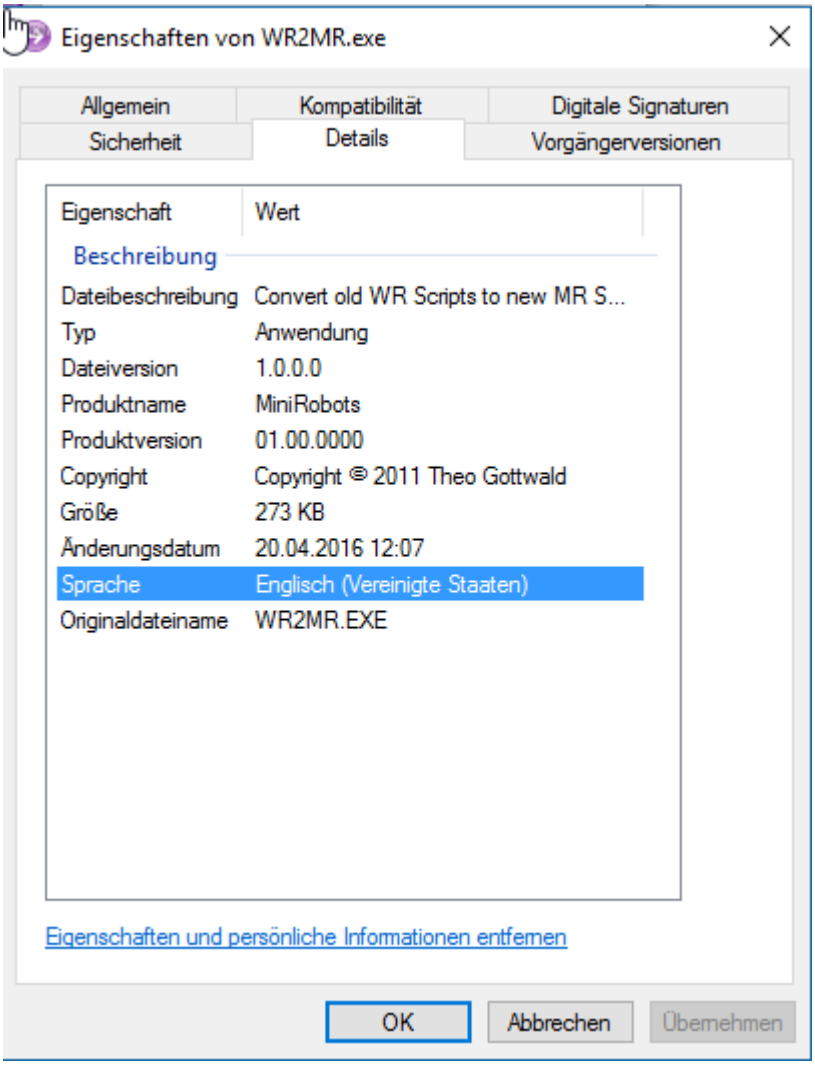
- additionally you can "Refresh" the explorer view. Because there is one more thing to know.

CHANGING the Icon may not show up immediately in the Windows Explorer, because of the "old Icon" still being stored in the windows "Icon Cache".

You can use several ways to check which Icon is really attached to a file.
- Use the available RES.-Command
- Copy the file to another place with a new Name
- Open the "File-Properties", they will show the most actual Icon
- press and hold down the left strg/ctrl-Key and then turn the Mouse-Wheel. Changing the Icon-Size may also reveal the "real Icon".

CHANGING the Version Information, make sure to use the Language that is displayed.
Otherwise you may end up with empty version information.

*© 2023 Theo Gottwald * https://www.smart-package.com*



Especially when changing "Version Information" we strongly recommend to work with a Backup" and not with the original File.
For this several Commands have an "Backup-Option", already built in".

You can also apply any of these methods to groups of files, using `FEF`.

Here is a code Sample that will change the Icon of a EXE-File.

```
'=============================================================
   ' Change the Icon of an EXE-File
   $$PAB=?path\WR2MR.exe
   $$ICO=?path\My.ico
   RES.Change Icon|$$PAB|$$ICO
ENR.
'=============================================================
   ' Change the Manifest of an EXE-File
   $$PAB=?path\WR2MR.exe
   $$MAN=?path\My.xml
   RES.Change Manifest|$$PAB|$$MAN
ENR.
'=============================================================
```

3.76.2 RES. - Manage Resources

MiniRobotLanguage (MRL)

RES. Command

Manage Ressources like Icons, Manifest and Version Information

Intention

This command is used to change or add the Icon, Manifest or Version Information of Executable or DLL-Files.

Syntax

RES.P1|P2[|P3...|Px]

Parameter Explanation

P1 - Command can be any of these

```
Refresh Explorer
Change Icon
Change Manifest
Change Version
Change Version EN
Change Version DE
Extract All
Extract Icon
Icons Path
Extract Manifest
Extract Version
Last Version
Last Manifest
```

P2-Px - Parameters depending on the given Command.

Example

```
'*******************************************
RES.Refresh Explorer
END.

'*******************************************
VAR.$$EXE=Hello.exe
VAR.$$FIA=?path\EXEs\$$EXE
RES.Extract Version|$$FIA|?path\
ENR.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

'**

Remarks

Please take care of these points.

1. Icon-Files may be copyrighted.

2. Signed files may loose their signature (but you may sign them yourself after the process).

3. If the process fails for whatever reason (Antivirus .. etc.) the result may be an unusable file!
   Especially for this reason, always work on a copy of the original file!

4. Using the File-Version changing Commands will in some cases (for example, if there is wrong aligned version data in the target file)
   remove all file-version information that have been there before, and replace them with your given data. Therefore always work on a copy of
   the file to test what you are going to make changes on.

Limitations:

Note that the Explorer has its own logic in displaying version Information, dependent on the windows version.
This may get into your way when you have multi-language resources.

3.76.3 RES.Change Icon

MiniRobotLanguage (MRL)

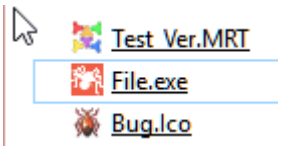
RES.Change Icon

Change the Icons of an executable or DLL-File

Intention

This command is used to change the Icon of an Executable or DLL-File.
As Source Icon, you can specify whether an ".ico"-File, or you can specify another Executable or DLL.
In this case the program will first extract the icon and then use it for the Executable.

Lets make an Example. We have an Folder like this:

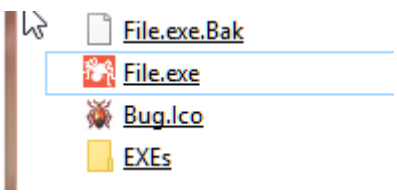


Here is our Script.

```
17  VAR.$$SRC=?path\Bug.ico
18  VAR.$$TAR=?path\File.exe
19
20  RES.Change Icon|$$TAR|$$SRC|1
21  ENR.
22
```

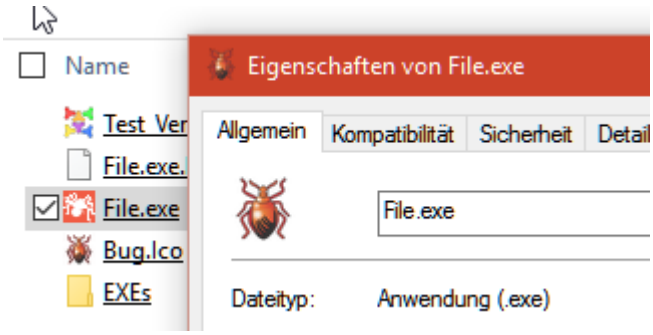
Now we run the Script. The folder will just change a bit and look like this.
For technical reasons the Icon seems unchanged.
Don't worry the Icon was changed, the Explorer just did not realize it yet, due to cache-effects.

You may also notice that the was made an Backup of the Target-File named "`File.exe.Bak`".
This is because we specified the "1" as third Parameter.
It is recommended to always work on a copy of the file.
Doing it this way, you always have a working copy of the Target-File as Backup.



© 2023 Theo Gottwald * https://www.smart-package.com

Now we use the "Properties" to see which Icon is really in there.



And you see, that the Icon has been "implanted".

Important Note: You must specify an valid "`.ico`"-File as Source-Parameter.
You can **not** specify an EXE-File or an DLL-File, even if this one may contain an Icon.
If you specify any other filetype the result is unpredictable.
In our tests, most often the target file will just not have any Icon after the operation.

Syntax

```
RES.Change Icon|P1|P2[|P3]
RES.CI|P1|P2[|P3]
```

Parameter Explanation

P1 - Path of `EXE-File or DLL-File`
P2 - Path of `Icon-File`
P3 - (num) **0/1/2/3 - Flag (default is 0)**
0 - no Backup, Refresh Explorer
1 - make Backup before changing file, Refresh Explorer
2 - do not "Refresh Explorer" do not make a Backup
3 - do not "Refresh Explorer", but make a Backup

Example

```
'***********************************************
' Path to the Icon File
VAR.$$SRC=?path\Bug.ico

' Path to the File that will get this Icon.
VAR.$$TAR=?path\File.exe

RES.Change Icon|$$TAR|$$SRC|1
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

Please take care of these points.

1. Files may be protected or copyrighted
2. Signed files may loose their signature (but you may sign them yourself after the process)
3. If the process fails for whatever reason (Antivirus .. etc.) the result may be an unusable file!

Especially for this reason, always work on a copy of the original file!

Limitations:

-

3.76.4 RES.Change Manifest

MiniRobotLanguage (MRL)

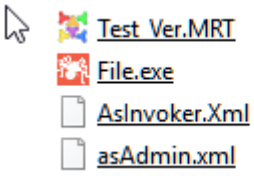
RES.Change Manifest

Change the Manifest of any executable

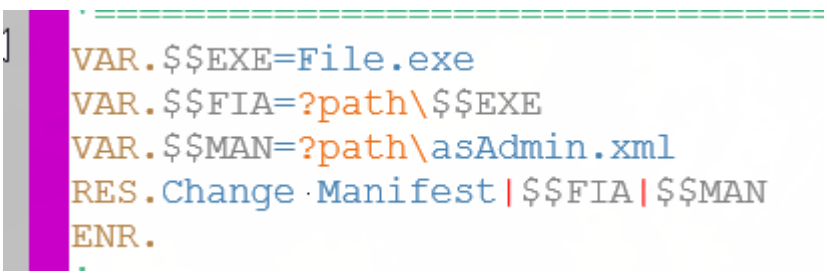
Intention

This command is used to attach an Manifest(.xml) File of your choice to an executable.
The original Manifest - if there was one before - will be removed during the process.

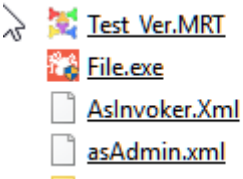
Lets make a Sample. Here we have an executable and an manifest file.



Here is our Script. We run it.



Now the folder looks like this:

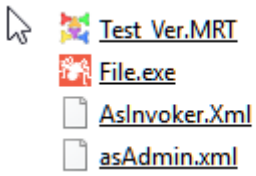


As you can see, the Manifest was implanted into the Executable. Now we remove it and make it to "asInvoker".
Here is our Script:

```
VAR.$$EXE=File.exe
VAR.$$FIA=?path\$$EXE
VAR.$$MAN=?path\asInvoker.xml
' You can use the short Form "cm" for Change Manifest, also.
RES.CM|$$FIA|$$MAN
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

We run it and ... we are back!



Syntax

RES.Change Manifest|P1|P2[|P3]
RES.CM|P1|P2[|P3]

Parameter Explanation

P1 - Path of `EXE-File or DLL-File`
P2 - Path of Manifest-File (must be an .xml-File)
P3 - (num) **0/1/2/3 - Flag (default is 0)**
0 - no Backup, Refresh Explorer
1 - make Backup before changing file, Refresh Explorer
2 - do not "Refresh Explorer" do not make a Backup
3 - do not "Refresh Explorer", but make a Backup

Example

```
'*********************************************
VAR.$$EXE=File.exe
VAR.$$FIA=?path\$$EXE
VAR.$$MAN=?path\asInvoker.xml
RES.Change Manifest|$$FIA|$$MAN
ENR.
```

Remarks

Please take care of these points.

1. Files may be protected or copyrighted
2. Signed files may loose their signature (but you may sign them yourself after the process)
3. If the process fails for whatever reason (Antivirus .. etc.) the result may be an unusable file!
Especially for this reason, always work on a copy of the original file!

3.76.5 RES.Change Version

MiniRobotLanguage (MRL)

RES.Change Version

Add or change Version Information in an Executable File or DLL

Intention

This command is used to Add or Change Version Information in an Executable File or DLL.
Adding or changing is supported, even Multi-Language Resources can be added or changed.

Here is an Example:

```
   ' Sample changing Version Information
' Name and Path of the File into variable
VAR.$$FIA=?path\File.exe
' Tell command what do change
VAR.$$VER=LangId = 040704B0|ProductName=Package Robot|
FileVersion=1.2.3.4.56|MainLangId = 040704B0
' Do changes
RES.Change Version|$$FIA|$$VER|1
ENR.
```

The **special Version for German**:
`RES.Change Version` **`DE`**`|$$FIA|$$VER`
will internally prefix the String with a "`LangId = 040704B0|`" and add a "`|MainLangId=040704B0`" at the end.

The **special Version for English:**
`RES.Change Version` **`EN`**`|$$FIA|$$VER`
will internally prefix the String with a "`LangId = 040904B0|`" and add a "`|MainLangId=040904B0`" at the end.

Note that the proper use of "MainLangID = xxxxxx" and "LangId = xxxxxx" is important.

Technically:
"**`MainLangId`**" defines the "`VarFileInfo`" Block of the original Resources-File, that was used when the Executable was created..

```
BLOCK "VarFileInfo"
{
VALUE "Translation", 0x0407 0x04B0
VALUE "Translation", 0x0409 0x04B0
}
```

"**`LangId`**" defines a block inside the **`"StringFileInfo"`** Block of the original Resources-File, that was use

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
BLOCK "StringFileInfo"
{
BLOCK "040704B0"
{
VALUE "Comments", "[-De-] Comments"
VALUE "CompanyName", "[-De-] CompanyName"
…
}
BLOCK "040904B0"
{
VALUE "Comments", "[-En-] Comments"
VALUE "CompanyName", "[-En-] CompanyName"
…
}
}
```

About Lang-charset and string-name

Its important to use the proper `MainLangId=xxxxxxxx`. The values for all countries can be found in MSDN here:

MSDN StringFileInfo BLOCK

The values for the charactersets are in Decimal on the MSDN Page. These need to be converted to Hexadezimal.

Take something like <`BLOCK "040904E4"`>

note that the first half "`0490`" correspond to *`U.S. English`*, The second half "`04E4`" correspond to Multilingual (Decimal `1252`).

Here you would write: `MainLangId=049004E4`

Syntax

```
RES.Change Version|P1|P2[|
P3...|Px]
RES.Change Version en|P1|P2[|
P3...|Px]
RES.Change Version de|P1|P2[|
P3...|Px]
```

There are the following, functional equal short forms available:

```
RES.CV|P1|P2[|P3...|Px]
RES.CE|P1|P2[|P3...|Px]
RES.CD|P1|P2[|P3...|Px]
```

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - Path of `EXE-File or DLL-File`
P2 - See Description below.
P3 - (num) **0/1/2/3 - Flag (default is 0)**
0 - no Backup, Refresh Explorer
1 - make Backup before changing file, Refresh Explorer
2 - do not "Refresh Explorer" do not make a Backup
3 - do not "Refresh Explorer", but make a Backup

Description for P2:

P2 - Contains one or more "Subcommands", all in one String. All spearated by the Pipe-Symbol "|".
You may start with:
`LangId = 040704B0|`

then follow with one or more of the Parmeters below.

finally write:
`|MainLangId = 040704B0`
the given number is in Detail explained here: MSDN StringFileInfo BLOCK .
It starts with a 4 digit Country-code (in Hexadezimal) then 4 digits characterset (Hexadezimal also!).

Inside follow one or more of these Version-Strings followed with an "=" and a value:
- `FileDescription`
- `FileVersion`
- `ProductName`
- `ProductVersion`
- `LegalCopyright`
- `LegalTrademarks`
- `OriginalFilename`
- `CompanyName`
- `Comments`

All of these must be followed by an "=" and then the String that shall be assigned to this Version-Info.
If it is followed by more other "Subcommands" you need to delimit them with the Pipe-Symbol "|".

Example:

```
LangId = 040704B0|ProductName=Package Robot|FileVersion=1.2.3.4.56|MainLangId =
```

Example

```
'*********************************************
   ' Sample changing Version Information
VAR.$$EXE=File.exe
VAR.$$FIA=?path\$$EXE
VAR.$$VER=LangId = 040704B0|ProductName=Package Robot|
FileVersion=1.2.3.4.56|MainLangId = 040704B0
RES.Change Version|$$FIA|$$VER|1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

Remarks

Please take care of these points.

1. Files may be protected or copyrighted
2. Signed files may loose their signature (but you may sign them yourself after the process)
3. If the process fails for whatever reason (Antivirus .. etc.) the result may be an unusable file!
Especially for this reason, always work on a copy of the original file!
4. Using the File-Version changing Commands will remove all file-version information that have been there before,
and replace them with your given data.

Limitations:

-

3.76.6 RES.Refresh Explorer

MiniRobotLanguage (MRL)

RES.Refresh Explorer

Refresh the Explorer-View after changing Ressources like Icons, Manifest and Version Information

Intention

This command is used to Refresh the Explorer-View after changing Ressources like Icons, Manifest and Version Information.

Syntax

```
RES.Refresh Explorer
RES.RE
```

Parameter Explanation for VBE

-

Example

```
'*********************************************
' Refresh the Explorer View
RES.Refresh Explorer
END.
```

Remarks

Please take care of these points.

1. Files may be protected or copyrighted
2. Signed files may loose their signature (but you may sign them yourself after the process)
3. If the process fails for whatever reason (Antivirus .. etc.) the result may be an unusable file!
Especially for this reason, always work on a copy of the original file!
4. Using the File-Version changing Commands will remove all file-version information that have been there before,
and replace them with your given data.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Limitations:

Due to Windows and Explorer Properties, this may not always work as expected.

3.76.7 RES.Extract All

MiniRobotLanguage (MRL)

RES.Extract All

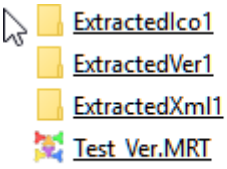
Extract Resources from a given File

Intention

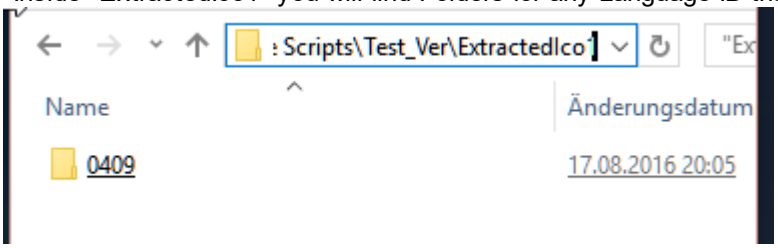
This command is extract Resources from an EXE- or DLL-File.
These Resources will be stored in Folders in a given path.

```
' Example
' This is the path to the Source-File to be extracted
 VAR.$$FIA=?path\EXEs\Hello.exe
' The second Parameter is the Path to the root of all "Target Folders".
 RES.Extract All|$$FIA|?path\
```

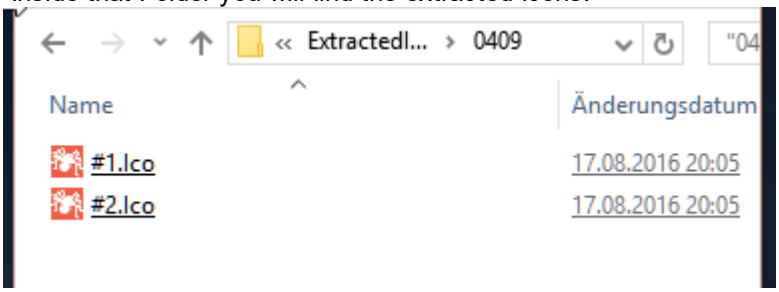
This Script will create these folders in `?path\`.



Inside "ExtractedIco1" you will find Folders for any Language ID that had Icons.

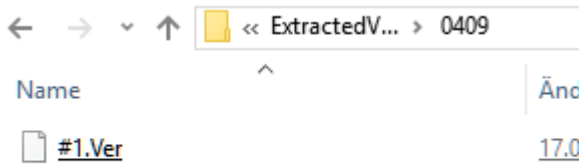


Inside that Folder you will find the extracted Icons.



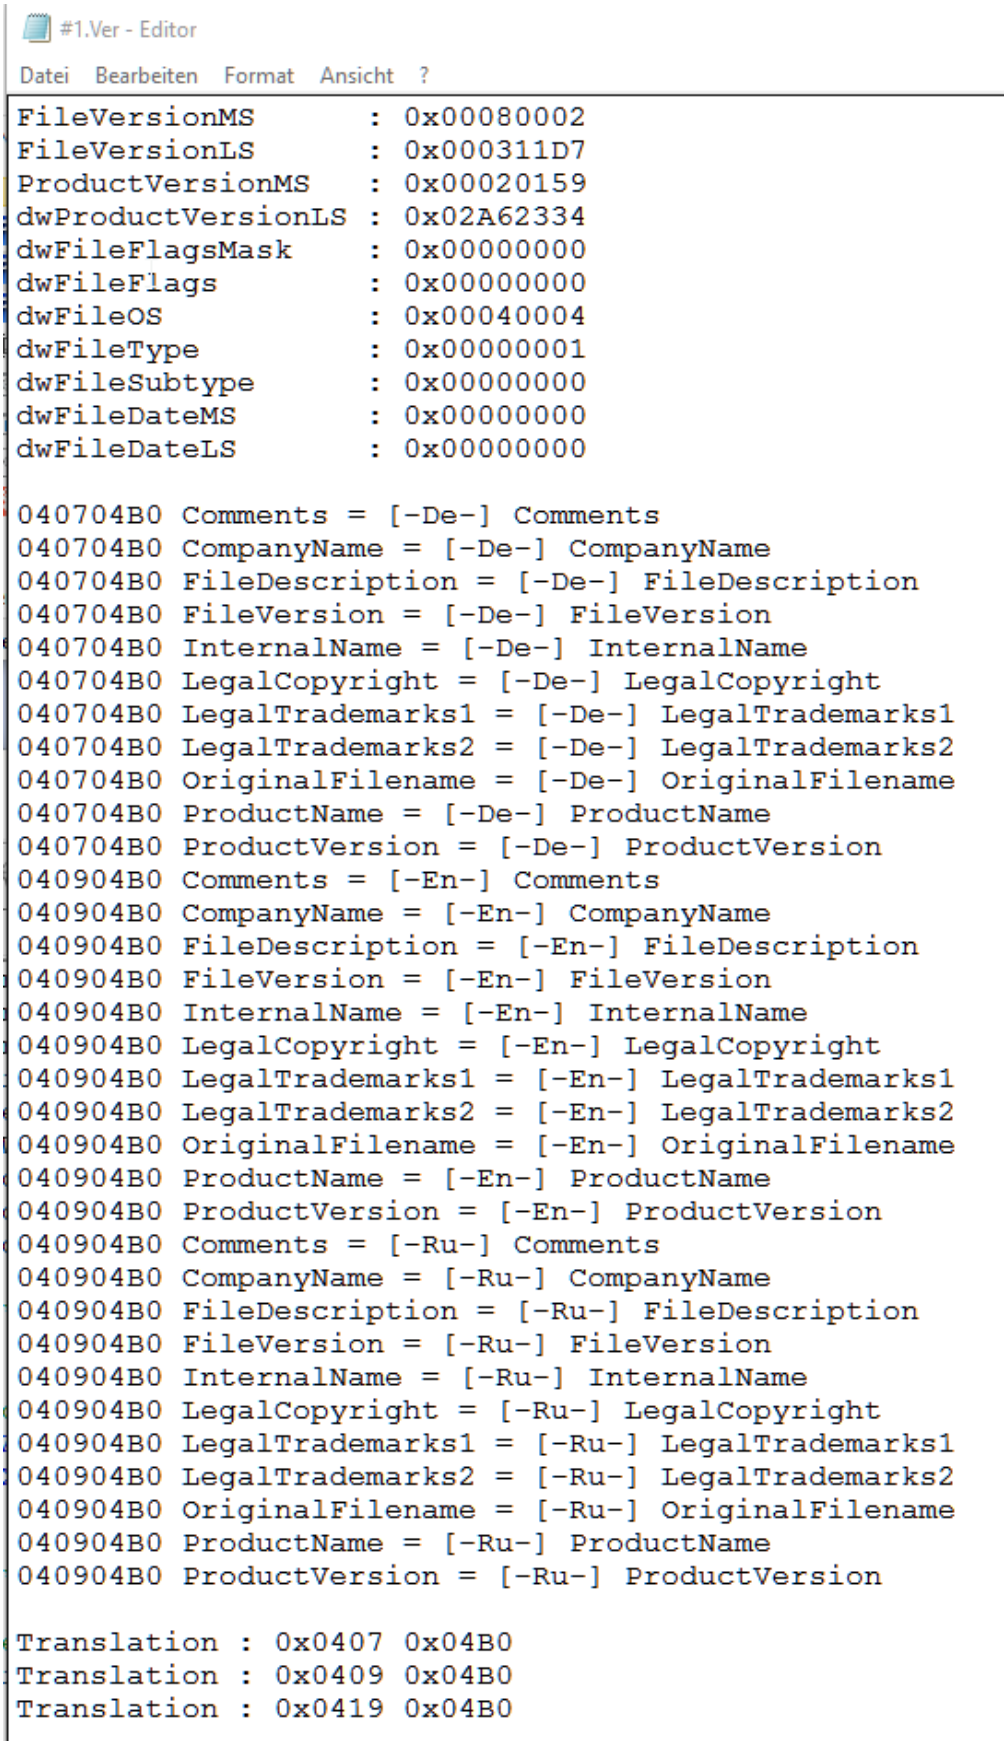
The same applies to the "ExtractedVer1" Folder.
Inside you will first find an folder for each language-ID.
And inside this Folder you find the Version Information for each Language-ID.

© 2023 Theo Gottwald * https://www.smart-package.com



In most cases the generated "`.ver`"-File will look somehow like the file below.
It has an own "Pseudocode"-Format.
It is not possible to import this file anywhere. Its just for reading and analyzing.

*© 2023 Theo Gottwald * https://www.smart-package.com*



© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

RES.Extract All|P1|P2
RES.EA|P1|P2

Parameter Explanation

P1 - Path of `EXE-File or DLL-File`
P2 - Path of Target-Folder

Example

```
'*********************************************
'#EXE:?path\
'#SPI:ForceWrite
' The following files will be inserted into the Executable.
'#INC:?path\EXEs\Hello.exe

VAR.$$FIA=?path\EXEs\Hello.exe
RES.Extract All|$$FIA|?path\
ENR.

'*********************************************
    ' Here is a more complex Sample that uses "RES.LastVersion" to display the las
 VAR.$$EXE=Hello.exe
 VAR.$$FIA=?path\EXEs\$$EXE
 IEF.$$FIA
   RES.Extract Version|$$FIA|?path\
  ' Display Path to Version-File
   MBX.$$TXT

  RES.Last Version|$$TXA
   ' Display Path to Version-File
   MBX.$$TXA
   ' Display Content of Version File
   VAR.$$TXB=$tos$
   MBX.$$TXB
 EIF.
 ENR.
```

Remarks

-

Limitations:

Note that the Explorer has its own logic in displaying version Information, dependent on the windows version.
This may get into your way when you have multi-language resources.

3.76.8 RES.Extract Icon

MiniRobotLanguage (MRL)

RES.Extract Icon

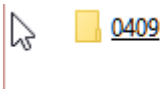
Extract Icons from a specified EXE- or DLL-File

Intention

This command is extract Icon-Resources from an EXE- or DLL-File.
These Resources will be stored in Folders with the name of the country code, in a given path.

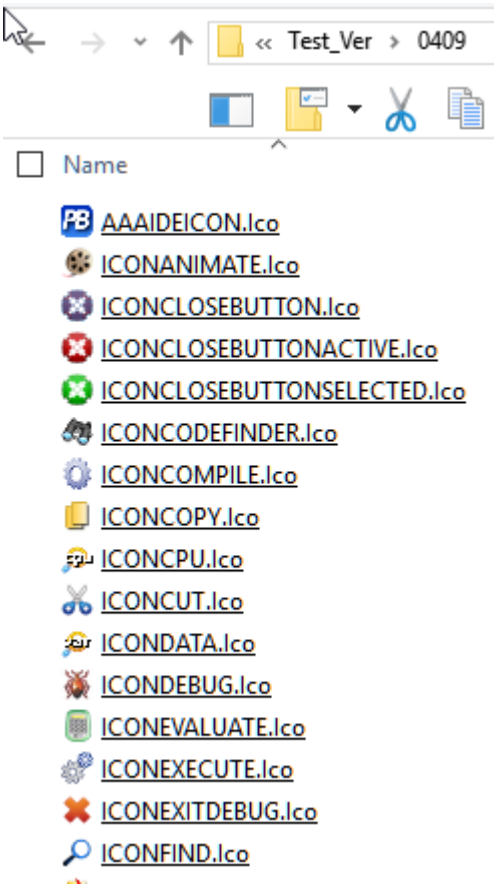
```
' Example
' This is the path to the Source-File to be extracted
 VAR.$$FIA=?path\EXEs\Hello.exe
' The second Parameter is the Path to the root of all "Target Folders".
 RES.Extract Icon|$$FIA|?path\
 MBX.$tos$
 ENR.
```

This Script will create these folder with the name of the LanguageID of the Icons-Resource in `?path\`.



Inside that Folder you will find the extracted Icons.

© 2023 Theo Gottwald * https://www.smart-package.com



The name and path of the last saved Icon will be placed on TOS.

Syntax

RES.Extract Icon|P1|P2
RES.EI|P1|P2

Parameter Explanation

P1 - Path of `EXE-File or DLL-File`
P2 - Path of Target-Folder

Example

```
'*********************************************
'#EXE:?path\
'#SPI:ForceWrite
' This is the path to the Source-File to be extracted
    VAR.$$FIA=?path\EXEs\Hello.exe
   ' The second Parameter is the Path to the root of all "Target Folders".
    RES.Extract Icon|$$FIA|?path\
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Last Icon Path is now on the TOS
MBX.$tos$
ENR.
```

Remarks

-

Limitations:

Note that there is currently no way to extract only a specified Icon.

3.76.9 RES.Extract Manifest

MiniRobotLanguage (MRL)

RES.Extract Manifest

Extract Manifest-Resources from a given EXE- or DLL-File

Intention

This command is extract Manifest-Resources from an EXE- or DLL-File.
These Resources will be stored in Folders with the name of the country code, in a given path.

Here is a Sample-Script.

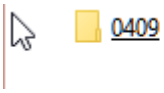
```
  ' This is the path to the Source-File to be extracted
    VAR.$$FIA=?path\EXEs\Hello.exe
   ' The second Parameter is the Path to the root of all "Target Folders".
 RES.Extract Manifest|$$FIA|?path\
MBX.$tos$
  ' To analyze the Manifest in the Script, you can use
RES.Last Manifest|$$TXT
VAR.$$TXA=$tos$
   ' The Manifest is now in $$TXA
MBX.$$TXA
ENR.
```

This Script will display fist this Messagebox with the path to the ".Xml"-File.:

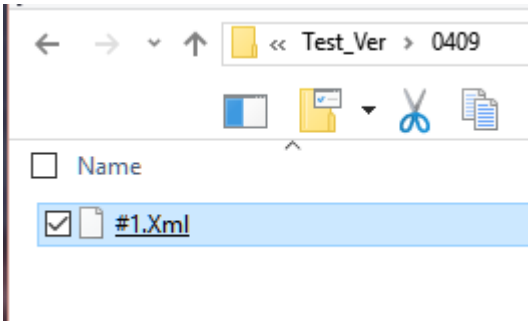
Secondly it will display a Messagebox with the Content of the ".Xml"-file.
The following picture shows only a part.

*© 2023 Theo Gottwald * https://www.smart-package.com*

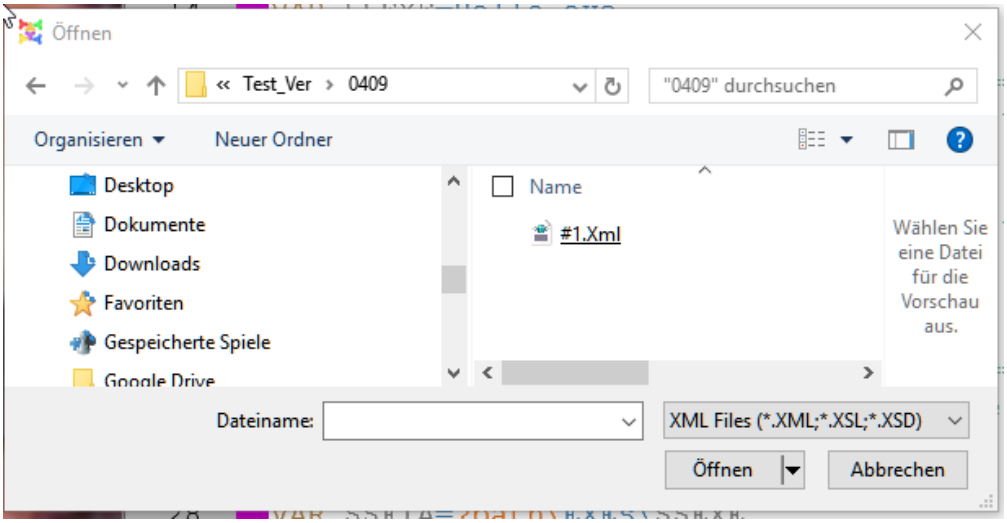
This Script will create these folder with the name of the LanguageID of the Manifest-Resource in `?path\`.



Inside that Folder you will find the extracted Manifest as a "`.XML`"-File.

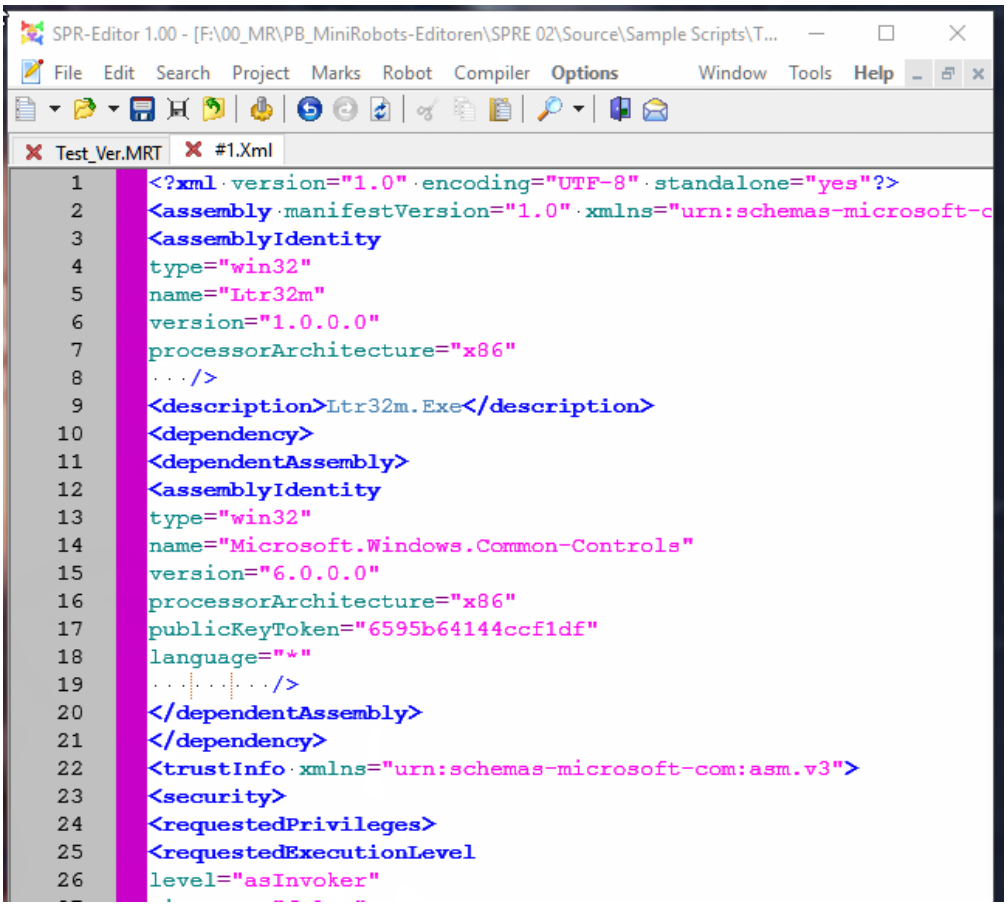


You can Load XML-Files with SPRE, just change the Filter to "XML-Files":



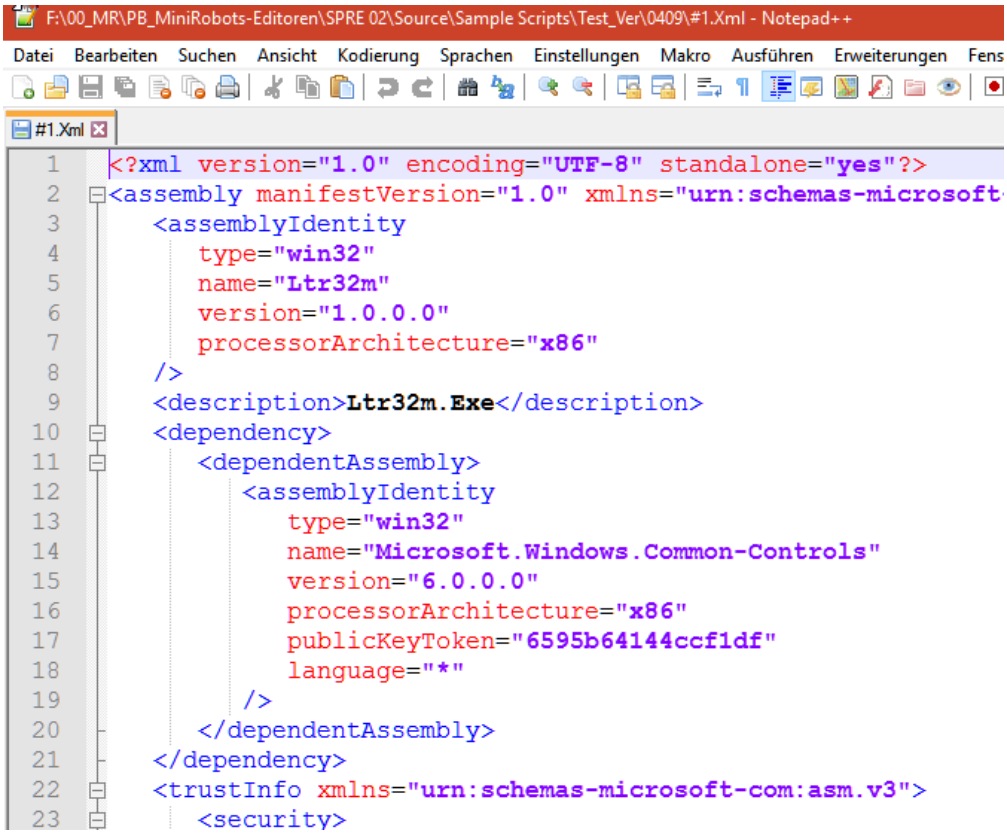
© 2023 Theo Gottwald * https://www.smart-package.com

This may look somehow like here:

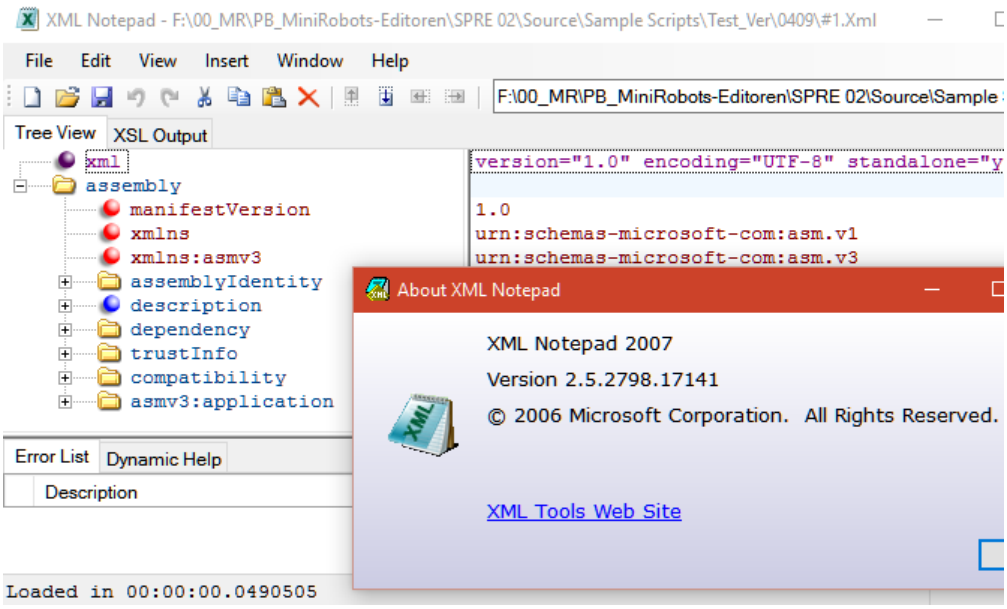


You can also open XML-Files with some advanced Text-Editor Programs. Here "Notepad++".

© 2023 Theo Gottwald * https://www.smart-package.com



Another Option is the "XML-Notepad".



Syntax

RES.Extract Manifest|P1|P2

RES.EM|P1|P2

Parameter Explanation

P1 - Path of `EXE-File or DLL-File`
P2 - Path of Target-Folder

Example

```
'*********************************************
'#EXE:?path\
'#SPI:ForceWrite
' The following files will be inserted into the Executable.
'#INC:?path\EXEs\Hello.exe
    ' This is the path to the Source-File to be extracted
     VAR.$$FIA=?path\EXEs\Hello.exe
    ' The second Parameter is the Path to the root of all "Target Folders".
  RES.Extract Manifest|$$FIA|?path\
 MBX.$tos$
 ' To analyze the Manifest in the Script, you can use
 RES.Last Manifest|$$TXT
 VAR.$$TXA=$tos$
 ' The Manifest is now in $$TXA
 MBX.$$TXA
 ENR
```

3.76.11 RES.Last Manifest

MiniRobotLanguage (MRL)

RES.Last Manifest

Get the Path and Data from the last extracted Manifest

Intention

This command is used to get the Data from the last extracted Manifest.
The command will get the Path to the Manifest-File into a Variable, and the Data of the File on the Top Of Stack `$tos$`.
To see the effect of the Program, its necessary to first "extract" an Manifest.
The command can also be used after an "`RES.Extract All`".

Here is a Sample-Script.

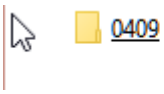
```
' This is the path to the Source-File to be extracted
   VAR.$$FIA=?path\EXEs\Hello.exe
  ' The second Parameter is the Path to the root of all "Target Folders".
 RES.Extract Manifest|$$FIA|?path\
MBX.$tos$
' To analyze the Manifest in the Script, you can use
RES.Last Manifest|$$TXT
VAR.$$TXA=$tos$
' The Manifest is now in $$TXA
MBX.$$TXA
ENR.
```

This Script will display fist this Messagebox with the path to the "`.Xml`"-File.:

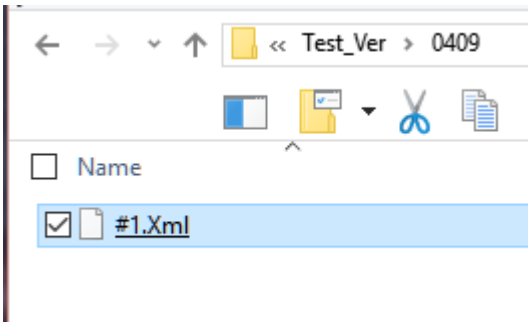
Secondly it will display a Messagebox with the Content of the "`.Xml`"-file.
The following picture shows only a part.

 *© 2023 Theo Gottwald * https://www.smart-package.com*

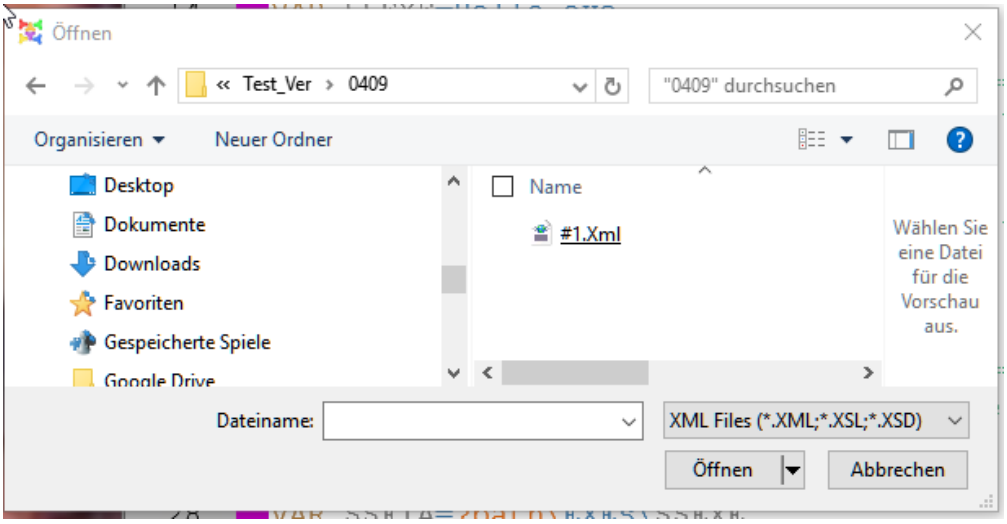
This Script will create these folder with the name of the LanguageID of the Manifest-Resource in `?path\`.



Inside that Folder you will find the extracted Manifest as a "`.XML`"-File.

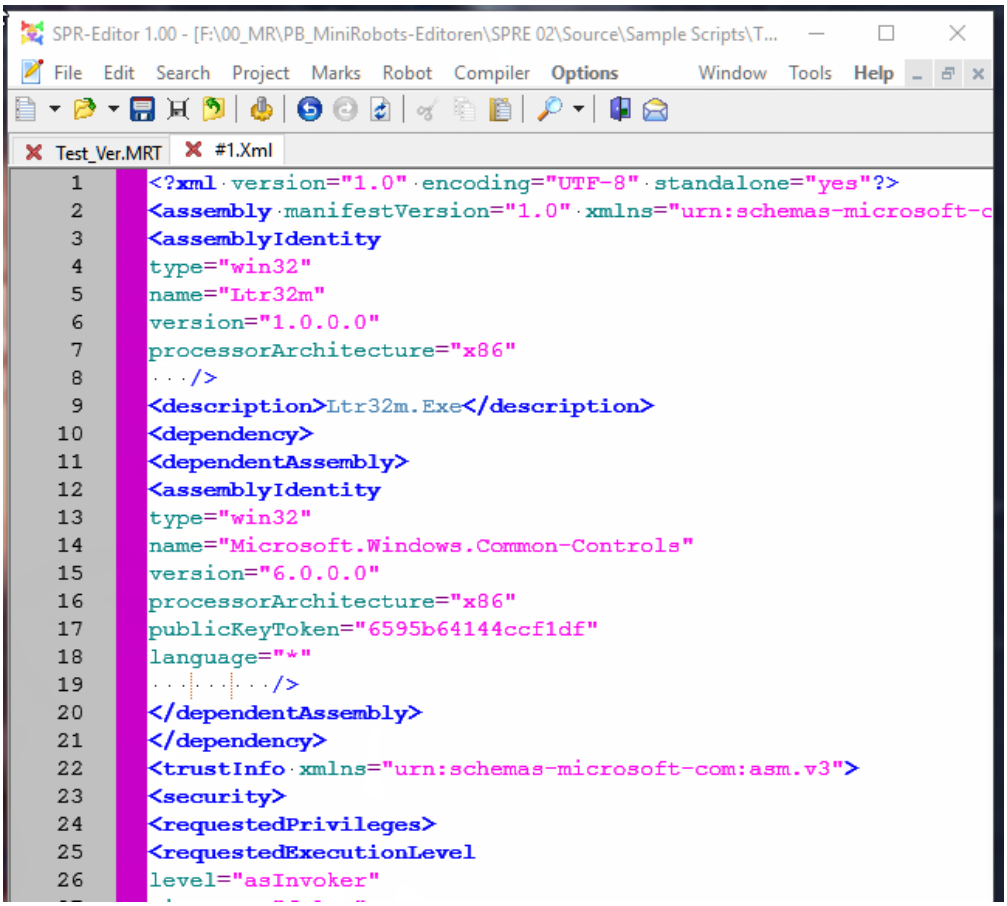


You can Load XML-Files with SPRE, just change the Filter to "XML-Files":



This may look somehow like here:

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

RES.Last Manifest|P1
RES.LM|P1

Parameter Explanation

P1 – Variable that will get the Path to the last extracted Manifest-File.

Example

```
' This is the path to the Source-File to be extracted
    VAR.$$FIA=?path\EXEs\Hello.exe
   ' The second Parameter is the Path to the root of all "Target Folders".
 RES.Extract Manifest|$$FIA|?path\
MBX.$tos$
' To analyze the Manifest in the Script, you can use
RES.Last Manifest|$$TXT
VAR.$$TXA=$tos$
' The Manifest is now in $$TXA
MBX.$$TXA
```

3.76.12 RES.Last Version

MiniRobotLanguage (MRL)

RES.Last Version

Get the Path and Data from the last extracted Version Information

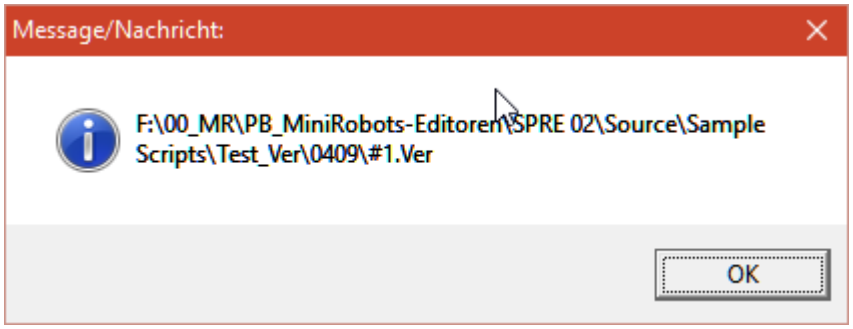
Intention

This command is used to get the Data from the last extracted Version Information.
The command will get the Path to the last extracted Version-File into a Variable, and the Data of the File on the Top Of Stack `$tos$`.
To see the effect of the Program, its necessary to first "extract" an Version Information.
The command can also be used after an "`RES.Extractr All`".

Here is a Sample-Script.

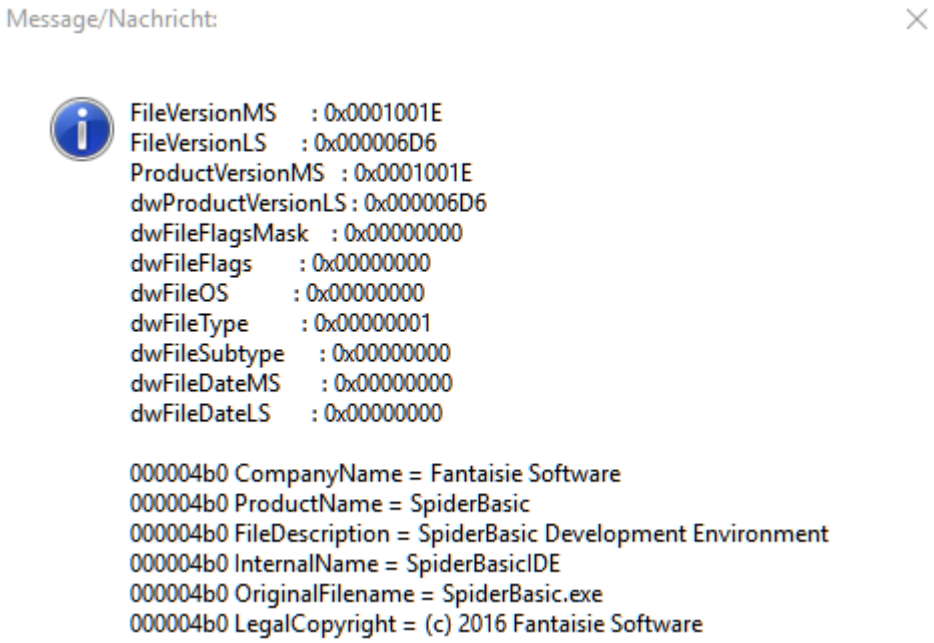
```
' This is the path to the Source-File to be extracted
VAR.$$FIA=?path\File.exe
' The second Parameter is the Path to the root the "Target Folder".
RES.Extract Version|$$FIA|?path\
MBX.$tos$
' To analyze the Version-Information in the Script, you can use
RES.Last Version|$$TXT
VAR.$$TXA=$tos$
' The Version-Info is now in $$TXA
MBX.$$TXA
ENR.
```

This Script will display fist this Messagebox with the path to the "`.Ver`"-File.:

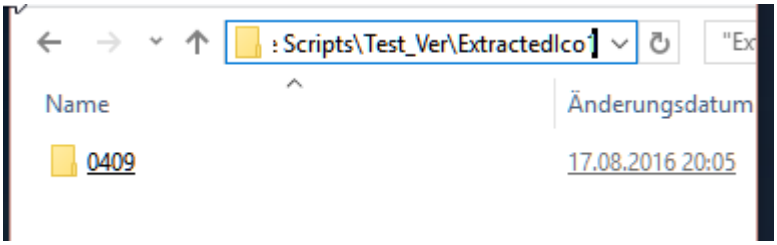


Secondly it will display a Messagebox with the Content of the "`.Ver`"-file.
The following picture shows only a part.

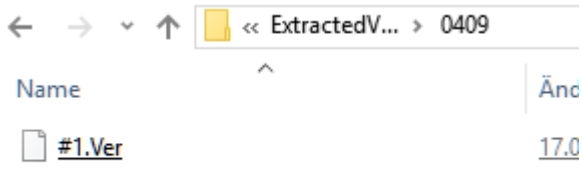
© 2023 Theo Gottwald * https://www.smart-package.com



This Script will create these folder with the name of the LanguageID for each available Version-Resource, in `?path\`.

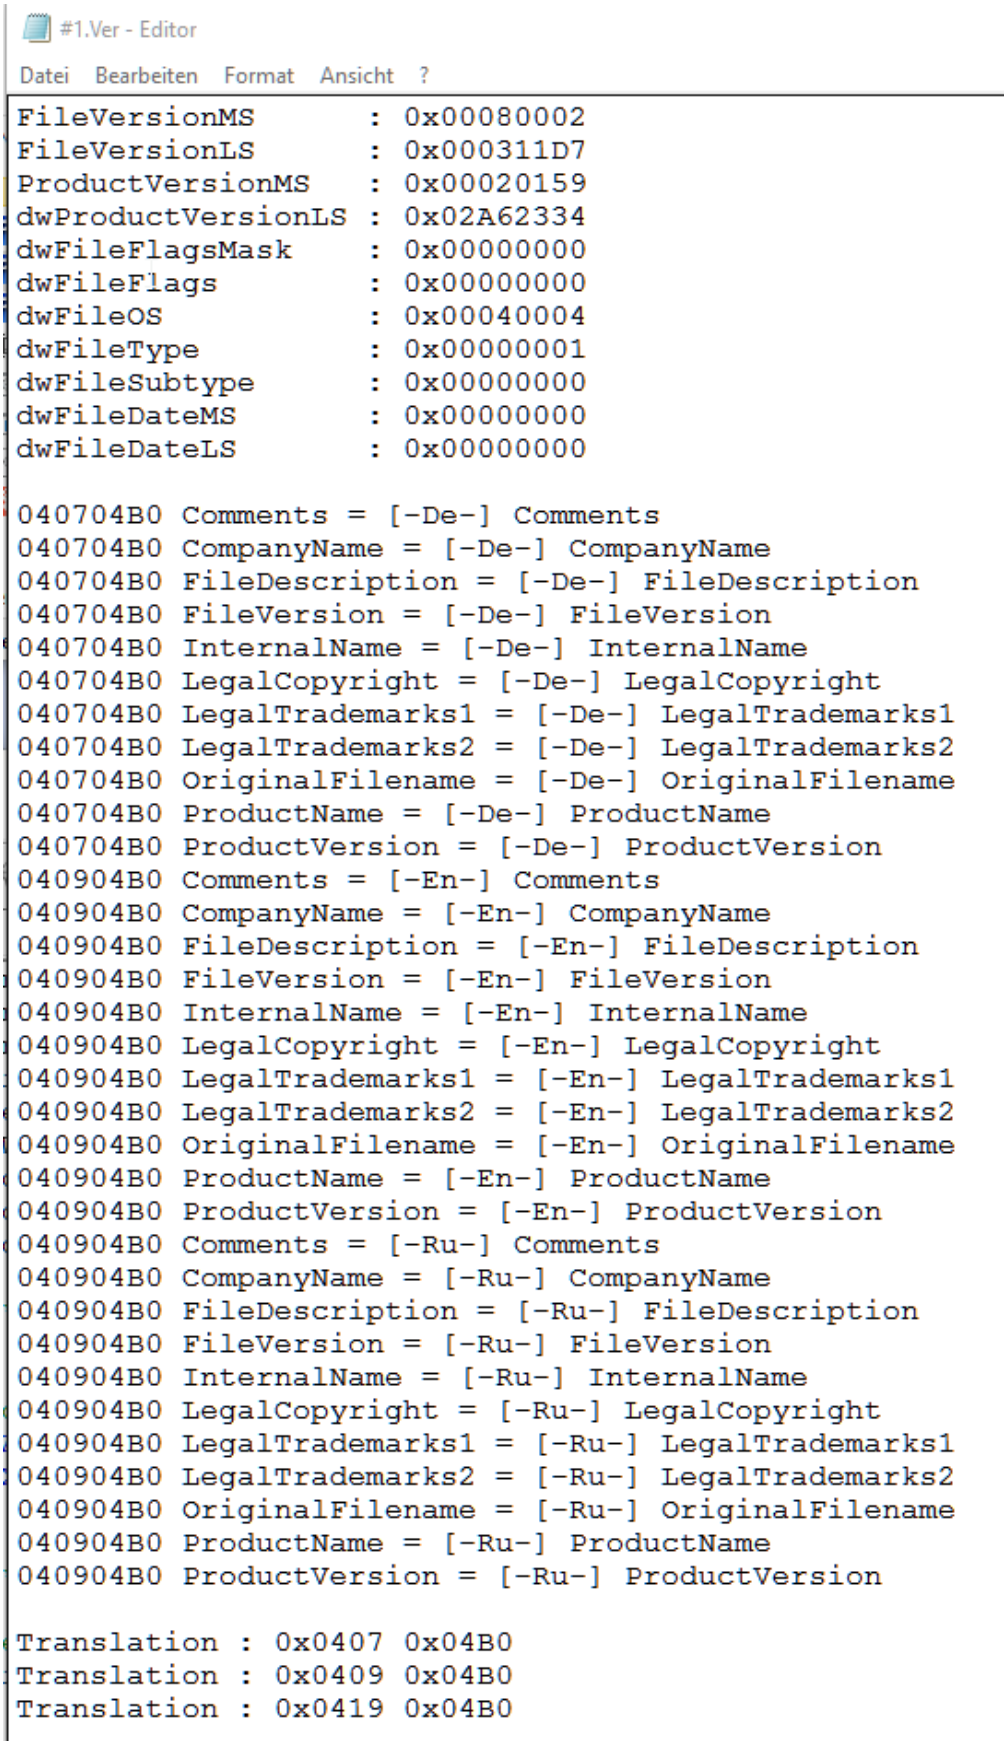


Inside that Folder you will find the extracted Version Information for each Language-ID.



In most cases the generated "`.ver`"-File will look somehow like the file below.
It has an own "Pseudocode"-Format.
It is not possible to import this file anywhere. Its just for reading and analyzing.

© 2023 Theo Gottwald * https://www.smart-package.com



© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

RES.Last Version|P1
RES.LV|P1

Parameter Explanation

P1 – Variable that will get the Path to the last extracted Manifest-File.

Example

```
' This is the path to the Source-File to be extracted
   VAR.$$FIA=?path\EXEs\Hello.exe
  ' The second Parameter is the Path to the root of all "Target Folders".
 RES.Extract Version|$$FIA|?path\
MBX.$tos$
' To analyze the Version in the Script, you can use
RES.Last Version|$$TXT
VAR.$$TXA=$tos$
' The Version-Data is now in $$TXA
MBX.$$TXA
ENR.
```

3.76.13 RES.Last Icon

MiniRobotLanguage (MRL)

RES.Last Icon

Get the Path and Data from the last extracted Icon

Intention

This command is used to get the Path and Data from the last extracted Icon.
This command is available rather for completeness, it may not be as useful as the other Commands (`RES.Last Version` for example).
The command will get the Path to the last extracted Icon-File into a Variable, and the Data of the File on the Top Of Stack `$tos$`.
To see the effect of the Program, its necessary to first "extract" an Icon.
The command can also be used after an "`RES.Extractr All`"

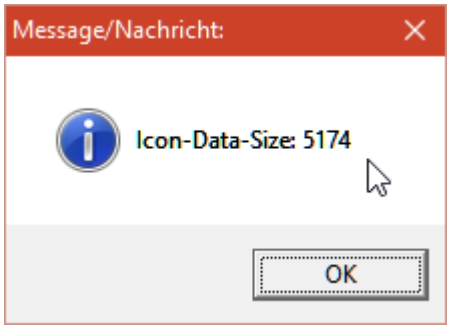
Here is a Sample-Script.

```
' This is the path to the Source-File to be extracted
VAR.$$EXE=Hello.exe
VAR.$$FIA=?path\File.exe
' The second Parameter is the Path to the root of all "Target
Folders".
RES.Extract Icon|$$FIA|?path\
MBX.$tos$
' To analyze the Icon in the Script, you can use
RES.Last Icon|$$TXT
VAR.$$TXA=$tos$
' The Icon is now in $$TXA
LEN.$$TXA|$$TXA
MBX.Icon-Data-Size: $$TXA
ENR.
```

This Script will display fist this Messagebox with the path to the "`.ico`"-File.:

© 2023 Theo Gottwald * https://www.smart-package.com

Secondly it will display a Messagebox with the Size of the ".ico"-file.



In most cases, multiple Icons are extracted. This command will only return the Path to the last Icon, that was extracted.
To get Informations about the other icons, it makes sense to use the result from this command and use other commands.
Here is an example that will display all path's from all extracted Icons

```
 This is the path to the Source-File to be extracted
VAR.$$EXE=Hello.exe
VAR.$$FIA=?path\File.exe
' The second Parameter is the Path to the root of all "Target Folders".
RES.Extract Icon|$$FIA|?path\
MBX.$tos$
' To analyze the Icon in the Script, you can use
RES.Last Icon|$$TXT
VAR.$$TXA=$tos$
' The Icon is now in $$TXA
LEN.$$TXA|$$TXA
MBX.Icon-Data-Size: $$TXA
GFT.h|$$TXT|$$PAT
MBX.$$PAT
FEF.DoIt|$$TMP|$$PAT
MBX.Ready
ENR.

:DoIt
PRT.$$TMP
RET.
ENR.
```

In case the result has a multi-language resource, you can use the Script below..

```
' This is the path to the Source-File to be extracted
VAR.$$EXE=Hello.exe
VAR.$$FIA=?path\File.exe
' The second Parameter is the Path to the root of all "Target Folders".
RES.Extract Icon|$$FIA|?path\
MBX.$tos$
' To analyze the Icon in the Script, you can use
RES.Last Icon|$$TXT
VAR.$$TXA=$tos$
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' The Icon is now in $$TXA
LEN.$$TXA|$$TXA
MBX.Icon-Data-Size: $$TXA
GFT.c|$$TXT|$$PAT
' Only needed for Multi-Language Resources
BLB.$$PAT|$$RES
MBX.$$PAT$crlf$->$$RES
FEF.DoIt|$$TMP|$$RES
MBX.Ready
ENR.

:DoIt
PRT.$$TMP
RET.
ENR.
```

Syntax

RES.Last Icon|P1
RES.LI|P1
RES.Icon Path|P1
RES.IP|P1

Parameter Explanation

P1 – Variable that will get the Path to the last extracted Icon-File.

Example

```
' This is the path to the Source-File to be extracted
VAR.$$EXE=Hello.exe
VAR.$$FIA=?path\File.exe
' The second Parameter is the Path to the root of all "Target Folders".
RES.Extract Icon|$$FIA|?path\
MBX.$tos$
' To analyze the Icon in the Script, you can use
RES.Last Icon|$$TXT
VAR.$$TXA=$tos$
' The Icon is now in $$TXA
LEN.$$TXA|$$TXA
MBX.Icon-Data-Size: $$TXA
ENR.
```

3.77.2 1. SCS. - Select Case

MiniRobotLanguage (MRL)

SCS. Command

Select CaSe

Intention

This command implements a multiple-choice decision ("SELECT CASE"). You have 3 ways to use this Command:

1. Use it together with CAS. .. CAE. and ESC. / ESL. to Test for Textual or Character Strings.

See example below.

```
$$TXT=Karl
SCS.$$TXT
CAS.Karl
  PRT.This will come
CAS.Peter
  PRT.This will not come
CAE.
  PRT. This will come if no other choice was true
ESC.
MBX.Ready
ENR.
```

2. Use it together with CAN. .. CAE. and ESC. / ESL. to Test for numbers or formulas (numerical compare).

See example below.

```
$$NUM=14
SCS.$$NUM
CAN.14
  PRT.This will come
CAS.Peter
  PRT.This will not come
CAE.
  PRT. This will not come
ESC.
MBX.Ready
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

3. Use it together with CFP. .. CAE. and ESC. / ESL. to Test for Search Patterns 1862 in the current localized Top-Window.

See example below.

```
STW.Act|TFrmHelpMan|- Help
$$PA1=?pattern\Tabelle.bmp
$$PA2=?pattern\SCS02.bmp
$$PA3=?pattern\JK_8.bmp
SCS.1
 CFP.$$PA1
  MBX.Pattern found: $$PA1
 CFP.$$PA2
  MBX.Pattern found: $$PA2
 CFP.$$PA3
  MBX.Pattern found: $$PA3
ESL.
MBX.OK
ENR.
```

Syntax

SCS.P1

Parameter Explanation

P1 **-** String which shall be compared to the CAS./CAN.-Cases.

Example

```
'*****************************************
' Simple Demo for SCS., CAS., CAE., ESC.
'*****************************************
: §§TXT=Karl Kovse
SCS.§§TXT
CAS.Karl
  PRT.This will come
CAS.Peter
  PRT.This will not come
CAE.
  PRT. This will not come
ESC.
MBX.Ready
ENR.

'*****************************************
' Nested Sample for SCS., CAS., CAE., ESC. and CAN.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************
FOR.$$LOP|1|20
  VAR.$$TXT=Peter$$LOP
  VAR.$$NUM=500
  PRT.TXT=$$TXT
  SCS.$$TXT
  CAS.Was first case.
    PRT.First Case
' This one will come in the twentieth
  CAS.{Rufus&OR:Peter2}
    PRT.Was "Peter2..."
' You can jump out of the structure directly with GOTO.
' And you can nest unlimited many SCS.
    SCS.$$NUM
    CAN.(100*5)
      PRT.You can nest it unlimited.
    CAN. 499
  ' You can even intermix CAS. / CAN.
    CAS. Intermixed
    CAE.
      PRT.THis will not come
    ESC.
    JMP.otu
  CAS.Third
    PRT.Was Third
  CAS.{Peter&AND:3}
    PRT.Was "Peter" and "3"
' If you need a perfect match ...
  CAS.{&EXACT:Theo}
    PRT.This one is Theo.
  CAS.Fourth.
    PRT.Was this one.
' CASE ELSE
  CAE.
    PRT.Was nothing of all.
' END SELECT
  ESC.
  :otu
NEX.
MBX.Ending
:enz
ENR.
'-----------------------------------------------------------
```

Remarks

Please do not write code between the `SCS.` and the first following `CAS./CAN.`
While this code will actually be executed, you could get memory-leaks if you jump out of the construct from that place.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

There are no relevant nesting limitations. if you do not understand some behavior of the CAS., then please take a look on the "Standard Search Patterns".
These are used inside the CAS.

See also:

- **1.6.1. Program Flow Control** 121

- 7.ESC. - End Select Case 2999

© 2023 Theo Gottwald * https://www.smart-package.com

3.77.3 2. CAS. - Case-String

MiniRobotLanguage (MRL)

CAS. Command

Case String

Intention

This command can be used to script multiple-choice decisions.
It has to be used together with:

`SCS., CAN., CAE., and ESC..`

See example below.

```
: §§TXT=Karl Kovse
SCS.§§TXT
CAS.Karl
  PRT.This will come
CAS.Peter
  PRT.This will not come
CAE.
  PRT. This will not come
ESC.
MBX.Ready
ENR.
```

Syntax

CAS.[P1]

Parameter Explanation

P1 - String which shall be compared to the `SCS.`-String. Can use Standard-Search Patterns 341 like:
`{Yes&OR:Qui}` see chapter with explanation of standard search patterns.
If **P1** is omitted, only an empty string will meet the condition.

Example

```
'*****************************************
' Demo for SCS., CAS., CAE., ESC. and CAN.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************
' SCS.-Test
'DBM.2
'-------------------------
FOR.$$LOP|1|20
VAR.$$TXT=Peter$$LOP
VAR.$$NUM=500
PRT.TXT=$$TXT
SCS.$$TXT
CAS.Was first case.
PRT.First Case
' This one will come in the twentieth
CAS.{Rufus&OR:Peter2}
PRT.Was "Peter2..."
' You can jump out of the structure directly with GOTO.
' And you can nest unlimited many SCS.
SCS.$$NUM
CAN.(100*5)
PRT.You can nest it unlimited.
CAN. 499
' You can even intermix CAS. / CAN.
CAS. Intermixed
CAE.
PRT.THis will not come
ESC.
JMP. otu
CAS.Third
PRT.Was Third
CAS.{Peter&AND:3}
PRT.Was "Peter" and "3"
' If you need a perfect match ...
CAS.{&EXACT:Theo}
PRT.This one is Theo.
CAS.Fourth.
PRT.Was this one.
' CASE ELSE
CAE.
PRT.Was nothing of all.
' END SELECT
ESC.
:otu
NEX.
MBX.Ending
:enz
END.
```

Remarks

Please do not write code between the SCS. and the first following CAS./CAN. While this code will actually be executed, you could get memory-leaks if you jump out of the construct from that place.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

There are no relevant nesting limitations. if you do not understand some behavior of the CAS., then please take a look on the "Standard Search Patterns". These are used inside the CAS.

See also:

- **3.2 Standard-Search Pattern** 341
- **1.6.1. Program Flow Control** 121
- 1. SCS. - Select Case 2983
- 2. CAS. - Case-String 2987
- 3. CAN. - Case-Numeric 2990
- 4. CAE. - Case-Else 2996
- 5.CFP. - Case Find Pattern 2993
- 6.ESL. - End Select Loop 3002
- 7.ESC. - End Select Case 2999

© 2023 Theo Gottwald * https://www.smart-package.com

3.77.4 3. CAN. - Case-Numeric

MiniRobotLanguage (MRL)

CAN. Command

Case Numeric

Intention

This command can be used to script multiple-choice decisions using numerical choice.
It has to be used together with:

`CAS.`, `SCS..`, `CAE.`, and `ESC..`

See example below.

```
$$NUM=3
GSB.decide
$$NUM=7
GSB.decide
$$NUM=4
GSB.decide

ENR.
*---------------------
:decide
SCS.$$NUM
CAN.2
  DBP.I am here with 2
CAN.(2+1)
  DBP.I am here with 3
CAN.4
  DBP.I am here with 4
CAE.
  DBP. Anything else
ESC.
RET.
```

It will also work with Floating Point numbers:

```
$$NUM=6.012
SCS.$$NUM
CAN.6
  DBP.I am here with 2
CAN.(5+1)
  DBP.I am here with 3
CAN.(6+0.012)
  DBP.I am here with 6.012
CAE.
  DBP. Anything else
ESC.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

Syntax

CAN . P1

Parameter Explanation

P1 - Numeric value or variable which shall be compared to the `SCS`.-Parameter. Can use Formula in Brakets like: `($$NUM*$$EXP+($$REZ))`
which is evaluated at runtime. Actually the result is compared as string to the Parameter from `SCS`. Supports Floating-Point or Integer Numeric types.

Speed in Ticks:

This command uses typically around 18(fixed number as Parameter) to 130 Ticks (Variable as Parameter). If you use difficult Formula, even more.

Example

```
'*****************************************
' Demo for SCS., CAS., CAE., ESC. and CAN.
'*****************************************
' SCS.-Test
'DBM.2
'-----------------------------------------------------------
FOR.$$LOP|1|20
  VAR.$$TXT=Peter$$LOP
  VAR.$$NUM=500
  PRT.TXT=$$TXT
  SCS.$$TXT
  CAS.Was first case.
    PRT.First Case
' This one will come in the twentieth
  CAS.{Rufus&OR:Peter2}
    PRT.Was "Peter2..."
' You can jump out of the structure directly with GOTO.
' And you can nest unlimited many SCS.
    SCS.$$NUM
    CAN.(100*5)
      PRT.You can nest it unlimited.
    CAN. 499
' You can even intermix CAS. / CAN.
    CAS. Intermixed
    CAE.
      PRT.THis will not come
    ESC.
    JMP. otu
  CAS.Third
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
    PRT.Was Third
  CAS.{Peter&AND:3}
    PRT.Was "Peter" and "3"
' If you need a perfect match ...
  CAS.{&EXACT:Theo}
    PRT.This one is Theo.
  CAS.Fourth.
    PRT.Was this one.
' CASE ELSE
  CAE.
    PRT.Was nothing of all.
' END SELECT
  ESC.
  :otu
NEX.
MBX.Ending
:enz
END.
```

Remarks

please do not write code between the SCS. and the first following CAS./CAN. While this code will actually be executed, you could get memory-leaks if you jump out of the construct from that place.

Limitations:

There are no relevant nesting limitations.Please always make formulas into () or they may not be calculated.

See also:

- 1.6.1. Program Flow Control 121
- 1. SCS. - Select Case 2983
- 2. CAS. - Case-String 2987

- 4. CAE. - Case-Else 2996
- 5.CFP. - Case Find Pattern 2993
- 6.ESL. - End Select Loop 3002
- 7.ESC. - End Select Case 2999

© 2023 Theo Gottwald * https://www.smart-package.com

3.77.5 4. CFP. - Case-Pattern

MiniRobotLanguage (MRL)

CFP. Command

Case Find Pattern

Intention

This command can be used to script multiple-choice decisions using a graphical Pattern 1862.
It has to be used together with:

`SCS., CAE., and ESC. and ESL.`
It can be nested to any depth.

The Parameter behind `SCS.` will specify how `CFP.` will work.
There are 3 choices:

`SCS.0`
The given Pattern must NOT be found for the condition to be true.

`SCS.1 or SCS.(positive number)`
The given Pattern must be found at least as often as the number specifies, for the condition to be true.

`SCS.-1 or SCS.(negative number)`
The given Pattern must be found exactly as often as the number specifies, for the condition to be true.

See example below.

```
STW.Act|TFrmHelpMan|- Help
$$PA1=?pattern\Tabelle.bmp
$$PA2=?pattern\SCS02.bmp
$$PA3=?pattern\JK_8.bmp
SCS.1
 CFP.$$PA1
  MBX.Pattern found: $$PA1
 CFP.$$PA2
  MBX.Pattern found: $$PA2
 CFP.$$PA3
  MBX.Pattern found: $$PA3
ESL.
MBX.OK
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

CFP.P1[|P2][|P3]

Parameter Explanation

P1 - Filename of Pattern-File for details on how to use Pattern-Files see the LFP.-Command.
The Pattern-File does not in any way relate to the Parameter given with SCS.

P2 - opt. Destination Point Shift, will be used to move the target point by a specified amount of Pixels.
For example, if the Target is found at 100,50 and you specify here -10,40 then the final Point will be at 90,90.
P3 - opt. Variable for Result. if omitted the result will be placed on TOS.

Speed in Ticks:

This is a slow command, which is possibly in the range of 0.2 to 1 seconds, depending on the Pattern-Size and complexity.

Example

```
'*****************************************
' Demo for SCS., CAS., CAE., ESC. and CAN.
'*****************************************
' SCS.-Test
'DBM.2
'-------------------------------------------------------------
FOR.$$LOP|1|20
  VAR.$$TXT=Peter$$LOP
  VAR.$$NUM=500
  PRT.TXT=$$TXT
  SCS.$$TXT
  CAS.Was first case.
    PRT.First Case
' This one will come in the twentieth
  CAS.{Rufus&OR:Peter2}
    PRT.Was "Peter2..."
' You can jump out of the structure directly with GOTO.
' And you can nest unlimited many SCS.
    SCS.$$NUM
    CAN.(100*5)
      PRT.You can nest it unlimited.
    CAN. 499
' You can even intermix CAS. / CAN.
    CAS. Intermixed
    CAE.
      PRT.THis will not come
    ESC.
    JMP. otu
  CAS.Third
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
    PRT.Was Third
  CAS.{Peter&AND:3}
    PRT.Was "Peter" and "3"
' If you need a perfect match ...
  CAS.{&EXACT:Theo}
    PRT.This one is Theo.
  CAS.Fourth.
    PRT.Was this one.
' CASE ELSE
  CAE.
    PRT.Was nothing of all.
' END SELECT
  ESC.
  :otu
NEX.
MBX.Ending
:enz
END.
```

Remarks

please do not write code between the SCS. and the first following CAS./CAN. While this code will actually be executed, you could get memory-leaks if you jump out of the construct from that place.

Limitations:

There are no relevant nesting limitations.Please always make formulas into () or they may not be calculated.

© 2023 Theo Gottwald * https://www.smart-package.com

3.77.6 5. CAE. - Case-Else

MiniRobotLanguage (MRL)

CAE. Command

Case Else

Intention

This command can be used together with:

- SCS.
- CAN.
- ESC.
- CAS.

to build multiple-choice constructs.

CAE always evaluates to TRUE if none of the previous constructs has evaluated TRUE.

See example below.

```
: §§TXT=Karl Kovse
SCS.§§TXT
CAS.Karl
  PRT.This will come
CAS.Peter
  PRT.This will not come
CAE.
  PRT. This will not come
ESC.
MBX.Ready
ENR.
```

Syntax

CAE.

Parameter Explanation

This command does not need any parameters.

Speed in Ticks:

© 2023 Theo Gottwald * https://www.smart-package.com

This command uses typically around 14 Ticks.

Example

```
'*****************************************
' Demo for SCS., CAS., CAE., ESC. and CAN.
'*****************************************
' SCS.-Test
'DBM.2
FOR.$$LOP|1|20

```

Speed in Ticks:

This command uses typically around 15 Ticks.

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

Please do not write code between the SCS. and the first following CAS./CAN.
While this code will actually be executed, you could get memory-leaks if you jump out of the construct from that place.

Limitations:

There are no relevant nesting limitations.

Here is a general hint:
Please always make formulas into (...) to make sure they will be calculated.

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.78.2 POP. - POP Variable from Stack

POP. - POP Variables from User-St Previous 3005 Top 41 Next 3010

MiniRobotLanguage (MRL)

POP. Command

POP variable from user stack, without resolution

Intention

Takes off the Top of the current User-Stack and trim left and right side, then put it into the Variable in **P1**.
Will resolve Variables which are on the stack.
Takes the TOS into the Variable behind `POP`. Counterpart to `PUS.`, `PUV.` `PSS.`, `PNS.`, and `PVS`.- these will Push Variables onto Stack with different sorts of Variable-Resolution.
If you do not want the content to be trimmed, use POV. instead.

You can `POP.` any Stack Content into the variable.
While `PVS.` and PUS. explicitly does NOT resolve variables and special-folder, POP. `PUV.` `PSS.`, `PNS` do just that.
To avoid Variable Resolution when taking things from the Stack, you can use instead of POP. you can use the POV. 3010-Command the following code with VAO. and $$000.

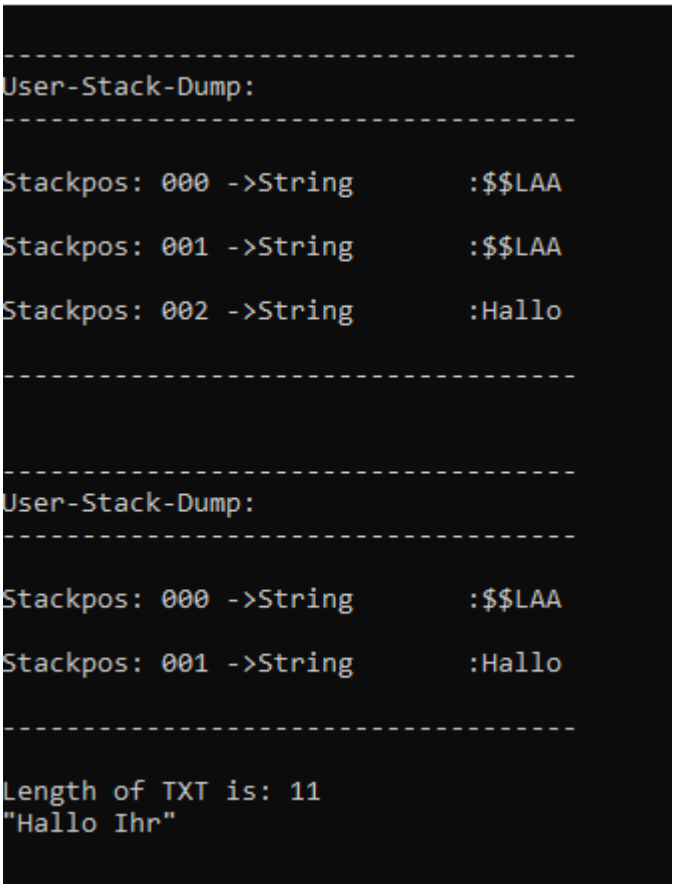
```
VAO.$$VAR=$$000
```

PVS. - Put Variable-Name on Stack without resolving anything
PSS. - Resolve Variables and Special-Folders before putting the Variable on Stack
PNS. - Do a numerical resolution and calculate Formulas in the Variable (if they are in ()). Then put the result on TOS.
PUV. - Do a Variable-Type dependent Variable resolution. Variables that are defined in some way have a Variable-Type (See GVT.-Command)
PUS. - Put Variable-Name on Stack without resolving anything. Unlike PVS., Variables will not be split if separated with |"|". Just the whole Parameter will be placed on TOS.

You can try this Script and see the stack and the return.

```
$$LAA="Hallo Ihr"
PVS.Hallo|$$LAA|$$LAA
DMP.6
POP.$$TXT
DMP.6
LEN.$$TXT|$$LEN
PRT.Length of TXT is: $$LEN
PRT.$$TXT
MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

POP.P1

Parameter Explanation

P1 - `Variable` that will take the result from TOS: The result will be trimmed and variables will be resolved.

If you omit the needed Parameter, POP. will set the timeout-flag and just continue to execute without doing anything.

`POP.` will only take 1 Parameter, if you need more use `PUV.`

```
The Stack being used is the actual User-Stack.
It can be the Local User Stack or the Global User-Stack, which
depends on Settings done with STS.-Command.

If the Popped items are deleted from stack or not also depends
on the Settings done with STS.

Please note, that Special Folders are resolved before
Variables, therefore Special-Folders that may be unresolved
inside Variables wont be touched.
```

Speed in Ticks:

© 2023 Theo Gottwald * https://www.smart-package.com

This command uses typically around 90 Ticks.

Example

```
' Pop Variable from User-Stack (with resolution)
PRT.Items on Stack: #tos#
: $$TXA=Laba
: $$TXB=Lax
DBP. Variables Content (1): $$TXA-$$TXB
PUV.$$TXA|$$TXB
GSB.tos
POP.$$TXC
DBP.$$TXC
GSB.tos
MBX.Ready
END.
:tos
DMP.4
DBP. Items on Stack: #tos#
DBP. Item on TOS: <$dtos$>
RET.
```

Remarks

-

Limitations:

-

See also:

- POV. - POp Variables from User-Stack 3010

© 2023 Theo Gottwald * https://www.smart-package.com

3.78.3 POV. - POp Variables from User-Stack

MiniRobotLanguage (MRL)

POV. Command

Pop Variables from user stack

Intention

Takes up to 25 variables, which Content is been taken from the Stack/the Que.

Counterpart to `PUV.` - Push Variables onto Stack. You can however pop any Stack Content into variables.

You can `PUV.` any Stack Content into the variable(s).

While `PVS.` and PUS. explicitly does NOT resolve variables and special-folder, POP. `PUV. PSS., PNS` do just that.
The POP.-Command will do a variable resolution and trim the result.
To avoid Variable Resolution and trimming, when taking things from the Stack, you can use POV. or this:

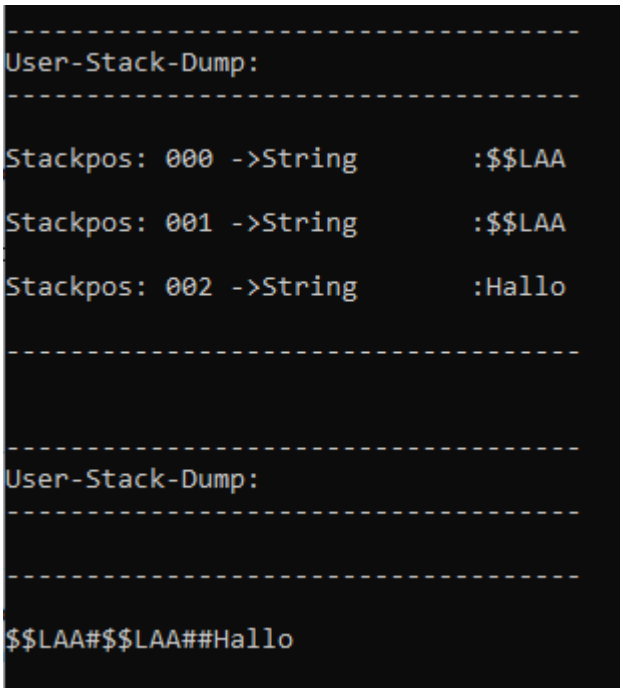
```
VAO.$$VAR=$$000
```

PVS. - Put Variable-Name on Stack without resolving anything
PSS. - Resolve Variables and Special-Folders before putting the Variable on Stack
PNS. - Do a numerical resolution and calculate Formulas in the Variable (if they are in ()). Then put the result on TOS.
PUV. - Do a Variable-Type dependent Variable resolution. Variables that are defined in some way have a Variable-Type (See GVT.-Command)
PUS. - Put Variable-Name on Stack without resolving anything. Unlike PVS., Variables will not be split if separated with |"|". Just the whole Parameter will be placed on TOS.

Using teh following Script will bring you this Stack and Output:

```
$$LAA="Hallo Ihr"
PVS.Hallo|$$LAA|$$LAA
DMP.6
POV.$$TXT|$$TXA|$$TXB
DMP.6
PRT.$$TXT#$$TXA##$$TXB
MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

POV.[P1][|P2...|P25]

Parameter Explanation

P1 **-** Variable

P2 **-** Variable P2 to Px, separated by comma or |

The Stack being used is the actual User-Stack.
It can be the Local User Stack or the Global User-Stack, which depends on Settings done with STS.-Command.

If the popped items are being deleted from stack, depends on the Settings done with STS.

Example

```
' Pop Variables Content from User-Stack
'DBM.2
DBP.Items on Stack: #tos#
: $$TXA=Laba
: $$TXB=Lax
DBP. Variables Content (1): $$TXA-$$TXB
PUV.$$TXA|$$TXB
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
DBP. Items on Stack: #tos#
DBP. Item on TOS: <$dtos$>
DMP.4
: $$TXA=
: $$TXB=
DBP. Variables have been cleared (2): $$TXA-$$TXB
DMP.4
POV.$$TXB|$$TXA
DBP. Variables Content after POV. (3): $$TXA-$$TXB
MBX.Ready
END.
```

Remarks

-

Limitations:

25 Variables is the maximum number of possible parameters.

See also:

- The global and local Stack 366
- STS. - Set STack Settings 3038
- STJ. - STack Job 3030
- STV. - Stack To/from Variable 3040

- PUV. PUsh variables on the User-Stack 3019
- POP. - POP Variable from Stack 3007

© 2023 Theo Gottwald * https://www.smart-package.com

3.78.4 PUS. - Push Parameter onto Stack/Que

PUS. - PUsh Parameter on the User-Stack **Previous** 3010 **Top** 41 **Next** 3019

MiniRobotLanguage (MRL)

PUS. Command

Push parameter onto User Stack

Intention

Pushes the complete parameter on top of the User-Stack.
Variables or special-folders are not processed.

You can `PUV.` any Stack Content into the variable(s).

While `PVS.` and PUS. explicitly does NOT resolve variables and special-folder, POP. `PUV. PSS., PNS` do just that.
To avoid Variable Resolution when taking things from the Stack, you can use POV. 3010 or

```
VAO.$$VAR=$$000
```

PVS. - Put Variable-Name on Stack without resolving anything
PSS. - Resolve Variables and Special-Folders before putting the Variable on Stack
PNS. - Do a numerical resolution and calculate Formulas in the Variable (if they are in ()). Then put the result on TOS.
PUV. - Do a Variable-Type dependent Variable resolution. Variables that are defined in some way have a Variable-Type (See GVT.-Command)
PUS. - Put Variable-Name on Stack without resolving anything. Unlike PVS., Variables will not be split if separated with |"|". Just the whole Parameter will be placed on TOS.

Syntax

```
PUS.[P1]
```

Parameter Explanation

P1 – `String`

```
The Stack being used is the actual User-Stack.
It can be the Local User Stack or the Global User-Stack, which
depends on settings done with STS.-Command.

If the popped items are deleted from stack or not also depends
on the settings done with STS.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Speed in Ticks:

This command uses typically around 23 Ticks.

Example

```
DBM.2
PRT.Items on Stack: #tos#
: $$TXA=Laba
: $$TXB=Lax
PRT. Variables Content (1): $$TXA-$$TXB
PUS.$$TXA|$$TXB
PRT. Items on Stack: #tos#
PRT. Item on TOS: <$dtos$>
DMP.4
END.
```

Remarks

-

Limitations:

-

- POP. - POP Variable from Stack 3007
- POV. - POp Variables from User-Stack 3010

© 2023 Theo Gottwald * https://www.smart-package.com

3.78.5 PVS. - Push Variables on Stack/Que

MiniRobotLanguage (MRL)

PVS. Command

Push Variables onto the User Stack without resolving them

Intention

Pushes the Variabler on top of the User-Stack.
Variables or special-folders are not processed.

You can `PUV.` any Stack Content into the variable(s).

While `PVS.` and PUS. explicitly does NOT resolve variables and special-folder, POP. does, `PUV.` `PSS.`, `PNS.` also do that.
PVS. - Put Variable-Name on Stack without resolving anything
PSS. - Resolve Variables and Special-Folders before putting the Variable on Stack
PNS. - Do a numerical resolution and calculate Formulas in the Variable (if they are in ()). Then put the result on TOS.
PUV. - Do a Variable-Type dependent Variable resolution. Variables that are defined in some way have a Variable-Type (See GVT.-Command)
PUS. - Put Variable-Name on Stack without resolving anything. Unlike PVS., Variables will not be split if separated with |"|". Just the whole Parameter will be placed on TOS.

Using PVS. the Stack will look like this:

```
$$LAA="Hallo Ihr"
PVS.$$LAA
DMP.6
```

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->String       :$$LAA

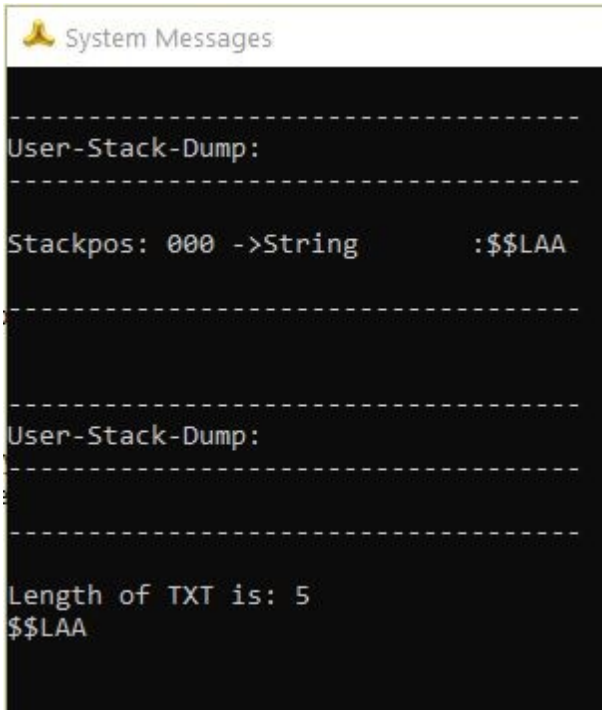
-----------------------------------
```

If you want to retrieve the Variable unresolved from the Stack, you can use VAQ 3556. and $$000.

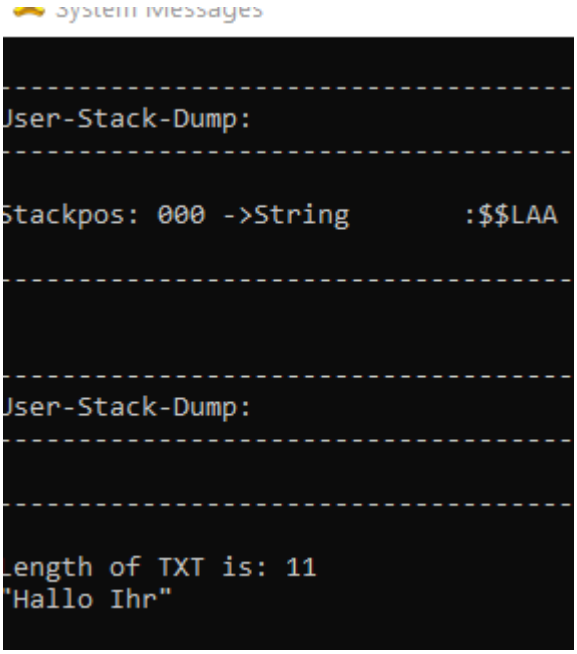
```
$$LAA="Hallo Ihr"
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
PVS.$$LAA
DMP.6
VAO.$$TXT=$$000
DMP.6
LEN.$$TXT|$$LEN
PRT.Length of TXT is: $$LEN
PRT.$$TXT
MBX.!
```



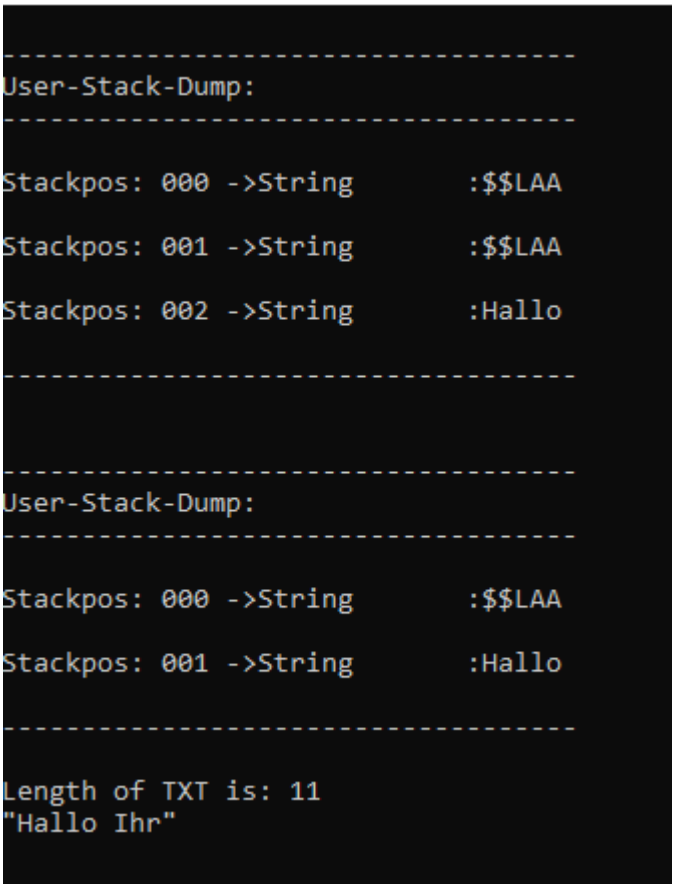
If you use POP. instead of VAO., the stack will look like that, and the Variable will be resolved:



© 2023 Theo Gottwald * https://www.smart-package.com

You can use multiple Parameters, each of these will be placed on the Stack.

```
$$LAA="Hallo Ihr"
PVS.Hallo|$$LAA|$$LAA
DMP.6
POP.$$TXT
DMP.6
LEN.$$TXT|$$LEN
PRT.Length of TXT is: $$LEN
PRT.$$TXT
```



Syntax

PVS.P1[|Px ...|P25]

Parameter Explanation

P1 - (Variable or Text) will be placed directly on TOS without resolution,
P2 ...P25 - (optional) Each of these will be placed on the Stack.

© 2023 Theo Gottwald * https://www.smart-package.com

```
The Stack being used is the actual User-Stack.
It can be the Local User Stack or the Global User-Stack, which
depends on settings done with STS.-Command.

If the popped items are deleted from stack or not also depends
on the settings done with STS.
```

Example

```
DBM.2
PRT.Items on Stack: #tos#
: $$TXA=Laba
: $$TXB=Lax
PRT. Variables Content (1): $$TXA-$$TXB
PVS.$$TXA|$$TXB
PRT. Items on Stack: #tos#
PRT. Item on TOS: <$dtos$>
DMP.4
END.
```

Remarks

3.78.6 PUV. PUsh variables on the User-Stack

MiniRobotLanguage (MRL)

PUV. Command

PUsh Variable(s) on the user stack

Intention

Takes up to 25 variables, which content is been pushed on Top of the User-Stack/the Queue. Counterpart to `POV.` (`POP` Variables from Stack).

You can Push any variables onto the stack. PUV. will do a type-dependend variable resolution. This will only work, if the Variables have been defined with a type. Otherwise the resolution will be a Binary-compatible Variable-resolution.

You can `PUV.` any Stack Content into the variable(s).

While `PVS.` and PUS. explicitly does NOT resolve variables and special-folder, POP. `PUV. PSS., PNS` do just that.
PVS. - Put Variable-Name on Stack without resolving anything
PSS. - Resolve Variables and Special-Folders before putting the Variable on Stack
PNS. - Do a numerical resolution and calculate Formulas in the Variable (if they are in ()). Then put the result on TOS.
`PUV.` - Do a Variable-Type dependent Variable resolution. Variables that are defined in some way have a Variable-Type (See GVT 3477.-Command)
PUS. - Put Variable-Name on Stack without resolving anything. Unlike PVS., Variables will not be split if separated with |"|". Just the whole Parameter will be placed on TOS.

Sample-Code and a Stack-Printout:

```
$$LAA="Hallo you "
PUV.People|$$LAA|$$LAA
DMP.6
POV.$$TXA|$$TXB|$$TXC
DMP.6
PRT.$$TXA#$$TXB##$$TXC
MBX.!
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

PUV.P1[|P2]...[|P25]

Parameter Explanation

P1 **-** Variable

P2 - Px **-** Variables

The Stack being used is the actual User-Stack.
It can be the Local User Stack or the Global User-Stack, which depends on Settings done with STS.-Command.

If the Popped items are deleted from stack or not also depends on the Settings done with STS.

Speed in Ticks:

This command uses around 150 Ticks with one Parameter.

Example

```
' Pop Variables Content from User-Stack
'DBM.2
DBP.Items on Stack: #tos#
: $$TXA=Laba
: $$TXB=Lax
DBP. Variables Content (1): $$TXA-$$TXB
PUV.$$TXA|$$TXB
DBP. Items on Stack: #tos#
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
DBP. Item on TOS: <$dtos$>
DMP.4
: $$TXA=
: $$TXB=
DBP. Variables have been cleared (2): $$TXA-$$TXB
DMP.4
POV.$$TXB,$$TXA
DBP. Variables Content after POV. (3): $$TXA-$$TXB
MBX.Ready
END.
```

Remarks

-

Limitations:

25 Variables is the maximum number of possible parameters.

See also:

- STJ. - STack Job 3030
- STV. - Stack To/from Variable 3040
- PUS. - Push Parameter onto Stack/Que 3013
- POP. - POP Variable from Stack 3007
- POV. - POp Variables from User-Stack 3010

© 2023 Theo Gottwald * https://www.smart-package.com

3.78.7 PNS. Push Numeric variables on the User-Stack

PNS. - PUsh Numeric Variables on the User-Stack **Previous** 3013 **Top** 41 **Next** 3030

MiniRobotLanguage (MRL)

PNS. Command

PUsh Numeric Variable(s) on the user stack

Intention

Takes up to 25 variables, which content is been pushed on Top of the User-Stack/the Queue. Counterpart to `POV.` (`POP` Variables from Stack).
As the command tries to resolve Numbers and Formulas, you can get a "0" or "1" result if you use it for strings taht can in any way be resolved to a formula. Therefore Use PSS. for Strings and PNS. for numbers.

You can Push any variables onto the stack. PUV. will do a type-dependend variable resolution. This will only work, if the Variables have been defined with a type. Otherwise the resolution will be a Binary-compatible Variable-resolution.

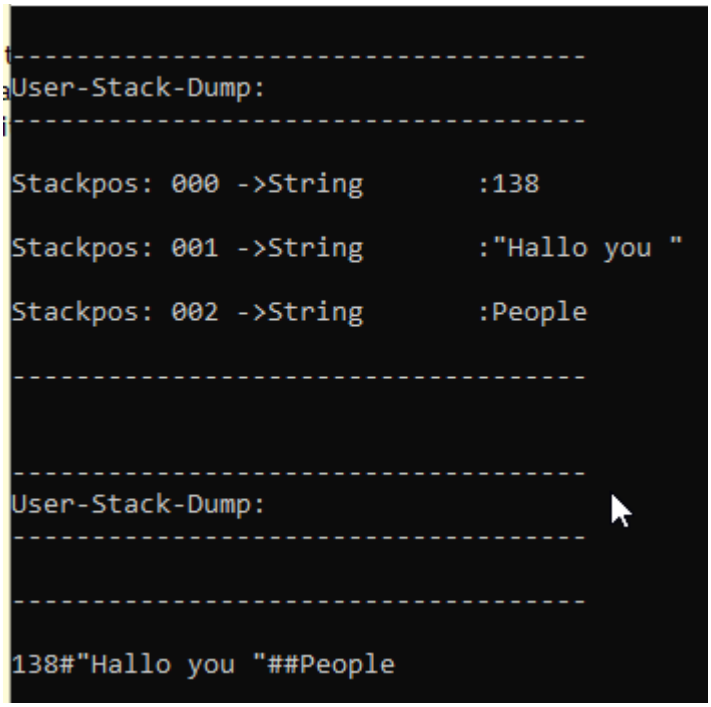
You can `PUV.` any Stack Content into the variable(s).

While `PVS.` and PUS. explicitly does NOT resolve variables and special-folder, POP. `PUV.` `PSS.`, `PNS` do just that.
PVS. - Put Variable-Name on Stack without resolving anything
PSS. - Resolve Variables and Special-Folders before putting the Variable on Stack
PNS. - Do a numerical resolution and calculate Formulas in the Variable (if they are in ()). Then put the result on TOS.
`PUV.` - Do a Variable-Type dependent Variable resolution. Variables that are defined in some way have a Variable-Type (See GVT 3477.-Command)
PUS. - Put Variable-Name on Stack without resolving anything. Unlike PVS., Variables will not be split if separated with `|"|"`. Just the whole Parameter will be placed on TOS.

Sample-Code and a Stack-Printout:

```
$$LAA="Hallo you "
$$LAB=(1+2+3*45)
PNS.People|$$LAA|$$LAB
DMP.6
POV.$$TXA|$$TXB|$$TXC
DMP.6
PRT.$$TXA#$$TXB##$$TXC
MBX.!
```

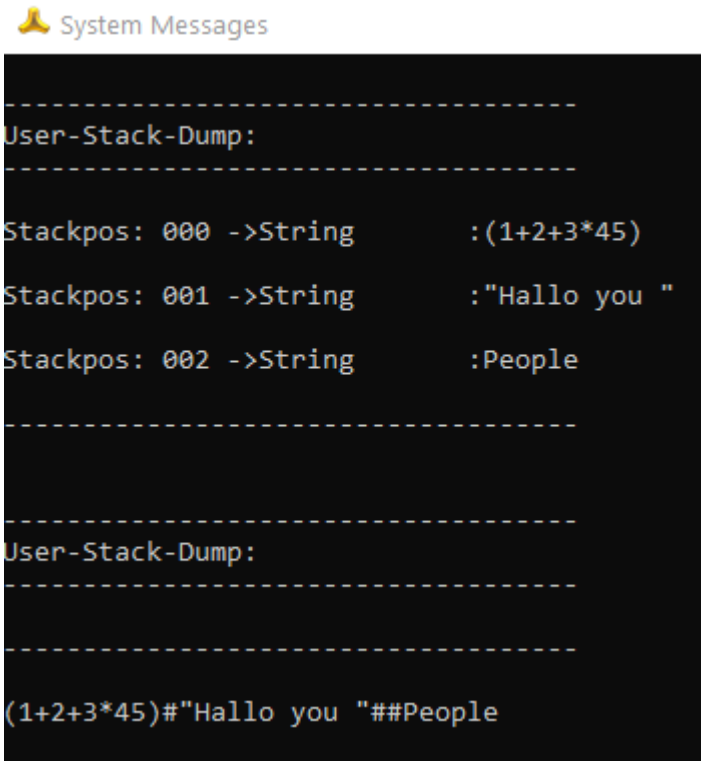
*© 2023 Theo Gottwald * https://www.smart-package.com*



Please compare the Result with the Results from PSS.

```
$$LAA="Hallo you "
$$LAB=(1+2+3*45)
PSS.People|$$LAA|$$LAB
DMP.6
POV.$$TXA|$$TXB|$$TXC
DMP.6
PRT.$$TXA#$$TXB##$$TXC
MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

PNS.[P1][|P2]...[|PX]

Parameter Explanation

P1 **-** Variable

P2 - Px - (optinal) more Variables

The Stack being used is the actual User-Stack.
It can be the Local User Stack or the Global User-Stack, which depends on Settings done with STS.-Command.

If the Popped items are deleted from stack or not also depends on the Settings done with STS.

Example

```
' Pop Variables Content from User-Stack
'DBM.2
DBP.Items on Stack: #tos#
: $$TXA=(1*10+23)
```

3.78.8 PSS. Push String variables on the User-Stack

PSS - PUsh String Variables on the User-Stack **Previous** 3013 **Top** 41 **Next** 3030

MiniRobotLanguage (MRL)

PSS. Command

PUsh String Variable(s) on the user stack

Intention

Takes up to 25 String/Text-Variables, which content is been pushed on Top of the User-Stack/the Queue. Counterpart to `POV.` (`POP` Variables from Stack).

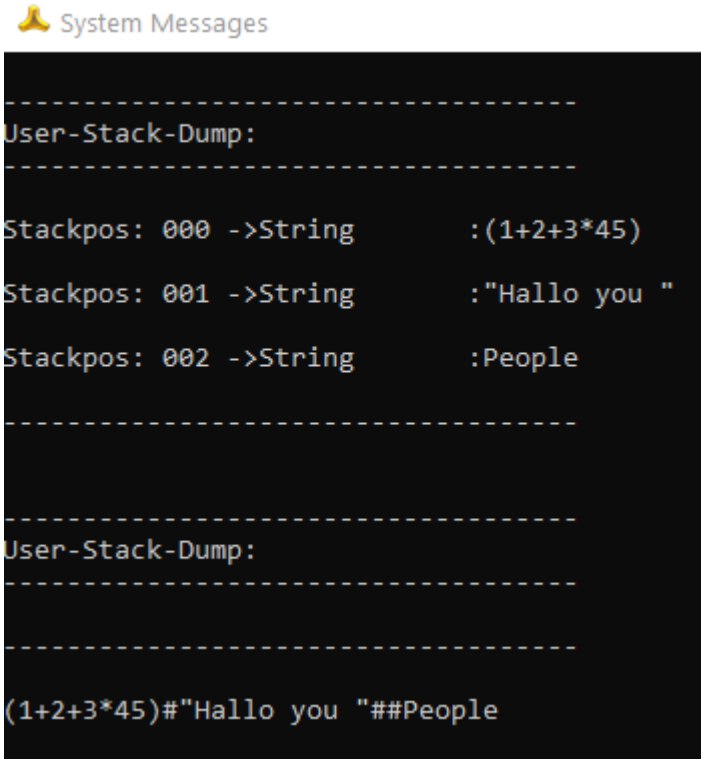
You can Push any variables onto the stack. PSS. will do a String-type variable resolution.

While `PVS.` and PUS. explicitly does NOT resolve variables and special-folder, POP. `PUV.` `PSS.`, `PNS` do just that.
PVS. - Put Variable-Name on Stack without resolving anything
PSS. - Resolve Variables and Special-Folders before putting the Variable on Stack
PNS. - Do a numerical resolution and calculate Formulas in the Variable (if they are in ()). Then put the result on TOS.
`PUV.` - Do a Variable-Type dependent Variable resolution. Variables that are defined in some way have a Variable-Type (See GVT 3477.-Command)
PUS. - Put Variable-Name on Stack without resolving anything. Unlike PVS., Variables will not be split if separated with |"|". Just the whole Parameter will be placed on TOS.

Sample-Code and a Stack-Printout:

```
$$LAA="Hallo you "
$$LAB=(1+2+3*45)
PSS.People|$$LAA|$$LAB
DMP.6
POV.$$TXA|$$TXB|$$TXC
DMP.6
PRT.$$TXA#$$TXB##$$TXC
MBX.!
```

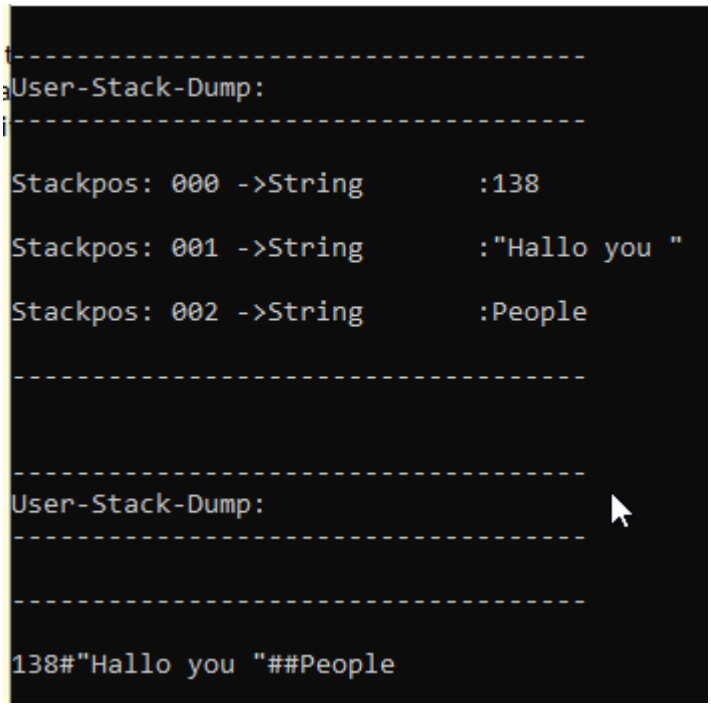
*© 2023 Theo Gottwald * https://www.smart-package.com*



Please compare the results with those from the PNS. - Command.

```
$$LAA="Hallo you "
$$LAB=(1+2+3*45)
PNS.People|$$LAA|$$LAB
DMP.6
POV.$$TXA|$$TXB|$$TXC
DMP.6
PRT.$$TXA#$$TXB##$$TXC
MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

PSS.P1[|P2]...[|P25]

Parameter Explanation

P1 **-** Variables with Text or String COntent. Should not be binary content that may eventually get Variable-Expanded.

P2 - Px - (optional) More Variables

The Stack being used is the actual User-Stack.
It can be the Local User Stack or the Global User-Stack, which depends on Settings done with STS.-Command.

If the Popped items are deleted from stack or not also depends on the Settings done with STS.

Example

```
' Pop Variables Content from User-Stack
'DBM.2
DBP.Items on Stack: #tos#
: $$TXA=Laba
: $$TXB=Lax
DBP. Variables Content (1): $$TXA-$$TXB
PSS.$$TXA|$$TXB
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
DBP. Items on Stack: #tos#
DBP. Item on TOS: <$dtos$>
DMP.4
: $$TXA=
: $$TXB=
DBP. Variables have been cleared (2): $$TXA-$$TXB
DMP.4
POV.$$TXB,$$TXA
DBP. Variables Content after POV. (3): $$TXA-$$TXB
MBX.Ready
END.
```

Remarks

-

3.78.9 STJ. - STack Job

MiniRobotLanguage (MRL)

STJ. Command

STack Job

Intention

This Command is the universal Command to manage the User-Stack/Que. 104

- You can exchange stack items (SWAP).
- You can duplicate Items (DUPL).
- You can delete items (REMO)
- You can insert items anywhere in the stack (INSE)

Usage is like this:

```
' This command will swap Stack positions 0 and 2
STJ.SWAP|0|2
```

Now how does the Stack look before and after?
We assume that there are 10 Elements on the Stack, we'll just look at the first 4 Stack positions. This is the stack before the command.

Note: We will use this Stack as the start-stack for all of the following Stack-commands examples.

```
-------------------------------------
User-Stack-Dump:
-------------------------------------

Stackpos: 000 ->String        :Stackplace 10
Stackpos: 001 ->String        :Stackplace 9
Stackpos: 002 ->String        :Stackplace 8
Stackpos: 003 ->String        :Stackplace 7
```

picture 1 - the starting stack before the stack-commands

Now we will swap elements 0 and 2 using the command:

```
STJ.SWAP|0|2
```

And then the stack looks like this:

© 2023 Theo Gottwald * https://www.smart-package.com

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->String        :Stackplace 8
Stackpos: 001 ->String        :Stackplace 9
Stackpos: 002 ->String        :Stackplace 10
Stackpos: 003 ->String        :Stackplace 7
```

You can see that the elements are exchanged.
Using the SWAP Command, you can exchange ANY of the Stack-Elements.

Also you can exchange multiple elements in just one command.
The parameters are always used in pairs. If one parameter is missing, the TOS is exchanged with it.

For example:

```
STJ.SWAP|1|2|3|4
```

Will result in this:

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->String        :Stackplace 10
Stackpos: 001 ->String        :Stackplace 8
Stackpos: 002 ->String        :Stackplace 9
Stackpos: 003 ->String        :Stackplace 6
Stackpos: 004 ->String        :Stackplace 7
```

Now lets add just one parameter to exchange it with the TOS.

```
STJ.SWAP|1|2|3|4|4
```

This what we get:

```
-----------------------------------
User-Stack-Dump:
-----------------------------------

Stackpos: 000 ->String        :Stackplace 7
Stackpos: 001 ->String        :Stackplace 8
Stackpos: 002 ->String        :Stackplace 9
Stackpos: 003 ->String        :Stackplace 6
Stackpos: 004 ->String        :Stackplace 10
```

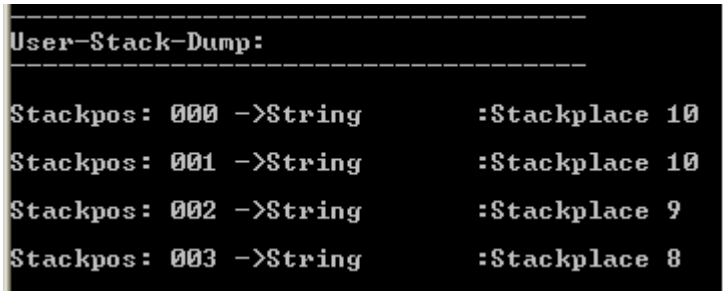
You can exchange up to 20 Stack-elements in the same command!
All exchanges are done from left to right, one after the other.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Now lets **duplicate a Stack element**. The stack before the command is the same like in *picture 1*. In the first example we are going to DUPLicate the TOS (Top of Stack Element).
Because this is the most commonly used case. The command is:

```
STJ.DUPL|0
```

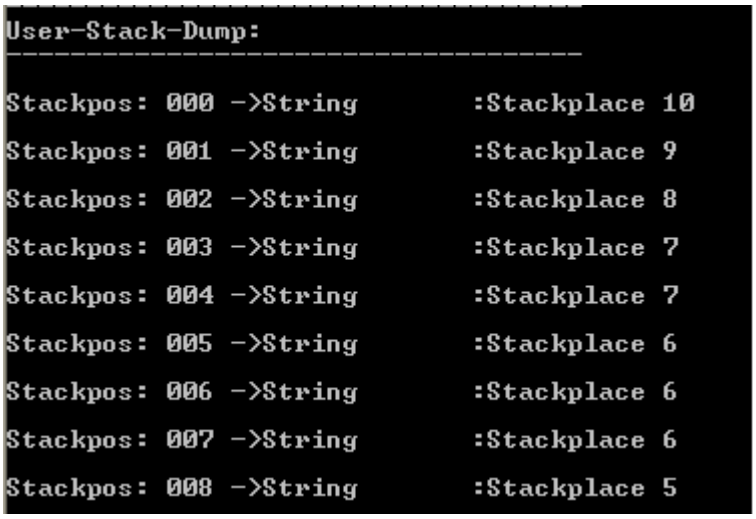
And the result is as expected:



Again you can use up to 20 parameters to duplicate many stack elements with just one command. We will jsut use three duplications here.

```
STJ.DUPLICATE|3|4|4
```

which will result in this:



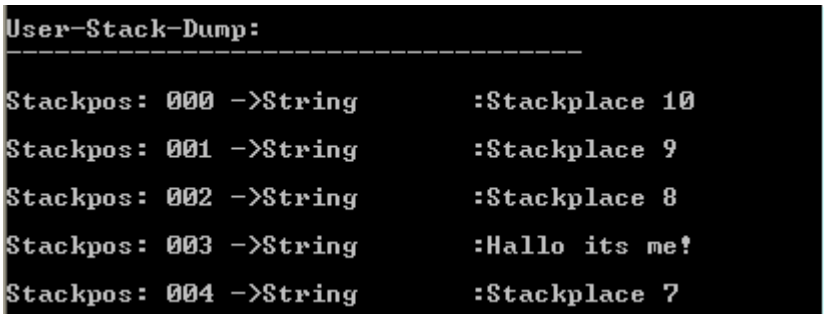
Internally the duplicates are done in a way to avoid shifting effect.

Next let's INSERT something. The stack before the command is the same like in *picture 1*. In the first example we are going to INSErt something on the TOS (Top of Stack).
Because this is the most commonly used case. The command is:

```
STJ.INSERT|3|Hallo its me!
```

The result is as expected:

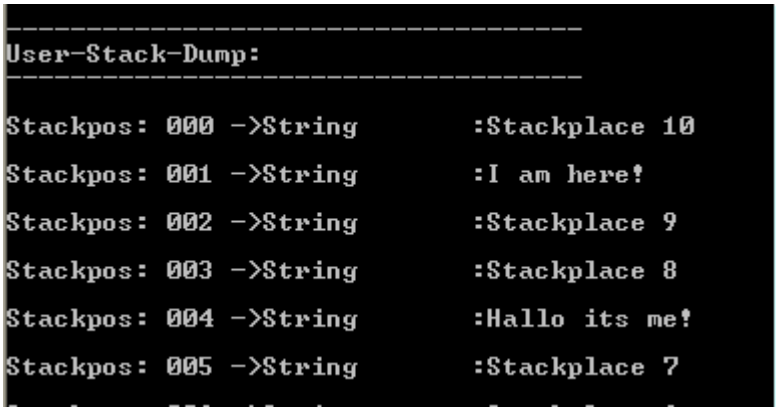
© 2023 Theo Gottwald * https://www.smart-package.com



As always with `STJ.` you can add more parameters. Generally they are used in pairs of two. First the number, then the String. Objects will always be inserted as string elements currently. If you omit the second parameter, or if you leave it empty, an empty string will be inserted. Here is an example with just two elements:

```
STJ.INSERT|3|Hallo its me!|1|I am here!
```

The result is:



You can add more parameters, up to ten elements can be inserted with just one command. INSErts will **not** be processed in strict order from left to right.
They will be processed in a way that "Shifting effects" that will not occur.
An element that you want to have inserted at place 2 will be at place 2 when you dump the stack after the operation. Of course inserting multiple elements at the same place will always shift elements to another place. For example:

```
STJ.INSE|4|Me at place 4||4|Me too at place 4|2|Me at place 2
```

If this would be processed from "Left to right", we would have two inserts at place 4 and then we would insert an element at place 2. This would shift our previous place 4 element to place 5!

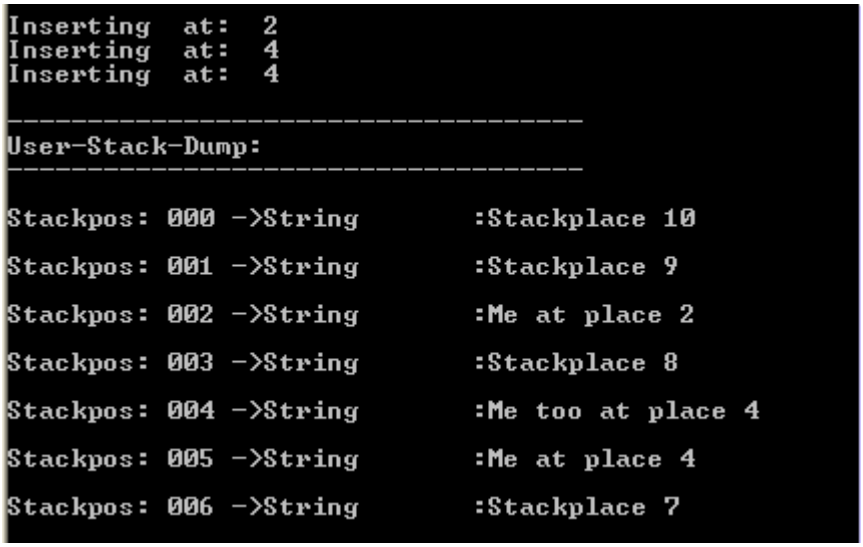
Therefore the INSERT command handles it internally different. The result of this command will be, as if you had done this:

```
STJ.INSE|2|Me at place 2|4|Me at place 4||4|Me too at place 4
```

As you can see below all INSERTS are made in a way that shifting effects are avoided, and that you get what you want.

Below you see the result.

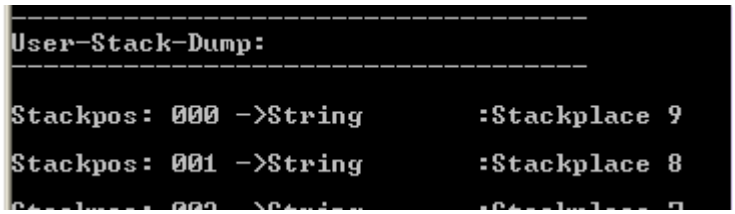
*© 2023 Theo Gottwald * https://www.smart-package.com*



If you got until here, the REMOve command may be already clear to you. Let us anyway take a look at some examples. As always we start with our stack like in *picture 1*. This is the easiest way. We remove just the TOS-element:

```
STJ.REMOVE|0
```

The result is as expected:



Now it gets more interesting. Imagine we would remove the elements just in this order:

```
STJ.REMOVE|0|2
```

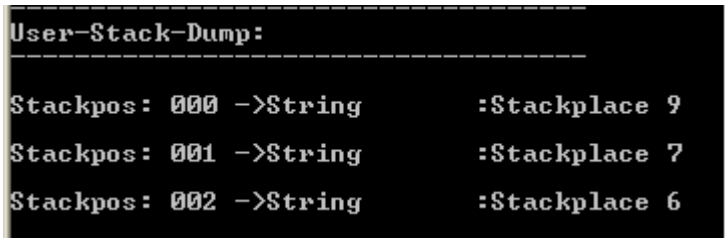
Then internally after the removal of element 0 (TOS), the former element 2 would shift one up and be element 1. If we would go on to remove element 2, we would really remove element 3!

To avoid this, internally the elements are removed from highest to lowest NOT in the order you specify them in the command This avoids confusion through shifting effect.

Important: When the actual stack is switched to a Que, then the internal removal order is automatically reversed. This is true for the REMOVE as well as for the DUPLICATE command.

And here is the result as expected:

 *© 2023 Theo Gottwald * https://www.smart-package.com*



This way, its much easier for you to specify the right elements to be removed. You do not need to care for the right order of removal to avoid shifting effects.

Therefore if you write:

```
STJ.REMOVE|0|2|4
```

exactly the same will happen, as if you write:

```
STJ.REMOVE|4|2|0
```

because the elements are internally sorted, and removed in the right order that avoids "shifting effects". Still you can do something like this:

```
 STJ.REMOVE|0|0|0
```

Which will just delete the first three elements from the Stack.

Important: it does not matter, if you write:

```
STJ.DUPL|0|1
```

or if you write

```
STJ.DUPLICATE|0|1
```

Therefore you can decide if you want to save a bit typing or if you prefer readability.

Syntax

STJ. P1|P2[..|PX]

Parameter Explanation

P1 **-** Stack-Command:

```
SWAP - Exchange given Elements
DUPL - Duplicate given Element(s)
REMO - Remove given Element(s)
INSE - Insert String/Variable into Stack-Position
```

P2 **-** VAR/NUM - depend on used Stack-Command
PX **-** VAR/NUM depend on used Stack-Command

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
STS.GLOB
' Put 10 Items on global Stack
FOR.$$A01|1|10
  VAR.$$B00=Stackplace $$A01
  PUV.$$B00
NEX.
STS.DUMP
DBM.2
: $$B00=3
: $$B01=2
: $$B02=1
' Swap Items 3 with 2
STJ.SWAP|$$B00|$$B01
STS.DUMP
' Insert a 2 (=$$B01) below TOS and insert "Hallo" at Stack-
Pos. 3
STJ.INSE|0|$$B01|$$B00|Hallo
STS.DUMP
' Remove Items 9,8 and 4 from Stack
STJ.REMO|9|8|4
STS.DUMP
' Duplicate Items 2 and 3
STJ.DUPL|$$B01|$$B00
STS.DUMP
DMP.
MBX.Ready
END.
```

Remarks

If you add multiple Parameters, they will not be processed strictly from left to right. Instead they will internally be reordered to avoid "Shifting effects".

Limitations:

-

3.78.10 STS. - Set STack Settings

MiniRobotLanguage (MRL)

STS. Command

Set sTack Settings

Intention

This Command is the universal Command to manage the User-Stack/Que.

Syntax

STS.P1[|P2]...[|Px]

Parameter Explanation

P1 **-** TXT or VAR
P2 - Px **-** TXT or VAR

```
The following Stack-Commands can be given as Parameter and
will be executed one after the other:

LOCAL - Switches all Commands to "LOCAL STACK"
GLOBAL - Switches all Commands to "GLOBAL STACK"
LIFO - Switches the actual Stack to LIFO*1 (Stack)
FIFO - Switches the actual Stack to FIFO*2 (Que)
SETNODEL - Switches the actual Stack to "No Delete"*3
SETDEL - Switches the actual Stack to "Delete"*4
STANDARD - Resets the Stack-Engine to Standard-Settings.*5
CLEAR - Clear the actual Stack, delete all Elements.
RESET - Clear Stack and Reset Settings
DUMP - Dump actual Stack into Console-Window.
SWAP - Exchange TOS and Stack Element below TOS.
DUPLICATE - Duplicate "Top-of-Stack"-Element.
REMOVE - Remove Element at TOS
```

You can write the first 4 letters of the Parameter or use the full word for better readability of the script.

Example

```
DBM.2
VAR.$$B00=Stackplace 2
' You can write the full words, but ...
STS.GLOBAL
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
VAR.$$B01=This will be duplicated
PUV.$$B00|$$B01
' The first 4 letters are enough
STS.DUMP,DUPL,DUMP,REMO,DUMP,DUPL,DUMP,REMO,REMO,DUMP
DMP.
MBX.Ready
ENR.
```

Remarks

*1 "LAST IN FIRST OUT"
*2 "FIRST IN FIRST OUT"
*3 Elements are NOT deleted when taken from Stack.
*4 Elements are deleted when taken from Stack. (Standard)
*5 Standard-Settings: LIFO, DELETE, MAX-Size=25 Elements.

Limitations:

There are no built-in Limitations to the number of Stack-Commands in a line.
Use the STV.-command to change the maximum number of stack elements.

- STS. - Set STack Settings 3038
- STJ. - STack Job 3030
- STV. - Stack To/from Variable 3040
- PUS. - Push Parameter onto Stack/Que 3013
- PUV. PUsh variables on the User-Stack 3019
- POP. - POP Variable from Stack 3007
- POV. - POp Variables from User-Stack 3010

© 2023 Theo Gottwald * https://www.smart-package.com

3.78.11 STV. - Stack To/from Variable

MiniRobotLanguage (MRL)

STV. Command

STack from/to Variable

Intention

`STV.` saves the whole actual stack into a variable or restores the whole stack from a variable. You can also use this command to change the maximum number of stack elements.
This will not only get the Top-Element from the stack, but will save the complete stack into the variable in a binary format.
This will only be useful to restore the stack later from the variable.

Syntax

STV. P1|P2

Parameter Explanation

P1
- TXT or VAR

P2
- VAR

```
The following Stack-Commands can be given as Parameter and
will be executed one after the other:

TOVAR - Transfers the complete Stack into a variable.
TOVCLEAR - like TOVA, but also clears the stack.
FROM - restores a stack from Variable VAR.
SWAP - Exchange given Element and TOS
DUPLICATE - Duplicate given Element
REMOVE - Remove given Element
SIZE - change the maximum stack size (limited only by Memory)
```

You can write the first four letters or use the full word.

Example

```
DBM.2
: $$A00=1
VAR.$$B00=Stackplace 2
JMP. over
STS.GLOB
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
PUV.$$B00
STS.DUMP
' Following command copies the Global stack into $$AAA
STV.TOVA|$$AAA
STS.DUMP|CLEA|DUMP
STV.FROM|$$AAA
STS.DUMP
:over
STS.LOCA|DUMP
PUV.$$B00
STS.DUMP
' Following command copies the Local stack into $$AAA
STV.TOVA|$$AAA
STS.DUMP
STS.CLEA|DUMP
STV.FROM|$$AAA
STS.DUMP
DMP.
END.
```

Remarks

When using FROM, please note that stack-content is been completely replaced by the content in VAR When using TOVC the stack content is been cleared while there is a copy in VAR.

Limitations:

See also:

- The global and local Stack 366
- STJ. - STack Job 3030
- STS. - Set STack Settings 3038
- PUS. - Push Parameter onto Stack/Que 3013
- PUV. PUsh variables on the User-Stack 3019
- POP. - POP Variable from Stack 3007
- POV. - POp Variables from User-Stack 3010

3.79 String commands

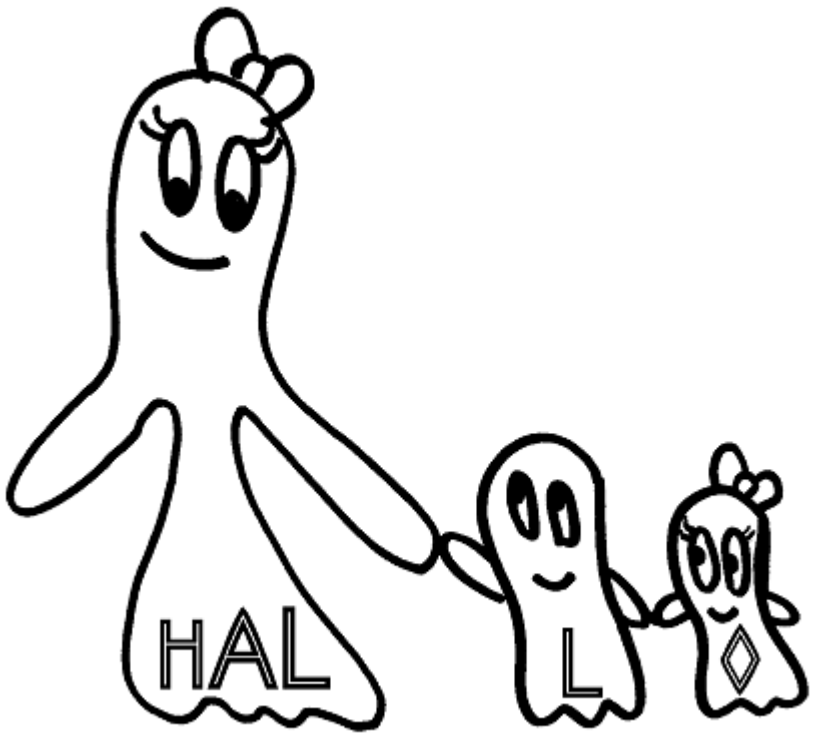
3.79.1 ! Smarty's String Operations

Smarty's String Operations Previous 3040 Top 41 Next 3043

Smarty's String Operations

BASIC was popular for handling its Memory in "Strings".
Strings can be used for text-data, but they can also be used for any type of binary data.

There is no need for you to reserve or free memory. The Robot will do it under the hood.



*© 2023 Theo Gottwald * https://www.smart-package.com*

3.79.2 ACH. - After Character

MiniRobotLanguage (MRL)

ACH. Command

After Character

Intention

Split a file-path or string (text) at any character. Return the Part after the specified character. You can specify a character/string and optional an index number.
The Index Number is used to count all occurrences of that character and select the specified character. If you have a string:

```
http://www.fa2.de/index.html
```

You can do several things using `ACH.` For example:

```
ACH.$$TXT|.
' Result on TOS will be: "de/index.html"
```

You can specify more parameters and do this:

```
ACH.$$TXT|/|3
' Result on TOS will be: "index.html"
```

You can use it to get the extension of a filename:

```
$$FIL=C:\Folder\MyFile.txt
ACH.$$FIL|.||$$RET
DBP.$$RET
```

Syntax

ACH.P1|P2[|P3][|P4]

Parameter Explanation

P1 - Variable with string to split

P2 - Character or string to split variable at.
Can not be the "|" (Pipe Symbol).

P3 - ***(optional)*** Index number of the element that defines the splitting point. If the number is negative (-1,-5 etc.) then

© 2023 Theo Gottwald * https://www.smart-package.com

the elements are counted from right to left (in reverse order).

P4 - (optional) Variable for Result, if omitted TOS is used.

Example

```
'*********************************************
' Sample: ACH
'*********************************************
'
$$FIL=C:\Folder\MyFile.txt
ACH.$$FIL|.||$$RET
DBP.$$RET

 $$TES=Hallo.txt
ACH.$$TES|.||$$RES
DBP.$$RES

$$TES=Hallo.txt
BCH.$$TES|.||$$RES
DBP.$$RES
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.3 ALB. - After last Backslah

MiniRobotLanguage (MRL)

ALB. Command

After Last Backslash

Intention

Split a file-path or string (text) at the slash or backslash. Return the Part after the last backslash or slash in the string. The effect is very simple. If you have a string:

```
http://www.fa2.de/index.html
```

ALB. will return all after the last slash/backslash, in this case we get

```
index.html
```

As it supports the backslash "\" as well as the slash "/", it can be used on windows-pathes as well as on web-URLs.

Syntax

ALB.[P1][|P2]

Parameter Explanation

P1 - Path or hyperlink or string as text or as variable

P2 - Variable for Result. If omitted, Result is been put on TOS.

Example

```
'*********************************************
' Sample: ALB
' AWT at 2011-07-07
'*********************************************
'
' fill variable $$MYP
VAR.$$MYP=?pfad\AWT.dll
'
' use ALB to get the filename into $$SOL
ALB.$$MYP|$$SOL
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
PRT.Variable MYP is: §§MYP
PRT.Variable SOL is: §§SOL

' Another example
VAR.§§FIL=C:\MyDir\Mydir2
' In this case the result will be placed on the TOS
ALB.§§FIL

' Use VRT. if you have pathes with a "\" at the end
VAR.§§FIL=C:\MyDir\Mydir2\
' In this case the result will be placed on the TOS
VRT.§§FIL|\
ALB.§§FIL

DMP.6

MBX.Ready
'-------------------------------------------------------------
```

3.79.4 ASC. - Get ASCII - Code

MiniRobotLanguage (MRL)

ASC. Command

Get ASCII Code

Intention

This command puts the ASCII-Code for the character or chain of characters in a variable.

Syntax

ASC.[P1] [|P2] [|P3]

Parameter Explanation

P1 - Input-Parameter, if omitted TOS is taken

P2 - Output-variable, if omitted TOS is takeen

P3 - optional Index (Increment)

Example

```
'**********************************
' ASC.-DEMO
'**********************************
'DBM.2
PRT.-------------------------
' We work from Stack to Stack if no
' Parameters are specified.
: §§TXT=NBC
PUV.§§TXT
ASC.
PRT.We get the ASCII-Code for "N" thats >§§000<
PRT.-------------------------
' We work from Variable to Stack if one
' Parameters is specified.
: §§TXT=MUM
ASC.§§TXT
PRT.We get the ASCII-Code for M >§§000<
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRT.-------------------------
' We work from Variable to Variable if
' two Parameters are specified.
: §§TXT=CMD
ASC.§§TXT|§§LFN
PRT.We get the ASCII-Code for C >§§LFN<
PRT.-------------------------
' We work from Variable to Variable
' and use thirdparameter as additional index.
: §§TXT=abcdefg
: §§IND=3
ASC.§§TXT|§§LFN|§§IND
PRT.We get the ASCII-Code for "c" >§§LFN<
PRT.-------------------------
MBX.Ready
END.
```

3.79.5 BCH. - Before Character

MiniRobotLanguage (MRL)

BCH. Command

Before Character

Intention

Split a file-path or string (text) at any character. Return the Part before the specified character. You can specify a character/string and optional an index number.
The Index Number is used to count all occurrences of that character and select the specified character. If you have a string:

```
http://www.fa2.de/index.html
```

You can do several things using `BCH.` For example:

```
BCH.$$TXT|.
' Result on TOS will be: "http://www.fa2"
```

You can specify more parameters and do this:

```
BCH.$$TXT|/|3
' Result on TOS will be: "http://www.fa2.de"
```

You can use it to get all but the extension of a filename:

```
$$FIL=C:\Folder\MyFile.txt
BCH.$$FIL|.||$$RET
DBP.$$RET
```

Syntax

BCH.P1|P2[|P3][|P4]

Parameter Explanation

P1 - Variable with string to split

P2 - Character or string to split variable at.
Can not be the "|" (Pipe Symbol).

P3 - ***(optional)*** Index number of the element that defines the

*© 2023 Theo Gottwald * https://www.smart-package.com*

splitting point. If the number is negative (-1,-5 etc.) then
the elements are counted from right to left (in reverse order).

P4 - (optional) Variable for Result, if omitted TOS is used.

Example

```
'*********************************************
' Sample: BCH
'*********************************************
'
$$FIL=C:\Folder\MyFile.txt
BCH.$$FIL|.||$$RET
DBP.$$RET

$$TES=Hallo.txt
ACH.$$TES|.||$$RES
DBP.$$RES

$$TES=Hallo.txt
BCH.$$TES|.||$$RES
DBP.$$RES
```

3.79.6 BLB. - Before last Backslash

MiniRobotLanguage (MRL)

BLB. Command

Before Last Backslash

Intention

Split a file-path or string (text) at the slash or backslash. Return the Part before the last backslash or slash in the string. The effect is very simple. If you have a string:

```
http://www.fa2.de/index.html
```

BLB. will return all thats before the last slash/backslash, in this case we get

```
http://www.fa2.de
```

As it supports the backslash "\" as well as the slash "/", it can be used on windows-pathes as well as on web-URLs.

Syntax

BLB.[P1][|P2]

Parameter Explanation

P1 - Path or hyperlink or String

P2 - Variable for Result. If omitted, Result is been put on TOS.

Example

```
'*********************************************
' Sample: BLB
'
'*********************************************
'
' fill variable $$MYP
VAR.$$MYP=?pfad\AWT.dll
'
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' use ALB to get the path into §§SOL
BLB.§§MYP|§§SOL
PRT.Before BLB: §§MYP
PRT.After BLB: §§SOL

' Another example
VAR.§§FIL=C:\MyDir\Mydir2
' In this case the result will be placed on the TOS
BLB.§§FIL

' Use VRT. if you have pathes with a "\" at the end
VAR.§§FIL=C:\MyDir\Mydir2\
' In this case the result will be placed on the TOS
VRT.§§FIL|\
BLB.§§FIL

DMP.6

MBX.Ready
ENR.
'-------------------------------------------------------------
```

3.79.7 Change case (upper/ lowercase)

3.79.7.1 VTL. - Variable to Lowercase

MiniRobotLanguage (MRL)

VTL. Command

Variable To Lowercase

Intention

This command can be used to make the string-content of a variable to lowercase.

Example:

```
: §§TXT=HaLlO PeTeR
VTL.§§TXT
DBP.§§TXT
' Result is "hallo peter"
```

In the second operation mode you can give a target variable. This way the original variable will not be overwritten.

```
: §§TXT=HaLlO PeTeR
VTL.§§TXT|$$TAR
DBP.$$TAR
' Result is "hallo peter"
```

Syntax

VTL.[P1][|P2]

Parameter Explanation

P1 **-** ***(optional)*** Source and Target-variable, if omitted, TOS is used.

P2 **-** ***(optional)*** if given then **P1** is source and **P2** is destination

Example

```
'************************************
' VTU./VTL./VTM.- DEMO
'************************************
: §§TXT=Hallo Peter
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
VTU.§§TXT
PRT.§§TXT

VTL.§§TXT
PRT.§§TXT

VTM.§§TXT
PRT.§§TXT

' Using two Parameters
: §§TXT=Hallo Peter

VTU.§§TXT|§§ERG
PRT.§§TXT -> §§ERG

VTL.§§TXT|§§ERG
PRT.§§TXT -> §§ERG

VTM.§§TXT|§§ERG
PRT.§§TXT -> §§ERG

MBX.!
END.
```

3.79.7.2 VTM. - Variable to Mixedcase

MiniRobotLanguage (MRL)

VTM. Command

Variable To Mediumcase

Intention

This command can be used to make the string-content of a variable to Medium-Case.
In Mixed-Case the first letter of each word is always a uppercase letter, all successive letters are lowercase letters.

Example:

```
: §§TXT=HaLlO PeTeR
VTM.§§TXT
DBP.§§TXT
' Result is "Hallo Peter"
```

In the second operation mode you can give a target variable. This way the original variable will not be overwritten.

```
: §§TXT=HaLlO PeTeR
VTM.§§TXT|$$TAR
DBP.$$TAR
' Result is "Hallo Peter"
```

Syntax

VTM.[P1][|P2]

Parameter Explanation

P1 **-** ***(optional)*** Source and Target-variable, if omitted, TOS is used.

P2 **-** ***(optional)*** if given then **P1** is source and **P2** is destination

Example

```
'************************************
' VTU./VTL./VTM.- DEMO
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'************************************
: §§TXT=Hallo Peter

3.79.8 CHR. - Get CHaRacter

MiniRobotLanguage (MRL)

CHR. Command

Get Character

Intention

This command can be used to get the String-Character for a one or more specified ASCII-Codes. Usage is easy.

```
CHR.$$INP|$$OUT
```

Syntax

CHR. [P1][|P2[|P3]

Parameter Explanation

If 3 Parameters are used, the command will put a sequence (P1 to P3) into P2.

P1 – Input-Parameter, if omitted TOS is taken
P2 – Output-variable, if omitted TOS is taken
P3 - optional. If given all CHR(P1 to P3) are filled into VAR in P2

Example

```
'**********************************
' CHR.-DEMO
'**********************************
'DBM.2
PRT.-------------------------
' We work from Stack to Stack if no
' Parameters are specified.
VAN.$$NUM=65
PUV.$$NUM
DMP.4
CHR.
PRT.We get the letter A: >$$000<
PRT.-------------------------
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' We work from Variable to Stack if one
' Parameters is specified.
: §§TXT=66
CHR.§§TXT
PRT.We get the letter B: >$$000<
PRT.-------------------------
' We work from Variable to Variable if two
' Parameters are specified.
: §§TXT=67
CHR.§§TXT|§§LFN
PRT.We get the letter C >§§LFN<
PRT.-------------------------
' We work from Variable to Variable and use third
' parameter to generate a sequence of ASC-Chars.
' The Chars from 65 to &8 will be put into §§LFN.
: §§TXT=65
: §§IND=68
CHR.§§TXT|§§LFN|§§IND
PRT.We get the letters from A to D >§§LFN<
PRT.-------------------------
END.
```

Remarks

Parameters are range-checked. Numbers lower then 0 will be set to 0, numbers higher then 255 will be set to 255.

Limitations:

-

3.79.9 CSP. - Clip String Part

MiniRobotLanguage (MRL)

CSP. Command

Clip String Part

Intention

Returns a part of a string/text with Text at letf and(or right side removed.
If you have a text/string and you want to clip some letters from left or right side, think of `CSP.` Usage is easy:

```
VAR.$$TXT=Hello name is Peter, Tel.12345
' Now we are going to Clip some letters from Left side
' We put the result in $$RES
CSP.5|$$TXT|$$RES
DBP.$$RES
' The result is "name is Peter, Tel.12345"

' We will now clip 5 characters from the right side
' and put the result into the same variable as the Source
VAR.$$TXT=Hello name is Peter, Tel.12345
CSP.,5|$$TXT
DBP.$$TXT
' The result is "llo name is Peter, Tel."

' We can also clip text at both sides at the same time
VAR.$$TXT=Hello name is Peter, Tel.12345
CSP.3,8|$$TXT|$$RES
DBP.$$RES
' The result is: "lo name is Peter, T"
```

Syntax

CSP.P1|P2[|P3]

Parameter Explanation

P1 – Clip-Position(s), Format:
(number of characters to clip from left side),(number of characters to clip from right side)

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 - Input variable, variable with Source-String, if P3 is missing, this variable will also be
used as Target variable.

P3 - ***(optional)*** Target-Variable, receives the result.

Example

```
'**********************************
' CSP.-Sample
'**********************************
VAR.$$TXT=Hello name is Peter, Tel.12345
' Now we are going to Clip some letters from Left side
' We put the result in $$RES
CSP.5|$$TXT|$$RES
DBP.$$RES

' We will now clip 5 characters from the right side
' and put the result into the same variable as the Source
VAR.$$TXT=Hello name is Peter, Tel.12345
CSP.,5|$$TXT
DBP.$$TXT

' We can also clip text at both sides at the same time
VAR.$$TXT=Hello name is Peter, Tel.12345
CSP.3,8|$$TXT|$$RES
DBP.$$RES
'
ENR.
```

Remarks

Binary compatible variable resolution is used for the Source-Part.

Limitations:

-

3.79.10 Delimited Strings

3.79.10.1 GES. - Get-Extracted-String

MiniRobotLanguage (MRL)

GES. Command

Get Extracted String

Intention

Simply said: "**Splits a string into two parts**". More exact; you have text or string that consists of basically two parts. These parts are delimited by one or more known delimiter-character(s). This is the situation where you should think of `GES.`.

Returns the portion of a string - leading up to / or following - the first occurrence of a specified character or string. Let us see an easy example. We got a text and we want to have the first and the last name separated.

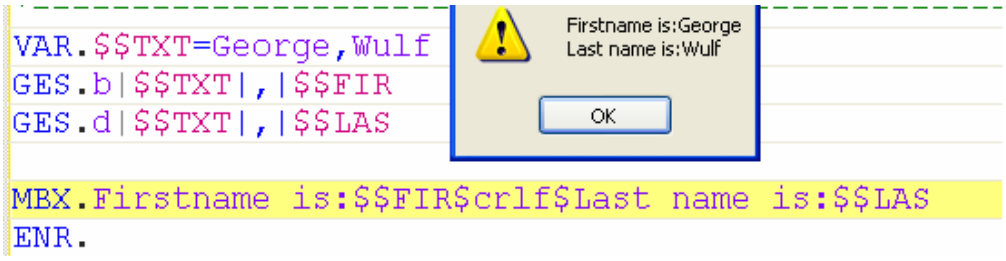
```
' We got this text
VAR.$$TXT=George,Wulf

' Here we get the first string before the delimiter
GES.b|$$TXT|,|$$FIR

' Here we get the next string after the delimiter
GES.d|$$TXT|,|$$LAS

' This is to display the result
MBX.Firstname is:$$FIR$crlf$Last name is:$$LAS
ENR.
```

And this is the result:



The modes of operation can be separated into two groups:

a,b,c,d - these work on whether a single split-string character, or on a split string of any length is given in **P3.**

e,f,g,h - these treat the split-string **P3** as a group of single characters and test for each of them.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

GES.P1|P2[|P3][|P4]

Parameter Explanation

P1 **-** Prototype

Please use only one single prototype for this command.

a - get numeric result: position of last character before the split-string..

b - return the extracted string which is before the split-character..

c - get numeric result: position of next character after the split-string..

d - return the extracted string which is after the split-character.

e - get numeric result: position of last character before any of the chars in the split-string..

f - return the extracted string which is before any of the chars in the split-string.

g - get numeric result: position of next character after any of the chars in the split-string..

h - return the extracted string which is after any of the chars in the split-string.

Please use only one prototype for this command. The result can be in the original Variable P2 or if P4 is given, it will be placed in P4.

P2 **-** VAR for Source/Destination
P3 **-** VAR with Split-String or Character.
P4 **-** VAR forResult. If ommited Result is been placed in Source-Variable P2.

Example

```
'**********************************
' GES.-Demo
'**********************************
'DBM.2
'JNF.Move-Console.txt
: §§TXT=http://www.space web.com/links.htm
' When using 2 Parameters, the $sp$ is the default Split-Char
' Here we get anything till the first space
PRT. Before:>§§TXT<
GES.b|§§TXT
PRT. After :>§§TXT<
PRT.---------------------------
: §§TXT=http://www.space web.com/links.htm
' Now we us the / Sign as Split-char and after
PRT. Before:>§§TXT<
GES.b|§§TXT|/

3.79.10.2 SBD. - String between Delimiter

MiniRobotLanguage (MRL)

SBD. Command

String Between Delimiter

Intention

Return a delimited part of a string. A example for a delimited string is a "csv" file from Excel. It could look like this:

```
VAR.$$TXT=Name,Last Name,Zip-Code
```

In this case the comma is the delimiter. Using the `SBD.`-command you can get any part of such delimited strings. Usage is like this:

```
VAR.$$TXT=Name,Last Name,Zip-Code
SBD.$$TXT|,|2|$$RES
DBP.$$RES
```

Will return "Last name", as its the second part in the delimited string.

There is another mode of operation. Imagine the delimiter is a PIPE-Sign "|". Now the PIPE-Sign is the delimiter for the command itself, how could we do that?

We can do that with the second operation mode, we use **P5**. When we specify **P5** then we can change the delimiter for the command itself. It's as easy as this:

```
' Here we have a string that is delimited with PIPE's
VAR.$$TXT=Name|Last Name|Zip-Code
' We tell SBD. that we use the comma as command-delimiter (see
P5)
SBD.,$$TXT,|,2,$$RES
DBP.$$RES
```

As alternative, you can use the `RPL.`-command and replace all Pipes with something else before using `SBD.`

In this case only one `SBD.` command is used to extract multiple parts of a delimited string to five variables: `$$V01` to `$$V05`.

```
'#EXE:?path\
'#SPI:ForceWrite

VAS.$$SRC=12*34*45*67*89
' We remove leading and trailing delimiters first
VBT.$$SRC|*

' We replace double delimiters next
$$REP=**
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
$$WIT=*
RPL.$$SRC|$$REP|$$WIT

' Get number of delimited elements
GSC.$$SRC|*|$$CNT|d

' Split the delimited parts
FOR.$$LOP|1|$$CNT
  SBD.$$SRC|*|$$LOP|$$RES
' Construct output variable
  VAN.$$VON=$$LOP
  FMT.$$VON|00
  VAR.$$VAR=$$V$$VON
' Store into output variable
  VAI.$$VAR=$$RES
NEX.

' Print the 5 Variables
PRT.$$V01
PRT.$$V02
PRT.$$V03
PRT.$$V04
PRT.$$V05
MBX.!
ENR.
```

Syntax

SBD.[P5]P1|P2|P3[|P4]

Parameter Explanation

P1 - STR Source string from which the part should be extracted.

P2 - Delimiter inside the source string.

P3 - Index of delimited string-item to be extracted

P4 - optional Variable for result. If omitted, result goes to TOS.

P5 - optional SINGLE CHAR. Delimiter for SBD itself. Cannot be "$"
or "§". If omitted its "|".

Example

```
' Example for SBD. Result is "das"
: $$TAR=Hallo Peter das ist ein Satz.
: $$IDX=3
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SBD.$$TAR|$SP$|$$IDX|$$TAR
PRT.Result is: $$TAR
DMP.
END.

' Example 2 for SBD. Result is "das"
: $$TAR=Hallo|Peter|das|ist|ein|Satz.
: $$IDX=3

SBD.!$$TAR!|!$$IDX!$$TAR
PRT.Result is: $$TAR
DMP.
END.
```

3.79.10.3 SBM. - String between Delimiter-Multiple

MiniRobotLanguage (MRL)

SBM. Command

String Between delimiter Multiple

Intention

Return a delimited part of a string. You can specify multiple parts to be returned in one string. For example:

```
$$VAR=12*3*45*5*67
SBM.$$VAR|*|2|4|$$RES

$$RES will be 3*45*5
```

A example for a delimited string is a "csv" file from Excel. It could look like this:

```
VAR.$$TXT=Name,Last Name,Zip-Code
```

In this case the comma is the delimiter. Using the `SBM.`-command you can get any part of such delimited strings. Usage is like this:

```
VAR.$$TXT=Name,Last Name,Zip-Code
SBM.$$TXT|,|2|3|$$RES
DBP.$$RES
```

Will return "Last name,Zip-Code,", as its the second and the third part in the delimited string. Note that you will find any delimited part in the result aagain delimited with delimiters, even if there were no such delimiters in the source string. This is done to be compatible with empty delimited parts.

There is another mode of operation. Imagine the delimiter is a PIPE-Sign "|". Now the PIPE-Sign is the delimiter for the command itself, how could we do that?

We can do that with the second operation mode, we use **P5**. When we specify **P5** then we can change the delimiter for the command itself. It's as easy as this:

```
' Here we have a string that is delimited with PIPE's
VAR.$$TXT=Name|Last Name|Zip-Code
' We tell SBD. that we use the comma as command-delimiter (see
P5)
SBM.,$$TXT,|,2,$$RES
DBP.$$RES
' Will print: "Last Name|Zip-Code|"
```

As alternative, you can use the `RPL.`-command and replace all Pipes with something else before using `SBM.`

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

SBM.[P6]P1|P2|P3|P4[|P5]

Parameter Explanation

P1 - STR Source string from which the part should be extracted.

P2 - Delimiter inside the source string.

P3 - Start-Index of delimited string-item to be extracted

P4 - End-Index of delimited string-item to be extracted

P5 - Variable for result. If omitted, result goes to TOS.

P6 - optional SINGLE CHAR. Delimiter for SBD itself.
Cannot be "$" or "§". If omitted its "|".

Example

```
'**********************************
' SBM.-Demo
'**********************************
DBM.2
VAR.$$URA=//Local/www.com/it/berater/org
SBM.$$URA|/|3|4|$$ERG
PRT. Ergebnis von SBM: $$ERG
:enx
MBX.!
END.
```

Remarks

If you have a delimited String and you want to spit all the delimited parts -each into an separate variable, best use `SBD.` and copy it several times for each delimited part.

Limitations:

-

3.79.10.4 VRD. - Variable-Remove-Doubles

MiniRobotLanguage (MRL)

VRD. Command

Variable Remove Doubles

Intention

This command can be used to make strings have only single delimiters.

The command has two modes: Text-mode and Binary mode.
In Text mode ASCII 32 and ASC 9 (TAB's and SPACES) are processed to single Spaces in one Run. In text-mode, the string is not allowed to contain ASCII(0).

In Binary Modes all characters are allowed.

Syntax

VRD.[P1][|P2]

Parameter Explanation

P1 - is Source and Target-variable

P2 - is obsolete for Text-Trimming.
  In that case it just trims away all spaces left and right.
  If Parameter 2 is "all" the all characters from CHR$(0 to 32)
  will be trimmed.

Example

```
''************************************
' VRD/VBT/SBD - DEMO
'************************************
VAR.§§LIN=12     345     6789
' We first remove the double delimiters in Textmode
VRD.§§LIN
PRT.>§§LIN<
VAR.§§LIN=1234aa4567bb34567
' We now remove double delimiters in binary Mode
VRD.§§LIN|abc
PRT.>§§LIN<
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX.!
END.
```

Remarks

Often used together with `SBD.` or `SBM.` or `FEM.`

Limitations:

-

3.79.11 DIC.-Delimited Item Commands

MiniRobotLanguage (MRL)

DIC. Command

Delimited Item Commands

These commands are for Excel- and CSV-Files.

You can
- remove Columns,
- Insert Columns,
- Swap Columns.
- return only those Columns you want
- return only those Columns you want in the order you want

In real life many information is stored in Excel-Files, and often we have to work with these.

Using `SBD.` it was always possible to use with Excel-CSV-Files.
Now using the new `DIC.`-Commands, many tasks that needed to be programmed before,
can now done with just 1 Line of Code.
.
The `DIC.`-Command works on "Line-by-Line" Base.
Therefore you will normally load the "csv"-File using the `TXT.`-Commands.
And then work on it "Line-by-Line" using the `DIC.`-Commands.

```
DIC.Swap|$$DEL|$$LIN|$$INA|$$INB|$$RES
DIC.Insert|$$DEL|$$LIN|$$IND|$$RES
DIC.remove|$$DEL|$$LIN|$$IND|$$RES
DIC.Get_in_Order|$$DEL|$$LIN|$$IND|$$RES
DIC.Get_Fields|$$DEL|$$LIN|$$IND|$$RES
```

Now here are some Samples for the DIC.-Commands:

```
' Get only the specified fields in the specified Order
VAR.$$DEL=;
VAR.$$LIN=AA;BB;CC;DD;EE;FF
VAR.$$IND="C","E",1,6,4
DIC.Geo|$$DEL|$$LIN|$$IND|$$RES
' returns:  CC;EE;AA;FF;DD
DBP.$$RES
ENR.

' Get only the specified fields in original Order
VAR.$$DEL=;
VAR.$$LIN=AA;BB;CC;DD;EE;FF
VAR.$$IND="A","E",2
DIC.Get|$$DEL|$$LIN|$$IND|$$RES
' returns: AA;BB;EE
DBP.$$RES
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Swap the two Columns $$INA and $$INB
VAR.$$DEL=;
VAR.$$LIN=AA;BB;CC;DD;EE;FF
VAR.$$INA="A"
VAR.$$INB="E"
' returns: EE;BB;CC;DD;AA;FF
DIC.Swap|$$DEL|$$LIN|$$INA|$$INB|$$RES
DBP.$$RES
ENR.

' Insert Columns before the specified places
VAR.$$DEL=;
VAR.$$LIN=AA;BB;CC;DD;EE;FF
VAR.$$IND="A","E"
DIC.Insert|$$DEL|$$LIN|$$IND|$$RES
' returns: ;AA;BB;CC;DD;;EE;FF
DBP.$$RES
ENR.

' remove specified Columns
VAR.$$DEL=;
VAR.$$LIN=AA;BB;CC;DD;EE;FF
VAR.$$IND="A","E",3
DIC.remove|$$DEL|$$LIN|$$IND|$$RES
' returns: BB;DD;FF
DBP.$$RES
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.11.1 DIC.Eval_Column_List

MiniRobotLanguage (MRL)

DIC.Eval_Column_List

Convert and sort Description of delimited Fields.

Intention

Assume you have several X-Coordinate from A Spreadsheet like this: `"AA" but also like "A-C" or "3-7".`
Now you want to convert it to its numeric representation which in this case would be 27.
This function will NOT remove fields that are multiple times specified.

```
VAR.$$LIN="1","2-5","Y-AB","J-L",21,"AC-AF","JK-JZ"

' Now we call the command
DIC.ecl|$$LIN|$$RES

' And Debug-Print the Result 27
DBP.$$RES

ENR.

' The Result
'  1,2,3,4,5,10,11,12,21,25,26,27,28,29,30,31,32,271,272,273,274,275,276,277,278
```

Syntax

DIC.ecl|P1[|P2]
DIC.Eval_Column_List|P1[|P2]

Parameter Explanation

P1 – Field Index can be a number like 1,2,3 or a Letter like A, AB. Letters must not be enclosed in " ".
You can also specify the "-" Sign to specify a Range. Like: "A-C". This will be interpreted as "A","B","C".
P2 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

```
'*********************************
'
'*********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

This Command does somehow the same like DIC.Get_Field_Index. But unlike this command, DIC.L2N will not accept Fields in " ".

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.11.2 DIC.Format_Numeric

MiniRobotLanguage (MRL)

DIC.Format_Numeric

Format delimited Fields in a Line in the same way like with FMT.

Intention

Assume you a line containing some Floating-Point Numbers. Now if you convert them to TAB-separated Text, they may be badly formatted if they do not have an equal length.
Use this Command to format specified Numeric Data in a line.

```
VAR.$$LIN=2022/07/19$tab$03:44:06$tab$-32.4$tab$-12.0$tab$-12.0$tab$-17.7$tab$36
VAR.$$DEL=$tab$
VAR.$$IND=4,5,6,7
' For more Options see FMT.-Command
VAR.$$FMT=00.00

' Now we call the command
DIC.Format_Numeric|$$LIN|$$DEL|$$IND|$$FMT|$$RES

' And Debug-Print the Result 27
DBP.$$LIN$crlf$$$RES

ENR.
```

Result:

```
[22:08:18] 2022/07/19        03:44:06 -32.4     -12.0     -12.0     -17.7     36.7      377
2022/07/19        03:44:06 -32.4     -12.00    -12.00    -17.70    36.70     377
```

Syntax

DIC.fnu|P1|P2|P3|P4[|P5][|P6]
DIC.Format_Numeric|P1|P2|P3|P4[|P5][|P6]

Parameter Explanation

P1 – Field Index can be a number like 1,2,3 (makes no sense anyway) or a Letter like "A", "AB". Letters must be enclosed in " ".
P2 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'************************************
'
'************************************
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.11.3 DIC.Get_Field_Index

MiniRobotLanguage (MRL)

DIC.Get_Field_Index

Convert Description of delimited Field to numbers.

Intention

Assume you have a XCoordinate from A Spreadsheet like this: "AA".
Now you want to convert it to its numeric representation which in this case would be 27.

```
VAR.$$LIN=AA

' Now we call the command
DIC.gfi|$$LIN|$$RES

' And Debug-Print the Result 27
DBP.$$RES

ENR.
```

Syntax

DIC.gfi|P1[|P2]
DIC.Get_Field_Index|P1[|P2]

Parameter Explanation

P1 – Field Index can be a number like 1,2,3 (makes no sense anyway) or a Letter like "A", "AB". Letters must be enclosed in " ".
P2 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

```
'************************************
'
'************************************
```

3.79.11.4 DIC.Get_Fields

MiniRobotLanguage (MRL)

DIC.Get_Fields

Get specified Fields from a Delimited String in the Original Order

Intention

Assume you have a Line like this:
`AA;BB;CC;DD;EE;FF`
as you can read it Line-bs-line out of a csv.-file

Now, you decide that you only need the Columns 1,2, and 5.
Note that with this command, you can specify the Columns in any order, the result will be the same.

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items
VAR.$$LIN=AA;BB;CC;DD;EE;FF

' This is the Index-List with the Elements that we want to get in the result
VAR.$$IND="A","E",2

' Now we call the command
DIC.Get|$$DEL|$$LIN|$$IND|$$RES

' And Debug-Print the Result
DBP.$$RES

' Result:
' BB;DD;FF
ENR
```

And this is the result: **`BB;DD;FF`**

Syntax

DIC.Get_Fields|P1|P2|P3[|P4]

Parameter Explanation

P1 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`. This is the specified delimiter that delimits the fields in the specified Line **P2**.
P2 – Line with delimited Items.

© 2023 Theo Gottwald * https://www.smart-package.com

P3 – Variable with Index of Fields to get. Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.
P4 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

```
'**********************************
' DIC.Get - Sample
'**********************************
  ' This is the delimiter character
  VAR.$$DEL=;

  ' This is the Line that has delimited items
  VAR.$$LIN=AA;BB;CC;DD;EE;FF

  ' This is the Index-List with the Elements that we want to get in the result
  VAR.$$IND="A","E",2

  ' Now we call the command
  DIC.Get|$$DEL|$$LIN|$$IND|$$RES

  ' And Debug-Print the Result
  DBP.$$RES

  ' Result:
  ' BB;DD;FF
  ENR
```

Remarks

-

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.11.5 DIC.Get_in_Order

MiniRobotLanguage (MRL)

DIC.Get_in_Order

Get specified Fields from a Delimited String in the Order of the List-Parameter

Intention

Assume you have a Line like this:
`AA;BB;CC;DD;EE;FF`
as you can read it Line-by-line out of a csv.-file

Now, you decide that you only need the Columns 3,5,1,6 and 4 in this order.
Note that with this command, you can specify the Columns in the order that will be in the result.

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items
VAR.$$LIN=AA;BB;CC;DD;EE;FF

' This is the Index-List with the Elements that we want to get in the result
VAR.$$IND="C","E",1,6,4

' Now we call the command
DIC.Geo|$$DEL|$$LIN|$$IND|$$RES

' And Debug-Print the Result
DBP.$$RES
ENR
```

And this is the result: **`CC;EE;AA;FF;DD`**

Syntax

DIC.Get_in_Order|P1|P2|P3[|P4]

Parameter Explanation

P1 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`. This is the specified delimiter that delimits the fields in the specified Line **P2**.
P2 – Line with delimited Items.
P3 – Variable with Index of Fields to get. Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.

© 2023 Theo Gottwald * https://www.smart-package.com

P4 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

```
'**********************************
' DIC.Geo - Sample
'**********************************
  ' This is the delimiter character
  VAR.$$DEL=;

  ' This is the Line that has delimited items
  VAR.$$LIN=AA;BB;CC;DD;EE;FF

  ' This is the Index-List with the Elements that we want to get in the result
  VAR.$$IND="C","E",1,6,4

  ' Now we call the command
  DIC.Geo|$$DEL|$$LIN|$$IND|$$RES

  ' And Debug-Print the Result
  DBP.$$RES

  ' Result:
  ' CC;EE;AA;FF;DD
  ENR
```

Remarks

-

Limitations:

-

See also:

- 1.5.2 Working with Text-Strings 110
- VAR. - Variable Set Value/Clear 3562
- IVS. / NVS. - If-Variable-String 3531
- GSS. - GetSplitString 3137
- SRT. - Sort Items 3147
- ! STR. - String Command 3150
- GES. - Get-Extracted-String 3067
- SBD. - String between Delimiter 3070
- SBM. - String between Delimiter-Multiple 3070
- FEM. - For Each Member 929
- LEN. - Length-of-String 3140

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.11.6 DIC.Insert

MiniRobotLanguage (MRL)

DIC.Insert

Insert Fields before specified places into a Delimited String

Intention

Assume you have a Line like this:
`AA;BB;CC;DD;EE;FF`
as you can read it Line-by-line out of a csv.-file

Now, you decide that you want to insert Columns before "A" and before "E".

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items
VAR.$$LIN=AA;BB;CC;DD;EE;FF

' This is the Index-List with the Elements where we want to insert new fiels bef
VAR.$$IND="A","E"

' Now we call the command
DIC.Insert|$$DEL|$$LIN|$$IND|$$RES

' And Debug-Print the Result
DBP.$$RES
ENR
```

And this is the result: **`;AA;BB;CC;DD;;EE;FF`**

Syntax

DIC.Insert|P1|P2|P3[|P4]

Parameter Explanation

P1 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`. This is the specified delimiter that delimits the fields in the specified Line **P2**.
P2 – Line with delimited Items.
P3 – Variable with Index of Fields to Insert Fields before. Technically the command will just place a delimiter in front of these fields.
Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.

© 2023 Theo Gottwald * https://www.smart-package.com

P4 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

```
'**********************************
' DIC.Insert - Sample
'**********************************
  ' This is the delimiter character
  VAR.$$DEL=;

  ' This is the Line that has delimited items
  VAR.$$LIN=AA;BB;CC;DD;EE;FF

  ' This is the Index-List with the Elements where we want to insert new fiels bef
  VAR.$$IND="A","E"

  ' Now we call the command
  DIC.Insert|$$DEL|$$LIN|$$IND|$$RES

  ' And Debug-Print the Result
  DBP.$$RES

  ' Result:
  '  ;AA;BB;CC;DD;;EE;FF
  ENR
```

Remarks

-

Limitations:

-

See also:

- LEN. - Length-of-String 3140

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.11.7 DIC.Letter_to_Number

MiniRobotLanguage (MRL)

DIC.Letter_to_Number

Convert Description of delimited Field to numbers.

Intention

Assume you have a XCoordinate from A Spreadsheet like this: "AA".
Now you want to convert it to its numeric representation which in this case would be 27.

```
VAR.$$LIN=AA

' Now we call the command
DIC.l2n|$$LIN|$$RES

' And Debug-Print the Result 27
DBP.$$RES

ENR.
```

Syntax

DIC.l2n|P1[|P2]
DIC.Letter_to_Number|P1[|P2]

Parameter Explanation

P1 – Field Index can be a number like 1,2,3 (makes no sense anyway) or a Letter like A, AB. Letters must not be enclosed in " ".
P2 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

```
'*************************************
'
'*************************************
```

Remarks

This Command does somehow the same like DIC.Get_Field_Index. But unlike this command, DIC.L2N will not accept Fields in " ".

© 2023 Theo Gottwald * https://www.smart-package.com

This Command does not need Excel to be installed on the System.

Limitations:

-

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.11.8 DIC.Number_to_Letter

MiniRobotLanguage (MRL)

DIC.Number_to_Letter

Convert Description of delimited Field to numbers.

Intention

Assume you have a XCoordinate from A Spreadsheet like this: "AA".
Now you want to convert it to its numeric representation which in this case would be 27.

```
VAR.$$LIN=285

' Now we call the command
DIC.l2n|$$LIN|$$RES

' And Debug-Print the Result JY
DBP.$$RES

ENR.
```

Syntax

DIC.n2l|P1[|P2]
DIC.Number_to_Letter|P1[|P2]

Parameter Explanation

P1 – Field Index can be a number like 1,2,33
P2 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

```
'*********************************
'
'*********************************
```

Remarks

This Command does not need Excel to be installed on the System..

Limitations:

3.79.11.9 DIC.Remove

MiniRobotLanguage (MRL)

DIC.Remove

Remove specified Fields from a Delimited String

Intention

Assume you have a Line like this:
`AA;BB;CC;DD;EE;FF`
as you can read it Line-by-line out of a csv.-file

Now, you decide that you want to remove Columns 1,3, and 5.

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items
VAR.$$LIN=AA;BB;CC;DD;EE;FF

' This is the Index-List with the Elements where we want to insert new fiels bef
VAR.$$IND="A","E",3

' Now we call the command
DIC.remove|$$DEL|$$LIN|$$IND|$$RES

' And Debug-Print the Result
DBP.$$RES
ENR
```

And this is the result: **`BB;DD;FF`**

Syntax

DIC.Remove|P1|P2|P3[|P4]

Parameter Explanation

P1 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`.
This is the specified delimiter that delimits the fields in the specified Line **P2**.
P2 – Line with delimited Items.
P3 – Variable with Index of Fields to remove.
Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.
P4 – (optional) Variable for Result. If omitted result is placed on TOS.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
' DIC.Remove - Sample
'**********************************
  ' This is the delimiter character
  VAR.$$DEL=;

  ' This is the Line that has delimited items
  VAR.$$LIN=AA;BB;CC;DD;EE;FF

  ' This is the Index-List with the Elements where we want to insert new fiels bef
  VAR.$$IND="A","E",3

  ' Now we call the command
  DIC.Remove|$$DEL|$$LIN|$$IND|$$RES

  ' And Debug-Print the Result
  DBP.$$RES

  ' Result:
  '  BB;DD;FF

  ENR
```

Remarks

-

Limitations:

3.79.11.1(DIC.Set_Multiple

MiniRobotLanguage (MRL)

DIC.Set_Multiple

Set specified Fields from a Delimited String in the Order of the List-Parameter to other specified values

Intention

Assume you have a TAB-delimited Line like this:

```
2022/07/19 03:44:06    -32.4 -12.00      -12.00      -17.70
     36.70 377
```

Now, you decide that you want to change the Columns
`4,6,5,7` in this order to this values:
`-45,+56.00,.15.00,5`

Note that with this command, you can specify the Columns in the order that you specify the values in **P4**.

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items and will be changed
VAR.$$LIN=2022/07/19$tab$03:44:06$tab$-32.4$tab$-12.00$tab$-12.00$tab$-17.70$tab

' This is the Index-List with the Elements that we want to set the values for.
' The Order is not iumportant, just that the values in P5 will be matched 1:1 to
VAR.$$IND=4,6,5,7
' These are the values that will be set to these fields
VAR.$$VAL=-45,+56.00,.15.00,5

' Now we call the command
DIC.sem|$$LIN|$$DEL|$$IND|$$VAL

' And Debug-Print the Result
DBP.$$LIN
ENR.
```

And this is the result:

```
2022/07/19   03:44:06      -32.4   -45    .15.00  +56.00  5      377
```

Before: `2022/07/19 03:44:06 -32.4 -12.00 -12.00 -17`

After: `2022/07/19 03:44:06 -32.4 -45 .15.00 +56.00 5 377`

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

DIC.Set_Multiple|P1|P2|P3|P4[|P5]

Parameter Explanation

P1 – Line with delimited Items.
P2 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`. This is the specified delimiter that delimits the fields in the specified Line **P1**.
P3 – Variable with Index of Fields to be changed. Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to change.
IMPORTANT: The number of Elements in **P3** must 1:1 match the number of Elements in **P4** else the Command will run into an error and return an empty result.
P4 – Variable with values to set into the fields that are specified by P3.
P5 – (optional) Variable for Result. If omitted result is placed in **P1** overwriting the original line..

Example

```
'***********************************
' DIC.Sem - Sample
'***********************************
  VAR.$$LIN=2022/07/19$tab$03:44:06$tab$-32.4$tab$-12.0$tab$-12.0$tab$-17.7$tab$36
  VAR.$$DEL=$tab$
  VAR.$$IND=4,6,5,7
  VAR.$$VAL=-45,+56.00,.15.00,5
  ' For more Options see FMT.-Command
  VAR.$$FMT=00.00

  ' Now we call the command
  DIC.Format_Numeric|$$LIN|$$DEL|$$IND|$$FMT|$$RES
  $$RET=$$RES
  DIC.sem|$$RET|$$DEL|$$IND|$$VAL

  VAR.$$REF=$$RET
  VAR.$$VAL=XI
  VAR.$$INX=5
  DIC.set|$$REF|$$DEL|$$INX|$$VAL

  ' And Debug-Print the Result 27
  DBP.$crlf$$$LIN$crlf$$$RES$crlf$$$RET$crlf$$$REF

  ' Output:
  ' 2022/07/19   03:44:06    -32.4 -12.0       -12.0       -17.7       36.7  377
  ' 2022/07/19   03:44:06    -32.4 -12.00      -12.00      -17.70      36.70 377
  ' 2022/07/19   03:44:06    -32.4 -45         .15.00      +56.00      5     377
  ' 2022/07/19   03:44:06    -32.4 -45         XI          +56.00      5     377
```

3.79.11.1 DIC.Set_Value

MiniRobotLanguage (MRL)

DIC.Set_Value

Set a Value of a specified Field from a Delimited String to another specified value

Intention

Assume you have a TAB-delimited Line like this:

```
2022/07/19 03:44:06    -32.4 -45    .15.00      +56.00      5
     377
```

Now, you decide that you want to change the Column `5` to this value: `XI`

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items and will be changed
VAR.2022/07/19 03:44:06$tab$-32.4$tab$-45$tab$.15.00$tab$+56.00$tab$5$tab$377

' This is the Index of the Elements that we want to set the value for.
VAR.$$INX=5
' This is the values that will be set into the field
VAR.$$VAL=XI

' Now we call the command
DIC.set|$$REF|$$DEL|$$INX|$$VAL

' And Debug-Print the Result
DBP.$$LIN
ENR.
```

And this is the result:

```
2022/07/19   03:44:06      -32.4   -45     XI      +56.00  5       377
```

Before:

```
2022/07/19  03:44:06 -32.4    -45  .15.00   +56.00
```

After:

```
2022/07/19 03:44:06 -32.4    -45  XI
+56.00   5    377
```

3.79.11.1 DIC.Swap

MiniRobotLanguage (MRL)

DIC.Swap

Exchange two Fields inside a Delimited String

Intention

Assume you have a Line like this:
`AA;BB;CC;DD;EE;FF`
as you can read it Line-by-line out of a csv.-file

Now, you decide that you want to insert Columns before "A" and before "E".

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items
VAR.$$LIN=AA;BB;CC;DD;EE;FF

' Theseare the two fields to be exchanged
VAR.$$INA="A"
VAR.$$INB="E"

' Now we call the command
DIC.Swap|$$DEL|$$LIN|$$INA|$$INB|$$RES

' And Debug-Print the Result
DBP.$$RES
ENR
```

And this is the result: **`EE;BB;CC;DD;AA;FF`**

Syntax

DIC.Swap|P1|P2|P3|P4[|P5]

Parameter Explanation

P1 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`. This is the specified delimiter that delimits the fields in the specified Line **P2**.
P2 – Line with delimited Items.

© 2023 Theo Gottwald * https://www.smart-package.com

P3 – Variable with Index of Fields A to Swap with Field in **P4**.
Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.
P4 – Variable with Index of Fields B to Swap with Field in **P3**.
Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.
P5 – (optional) Variable for Result. If omitted result is placed on TOS.

Example

```
'**********************************
' DIC.Swap - Sample
'**********************************
  ' This is the delimiter character
  VAR.$$DEL=;

  ' This is the Line that has delimited items
  VAR.$$LIN=AA;BB;CC;DD;EE;FF

  ' Theseare the two fields to be exchanged
  VAR.$$INA="A"
  VAR.$$INB="E"

  ' Now we call the command
  DIC.Swap|$$DEL|$$LIN|$$INA|$$INB|$$RES

  ' And Debug-Print the Result
  DBP.$$RES

  ' Result:
  '  EE;BB;CC;DD;AA;FF
  ENR
```

3.79.12 Format Strings

3.79.12.1 FMT. - Format Numeric Output

MiniRobotLanguage (MRL)

FMT. Command

Format Numeric Output

Intention

This command can be used to format numeric output according to a format-prototype contained in **P2**. `FMT.` has 3 modes of operation.

In Mode 1, you can just specify a number of digits. Here are some examples:

```
$$NUM=25.22222
FMT.$$NUM|3
DBP.$$NUM
' result is "25.2"

$$NUM=125.22222
FMT.$$NUM|3
DBP.$$NUM
' result is "125"

$$NUM=125.22222
FMT.$$NUM|(4+1)
DBP.$$NUM
' result is "125.22"
```

In Mode 2 you can specify a pattern which will be used for the formatting. It must contain non numeric characters, that are all characters except "`0123456789`", while not being a formula in (..) .

Example:

```
$$NUM=125.22222
FMT.$$NUM|00.000
DBP.$$NUM
' Result is "125.222"

$$NUM=125.22223
FMT.$$NUM|0+00
DBP.$$NUM
' Result is "1+25"

$$NUM=082324
FMT.$$NUM|00\:00\:00
DBP.$$NUM
' Result is "08:23:24"
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

FMT.[P1][|P2]

Parameter Explanation

P1 - Source and Target-variable, must contain a number
or formula in (..).

P2 - There are four modes of operation, depending on the
format of ***P2***.

First: You can specify a pure numeric parameter, then
this will be the number of digits in the output.

Second: You can use one pattern to format the output
according to this pattern.

Third: You can specify two patterns, separated by a
colon.
Then the first one will be used for positive numbers,
the second one will specify the format for negative
numbers.

Fourth: You can specify tthree patterns, each separated
by a colon. Then the first pattern will be used to
format
positive numbers, the second pattern will specify the
format
for negative numbers. And the third pattern will specify
the
format of a zero.

The following table shows the characters you can use to
create the user-defined format strings (patterns) and
what
they are good for.

(empty) - If P2 is omitted, the number is just trimmed
at both sides, similar to VBT.

0 - digit placeholder. FMT. will either insert a digit
or
a 0. If there is a digit in num_expression in the
position
where the 0 appears in the pattern string, FMT. return
that
digit. Otherwise FMT. return a "0".
If the number being formatted has fewer digits than
there are

© 2023 Theo Gottwald * https://www.smart-package.com

```
      zeros (on either side of the decimal point) in the
pattern,
      leading or trailing zeros are added.
      If the number has more digits to the right of the
decimal
      point than there are zeros to the right of the decimal
point
      in the format expression, then the number is rounded to
as
      many decimal places as there are zeros in the mask.

      If the number has more digits to the left of the decimal
      point than there are zeros to the left of the decimal
point
      in the pattern, then the extra digits are displayed
without
      truncation.

      If the numeric value is negative, the negation symbol
will
      be treated as a decimal digit. Therefore take care, when
      displaying negative values with this placeholder style.
      In such cases, it is recommended that multiple patterns
are
      be used.

     # - digit placeholder. If there is a digit for this
position,
      FMT. replaces this placeholder with that digit, with
nothing,
      or with a user-specified character. Unlike the 0 digit
      placeholder, if the numeric value has the fewer digits
than
      there are # characters on either side of the decimal
      placeholder, FMT. will either omit this character
position
      from the final formatted string; or substitute a
      user-specified replacement character if one has been
defined
      (see the asterisk (*) character for more information).
      To specify leading spaces, prefix the mask with "* "
      (asterisk and a space character).

      PUS.0.23
      FMT.|*=##.###
      DBP.$$000
      ENR.
      ' Result is "===0.23="

   . (period-sign)  Decimal placeholder. Determines the
position
      of the decimal point in the result.

      If any numeric field is specified to the left of the
decimal
      point, at least one digit will always result, even if
only a
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
      zero.  The zero is not considered to be a "leading" zero
if
      it is the only digit to the left of the decimal.
Placing
      more than one period character in the fmt$ string will
      produce undefined results.

   %  (percent-sign) Percentage placeholder. FMT. multiplies
      the specified source number with 100, and adds a
trailing
      percent symbol.  For example:

      VAN.$$NUM=0.2
      FMT.$$NUM|0.0%
      DBP.$$NUM
      ENR.
     ' Result is 20.0%

,  (comma-sign) Thousands separator. Used to separate
thousands
   from hundreds within a number that has four or more digits
to
   the left of the decimal point.  In order to be recognized
as a
   format character, the comma must be placed immediately
after a
   digit placeholder character (also see Restrictions below).

   VAN.$$NUM=2312.56
   FMT.$$NUM|$00,000.00
   DBP.$$NUM
   ENR.
   ' Result is $02,312.56

*x  (asterisk + specified character of your choice)
   Digit placeholder and fill-character.
   Instructs FMT. to insert a digit or character "x" in that
   position. If there is a digit in num_expression at the
position
   where the * appears in the format string, that digit is
used.
   Otherwise, the "x" character is used (where "x" represents
your
   specified character). The *x specifier acts as two digit
(#)
   fields.

   VAN.$$NUM=8888.9
   FMT.$$NUM|$**####,.00
   DBP.$$NUM
   ENR.
   ' Result is $**8,888.90
"  (double-quote) Quoted string. FMT. treats all characters up
to
   the next quotation mark as-is, without interpreting them as
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
   digit placeholders or format characters.  Also see
backslash.

   VAN.$$NUM=54.3
   VAR.$$FOR="x="#
   FMT.$$NUM|$$FOR
   DBP.$$NUM
   ENR.
   ' Result is "x=54"
```

\x (backslash) Escaped character prefix. FMT. treats the character
"x" immediately following the backslash (\) as a literal character rather than a digit placeholder or a formatting character. Many characters in a mask have a special meaning and cannot be used as literal characters unless they are preceded by a backslash.
The backslash itself is not copied. To display a backslash, use two backslashes (\\). To display a literal double-quote, use two double-quote characters.
To simplify the mask string for common numeric formats, FMT. permits the dollar symbol, the left and right parenthesis symbols, the plus and minus symbols, and the space character ("$()+- ") to pass through from the mask string into the formatted output string, without requiring an escape (\) prefix character.

Example

```
'************************************
' FMT.-Sample
'************************************
' Format up to 6 digits
$$NUM=125.22223
FMT.$$NUM|(4+2)
DBP.$$NUM
END.
```

Remarks

-

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

You cannot pass a non-numeric expression or text-string to be formatted.
Also you should not place more than one decimal point in the pattern.

`FMT.` can return the maximum possible number of digits (that is up to 4932 for Extended-precision); however, the resulting digits will be meaningless beyond the actual precision.
Consequently, the specified value may produce formatted strings that are wider than the length of the specified pattern, for example:

A$ = FORMAT$(3e30!, "#,###") ' returns 41 characters

Rounding, if necessary, is implemented by the "banker's rounding" principle: if the fractional digit being rounded off is exactly five, with no trailing digits, the number is rounded to the nearest even number. This provides better results, on average, and follows the IEEE standard. For example:

```
VAN.$$NUM=3e30
VAR.$$FOR=#,###
FMT.$$NUM|$$FOR
DBP.$$NUM
ENR.

Result is:
3,000,000,000,000,000,000,000,000,000,000,000
```

3.79.12.2 VSL. - Variable Set Left

MiniRobotLanguage (MRL)

VSL. Command

Variable Set Left Aligned

Intention

This command can be used to re-format a string in a way that it will fit into a table, left-aligned. You can also specify the fill-character for the alignment.
Here is an example, we use the "*" as fill-character:

```
$$TXT=Peter
VSL.$$TXT|10|*
DBP.<$$TXT>
' Result is <Peter*****>
```

In the second operation mode you can omit the fill-character, in this case just a SPACE (`$sp$`) is used as fill-character. It looks like this:

```
$$TXT=Peter
VSL.$$TXT|10
DBP.<$$TXT>
' Result is <Peter     >
```

Syntax

VSL.P1[|P2][|P3]

Parameter Explanation

P1 - Source and Target-variable.

P2 - ***(optional)*** if given then **P1** specifies the number of fill-characters to be used. If omitted, 20 is used as default.

P3 - ***(optional)*** If specified, this is the fill-character to be used. If omitted, SPACE (ASCII 32) is used as default.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'************************************
' VTU./VTL./VTM.- DEMO
'************************************
'
$$TXT=Peter
VSL.$$TXT|10|-
DBP.<$$TXT>
$$TXT=Peter
VSM.$$TXT|10|#
DBP.<$$TXT>
$$TXT=Peter
VSR.$$TXT|10|+
DBP.<$$TXT>

$$NUM=125.22222
FMT.$$NUM|00.000
DBP.$$NUM
ENR.
```

Will give this output:

```
<Peter----->
<##Peter###>
<+++++Peter>
125.222
```

Remarks

-

Limitations:

You can not specify an Null-String (empty variable) as Fill-character. Trying to do so, will make that `$sp$` will be used for the alignment.

3.79.12.3 VSM. - Variable Set Middle

MiniRobotLanguage (MRL)

VSM. Command

Variable Set Middle (Center-) Aligned

Intention

This command can be used to re-format a string in a way that it will fit into a table, center-aligned. You can also specify the fill-character for the alignment.
Here is an example, we use the "*" as fill-character:

```
$$TXT=Theo
VSM.$$TXT|10|*
DBP.<$$TXT>
' Result is <***Theo***>
```

In the second operation mode you can omit the fill-character, in this case just a SPACE (`$sp$`) is used as fill-character. It looks like this:

```
$$TXT=Peter
VSM.$$TXT|10
DBP.<$$TXT>
' Result is <  Peter   >
```

Syntax

VSM.P1[|P2][|P3]

Parameter Explanation

P1 - Source and Target-variable.

P2 - ***(optional)*** if given then **P1** specifies the number of fill-characters to be used. If omitted, 20 is used as default.

P3 - ***(optional)*** If specified, this is the fill-character to be used. If omitted, SPACE (ASCII 32) is used as default.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'************************************
' VTU./VTL./VTM.- DEMO
'************************************
'
$$TXT=Peter
VSL.$$TXT|10|-
DBP.<$$TXT>
$$TXT=Peter
VSM.$$TXT|10|#
DBP.<$$TXT>
$$TXT=Peter
VSR.$$TXT|10|+
DBP.<$$TXT>

$$NUM=125.22222
FMT.$$NUM|00.000
DBP.$$NUM
ENR.
```

Will give this output:

```
<Peter----->
<##Peter###>
<+++++Peter>
125.222
```

Remarks

-

Limitations:

You can not specify an Null-String (empty variable) as Fill-character. Trying to do so, will make that `$sp$` will be used for the alignment.

3.79.12.4 VSR. - Variable Set Right

MiniRobotLanguage (MRL)

VSR. Command

Variable Set Right Aligned

Intention

This command can be used to re-format a string in a way that it will fit into a table, right -aligned. You can also specify the fill-character for the alignment.
Here is an example, we use the "*" as fill-character:

```
$$TXT=Theo
VSR.$$TXT|30|*
DBP.<$$TXT>
' Result is <******Theo>
```

In the second operation mode you can omit the fill-character, in this case just a SPACE (`$sp$`) is used as fill-character. It looks like this:

```
$$TXT=Peter
VSR.$$TXT|10
DBP.<$$TXT>
' Result is <     Peter>
```

Syntax

VSR.P1[|P2][|P3]

Parameter Explanation

P1 - Source and Target-variable.

P2 - ***(optional)*** if given then **P1** specifies the number of fill-characters to be used. If omitted, 20 is used as default.

P3 - ***(optional)*** If specified, this is the fill-character to be used. If omitted, SPACE (ASCII 32) is used as default.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'************************************
' VTU./VTL./VTM.- DEMO
'************************************
'
$$TXT=Peter
VSL.$$TXT|10|-
DBP.<$$TXT>
$$TXT=Peter
VSM.$$TXT|10|#
DBP.<$$TXT>
$$TXT=Peter
VSR.$$TXT|10|+
DBP.<$$TXT>

$$NUM=125.22222
FMT.$$NUM|00.000
DBP.$$NUM
ENR.
```

Will give this output:

```
<Peter----->
<##Peter###>
<+++++Peter>
125.222
```

Remarks

-

Limitations:

You can not specify an Null-String (empty variable) as Fill-character. Trying to do so, will make that `$sp$` will be used for the alignment.

3.79.13 GFS. - Get-Filtered-String

MiniRobotLanguage (MRL)

GFS. Command

Get Filtered String

Intention

This command implements a string-filter. A string-filter is a thing that filters a string in a way that only allowed chars are left in that string.
While some uses of this command are simple, the command itself implements a complex string processor that can be customized to filter your strings in many ways.

IMPORTANT: You need to additionally specify the "z" or "x" or "y" or "o","p" Prototype to get the filtered result calculated.
Please specify these in the right order, as they are processed one after the other from left to right.

Example:

```
  ' Will work
GFS.tz|$$TXT

  ' Will NOT work, because z is used before t is processed
GFS.zt|$$TXT
```

Mode 1: the Keep Chars-Filter

Let's see an example. We use two prototypes here:
t - select filter chars for "time string"
z - keep only filter-chars

Note that the **sequence of the prototypes is important** here. The string processor **evaluates the prototypes from left to right**. We have first to select the "filter chars" then we can use them in a filter-set.

© 2023 Theo Gottwald * https://www.smart-package.com

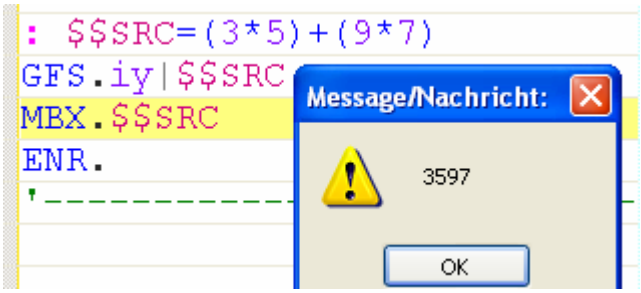
Thats why you can not write::

```
GFS.zt|$$SRC
```

If you do so,.the result will be an empty string.

Lets see another example.

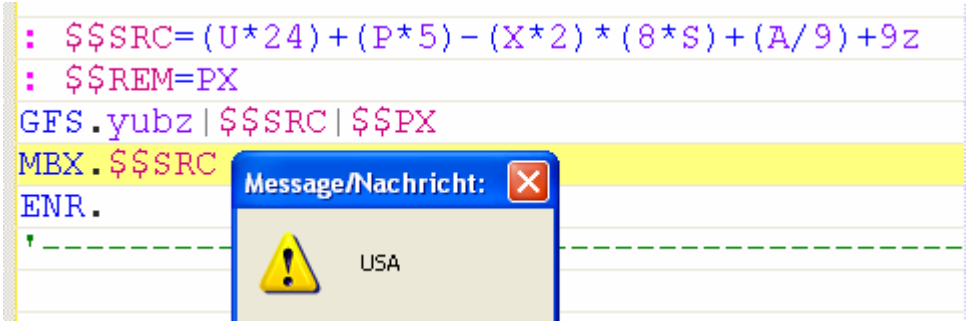
Mode 2: the Remove Chars-Filter



In the RCF-Mode, the selected chars will be removed from the string. In this example we select the i-prototype which is `"E.,()<>+-/\*^"` (see below). Now all chars that are inside that filter-char-set will be removed from the source string. You can see the result in the messagebox in the picture above.

Mode 3: the Combined Mode-Filter

This mode is just a combination of the two modes above. You can combine as many filters as you want in a single `GFS.`-Instruction. In this example we give a third parameter `$$REM` that is automatically added to the filter-chars at the start. The following example implements two filters.



When the filter starts, it takes the `$$REM` and adds it to the filter-char. It does this because its the third parameter.
Next it comes to the "y"-prototype and executes an "Remove all filter-chars"-Filter (RCF).
Then it comes to the "u"-prototype that will clear the filter-chars-list. We do this just for this example, it would not really be necessary here.
The next prototype is the "b", it adds all uppercase english letters to the filter-chars.
And finally we execute the "z"-prototype that is a "KCF"- "Keep Only Filter-Chars". It will remove all chars that are NOT in the filter-char list. As a result we get the string USA, as you can see in the picture.

Mode 4: The two special filters

© 2023 Theo Gottwald * https://www.smart-package.com

There are two special filters included which are not influenced by the filter-char list and the other commands. These two prototypes will just work on the given string and immediately process it. These are the "o" and the "p"-prototype. They serve a special purpose.
The **"o" - prototype** will remove all ASCII-Chars below 32 from your given input string.
To understand the next prototype you will need to know that the normal "Space"-Character has the ASCII of 32. But there is another one which look equal and has an ASCII of 160. This one can make processing of strings for you difficult because you may think "Its an Space" but in reality its an ASCII 160 that is in fact not an Space.
To overcome that problem, **the filter option "p"** will replace any ASCII 160 to an ASCII of 32.

Mode 5: Use a custom filter string from stack

We have already shown how to give a custom filter-char-set, using a third parameter. You can add a value from stack, using the "c" prototype. See the example in the next picture.

You can push the current filter-char-set at any time to the stack, using the "q" prototype. You can also put the current input-string onto the stack, using the "r"-prototype.

```
: $$SRC=(U*24)+(P*5)-(X*2)*(8*S)+(A/9)+9z
: $$REM=PX
PUV.$$REM
STS.DUMP
GFS.cyubz|$$SRC|$$PX
MBX.$$SRC
ENR.
```

Important note:
As this commands implements a "string processor" the sequence of the prototypes is important, unlike in most other commands. The prototype are processed in the order they are provided.

Syntax

GFS.P1[|P2][|P3]

Parameter Explanation

P1 - Prototypes.

Options:

© 2023 Theo Gottwald * https://www.smart-package.com

```
a - force binary compatible resolution for string parameter*

Filter-Char prototypes:
b - "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
c - Add "custom" TOS to Filter-chars
d - add "0123456789"

' add Chars that are allowend in an e-mailadress before the @
e - "!#$%&'*+-/=?^_`.{|}~"

f - add "0123456789."

' add german Umlauts
g - "äöüßÄÜÖß"

' add hex-numbers
h - "aAbBcCdDeEfF0123456789"

' add mathematical symbols
i - "E.,()<>+-/\*^"

' add grammatic text symbols
j - "!?.,;-()"

' "k" - add english letter-set
k - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ"

l- add german letter set
"abcdefghijklmnopqrstuvwxyzäöüABCDEFGHIJKLMNOPQRSTUVWXYZÄÖÜß"

m - add valid Filename-chars excluding the \ and :
"abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß[]
{}@.1234567890_-;:+#§%&()=! "

n - Add ":\"

'  add "small letters"
s - "abcdefghijklmnopqrstuvwxyz"

' add time-symbols
t - ":0123456789"

Special filters (Immediately executed)

o - Remove ASC 0 - 31 from input-string (immediately)
p - Replace ASC 160 with ASCII 32 (immediately)

r - current filter-charset -> TOS
q - current input-string on TOS
u - empty/clear filter-char set
v - valid Pathnames; contains all chars that are valid
    in a pathname.

w - valid filenames
x - Remove exact match of filter-char-st from input-string
y - Remove any letter in filter-char-st from Input-string
z - Keep any letter that is in filter-char set
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
    and remove all other letters.

P2 - (optional) Variable with input-String that is
     going to be filtered. If given, result will be in
     same variable.
     If omitted, string is taken from TOS. In this case,
     filtered string is also put n TOS.

P3 - (optional) Filter-Char-String. If given, will be added
      to Filter-Char-Set at start of operation.

* binary compatible variable resolution:
Only the given variable name is resolved. Special-variables or
variable names inside the variable are not resolved.
```

Example

```
'************************************
' GFS.-Test
'************************************
: $$SRC=(U*24)+(P*5)-(X*2)*(8*S)+(A/9)+9z
: $$REM=PX
PUV.$$REM
STS.DUMP
GFS.cyubz|$$SRC|$$PX
MBX.$$SRC
ENR.
```

3.79.14 GRE. - Get Regular Expression

MiniRobotLanguage (MRL)

GRE. Command

Get Regular Expressions

Intention

Enables you to extract Parts from Strings or test if a string matches a regular expression.

What are regular expressions good for?

Ok, they are a challenge if you use them first time. But Challenges are something positive. Catch them. At the end of a challenge you will know yourself better - and you will have new abilities.

When you know about regular expressions, you can do things the easy way. Things, you would have never thought about before.
The following line will extract the E-Mail adress from the line.

```
' Use Regular Expression to extract an e-mail address
: $$NUM=2
: $$MAN=please send an email to info@it-berater.org
VAS.$$MSK=([a-z0-9._/+-]+)(@[a-z0-9.-]+)
' This will do the Job.
GRE.$$NUM,$$MAN,$$MSK
STS.DUMP
DMP.
END.
```

See Regular Expression 381

Syntax

GRE.[P1],P2,P3

Parameter Explanation

P1* - *(optional) `Start of Stringscan. This can be a Variable containing a number or a plain number.`

P2 - `VAR` with Main String. Can only be a Variable.

P3 - `VAR` with Regular Expression. This Variable contains the regular Expression.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 and **P3** must be Variables. You cannot just write the Regular Expression in the Parameter-Field because the **$** and the | are special-characters in Regular Expressions.

Please note that for this command, you have to use the "," instead of the "|" to separate the Parameters.

Example

```
' Use Regular Expression to extract an e-mail address
: $$NUM=2
: $$MAN=please send an email to info@it-berater.org
VAS.$$MSK=([a-z0-9._/+-]+)(@[a-z0-9.-]+)
GRE.$$NUM,$$MAN,$$MSK
STS.DUMP
DMP.
END.

' Use Regular Expression to extract the value
VAS.$$MSK=\$[0-9.,]+
: $$MAN=Der Schuldbetrag ist $39.75 plus Steuern
GRE.$$NUM,$$MAN,$$MSK
STS.DUMP
DMP.
END.
```

Remarks

Limitations:

3.79.15 GRR. - Get Regular Replace

MiniRobotLanguage (MRL)

GRR. Command

Get Regular Replace

Intention

`GRR.` Enables you to replace Parts from Strings which match a regular expression.

What is it really good for?

Using "regular expressions" you can do things that would be difficult to realize in other ways. Take our example. You want to replace all e-mail addresses in a document automatically with the term "[e-mail]. Sounds difficult?

Is easy:

```
' Use Regular Expression to replace an e-mail adress
: $$NUM=2
: $$MAC=please send an email to info@it-berater.org
: $$MSK=([a-z0-9._/+-]+)(@[a-z0-9.-]+)
: $$REP=[E-Mail]

DBP.Before:
DBP.$$MAC

GRR.$$NUM,$$MAC,$$MSK,$$REP

DBP.After Replace
DBP.$$MAC
END.
```

See Regular Expression 381

Syntax

GRR.[P1],P2,P3,P4

Parameter Explanation

P1 **- *(optional)*** `NUM/VAR`

— *Start of Stringscan.*

— This can be a Variable containing a number or a number.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 **-** VAR
— Main String. Can only be a Variable of any Type.
— Non-String-Types will be converted to a Textstring.

P3 **-** VAR Regular Expression. This Variable contains the regular Expression.

P4 **-** VAR

P2 and **P3** must be Variables.
You cannot just write the Regular Expression in the Parameter-Field as the $ and the | are special-characters in Regular Expressions.

Please note that for this command, you have to use the "," instead of the "|" to separate the Parameters.

Example

```
' Use Regular Expression to replace an e-mail adress
: $$NUM=2
: $$MAC=please send an email to info@it-berater.org
: $$MSK=([a-z0-9._/+-]+)(@[a-z0-9.-]+)
: $$REP=[E-Mail]

DBP.Before:
DBP.$$MAC

GRR.$$NUM,$$MAC,$$MSK,$$REP

DBP.After Replace
DBP.$$MAC
END.
```

Remarks

3.79.16 GSC. - Get String Count

MiniRobotLanguage (MRL)

GSC. Command

Get Substring/Delimiter Count

Intention

Returns the number of occurences of a given substring or delimiter within a main-string.
There are several modes of operation. General usage is easy:

```
GSC.$$MAI|$$SUB
DBP.Result is: $$000
```

Which will get the number of delimiters. You can also count the number of delimited elements by adding the flag "**d**".

```
GSC.$$MAI|$$SUB||d
DBP.Result is: $$000
```

If you add the flag "**a**" the nany of the elemnts in P2 will be treated as delimiter. Like this:

```
$$MAI=Ralf,Peter;Mark.Paul
$$SUB=;,.
GSC.$$MAI|$$SUB||da
DBP.Result is: $$000
```

Syntax

GSC.P1|P2[|P3][|P4]

Parameter Explanation

P1 - Main-String
P2 - Sub-String/Delimiter
P3 - ***(optional)*** Variable for the result of the operation.
If omitted, TOS is used.
P4 - ***(optional)*** Flags. Can be any or all of the following letters:

"a" - then ANY of the characters in P2 is been treated as delimiter/string to count.
"d" - then elements are counted, rather then delimiters, result will be higher.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
"e" - equal-case-mode is switched on
```

Example

```
'**********************************
' GSC.-Sample
' Count delimited Elements
'**********************************
' Use Elements-Coint Flag: "d"
$$MAI=Haus;Ochse;Karl
$$SUB=;
GSC.$$MAI|$$SUB||d
DBP.Result is: $$000
ENR.

'**********************************
' GSC.-Sample 2
' Count delimiters
'**********************************
' Use Elements-Coint Flag: "d"
$$MAI=Haus;Ochse;Karl
$$SUB=;
GSC.$$MAI|$$SUB
DBP.Result is: $$000
ENR.
```

Remarks

-

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.17 GSS. - GetSplitString

MiniRobotLanguage (MRL)

GSS. Command

Get Split String

Intention

Returns a part of a string/text. If you have a text/string and you want just a part of it, think of `GSS.` Usage is easy:

```
VAR.$$TXT=My name is Peter, Tel.12345
DBP.$$TXT
' The result is the complete text

' Now we are going to split this string into pieces
' We put the left two characters into $$RES
GSS.1|2|$$TXT|$$RES
DBP.$$RES
' The result is "My"

' We put the right five characters into $$RES
GSS.-5|-1|$$TXT|$$RES
DBP.$$RES
' The result is "12345"

' We put characters 3 to 8  into $$RES
GSS.3|8|$$TXT|$$RES
DBP.$$RES
' The result is "name"
```

Syntax

GSS.P1|P2[|P3][|P4]

Parameter Explanation

P1 - Starting position
P2 - Ending position
P3 - Source Variable
P4 - Target Variable

*© 2023 Theo Gottwald * https://www.smart-package.com*

There are three versions of GSS. depending on how many parameters are specified.
The first two position parameters must always be given.

If **P1** or **P2** are negative, the character is counted starting from end of source-string backwards to the first character on the string.

GSS.P1|P2

The Source String is taken from **TOS**.
P1 gives the first character of the substring.
P2 gives the last character of the substring to extract.
The Result is been placed on **TOS**.

GSS.P1|P2|P3

The Source String is taken from **P3**.
P1 gives the first character of the substring.
P2 gives the last character of the substring to extract.
The Result is been placed on **TOS**.

GSS.P1|P2|P3|P4

The Source String is taken from **P3**.
P1 gives the first character of the substring.
P2 gives the last character of the substring to extract.
P4 takes the Result.

For all three versions of GSS.:
If **P1** or **P2** are negative, the character is been counted from end of source-string.

Example

```
'**********************************
' GSS.-DEMO
'**********************************
' GSS needs at least two parameters
' String total len=11
: §§TXT=ABCDEFGHIJK
PUV.§§TXT
DMP.4
GSS.2|3
DMP.4
PRT.-------------------------
PUV.§§TXT
DMP.4
GSS.-6|-4
DMP.4
PRT.-------------------------
PUV.§§TXT
DMP.4
: §§NUM=4
GSS.(§§NUM+1)|(-§§NUM)|§§SRC|§§RES
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRT.Result: >§§RES<
DMP.
END.
```

Remarks

Variables inside the source are only resolved if the length of the source string is 5. Therefore it can safely be used fort for Binary data.
For the same reason, Special-Characters etc. are not resolved, to avoid unwanted changes in binary data..

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.18 LEN. - Length-of-String

MiniRobotLanguage (MRL)

LEN. Command

LENgth of string

Intention

This command returns the length of a string in bytes. Usage is very intuitive:

```
: §§TXT=ABCDEFGHIJK

' Will return 11 on TOS
LEN.§§TXT
DBP.$$000

' Will return 11 in variable $$RES
LEN.§§TXT|$$RES
DBP.$$RES
```

Syntax

LEN.[P1][|P2]

Parameter Explanation

P1 - String to get Len from.
P2 - ***(optional)*** Variable to return the String-Len

All Parameters can be omitted. In each case the Source or Destination is TOS.

Example

```
'**********************************
' LEN.-Sample
'**********************************
: §§TXT=ABCDEFGHIJK
' Will return 11 on TOS
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
LEN.$$TXT
DBP.$$000
'
' Will return 11 in variable $$RES
LEN.$$TXT|$$RES
DBP.$$RES

END.

'**********************************
' LEN.-Test
'**********************************
VAR.$$TXT=12345678
PUV.$$TXT
DMP.4
' String from TOS, LEN-> TOS
LEN.
DMP.4
' Len->TOS
LEN.$$TXT
DMP.4
LEN.$$TXT|$$RET
PRT.$$RET
DMP.
END.
```

Remarks

-

Limitations:

The theoretical maximum length of a variable /text / string is 2 GB. In real life, it is less, because variables need string memory and that must not be fragmented. After all the maximum size of a variable on your system depends on the amount of RAM that is available, and it depends on how fragmented your memory is. Under normal circumstances several hundred MegaBytes should be no problem.

3.79.19 RPL. - RePLace in String

MiniRobotLanguage (MRL)

RPL. Command

RePLace in string

Intention

This command can be used to replace parts of a string with another.

There are several options, which can be handy, if you want to replace in binary strings or for special tasks.

Syntax

RPL.P1|P2|P3[|P4]

Parameter Explanation

P1 - Source and Destination
P2 - Replace-String (this one is replaced)
P3 - with-String (this is what it is replaced with)
P4 - Options, see below:

You can only specify one flag for RPL. as **P4**.
These are the flags for P4:

a - "ANY" & binary-compatible.
Using this one you will replace single letters
with single letters.

b - binary compatible does not resolve special-folders or
system-variables

c - "ANY" using this one you will replace single letters
with single letters. Not binary compatible.

e - Equalcase-Replace. Replace is done in Equalcase-Mode,
the Result will anyway keep its case.

f - fast replace. Default mode if no option is specified.

w - "Whole Words Algo"-Mode. in this mode only words are
replaces
and only if they are not enclosed in " ".

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
First Parameter is a Variable, local or Global.
If invalid ("-") for example, Stack is used.
```

Speed in Ticks:

This command uses typically around 170 to 230 Ticks heavily depending on Parameters.

Example

```
'**********************************
' RPL.-Test
'**********************************
PRT. Do a Fast-Replace
: $$TXT=Hallo "PETER",Peter, PETER when PETERSCHMIDT...
: §§REP=PETER
: §§WIT=RALF
PRT.$$TXT
RPL.$$TXT|§§REP|§§WIT
PRT.$$TXT
PRT.------------------------------
PRT. Do a Equalcase-Replace
: $$TXT=Hallo "PETER",Peter, PETER when PETERSCHMIDT...
: §§REP=PETER
: §§WIT=RALF
PRT.$$TXT
RPL.$$TXT|§§REP|§§WIT|e
PRT.$$TXT
PRT.------------------------------
PRT. Use "whole-word Algo"
: $$TXT=Hallo "PETER",Peter, PETER when PETERSCHMIDT...
: §§REP=PETER
: §§WIT=RALF
PRT.$$TXT
RPL.$$TXT|§§REP|§§WIT|w
PRT.$$TXT
PRT.------------------------------
PRT. Use "any matchstring"
: $$TXT=Hallo "PETER",Peter, PETER when PETERSCHMIDT...
: §§REP=PETER
: §§WIT=RALF
PRT.$$TXT
RPL.$$TXT|§§REP|§§WIT|c
PRT.$$TXT
PRT.------------------------------
DMP.
END.

'**********************************
' RPL.-Sample
' Here we use RPL to replace Text in
' a line-based Textfile
' We search for a Date like 11.?7.*
' and replace it with 12.08.2015
'**********************************
$$FIL=?path\Test.txt
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$TAR=?path\Target.txt
' Delete it if it existed before
DEL.$$TAR
' We search for the line with the date
$$SRC=11.?7.*
' New date - we replace the old one with this
$$NEW=12.08.2015
FIF.tww|$$FIL|$$SRC
JIZ.$$000|Lab_nf
$$LIN=$$000
$$STA=$$000
$$END=$$000
$$STR=$$000
$$TRE=$$000
PRT.String: $$STR Found in Line: $$LIN
PRT.From Character $$STA to $$END
GLC.$$FIL|$$REA
' Line where String is minus 1
CAL.$$TOL=$$LIN-1
' Copy all lines until the wanted Line
FOR.$$COP|1|$$TOL
  LFF.$$FIL|$$COP|$$RES
   ' We use the delimiter that was found in the source file
  $$TXT=$$RES$$TRE
  ATF.$$TAR|$$TXT
NEX.
   ' Here is the Line with the date
LFF.$$FIL|$$LIN|$$TXA
RPL.$$TXA|$$STR|$$NEW
$$TXB=$$TXA$$TRE
ATF.$$TAR|$$TXB
' Now copy Rest of file
' Line where String is plus 1
CAL.$$TOL=$$LIN+1
FOR.$$COP|$$TOL|$$REA
  LFF.$$FIL|$$COP|$$RES
   ' We use the delimiter that was found in the source file
  $$TXT=$$RES$$TRE
  ATF.$$TAR|$$TXT
NEX.

:Lab_nf
MBX.!
ENR.
```

Remarks

If you use the ANY option, within MainString, each occurrence of each character in MatchString will be replaced with the corresponding character in NewString. In this case, MatchString and NewString must be the same length, because there is a one-to-one relation.

"|w" - replaces only whole words (no words in word, no words in qoutes) in text but not within double quotes

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

Due to speed-reasons, "|w"-Algo has the limitation, that the result-string cannot exceed the source in size by more then 100 KB.
If you need more then just append enough spaces to the source string before.
This limitation should never be a problem in practical use.

3.79.20 SRT. - Sort Items

MiniRobotLanguage (MRL)

SRT. Command

SoRT delimited items

Intention

This command is used to sort delimited items alphabetically.

Items in this definitions are members of a string, delimited with a known delimiter. In a Text-file which has been loaded, the delimiter would be `$crlf$` for example.

Usage can be as easy as calling:

```
VAR.$$TXT=Name Last-Name Zip-Code
SRT.$$TXT
DBP.$$TXT
```

Now for special reasons you can specify more parameters. For example:

```
VAR.$$TXT=Name Last-Name Zip-Code
SRT.$$TXT|$sp$|d
DBP.$$TXT
' returns "Last-Name Name Zip-Code"
```

or change to ascending sort-order:

```
VAR.$$TXT=Name Last-Name Zip-Code
SRT.$$TXT|$sp$|a
DBP.$$TXT
' returns "Zip-Code Name Last-Name"
```

Syntax

SRT.P1[|P2][|P3][|P4]

Parameter Explanation

P1 - String with delimited elements to sort.

P2 - ***(optional)*** Delimiter-Char

P3 - ***(optional)*** "a" or "d" - ascending sort or descending sort-order

*© 2023 Theo Gottwald * https://www.smart-package.com*

P4 - ***(optional)*** "Tag-String".
This string is internally generated and shows how the source
string has been sorted.

If you omit the P2 delimiter, the command will try to find it automatically.

Example

```
' Keyword-Sorter
' This script reads a file with keywords
' it replaces the delimiter and removes double delimiters
' and double Keywords.
' It will then sort the keywords and save them in another file.
'
' Its an example for RPL., FEM. and SRT.

3.79.21 STR.- String Command

3.79.21.1 ! STR. - String Command

MiniRobotLanguage (MRL)

STR. Command

String commands

Intention

This command contains a set of String-Commands. You can use it mainly to change binary strings. For this, variables will only be resolved one time (binary compatible). specialfolders and systemvariables are will be evaluated, to prevent unwanted changes in binary data.

The command has several modes of operation. Each of these is like a separate command.

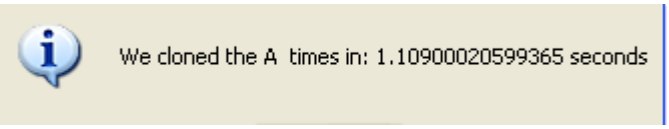
- CLONE - Mode 3150. This Mode will create a new String. out of a second string. The result is a string, consisting of multiple copies of the second specified string.
- DELETE - Mode 3150: Delete bytes/chars from inside the string.
- FIND - Mode 3176: Search for a String inside a String. Result will be on TOS. String is NOT changed in this Mode.
- INSERT - Mode 3192: This Mode will insert a String at a place into the Source String.
- OVERWRITE - Mode: 3205 This Mode will patch the Source String with a second Patch String. It will "overwrite" the Source String, while it will never change the total length of the String.
- PATCH - Mode: 3208 This Mode combines the DELETE and the INSERT Mode. Unlike the OVERWRITE-Mode, this Mode can change the length of a String.
- REVERSE - Mode 3212: This will reverse all bytes in a String. The last byte will be the first byte.
- GENERATE 3188 RANDOM STRING - Mode: This will generate a random string from specified length and of specified characters.
- STR.CHARS A 3155 - OTP-PRNG. This CPRNG is based on the ANSI X9.17 standard for secure key generation and uses Rijndael as its cryptographic base algorithm.
- STR.CHARS B 3159 This is an enhanced version of CHARS A. It uses the same PRNG. This version will create between 10 and 20 Pads using CHARS A. Then all of these will be combined using the XOR.
- STR.CHARS C 3163 This CPRNG is based on the recursion-with-carry generator, invented by George Marsaglia. Estimated Cycle length is 3 x 10^47.
- STR.CHARS D 3167 This is an enhanced version of CHARS C. This version will create a Pad with the algo from STR.CHARS A 3155 first. It will then created between 4 and 8 Pads using the algo from `CHARS C`. Then all of these Pads will be combined using the XOR to get a final result.

*© 2023 Theo Gottwald * https://www.smart-package.com*

- STR.MAKE PAD 3195 MAKE PAD has the same Syntax like GENERATE RANDOM STRING - but uses internally another PRNG (Pseudo Random Number Generator) with a Periode length of about 2^60 which is in numbers (rough estimation) 1152921504000000000 before the sequence will repeat. Therefore the result should be safe for cryptographic uses.This Mode will generate a random String of specified length and from specified characters. You can use it to generate passwords.
- STR.FROM BASE64 URL 3182 will convert the MIME/BASE64 URL data that is contained in a variable, back to the original-Format. The result will be in the same variable or in a Target variable if given.
- STR.TO BASE64 URL 3219 will convert the text or binary data that is contained in a variable, to the BASE64 URL-Format. The result will be in the same variable or in a Target variable if given.
- STR.FROM HEXASCI 3185 will convert the HEXASCII-text that is contained in a variable, to the Original-Format. The result will be in the same variable or in a Target variable if given.
- STR.TO HEXASCI 3222 will convert the text or binary data that is contained in a variable, to the HEXASCII-Format. The result will be in the same variable or in a Target variable if given.
- STR.MIME TO TEXT 3198 will convert the MIME/BASE64 data that is contained in a variable, back to the original-Format. The result will be in the same variable or in a Target variable if given.
- STR.TEXT TO MIME 3215 will convert the text or binary data that is contained in a variable, to the MIME-Format. The result will be in the same variable or in a Target variable if given.

Timing considerations

```
' Timing considerations
: $$TIM=#dtime#
: $$TXT=A
: $$NUM=30000000
STR.CLONE|$$SRC|$$NUM|$$TXT
LEN.$$SRC|$$LEN
VAR.$$TIM=#dsince#
MBX.We cloned the A $tos$ times in: $$TIM seconds
```



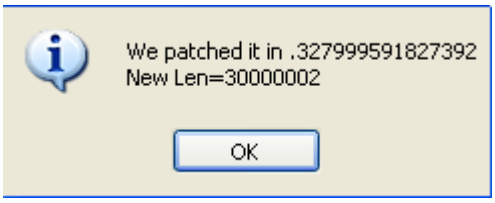
To generate a string of 29.3 MB we needed about 1 second. The times on different systems may vary, the times on my testing systems are only to give you a rough idea.

Now the STR.PATCH is possibly our slowest operation. Let's see how slow it is.

```
VAR.$$NEW=BB
VAR.$$POS=4
VAR.$$DEL=0
VAR.$$TIM=#dtime#
STR.PATCH|$$SRC|$$POS|$$DEL|$$NEW
VAR.$$TIM=#dsince#
```

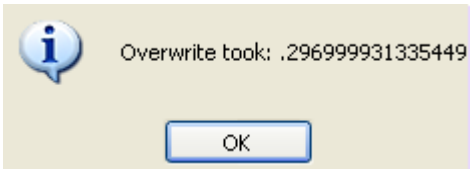
© 2023 Theo Gottwald * https://www.smart-package.com

```
LEN.$$SRC|$$LEN
MBX.We patched it in $$TIM$crlf$New Len=$$LEN
```



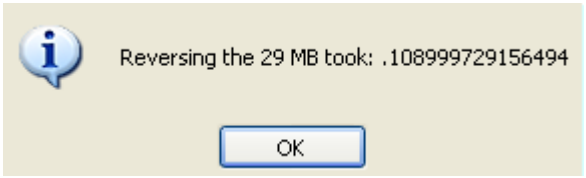
We needed 0.3 of a second to patch the 29 MB String. Now let's see how much it would be if we use `STR.OVERWRITE`.

```
VAR.$$TIM=#dtime#
STR.OVERWRITE|$$SRC|$$POS|$$NEW
VAR.$$TIM=#dsince#
MBX.Overwrite took: $$TIM
ENR.
```



Looks like there is no large difference in practical use.
Finally let's reverse that string and look how long it takes.

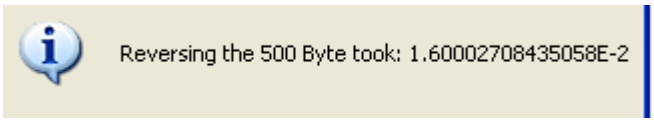
```
VAR.$$TIM=#dtime#
STR.REVERSE|$$SRC|$$POS|$$NEW
VAR.$$TIM=#dsince#
MBX.Reversing the 29 MB took: $$TIM
```



Seems not to be a big deal. Looks like you can make ten times that in a second. This should give you a rough approximation of execution times of these String commands.

Lets end with something simple.
Let's revers a string with just 500 bytes and measure this.

```
VAR.$$TIM=#dtime#
STR.REVERSE|$$SRC
VAR.$$TIM=#dsince#
MBX.Reversing the 500 Byte took: $$TIM
```



© 2023 Theo Gottwald * https://www.smart-package.com

In other words: 0.016 seconds. You can do that 62 times in a second.

General Hints:
To Replace bytes in a String, use the RPL. - RePLace in String 3143 command.
To extract a part out of a String, use the GSS. - GetSplitString 3137 command.
If your String is a delimited String (like a .csv-file), use:

- SBD. - String between Delimiter 3070
- SBM. - String between Delimiter-Multiple 3070

To filter a String, use: GFS. - Get-Filtered-String 3122.

Syntax

STR.P1[|P2][|P3][|P4]

Parameter Explanation

P1 **-** MODE of operation

P2 **-** Source and (if no P2) destination variable

P3 **-** numeric parameter, will be completely resolved

P4 **-** depend on the Mode of operation

Example

```
'************************************
' STR.
'************************************
VAR.$$SRC=Alles alt macht der Mai!
VAR.$$NEU=Neu
VAR.$$ALT=alt
STR.FIND|$$SRC|1|$$ALT
VAR.$$POS=$tos$
DBP.Patching at: $$POS
STR.OVERW|$$SRC|$$POS|$$NEU
DBP.$$SRC
ENR.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

Variables inside the source are only resolved once. Therefore it can be safely used fort for Binary data. Specialfolders and systemvariables etc. are not resolved, to avoid unwanted changes in binary data..

3.79.21.2 STR.CHARS A

MiniRobotLanguage (MRL)

STR.Chars A

Generate a string with random Bytes

Intention

The used PRNG (Pseudo Random Number Generator) provides a source of cryptographically strong random 'bytes for use in creating session keys, One-TIme Pads and other similar purposes.
This CPRNG is based on the ANSI X9.17 standard for secure key generation and uses Rijndael as its cryptographic base algorithm.
A cryptographically strong PRNG produces values which are not predictable.
This quality separates such generators from other software random number 'generators, which always produce a predictable stream of values regardless 'of the size of a generator's period. If cryptographic strength is not 'required, a CPRNG constitutes overkill.
However, if cryptographic strength is in fact required, only a generator designed specifically for such use is acceptable.

The command itself looks like this:

```
STR.CHARS A|$$CNT|$$RES
```

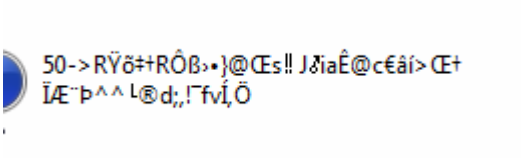
And here is a small example:

```
: $$NUM=5
STR.CHARS A|$$NUM|$$RES
MBX.$$RES
```

This is a larger example which produces a Pad of size 50.

```
: $$CNT=50
STR.CHARS A|$$CNT|$$RES
LEN.$$RES|$$LEN
MBX.$$LEN->$$RES
ENR.
```

It brings up this output:



Use the CTF. - Copy-To-File 964 to write it to a USB-Stick or Harddisk.

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

STR.CHARS A|P1[|P2]

Parameter Explanation

P1 **-** length of desired random string in bytes. If omitted, a default length of 32 byte length is used.

P2 **-** destination variable, if omitted TOS will be used for the result.

Example

```
'************************************
' STR.CHARS A
'************************************
: $$CNT=50
STR.CHARS A|$$CNT|$$RES
LEN.$$RES|$$LEN
MBX.$$LEN->$$RES
ENR.
```

Remarks

While we have made any effort to produce PRNG's of highest quality, there is no absolute warranty whatever, that these randomly generated strings are safe for use with cryptographic or safety software, or even for password-generation on a specific computer-hardware. Therefore you have to use them on your own risk.

Below you can see the results of the so called "ENT-Test Suite" for OTP's generated with this PRNG.

3.79.21.3 STR.CHARS B

MiniRobotLanguage (MRL)

STR.Chars B

Generate a string with random Bytes

Intention

The used PRNG (Pseudo Random Number Generator) provides a source of cryptographically strong random 'bytes for use in creating session keys, One-TIme Pads and other similar purposes.
This CPRNG is based on the ANSI X9.17 standard for secure key generation and uses Rijndael as its cryptographic base algorithm.
A cryptographically strong PRNG produces values which are not predictable.
This quality separates such generators from other software random number 'generators, which always produce a predictable stream of values regardless 'of the size of a generator's period. If cryptographic strength is not 'required, a CPRNG constitutes overkill.
However, if cryptographic strength is in fact required, only a generator designed specifically for such use is acceptable.

This version will create between 10 and 20 Pads using the above algo. Then all of these will be combined using the XOR. Therefore an attack based on quality of Random numbers looks impossible from my standpoint.

The command itself looks like this:

```
STR.CHARS B|$$CNT|$$RES
```

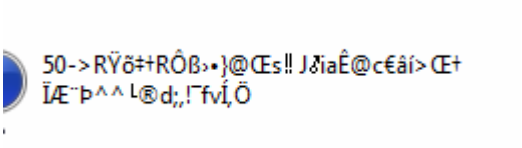
And here is a small example:

```
: $$NUM=5
STR.CHARS B|$$NUM|$$RES
MBX.$$RES
```

This is a larger example which produces a Pad of size 50.

```
: $$CNT=50
STR.CHARS B|$$CNT|$$RES
LEN.$$RES|$$LEN
MBX.$$LEN->$$RES
ENR.
```

It brings up this output:



© 2023 Theo Gottwald * https://www.smart-package.com

Use the CTF. - Copy-To-File 964 to write it to a USB-Stick or Harddisk.

Syntax

STR.CHARS B|P1[|P2]

Parameter Explanation

P1 **-** length of desired random string in bytes. If omitted, a default length of 32 byte length is used.

P2 **-** destination variable, if omitted TOS will be used for the result.

Example

```
'************************************
' STR.CHARS B
'************************************
: $$CNT=50
STR.CHARS B|$$CNT|$$RES
LEN.$$RES|$$LEN
MBX.$$LEN->$$RES
ENR.
```

Remarks

While we have made any effort to produce PRNG's of highest quality, there is no absolute warranty whatever, that these randomly generated strings are safe for use with cryptographic or safety software, or even for password-generation on a specific computer-hardware. Therefore you have to use them on your own risk.

Below you can see the results of the so called "ENT-Test Suite" for OTP's generated with this PRNG.

3.79.21.4 STR.CHARS C

MiniRobotLanguage (MRL)

STR.Chars C

Generate a string with random Bytes

Intention

The used PRNG (Pseudo Random Number Generator) provides a source of cryptographically strong random 'bytes for use in creating session keys, One-TIme Pads and other similar purposes.
This CPRNG is based on the recursion-with-carry generator, invented by George Marsaglia.
Estimated Cycle length is 3 x 10^47.
This PRNG Passes All Test in ENT and in DIEHARD
ENT Can be found at: http://www.fourmilab.ch/random/
DIEHARD Can be found at: http://stat.fsu.edu/~geo/diehard.html

The command itself looks like this:

```
STR.CHARS C|$$CNT|$$RES
```

And here is a small example:

```
: $$NUM=5
STR.CHARS C|$$NUM|$$RES
MBX.$$RES
```

This is a larger example which produces a Pad of size 50.

```

3.79.21.5 STR.CHARS D

MiniRobotLanguage (MRL)

STR.Chars D

Generate a string with random Bytes

Intention

The used PRNG (Pseudo Random Number Generator) provides a source of cryptographically strong random 'bytes for use in creating session keys, One-TIme Pads and other similar purposes.
This CPRNG is based on the recursion-with-carry generator, invented by George Marsaglia.
Estimated Cycle length is 3 x 10^47.
This PRNG Passes All Test in ENT and in DIEHARD
ENT Can be found at: http://www.fourmilab.ch/random/
DIEHARD Can be found at: http://stat.fsu.edu/~geo/diehard.html

This version will create a Pad with the algo from STR.CHARS A 3155 .
And will then created between 4 and 8 Pads using the above algo.
Then all of these Pads will be combined using the XOR to get a final result.
Therefore an attack based on quality of Random numbers looks impossible from my standpoint.

The command itself looks like this:

```
STR.CHARS C|$$CNT|$$RES
```

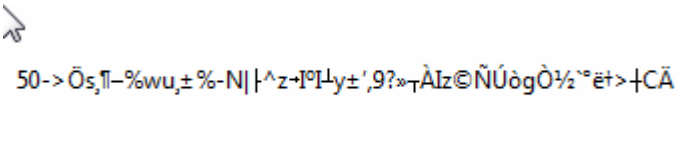
And here is a small example:

```
: $$NUM=5
STR.CHARS C|$$NUM|$$RES
MBX.$$RES
```

This is a larger example which produces a Pad of size 50.

```
: $$CNT=50
STR.CHARS C|$$CNT|$$RES
LEN.$$RES|$$LEN
MBX.$$LEN->$$RES
ENR.
```

It brings up this output:



50->Õs¶–%wu±%-N|├^z→Iº╚╜y±'‚9?»┬ÀIz©ÑÚògÒ½`°ë†>┼CÃ

© 2023 Theo Gottwald * https://www.smart-package.com

Use the CTF. - Copy-To-File 964 to write it to a USB-Stick or Harddisk.

Syntax

STR.CHARS D|P1[|P2]

Parameter Explanation

P1 **-** length of desired random string in bytes. If omitted, a default length of 32 byte length is used.

P2 **-** destination variable, if omitted TOS will be used for the result.

Example

```
'************************************
' STR.CHARS D
'************************************
: $$CNT=50
STR.CHARS D|$$CNT|$$RES
LEN.$$RES|$$LEN
MBX.$$LEN->$$RES
ENR.
```

Remarks

While we have made any effort to produce PRNG's of highest quality, there is no absolute warranty whatever, that these randomly generated strings are safe for use with cryptographic or safety software, or even for password-generation on a specific computer-hardware. Therefore you have to use them on your own risk.

Below you can see the results of the so called "ENT-Test Suite" for OTP's generated with this PRNG.

3.79.21.6 STR.CLONE

MiniRobotLanguage (MRL)

STR.CLONE

String commands

Intention

CLONE - Mode. This command will create a new String. by appending a specified second string for a given number of times. The result is a string, consisting of multiple copies of the second specified string. Here is an example:

```
VAR.$$NEU=Neu
STR.CLONE|$$SRC|5|$$NEU
MBX.$$SRC
ENR.
```

And this is the result:

We have created a new String that consists of 5 times the given second string. In the same way, you can make a string that is filled with SPACES or zero'es.

```
VAR.$$NEU=$nul$
STR.CLONE|$$SRC|3|$$NEU
MBX.$$SRC
ENR.
```

or

```
VAR.$$NEU=$sp$
STR.CLONE|$$SRC|3|$$NEU
MBX.<$$SRC>
ENR.
```

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

STR.CLONE|P1|P2|P3

Parameter Explanation

P1 **-** destination variable

P2 **-** numeric parameter, will be completely resolved

P3 **-** Clone-String

Example

```
'************************************
' STR.CLONE
'************************************
VAR.$$NEU=Neu
STR.CLONE|$$SRC|5|$$NEU
MBX.$$SRC
ENR.
ENR.
```

Remarks

Variables inside the source are only resolved once. Therefore it can be safely used for binary data. Specialfolders and systemvariables etc. are not resolved, to avoid unwanted changes in binary data.

To Replace bytes in a String, use the RPL. - RePLace in String 3143 command.
To extract a part out of a String, use the GSS. - GetSplitString 3137 command.
If your String is a delimited String (like a .csv-file), use:

- SBD. - String between Delimiter 3070
- SBM. - String between Delimiter-Multiple 3070

Limitations:

-

See also:

- LEN. - Length-of-String 3140

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.21.7 STR.DELETE

MiniRobotLanguage (MRL)

STR.DELETE

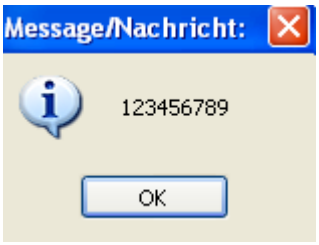
String commands

Intention

DELETE - Mode: Delete bytes/chars from inside the string. In this example, we are going to delete the Letters "AB" out of this string.

```
VAR.$$SRC=12345AB6789
STR.DELETE|$$SRC|6|7
MBX.$$SRC
ENR.
```

The result is as expected:



The string is deleted from Byte 6 to Byte 7.

Syntax

STR.DELETE|P1|P2|P3

Parameter Explanation

P1 **- Source and destination** variable

P2 **-** numeric parameter, will be completely resolved.
Start Position, first byte that is been deleted.

P3 **-** numeric parameter, will be completely resolved. End position.
Last byte that is been deleted.

if any of the numerical parameters evaluates to 0, nothing is been deleted.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'************************************
' STR.
'************************************
VAR.$$SRC=12345AB6789
STR.DELETE|$$SRC|6|7
MBX.$$SRC
ENR.
```

Remarks

Variables inside the source **P1** are only resolved once. Therefore it can be safely used for binary data. Specialfolders and systemvariables etc. are not resolved, to avoid unwanted changes in binary data..

Limitations:

-

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.21.8 STR.FIND

MiniRobotLanguage (MRL)

STR. FIND - Mode

String commands

Intention

FIND - Mode: Search for a String inside a String. The Result will be placed on TOS 104
.
The Source-String is NOT changed in this Mode.

The result is 0 if the find-string is not found.
The result will be a number between zero and the length of the source-string if the find-string is found in the source string. Here is an example:

```
VAR.$$SRC=12345AB6789
VAR.$$FND=AB
STR.FIND|$$SRC|1|$$FND
VAR.$$POS=$tos$
DBP.Found at: $$POS
ENR.
```

We get the expected result:

```
[13] Found at: 6
```

FIND will always return the first occurrence after the given starting position or zero if nothing was found. If the starting position is zero, starting position 1 is used.

if the starting position is negative, for example -1, special rules apply.

- -1 - start search at the end of the string
- -2 - start search at the second byte from the end of the string
- and so on. Note that in any case, the result is the absolute position of a found item or zero.

Here is an example:

```
VAR.$$SRC=12345AB67AB89
VAR.$$FND=AB
STR.FIND|$$SRC|-1|$$FND
VAR.$$POS=$tos$
DBP.Found at: $$POS
ENR.
```

The result is the second "AB" in the Source-String, starting at byte-position 10.

```
[13] Found at: 10
```

© 2023 Theo Gottwald * https://www.smart-package.com

FIND is case-sensitive. If you do not want that, use `VTU.` on both the source and the Find-String.

To Replace bytes in a String, use the RPL. - RePLace in String 3143 command.
To extract a part out of a String, use the GSS. - GetSplitString 3137 command.
If your String is a delimited String (like a .csv-file), use:

- SBD. - String between Delimiter 3070
- SBM. - String between Delimiter-Multiple 3070

Syntax

STR.FIND|P1|P2|P3

Parameter Explanation

P1 **-** Source variable

P2 **-** numeric parameter, will be completely resolved. Starting position for search, can be negative to search from the end of the string (reverse direction). Binary compatible variable resolution.

P3 **-** String to search for. Binary compatible variable resolution.

Example

```
'************************************
' STR.FIND
'************************************
VAR.$$SRC=12345AB6789
VAR.$$FND=AB
STR.FIND|$$SRC|1|$$FND
VAR.$$POS=$tos$
DBP.Found at: $$POS
ENR.

'************************************
' STR.FIND, search from end of string
'************************************
VAR.$$SRC=12345AB67AB89
VAR.$$FND=AB
STR.FIND|$$SRC|-1|$$FND
VAR.$$POS=$tos$
DBP.Found at: $$POS
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

Variables inside the source **P1** are only resolved once. Therefore it can be safely used for binary data. Specialfolders and systemvariables etc. are not resolved, to avoid unwanted changes in binary data.

Limitations:

3.79.21.9 STR.FIND ANY

MiniRobotLanguage (MRL)

STR.fay
STR.Find Any

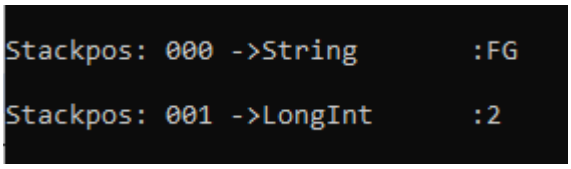
General Multi-Instring Command, will search for multiple Terms in one run.

Intention

This command is used to test if one of multiple Terms is inside a given String.
It will return the found Term and the Number of the term.
It will not return where the term was found.
It will only return the first found term.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<123456>$crlf$<abcdefg>$crlf$
$$SEA="XBC","FG"
$$POS=1
$$NUM=3
STR.fay|$$TXT|$$SEA|$$POS|p
DMP.6
MBX.!
ENR.
```

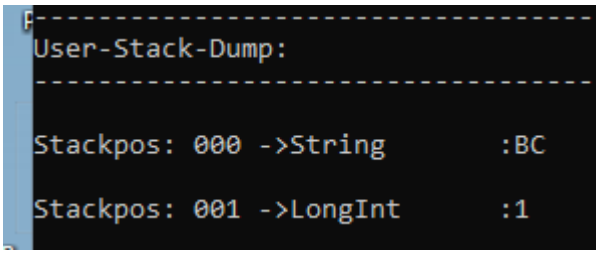
Result:



The Term FG has been found, which is the second Term.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<123456>$crlf$<abcdefg>$crlf$
$$SEA="BC","FG"
$$POS=1
$$NUM=3
STR.fay|$$TXT|$$SEA|$$POS|p
DMP.6
MBX.!
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com



The Term BC has been found, which is the First Term.

Syntax

STR.fay|P1|P2|P1|P2
STR.Find Any|P1|P2|P1|P2

Parameter Explanation

P1 - **(Mainstring,Text)** Variable with Text (Mainstring).
P2 - **(Input,Text)** Variable with the Terms that are searched. All Terms must be delimited using **" "** and separated using **,**
Example: `$$SEA="Term 1","/A","/D"`
P3 - **(Input,Numeric)** Variable with Starting-Position from where the Search will start.
P4 - **(Input,Character)** Optional Search Type:
p - default search "perfect Match"
e - Equalcase Search
w - Standard Search Pattern Search

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gal
'*****************************************************
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Line_after_Line|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

3.79.21.1 STR.FROM BASE64 URL

MiniRobotLanguage (MRL)

STR.FROM BASE64 URL

String commands

Intention

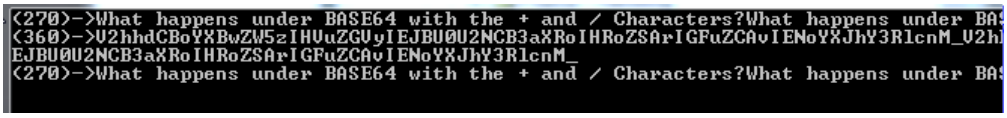
To transfer binary data in written form, all "non-printable characters" like ASCII 12,13 and others need to be encoded in printable Form.
For this generally the MIME-Format can be used. The MIME-Format is also called "BASE 64" Format. There is a special case where we do not want to have "+" and "/" signs in the result. This is the so called "BASE64 URL-Format".

`STR.FROM BASE64 URL` will convert the MIME/BASE64 URL data that is contained in a variable, back to the original-Format. The result will be in the same variable or in a Target variable if given.

The command itself looks like this:

```
' $$SRC - Binary or Text-Data to convert to MIME
' $$TAR - MIME-Format Result
STR.FROM BASE64 URL|$$SRC|$$TAR
```

The Result looks somehow like you see below.
Its a Screenshot from the Examples below (see Examples-Section).



As you can see the MIME encoded Binary is 360 bytes long, while the original size was 270 bytes. That is generally 134% the size of the original size.

If the MIME-Text contains linefeeds ($crlf$), these will be ignored.

 © 2023 Theo Gottwald * https://www.smart-package.com

This is the revers command to STR.TO BASE64 URL 3219.

Syntax

STR.FROM BASE64 URL|P1[|P2]

Parameter Explanation

P1 - source variable. If **P2** is missing then its also the destination variable

P2 - ***(optional)*** destination variable. If omitted the result is placed in the variable in **P1**.

Example

```
'************************************
' STR.TO BASE64 URL and
' STR.FROM BASE64 URL
' using one Input-Output-Variable
'************************************
$$SRC=What happens under BASE64 with the + and / Characters?
$$SRC=$$SRC$$SRC$$SRC$$SRC$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
STR.TO BASE64 URL|$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
STR.FROM BASE64 URL|$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
MBX.It works!

$$SRC=What happens under BASE64 with the + and / Characters?
$$SRC=$$SRC$$SRC$$SRC$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
STR.TO BASE64 URL|$$SRC||24
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
STR.FROM BASE64 URL|$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC

MBX.It works!
ENR.
```

3.79.21.1 STR.FROM HEXASCI

MiniRobotLanguage (MRL)

STR.FROM HEXASCI

String commands

Intention

To transfer binary data in written form, all "non-printable characters" like ASCII 12,13 and others need to be encoded in printable Form.
HEXASCII is a Format, which encodes ASC-Codes with their ASCII-value in Hexadecimal Format.

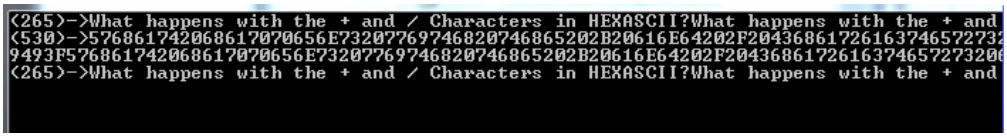
```
A -> 1E
B -> 30
```

etc.
`STR.FROM HEXASCI` will convert the HEXASCII-text that is contained in a variable, to the Original-Format. The result will be in the same variable or in a Target variable if given.

The command itself looks like this:

```
' $$SRC - Binary or Text-Data to convert to MIME
' $$TAR - MIME-Format Result
STR.FROM HEXASCI|$$SRC|$$TAR
```

The Result looks somehow like you see below.
Its a Screenshot from the Examples below (see Examples-Section).



As you can see the HEXASCII encoded Binary is 530 bytes long, while the original size was 265 bytes. That is generally 200% the size of the original size.
Therefore its less efficient then MIME Encoding,

This is the reverse command to STR.TO HEXASCI 3222 .

Syntax

STR.TO HEXASCI|P1[|P2]

Parameter Explanation

P1 - source variable. If **P2** is missing then its also the destination variable

© 2023 Theo Gottwald * https://www.smart-package.com

P2 - (optional) destination variable. If omitted the result is placed in the variable in **P1**.

Example

```
'************************************
' STR.TO HEXASCI and
' STR.FROM HEXASCI
'************************************
$$SRC=What happens with the + and / Characters in HEXASCII?
$$SRC=$$SRC$$SRC$$SRC$$SRC$$SRC

3.79.21.1 STR.GENERATE

MiniRobotLanguage (MRL)

STR.GENERATE RANDOM

String commands

Intention

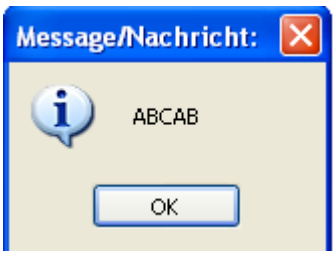
GENERATE RANDOM STRING - Mode: This Mode will generate a random String of specified length and from specified characters. You can use it to generate passwords.
The sequence lenght is about 2^32 for this PRNG.
For true cryptpgraphical random numbers and "One Time Pads" use other options, for example the `CHAR D - Option`.

The command itself looks like this:
`STR.GENERATE|$$SRC|$$CNT|$$CHR`

And here is a small example:

```
: $$TXT=ABC
: $$NUM=5
STR.GENERATE|$$SRC|$$NUM|$$TXT
MBX.$$SRC
STR.GENERATE|$$SRC
MBX.$$SRC
ENR.
```

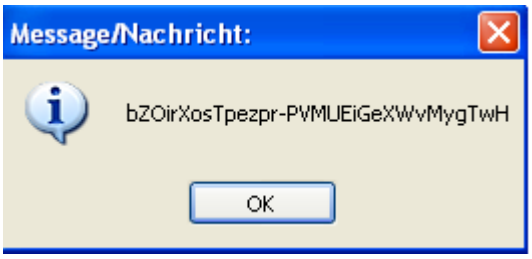
Which will bring up a Message-Box like this ..



Pic.1 Result from:
`STR.GENERATE|$$SRC|$$NUM|$$TXT`

and a Message-Box like this:

© 2023 Theo Gottwald * https://www.smart-package.com



Pic.2 Result from:
`STR.GENERATE|$$SRC`

Syntax

STR.GENERATE|P1[|P2][|P3]

Parameter Explanation

P1 **-** source and destination variable

P2 **-** ***(optional)*** length of desired random string in bytes. If omitted, a default length of 32 byte length is used.

P3 **-** ***(optional)*** variable with all characters that should be used for the random string generation.
Alternatively you can use some small letters to define the character-Set for **P3**.

- empty/if **P3** is omitted, then the whole charset from 255 ASC-Characters will be used.

"a" - all ASC-Character (0-255)
"b" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ_-?#+*"
"c" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ_-?"
"d" - "abcdefghijklmnopqrstuvwxyzöüäßABCDEFGHIJKLMNOPQRSTUVWXYZÄÜÖ"
"e" - "abcdefghijklmnopqrstuvwxyz"
"f" - "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
"g" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß'[]{}@|<>.1234567890_\-;:*+#§%&/()=! "
"h" - "0123456789ABCDEF"
"i" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß'´`[]{}@.1234567890_-;+#§%&()=! "
"k" - ":\abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß'[]{}@.1234567890_-;+#§%&()=! "

© 2023 Theo Gottwald * https://www.smart-package.com

```
"m" -
"abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ.12345678
90_\ "
"o" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ-"
"n" - "0123456789"
"p" - "\/:*?<>|"+ASC(34) (Double-Quotes)
"x" -
"abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß[]
{}@<>.1234567890_\-;:*+#§%&/()=!"
```

Example

```
'************************************
' STR.GENERATE
'************************************
: $$TXT=ABC
: $$NUM=5
STR.GENERATE|$$SRC|$$NUM|$$TXT
MBX.$$SRC
STR.GENERATE|$$SRC
MBX.$$SRC
ENR.
```

Remarks

There is no warranty whatever, that these randomly generated strings are safe for use with cryptographic or safety software, or even for passwords. Use them on your own risk.

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.21.13 STR.INSERT

MiniRobotLanguage (MRL)

STR.INSERT

String commands

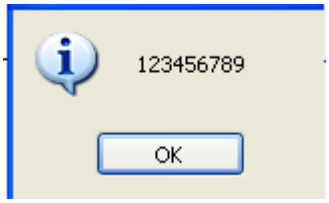
Intention

INSERT - Mode: This Mode will insert a String at a specified place into the Source String.
This command can change the length of a string.

Used on a large number of large strings, it will be slower then the `STR.OVERWRITE` command.

```
' Source and Target string
VAR.$$SRC=1234589
' String to insert
VAR.$$NEW=67
' Position where string will be inserted
VAR.$$POS=6
' This is where the magic happens
STR.INSERT|$$SRC|$$POS|$$NEW
' Here we get a message-box
MBX.$$SRC
ENR.
```

The result is:



To Replace bytes in a String, use the RPL. - RePLace in String 3143 command.
To extract a part out of a String, use the GSS. - GetSplitString 3137 command.
If your String is a delimited String (like a .csv-file), use:

- SBD. - String between Delimiter 3070
- SBM. - String between Delimiter-Multiple 3070

Syntax

STR.INSERT|P1|P2|P3

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** ***source and*** destination variable

P2 **-** numeric parameter, will be completely resolved.
Insert-Position is before the given byte-position.
The inserted string will start at that position.
If P2 is 1 or smaller then one, P3 will be appended
before the start of the source-string. if P2 is larger
then the length of the source-string, P3 will be appended
to the end of the string.

P3 **-** ***INSERT***-String. This string will be inserted into
the source string.

Example

```
'************************************
' STR.INSERT/FIND
'************************************
VAR.$$SRC=1234589
VAR.$$FND=5
VAR.$$NEW=67
STR.FIND|$$SRC|1|$$FND
VAR.$$POS=$tos$
VIC.$$POS
STR.INSERT|$$SRC|$$POS|$$NEW
MBX.$$SRC
ENR.

'************************************
' STR.INSERT
'************************************
VAR.$$SRC=1234589
VAR.$$NEW=67
VAR.$$POS=6
STR.INSERT|$$SRC|$$POS|$$NEW
MBX.$$SRC
ENR.
```

Remarks

Variables inside the source **P1** are only resolved once. Therefore it can be safely used for binary data. Specialfolders and systemvariables etc. are not resolved, to avoid unwanted changes in binary data.

Limitations:

3.79.21.14 STR.MAKE PAD

MiniRobotLanguage (MRL)

STR.Make Pad

Generate a highly random number

Intention

MAKE PAD has the same Syntax like GENERATE RANDOM STRING - but uses internally another PRNG (Pseudo Random Number Generator) with a Periode length of about 2^60 which is in numbers (rough estimation) 1152921504000000000 before the sequence will repeat. Therefore the result should be safe for cryptographic uses.

This Mode will generate a random String of specified length and from specified characters. You can use it to generate passwords.

For generation of Tables with random numbers in the full ASC-Range), cryptographical random numbers and "One Time Pads" prefer other options, for example the `CHAR D - Option`.

The command itself looks like this:

```
STR.MAKE PAD|$$SRC|$$CNT|$$CHR
```

And here is a small example:

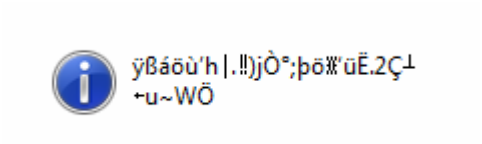
```
: $$TXT=ABC
: $$NUM=5
STR.MAKE PAD|$$SRC|$$NUM|$$TXT
MBX.$$SRC
```

Which will bring up a Message-Box like this ..

Pic.1 Result from:

```
STR.MAKE PAD|$$SRC|$$NUM|$$TXT
```

and a Message-Box like this:



© 2023 Theo Gottwald * https://www.smart-package.com

Pic.2 Result from:
STR.MAKE PAD|$$SRC

Syntax

STR.MAKE PAD|P1[|P2][|P3]

Parameter Explanation

P1 **-** source and destination variable

P2 **-** ***(optional)*** length of desired random string in bytes. If omitted, a default length of 32 byte length is used.

P3 **-** ***(optional)*** variable with all characters that should be used for the random string generation.
Alternatively you can use some small letters to define the character-Set for **P3**.

- empty/if **P3** is omitted, then the whole charset from 255 ASC-Characters will be used.

"a" - all ASC-Character (0-255)
"b" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ_-?#+*"
"c" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ_-?"
"d" - "abcdefghijklmnopqrstuvwxyzöüäßABCDEFGHIJKLMNOPQRSTUVWXYZÄÜÖ"
"e" - "abcdefghijklmnopqrstuvwxyz"
"f" - "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
"g" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß'[]{}@|<>.1234567890_\-;:*+#§%&/()=! "
"h" - "0123456789ABCDEF"
"i" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß'´`[]{}@.1234567890_-;+#§%&()=! "
"k" - ":\abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß'[]{}@.1234567890_-;+#§%&()=! "
"m" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ.1234567890_\ "
"o" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ-"
"n" - "0123456789"
"p" - "\/:*?<>|"+ASC(34) (Double-Quotes)
"x" - "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZüöäÜÖÄß[]{}@<>.1234567890_\-;:*+#§%&/()=!"

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'************************************
' STR.MAKE PAD
'************************************
: $$TXT=ABC
: $$NUM=5
STR.MAKE PAD|$$SRC|$$NUM|$$TXT
MBX.$$SRC
STR.MAKE PAD|$$SRC
MBX.$$SRC
ENR.
```

Remarks

While we have made any effort to produce PRNG's of highest quality, there is no warranty whatever, that these randomly generated strings are safe for use with cryptographic or safety software, or even for password-generation on a specific computer-hardware. Use them on your own risk.

3.79.21.1 STR.MIME TO TEXT

MiniRobotLanguage (MRL)

STR.MIME TO TEXT

String commands

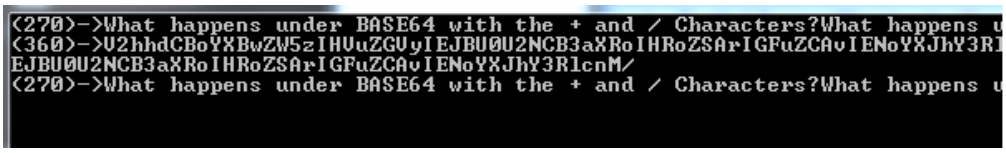
Intention

To transfer binary data in written form, all "non-printable characters" like ASCII 12,13 and others need to be encoded in printable Form.
For this generally the MIME-Format can be used. The MIME-Format is also called "BASE 64" Format.
`STR.MIME TO TEXT` will convert the MIME/BASE64 data that is contained in a variable, back to the original-Format. The result will be in the same variable or in a Target variable if given.

The command itself looks like this:

```
' $$SRC - Binary or Text-Data to convert to MIME
' $$TAR - MIME-Format Result
STR.MIME TO TEXT|$$SRC|$$TAR
```

The Result looks somehow like you see below.
Its a Screenshot from the Examples below (see Examples-Section).



As you can see the MIME encoded Binary is 360 bytes long, while the original size was 270 bytes. That is generally 134% the size of the original size.

If the MIME-Text contains linefeeds ($crlf$), these will be ignored.

 © 2023 Theo Gottwald * https://www.smart-package.com

This is the revers command to STR.TEXT TO MIME3215.

Syntax

STR.MIME TO TEXT|P1[|P2]

Parameter Explanation

P1 **-** source variable. If **P2** is missing then its also the destination variable

P2 **-** ***(optional)*** destination variable. If omitted the result is placed in the variable in **P1**.

Example

```
'************************************
' STR.MIME TO TEXT and
' STR.TEXT TO MIME
' using one Input-Output-Variable
'************************************

3.79.21.1 STR.NINSTR

MiniRobotLanguage (MRL)

STR.nis
STR.NInstr

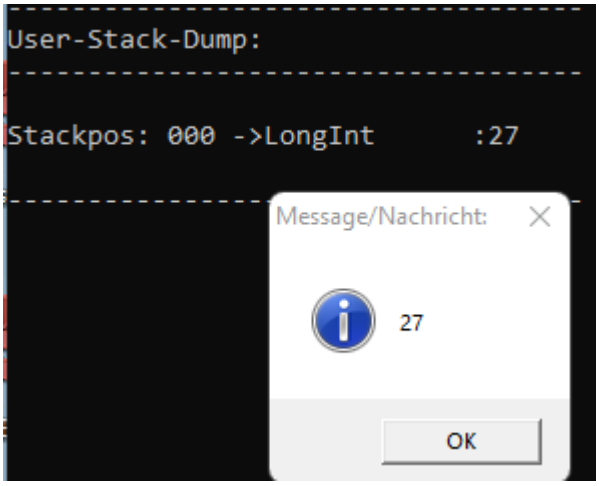
Instring Command, will search for the n'th search-Terms in one run.

Intention

This command is used to find the n'th match of a search Termin in Mainstring.
It will return the Position of the found Term.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<123456>$crlf$<abcdEFg>$crlf$
$$SEA=EF
$$POS=1
$$NUM=2
STR.nis|$$TXT|$$SEA|$$NUM|$$POS|$$RES
DMP.6
MBX.$$RES
ENR.
```

Result:



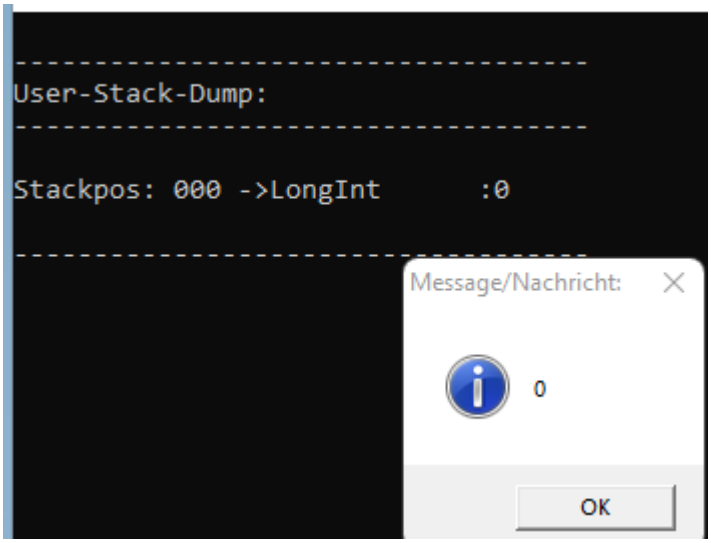
The Text was found at Position 27.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<123456>$crlf$<abcdEFg>$crlf$
$$SEA=ef
$$POS=1
$$NUM=2
STR.nis|$$TXT|$$SEA|$$NUM|$$POS|$$RES
DMP.6
MBX.$$RES
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
```

Result:



The Text "ef" was not found.

Syntax

STR.nis|P1|P2|P3[|P4][|P5]
STR.NInstr|P1|P2|P3[|P4][|P5]

Parameter Explanation

P1 - **(Mainstring,Text)** Variable with Text (Mainstring).
P2 - **(Input,Text)** Variable with the Text to search for.
P3 - **(Input,Numeric)** Variable with Number of the wanted appearance of the search term.
P4 - **(Input,Numeric)** Variable with Starting-Position from where the Search will start.
P5 - **(Output,Numeric)** Variable that will contain the result. The result will also be put on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: STR.nis
'*****************************************************
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<123456>$crlf$<abcdEFg>$crlf$

3.79.21.1 STR.OVERWRITE

MiniRobotLanguage (MRL)

STR.OVERWRITE

String commands

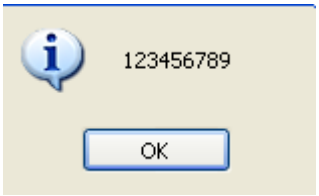
Intention

OVERWRITE - Mode: This Mode will patch the Source String with a second Patch String. It will "overwrite" the Source String, while it will never change the total length of the Source String.

Here is an example:

```
VAR.$$SRC=12345XX89
VAR.$$NEW=67
VAR.$$POS=6
STR.OVERW|$$SRC|$$POS|$$NEW
MBX.$$SRC
ENR.
```

We want to OVERWRITE the two "XX" in the Source String with the missing numbers "67".
The result is just that. In real life, you can use this command for example to patch binary files. OVERWRITE will take care that the overall length of the file is never changed, and that no content in the file is been moved. It will just "overwrite" some content with your content.

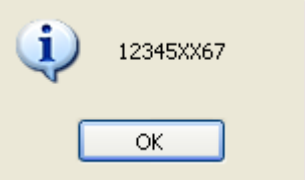


You can specify negative numbers as positional parameter. In this case, the position will be calculated from the end of the source string:

```
VAR.$$SRC=12345XX89
VAR.$$NEW=67
' - 2 => Second byte from end of the string
VAR.$$POS=-2
STR.OVERW|$$SRC|$$POS|$$NEW
MBX.$$SRC
ENR.
```

Like in this example.

© 2023 Theo Gottwald * https://www.smart-package.com



To Replace bytes in a String, use the RPL. - RePLace in String 3143 command.
To extract a part out of a String, use the GSS. - GetSplitString 3137 command.
If your String is a delimited String (like a .csv-file), use:

- SBD. - String between Delimiter 3070
- SBM. - String between Delimiter-Multiple 3070

Syntax

STR.OVERWRITE|P2|P3

Parameter Explanation

P1 **-** source and destination variable

P2 **-** numeric parameter, will be completely resolved. This is the start-byte. Its the first byte that will be overwritten with the target string **P3**. You can specify a negative value for P2 then the position will be calculated from the end of the string (reverse direction).

P3 **-** Overwrite-String, must have a length larger then zero.

Example

```
'************************************
' STR.OVERWRITE
'************************************
VAR.$$SRC=12345XX89
VAR.$$NEW=67
VAR.$$POS=6
STR.OVERW|$$SRC|$$POS|$$NEW
MBX.$$SRC
ENR.

'************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' STR.OVERWRITE, negative position
'************************************
VAR.$$SRC=12345XX89
VAR.$$NEW=67
VAR.$$POS=-2
STR.OVERW|$$SRC|$$POS|$$NEW
MBX.$$SRC
ENR.
```

Remarks

Variables inside the source **P1** are only resolved once. Therefore it can be safely used for binary data. Specialfolders and systemvariables etc. are not resolved, to avoid unwanted changes in binary data..

Limitations:

-

3.79.21.11 STR.PATCH

MiniRobotLanguage (MRL)

STR.PATCH

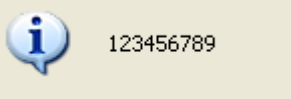
String commands

Intention

PATCH - Mode: This Mode combines the DELETE 3174 and the INSERT Mode 3192 into one command. Unlike the OVERWRITE-Mode 3205, this Mode can change the length of a String if needed. Here is a simple example:

```
VAR.$$SRC=12345XX89
' These characters will be inserted
VAR.$$NEW=67
' Starting position is byte 6
VAR.$$POS=6
' DELETE 2 characters
VAR.$$DEL=2
STR.PATCH|$$SRC|$$POS|$$DEL|$$NEW
MBX.$$SRC
ENR.
```

The result is as expected:



You can also use a negative P2, in that case the position will be calculated from the end of the string (reverse direction). Like this:

```
VAR.$$SRC=12345XX89
VAR.$$NEW=67
VAR.$$POS=-4
VAR.$$DEL=2
STR.PATCH|$$SRC|$$POS|$$DEL|$$NEW
MBX.$$SRC
ENR.
```

The **result is the same like before**, as the position "-4" is the same character then the position "6", if the total string length is 9.

You can use the `STR.PATCH` command also as a replacement for the `STR.DELETE` command, if you do specify an empty Insert-parameter **P4**. That works, because if **P4** is empty then the INSERT-Part will be skipped and only the DELETE will be made. Like this:

```
VAR.$$SRC=12345XX89
```

© 2023 Theo Gottwald * https://www.smart-package.com

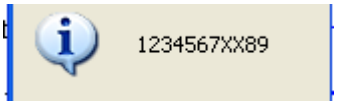
```
VAR.$$NEW=
VAR.$$POS=-4
VAR.$$DEL=2
STR.PATCH|$$SRC|$$POS|$$DEL|$$NEW
MBX.$$SRC
ENR.
```

The result is this:

In the same way, you can have the DELETE-Part skipped, if you specify a zero for **P3**. This is the number of characters to be deleted. Of course if **P3** is zero, nothing is going to be deleted. Instead the complete DELETE part is being skipped. In that case the INSERT Part will be executed, if **P4** is not empty. Here is an example:

```
VAR.$$SRC=12345XX89
VAR.$$NEW=67
VAR.$$POS=-4
VAR.$$DEL=0
STR.PATCH|$$SRC|$$POS|$$DEL|$$NEW
MBX.$$SRC
ENR.
```

The result is just the INSERTed string, and nothing deleted.



Using the `STR.PATCH` command on many large strings (>100 MB) may be significantly slower then using the `STR.OVERWRITE` command. Therefore prefer the `STR.OVERWRITE`, if the String that is inserted has the same length as the string that is been deleted.

Syntax

STR.PATCH|P1|P2|P3|P4

Parameter Explanation

P1 - source and destination variable

P2 - numeric parameter, will be completely resolved.
Starting position of the DELETE/INSERT operations.

P3 - numeric parameter, will be completely resolved. Number of bytes to delete, starting at the position **P2**. If **P3** evaluates to zero, nothing is deleted. Then only the

© 2023 Theo Gottwald * https://www.smart-package.com

INSERT is been done.

P4 **-** Insert-String, String that is inserted. If Length of **P4** evaluates to zero, nothing will be inserted. In this case the PATCH command will work somehow like DELETE (**P2** is count here, while it is a position in DELETE).

Example

```
'************************************
' STR.PATCH
'************************************
VAR.$$SRC=12345XX89
' These characters will be inserted
VAR.$$NEW=67
' Starting position is byte 6
VAR.$$POS=6
' DELETE 2 characters
VAR.$$DEL=2
STR.PATCH|$$SRC|$$POS|$$DEL|$$NEW
MBX.$$SRC
ENR.

'************************************
' STR.PATCH (INSERT MODE)
'************************************
VAR.$$SRC=12345XX89
VAR.$$NEW=67
VAR.$$POS=-4
VAR.$$DEL=0
STR.PATCH|$$SRC|$$POS|$$DEL|$$NEW
MBX.$$SRC
ENR.

'************************************
' STR.PATCH (DELETE MODE)
'************************************
VAR.$$SRC=12345XX89
VAR.$$NEW=
VAR.$$POS=-4
VAR.$$DEL=2
STR.PATCH|$$SRC|$$POS|$$DEL|$$NEW
MBX.$$SRC
ENR.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

Variables inside the source **P1** and **P4** are only resolved once. Therefore it can be safely used for binary data. Specialfolders and systemvariables etc. are not resolved, to avoid unwanted changes in binary data..

3.79.21.1 STR.REVERSE

MiniRobotLanguage (MRL)

STR.REVERSE

String commands

Intention

REVERSE - Mode: This will reverse all bytes in a String. The last byte will be the first byte.

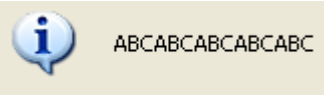
The command itself looks like this:

```
STR.REVERSE|$$SRC
```

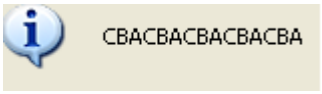
And here is a small example:

```
: $$TXT=ABC
: $$NUM=5
STR.CLONE|$$SRC|$$NUM|$$TXT
MBX.$$SRC
STR.REVERSE|$$SRC
MBX.$$SRC
ENR.
```

Which will bring up a Message-Box before the reversing:



and a Message-Box after the string was reversed:



Looking at these clearly shows what we have been doing here.

To Replace bytes in a String, use the RPL. - RePLace in String 3143 command.
To extract a part out of a String, use the GSS. - GetSplitString 3137 command.
If your String is a delimited String (like a .csv-file), use:

- SBD. - String between Delimiter 3070
- SBM. - String between Delimiter-Multiple 3070

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

STR.REVERSE|P1

Parameter Explanation

P1 **-** source and destination variable

Example

```
'************************************
' STR.REVERSE
'************************************
: $$TXT=ABC
: $$NUM=5
STR.CLONE|$$SRC|$$NUM|$$TXT
MBX.$$SRC
STR.REVERSE|$$SRC
MBX.$$SRC
ENR.
```

Remarks

Variables inside the source **P1** are only resolved once. Therefore it can be safely used for binary data. Specialfolders and systemvariables etc. are not resolved, to avoid unwanted changes in binary data.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.79.21.2 STR.TEXT TO MIME

MiniRobotLanguage (MRL)

STR.TEXT TO MIME

String commands

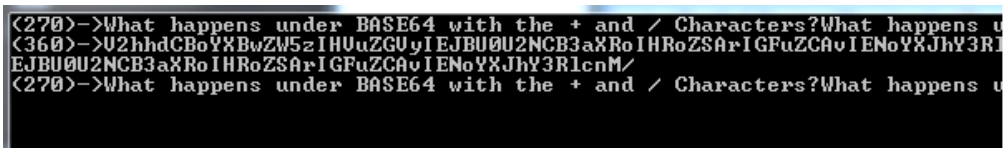
Intention

To transfer binary data in written form, all "non-printable characters" like ASCII 12,13 and others need to be encoded in printable Form.
For this generally the MIME-Format can be used. The MIME-Format is also called "BASE 64" Format.
`STR.TEXT TO MIME` will convert the text or binary data that is contained in a variable, to the MIME-Format. The result will be in the same variable or in a Target variable if given.

The command itself looks like this:

```
' $$SRC - Binary or Text-Data to convert to MIME
' $$TAR - MIME-Format Result
STR.TEXT TO MIME|$$SRC|$$TAR
```

The Result looks somehow like you see below.
Its a Screenshot from the Examples below (see Examples-Section).



As you can see the MIME encoded Binary is 360 bytes long, while the original size was 270 bytes. That is generally 134% the size of the original size.

There is an additional third parameter, that allows for a maximum line-length, after which a `$crlf$` will be inserted (newline). If this parameter is zero, no `$crlf$` will be inserted. Otherwise, it may look like this:

```
STR.TEXT TO MIME|$$SRC|$$TAR|24
```

or

```
STR.TEXT TO MIME|$$SRC||24
```

The Result now contains a linefeed ($crlf$) after each line with the given number of characters.

© 2023 Theo Gottwald * https://www.smart-package.com

Now the Ratio is 144% because of the additional Newlines that have been added. They will be ignored when decoding MIME back to the original Text or Binary.

This is the reverse command to STR.MIME TO TEXT 3198.

Syntax

STR.TEXT TO MIME|P1[|P2][|P3]

Parameter Explanation

P1 **-** source variable. If **P2** is missing then its also the destination variable

P2 **-** ***(optional)*** destination variable. If omitted the result is placed in the variable in **P1**.

P3 **-** ***(optional)*** numerical parameter. If given, a $crlf$ (Newline) is placed after the given number of characters.

Example

```
'************************************
' STR.MIME TO TEXT and
' STR.TEXT TO MIME
' using one Input-Output-Variable
'************************************
$$SRC=What happens under BASE64 with the + and / Characters?

3.79.21.2 STR.TO BASE64 URL

MiniRobotLanguage (MRL)

STR.TO BASE64 URL

String commands

Intention

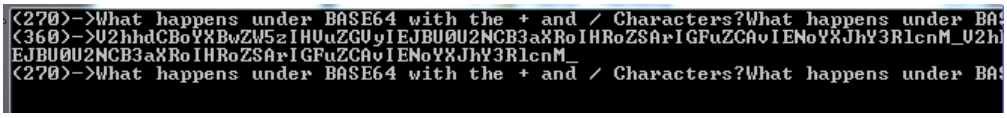
To transfer binary data in written form, all "non-printable characters" like ASCII 12,13 and others need to be encoded in printable Form.
For this generally the MIME-Format can be used. The MIME-Format is also called "BASE 64" Format. There is a special case where we do not want to have "+" and "/" signs in the result. This is the so called "BASE64 URL-Format".

`STR.TO BASE64 URL` will convert the text or binary data that is contained in a variable, to the BASE64 URL-Format. The result will be in the same variable or in a Target variable if given.

The command itself looks like this:

```
' $$SRC - Binary or Text-Data to convert to MIME
' $$TAR - MIME-Format Result
STR.TO BASE64 URL|$$SRC|$$TAR
```

The Result looks somehow like you see below.
Its a Screenshot from the Examples below (see Examples-Section).



As you can see the MIME encoded Binary is 360 bytes long, while the original size was 270 bytes. That is generally 134% the size of the original size.

There is an additional third parameter, that allows for a maximum line-length, after which a `$crlf$` will be inserted (newline). If this parameter is zero, no `$crlf$` will be inserted. Otherwise, it may look like this:

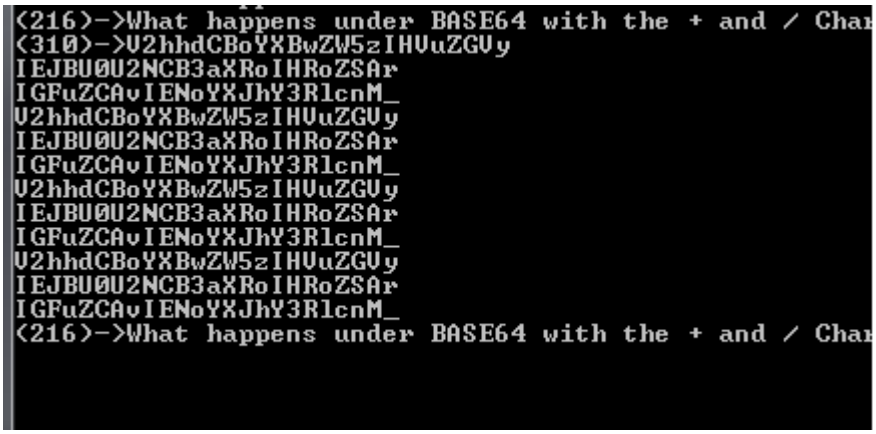
```
STR.TO BASE64 URL|$$SRC|$$TAR|24
```

or

```
STR.TO BASE64 URL|$$SRC||24
```

The Result now contains a linefeed ($crlf$) after each line with the given number of characters.

© 2023 Theo Gottwald * https://www.smart-package.com



Now the Ratio is 144% because of the additional Newlines that have been added. They will be ignored when decoding MIME back to the original Text or Binary.

This is the reverse command to STR.FROM BASE64 URL 3182.

Syntax

STR.TO BASE64 URL|P1[|P2][|P3]

Parameter Explanation

P1 **-** source variable. If **P2** is missing then its also the destination variable

P2 **-** ***(optional)*** destination variable. If omitted the result is placed in the variable in **P1**.

P3 **-** ***(optional)*** numerical parameter. If given, a $crlf$ (Newline) is placed after the given number of characters.

Example

```
'************************************
' STR.TO BASE64 URL and
' STR.FROM BASE64 URL
' using one Input-Output-Variable
'************************************
$$SRC=What happens under BASE64 with the + and / Characters?
$$SRC=$$SRC$$SRC$$SRC$$SRC$$SRC

3.79.21.2 STR.TO HEXASCI

MiniRobotLanguage (MRL)

STR.TO HEXASCI

String commands

Intention

To transfer binary data in written form, all "non-printable characters" like ASCII 12,13 and others need to be encoded in printable Form.
HEXASCII is a Format, which encodes ASC-Codes with their ASCII-value in Hexadecimal Format.

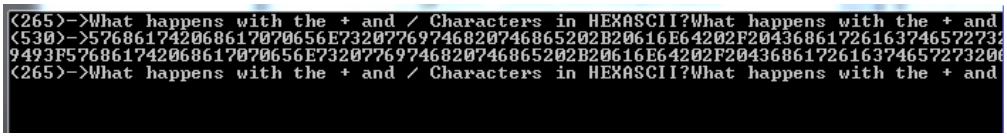
```
A -> 1E
B -> 30
```

etc.
`STR.TO HEXASCI` will convert the text or binary data that is contained in a variable, to the HEXASCII-Format. The result will be in the same variable or in a Target variable if given.

The command itself looks like this:

```
' $$SRC - Binary or Text-Data to convert to MIME
' $$TAR - MIME-Format Result
STR.TO HEXASCI|$$SRC|$$TAR
```

The Result looks somehow like you see below.
Its a Screenshot from the Examples below (see Examples-Section).



As you can see the HEXASCII encoded Binary is 530 bytes long, while the original size was 265 bytes. That is generally 200% the size of the original size.
Therefore its less efficient then MIME Encoding,

This is the reverse command to STR.FROM HEXASCI 3185.

Syntax

STR.TO HEXASCI|P1[|P2]

Parameter Explanation

P1 - source variable. If **P2** is missing then its also the destination variable

© 2023 Theo Gottwald * https://www.smart-package.com

P2 - (optional) destination variable. If omitted the result is placed in the variable in **P1**.

Example

```
'************************************
' STR.TO HEXASCI and
' STR.FROM HEXASCI
'************************************
$$SRC=What happens with the + and / Characters in HEXASCII?
$$SRC=$$SRC$$SRC$$SRC$$SRC$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
STR.TO HEXASCI|$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
STR.FROM HEXASCI|$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
MBX.It works!
ENR.

'************************************
' STR.TO HEXASCI and
' STR.FROM HEXASCI
'************************************
$$SRC=What happens with the + and / Characters in HEXASCII?
$$SRC=$$SRC$$SRC$$SRC$$SRC
LEN.$$SRC|$$LEN
PRT.($$LEN)->$$SRC
STR.TO HEXASCI|$$SRC|$$TAR
LEN.$$TAR|$$LEN
PRT.($$LEN)->$$TAR
STR.FROM HEXASCI|$$TAR|$$ERG
LEN.$$ERG|$$LEN
PRT.($$LEN)->$$ERG
MBX.It works!
ENR.
```

3.79.22 Trim String

3.79.22.1 VBT. - Variable-Both-sides-Trim

MiniRobotLanguage (MRL)

VBT. Command

Variable Both sides Trim

Intention

This command can be used to Trim Spaces from both sides of a variable-value.

By using the optional parameters you can trim any chars from both sides of the variable value.

Example:

```
VAR.§§LIN=  345  Hallo Marco
' We first remove the outer Spaces
VBT.§§LIN
DBP.>§§LIN<
' Result is: >345  Hallo Marco<
```

Now we use the Parameter **P2.**

```
VAR.§§LIN=  345  Hallo Marco
' $sp$ is a system-variable that is resolved to a SPACE
character
VBT.§§LIN|$sp$345
DBP.>§§LIN<
' Result is: >Hallo Marco<
```

Now we use the third mode, for this Parameter **P2 is the term "all"**

```
VAR.§§LIN=  345  Hallo Marco $crlf$
' "all" means all characters with ASCII codes below 33
VBT.§§LIN|all
DBP.>§§LIN<
' Result is: >345  Hallo Marco<
```

Syntax

VBT.[P1][|P2]

Parameter Explanation

*© 2023 Theo Gottwald * https://www.smart-package.com*

P1 - ***(optional)*** Source and Target-variable, if omitted, TOS is used.

P2 - ***(optional)*** if given, ANY of the characters in **P2** will be trimmed at both sides of **P1**

If Parameter 2 is "all" the characters from ASCI(0 to 32) will be trimmed from both sides of **P1**.

Example

```
''************************************
' VBT/SBD - DEMO
'************************************
VAR.§§LIN=  345  Hallo Marco
' We first remove the outer Spaces
VBT.§§LIN
PRT.>§§LIN<
' Now we remove the outer numbers and spaces
VBT.§§LIN|123 4567890
PRT.>§§LIN<
SBD.§§LIN|$sp$|4|§§ERG
MBX.§§ERG
END.
```

3.79.22.2 VLT. - Variable-Left-Trim

MiniRobotLanguage (MRL)

VLT. Command

Variable Left sides Trim

Intention

This command can be used to Trim Spaces from the left side of a variable-value.

By using the optional parameters you can trim any chars from the left side of the variable value.

Example:

```
VAR.§§LIN=  345  Hallo Marco
' We first remove the outer Spaces
VLT.§§LIN
DBP.>§§LIN<
' Result is: >345  Hallo Marco <
```

Now we use the Parameter **P2.**

```
VAR.§§LIN=  345  Hallo Marco
' $sp$ is a system-variable that is resolved to a SPACE
character
VLT.§§LIN|$sp$345
DBP.>§§LIN<
' Result is: >Hallo Marco <
```

Now we use the third mode, for this Parameter **P2 is the term "all"**

```
VAR.§§LIN= $crlf$ 345  Hallo Marco
' "all" means all characters with ASCII codes below 33
VLT.§§LIN|all
DBP.>§§LIN<
' Result is: >345  Hallo Marco<
```

Syntax

VLT.[P1][|P2]

Parameter Explanation

P1 **- *(optional)*** Source and Target-variable, if omitted,

© 2023 Theo Gottwald * https://www.smart-package.com

TOS is used.

P2 - ***(optional)*** if given, ANY of the characters in **P2** will be trimmed at the left side of **P1**

If Parameter 2 is "all" the characters from ASCI(0 to 32) will be trimmed from the left side of **P1**.

Speed in Ticks:

This command uses typically around 290 Ticks.

Example

```
''************************************
' VLT/VBT/SBD - DEMO
'************************************
'DBM.2

VAR.§§LIN=  345  Hallo Marco
' We first remove the outer Spaces
VBT.§§LIN
PRT.>§§LIN<
' Now we remove the outer numbers and spaces
VLT.§§LIN|123 4567890
PRT.>§§LIN<
SBD.§§LIN|$sp$|4|§§ERG
MBX.§§ERG
END.
```

3.79.22.3 VRT. - Variable-Right-Trim

MiniRobotLanguage (MRL)

VRT. Command

Variable Right sides Trim

Intention

This command can be used to Trim Spaces from the right side of a variable-value.

By using the optional parameters you can trim any chars from the right side of the variable value.

Example:

```
VAR.$$LIN=  345  Hallo Marco
' We first remove the outer Spaces
VRT.$$LIN
DBP.>$$LIN<
' Result is: >345  Hallo Marco<
```

Now we use the Parameter **P2.**

```
VAR.$$LIN=   Hallo Marco   345
' $sp$ is a system-variable that is resolved to a SPACE
character
VRT.$$LIN|$sp$345
DBP.>$$LIN<
' Result is: >Hallo Marco   345<
```

Now we use the third mode, for this Parameter **P2 is the term "all"**

```
VAR.$$LIN=345  Hallo Marco $crlf$
' "all" means all characters with ASCII codes below 33
VRT.$$LIN|all
DBP.>$$LIN<
' Result is: >345  Hallo Marco<
```

Syntax

VRT.[P1][|P2]

Parameter Explanation

P1 - ***(optional)*** Source and Target-variable, if omitted, TOS is used.

© 2023 Theo Gottwald * https://www.smart-package.com

P2 **-** ***(optional)*** if given, ANY of the characters in **P2** will be trimmed from the right side of **P1**

If Parameter 2 is "all" the characters from ASCI(0 to 32) will be trimmed from the right side of **P1.**

Example

```
''************************************
' VRT/VBT/SBD - DEMO
'************************************
'DBM.2

VAR.§§LIN=  Hallo Marco 345
' We first remove the outer Spaces
VBT.§§LIN
PRT.>§§LIN<
' Now we remove the outer numbers and spaces
VRT.§§LIN|123 4567890

3.79.23 URL. - Split URL

MiniRobotLanguage (MRL)

URL. Command

split URL

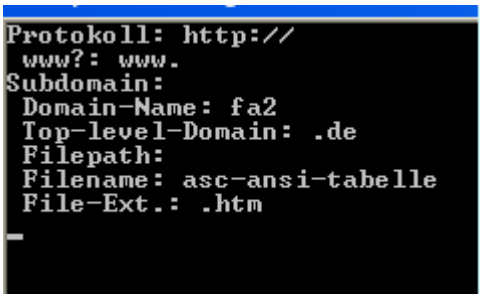
Intention

Splits an internet URL into its different parts.

Example:

```
: $$NUM=1
: $$MAN=http://www.fa2.de/asc-ansi-tabelle.htm
' Output is placed inside these variables in order
URL.$$MAN|$$V00|$$V01|$$V02|$$V03|$$V04|$$V05|$$V06|$$V07
PRT.Protokoll: $$V00
PRT. www?: $$V01
PRT.Subdomain: $$V02
PRT. Domain-Name: $$V03
PRT. Top-level-Domain: $$V04
PRT. Filepath: $$V05
PRT. Filename: $$V06
PRT. File-Ext.: $$V07
MBX.!
END.
```

And here is the result:



Syntax

URL.P1[|P2 ... P9]

Parameter Explanation

P1 - (in) - URL to split into parts

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 - (out) - protocol (http://, ftp:// etc.)

P3 - (out) - www. if there or empty

P4 - (out) - Sub-Domains if any

P5 - (out) - Domain-Name

P6 - (out) - Top-Level-Domain

P7 - (out) - Path

P8 - (out) - Filename

P9 - (out) - File-Extension

The Stack being used is the actual User-Stack.
It can be the Local User Stack or the Global User-Stack, which depends on Settings done with STS.-Command.

If the Popp'ed items are deleted from stack or not also depends on the Settings done with STS.

Example

```
'********************************
' URL. Sample 1
'********************************
: $$NUM=1
: $$MAN=http://www.it-berater.org
' All output is placed on Stack in reverse order
URL.$$MAN
DMP.4
MBX.!
END.

'********************************
' URL. Sample 2
'********************************
: $$NUM=1
: $$MAN=http://www.it-berater.org
' Output is placed inside these variables in order
URL.$$MAN|$$V00|$$V01|$$V02|$$V03|$$V04|$$V05|$$V06|$$V07
PRT.Protokoll: $$V00
PRT. www?: $$V01
PRT.Subdomain: $$V02
PRT. Domain-Name: $$V03
PRT. Top-level-Domain: $$V04
PRT. Filepath: $$V05
PRT. Filename: $$V06
PRT. File-Ext.: $$V07
MBX.!
END.
```

3.79.24 Unicode-Conversion

3.79.24.1 ATU. - ANSI to Unicode

MiniRobotLanguage (MRL)

ATU. Command

ANSI to Unicode

Intention

This command returns Text in P1 converted to Unicode 2-Byte Format.

```
' Use it with 1 or 2 Parameters
$$TXT=ABCDEFGHIJK
PRT.$$TXT|h
ATU.$$TXT
PRT.$$TXT|h
MBX. Ready

' Or use it like this
$$TXT=ABCDEFGHIJK
ATU.$$TXT|$$TAR
PRT.$$TXT|h
PRT.$$TAR|h
MBX. Ready
```

Syntax

ATU.[P1][|P2]

Parameter Explanation

P1 **-** ***Input*** String in Variable. If **P2** is omitted the result will also be placed in **P1**.
P2 **-** ***(optional)*** Variable to return the Unicode-Result.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

_

Remarks

This command is the counterpart of the UTA. - Command.

Limitations:

The theoretical maximum length of a variable /text / string is 2 GB. In real life, it is less, because variables need string memory and that must not be fragmented. After all the maximum size of a variable on your system depends on the amount of RAM that is available, and it depends on how fragmented your memory is. Under normal circumstances several hundred MegaBytes should be no problem.

3.79.24.2 UTA. - Unicode to ANSI

MiniRobotLanguage (MRL)

UTA. Command

Unicode to ANSI

Intention

This command returns the Unicode-Text in **P1** to 1-Byte ANSI Format.

```
' Use it with 1 or 2 Parameters
$$TXT=ABCDEFGHIJK
PRT.$$TXT|h
ATU.$$TXT
PRT.$$TXT|h
UTA.$$TXT
PRT.$$TXT|h
MBX. Ready

' Or use it like this
$$TXT=ABCDEFGHIJK
ATU.$$TXT|$$TAR
PRT.$$TXT|h
PRT.$$TAR|h
UTA.$$TAR|$$TXT
PRT.$$TXT|h
MBX. Ready
```

Syntax

UTA.[P1][|P2]

Parameter Explanation

P1 **-** ***Input*** String in Variable. If **P2** is omitted the result will also be placed in **P1**.
P2 **-** ***(optional)*** Variable to return the ANSI-Result.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

_

Remarks

This command is the counterpart of the ATU. - Command.

Limitations:

The theoretical maximum length of a variable /text / string is 2 GB. In real life, it is less, because variables need string memory and that must not be fragmented. After all the maximum size of a variable on your system depends on the amount of RAM that is available, and it depends on how fragmented your memory is. Under normal circumstances several hundred MegaBytes should be no problem.

3.80 TXT. Text-File Engine

MiniRobotLanguage (MRL)

TXT. the Text-File Engine

This Engine can parse and change Textfiles or CSV-Files very fast (Example 1600 Lines per Second).

Intention

Assume that you want to do something with a Text- or csv-File.
You want to read "Line-by-Line" and write something out of this.
Maybe remove some fields or sort something.

Normally you you could use the Commands like `CFF.`, `LFF.`, `FEL.`, `SBD`, etc.
This will work and will also be sufficient fast in most cases.

But there are cases when you have large files with 50.000 or more Lines,
when its just gets very slow, reading Line-by-Line from the harddisk.

Now here comes the **TXT.-Engine**.
The `TXT.`- Commands will read the whole file into memory and do all changes and stuff also in memory.
As it does not touch the harddrive during the operation, all commands will be done with full speed.

The `TXT.Command` can also load and convert Unicode-Textfiles.
All loaded Textfiles must be converted to `$crlf$`-ending Lines and to ANSI.
For this there are commands available.

If you work on csv-Files, please also take a look on the DCI.-Command 2012.
Using `TXT.` together with `DCI.` you can do all sorts of stuff with Csv.-Files in very short time,
and get very fast results.

Some commands like TXT.Sort... and similar have been **optimized for Speed and tested with Files up to 360.000 Lines.**

3.80.1 !Sample-Code: Indentation Checker

TXT.-Commands-Sample Code Previous 2702 Top 41 Next 2706

MiniRobotLanguage (MRL)

Indentation Checker for Python Code

This Script is a Indentation Checker for Python Scripts

Intention

As PYTHON uses a "Block Indentation Syntax", which even checks if you use TAB's or SPACES,
its very easy to make indentation errors.
And depending on the type of Editor you will not even see then because TABs and Spaces are both generally invisible.
Going through a thousands of code lines checking the indentation manually is also not a good solution.
Why not let it the SPR do?
Due to its very easy block-Syntax he does not have this kind of problems, and when compiled he is as fast as Python Code or even faster.
Using the SPR and its PlugIn we can realize a Indentation Checker for Python Scripts quickly.
The Code below is an example for that.
After changing its structure from FEL. to the new TXT.-Commands, it got a speedup fo ten times!
Currently it takes just about 1 second for checking 1000 Lines of Code.

3.80.2 !TXT. - Text File Engine

MiniRobotLanguage (MRL)

TXT.-Commands

Text-File Operations commands

Intention

These commands are the easy way to work through Textfiles.
What you can do:

1. Load and Save Textfiles,csv-Files
2. Process Textfiles from an internal Cache without need to access the Filesystem
3. Process csv- or delimited Textfiles in multiple ways with a high Speed. Typical real life example are about 1600 - 2000 Lines per second.
4. Store Textfile in Variable (with or without Filename)
5. Restore Textfile from Variable (with or without Filename)
6. Store TXT.-Files in an internal Memory and restore it from there using the TXT.Push_Intern / TXT.Pop_Intern Commands.
7. Remove, insert or Swap colums in a csv-File.
8. Get the Linenumber of a Byte-Position in a Textfile
9. Get the complete Line of specified a Linenumber
10. Get all Lines from specific line to the start or end of text
11. Get the start or end of a Line from a specified Byte-Position
12. Change specfied Lines (replace with a specified line)
13. Get Textfile from the LOF./LFT.-Command or
14. Move a textfile to the LOF./LFT.-Command
15. several Replace Operations and more.

Here is a Quick and incomplete Overview on the Commands:

"ltf","load_textfile"

Load a Textfile int othe internal Buffer for Processing

```
' $$FIL - Filename
' $$RES (optional) Returns Number of loaded lines
TXT.Load_Textfile|$$FIL[|$$RES]
```

"clr","clear"

Clear the internal Buffer

```
TXT.Clear
```

"gfn","get_filename"

```
' Get Filename of File in Buffer
TXT.gfn|$$FIL
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

"gtl","get_lenght"

```
' Get lenght of loaded Text in Bytes
  TXT.gtl|$$LAC
```

"tov","to_var"

```
' Move Textfile including  Filename to Variable
  TXT.To_Var|$$VAR
```

"toc","to_var_and_clear"

```
' Move Textfile including  Filename to Variable and clear internal Buffer
  TXT.To_Var|$$VAR
```

"frv","from_var"

```
' Get Textfile including Filename from Variable
  TXT.From_Var|$$VAR
```

"lpt","load_pure-Text"

```
' Load Pure-Textfile and Filename from 2 Variables
  TXT.lpt|$$TXT[|$$FIL]
```

"gpt","get_pure_text"

```
' "Get Pure Text". Only Textfile into $$TXT. If available, $$FIL returns the Fil
  TXT.gpt|$$TXT[|$$FIL]]
```

"glc","get_line_count"

```
' "Get Line Count". Get number of loaded lines.
  TXT.glc|$$CNT
```

"gel","get_line"

```
' Get Line Number $$NUM into $$LIN
' TXT.gel|$$NUM|$$LIN
```

"gll","get_line_lefttrim"

```
' Return Line $$LIN, like "gel" but left side trimmed (all ASC 0-32 removed)
  TXT.gll|$$LIN|$$RES
```

"glt","get_line_trimmed"

```
' Return Line $$LIN, like "gel" but both sides trimmed (all ASC 0-32 removed)
  TXT.glt|$$LIN|$$RES
```

"slt","set_line_to"

```
' Overwrite Line $$NUM with new Line $$NEW (Replace Line)
  TXT.slt|$$NUM|$$NEW
```

"glp","get_line_position"

```
' Get position of first and last character of line $$NUM into $$POS and last int
  TXT.glp|$$NUM|$$POS|$$POE
```

"lnp","linenumber_from_position"

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Get linenumber from Byte-Position $$POS into $$LIN
  TXT.lnp|$$POS|$$LIN
```

"lsp","line_Start_end_by_position"

```
' Get start/end of Line by Byte-Position in Text
  TXT.lsp|$$LIN|$$STR|$$END
```

"flw","find_line_with"

```
' Find Line with String. Search first occurence of $$SEA in Textfile, return the
' Falls angegeben suche ab (inkl.) Zeile $$STA
  TXT.flw|$$SEA|$$LIN[|$$STA]
```

"fit","Find_Text"

```
' $$SEA - Searchstring
' $$FRO - Search from (B)yte or (L)ine
' Returns:
' |$$POT - Postion in Text
' |$$POL - Postion in Line
' |$$LIN - Complete Line
' |$$LNN - Linenumber
  TXT.fit|$$SEA|$$FRO[|$$POT][|$$LIN][|$$LNN]
```

"gbl","get_before_line"

```
' "Get Before Line". Get all Text that is before and without the specified line
  TXT.gbl|$$LIN|$$BLT
```

"gal","get_after_line"

```
' "Get After Line". Get all Text that is After and without the specified line in
  TXT.gal|$$LIN|$$ALT
```

"gts","get_to_start"

```
' Get all Text from and including the specified line until the start of the text
  TXT.gts|$$LIN|$$TXT
```

"gte","get_to_end"

```
' Get all Text from and including the specified line until the end of the text
  TXT.gte|$$LIN|$$TXT
```

"sav","save_file"

```
' Save Text under the Filename with which it was loaded from, or if specified wi
' Leaves a result on the TOS, NTFSD-Enabled
  TXT.Save[|$$FIL]
```

"gfl","get_from_lof"

```
' Get from LOF # will load Textfile from LOF. Index Number $$IND
  TXT.get_from_lof|$$IND
```

"tol","to_lof"

```
' To lof cache # will put Textfile into LOF. Cache Index Number $$IND
  TXT.To_Lof|$$IND
```

© 2023 Theo Gottwald * https://www.smart-package.com

"rit","replace_in_text"

```
' "replace_in_text". Do a replace over the complete text using a Equalcase-Repla
' TXT.rit|$$OLD|$$NEW
```

"ril","replace_in_line"

```
' "replace_in_line". Do a replace only in the specified Line using a Equalcase-R
  TXT.ril|$$LIN|$$OLD|$$NEW[|$$STA]
```

"rep","Replace"

Search a Text in the TXT.-internal Buffer and replace it with a given other sequence.
Will replace all occurrences.

"tra","Translate_Chars"

Using TXT.tra there is a 1:1 relation between the characters in $$OLD and the characters in $$NEW.
So if a character in $$OLD is found its replaced with the corresponding Character in $$NEW
Therefore both - $$OLD and $$NEW - MUST have the same lenght, esle there will be no changes and you will get the Timeout Flag set.

```
TXT.tra|$$OLD|$$NEW[|$$STA][|$$END]
```

"luf","load_unicode_file"

```
' Load and convert Unicode-File to ANSI
  TXT.luf|$$FIL
```

"sau","save_as_unicode"

```
' Convert ANSI-File to Unicode and save (using default codepage)
  TXT.sau[|$$FIL]
```

"ctu","convert_to_unicode"

```
' Convert ANSI-String to Unicod with default Codepage
  TXT.cta|$$ANS|$$UNI
```

"cta","convert_to_ansi"

```
' Convert Unicod with default Codepage to ANSI-String
  TXT.cta|$$UNI|$$ANS
```

3.80.3 Conversions

Geben Sie hier den Text ein.

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.3.1 Convert_to_ANSI

MiniRobotLanguage (MRL)

TXT.cta
TXT.Convert_to_ANSI

This command will do several converts from Unicode to ANSI.

Intention

This command has three modes of Operation:

```
TXT.cta
```

Without Parameters it will convert the TXT.-internal Buffer to ANSI.

```
TXT.cta|$$TXT
```

Called with **P1**, it will convert the content of **P1** to ANSI and store it on the TOS.

```
TXT.cta|$$TXT|$$UNI
```

Called with **P1 and P2**, it will convert the content of **P1** to ANSI and store it in P2.

If you convert files from Unicode to ANSI and back, please note that due the nature of this process, some international characters may get lost.

```
TXT.Convert_to_Unicode|$$FIL
MBX.Operation was succesfull, Result: $tos$
```

There is no checking if the file or Text was Unicode before. Therefore converting an ANSI File to ANSI may lead to a loss of half the data.

Syntax

TXT.cta[|P1][|P2]
TXT.Convert_to_ANSI[|P1][|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - (Input, optional) Variable with Unicode-Content. If omitted the TXT.-internal Buffer is been used.

P2 - (Output) Variable with the result of the operation. If omitted the result is placed on TOS.

Example

```
'******************************************************
' EXAMPLE 1: TXT.luf  and TXT.cta
'******************************************************
VAR.$$LAA=?path\..\Pics\Outlook.msg
TXT.luf|$$LAA
TXT.cta

3.80.3.2 Convert_to_Unicode

MiniRobotLanguage (MRL)

TXT.ctu
TXT.Convert_to_Unicode

This command will do several converts from ANSI to Unicode.

Intention

This command has three modes of Operation:

```
TXT.ctu
```

Without Parameters it will convert the TXT.-internal Buffer to Unicode.

```
TXT.ctu|$$TXT
```

Called with **P1**, it will convert the content of **P1** to Unicode and store it on the TOS.

```
TXT.ctu|$$TXT|$$UNI
```

Called with **P1 and P2**, it will convert the content of **P1** to Unicode and store it in P2.

If you convert files from Unicode to ANSI and back, please note that due the nature of this process, some international characters may get lost.

```
TXT.Convert_to_Unicode|$$FIL
MBX.Operation was succesfull, Result: $tos$
```

Syntax

TXT.ctu[|P1][|P2]
TXT.Convert_to_Unicode[|P1][|P2]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - (Input, optional) Variable with ANSI-Content. If omitted the TXT.-internal Buffer is been used.

P2 - **(Output)** Variable with the result of the operation. If omitted the result is placed on TOS.

Example

```
'******************************************************
' EXAMPLE 1: TXT.luf  and TXT.ctu
'******************************************************
VAR.$$LAA=?path\..\Pics\Outlook.msg
TXT.ltf|$$LAA
TXT.ctu
TXT.gpt|$$TXT
PRT.$$TXT
MBX.Ready
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

3.80.3.3 CR_to_CRLF

MiniRobotLanguage (MRL)

TXT.cr_to_crlf
TXT.crp

Replace all cr (ASC 13) from the TXT.-internal Buffer with a new Line ($crlf$ ASC 13,10).

Intention

This command will do a Replace of all ASC 13 Characters (CR) with ASC(13,10) $crlf$ in the complete loaded Text.
Some files - for example csv-files that have been exported from MS-Office Excel, may not contain a $crlf$ at the end of each line,
but may contain just a `$cr$` instead.
To work with these files, we must change the Line-End to `$crlf$`.
If there are zero `$lf$` in the file, the `TXT.Load_Textfile` Command may do that automatically.
Sometimes if there are still a few `$lf$` inside the text, then you need to do that manually.

```
' Change Line Number $$NUM into $$NEW
TXT.Load_Textfile|$$FIA|$$NUM
TXT.crp
TXT.Get_Line_Count|$$NUM
IVV.$$NUL<5
  $$ERR=Ist die Datei leer?
  GTO.ero
EIF.
DBP.$$NUL Zeilen geladen
```

Syntax

TXT.cr_to_crlf
TXT.crp

Parameter Explanation

-

Example

```
'*****************************************************
' EXAMPLE 1: TXT.crp
```

© 2023 Theo Gottwald * https://www.smart-package.com

```

3.80.3.4 CRLF_to_CR

MiniRobotLanguage (MRL)

TXT.crlf_to_cr
TXT.crr

Replace all $crlf$ (ASC 13,10) from the TXT.-internal Buffer with a cr (ASC 13).

Intention

This command will do a Replace of all ASC 13,10 Characters (`$crlf$`) with ASC(13) `$cr$` in the complete loaded Text.
Some files - for example csv-files that have been exported from MS-Office Excel, may not contain a $crlf$ at the end of each line,
but may contain just a `$cr$` instead. To work with these files, we must change the Line-End to `$crlf$`.
If there are zero `$lf$` in the file, the `TXT.Load_Textfile` Command may do that automatically.
Sometimes if there are still a few `$lf$` inside the text, then you need to do that manually.
Now when you want to convert it back, before you save the file, you can use this command.

```
' Change Line Number $$NUM into $$NEW
TXT.Load_Textfile|$$FIA|$$NUM
TXT.crp
TXT.Get_Line_Count|$$NUM
IVV.$$NUL<5
  $$ERR=Ist die Datei leer?
  GTO.ero
EIF.
DBP.$$NUL Zeilen geladen
TXT.crr

3.80.3.6 LF_to_CRLF

MiniRobotLanguage (MRL)

TXT.lf_to_crlf
TXT.lfp

Replace all lf (ASC 10) from the TXT.-internal Buffer with a new Line ($crlf$ ASC 13,10).

Intention

This command will do a Replace of all ASC 10 Characters (LineFeed) with ASC(13,10) $crlf$ in the complete loaded Text.
Some files - for example csv-files that have been exported from MS-Office Excel, may not contain a $crlf$ at the end of each line,
but may contain just a `$lf$` instead.
To work with these files, we must change the Line-End to `$crlf$`.
If there are zero `$cr$` in the file, the `TXT.Load_Textfile` Command may do that automatically.
Sometimes if there are still a few `$cr$` inside the text, then you need to do that manually.

3.80.3.7 Translate_Chars

MiniRobotLanguage (MRL)

TXT.tra
TXT.Translate_Chars

Translate Characters in the TXT.-internal Buffer

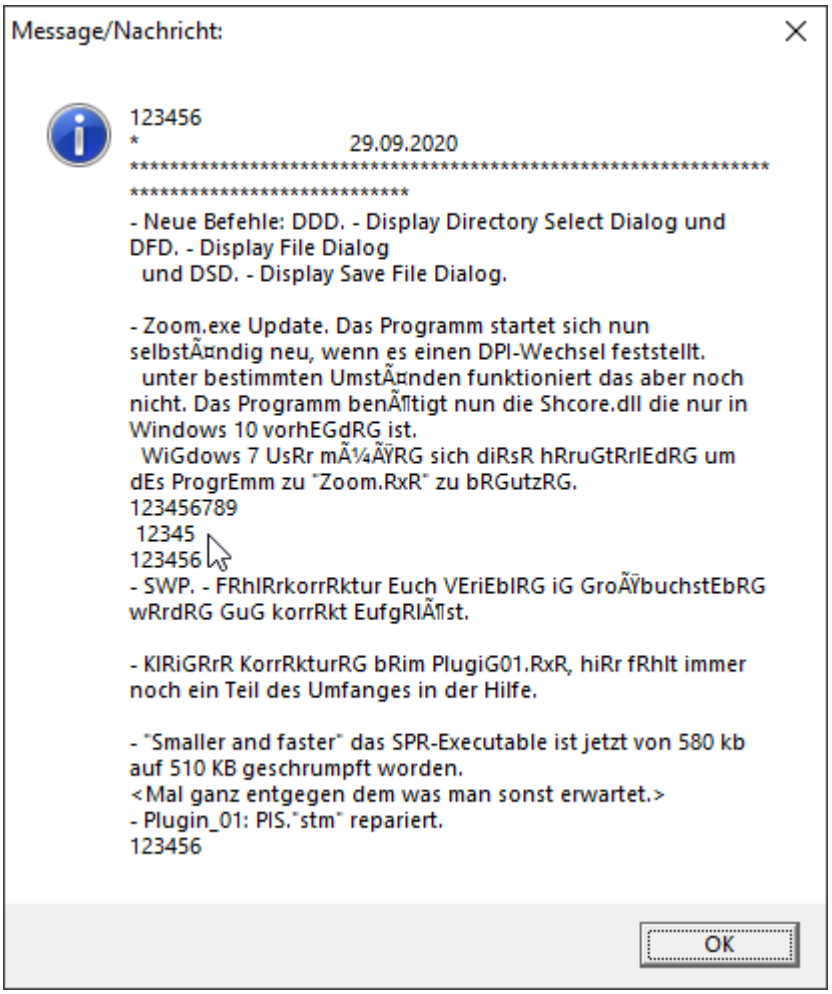
Intention

Using TXT.tra there is a 1:1 relation between the characters in $$OLD (P1) and the characters in $$NEW (P2).
So if a character in $$OLD is found it is replaced with the corresponding Character in $$NEW.
Therefore both - $$OLD and $$NEW - MUST have the same lenght, else there will be no changes and you will get the Timeout Flag set.

```
'Translate_Chars
' a -> E
' n -> G
' e -> R
' Looks like this:
TXT.tra|ane|EGR|520|800

VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
' This example shows all features of TXT.tra
TXT.tra|ane|EGR|520|800
' You can also see that the Translate_Chars starts a Position
520, as specified and ends at Position 800.
' So the start of the text is unchanged and also the end.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

```
TXT.tra|P1|P2[|P3][|P4]
TXT.Translate_Chars|P1|P2[|P3]
[|P4]
```

Parameter Explanation

P1 – **`(Input)`** Variable with Characters to translate. Using TXT.tra each occurrence of each character in **P1** will be replaced with the corresponding character in **P2**.
because of that, **P1** and **P2** must be the same length. There is a one-to-one correspondence between their characters.

P2 – **`(Input)`** Variable with the String that shall replace the characters in **P1**.

P3 – **`(`***optional, numeric***`)`** Variable with a Byte-Position in the TXT.-Buffer, if given the Translate_Chars will start at that Position.
If omitted the Text is been searched and replaced from Position 1.

P4 – **`(`***optional, numeric***`)`** Variable with a Byte-Position in the TXT.-Buffer, if given the Translate_Chars will end at that Position.
If omitted the complete Text is been searched and replaced to the end.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
VAN.$$STA=100
'Translate_Chars all "a" with "e" and "s" with "f" in internal
TXT.-Buffer starting from Byte-Position 100
VAR.$$OLD=as
VAR.$$NEW=ef
TXT.rep|$$OLD|$$NEW|$$STA
ENR.
```

3.80.4.1 Delimited_Items_Insert

MiniRobotLanguage (MRL)

TXT.Delimited_Items_Insert

Insert Fields before specified places into a Delimited String, process the whole TXT.-Buffer with all lines in one run.

Intention

Technically this works like the DIC.Insert-Command.
It will however be applied to all Lines in the TXT.-Buffer.
Therefore you do not need to specify a Line, or target. Target is the complete loaded file.

This Sample is from the DIC.-Insert Command.

Assume you have a Line like this:
`AA;BB;CC;DD;EE;FF`
as you can read it Line-by-line out of a csv.-file

Now, you decide that you want to insert Columns before "A" and before "E".

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items
VAR.$$LIN=AA;BB;CC;DD;EE;FF

' This is the Index-List with the Elements where we want to insert new fiels bef
VAR.$$IND="A","E"

' Now we call the command
DIC.Insert|$$DEL|$$LIN|$$IND|$$RES

' And Debug-Print the Result
DBP.$$RES
ENR
```

And this is the result: **`;AA;BB;CC;DD;;EE;FF`**

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

TXT.dic|P1|P2
TXT.Delimited_Items_Insert|P1|P2

Parameter Explanation

P1 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`. This is the specified delimiter that delimits the fields in the specified Line **P2**.
P2 – Variable with Index of Fields to Insert Fields before. Technically the command will just place a delimiter in front of these fields.
Can be Single number like 1 or can be an Letter like "A". You can give a **comma-separated list with Numbers of the fields to get**.

Example

```
'***********************************
' DIC.Insert - Sample
'***********************************
  ' This is the delimiter character
  VAR.$$DEL=;

  ' This is the Line that has delimited items
  VAR.$$LIN=AA;BB;CC;DD;EE;FF

  ' This is the Index-List with the Elements where we want to insert new fiels bef
  VAR.$$IND="A","E"

  ' Now we call the command
  DIC.Insert|$$DEL|$$LIN|$$IND|$$RES

  ' And Debug-Print the Result
  DBP.$$RES

  ' Result:
  '  ;AA;BB;CC;DD;;EE;FF
  ENR
```

3.80.4.2 Delimited_Items_Remove

MiniRobotLanguage (MRL)

TXT.Delimited_Items_Remove

Remove specified Fields from a Delimited String, similar to DIC.Remove, but process the whole TXT.-Buffer, not just a line.

Intention

This command does the same like DIC.Remove 3096 but will process the whole TXT.-Buffer "Line by Line".
Therefore it does not need an Line-Specifier.

The following Sample is from DIC.Remove 3096
Assume you have a Line like this:
`AA;BB;CC;DD;EE;FF`
as you can read it Line-by-line out of a csv.-file

Now, you decide that you want to remove Columns 1,3, and 5.

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items
VAR.$$LIN=AA;BB;CC;DD;EE;FF

' This is the Index-List with the Elements where we want to insert new fiels bef
VAR.$$IND="A","E",3

' Now we call the command
DIC.remove|$$DEL|$$LIN|$$IND|$$RES

' And Debug-Print the Result
DBP.$$RES
ENR
```

And this is the result: **`BB;DD;FF`**

Syntax

TXT.dir|P1|P2

Parameter Explanation

P1 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`.

© 2023 Theo Gottwald * https://www.smart-package.com

This is the specified delimiter that delimits the fields in the specified Line **P2**.

P2 – Variable with Index of Fields to remove.
Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.

Example

```
'**********************************
' DIC.Remove - Sample
'**********************************
  ' This is the delimiter character
  VAR.$$DEL=;

  ' This is the Line that has delimited items
  VAR.$$LIN=AA;BB;CC;DD;EE;FF

3.80.4.3 Delimited_Items_Swap

MiniRobotLanguage (MRL)

TXT.Delimited_Items_Swap
TXT.dis

Exchange two Fields inside a Delimited String, similar to DIC.Swap, but process the whole TXT.-Buffer, not just a line.

Intention

This command does the same like DIC.Swap 3104 but will process the whole TXT.-Buffer "Line by Line".
Therefore it does not need an Line-Specifier.

The following Sample is from DIC.Swap 3104

Assume you have a Line like this:
`AA;BB;CC;DD;EE;FF`
as you can read it Line-by-line out of a csv.-file

Now, you decide that you want to insert Columns before "A" and before "E".

```
' This is the delimiter character
VAR.$$DEL=;

' This is the Line that has delimited items
VAR.$$LIN=AA;BB;CC;DD;EE;FF$crlf$
VAV.$$LIM=$$LIN$$LIN$$LIN
TXT.Load_Pure_Text|$$LIM
' Theseare the two fields to be exchanged
VAR.$$INA="A"
VAR.$$INB="E"

' Now we call the command
TXT.dis|$$DEL|$$INA|$$INB

' And Save the Result
$$OUT=?exeloc\Result.txt
TXT.Save_File|$$OUT
ENR.
```

And this is the result:

EE;BB;CC;DD;AA;FF
EE;BB;CC;DD;AA;FF
EE;BB;CC;DD;AA;FF

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

TXT.Dis|P1|P2|P3
TXT.Delimited_Items_Swap|P1|P2|P3

Parameter Explanation

P1 – Delimiter, can be a Single character like semicolon or multiple characters like `$crlf$`.
This is the specified delimiter that delimits the fields..
P2 – Variable with Index of Fields A to Swap with Field in **P3**.
Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.
P3 – Variable with Index of Fields B to Swap with Field in **P2**.
Can be Single number like 1 or can be an Letter like "A". You can give a comma-separated list with Numbers of the fields to get.

Example

```
'***********************************
' DIC.Swap - Sample
'***********************************
  ' This is the delimiter character
  VAR.$$DEL=;

  ' This is the Line that has delimited items
  VAR.$$LIN=AA;BB;CC;DD;EE;FF

  ' Theseare the two fields to be exchanged
  VAR.$$INA="A"
  VAR.$$INB="E"

  ' Now we call the command
  DIC.Swap|$$DEL|$$LIN|$$INA|$$INB|$$RES

  ' And Debug-Print the Result
  DBP.$$RES

  ' Result:
  '  EE;BB;CC;DD;AA;FF
  ENR
```

Remarks

This command is currently not optimized for very large Tables with 100.000's of lines. Using it for very large tables may lead to significant waiting times.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

3.80.4.4 Filter_Lines

MiniRobotLanguage (MRL)

TXT.flt
TXT.Filter_Lines

Only keep Lines that contain specified Words in a specified Column.

Intention

This command is useful if you have to do with csv-files. Assume you have a List with Members of an Organisation.
Now you want to only keep certain Members in your Result List, for example those from a specified Country and with specified Occupation.
Like this one: WEF-Members (Internet-Link)

In Column "F" there you can read the profession, and in Column "L" the Country. Like this: (Sample)

	A	B	C	D	E	F	G	H	I	J	K	L	M
	YEAR	First name	Family name	Link bio	Sex	Occupation /	Organisation	Political/Gov	Category	Past / other	University	Country	Region
	2001 GLT	Andrew	McLaughlin	– no bio	M	– no info			-			?	
	1996 GLT	Michael J.	Smith	– no bio	M	– no info	?		?			?	?
	1993 GLT	Martin A.	O'Neill	– no bio	M	President an	Hi-Touch Int		-	Business		?	?
	2016 YGL	Hassina	Syed	Hassina Syed	F	Womens Rig	Chamber of Commerce			Activist		Afghanistan	Asia
	2021 YGL	Mohammad	Omaid	Mohammed	M	Director	Azizi Bank			Banking		Afghanistan	Asia
	2011 YGL	Fawad	Ahmad Musl	– no bio	M	President an	Jahaan Techr		-	Business		Afghanistan	Asia

Now you just want all "Politician" and other "Actors" from "Germany" or "Poland".
This is the Script (active Part, full Script see below at Example):

```
$$IND="L"
$$SEA="Germany","Poland"
$$STA=2
$$DEL=;
' We use Stadard Search Pattern
TXT.flt|$$IND|$$SEA|$$STA|$$DEL|w
TXT.dbp

$$IND="F"
$$SEA="Politician","Actor"
$$STA=2
$$$DEL=;
' We use Stadard Search Pattern
TXT.flt|$$IND|$$SEA|$$STA|$$DEL|e
```

Here is a Part of the Result.

13	2015 YGL	Franziska 'Sk	Keller	Ska Keller	F	Politician	European Pa	MEP, Leader	Political & Government		Germany	Europe
14	2016 YGL	Jens	Spahn	Jens Spahn	M	Politician	Government	Federal Mini	Political & Government		Germany	Europe
15	2020 YGL	Annalena	Baerbock	Annalena Ba	F	Politician	Federal Fore	Minister of F	Political & Government		Germany	Europe
16	2012 YGL	Daniel	Bahr	Daniel Bahr	M	Politician	Government	Federal Mini	Politics & Government		Germany	Europe
17	1993 GLT	Jan Maria	Rokita	Jan Rokita	M	Politician	Parliament c	Former Mem	Political & Government		Poland	Europe
18	1994 GLT	Aleksander	Kwasniewsk	Aleksander K	M	Politician	Government	Government	Political & Government	Gdansk	Poland	Europe
19	1995 GLT	Waldemar	Pawlak	Waldemar Pa	M	Politician	Government	Prime Minist	Political & G	Deputy Prime Minister an	Poland	Europe

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

TXT.flt|P1|P2[|P3]
TXT.Filter_Lines|P1|P2[|P3]

Parameter Explanation

P1 **- (Input)** Column number which must contain the specified words in **P3**.
P2 **- (Input)** Variable with List of item to search for.The List must contain the words enclosed in "" and separated with ",".
Only Lines with any of the specified words in the Column P1 will be left in the final result.
Example: `"Fox","Wulf",Neutron"`
P3 **- (Input)** Startline, if omitted default is 2 (to skip Headerline). First upper Line is Line 1. Lines before the Startline will be in the result untouched.
P4 **- (Input)** Variable with delimiter
P5 **- (Input)** **Flag**, can be any of these: "**p**" (default) - normal compare, "**w**" - compare using SPR-Standard-Search Patterns,
"**e**" - Equalcase Compare, "**c**" - contains, "**ce**" - contains equalcase, "**x**" - Exclusive Flag (do NOT list Lines before the Startline)

Example

```

3.80.4.5 Find_first_in_Column

MiniRobotLanguage (MRL)

TXT.Fic
TXT.Find_first_in_Column

Find the first Entry in a specified column with a specified value.

Intention

This command is useful if you have to do with csv-files.
Most often this can be used after you have sorted the csv-File.
After Sorting, you want a complete Block of Entried. For example, if you have this File:

	A	B	C	D	E	F	G	H	I	J	K	L
1	993 GLT	Angela	Merkel	Angela Merk	F	Politician	Federal Char	Chancellor o	Political &	Government		Germany
2	1993 GLT	Claudia	Nolte (Crawf	Claudia Nolt	F	Politician	CDU	Ex-Federal M	Political &	Government		Germany
3	1993 GLT	Jan Maria	Rokita	Jan Rokita	M	Politician	Parliament c	Former Mem	Political &	Government		Poland
4	1994 GLT	Aleksander	Kwasniewsk	Aleksander K	M	Politician	Government	Government	Political &	Government	Gdansk	Poland
5	1995 GLT	Waldemar	Pawlak	Waldemar Pa	M	Politician	Government	Prime Minist	Political & G	Deputy Prime Minister an		Poland
6	1995 GLT	Christian	Wulff	Christian Wu	M	Politician	Office of Pre	President of	Political &	Government		Germany
7	2005 YGL	Silvana	Koch-Mehrin	Silvana Koch	F	Politician	European Pa	CEO of Wom	Political & G	Former MEP, EU Represer		Germany

then you have in Column "L" a block of 3 Entries which are from Poland.
The `TXT.Fic` will find the most upper of these entries, starting from a given Start-Line.

```
' This is the short version of the Sample Script, the full version see below.

3.80.4.7 Get_any_Delimited_Item_from_Line

MiniRobotLanguage (MRL)

TXT.gdal
TXT.Get_any_delimited_Item_from_Line

Use a Line with the specified Number from the TXT.-internal Buffer and extract delimited Items from that Line.
Here multiple Single-Character Delimiter-characters can be specified.

Intention

This command is useful if you have to do with csv-files.
This Command can be used to work on a "Line by line" base through a file working with delimited Items.
The Command will extract single delimited Items but can also be used to extract multiple Items in one run.
The Items will be returned in their normal order, no Matter in which order the Items are specified.
Internally this Command works somehow (not exactly) like DIC.Get_in_Order 3088.

```
' Assume Line 10 Line could be AA;BB;CC;DD;EE;FF
VAN.$$LIN=10
VAR.$$DEL=;
VAR.$$IND="A","E",2
TXT.get_any_delimited_item_from_line|$$LIN|$$DEL|$$IND|$$RES
DBP.$$RES

' Result:
' BB;DD;FF
```

Syntax

TXT.gdal|P1|P2|P3[|P4]
TXT.Get_any_delimited_Item_from_Line|P1|P2|P3[|P4]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Input)** Variable with delimiter. Delimiter can be one or multiple characters.
P3 - **(Input)** Variable with Index of item to get. Can also be a List of Items to get. The List can contain whether the Column-Number or the Letter in "".
The Items will be returned in their normal order, no Matter in which order the Items are specified.

```
1,3,"C","AA"
```

P4 - **(Output)** Variable for Result

Example

```
'*****************************************************
'
'*****************************************************
```

TXT.gdat
TXT.Get_any_delimited_Item_from_Text

Use the complete TXT.-internal Buffer and extract delimited Items from there. Here multiple Single-Character Delimiter-characters can be specified.

Intention

This command is useful if you have to do with csv-files.
This Command can be used to work on a "Line by line" base through a file working with delimited Items.
The Command will extract single delimited Items but can also be used to extract multiple Items in one run.
The Items will be returned in their normal order, no Matter in which order the Items are specified.
Internally this Command works somehow (not exactly) like DIC.Get_in_Order 3088.

```
' Assume Line 10 Line could be AA;BB;CC;DD;EE;FF
VAN.$$LIN=10
VAR.$$DEL=;
VAR.$$IND="A","E",2
TXT.get_any_delimited_item_from_line|$$LIN|$$DEL|$$IND|$$RES
DBP.$$RES

' Result:
' BB;DD;FF
```

Syntax

TXT.gdat|P1|P2[|P3]
TXT.Get_any_delimited_Item_from_Text|P1|P2[|P3]

Parameter Explanation

P1 **-** **(Input)** Variable with delimiter. Delimiter can be one or multiple characters.

© 2023 Theo Gottwald * https://www.smart-package.com

P2 **-** **`(Input)`** Variable with Index of item to get. Can also be a List of Items to get. The List can contain whether the Column-Number or the Letter in "".
The Items will be returned in their normal order, no Matter in which order the Items are specified.

```
1,3,"C","AA"
```

P3 **-** **`(Output)`** Variable for Result

Example

```
'*******************************************************
'
'*******************************************************
```

3.80.4.9 Get_Column_Block

MiniRobotLanguage (MRL)

TXT.Gcb
TXT.Get_Column_Block

Find the first Entry in a specified column with a specified value.

Intention

This command is useful if you have to do with csv-files.
Most often this can be used after you have sorted the csv-File.
After Sorting, you want a complete Block of Entried. For example, if you have this File:

	A	B	C	D	E	F	G	H	I	J	K	L
1	993 GLT	Angela	Merkel	Angela Merk	F	Politician	Federal Char	Chancellor o	Political & Government			Germany
2	1993 GLT	Claudia	Nolte (Crawf	Claudia Nolt	F	Politician	CDU	Ex-Federal M	Political & Government			Germany
3	1993 GLT	Jan Maria	Rokita	Jan Rokita	M	Politician	Parliament c	Former Mem	Political & Government			Poland
4	1994 GLT	Aleksander	Kwasniewsk	Aleksander K	M	Politician	Government	Government	Political & Government		Gdansk	Poland
5	1995 GLT	Waldemar	Pawlak	Waldemar Pa	M	Politician	Government	Prime Minist	Political & Gi	Deputy Prime Minister an		Poland
6	1995 GLT	Christian	Wulff	Christian Wu	M	Politician	Office of Pre	President of	Political & Government			Germany
7	2005 YGL	Silvana	Koch-Mehrin	Silvana Koch	F	Politician	European Pa	CEO of Wom	Political & Gi	Former MEP, EU Represer		Germany

then you have in Column "L" a block of 3 Entries which are from Poland.
The `TXT.gcb` will give you the complete Block from the first to the last found entry with the given Specifications.

```
' This is the short version of the Sample Script, the full version see below.
$$IND="L"
$$SEA="Poland"
$$STA=1
$$DEL=;
' We use Standard Search Pattern
TXT.gcb|$$IND|$$STA|$$SEA|$$DEL|w
```

	A	B	C	D	E	F	G	H	I	J	K	L	M
1	1993 GLT	Jan Maria	Rokita	Jan Rokita	M	Politician	Parliament c	Former Mem	Political & Government			Poland	Europe
2	1994 GLT	Aleksander	Kwasniewsk	Aleksander K	M	Politician	Government	Government	Political & Government		Gdansk	Poland	Europe
3	1995 GLT	Waldemar	Pawlak	Waldemar Pa	M	Politician	Government	Prime Minist	Political & Gi	Deputy Prime Minister an		Poland	Europe

Syntax

TXT.Gcb|P1|P2[|P3][|P4][|P5]
TXT.Get_Column_Block|P1|P2[|P3][|P4][|P5]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **- (Input)** Variable with Index of item to get. Can also be a List of Items to get. The List can contain whether the Column-Number or the Letter in "".
Can be "C" or "AA" - must be a Single Item.

P2 **- (Input)** Variable with Startline, default is 2 (to skip an Header).

P3 **- (Input)** Variable with **one or more** Words to compare to. These must be quoted and separated with ",".
Example: "Headline","Party","Column"

P4 **- (Input)** Delimiter, if omitted Semicolon is used.

P5 **- (Input)** **Flag**, can be any of these: "**p**" (default) - normal compare, "**w**" - compare using SPR-Standard-Search Patterns,
"**e**" - Equalcase Compare, "**c**" - contains, "**ce**" - contains equalcase

3.80.4.10 Get_Delimited_Item_from_Line

MiniRobotLanguage (MRL)

TXT.gdil
TXT.Get_delimited_Item_from_Line

Use a Line with the specified Number from the TXT.-internal Buffer and extract delimited Items from that Line.
Here a multicharacter delimiter can be specified.

Intention

This command is useful if you have to do with csv-files.
This Command can be used to work on a "Line by line" base through a file working with delimited Items.
The Command will extract single delimited Items but can also be used to extract multiple Items in one run.
The Items will be returned in their normal order, no Matter in which order the Items are specified.
Internally this Command works like DIC.Get_in_Order 3088.

```
' Assume Line 10 Line could be AA;BB;CC;DD;EE;FF
VAN.$$LIN=10
VAR.$$DEL=;
VAR.$$IND="A","E",2
TXT.get_delimited_item_from_line|$$LIN|$$DEL|$$IND|$$RES
DBP.$$RES

' Result:
' BB;DD;FF
```

Syntax

TXT.gdil|P1|P2|P3[|P4]
TXT.Get_delimited_Item_from_Line|P1|P2|P3[|P4]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **-** **`(Input,numeric)`** Variable with Line-Number.
P2 **-** **`(Input)`** Variable with delimiter
P3 **-** **`(Input)`** Variable with Index of item to get. Can also be a List of Items to get. The List can contain whether the Column-Number or the Letter in "".
The Items will be returned in their normal order, no Matter in which order the Items are specified.

```
1,3,"C","AA"
```

P4 **-** **`(Output)`** Variable for Result

Example

```
'*****************************************************
'
'*****************************************************
```

3.80.4.12 Keep_Columns

MiniRobotLanguage (MRL)

TXT.kec
TXT.Keep_Columns

Get Line with the specified Number from TXT.-internal Buffer into Variable.

Intention

This command is used to extract Columns from out of a csv-file.
You can use the Minus-Sign to specify a Range like this: "A-C" or "2-AC".
The columns will stay in their order, with those not specified, removed.
The original Buffer-COntent wil lautomati

```
$$TXA=A;B;C;D;E;F$crlf$
$$TXB=$$TXA$$TXA$$TXA$$TXA
' Load first Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXB
$$IND="2-4"
$$DEL=;
TXT.kec|$$IND|$$DEL
DBP.Main Buffer
TXT.dbp
ENR.

' Result:
B;C;D
B;C;D
B;C;D
B;C;D
```

```
' Generate 5 Lines of Text A
$$TXA=A;B;C;D;E;F;G;H;F$crlf$
$$TXB=$$TXA$$TXA$$TXA$$TXA
' Load first Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXB
$$IND="1","3-5"
$$DEL=;
TXT.kec|$$IND|$$DEL
DBP.Main Buffer
TXT.dbp
ENR.

A;C;D;E
A;C;D;E
A;C;D;E
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
A;C;D;E
```

Syntax

TXT.kec|P1[|P2]
TXT.Keep_Columns|P1[|P2]

Parameter Explanation

P1 **-** **`(Input,numeric)`** List with Columns to keep. Looks like this: `1,3,5,"A",B-E"`. Single Numbers do not necessary need to use `""`.
P2 **-** **`(Output)`** Variable will contain the delimiter. If omitted, the default delimiter is the semicolon.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gel
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
CFF.$$LAA|$$RES
TXT.lpt|$$RES|$$LAA
' Now we get only Line 5
TXT.gel|5|$$LIN
MBX.Line 5 is: $$LIN
ENR.
```

3.80.4.13 Repair_CSV

MiniRobotLanguage (MRL)

TXT.Rer
TXT.Repair_CSV

Repair loaded CSV-File, especially fixe opened " " that have not been closed.

Intention

This command is used repair CSV-Files.Sometime you may see that parts of a CSV-File are not displayed when loaded into Excel etc.
This can happen, if there are opened, and not closed "" inside the file.
This command will either close the "" or remove them if they are open.
If **P2** i snot "0" then it will also correct the number of used delimiters per Line to this specified number.

```
' Repair_csv
$$DEL=;
$$ANZ=7
TXT.Rer|$$DEL|$$ANZ
```

Syntax

TXT.Rer|P1[|P2]
TXT.Repair_CSV|P1[|P2]

Parameter Explanation

P1 - **`(Input,numeric)`** Variable with Delimiter-Character.
P2 - **`(Output)`** Variable will contain the number of delimiters per Line, or "0". If given lines with too less delimiters will be completed by adding delimiter characters.

Example

```
'*****************************************************
'
'*****************************************************
```

3.80.4.14 Sort_by_Column_Float

MiniRobotLanguage (MRL)

TXT.Sbcf
TXT.Sort_by_Column_Float

Treat the internal Buffer as a csv-file and Sort the File "by Column"

Intention

This command is used to work with csv-Files. It will Sort the internal Buffer "by a Column".
Float-Numbers must be treated in a special way to get a correct result.
For example, 4,00E-02 is the same like 0.004 and would alphabetically or even as Integer not properly be sorted.
The same applies to 2.00E+04 which equals 4000 and will also be sorted in the right way using this command.
Here we are going to sort by Column "D", ignoring the Headline.
The german separator "," (e.g. **2,5**) will be replaced with the international "." (e.g. **2.5**) before sorting.

Important: All Data here is fictional and just for demonstrating the SPR-Commands.

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country
2	Ulrike	Nieter	– no bio	0,8	Germany
3	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
4	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany

```
$$IND="A"
' Start in Line 2 to keep the header
$$STA=2
TXT.sort_by_column_Float|$$STA|$$IND|;|a
```

Result:

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country
2	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
3	Ulrike	Nieter	– no bio	0,8	Germany
4	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany

```
$$IND="A"
' Start in Line 2
$$STA=2
$$IND="D"
TXT.sort_by_column_Float|$$STA|$$IND|;|d
```

© 2023 Theo Gottwald * https://www.smart-package.com

Result:

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country
2	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany
3	Ulrike	Nieter	– no bio	0,8	Germany
4	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany

This command has been optimized for Speed. Even large Files with 40 MB in Size should be sorted within 1-2 Seconds or less.

Syntax

TXT.Sbcf|P1|P2[|P3][|P4]
TXT.Sort_by_Column_Float|P1|P2[|P3][|P4]

Parameter Explanation

P1 **- (Input,numeric)** Start-Line, because in Line 1 is most often a Header, StartI_line is most often and per default Line 2.
P2 **- (Input)** Sorting Column. Something like a number like **3** or a letter in **"C"**.
P3 **- (Input)** Variable with delimiter. Delimiter can be one or multiple characters. If omitted **;** is used.
P4 **- (Input) Flags** a/d/l - **A**scending / **D**escending sort, **L** - equalcase sort (uses Lowercase internal)

Example

```

'#############################################################
##########
```

Remarks

Optimized for speed. Can sort very large files in a Second..
`$crlf$` (CarriageReturn/LineFeed) at the end of the loaded File will be stripped before Sorting.
This was necessary to prevent empty lines to get sorted into the result.

3.80.4.15 Sort_by_Column_Integer

MiniRobotLanguage (MRL)

TXT.Sbci
TXT.Sort_by_Column_Integer

Treat the internal Buffer as a csv-file and Sort the File "by Column"

Intention

This command is used to work with csv-Files. It will Sort the internal Buffer "by a Column".
Integer Numbers must be treated in a special way to get a correct result.
For example, 900 would alphabetically be sorted after 1000 in a pure "Letter sort", therefore this command is the solution.
Here we are going to sort by Column "A", ignoring the Headline.

Important: All Data here is fictional and just for demonstrating the SPR-Commands.

	A	B	C	D	E
1	First name	Family name	Link bio	Salary	Country
2	Wolfgang	Riehle	Wolfgang Rie	9000	Germany
3	Ulrike	Nieter	– no bio	1200	Germany
4	Ernst-Adrian	von Dörnber	Ernst-Adrian	79000	Germany

```
$$IND="A"
' Start in Line 2 to keep the header
$$STA=2
TXT.sort_by_column_Integer|$$STA|$$IND|;|a
```

Result:

	A	B	C	D	E
1	First name	Family name	Link bio	Salary	Country
2	Ulrike	Nieter	– no bio	1200	Germany
3	Wolfgang	Riehle	Wolfgang Rie	9000	Germany
4	Ernst-Adrian	von Dörnber	Ernst-Adrian	79000	Germany

```
$$IND="A"
' Start in Line 2
$$STA=2
$$IND="D"
TXT.sort_by_column_Integer|$$STA|$$IND|;|d
```

Result:

© 2023 Theo Gottwald * https://www.smart-package.com

	A	B	C	D	E
1	First name	Family name	Link bio	Salary	Country
2	Ernst-Adrian	von Dörnber	Ernst-Adrian	79000	Germany
3	Wolfgang	Riehle	Wolfgang Rie	9000	Germany
4	Ulrike	Nieter	– no bio	1200	Germany

This command has been optimized for Speed. Even large Files with 40 MB in Size should be sorted within 1-2 Seconds or less.

Syntax

TXT.Sbci|P1|P2[|P3][|P4]
TXT.Sort_by_Column_Integer|P1|P2[|P3][|P4]

Parameter Explanation

P1 **- `(Input,numeric)`** Start-Line, because in Line 1 is most often a Header, StartI_line is most often and per default Line 2.
P2 **- `(Input)`** Sorting Column. Something like a number like **3** or a letter in **"C"**.
P3 **- `(Input)`** Variable with delimiter. Delimiter can be one or multiple characters. If omitted **;** is used.
P4 **- `(Input) Flags`** a/d/l - **A**scending / **D**escending sort, **L** - equalcase sort (uses Lowercase internal)

Example

```

3.80.4.16 Sort_by_Column_Letter

MiniRobotLanguage (MRL)

TXT.Sbcl
TXT.Sort_by_Column_Letter

Treat the internal Buffer as a csv-file and Sort the File "by Column"

Intention

This command is used to work with csv-Files. It will Sort the internal Buffer "by a Column".
Here we are going to sort by Column "A", ignoring the Headline.

	A	B	C	D	E
	First name	Family name	Link bio	Sex	Country
2	Ulrike	Nieter	– no bio	F	Germany
3	Ernst-Adrian	von Dörnber	Ernst-Adrian	M	Germany
4	Wolfgang	Riehle	Wolfgang Rie	M	Germany

```
$$IND="A"
' Start in Line 2 to keep the header
$$STA=2
TXT.sort_by_column_letter|$$STA|$$IND|;|a
```

Result:

	A	B	C	D	E
1	First name	Family name	Link bio	Sex	Country
2	Ernst-Adrian	von Dörnber	Ernst-Adrian	M	Germany
3	Ulrike	Nieter	– no bio	F	Germany
4	Wolfgang	Riehle	Wolfgang Rie	M	Germany

```
$$IND="A"
' Start in Line 2
$$STA=2
TXT.sort_by_column_letter|$$STA|$$IND|;|d
```

Result:

	A	B	C	D	E
1	First name	Family name	Link bio	Sex	Country
2	Wolfgang	Riehle	Wolfgang Rie	M	Germany
3	Ulrike	Nieter	– no bio	F	Germany
4	Ernst-Adrian	von Dörnber	Ernst-Adrian	M	Germany

© 2023 Theo Gottwald * https://www.smart-package.com

This command has been optimized for Speed. Even large Files with 40 MB in Size should be sorted within 1-2 Seconds or less.
I have tested with a file that contained >350.000 Lines and it sorted instantly.

Syntax

TXT.Sbcl|P1|P2[|P3][|P4]
TXT.Sort_by_Column_Letter|P1|P2[|P3][|P4]

Parameter Explanation

P1 **- (Input,numeric)** Start-Line, because in Line 1 is most often a Header, StartI_line is most often and per default Line 2.
P2 **- (Input)** Sorting Column. Something like a number like **3** or a letter in **"C"**.
P3 **- (Input)** Variable with delimiter. Delimiter can be one or multiple characters. If omitted **;** is used.
P4 **- (Input) Flags** a/d/l - **A**scending / **D**escending sort, **L** - equalcase sort (uses Lowercase internal)

Example

3.80.5 Find- and Replace Operations

Geben Sie hier den Text ein.

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.5.1 Find_Line_with

MiniRobotLanguage (MRL)

TXT.flw
TXT.Find_Line_with

Search a Text in the TXT.-internal Buffer and return Line-Number and Byte-Position where it was found.

Intention

This is the simple search, it will just return the most needed results.
This command is used to get the Line-Number and Byte-Positions of a Search-String,
that was found in the Text that is in the Internal TXT-Buffer, into Variables.
As slightly faster Alternative to `TXT.flw`, this command will return all needed Information to replace the text or work with it in any way.

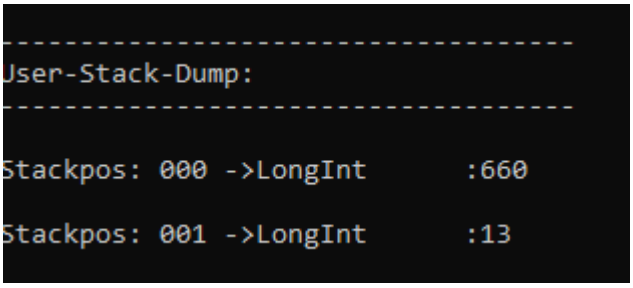
```
$$SEA=SWP.
$$LAB=0
TXT.flw|$$SEA|0|$$RES|$$LAB
DMP.6
MBX.$$RES-$$LAB
ENR.
```

If you use the command without Output-Variables, the result will be on the stack in reverse order.

```
TXT.flw|$$SEA
```

What you see here is:

TOS:	Byte-Position of found Text in whole Text
TOS+1:	Line-Number where the Text was found



Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

TXT.flw|P1[|P2][|P3][|P4]
TXT.Find_Line_with|P1[|P2][|P3][|P4]

Parameter Explanation

P1 **-** **`(Input)`** Variable with String to search for.
P2 **-** **`(numeric)`** Variable will contain a number or 0, this the Starting-Line for the search. The search will at the first byte of the Line.
If this is 0 or 1, the complete loaded Textfile will be searched.
P3 **-** **`(Output)`** Variable will contain the Line-Number of the Line that contains the Search String.
If omitted, the result is placed on TOS.
P4 **-** **`(Output)`** Variable will contain the Byte-Position of the fist-Byte of the Search string in the Text.
If omitted, the result is placed on TOS.

Example

```
'******************************************************
' EXAMPLE 1:
'******************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
VAN.$$LAC=0
$$SEA=SWP.
$$LAB=0
TXT.flw|$$SEA|0|$$RES|$$LAB
JIV.$$RES!13|Lab_failed
JIV.$$LAB!660|Lab_failed
ENR.
```

3.80.5.2 Find_Text

MiniRobotLanguage (MRL)

TXT.fit
TXT.Find_Text

Search a Text in the TXT.-internal Buffer and return various Information where it was found.
Can also do a reverse search, see P2.

Intention

This is the extended search command. it will return detailled results.
This command is used to get the Byte-Positions of Start- and End of a specified Line, from the Text that is in the Internal TXT-Buffer into Variables.
Unlike TXT.glp, it works from a Byte-Position. So you say "Byte 42" and the command will return the start- and End-Byte of the line,
that contains Byte 43. Variable **P2** will contain the Start-Byte of the Line. Variable **P3** will contain the Last-Byte of the Line before and excluding the `$crlf$`.
This Command can be used to work on a Byte-Base through a file without accessing the file on the harddrive.

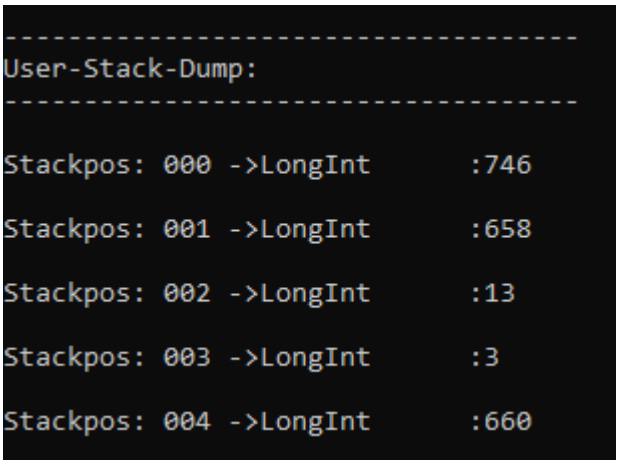
```
$$SEA=SWP.
$$LAB=0
TXT.fit|$$SEA|0|$$RES|$$LAB
DMP.6
MBX.Was found at Byte-Pos: $$RES$crlf$ Byte-Position in the
Line:$$LAB
ENR.

TXT.fit|$$SEA
```

So you get following Information:

TOS: End-Byte of Line with the found text
TOS+1: Start-Byte of Line with the found text
TOS+2: Linenumber where the Text was found, or "0" if not found
TOS+3: Byte-position of the found-Text in the Line (Text starts here at character 3 in the Line 13)
TOS+4: Byte-Position of the found Text in the whole-text

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

TXT.fit|P1[|P2][|P3][|P4][|P5][|P6][|P7]
TXT.Find_Text|P1[|P2][|P3][|P4][|P5][|P6][|P7]

Parameter Explanation

P1 - **(Input)** Variable with String to search for.
P2 - **(numeric or string)** Starting-Position and Flags "**B**" (Byte) and "**L**" (Line). If omitted "L" is taken as default.
If "**R**" is specified this will activate "Reverse Search".
Variable will contain a number or 0 can also contain "L" or "B" or "R",
This the Starting-Line Number for the search. The search will start at the first byte of the specified Line.
If this contains a letter "**B**" then the number will be taken as a Byte-Position, where to start the search.
If this contains a letter "**R**" then a reverse search is performed.
If the number is a Byte-Position (using "B"), it will be counted counted from the end of the file and it will perform a Reverse search,
from the end of the file towards the start.
If the number is a Linenumber, the linenumber will also be reversed, eg. the last line is Line 1.
If this is 0 or 1, the complete loaded Textfile will be searched.
If no letter is given, the default way to interpret this number is "L" (as Linenumber).

P3 - **(Output)** Variable will contain the Byte-Position of the Search String in the whole Text.If omitted, the result is placed on TOS.
If this result is "0" nothing was found.

P4 - **(Output)** Variable will contain the Byte-Position of the Search String in the Line where it was found.
If omitted, the result is placed on TOS. If this result is "0" nothing was found.

© 2023 Theo Gottwald * https://www.smart-package.com

P5 **-** **(Output)** Variable will contain the Line-Number of the Line that contains the Search String or 0 if nothing was found.
If omitted, the result is placed on TOS.

P6 **-** **(Output)** Variable will contain the Byte-Position of the fist-Byte of the Line where the Search string was found.
If omitted, the result is placed on TOS.

P7 **-** **(Output)** Variable will contain the Byte-Position of the Last-Byte of the Line where the Search string was found.
Does not include the `$crlf$` at the End of the Line.If omitted, the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
VAN.$$LAC=0
$$SEA=SWP.
$$LAB=0
TXT.fit|$$SEA|0|$$RES|$$LAB
ENR.
```

3.80.5.3 Replace

MiniRobotLanguage (MRL)

TXT.rep
TXT.Replace

Search a Text in the TXT.-internal Buffer and replace it with a given other sequence.

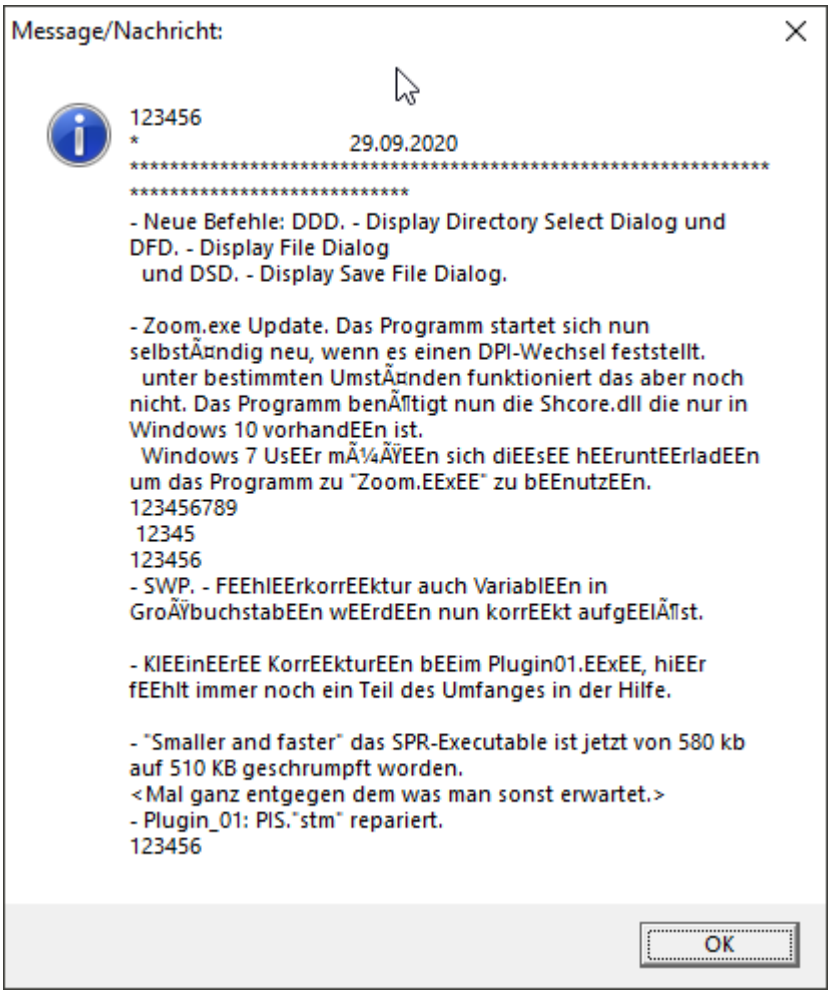
Intention

This command is used to replace all occurrences of a Search-String in the TXT.-Buffer with another String.

```
'Replace all "e" with "ef" in internal TXT.-Buffer
VAR.$$LAB=e
VAR.$$LAC=ef
TXT.rep|$$LAB|$$LAC
ENR.

VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
' This example shows all features of TXT.rep
' We are running in 2 times so its clear that as this is NOT
an Equalcase-Replace,
' the "EE" will not be treated as "ee" and therefore also not
replaced.
' This is teh differnece to TXT.rit
TXT.rep|e|EE|520|800
TXT.rep|e|EE|520|800
' You can also see that the replace starts a Position 520, as
specified and ends at Position 800.
' So the start of the text is unchanged and also the end.
```

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

```
TXT.rep|$$SEA|$$REP[|$$STA]
[|$$END]
TXT.Replace|P1|P2[|P3][|P4]
```

Parameter Explanation

P1 – **`(Input)`** Variable with String to search for.
P2 – **`(Input)`** Variable with the String that shall replace the String in **P1**.
P3 – **`(`***optional, numeric***`)`** Variable with a Byte-Position in the TXT.-Buffer, if given the replace will start at that Position.
If omitted the Text is been searched and replaced from Position 1.
P4 – **`(`***optional, numeric***`)`** Variable with a Byte-Position in the TXT.-Buffer, if given the replace will end at that Position.
If omitted the complete Text is been searched and replaced to the end.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
VAN.$$STA=100
'Replace all "e" with "ef" in internal TXT.-Buffer starting
from Byte-Position 100
VAR.$$OLD=e
VAR.$$NEW=ef
TXT.rep|$$OLD|$$NEW|$$STA
ENR.
```

3.80.5.4 Replace_in_Line

MiniRobotLanguage (MRL)

TXT.ril
TXT.Replace_in_Line

Search a Text in the TXT.-internal Buffer in a specified Line and replace just the first match with a given other string.

Intention

This command is specific in that it will only replace the first match of **P2** in the specified Line with **P3**.
Also you can specify a starting Position in **P4**.
If you want to replace all occurrences in a Line, you can get the Line-Position using TXT.glp and then use TXT.rep.
Or just call TXT.ril multiple TImes until the TOS returns "0".
The command will leave a "0" or a "1" on the TOS, depending if there was a replace or not.

```
'Replace all "e" with "ef" in internal TXT.-Buffer
VAR.$$LAB=e
VAR.$$LAC=ef
TXT.ril|13|$$LAB|$$LAC|15
ENR.
```

```
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
' This example shows all features of TXT.ril
' We are running in 2 times so its clear that due to the
Equalcase-Replace,
' also the "EE" will be treated as "ee" and replaced.
TXT.ril|e|EE|520
TXT.ril|e|EE|520
' You can also see that the replace starts a Position 520, as
specified.
' So the start of the text is unchanged.
```

Syntax

TXT.ril|$$LIN|$$SEA|$$REP[|$$STA]

TXT.Replace_in_Line|P1|P2|P3[|P4]

Parameter Explanation

P1 **-** **(Input,numeric)** Variable with Line-Number of the Line that shall be searched for something. The first Line is always Line 1.
P2 **-** **(Input)** Variable with String to search for.
P3 **-** **(Input)** Variable with the String that shall replace the String in **P2**.
P4 **-** **(*optional, numeric*)** Variable with a Byte-Position in the TXT.-Buffer, if given the replace will start at that Position.
If omitted the complete Text is been searched and replaced.

TOS: The TXT.ril returns a value of "0" on the TOS if there was no match found.
If there was something replaced, a "1" is been returned on the TOS.

Example

```
'*****************************************************
' EXAMPLE 1:
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
VAN.$$STA=100
'Replace all "e" with "ef" in internal TXT.-Buffer starting
from Byte-Position 100
VAR.$$OLD=e
VAR.$$NEW=ef
TXT.ril|13|$$OLD|$$NEW|$$STA
ENR.
```

Remarks

Will replace only the FIRST occurrences of the Search-String.

Limitations:

-

3.80.5.5 Replace_in_Text

MiniRobotLanguage (MRL)

TXT.rit
TXT.Replace_in_Text

Search a Text in the TXT.-internal Buffer and replace it with a given other sequence, using an Equalcase-Search Algo.

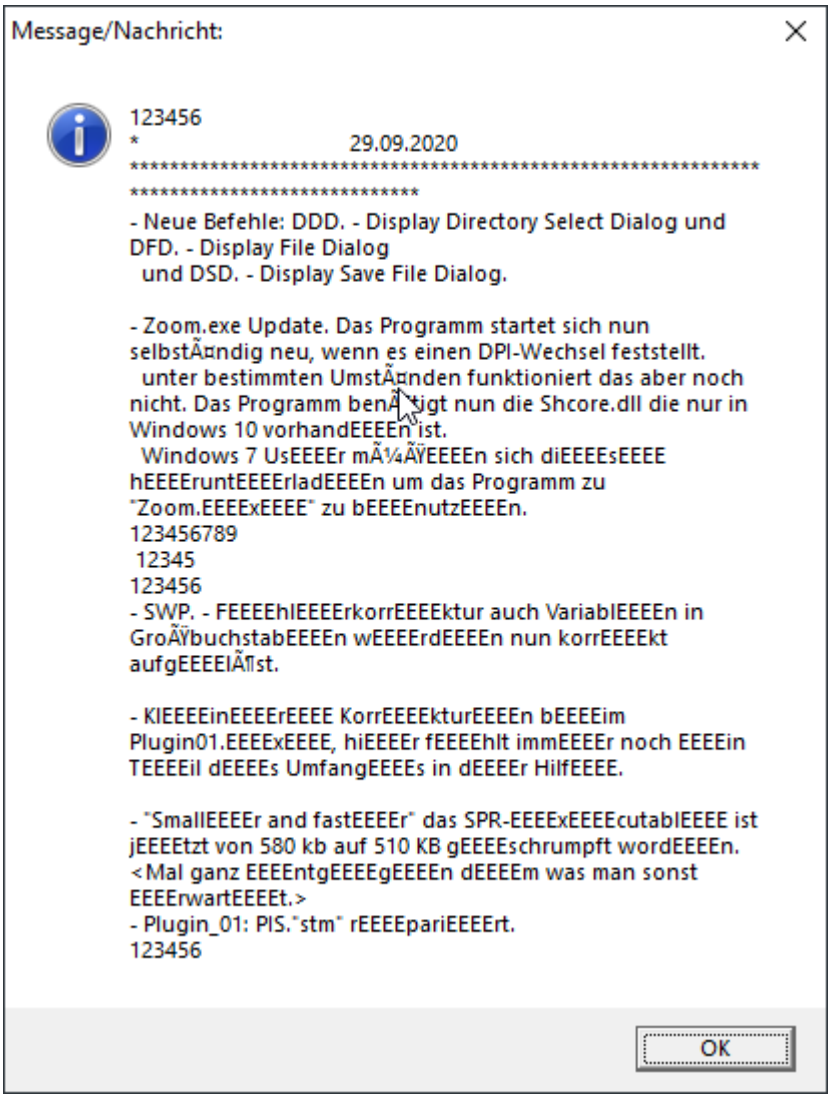
Intention

This command is used to replace all occurrences of a Search-String in the TXT.-Buffer with another String.
It uses an Equalcase-Algorhytm so it will search "equal-case" but the replace will be done with the proper case.

```
'Replace all "e" with "ef" in internal TXT.-Buffer
VAR.$$LAB=e
VAR.$$LAC=ef
TXT.rit|$$LAB|$$LAC
ENR.
```

```
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
' This example shows all features of TXT.rit
' We are running in 2 times so its clear that due to the
Equalcase-Replace,
' also the "EE" will be treated as "ee" and replaced.
TXT.rit|e|EE|520
TXT.rit|e|EE|520
' You can also see that the replace starts a Position 520, as
specified.
' So the start of the text is unchanged.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*



Syntax

TXT.rit|$$SEA|$$REP[|$$STA]
TXT.Replace_in_Text|P1|P2[|P3]

Parameter Explanation

P1 – **`(Input)`** Variable with String to search for.
P2 – **`(Input)`** Variable with the String that shall replace the String in **P1**.
P3 – **`(`***optional, numeric***`)`** Variable with a Byte-Position in the TXT.-Buffer, if given the replace will start at that Position.
If omitted the complete Text is been searched and replaced.

Example

```
'*******************************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' EXAMPLE 1:
'*************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
VAN.$$STA=100
'Replace all "e" with "ef" in internal TXT.-Buffer starting
from Byte-Position 100
VAR.$$OLD=e
VAR.$$NEW=ef
TXT.rit|$$OLD|$$NEW|$$STA
ENR.
```

Remarks

Will replace ALL occurences of the Search-String. Uses an Equalcase-Algo so the search-string will be found whether in lower- or in Upper-case..

3.80.6.1 Get_after_Line

MiniRobotLanguage (MRL)

TXT.gal
TXT.Get_after_Line

Get all Text that is after a specified Line, excluding the specified line.

Intention

This command is used to get all Text after a specified Line from the Text that is in the Internal TXT-Buffer, into a Variable.
It will not include the specified Line itself. Variable P2 will contain the Text after the Line Nr. P1.

```
' Get all Text before Line 10 into $$LEF
$$NUM=10
TXT.gal|$$NUM|$$LEF
LEN.$$LEF|$$LEN
'JIV.$$LEN!238|Lab_failed
```

Syntax

TXT.gal|P1[|P2]
TXT.Get_after_Line|P1[|P2]

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Output)** Variable will contain the Text. If omitted, the line is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gal
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA
' Get all Text before Line 10 into $$LEF
$$NUM=10
TXT.gal|$$NUM|$$LEF
LEN.$$LEF|$$LEN
MBX.Len of returned Text is:$$LEN
```

3.80.6.2 Get_before_Line

MiniRobotLanguage (MRL)

TXT.gbl
TXT.Get_before_Line

Get all Text that is before a specified Line, excluding the specified line.

Intention

This command is used to get all Text before a specified Line from the Text that is in the Internal TXT-Buffer, into a Variable.
It will not include the specified Line itself. Variable P2 will contain the Text before the Line Nr. P1.

```
' Get all Text before Line 10 into $$LEF
$$NUM=10
TXT.gbl|$$NUM|$$LEF
LEN.$$LEF|$$LEN
'JIV.$$LEN!238|Lab_failed
```

Syntax

TXT.gbl|P1[|P2]
TXT.Get_before_Line|P1[|P2]

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Output)** Variable will contain the Text. If omitted, the line is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gbl
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA
' Get all Text before Line 10 into $$LEF
$$NUM=10
TXT.gbl|$$NUM|$$LEF
LEN.$$LEF|$$LEN
MBX.Len of returned Text is:$$LEN
```

3.80.6.3 Get_Line

MiniRobotLanguage (MRL)

TXT.gel
TXT.Get_Line

Get Line with the specified Number from TXT.-internal Buffer into Variable.

Intention

This command is used to get a specified Line from the Text that is in the Internal TXT-Buffer into a Variable.
Variable P2 will contain the Line Nr. P1.

This Command can be used to work on a "Line by line" base through a file without accessing the file on the harddrive.

```
' Get Line Number $$NUM into $$LIN
$$NUM=10
TXT.gel|$$NUM|$$LIN
MBX.Line 10 is: $crlf$ $$LIN
```

Syntax

TXT.gel|P1[|P2]
TXT.Get_Line|P1[|P2]

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Output)** Variable will contain the Line. If omitted, the line is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gel
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
CFF.$$LAA|$$RES
TXT.lpt|$$RES|$$LAA
' Now we get only Line 5
TXT.gel|5|$$LIN
MBX.Line 5 is: $$LIN
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.6.4 Get_Line_Count

MiniRobotLanguage (MRL)

TXT.glc
TXT.Get_Line_Count

Return the number of lines of the currently loaded File inside the TXT.-internal Buffer

Intention

This command is used to return the number of lines of the Textfile, that was loaded into the internal Buffer of the TXT.-Commands.

```
' Load Textfile into intrnal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
TXT.glc|$$RES
MBX. The loaded File has $$RES Lines.
```

Syntax

TXT.glc|P1
TXT.Get_Line_Count|P1

Parameter Explanation

P1 - **(Output)** Variable with the result of the operation.
On error a "" is returned also the Timeout-Flag is set.
On success, the Lenght in Bytes/Charcters of the currently loaded file is been returned.
If omitted the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.ltf  and TXT.gtl etc.
'*****************************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
TXT.clr
TXT.glc|$$LAB
JIV.$$LAB!0|Lab_failed
TXT.gtl|$$LAC
JIV.$$LAC!0|Lab_failed
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.6.5 Get_Line_lefttrim

MiniRobotLanguage (MRL)

TXT.gel
TXT.Get_Line_lefttrim

Get Line with the specified Number from TXT.-internal Buffer into Variable and trim Spaces from left side.

Intention

This command is used to get a specified Line from the Text that is in the Internal TXT-Buffer into a Variable.
It will also trim all Spaces and TAB's from the left side.
Variable P2 will contain the Line Nr. P1.

This Command can be used to work on a "Line by line" base through a file without accessing the file on the harddrive.

```
' Get Line Number $$NUM into $$LIN
$$NUM=10
TXT.gll|$$NUM|$$LIN
MBX.Line 10 is: $crlf$ $$LIN
```

Syntax

TXT.gll|P1[|P2]
TXT.Get_Line_lefttrim|P1[|P2]

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Output)** Variable will contain the Line. If omitted, the line is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gel
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
CFF.$$LAA|$$RES
TXT.lpt|$$RES|$$LAA
' Now we get only Line 5
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
TXT.gll|5|$$LIN
MBX.Line 5 is: $$LIN
ENR.
```

Remarks

-

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.6.6 Get_Line_Position

MiniRobotLanguage (MRL)

TXT.glp
TXT.Get_Line_Position

Get Byte-Position of Line with the specified Number from TXT.-internal Buffer into Variables.

Intention

This command is used to get a specified Line-Position from the Text that is in the Internal TXT-Buffer into a Variables.
Variable **P2** will contain the number of the first byte of Line Nr. **P1**. Variable P3 will contain the number of the last character of Line **P1**,
the following `$crlf$` is not included. Threrefore if a line is followed by `$crlf$` then these bytes will come after **P3**.

```
' Get Line Number $$NUM into $$LIN
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.lft|$$LAA
$$NUM=15
' Get star- and ENd-Byte from Line 15
TXT.glp|$$NUM|$$STA|$$END
CFF.$$LAA|$$TXT
GSS.$$STA|$$END|$$TXT|$$LAE
' Line is now in $$LAE
LEN.$$LAE|$$RES
MBX.Line 10 is: $crlf$ $$LIN
```

Syntax

TXT.glp|P1|P2|P3
TXT.Get_Line_Position|P1|P2|P3

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Output)** Variable will contain the Start-Byte of the specified Line. If omitted, the result is placed on TOS.
P3 - **(Output)** Variable will contain the End-Byte of the specified Line. If omitted, the result is placed on TOS.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'*****************************************************
' EXAMPLE 1: TXT.glp

3.80.6.7 Get_Line_trimmed

MiniRobotLanguage (MRL)

TXT.glt
TXT.TXT.Get_Line_trimmed

Get Line with the specified Number from TXT.-internal Buffer into Variable and trim Spaces from both sides.

Intention

This command is used to get a specified Line from the Text that is in the Internal TXT-Buffer into a Variable.
It will also trim all Spaces and TAB's from both sides.
Variable P2 will contain the Line Nr. P1.

This Command can be used to work on a "Line by line" base through a file without accessing the file on the harddrive.

```
' Get Line Number $$NUM into $$LIN
$$NUM=10
TXT.glt|$$NUM|$$LIN
MBX.Line 10 is: $crlf$ $$LIN
```

Syntax

TXT.glt|P1[|P2]
TXT.Get_Line_trimmed|P1[|P2]

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Output)** Variable will contain the Line. If omitted, the line is placed on TOS.

Speed in Ticks:

This command uses typically around 250 Ticks.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gel
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
CFF.$$LAA|$$RES
TXT.lpt|$$RES|$$LAA
' Now we get only Line 5
TXT.glt|5|$$LIN
MBX.Line 5 is: $$LIN
ENR.
```

3.80.6.8 Get_Text_Block

MiniRobotLanguage (MRL)

TXT.Get_Text_Block
TXT.Gtb

Return a Part from the TXT.-internal Buffer into a Variable, specified with a Start- and End-Byte.

Intention

This command is used to get a specified Part from the Text that is in the Internal TXT-Buffer into a Variable.
Variable **P1** will contain the starting Byte number and **P2** will contain the last Byte number.

```
' Get Lines from 10 to 90 out of the TXT.-Buffer
TXT.gtb|10|900|$$LIS
PRT.$$LIS
MBX.!
```

Syntax

TXT.Gtb|P1|P2[|P3]
TXT.Get_Text_Block|P1|P2[|P3]

Parameter Explanation

P1 - **`(Input,numeric)`** Variable with starting Byte-Number.
P2 - **`(Input)`** Variable with the ending Byte-Number.
P3 - **`(Output)`** Variable for the result.

Example

```
'*******************************************************
'
'*******************************************************
```

3.80.6.9 Get_Text_Lines

MiniRobotLanguage (MRL)

TXT.Get_Text_Lines
TXT.Gtls

Return a number of Lines staring from the specified Line-Number to the second specified Line-Number from the TXT.-internal Buffer.

Intention

This command is used to get a specified Part from the Text that is in the Internal TXT-Buffer into a Variable.
Variable **P1** will contain the Line Nr. of the first Line, and **P2** will contain the Line-Number of the last line.

```
' Get Lines from 10 to 90 out of the TXT.-Buffer
TXT.gtls|10|90|$$LIS
PRT.$$LIS
MBX.!
```

Syntax

TXT.Gtls|P1|P2[|P3]
TXT.Get_Text_Lines|P1|P2[|P3]

Parameter Explanation

P1 - **(Input,numeric)** Variable with starting Line-Number.
P2 - **(Input)** Variable with the ending Line-Number.
P3 - **(Output)** Variable for the result.

Example

```
'******************************************************
'
'******************************************************
```

3.80.6.10 Get_To_End

MiniRobotLanguage (MRL)

TXT.gte
TXT.Get_to_End

Get all Text that is after a specified Line, including the specified line.

Intention

This command is used to get all Text that is after a specified Line, including the specified Line, from the Text that is in the Internal TXT-Buffer, into a Variable. Variable P2 will contain the result Text include and after the Line Nr. **P1**.

```
' Get all Text before Line 10 into $$LEF
$$NUM=10
TXT.gte|$$NUM|$$LEF
LEN.$$LEF|$$LEN
'JIV.$$LEN!238|Lab_failed
```

Syntax

TXT.gte|P1[|P2]
TXT.Get_to_End|P1[|P2]

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Output)** Variable will contain the Text. If omitted, the line is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gte
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA
' Get all Text after Line 10 into $$LEF
$$NUM=10
TXT.gte|$$NUM|$$LEF
LEN.$$LEF|$$LEN
MBX.Len of returned Text is:$$LEN
ENR.
```

3.80.6.11 Get_To_Start

MiniRobotLanguage (MRL)

TXT.gts
TXT.Get_to_Start

Get all Text that is before a specified Line, including the specified line.

Intention

This command is used to get all Text before a specified Line from the Text that is in the Internal TXT-Buffer, into a Variable.
It will include the specified Line itself. Variable P2 will contain the Text before and include the Line Nr. P1.

```
' Get all Text before Line 10 into $$LEF
$$NUM=10
TXT.gts|$$NUM|$$LEF
LEN.$$LEF|$$LEN
'JIV.$$LEN!238|Lab_failed
```

Syntax

TXT.gts|P1[|P2]
TXT.Get_to_Start|P1[|P2]

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Output)** Variable will contain the Text. If omitted, the line is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gts
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA
' Get all Text before Line 10 into $$LEF
$$NUM=10
TXT.gts|$$NUM|$$LEF
LEN.$$LEF|$$LEN
MBX.Len of returned Text is:$$LEN
```

3.80.6.12 Line_Start_End_by_Position

MiniRobotLanguage (MRL)

TXT.lsp
TXT.Line_Start_End_by_Position

Get Byte-Positions of Line Start and End using an Byte-Position as Input, from TXT.-internal Buffer into Variables.

Intention

This command is used to get the Byte-Positions of Start- and End of a specified Line,
from the Text that is in the Internal TXT-Buffer into Variables.
Unlike TXT.glp, it works from a Byte-Position. So you say "Byte 42" and the command will return the start- and End-Byte of the line,
that contains Byte 43. Variable **P2** will contain the Start-Byte of the Line. Variable **P3** will contain the Last-Byte of the Line before
and excluding the `$crlf$`.
This Command can be used to work on a Byte-Base through a file without accessing the file on the harddrive.

```
' Byte 35 is in Line 2
TXT.lnp|35|$$LAC
JIV.$$LAC!2|Lab_failed
' Get Line 2 Start and End-Position
TXT.glp|$$LAC|$$LAD|$$LAE
JIV.$$LAB!9|Lab_failed
JIV.$$LAC!56|Lab_failed
' Get Byte 35 Start and End-Position (of that Line containing
Byte 35)
TXT.lsp|35|$$LAB|$$LAC
JIV.$$LAB!9|Lab_failed
JIV.$$LAC!56|Lab_failed
ENR.
```

Syntax

TXT.lsp|P1|P2|P3
TXT.Line_Start_End_by_Position|P1|P2|P3

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **-** **`(Input,numeric)`** Variable with Byte Position.
P2 **-** **`(Output)`** Variable will contain the Start-Byte of the Line that contains this Byte. If omitted, the result is placed on TOS.
P3 **-** **`(Output)`** Variable will contain the End-Byte of the Line. If omitted, the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.glp
'*****************************************************
' Get Line Number $$NUM into $$LIN
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.lnp|100|$$LIN
TXT.lsp|100|$$STA|$$END
MBX.Byte 100 is in line $$LIN from: $$STA to $$END
ENR.
```

3.80.6.13 Linenumber_from_Position

MiniRobotLanguage (MRL)

TXT.lnp
TXT.Linenumber_from_Position

Get Line-Number in TXT.-internal Buffer from a Byte-Position.

Intention

This command is used to get a specified Line-Number from a Byte-Position, from the Text that is in the Internal TXT-Buffer.
Variable **P2** will contain the Line Nr. **P1** contains the Byte-Position.
For example, you have found something at Byte Postion 120 and now you want to know "Which Line is it?".
This Command can be used to work with Bytes on a "Line by line" base through a file without accessing the file on the harddrive.

```
' Get Line Number from byte 5
TXT.lnp|5|$$LAC
MBX.Byte 5 is in Line Nr.$$LAC
```

Syntax

TXT.lnp|P1[|P2]
TXT.Linenumber_from_Position|P1[|P2]

Parameter Explanation

P1 **-** **(Input,numeric)** Variable with Byte-Position.
P2 **-** **(Output)** Variable will contain the Line-Number.If omitted, the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gel
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA
$$BYT=5
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
TXT.lnp|$$BYT|$$LIN
' Now we get the Linenumber from the line that contains Byte 5
MBX.Byte 5 is in Line: $$LIN
ENR.
```

3.80.7.1 Delete_Characters

MiniRobotLanguage (MRL)

TXT.dch
TXT.Delete_Characters

Delete Text at the specified Byte-Position in the actual TXT.-Buffer.

Intention

This command is used to delete Bytes or Text from the internal Text-Buffer at any Position.
The Text is deleted and the remaining Text is moved up.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$POS=2
$$NUM=3
TXT.dch|$$POS|$$NUM
TXT.Save_File|$$OUT
ENR.
```

Result:

```
<DEFG>
<ABCDEFG>
<ABCDEFG>
```

Syntax

TXT.dch|P1|P2
TXT.Delete_Characters|P1|P2

Parameter Explanation

P1 **- (Input,Numeric)** Variable with Text that will be Inserted at Position **P2**.
P2 **- (Input,Numeric)** Variable with Line-Number, before which the Text will be inserted.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************************
' EXAMPLE 1: TXT.dch
'*****************************************************

3.80.7.2 Delete_Line

MiniRobotLanguage (MRL)

TXT.dli
TXT.Delete_Line

Delete a complete Line, including the $crlf$ at the end of the Line at the specified Position in the actual TXT.-Buffer.

Intention

This command is used to delete a complete Line, including the following `$crlf$` from the internal Text-Buffer.
The Line is deleted and the remaining Text is moved up.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<123456>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$POS=2
TXT.dli|$$POS
TXT.Save_File|$$OUT
ENR.
```

Result:

```
<ABCDEFG>
<ABCDEFG>
```

Syntax

TXT.dli|P1
TXT.Delete_Line|P1

Parameter Explanation

P1 - **`(Input,Numeric)`** Variable with Line-Number of Line that will be deleted.

Example

```
'*****************************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' EXAMPLE 1: TXT.dli
'*****************************************************
$$OUT=?exeloc\Result.txt

3.80.7.3 Delete_Lines

MiniRobotLanguage (MRL)

TXT.dls
TXT.Delete_Lines

Delete multiple Lines, including the $crlf$ at the end of the Lines, from Line P1 to Line P2.

Intention

This command is used to delete Lines, starting with Line **P1** until and including Line **P2**.
The Lines are deleted, including the following `$crlf$` and the remaining Text is moved up.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<123456>$crlf$<abcdefg>$crlf$
TXT.Load_Pure_Text|$$TXT
$$POS=2
$$NUM=3
TXT.dls|$$POS|$$NUM
TXT.Save_File|$$OUT
ENR.
```

Result:

```
<ABCDEFG>
```

Syntax

TXT.dls|P1|P2
TXT.Delete_Lines|P1|P2

Parameter Explanation

P1 **- (Input,Numeric)** Variable with Text that will be Inserted at Position **P2**.
P2 **- (Input,Numeric)** Variable with Line-Number, before which the Text will be inserted.

Example

```
'*****************************************************
```

3.80.7.4 Insert_Line_after_Line

MiniRobotLanguage (MRL)

TXT.ilal
TXT.Insert_Line_after_Line

Insert a Line after the specified Line in the actual TXT.-Buffer.

Intention

This command is used to Insert Bytes or Text into the internal Text-Buffer at any Position.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Line_after_Line|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

Result:

```
<ABCDEFG>
<ABCDEFG>
123
<ABCDEFG>
```

Syntax

TXT.ilal|P1|P2
TXT.Insert_Line_after_Line|P1|P2

Parameter Explanation

P1 - **`(Input,Text)`** Variable with Text that will be Inserted at Position **P2**.
P2 - **`(Input,Numeric)`** Variable with Line-Number, before which the Text will be inserted.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*****************************************************
' EXAMPLE 1: TXT.gal
'*****************************************************
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Line_after_Line|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

3.80.7.5 Insert_Line_at_End

MiniRobotLanguage (MRL)

TXT.ilae
TXT.Insert_Line_at_End

Insert a Line after the specified Line in the actual TXT.-Buffer.

Intention

This command is used to append the internal Text with - for example - an Footer.
In some cases you will want to add an `$crlf$` before the Footer so that its not appended to the last line.
Using this command a `$crlf$` will be automatically appended to the Footer-Text on the right side.
It will also append an `$crlf$` automatically to the Left side, if there is no `$crlf$` after the Text.
Therefore each call to this command will add a new Line.

Before:

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country
2	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
3	Ulrike	Nieter	– no bio	0,8	Germany
4	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany

```
$$HEA=Footer-Line
TXT.Insert_Line_at_End|$$HEA
```

After:

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country
2	Ulrike	Nieter	– no bio	0,8	Germany
3	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
4	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany
5	Footer-Line				

Syntax

TXT.ilae|P1
TXT.Insert_Line_at_End|P1

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **- `(Input,Text)`** Variable with Text that will be appended to the Text.

Example

```
'*****************************************************

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.7.6 Insert_Line_at_Pos

MiniRobotLanguage (MRL)

TXT.ilap
TXT.Insert_Line_at_Pos

Insert a Line (with an $crlf$ at the end) at the specified Byte-Position in the actual TXT.-Buffer.

Intention

This command is used to Insert a Text-Line including the needed `$crlf$` before and after the Text into the internal Text-Buffer at any Position.
Let say that you have the Text:

```
' Insert Text/Bytes at any Place inside the TXT.Buffer
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Line_at_Pos|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

then the result might look like this:

```
<
123
ABCDEFG>
<ABCDEFG>
<ABCDEFG>
```

Syntax

TXT.ilap|P1|P2
TXT.Insert_Line_at_Pos|P1|P2

Parameter Explanation

P1 **- (Input,Text)** Variable with Line that will be Inserted at Position **P2**. The `$crlf$` will be automatically appended.

© 2023 Theo Gottwald * https://www.smart-package.com

P2 **- `(Input,Numeric)`** Variable with Byte-Position, where the Text will be inserted. The Text that was before at this position will be moved to the right side.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.ilap
'*****************************************************
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Line_at_Pos|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

Remarks

-

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.7.7 Insert_Line_at_Start

MiniRobotLanguage (MRL)

TXT.ilas
TXT.Insert_Line_at_Start

Insert Text and $crlf$ before the actual TXT.-Buffer Content.

Intention

This command is used to prepend the internal Text with - for example - an Headline. An `$crlf$` will automatically be added to the Headline so that its not prepended to the first line.

Before:

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country
2	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
3	Ulrike	Nieter	– no bio	0,8	Germany
4	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany

```
$$HEA=Headline
TXT.Insert_Text_at_Start|$$HEA
```

After:

	A	B	C	D	E
1	Headline				
2	First name	Family name	Link bio	Lenght	Country
3	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
4	Ulrike	Nieter	– no bio	0,8	Germany
5	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany

Syntax

TXT.ilas|P1
TXT.Insert_Line_at_Start|P1

Parameter Explanation

P1 **-** **`(Input,Text)`** Variable with Text that will be prepended to the Text.

3.80.7.8 Insert_Line_before_Line

MiniRobotLanguage (MRL)

TXT.ilbl
TXT.Insert_Line_before_Line

Insert a Line before the specified Line in the actual TXT.-Buffer.

Intention

This command is used to Insert Bytes or Text into the internal Text-Buffer at a specified Line-Number Position.
A `$CRLF$` will automatically be appended to the Line.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Line_before_Line|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

Result:

```
<ABCDEFG>
123<ABCDEFG>
<ABCDEFG>
```

Syntax

TXT.ilbl|P1|P2
TXT.Insert_Line_before_Line|P1|P2

Parameter Explanation

P1 **-** **`(Input,Text)`** Variable with Text that will be Inserted at Position **P2**.
P2 **-** **`(Input,Numeric)`** Variable with Line-Number, before which the Text will be inserted.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************************
' EXAMPLE 1: TXT.gal
'*****************************************************
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Line_before_Line|$$HEA|$$POS

3.80.7.9 Insert_Text_after_Line

MiniRobotLanguage (MRL)

TXT.itbl
TXT.Insert_Text_after_Line

Insert Text after the specified Line in the actual TXT.-Buffer.

Intention

This command is used to Insert Bytes or Text into the internal Text-Buffer at any Position.

```
' Insert Text/Bytes at any Place inside the TXT.Buffer
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Text_after_Line|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

Result:

```
<ABCDEFG>
<ABCDEFG>123
<ABCDEFG>
```

Syntax

TXT.itbl|P1|P2
TXT.Insert_Text_after_Line|P1|P2

Parameter Explanation

P1 - **`(Input,Text)`** Variable with Text that will be Inserted at Position **P2**.
P2 - **`(Input,Numeric)`** Variable with Line-Number, after which the Text will be inserted.

3.80.7.10 Insert_Text_at_End

MiniRobotLanguage (MRL)

TXT.itae
TXT.Insert_Text_at_End

Insert Text after the actual TXT.-Buffer Content.

Intention

This command is used to append the internal Text with - for example - an Footer. In some cases you will want to add an `$crlf$` before the Footer so that its not appended to the last line.

Before:

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country
2	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
3	Ulrike	Nieter	– no bio	0,8	Germany
4	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany

```
$$HEA=Footer-Line
TXT.Insert_Text_at_End|$$HEA
```

After:

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country

3.80.7.11 Insert_Text_at_Pos

MiniRobotLanguage (MRL)

TXT.itap
TXT.Insert_Text_at_Pos

Insert Text at the specifies Byte-Position in the actual TXT.-Buffer.

Intention

This command is used to Insert Bytes or Text into the internal Text-Buffer at any Position.
After each Line there are 2 Byte with `$crlf$` that delimit the Lines.
These will also be counted for the Pos.-Value.

```
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=4
TXT.Insert_Text_at_pos|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

```
Result is:
```

```
<AB123CDEFG>
<ABCDEFG>
<ABCDEFG>
```

Syntax

TXT.itap|P1|P2
TXT.Insert_Text_at_Pos|P1|P2

Parameter Explanation

P1 **- `(Input,Text)`** Variable with Text that will be Inserted at Position **P2**.
P2 **- `(Input,Numeric)`** Variable with Byte-Position, where the Text will be inserted. The Text that was before at this position will be moved to the right side.

3.80.7.12 Insert_Text_at_Start

MiniRobotLanguage (MRL)

TXT.itas
TXT.Insert_Text_at_Start

Insert Text before the actual TXT.-Buffer Content.

Intention

This command is used to prepend the internal Text with - for example - an Headline. In most cases you will want to add an `$crlf$` to the Headline so that its not prepended to the first line.

Before:

	A	B	C	D	E
1	First name	Family name	Link bio	Lenght	Country
2	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
3	Ulrike	Nieter	– no bio	0,8	Germany
4	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany

```
' Get all Text before Line 10 into $$LEF
$$HEA=Headline$crlf$
TXT.Insert_Text_at_Start|$$HEA
```

After:

	A	B	C	D	E
1	Headline				
2	First name	Family name	Link bio	Lenght	Country
3	Ernst-Adrian	von Dörnber	Ernst-Adrian	4,00E-02	Germany
4	Ulrike	Nieter	– no bio	0,8	Germany
5	Wolfgang	Riehle	Wolfgang Rie	2,00E+04	Germany

Syntax

TXT.itas|P1
TXT.Insert_Text_at_Start|P1

Parameter Explanation

P1 - **`(Input,Text)`** Variable with Text that will be prepended to the Text.

3.80.7.13 Insert_Text_before_Line

MiniRobotLanguage (MRL)

TXT.itbl
TXT.Insert_Text_before_Line

Insert Text before the specified Line in the actual TXT.-Buffer.

Intention

This command is used to Insert Bytes or Text into the internal Text-Buffer at any Position.

```
' Insert Text/Bytes at any Place inside the TXT.Buffer
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Text_before_Line|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

Result:

```
<ABCDEFG>
123<ABCDEFG>
<ABCDEFG>
```

Syntax

TXT.itbl|P1|P2
TXT.Insert_Text_before_Line|P1|P2

Parameter Explanation

P1 **-** **`(Input,Text)`** Variable with Text that will be Inserted at Position **P2**.
P2 **-** **`(Input,Numeric)`** Variable with Line-Number, before which the Text will be inserted.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************************
' EXAMPLE 1: TXT.gal
'*****************************************************
$$OUT=?exeloc\Result.txt
$$TXT=<ABCDEFG>$crlf$<ABCDEFG>$crlf$<ABCDEFG>$crlf$
TXT.Load_Pure_Text|$$TXT
$$HEA=123
$$POS=2
TXT.Insert_Text_before_Line|$$HEA|$$POS
TXT.Save_File|$$OUT
ENR.
```

3.80.7.14 Set_Line_to

MiniRobotLanguage (MRL)

TXT.slt
TXT.Set_Line_to

Replace a Line with the specified Number from the TXT.-internal Buffer with a new Line.

Intention

This command is used to get a specified Line from the Text that is in the Internal TXT-Buffer into a Variable.
Variable P2 will contain the Line Nr. P1.

This Command can be used to work on a "Line by line" base through a file without accessing the file on the harddrive.

```
' Change Line Number $$NUM into $$NEW
$$NUM=10
VAR.$$NEW=Hallo
TXT.gel|$$NUM|$$LIN
MBX.Line 10 is: $crlf$ $$LIN
TXT.slt|$$NUM|$$NEW
TXT.gel|$$NUM|$$LIN
MBX.Line 10 is: $crlf$ $$LIN
```

Syntax

TXT.slt|P1|P2
TXT.Set_Line|P1|P2
TXT.Set_Line_to|P1|P2

Parameter Explanation

P1 - **(Input,numeric)** Variable with Line-Number.
P2 - **(Input)** Variable with the new Line that is going to replace the current line.

Example

```
'*************************************************
' EXAMPLE 1: TXT.gel
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************************
' Change Line Number $$NUM into $$NEW
$$NUM=10
VAR.$$NEW=Hallo
TXT.gel|$$NUM|$$LIN
MBX.Line 10 is: $crlf$ $$LIN
TXT.slt|$$NUM|$$NEW
TXT.gel|$$NUM|$$LIN
MBX.Line 10 is: $crlf$ $$LIN
ENR.
```

3.80.7.15 Set_Text_Lines

MiniRobotLanguage (MRL)

TXT.stl
TXT.Set_Text_Lines

Replace a number of Lines with the P3

Intention

This command is used to replace a block of Text-Lines from (and including) Line **P1** to (and including) Line **P2** with the content of **P3**.

```
' Untested
```

Syntax

```
TXT.stl|P1|P2|P3
TXT.Set_Text_Lines|P1|P2|P3
```

Parameter Explanation

P1 - **`(Input,numeric)`** Variable with Line-Number of the first Line that will be replaced.
P2 - **`(Input,numeric)`** Variable with Line-Number of the last Line that will be replaced.
P2 - **`(Input)`** Variable with the new Lines or Text that will be inserted.

Example

```
'*******************************************************
'
'*******************************************************
```

3.80.8 Load / Save Commands

Geben Sie hier den Text ein.

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.8.1 Clear

MiniRobotLanguage (MRL)

TXT.clr
TXT.Clear

Clear the internal Buffer where a file was loaded with TXT.ltf

Intention

This command is used to clear the internal Buffer, into which a Textfile was loaded, using the TXT.ltf-Command.
This command will just free the memory that was used to store the Textfile.
You do not need to use this command, as the SPR will freee all memory automatically:
- when you load a new file into the Buffer
- when the Script and the SPR-ends.

```
' Load Textfile into intrnal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
MBX.Operation was succesfull: $$RES
TXT.Clear
```

Syntax

TXT.clr
TXT.Clear

Parameter Explanation

```
Does not need any Parameters
```

Example

```
'*****************************************************
' EXAMPLE 1: TXT.ltf  and TXT.clr and TXT.gtl
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
TXT.ltf|$$LAA|$$RES
TXT.clr
TXT.gtl|$$LAB
JIV.$$LAB!0|Lab_failed
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

See also:

3.80.8.2 Load Text File

MiniRobotLanguage (MRL)

TXT.ltf
TXT.Load_Textfile

Load a Textfile into the internal Buffer for further Operations using other TXT.-Commands

Intention

This command is used to load a Textfile into the internal Buffer of the TXT.-Commands.
From there you can do all sorts of operations on the file without accessing the harddrive.

```
' Load Textfile into intrnal Buffer for further TXT.-Command
Operations
'$$RES is 0 in case of error
' returns number of loaded lines in case of success
TXT.Load_Textfile|$$FIL|$$RES
MBX.Operation was succesfull, Lines loaded: $$RES
```

Syntax

TXT.ltf|P1[|P2]
TXT.Load_Textfile|P1[|P2]

Parameter Explanation

P1 - Filename and Path of the Textfile to load.

P2 - **(Output)** Variable with the result of the operation.
On error a "0" is returned also the Timeout-Flag is set.
On succes, the number of loaded lines is returned.
If omitted the result is placed on TOS.

Speed in Ticks:

This command depends heavily on teh general file-system speed and the size of the Textfile. The command uses typically around 2500 Ticks with a small Textfile.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'*****************************************************
' EXAMPLE 1: TXT.ltf  and TXT.gpt and TXT.gtl
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
TXT.gpt|$$RES
VAN.$$LAB=0
LEN.$$RES|$$LAB
JIV.$$LAB!1040|Lab_failed
VAN.$$LAC=0
TXT.gtl|$$LAC
JIV.$$LAB!1040|Lab_failed
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.8.3 Load Unicode_File

MiniRobotLanguage (MRL)

TXT.luf
TXT.Load_Unicode_File

Load a Unicode-Textfile into the internal Buffer and convert to ANSI for further Operations using other TXT.-Commands

Intention

This command is used to load a Unicode-Textfile - for example a ".msg"-file - into the internal Buffer of the TXT.-Commands.
It will also convert the file to ANSI-Characterset, so it can be used like a normal ANSI-File.
From there you can do all sorts of operations on the file.
You can later use the "TXT.sau" Command to save it as Unicode back to the original Filename
Please note that due the nature of this process, some international characters may get lost.

```
' Load Unicode-Textfile into internal Buffer for further TXT.-
Command Operations
'$$RES is 0 in case of error
' returns number of loaded lines in case of success
TXT.Load_Unicode_File|$$FIL|$$RES
MBX.Operation was succesfull, Lines loaded: $$RES
```

Syntax

TXT.luf|P1[|P2]
TXT.Load_Unicode_File|P1[|P2]

Parameter Explanation

P1 - Filename and Path of the Textfile to load.

P2 - **(Output)** Variable with the result of the operation.
On error a "0" is returned also the Timeout-Flag is set.
On succes, the number of loaded lines is returned.

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
    If omitted the result is placed on TOS.
```

Example

```
'*****************************************************
' EXAMPLE 1: TXT.ltf  and TXT.gpt and TXT.gtl
'*****************************************************
VAR.$$LAA=?path\..\Pics\Outlook.msg
TXT.luf|$$LAA|$$RES
TXT.gpt|$$TXT
PRT.$$TXT
MBX.Ready
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

See also:

3.80.8.4 Save_as_Unicode

MiniRobotLanguage (MRL)

TXT.sau
TXT.Save_as_Unicode

Load a Unicode-Textfile into the internal Buffer and convert to ANSI for further Operations using other TXT.-Commands

Intention

This command is used to save the TXT%.-internal Buffer as a Unicode-Textfile - for example a ".msg"-file.
It will not do any changes to the internal FIle, just save it as Unicode.
If you convert files from Unicode to ANSI and back, please note that due the nature of this process, some international characters may get lost.

```
' Load Unicode-Textfile into internal Buffer for further TXT.-
Command Operations
TXT.Save_as_Unicode|$$FIL
MBX.Operation was succesfull, Result: $tos$
```

Syntax

TXT.sau|P1[|P2]
TXT.Save_as_Unicode|P1[|P2]

Parameter Explanation

P1 **-** ***(Input, optional)*** Filename and Path of the Textfile to Save it to. If omitted the original filename where it was loaded is been used.

P2 **-** **(Output)** Variable with the result of the operation. On error a "0" is returned also the Timeout-Flag is set.
On succes, the number of loaded lines is returned. If omitted the result is placed on TOS.

TOS: Calling TXT.SAV will leave a 0 or a 1 on the TOS that will show if the Operation was successful (1) or failure (0).

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*****************************************************
' EXAMPLE 1: TXT.luf  and TXT.sau
'*****************************************************
VAR.$$LAA=?path\..\Pics\Outlook.msg
TXT.sau|$$LAA
TXT.gpt|$$TXT
PRT.$$TXT
MBX.Ready
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

See also:

- !TXT. - Text File Engine 3252

3.80.8.5 Save_File

MiniRobotLanguage (MRL)

TXT.Sav
TXT.Save
TXT.Save_File

Save the TXT.-internal Buffer into the file where it was loaded, or to a specified File-Path.

Intention

This command is used to save the internally stored file back to the Harddrive.
Default it will use the same Filename with which it has originally been loaded.
As the internal File can be changed with several commands, this is a way to cahnge Files "In Memory" in a very fast way.

```

ITO.
  GTO.Lab_failed
EIF.
```

Syntax

TXT.Sav[|P1]
TXT.Save[|P1]
TXT.Save_File[|P1]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **- (Input)** Variable with the Filename and Path where the Textfile shall be saved.

If omitted, the same Path where the file was loaded is used, previous version is overwritten without asking..

Example

```
'******************************************************
' EXAMPLE 1: TXT.tov  and TXT.fov etc.
'******************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
TXT.sav|$$LAA
WFF.$$LAA|10
 ITO.
   GTO.Lab_failed
 EIF.
 DEL.$$LAA
 WFF.<>$$LAA
 PAU.0.1
 TXT.Save_File
 WFF.$$LAA|10
 ITO.
   GTO.Lab_failed
 EIF.
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.9.1 Append_from_Internal

MiniRobotLanguage (MRL)

TXT.afi
TXT.Append_from_Internal

Append the Content of an internal Place that is numbered from 0 to 9 to the TXT.-internal Buffer.

Intention

This command is used to Append either the TXT.-Buffer or a specified Variable to the specified Memory (0-9).
Later the whole Memory can be restored using the `TXT.Pop_Intern` or the `TXT.Pop_Keep` - Command.
The Content of the TXT.-Buffer will NOT be changed using this Command.

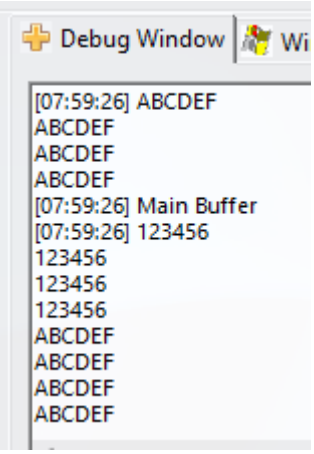
```
' Generate 5 Lines of Text A
$$TXA=ABCDEF$crlf$
$$TXB=$$TXA$$TXA$$TXA$$TXA
' Generate 5 Lines of Text B
$$TXC=123456$crlf$
$$TXD=$$TXC$$TXC$$TXC$$TXC

' Load first Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXB
' Save Reserve to internal Memory Place "0"
TXT.Push_Intern|0

' Load second Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXD

' Append it
TXT.afi|0
DBP.Internal Memory 0
TXT.dbp|0
DBP.Main Buffer
TXT.dbp
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

TXT.afi[|P1]
TXT.Append_from_Internal[|P1]

Parameter Explanation

P1 **-** **(Input)** Number or Variable with number of Internal Memory. Can be any Number between 0 and 9.
If omitted the place "0" is used.

P2 **-** **(Input,optional)** Text. If given this will be appended to the Internal Memory. If omitted the current TXT-Buffer will be appended.

Example

```
'******************************************************
'
'******************************************************
```

Remarks

3.80.9.2 Append_to_Internal

MiniRobotLanguage (MRL)

TXT.api
TXT.Append_to_Internal

Append the Content of the TXT.-internal Buffer to an internal Place that is numbered from 0 to 9.

Intention

This command is used to Append either the TXT.-Buffer or a specified Variable to the specified Memory (0-9).
Later the whole Memory can be restored using the `TXT.Pop_Intern` or the `TXT.Pop_Keep` - Command.
The Content of the TXT.-Buffer will NOT be changed using this Command.

```
' Generate 5 Lines of Text A
$$TXA=ABCDEF$crlf$
$$TXB=$$TXA$$TXA$$TXA$$TXA
' Generate 5 Lines of Text B
$$TXC=123456$crlf$
$$TXD=$$TXC$$TXC$$TXC$$TXC

' Load first Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXB

' Save Reserve to internal Memory Place "0"
TXT.Push_Intern|0

' Load second Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXD

' Append it to first Text
TXT.api|0
TXT.dbp|0
ENR.
```

Syntax

TXT.api[|P1]
TXT.Append_to_Internal[|P1]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **- (Input)** Number or Variable with number of Internal Memory. Can be any Number between 0 and 9.
If omitted the place "0" is used.

P2 **- (Input,optional)** Text. If given this will be appended to the Internal Memory. If omitted the current TXT-Buffer will be appended.

Example

```
'******************************************************
'
'******************************************************
```

- TXT.Get_Filename 3470
- TXT.Get_Lenght 3472

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.9.3 Clear_Intern

MiniRobotLanguage (MRL)

TXT.Cls
TXT.Clear_Intern

Clear the internal Places that may contain TXT.-Buffer-Backups and that are numbered from 0 to 9.
You can specify a number to clear that specified place. If you specify no number all places are cleared.

Intention

This command is used to clear those internal storage-places that are numbered from 0 to 9.
You can specify a number to clear that specified place. If you specify no number all places are cleared.

```
' Load Textfile into internal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
' Reserve speichern
TXT.Puk|1
' We have now a Backup of the Textfile in Internal Storage
"1".
' It can be restored - overwriting the current Buffer-Content
using:
TXT.Pop|1
' Clear all internal places
TXT.cls
```

Syntax

TXT.Cls[|P1]
TXT.Clear_Intern[|P1]

Parameter Explanation

P1 **- (Input)** Number or Variable with number. Can be any Number between 0 and 9.
If omitted all internal places are cleared.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*******************************************************
'
'*******************************************************
```

Remarks

-

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.9.4 Pop_Intern

MiniRobotLanguage (MRL)

TXT.Pop
TXT.Pop_Intern

Get the TXT.-internal Buffer from an internal Place that is numbered from 0 to 9.
The Content of the internal Place will be cleared.

Intention

This command is used to restore a complete Backup of the currently loaded Text from an internal Variable that is numbered from 0 to 9.
Therefore the Text must have been "saved" using the `TXT.Push_Intern` or the `TXT.Push_Keep` - Command.
The Content of the internal Place will be cleared after it was moved back into TXT.-Buffer.

```
' Load Textfile into internal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
' Reserve speichern
TXT.Pus|1
' We have now a Backup of the Textfile in Internal Storage
"1".
' It can be restored - overwriting the current Buffer-Content
using:
TXT.Pop|1
```

Syntax

TXT.Pop[|P1]
TXT.Pop_Intern[|P1]

Parameter Explanation

P1 **- (Input)** Number or Variable with number. Interger Number between 0 and 9.
If omitted the place "0" is used.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*******************************************************
'
'*******************************************************
```

Remarks

TXT.Pop is much faste compared with TXT.tov. Therefore in Scripts that should run as fast as possible,
this command is the better choice.

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.9.5 Pop_Keep

MiniRobotLanguage (MRL)

TXT.Pok
TXT.Pop_Keep

Copy the TXT.-internal Buffer from an internal Place that is numbered from 0 to 9.
The Content of the internal Place will not be altered.

Intention

This command is used to restore a complete Backup of the currently loaded Text from an internal Variable that is numbered from 0 to 9.
Therefore the Text must have been "saved" using the `TXT.Push_Intern` or the `TXT.Push_Keep` - Command.
The Content of the internal Place will not be altered, after it was moved back into TXT.-Buffer.

```
' Load Textfile into internal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
' Reserve speichern
TXT.Pus|1
' We have now a Backup of the Textfile in Internal Storage
"1".
' It can be restored - overwriting the current Buffer-Content
using:
TXT.Pop|1
```

Syntax

TXT.Pok[|P1]
TXT.Pop_Keep[|P1]

Parameter Explanation

P1 **- (Input)** Number or Variable with number. Can be any Number between 0 and 9.
If omitted the place "0" is used.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*******************************************************
'
'*******************************************************
```

3.80.9.6 Prepend_from_Internal

MiniRobotLanguage (MRL)

TXT.pfi
TXT.Prepend_from_Internal

Prepend the Content of an internal Place that is numbered from 0 to 9 to the TXT.-internal Buffer.

Intention

This command is used to Prepend either the TXT.-Buffer or a specified Variable to the specified Memory (0-9).
Later the whole Memory can be restored using the `TXT.Pop_Intern` or the `TXT.Pop_Keep` - Command.
The Content of the TXT.-Buffer will NOT be changed using this Command.

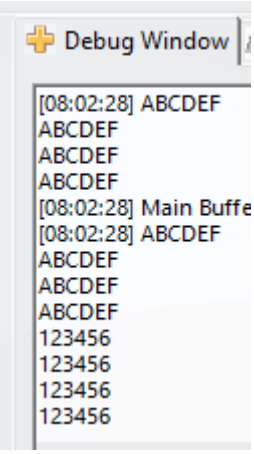
```
' Generate 5 Lines of Text A
$$TXA=ABCDEF$crlf$
$$TXB=$$TXA$$TXA$$TXA$$TXA
' Generate 5 Lines of Text B
$$TXC=123456$crlf$
$$TXD=$$TXC$$TXC$$TXC$$TXC

' Load first Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXB
' Save Reserve to internal Memory Place "0"
TXT.Push_Intern|0

' Load second Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXD

' Append it
TXT.pfi|0
DBP.Internal Memory 0
TXT.dbp|0
DBP.Main Buffer
TXT.dbp
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com



Syntax

TXT.pfi[|P1]
TXT.Prepend_from_Internal[|P1]

Parameter Explanation

P1 **-** **(Input)** Number or Variable with number of Internal Memory. Can be any Number between 0 and 9.
If omitted the place "0" is used.

P2 **-** **(Input,optional)** Text. If given this will be appended to the Internal Memory. If omitted the current TXT-Buffer will be appended.

Example

```
'******************************************************
'
'******************************************************
```

3.80.9.7 Prepend_to_Internal

MiniRobotLanguage (MRL)

TXT.Ppi
TXT.Prepend_to_Internal

The Content of the TXT.-Buffer will be prepended to the Text that is already stored in the internal Memory.

Intention

This command is used to prepend either the TXT.-Buffer or a specified Variable to the specified Memory (0-9).
Later the whole Memory can be restored using the `TXT.Pop_Intern` or the `TXT.Pop_Keep` - Command.
The Content of the TXT.-Buffer will NOT be changed using this Command.

```
' Generate 5 Lines of Text A
$$TXA=ABCDEF$crlf$
$$TXB=$$TXA$$TXA$$TXA$$TXA
' Generate 5 Lines of Text B
$$TXC=123456$crlf$
$$TXD=$$TXC$$TXC$$TXC$$TXC

' Load first Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXB

' Save Reserve to internal Memory Place "0"
TXT.Push_Intern|0

' Load second Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXD

' Prepend it to first Text
TXT.ppi|0
TXT.dbp|0
ENR.
```

Syntax

TXT.Ppi[|P1]
TXT.Prepend_to_Internal[|P1]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **- (Input)** Number or Variable with number of Internal Memory. Can be any Number between 0 and 9.
If omitted the place "0" is used.

P2 **- (Input,optional)** Text. If given this will be appended to the Internal Memory. If omitted the current TXT-Buffer will be appended.

Example

```
'******************************************************
'
'******************************************************
```

3.80.9.8 Push_Intern

MiniRobotLanguage (MRL)

TXT.Pus
TXT.Push_Intern

Move the Content of the TXT.-internal Buffer into a internal Place that is numbered from 0 to 9.
The Content of the TXT.-Buffer will be deleted after the Content has been moved.

Intention

This command is used to make a complete Backup of the currently loaded Text into an internal Variable that is numbered from 0 to 9.
Therefore the Text can be restored using the `TXT.Pop_Intern` or the `TXT.Pop_Keep` - Command.
The Content of the TXT.-Buffer will be cleared after the Content has been moved to the internal place.

```
' Load Textfile into internal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
' Reserve speichern
TXT.Push_Keep|0
' We have now a Backup of the Textfile in internal Place "0".
' It can be restored - overwriting the current Buffer-Content
using:
TXT.Pop_Keep|$$LAD
```

Syntax

TXT.Pus[|P1]
TXT.Push_Intern[|P1]

Parameter Explanation

P1 **- (Input)** Number or Variable with number. Can be any Number between 0 and 9.
If omitted the place "0" is used.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*******************************************************

3.80.9.9 Push_Keep

MiniRobotLanguage (MRL)

TXT.Puk
TXT.Push_Keep

Copy the TXT.-internal Buffer into a internal Place that is numbered from 0 to 9.
The Content of the TXT.-Buffer will not be altered.

Intention

This command is used to make a complete Backup of the currently loaded Text into an internal Variable that is numbered from 0 to 9.
Therefore the Text can be restored using the `TXT.Pop_Intern` or the `TXT.Pop_Keep` - Command.
The Content of the TXT.-Buffer will be unchanged, after the Content has been copied to the internal place.

```
' Load Textfile into internal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
' Reserve speichern
TXT.Push_Keep|0
' We have now a Backup of the Textfile in internal Place "0".
' It can be restored - overwriting the current Buffer-Content
using:
TXT.Pop_Keep|$$LAD
```

Syntax

TXT.Puk[|P1]
TXT.Push_Keep[|P1]

Parameter Explanation

P1 **- (Input)** Number or Variable with number. Can be any Number between 0 and 9.
If omitted the place "0" is used.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.10 To LOF / To Var

Geben Sie hier den Text ein.

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.10.1 From_Var

MiniRobotLanguage (MRL)

TXT.fov
TXT.From_Var

Restore the TXT.-internal Buffer from a Variable using an internal Format, that includes additional Informations, like the Filenname.

Intention

This command is used to restore the Internal TXT-Buffer "as if the file would have been loaded".
The content of the Variable must be created with the `TXT.To_Var` or the `To_Var_and_Clear` Command.
This Command-Set can be used to quickly switch between several Text-Files without loading them each time new from the harddrive.

```
' Load Textfile into internal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
' Reserve speichern
TXT.toc|$$LAD
' We have now a Backup of the Textfile in $$LAD.
' It can be restored - overwriting the current Buffer-Content
using:
TXT.fov|$$LAD
```

To transfer pure Text from a Variable into the Buffer, use the Command `TXT.Load_Pure_Text`.

Syntax

TXT.fov|P1
TXT.from_Var|P1

Parameter Explanation

P1 **-** **`(Input)`** Variable with the Textfile, this one must have been created using the `tov` or `toc`-command.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*****************************************************
' EXAMPLE 1: TXT.tov  and TXT.fov etc.
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
' Reserve speichern
TXT.toc|$$LAD
' We have now a Backup of the Textfile in $$LAD.
' It can be restored - overwriting the current Buffer-Content using:
TXT.fov|$$LAD
ENR.

'*****************************************************
' EXAMPLE 2: TXT.tov  and TXT.fov etc.
' Subprogram that removes Columns
'*****************************************************
:Lab_Remove_Cols
$$FIK=?exeloc\Test.txt
$$LIA="Q","M","K","I","H",F"
TXT.toc|$$BAK
TXT.Load_pure_Text|$$PAA|$$FIK
TXT.Delimited_Items_Remove|;|$$LIA
TXT.Get_pure_Text|$$PAA
TXT.fov|$$BAK
TXT.Get_Line_Count|$$NUL
RET.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

3.80.10.2 Get_from_LOF

MiniRobotLanguage (MRL)

TXT.gfl
TXT.Get_from_LOF

Restore the TXT.-internal Buffer from the File that was loaded with the LOF. 1063-Command
that includes additional Informations, like the Filenname.

Intention

This command is used to restore the Internal TXT-Buffer "as if the file would have been loaded" it takes the file and additional Informations from the LOF.-Command 1063.
As the LOF-Command can hold up to 128 Textfiles "in Memory", you will need to specify the "Index number" which the LOF.-Command has assigned to that file at Loading-Time.
The Text-File and Data will be transfered into the TXT.-internal Buffer. The LOF.-Buffer will be cleared!

```
$$MSG=Teste "to_lof"
' Clear LOF:-Buffer
LOF.!$$IND
LFT.$$IND|-1|$$LAB
JNZ.$$LAB|Lab_failed

' Transfer Text to LOF.-Buffer, clear TXT.-Buffer
TXT.tol|$$IND
LFT.$$IND|-1|$$RES
JIV.$$RES!20|Lab_failed

' Restore TXT.-Buffer from LOF.-Buffer, clear LOF.-Buffer
TXT.gfl|$$IND
TXT.gtl|$$LAB
JIV.$$LAB!1040|Lab_failed
```

Syntax

TXT.gfl|P1
TXT.Get_from_LOF|P1

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **- (Input)** Variable with the LOF-INDEX-Number of the Textfile that shall be transfered.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.tol  and TXT.gfl etc.
'*****************************************************
$$MSG=Teste "to_lof"
' Clear LOF:-Buffer
LOF.!$$IND
LFT.$$IND|-1|$$LAB

' Transfer Text to LOF.-Buffer, clear TXT.-Buffer
TXT.tol|$$IND
LFT.$$IND|-1|$$RES

' Restore TXT.-Buffer from LOF.-Buffer, clear LOF.-Buffer
TXT.gfl|$$IND
TXT.gtl|$$LAB
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.
The way the lines are delimited should be $crlf$, in some cases the loader will convert $cr or $lf-files to $crlf$ files.
To properly work with these commands, make sure that you work with this type of files that are $crlf$ delimited.

Limitations:

-

3.80.10.3 Get_pure_Text

MiniRobotLanguage (MRL)

TXT.gpt
TXT.Get_pure_Text

Copy the TXT.-internal Buffer into two Variables using normal Text-Format in Variable 1,
and the Filename in Variable 2.

Intention

This command is used to get the Text that is in the Internal TXT-Buffer into 2 Variables.
Variable P1 will contain the "pure Text". Variable P2 will receive the filename and Path.

This Command-Set can be used together with `TXT.lpt` to quickly switch between several Text-Files
without loading them each time new from the harddrive.

```
CFF.$$FIL|$$RES
' Load Pure Text
TXT.lpt|$$RE|$$FIL
' get Pure Text
TXT.gpt|$$RES|$$FIL
```

Syntax

TXT.gpt|P1[|P2]
TXT.Get_pure_Text|P1[|P2]

Parameter Explanation

P1 - **(Output)** Variable with the Textfile.
P2 - **(Output)** Variable will contain the Path and FIlename.

Example

```
'*****************************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' EXAMPLE 1: TXT.lpt  and TXT.fov etc.
'*************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
CFF.$$LAA|$$RES
TXT.lpt|$$RES|$$LAA
TXT.gfn|$$LAB
NVC.$$LAB=Test.txt
  GTO.Lab_failed
EIF.
TXT.gtl|$$LAB
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

See also:

- TXT.Load Textfile 3418

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.10.4 Load_pure_Text

MiniRobotLanguage (MRL)

TXT.lpt
TXT.Load_pure_Text

Restore the TXT.-internal Buffer from two Variables using normal Text-Format in Variable 1,
and the Filename in Variable 2.

Intention

This command is used to set the Internal TXT-Buffer "as if the file would have been loaded" from 2 Variables.
Variable P1 must be the "pure Text". Variable P2 must contain the filename and Path.
The content of the Variable can be created with the `TXT.gpt` or the `Get_pure_Text` Command.
Or it can just be an Text that was loaded with CFF. and the filename and Path in Variable P2.
This Command-Set can be used to quickly switch between several Text-Files without loading them each time new from the harddrive.

```
CFF.$$FIL|$$RES
' Load Pure Text
TXT.lpt|$$RE|$$FIL
' get Pure Text
TXT.gpt|$$RES|$$FIL
```

Syntax

TXT.lpt|P1|P2
TXT.Load_pure_Text|P1|P2

Parameter Explanation

P1 **-** **`(Input)`** Variable with the Textfile, this one must have been created using the `tov` or `toc`-command.

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'*****************************************************
' EXAMPLE 1: TXT.lpt  and TXT.fov etc.
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
CFF.$$LAA|$$RES
TXT.lpt|$$RES|$$LAA
TXT.gfn|$$LAB
NVC.$$LAB=Test.txt
  GTO.Lab_failed
EIF.
TXT.gtl|$$LAB
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.10.5 To_LOF

MiniRobotLanguage (MRL)

TXT.tol
TXT.To_LOF

Move the TXT.-internal Buffer to the Buffer of the LOF. 1063-Command that includes additional Informations, like the Filenname. Clear TXT.-Buffer.

Intention

This command is used to transfer (move) the TXT-Buffer "as if the file would have been loaded" into the specified Buffer of the LOF.-Command 1063.
As the LOF-Command can hold up to 128 Textfiles "in Memory", you will need to specify the "Index number" which shall be used.
The Text-File and Data will be transfered into the LOF-Buffer. The TXT.-internal -Buffer will be cleared!
If you use a LOF.-Buffer-Inde4x that is already "in use", the file that was loaded with LOF. will be lost and replaced with the File that is transfered from the TXT.-Buffer.
The Index-Numbers for the LOF.-internal FIle-Cache are in the range from 1 to 128, so i recommend that you just pick a free number out of these if you need to use a new Index--Number.
Possibly in many cases you may just use the same number that was used to transfer the file from LOF. into the TXT.-Buffer.

```
$$MSG=Teste "to_lof"
' Clear LOF:-Buffer
LOF.!$$IND
LFT.$$IND|-1|$$LAB
JNZ.$$LAB|Lab_failed

' Transfer Text to LOF.-Buffer, clear TXT.-Buffer
TXT.tol|$$IND
LFT.$$IND|-1|$$RES
JIV.$$RES!20|Lab_failed

' Restore TXT.-Buffer from LOF.-Buffer, clear LOF.-Buffer
TXT.gfl|$$IND
TXT.gtl|$$LAB
JIV.$$LAB!1040|Lab_failed
```

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

TXT.tol|P1
TXT.To_LOF|P1

Parameter Explanation

P1 **- (Input)** Variable with the LOF-INDEX-Number where the Textfile that shall be transfered to.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.tol  and TXT.gfl etc.
'*****************************************************
$$MSG=Teste "to_lof"
' Clear LOF:-Buffer
LOF.!$$IND
LFT.$$IND|-1|$$LAB

' Transfer Text to LOF.-Buffer, clear TXT.-Buffer
TXT.tol|$$IND
LFT.$$IND|-1|$$RES

' Restore TXT.-Buffer from LOF.-Buffer, clear LOF.-Buffer
TXT.gfl|$$IND
TXT.gtl|$$LAB
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.
The way the lines are delimited should be $crlf$, in some cases the loader will convert $cr or $lf-files to $crlf$ files.
To properly work with these commands, make sure that you work with this type of files that are $crlf$ delimited.

Limitations:

3.80.10.6 To_Var

MiniRobotLanguage (MRL)

TXT.tov
TXT.To_Var

Copy the TXT.-internal Buffer into a Variable
in a internal Format, that includes additional Informations, like the Filenname

Intention

This command is used to make a complete Backup of the currently loaded Text into a Variable.
Therefore the Text can be restored using the `TXT.From_Var`-Command.

```
' Load Textfile into internal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
' Reserve speichern
TXT.tov|$$LAD
' We have now a Backup of the Textfile in $$LAD.
' It can be restored - overwriting the current Buffer-Content
using:
TXT.fov|$$LAD
```

Syntax

TXT.tov|P1
TXT.To_Var|P1

Parameter Explanation

P1 - **(Output)** Variable with the result of the operation.
On error a "" is returned also the Timeout-Flag is set.
On success, the Lenght in Bytes/Charcters of the currently loaded file is been returned.
If omitted the result is placed on TOS.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*****************************************************
' EXAMPLE 1: TXT.ltf  and TXT.gtl etc.
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
' Reserve speichern
TXT.tov|$$LAD
' We have now a Backup of the Textfile in $$LAD.
' It can be restored - overwriting the current Buffer-Content
using:
TXT.fov|$$LAD
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.10.7 To_Var_and_Clear

MiniRobotLanguage (MRL)

TXT.toc
TXT.To_Var_and_Clear

Move the TXT.-internal Buffer into a Variable using an internal Format, that includes additional Informations, like the Filenname

Intention

This command is used to make a complete Backup of the currently loaded Text into a Variable.
After doing so, it will call the TXT.Clear-Command to clear the internal Buffer.
However the Text can be restored using the `TXT.From_Var`-Command.

```
' Load Textfile into internal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
' Reserve speichern
TXT.toc|$$LAD
' We have now a Backup of the Textfile in $$LAD.
' It can be restored - overwriting the current Buffer-Content
using:
TXT.fov|$$LAD
```

Syntax

TXT.toc|P1
TXT.To_Var_and_Clear|P1

Parameter Explanation

P1 - **(Output)** Variable with the result of the operation.
On error a "" is returned also the Timeout-Flag is set.
On success, the Lenght in Bytes/Charcters of the currently loaded file is been returned.
If omitted the result is placed on TOS.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*****************************************************
' EXAMPLE 1: TXT.ltf  and TXT.toc etc.
'*****************************************************
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
' Reserve speichern
TXT.toc|$$LAD
' We have now a Backup of the Textfile in $$LAD.
' It can be restored - overwriting the current Buffer-Content
using:
TXT.fov|$$LAD
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

3.80.11 Other Commands

Geben Sie hier den Text ein.

© 2023 Theo Gottwald * https://www.smart-package.com

3.80.11.1 DebugPrint

MiniRobotLanguage (MRL)

TXT.dbp
TXT.DebugPrint

Dump/Print the internal Buffer into the SPRE-Debug-Window

Intention

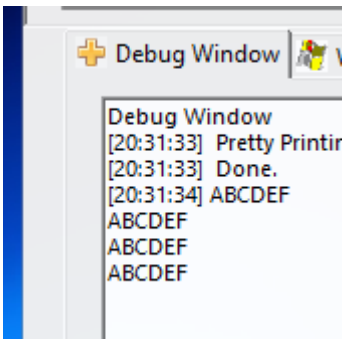
This command makes only sense when **used from the SPR-Editor**.
It will print the complete TXT.-Buffer into the Debug-Window of the SPRE.

There are two ways to use the command:

1. Do not specify any Parameter.
In this case the command will Print the complete TXT.-Buffer in the Debug-Window of the SPRE.

```
' Generate 5 Lines of Text A
$$TXA=ABCDEF$crlf$
$$TXB=$$TXA$$TXA$$TXA$$TXA
' Generate 5 Lines of Text B
$$TXC=123456$crlf$
$$TXD=$$TXC$$TXC$$TXC$$TXC

' Load first Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXB
TXT.dbp
' Save Reserve to internal Memory Place "0"
TXT.Push_Intern|0
ENR.
```



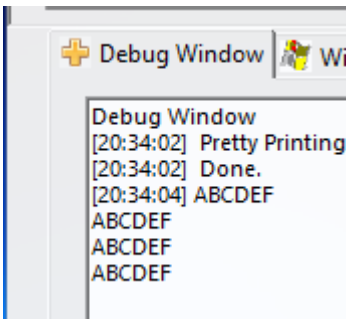
2. Specify an Numeric Parameter P1 (0-9)
In this case the Command will Print the content of the Internal Memory Locations (IML) 0-9.

```
' Generate 5 Lines of Text A
```

 © 2023 Theo Gottwald * https://www.smart-package.com

```
$$TXA=ABCDEF$crlf$
$$TXB=$$TXA$$TXA$$TXA$$TXA
' Generate 5 Lines of Text B
$$TXC=123456$crlf$
$$TXD=$$TXC$$TXC$$TXC$$TXC

' Load first Text into TXT.-Buffer
TXT.Load_Pure_Text|$$TXB
' Save Reserve to internal Memory Place "0"
TXT.Push_Intern|0
TXT.dbp|0
ENR.
```



Syntax

TXT.dpb
TXT.DebugPrint

Parameter Explanation

P1 **-** **(Input)** Number or Variable with number. Integer Number between 0 and 9.
If omitted the command will print the TXT.-Main Buffer.

Example

```
'*****************************************************
'
'*****************************************************
```

Remarks

-

Limitations:

-

3.80.11.2 Get_Filename

MiniRobotLanguage (MRL)

TXT.gfn
TXT.Get_Filename

Return Path and Filename of the currently loaded File inside the TXT.-internal Buffer

Intention

This command is used to return Path and Filename of the Textfile, that was loaded into the internal Buffer of the TXT.-Commands.

```
' Load Textfile into intrnal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
TXT.gfn|$$RES
MBX.File loaded:$crlf$ $$RES
```

Syntax

TXT.gfn|P1
TXT.Get_Filename|P1

Parameter Explanation

P1 - **(Output)** Variable with the result of the operation.
On error a "" is returned also the Timeout-Flag is set.
On success, the Filename (incl. Path) of the currently loaded file is been returned.
If omitted the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.ltf  and TXT.gfn etc.
'*****************************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
TXT.gtl|$$LAB
JIV.$$LAB!0|Lab_failed
TXT.gfl|$$IND
TXT.gtl|$$LAB
JIV.$$LAB!1040|Lab_failed
TXT.gfn|$$LAB
NVC.$$LAB=Test.txt
  GTO.Lab_failed
EIF.
ENR.
```

Remarks

Can acess very large pathes up to 32767 characters due to the use of **NTFS-direct**.

Limitations:

-

3.80.11.3 Get_Lenght

MiniRobotLanguage (MRL)

TXT.gtl
TXT.Get_Lenght

Return the lenght in Bytes/Characters of the currently loaded File inside the TXT.-internal Buffer

Intention

This command is used to return the Length in Bytes of the Textfile, that was loaded into the internal Buffer of the TXT.-Commands.

```
' Load Textfile into intrnal Buffer for further TXT.-Command
Operations
'($$RES is 0/1 success)
TXT.Load_Textfile|$$FIL|$$RES
TXT.gtl|$$RES
MBX.File loaded has a lenght of $$RES Bytes.
```

Syntax

TXT.gtl|P1
TXT.Get_Lenght|P1

Parameter Explanation

P1 - **(Output)** Variable with the result of the operation.
On error a "" is returned also the Timeout-Flag is set.
On success, the Lenght in Bytes/Charcters of the currently loaded file is been returned.
If omitted the result is placed on TOS.

Example

```
'*****************************************************
' EXAMPLE 1: TXT.ltf  and TXT.gtl etc.
'*****************************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$LAA=?path\..\Pics\Test.txt
TXT.ltf|$$LAA|$$RES
TXT.gtl|$$LAB
JIV.$$LAB!0|Lab_failed
TXT.gfl|$$IND
TXT.gtl|$$LAB
JIV.$$LAB!1040|Lab_failed
TXT.gfn|$$LAB
NVC.$$LAB=Test.txt
  GTO.Lab_failed
EIF.
ENR.
```

Remarks

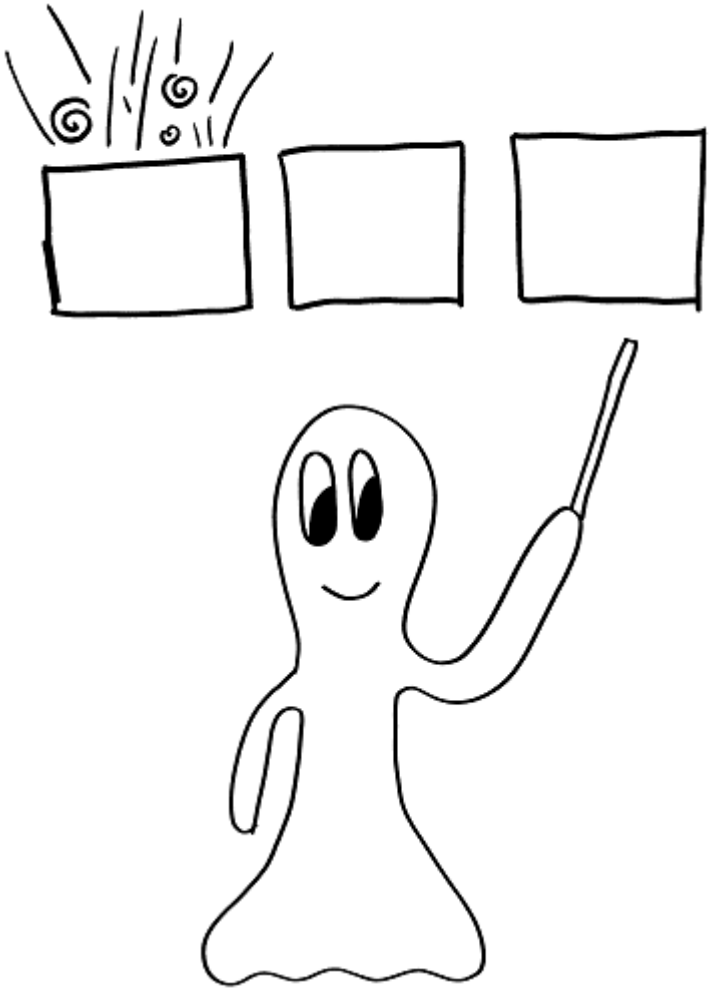
3.81 Variable Definitions and Operations

3.81.1 ! Smarty's Variable Commands

Smarty's Variable Commands



Variables simple and complex in once?

What are Variables?

Generally with the SPR, a Variable is always 5 Characters long.
It starts with "$$" or with "§§".
The next 3 characters, can be any alphanumeric characters.
A typical variable is "$$TXT" or "$$NUM".

At runtime the Variable is been replaced with its internal content.

Therefore the Use of Variables is as Simple as:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
VAR.$$TXT=Peter
MBX.Hallo $$TXT
ENR.
```

In the same way you can use Variables for calculations.

```
VAR.$$NUA=5
VAR.$$NUB=7
CAL.$$NUC=$$NUA+$$NUB
' Result is 12
MBX.Result is $$NUC
ENR.
```

If you use Variables inside Variables, or Variables as Parameters for Subprograms, this is where it gets more complex.
Try this example:

```
' Variable Definition
VAR.$$TX1=5
' Numeric Variable Definition
VAN.$$NUM=1
' We generate a Variable-Name inside $$IND
VAR.$$IND=$$TX$$NUM
' This command is "Variable Indirect", we assign to the Variable Name inside t
VAI.$$IND=21
MBX.$$TX1
ENR.
```

Internally Variable Resolution is done ion several ways:
- String-Variables are replaced
- Numeric Variables and formulas are solved
- Special-folders are replaced
- System-Variables are replaced

Not every command does ANY of the above Variable-resolutions.
The reason is that if a Binary content may contain Variable-Names or formulas inside, it shall not be resolved.
That's the reason why there is a bunch of different Variable-Resolution Commands.

Starting with `VAB.` that does not resolve anything on the right side.
Next is `VAO.` that does resolve just "once"
Then comes the normal `VAR.` that does resolve most things.

And there is for example `VAI.` that assign something to the Variable, which name is inside the given Variable.
You can use it in Subprograms or Macros to return results in Variables.

Internally Variables have a Variable-Type. Most often you have not to deal with that.
Using `GVT.` you are able to find out what Type a variable has.
Using this information, you can then decide what to do with the Variable-Content.

Also take a look at `VBA.` that can save you a lot of trouble when dealing with unknown Content.

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.81.2 GVT. - Get Variable Type

MiniRobotLanguage (MRL)

GVT. Command

Get Variable Type

Intention

This command can be used to find out which Vartype was used for the given Variable In **P1**. There are generally 8 Types of variables that are available for Scripting (Type 7 should never happen):

```
   1 = Stringvariable (ASC-Text or Data)
   2 = LongInteger (32 - bit signed Number)
   3 = PointAPI (2 Integer Coordinates, e.g. X and Y)
   4 = Quad (64 Bit Signed Integer)
   5 = Extended Precission FLoating Point Number
   6 = Rect
   7 = unknown Stringtype
   8 = Empty string / Variable invalid and can not be resolved.

' Example:

' Here we define some Variables
' Extended FP Variable (Type 5)
VAN.$$ERT=15.05

' String Variable - (Type 1)
VAR.$$RTT=A

' Extended FP Variable (Type 5)
VAN.$$XTT=0.015

' Point-API Variable (Type 3)
VAP.$$MYP=12,13

GVT.$$ERT
DBP.$tos$

GVT.$$RTT|$$RES
DBP.$$RES

GVT.$$XTT|$$RES
DBP.$$RES

GVT.$$MYP|$$RES
DBP.$$RES

' This variable is undefined you will get a
' result zero, and the timeout flag will be set.
'
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
GVT.$$MYP|$$RES
DBP.$$RES

ENR.
```

Note that currently Variables will normally loose their Variable-Type (and get Type 1 String) if they are assigned to another Variable. You can avoid this by using the VAO.-Command:

```
 ' This will preserve the Variable Type
 VAO.$$ABC=$$EFG
 VAO.$$ABC=§§_01
```

Syntax

GVT.P1[|P2]

Parameter Explanation

P1 - Variable-name of Source and Target variable

P2 - ***(optional)*** Variable which will receive the result. If omitted the result is placed on TOS.

Example

```
'*********************************
' GVT.-Sample

3.81.3 IEV. / NEV. - If exists Variable

MiniRobotLanguage (MRL)

IEV. / NEV.Conditional Statement

If exists Variable

Intention

Conditional Statement.
Test if a specified Variable exists.A Variable exists after it was defined anywhere in a Script. It does not matter if the content of the variable is zero, or if the variable is empty. Once it was defined, it exists.
A Variable can not be deleted, it will exist as long, as the Script runs.
Let's see an example:

```
' Here we define a Variable
VAR.$$ERT=15.05
IEV.$$ERT
  DBP.Variable exists
ELS.
  DBP.Variable NOT exists
EIF.
' Now we trry with a Variable that was not defined before.
IEV.$$ERX
  DBP.Variable exists
ELS.
  DBP.Variable NOT exists
EIF.
ENR.
```

As expected, the result is:

[00:07:24] Variable exists
[00:07:25] Variable NOT exists

You can only test for one Variable per command.
`NEV.` is the negative Form of `IEV.`

Syntax

IEV.P1 ELS. … EIF.
NEV.P1 ELS. … EIF.

Parameter Explanation

*© 2023 Theo Gottwald * https://www.smart-package.com*

P1 **-** Variable to test for. The variable can not be inside another
variable, always directly the given variable is tested.

IXX.'s can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or FEX. (Enumerations) to unlimited Depth.

Example

```
'**********************************
' IEV./EIF.-Sample
'**********************************
' Here we define a Variable
VAR.$$ERT=15.05
VAR.$$RTT=A
IEV.$$ERT
  DBP.Variable exists
ELS.
  DBP.Variable NOT exists
EIF.
' Now we trry with a Variable that was not defined before.
IEV.$$ERX
  DBP.Variable exists
ELS.
  DBP.Variable NOT exists
EIF.
ENR.
```

3.81.4 Inline Data Commands

What is "Inline Data"?
Inline-Data is Data that represents a picture, Password or Login Credentials, Text, or any other collection of Bytes.
"Inline" means that it is not an external file, but it is part of the Code.

You can now add Inline Data to any SPR-Script. The easiest way is to just enter the Inline-Data as Dezimal Numbers.
If you have ever used "BASIC" Language you may remind yourself to "READ and DATA" Commands.

With the SPR there is no separate READ and DATA Commands.
We only need the VDA. Command that starts the Block with Data, and then we need the VDE.-Command that ends the Block with Data.

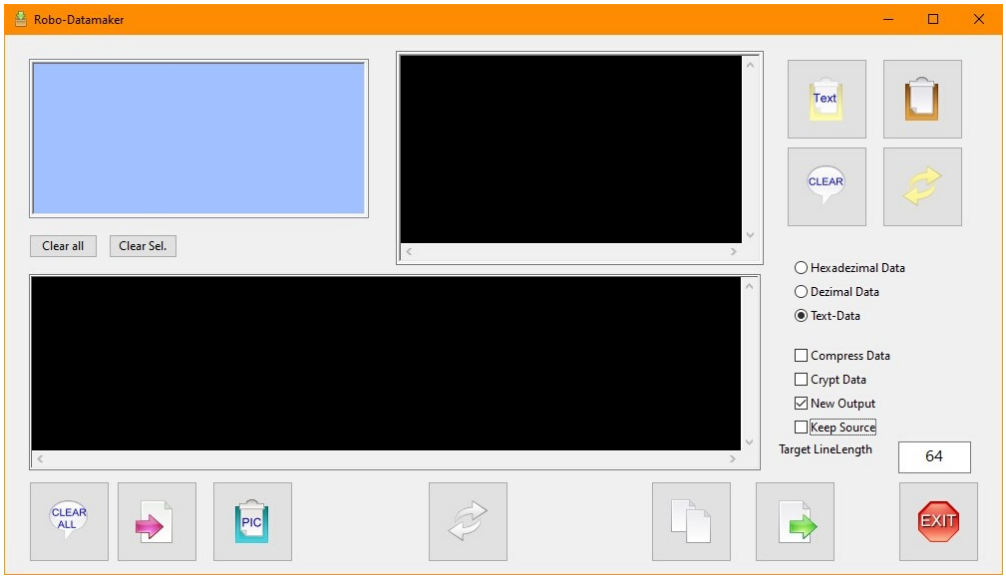
Technically when you jump to the Line with the Data, the Data is been put into the Variable after the VDA.- Command.

So the esiest way to use Inline Data is, to just enter it.

1. Just write your Data in dezimal numbers separated by ",".
This way you can manually enter data.

```
VDA.$$DTA|$$FIN=
64,65,255,0,21
VDE.
```

For all 3 further Options you will need to use the Datamaker.exe - Utility, which is in your SPR-Package included.



You can simply drag and drop files on to the Datamaker-Tool, to have them converted into Inline-Code.

The important Point is that the VDA.-Commands supports 4 Data-Types and additionally 2 Options.
You can simply set them in the Datamaker-Tool, the rest is done automatically.

© 2023 Theo Gottwald * https://www.smart-package.com

So lets take a look on the Datamaker-Tool.

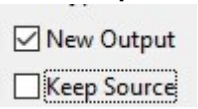
The Datamaker-Tool can get your Data from 3 Sources:
1. You can drag any file(s) into the Datamaker, they will then appear in the blue List-Box.
2. You can take Textual Data from your Clipboard and insert it into the upper black Box, using the PASTE-Button on the right side,.
3. You can insert a Picture from your Clipboard directly into the Datamaker. Use the blue "Paste Picture" Button for that.
I can recommend the "Greenshot" Freeware Utility to generate these pictures from Screenshots.
Using Greenshot you can directly put Screenshots into the Clipboard and make them to Inline-Data with just one Click.
Without saving it as a file.

Encryption and Compression

You can then process the Data according to the Checkmarks/Radiobuttons on the right side.
Therefore you can **encrypt** the Data (Good to hide Passwords). You can **compress** the Data (fast compression).
You do not need to worry on how to get the original data back, this is all done under the Hood from VDA.

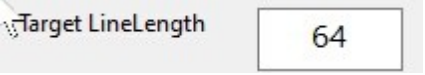
Further all Data is checksummed from the datamaker tool. The checksum is included in the data, so simple changes in the data will prevent the VDA. from unpacking the data. This will help you to keep your data safe.
Here is a hint: The encryption is always the same, with the same system, so it only to prevent people from reading the data visually.
Anybody who can let the script run, will of course get the original data out, by simply using VDA.

Further Options



You can further select if you want the processed files to be deleted from the blue List, or not ("**Keep Source**").
This will also influence the behavior of the Source Textbox.
In case you have dropped multiple files into the List, then you can convert them all in one strike.
For this you need to remove the "**New Output" Checkmark**, as this will generally clean the Output-Textbox before adding any new Code.

The Line-Lentgh for the Inline-Data



You can further decide the Line-Lenght of the Inline-Code. For this simply change the number in the white Edit-Box.
Default is generally 64, but you can make larger Lines. I did not test where the limit is.
Internally the Preprocessor will anyway connect all Inline-Data lines and store them in one place, so this may not have significant impact on the Runtime-behavior. You can

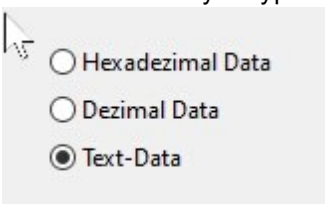
© 2023 Theo Gottwald * https://www.smart-package.com

change that for cosmetical reasons anyway. I suggest not to make lines longer then 255 Bytes because of the SPR-Editor (its something you can try).

The Middle grey Button with the Symbol is the "Convert to Inline Data" Button.
All items in the blue List will be processed according to the checkmarks when you click on it.

With Pictures from the Clipboard this is different. Because we can store the binary data easily, the pictures are immediately processed when you click on the "Paste Pic" Button.

There are currently 3 Types of Inline-Data supported. These are:



Generally prefer the "Text-Data" for most compact and fast processing.

Supported Data-Formats:

General comments:
As you can see, Dezimal Data starts with the Sequence "`?D". Then there is a `0,1` which means the Data is compressed but not encrypted. All this is done automatically if you use the Datamaker-Tool. The Data that has been created using the Datamaker-Tool also includes the Original Filename of the File - which will be in $$FIN - and a checksum to make sure that your data was not changed.
The chacksum is automatically calculated when the data is extracted. If the Data was changed, the VDA. will not extract the data and set the Timeout Flag..

1. Manually entered Dezimal Data: These are dezimal numbers between 0 and 255 separated by a ",".
This way you can manually enter data. `$$FIN` will be empty because this data can never contain a filename.

```
VDA.$$DTA|$$FIN=
64,65,255,0,21
VDE.
```

2. Dezimal Data: These are dezimal numbers between 0 and 255 separated by a ",". Each number represents 1 Byte of Data.
As you can see, Dezimal Data starts with the Sequence "`?D".

Looks like this:

```
' $$DTA = Data
' $$FIN = Filename of Sourcefile
' Length:  386 Bytes in  7 Lines.
```

 © 2023 Theo Gottwald * https://www.smart-package.com

```
VDA.$$DTA|$$FIN=
?D0,1,110,0,0,0,74,81,236,212,59,216,196,99,142,123,50,231,210,17,63,
92,23,69,204,17,252,33,210,155,44,235,50,194,135,6,208,22,59,220,
54,112,63,212,166,150,66,0,107,254,33,79,44,112,112,48,228,80,57,
66,0,107,123,27,22,136,95,124,168,167,215,151,155,168,210,137,135,
92,42,62,194,173,226,6,148,10,42,36,169,15,60,40,235,88,44,96,229,
181,175,53,99,103,6,66,152,10,13,86,58,70,1
VDE.
```

3. Headezimal data. These are Hexadezimal numbers, where each uses 2 Digits therefore there is no Separation between them.
Hexadezimal Data starts with the Sequence "`?H".

```
' F:\00_MR\PB_MiniRobots-Editoren\SPRE 02\Source\Sample Scripts\Tests\File.txt
' $$DTA = Data
' $$FIN = Filename of Sourcefile
' Length:  232 Bytes in  5 Lines.
VDA.$$DTA|$$FIN=
?H00016E0000004A51ECD43BD8C4638E7B32E7D2113F5C1745CC11FC21D29B2CEB32
C28706D0163BDC36703FD4A69642006BFE214F2C707030E4503942006B7B1B1688
5F7CA8A7D7979BA8D289875C2A3EC2ADE206940A2A24A90F3C28EB582C60E5B5AF
3563670642980A0D563A4601
VDE.
```

4. Text-Coded data.
This Format starts with "?M". This Format uses least Space because it uses all Textual Charactes to store the Information.
Please prefer this datatype for larger Data-Amounts, as it unpacks very efficiently and uses least space.

```
' F:\00_MR\PB_MiniRobots-Editoren\SPRE 02\Source\Sample Scripts\Tests\File.txt
' $$DTA = Data
' $$FIN = Filename of Sourcefile
' Length:  154 Bytes in  3 Lines.
VDA.$$DTA|$$FIN=
?MAAFuAAAASlHs1DvYxGOOezLn0hE/XBdFzBH8IdKbLOsywocG0BY73DZwP9SmlkIA
a/4hTyxwcDDkUDlCAGt7GxaIX3yop9eXm6jSiYdcKj7CreIGlAoqJKkPPCjrWCxg
5bWvNWNnBkKYCg1WOkYB
VDE.
```

If Data that was created using the Datamaker-Tool was changed and therefore the **included checksum does not match**, you will get in $$DTA the Text "VDA. can not retrieve Data.".

```
' Sample that leads to the Error Message "VDA. can not retrieve Data."
' This data is invalid therefore it will not be extracted.

3.81.4.1 Inline-Data Sample

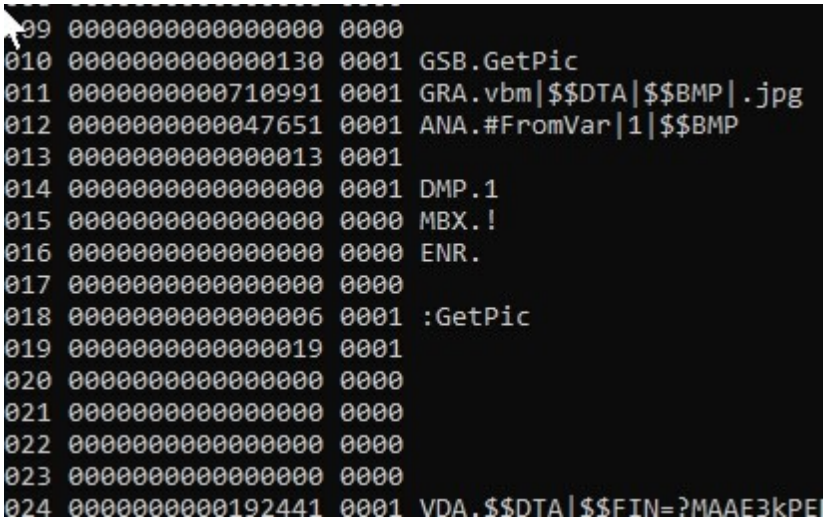
MiniRobotLanguage (MRL)

Inline-Data Sample and Speeddump

If exists Variable

Intention

Inline Data is not really limitted in Size unless it stays in the 32-Bit Memory limit.
Also there is no Speed-Problem.
Below is the Speed-Dump of 245kb of Inline-Data (see below). It just uses here 1/83th of a Second to get extracted.
Using Inline-Data, you can add all Sorts and supported Picture Formats directly to your Script.



Using Inline-Pictures and ANA-#FromVar

You can useall sorts of Inline-Pictures, no matter which Format they have.
BUT, as ANA.#FromVar will only accept pictures in a very defined Bitmap-Format, it is necessary to convert all other formats to this Format first.
Use the `GRA.vbm|$$DTA|$$BMP|.jpg` command to get the Inline pictures into the right Format.

It may also be necessary to use this command on ".bmp"-Inline Data, "Files", depending on how the files are internally organized.

*© 2023 Theo Gottwald * https://www.smart-package.com*

In this case, just convert from "-bmp" to "bmp".

```
GSB.GetPic
GRA.vbm|$$DTA|$$BMP|.bmp
ANA.#FromVar|1|$$BMP
ANA.Show|1!
ENR
```

Let's see an example:

```
'#EXE:?path\
'#SPI:ForceWrite

GSB.GetPic
GRA.vbm|$$DTA|$$BMP|.jpg
ANA.#FromVar|1|$$BMP
ANA.Show|1!
DMP.6
MBX.!
ENR.
'============================================================

:GetPic

3.81.4.2 VDA. / VDE. - Inline Data

MiniRobotLanguage (MRL)

VDA. Inline Data Start
VDE. Inline Data End

Variables with Inline Data

Intention

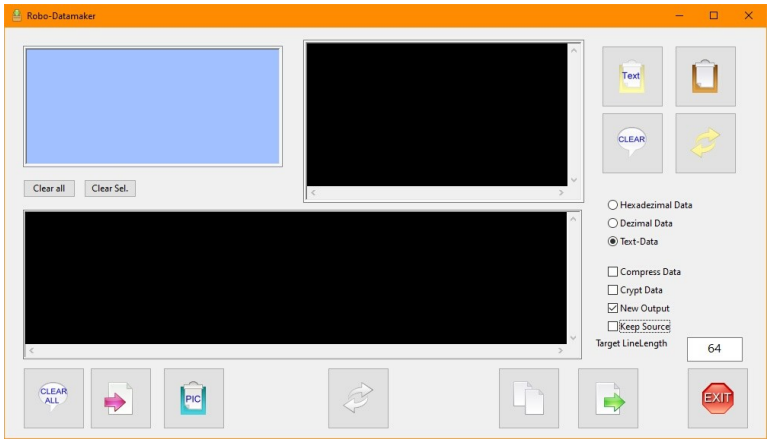
This command can be used to include Binary Data into your Script.
It is very useful to also include pictures or other data directly in the Script.

There are 4 Options to use this commands.

1. Just write your Data in dezimal numbers separated by ",".
This way you can manually enter data.

```
VDA.$$DTA|$$FIN=
64,65,255,0,21
VDE.
```

For all 3 further Options you will need to use the Datamaker.exe - Utility, which is in your SPR-Package included.



You can simply drag and drop files on to the Datamaker-Tool, to have them converted into Inline-Code.

There is a dedicated chapter about how to use the Datamaker-Tool 3483.

The important Point is that the VDA.-Commands supports 4 Data-Types and additionally 2 Options.
You can simply set them in the Datamaker-Tool, the rest is done automatically.

Supported Data-Formats:

*© 2023 Theo Gottwald * https://www.smart-package.com*

General comments:
As you can see, Dezimal Data starts with the Sequence "`?D". Then there is a 0,1 which means the Data is compressed but not encrypted. All this is done automatically if you use the Datamaker-Tool. The Data that has been created using the Datamaker-Tool also includes the Original Filename of the File - which will be in $$FIN - and a checksum to make sure that your data was not changed.
The chacksum is automatically calculated when the data is extracted. If the Data was changed, the VDA. will not extract the data and set the Timeout Flag..

1. Manually entered Dezimal Data: These are dezimal numbers between 0 and 255 separated by a ",".
This way you can manually enter data. $$FIN will be empty because this data can never contain a filename.

```
VDA.$$DTA|$$FIN=
64,65,255,0,21
VDE.
```

2. Dezimal Data: These are dezimal numbers between 0 and 255 separated by a ",". Each number represents 1 Byte of Data.
As you can see, Dezimal Data starts with the Sequence "`?D".

Looks like this:

```
' $$DTA = Data
' $$FIN = Filename of Sourcefile
' Length:  386 Bytes in  7 Lines.
VDA.$$DTA|$$FIN=
?D0,1,110,0,0,0,74,81,236,212,59,216,196,99,142,123,50,231,210,17,63,
92,23,69,204,17,252,33,210,155,44,235,50,194,135,6,208,22,59,220,
54,112,63,212,166,150,66,0,107,254,33,79,44,112,112,48,228,80,57,
66,0,107,123,27,22,136,95,124,168,167,215,151,155,168,210,137,135,
92,42,62,194,173,226,6,148,10,42,36,169,15,60,40,235,88,44,96,229,
181,175,53,99,103,6,66,152,10,13,86,58,70,1
VDE.
```

3. Headezimal data. These are Hexadezimal numbers, where each uses 2 Digits therefore there is no Separation between them.
Hexadezimal Data starts with the Sequence "`?H".

```
' F:\00_MR\PB_MiniRobots-Editoren\SPRE 02\Source\Sample Scripts\Tests\File.txt
' $$DTA = Data
' $$FIN = Filename of Sourcefile
' Length:  232 Bytes in  5 Lines.
VDA.$$DTA|$$FIN=
?H00016E0000004A51ECD43BD8C4638E7B32E7D2113F5C1745CC11FC21D29B2CEB32
C28706D0163BDC36703FD4A69642006BFE214F2C707030E4503942006B7B1B1688
5F7CA8A7D7979BA8D289875C2A3EC2ADE206940A2A24A90F3C28EB582C60E5B5AF
3563670642980A0D563A4601
VDE.
```

4. Text-Coded data.
This Format starts with "?M". This Format uses least Space because it uses all Textual Charactes to store the Information.

© 2023 Theo Gottwald * https://www.smart-package.com

Please prefer this datatype for larger Data-Amounts, as it unpacks very efficiently and uses least space.

```
' F:\00_MR\PB_MiniRobots-Editoren\SPRE 02\Source\Sample Scripts\Tests\File.txt
' $$DTA = Data
' $$FIN = Filename of Sourcefile
' Length:  154 Bytes in  3 Lines.
VDA.$$DTA|$$FIN=
?MAAFuAAAASlHs1DvYxGOOezLn0hE/XBdFzBH8IdKbLOsywocG0BY73DZwP9SmlkIA
a/4hTyxwcDDkUDlCAGt7GxaIX3yop9eXm6jSiYdcKj7CreIGlAoqJKkPPCjrWCxg
5bWvNWNnBkKYCg1WOkYB
VDE.
```

If Data that was created using the Datamaker-Tool was changed and therefore the **included checksum does not match**, you will get in `$$DTA` the Text "`VDA. can not retrieve Data.`".

```
' Sample that leads to the Error Message "VDA. can not retrieve Data."
' This data is invalid therefore it will not be extracted.
GSB.Laa
MBX.$$DTA
ENR.
'------------------------------------------------------------
:Laa
' F:\00_MR\PB_MiniRobots-Editoren\SPRE 02\Source\Sample Scripts\Tests\File.txt
' $$DTA = Data
' $$FIN = Filename of Sourcefile
' Length:  154 Bytes in  3 Lines.
VDA.$$DTA|$$FIN=

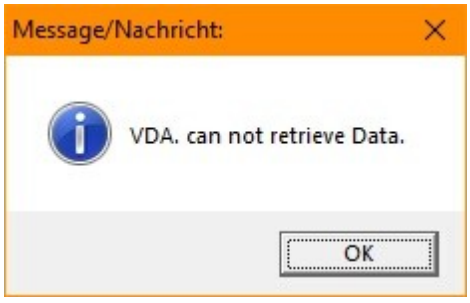
5bWvNWNnBkKYCg1WOkYB
VDE.
RET.
```



Syntax

VDA.P1|P2=
<Data>
VDE.

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 – ***Variable.*** This Variable will be filled with the Binary Data.

P2 – ***Variable.*** This Variable will be filled with the Original Filename or a "-" Sign if there is no filename. It may also be empty for manual entered data.

Speed in Ticks:

The speed of the decoding from the Inlined Data heavily depends on the used Format. For our speed-Test we used Lines with 64 Characters. As you may have seen, the line-lenght can be adjusted in the Data-Maker-Tool.
For 2695 Lines of Hexadezimal Data the robot needed 524.000 Ticks to extract the data , that is roughly 194 Ticks per line of Hexadezimal Data. For the same data compressed an in textual format, the robot needed just 6725 Ticks.
Therefore Textual Data is the preferred way to include large sets of Data. Its more efficient in terms of Space and its optimized for Speed. In Decimal coding, we get 4765 Lines that equal about 325kb of Data is extracted from Decimal coding in 496219 Ticks, that is a 1/32 th of a second which equals 100 Ticks per line.
Therefore if using Textual Data within the 32-bit Data-Range, the Robot should extract the data generally below 1 Second in Real-Time.

Example

Sample-Script using VDA. and VDE. to store and display a small picture.

```
GSB.Laa
ANA.#FromVar|1|$$DTA
ANA.Show|1#!
ENR.
'============================================================
:Laa

3.81.5 IVB. / NVB. - If Variable Between

MiniRobotLanguage (MRL)

IVB. Conditional Statement

If Variable Between

Intention

Conditional Statement.
Test if a specified numeric variable or point-variable is between the two given limits P2 and P3. Let's see an example:

```
' Here we define the value that is tested
' and the minimum and maximum value
VAR.$$ERT=15.05
VAR.$$MIN=15.06
VAR.$$MAX=16.001
' Here comes the test
IVB.$$ERT|$$MIN|$$MAX
  DBP.We're between
ELS.
  DBP. We're outside
EIF.
```

As expected, the result is:

```
[13]  We're outside
```

If we change the line:

```
VAR.$$MIN=15.04
```

we get the result like this:

```
[11] We're between
```

Now lets see how it works with point-variables. Imagine you want to make sure that coordinates stay in a specified range. Its always an x and an y - coordinate.

```
VAP.$$ERT=55,30
VAP.$$MIN=0,0
VAP.$$MAX=45,40
IVB.$$ERT|$$MIN|$$MAX
  DBP.We're between
ELS.
  DBP. We're outside
EIF.
```

As the x-value is 55 and therefore exceeds the given range of 45, we're outside this time.

© 2023 Theo Gottwald * https://www.smart-package.com

What happens is, that the instruction will test that the x and the y value are in their range that is given with the two range-points.

In case of numeric variables, P2 and P3 can be any numeric variables with about 80 bits of precision.

In case of point-variables, P2 and P3 must be Points also

Syntax

IVB.P1|P2|P3 ELS. … EIF.

Parameter Explanation

P1 **-** Variable or Point Variable with value(s) to test

P2 **-** minimum value

P3 **-** maximum value(s)

IXX.'s can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or FEX. (Enumerations) to unlimited Depth.

Example

```

3.81.6 IVC. / NVC. - If-Variable-Contains

MiniRobotLanguage (MRL)

IVC./NVC. Conditional Statement

If Variable Contains

Intention

Conditional Statement. Test if a specified text or binary string is contained in a given variable/text. The first parameter must be a variable.

There are several special operators and the 2 options "**e** - equalcase" and "**b** - binary".
Let us start with a simple example. We want to compile a script and make it react on a commandline parameter.

```
' Get the commandline
VAR.$$CMD=$cmdexe$
IVC.$$CMD=/u
  MBX.We'll uninstall it!
EIF.
ENR.
```

Now in case that we want to react on /u as well as on /U, we would need to specify the "e" option, that prevents the command from being case-sensitive. We would just change this line to get the desired effect:

```
IVC.$$CMD=/u|e
```

Now if you look for some special parameter in the command-line, you also want to know where it has been found. The position in the string, where the "/u" was. You get it from IVC. on the TOS.

```
VAR.$$CMD=/c:file.txt /U:mix.log
IVC.$$CMD=/u|e
  STS.DUMP
  MBX.!
EIF.
ENR.
```

The result will look like this, because the /u starts at character 13:

 © 2023 Theo Gottwald * https://www.smart-package.com

There is more. Assume that you want to know if a text contains ANY of a list of special characters. Going from here you would need to check for each single character. But help is here! You can use the **<** (**ANY OF**) Operator.

```
VAR.$$NAM=Rolf Müller
IVC.$$NAM<üäö
  DBP. german Umlaut found at $$000!
EIF.
ENR.
```

But do not intermix it with the **>** "**ONLY ANY OF**" Operator. This one will make sure that the given string contains ONLY characters that are are contained in the text/string given.

```
VAR.$$NAM=Rolfi
IVC.$$NAM>folR
  DBP. Its Ok!
ELS.
  DBP. Non matchin character found at $$000!
EIF.
ENR.
```

Which is not the case here. Therefore we get:

```
[12]  Non matchin character found at 5!
```

There is one more option to know, that is the "binary" option. When you want to find a string in a binary file, you must prevent the robot from searching for variables and special folders etc. in the binary code. The variable with the binary code must be resolved - and that is all.
This is done using the **b - flag**. Binary data is often read from files, maybe to patch them.
`IVC.` can help you on this. Here is an example for the usage of the b-option.

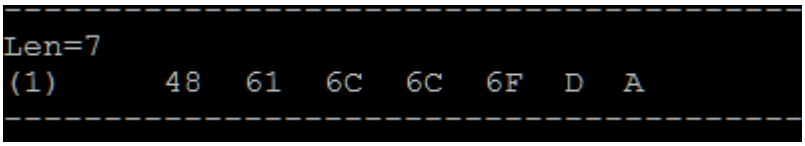
```
CFF.$$FIL|$$BIN
IVC.$$BIN=$$PAT
   ' do the patch
  STS.DUMP
  MBX.!
EIF.
ENR.
```

Hint: If you think that the evaluation is not correct, use

```
PRT.$$VAR|h
MBX.!
```

to check for invisible characters and Spaces. You will get a ASC-Dump like this, which shows all characters inside the variable with their Hex-ASC-Code.:

*© 2023 Theo Gottwald * https://www.smart-package.com*



The negative Form `NVC.` is also available.

Syntax

```
IVC.P1P2[|P3]… ELS. … EIF.
NVC.P1P2[|P3]… ELS. … EIF.
```

Parameter Explanation

P1 **-** `Variable[Operator]`

```
=  "contains" - the whole string must be contained in
variable.
    TOS is position in variable.

!  "contains not" - just the opposite of "=".TOS is position
    in variable.

>   contains "only any of". Must contain only each
    of the given characters. TOS is first non matching
character.

<   "contain any". Is true if any of the given characters is
    containes in variable. TOS is position of first match.

e   equalcase. The compare etc. will be done after all
characters
    have been converted to ANSI-Lower-case.

b   binary. In this case the Variables are only resolved once,
    specialfolders etc. are not resolved.
```

P2 **-** `Variable, contains the text/string with the characters to look for.`

P3 **-** ***(optional)*** `can be` **`b`** `- binary or` **`e`** `- equalcase.`

`IVC.`'s can be nested to unlimited Depth, and they can also enclose Sub-Programm Calls or FEX. (Enumerations) to unlimited Depth.

© 2023 Theo Gottwald * https://www.smart-package.com

Speed in Ticks:

This command uses typically around 130 to 250 Ticks heavily depending on Parameters.

Example

```
'**********************************
' GFS.-Test
'**********************************
'DBM.2
'JNF.Move-Console.txt

: $$TXT=12345678Abcde
: §§NUM=456

' This is a "Contains"
IVC.$$TXT=§§NUM
 PRT. §§NUM is a part of $$TXT
ELS.
 PRT. §§NUM is NOT part of $$TXT
EIF.
' Stack contains place where it was found.
DMP.4

' This is a "NOT Contains"
IVC.$$TXT!§§NUM
 PRT. §§NUM is not a part of $$TXT
ELS.
 PRT.§§NUM is a part of $$TXT
EIF.
' Stack contains place where it was found.
DMP.4

' This is a "Contains ANY"
IVC.$$TXT<152
 PRT. $$TXT contains any of: 125
ELS.
 PRT. $$TXT contains none of: 125
EIF.
' Stack contains place where it was found.
DMP.4

' This is a "NOT Contains ANY"
IVC.$$TXT>5a6
 PRT. $$TXT contains all of: 5a6
ELS.
 PRT. $$TXT contains not all of of: 5a6
EIF.
' Stack contains the position of the first non-matching
character.
DMP.4

DMP.
END.
```

3.81.7 IVP./ NVP. - If-Variable-Pattern

MiniRobotLanguage (MRL)

IVP. Conditional Statement

If Variable Pattern

Intention

Conditional Statement.
Test if a specified string evaluates true with a given 3.2 Standard-Search Pattern 341
.

`NVP.` is the negative Form of this statement.

Syntax

```
IVP.P1=P2 ... ELS. ... EIF.
```

Parameter Explanation

P1 - `Variable = Variable/Pattern`
`must be a Variable or Stack, Length=5`
P2 - `Pattern to compare with`

Important: Only **P2** can be a Pattern!

P1 must always be a variable.
P2 can be variable or Text and must be the Pattern.

IVP.'s can be nested to unlimited Depth, and they can also enclose Sub-Programm Calls or FEX. (Enumerations) to unlimited Depth.

Example

```
'*********************************
' IVP.-Test
'*********************************
'DBM.2
'JNF.Move-Console.txt
: §§TXG=Outlook 2003 - Posteingang
: §§TXI=Outlook 2003 - Inbox
: §§PAT={Outlook&AND:{Posteingang&OR:Inbox}}
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' First we test against the german version
IVP.§§TXG=§§PAT
 PRT.Pattern german Ok.
ELS.
 PRT. Pattern does not fit german.
EIF.

' Next we test against the intl. version
IVP.§§TXI=§§PAT
 PRT.Pattern intl. Ok.
ELS.
 PRT. Pattern does not fit intl. .
EIF.

DMP.
END.
```

3.81.8 IVS. / NVS. - If-Variable-String

MiniRobotLanguage (MRL)

IVS. Conditional Statement

If Variable String

Intention

Conditional Statement.
Test if a specified string is equal, not equal, or lexically higher or lower then another.

If **=** or **!** are specified as operator, its a simple string-compare if the strings/texts are equal or not.

If **>** or **<** are specified as operator, the command will make a lexical compare of the two strings. However if you want to sort items, take a look on the SRT. - Sort Items 3147 -command.

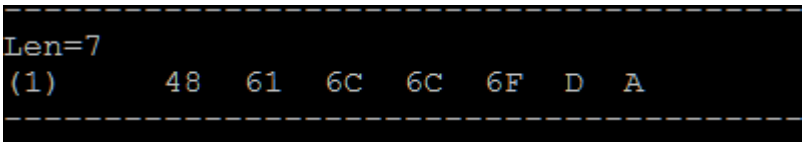
Please use `IVS.` for Strings instead of `IVV.` - which is only for Values (numeric).

You can use `NVS.` as the negative Form of the command.

Hint: If you think that the evaluation is not correct, use

```
PRT.$$VAR|h
MBX.!
```

to check for invisible characters and Spaces. You will get a ASC-Dump like this, which shows all characters inside the variable with their Hex-ASC-Code.:



Syntax

IVS.P1(op)P2|P3... ELS. ... EIF.

Parameter Explanation

P1 - `Variable`

 *© 2023 Theo Gottwald * https://www.smart-package.com*

(op) - Operator: =,>,<,! (! is NOT)

P2 **-** Variable

P3 **-** ***(optional)*** can be b - binary or e - equal-case.

e - equalcase.
The compare will be done after all characters have been converted to ANSI-Lower-case.

b - binary. In this case the Variables are only resolved once,
specialfolders etc. are ignored.

Example

```
'**********************************
' IVS.-Sample
'**********************************
: §§STA=Alles
: §§STB=Allex
: §§STC=alles
: §§TXT=comes alphabetically first
IVS.§§STA!§§STB
 PRT. Strings are not equal!
 IVS.§§STA>§§STB
   PRT."§§STA" §§TXT
 ELS.
   PRT."§§STB" §§TXT
 EIF.
EIF.

IVS.§§STA=§§STC|e
 PRT. In this case we are here.
EIF.
IVS.§§STA=allEs|e

DBP.Now is $$VAR + $$BAR
IVS.$$VAR=June
  IVS.$$BAR=Peter
    EFX.
  EIF.
EIF.
RET.
```

Remarks

`IVS`. and other IXX. can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or `FEX`. (Enumerations) to unlimited Depth.

Limitations:

-

See also:

- 1.5. Features and Hints 80
- IWS. / NWS. - If Window State 3724
- IVC. / NVC. - If-Variable-Contains 3524
- ELS. - ELSE 2150
- EIF. - END IF 2148
- CAL. - mathematical CALculation 2315
- IVV. / NVV. - If Variable Value 3534

© 2023 Theo Gottwald * https://www.smart-package.com

3.81.9 IVV. / NVV. - If Variable Value

MiniRobotLanguage (MRL)

IVV. Conditional Statement

If Variable Value

Intention

Test a condition and execute a block of program statements only if the condition is met.

There are two forms of `IVV.` available. First the quick-decision form, which is always like this:

```
IVV.(variable)(sign)(Number or variable)
```

It looks like this:

```
IVV.$$MAA=1
     ' Do something if result is NOT zero
ELS.
     ' Do this if result is zero.
EIF.
```

And secondly there is the mathematical `IVV.` It is formed like this:

```
IVV.(Any Formula like in CAL.)
```

The brackets (...) are needed so `IVV.` knows that you want the mathematical `IVV.` The result is tested against zero to decide whether the condition is true (if it is non-zero) or not true (when it is zero).

You can formulas with all operators from `CAL.`, if you include them into (...).
In that case the condition is true, when the result is NOT zero.

```
' This will make an OR'ed decision
IVV.($$MAA<9)+($$MAB>0)
' Do something if result is NOT zero
ELS.
' Do this if result is zero.
EIF.
```

You can also use a Syntax with delimiters "|". In this case you can use formulas on both sides as you wish.

```
'
IVV.($$MAA*5)|>|(8*1+0.5+$$XYZ)
```

`NVV.` is the negative version of `IVV.`

© 2023 Theo Gottwald * https://www.smart-package.com

Important:
Use `IVV.` only for numeric comparisons! For string comparisons use `IVS.` or `IVC.`

Syntax

```
IVV.P1|P2|P3
IVV.P1P2P3
   ...
ELS.
    ...
EIF.
```

Speed in Ticks:
This command uses typically around 60 to 120 Ticks, depending on the Parameters.

Parameter Explanation

P1 **-** Variable
P2- Condition
  ! (not equal),
  = (equal),
  > (bigger then),
  < (smaller then)
P3 **-** Any

When using Syntax 2, Codnition (P2) can be given as a Variable.

IVV's can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or FEX. (Enumerations) to unlimited Depth.

Speed in Ticks:
This command uses typically around 70 to 150 Ticks heavily depending on the given Parameters.

Example

```
: AAB=2
IVV.$$AAB!3
 IVV.$$AAA>1
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  JNF.MySub.txt|$$AAA|2
 ELS.
  JNF.YourSub.txt
 EVV.
ELS.
: AAC=Hallo
: $$AAD=Nur
  IVV.$$AAC>$$AAD
  JNF.MySub.txt|$$AAA|2
 ELS.
  JNF.YourSub.txt
 EVV.
EVV.
```

Remarks

Use `IVV.` only for numeric comparisons! For string comparisons use `IVS.` or `IVC.`

Limitations:

-

3.81.10 IWC. / NWC. - If Wildcard Pattern

IWC. / NWC. - If-Wildcard-Pattern Compare Previous 3534 Top 41 Next 3539

MiniRobotLanguage (MRL)

IWC. Conditional Statement

If WildCard Pattern Compare

Intention

Conditional Statement.
Test if a specified string evaluates true with a given Wildcard Pattern.
Wildcard-Patterns use the following Patterns:

? - matches any single character

***** - matches none or more of any characters

- matches any single numeric character

```
$$TXA=*Peter
$$TXB=Hallo Peter

' Here comes the magic
IWC.$$TXA|$$TXB
  DBV.Yes, we match the Pattern.
EIF.
```

NWC. is the negative Form of this statement.

Syntax

IWC.P1|P2 … ELS. … EIF.

Parameter Explanation

P1 **–** Variable to compare with

P2 **–** Variable with Pattern

Important: Only **P1** can be a Pattern.

IWC.'s can be nested to unlimited Depth, and they can also enclose Sub-Programm Calls or FEX. (Enumerations) to unlimited Depth.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'***********************************
' IWC.-Test
'***********************************
$$TXA=*Peter
$$TXB=Hallo Peter

IWC.$$TXA|$$TXB
  DBV.Yes, we match.
EIF.
END.
```

3.81.11 SAV. - Save/Restore Variable

MiniRobotLanguage (MRL)

SAV. Command

Save / Restore Variables (Encapsulation of Variables)

Intention

This command can be used in Subroutines to safely use Variables, that may also be in use somewhere else. For this the Command will "Save" the Variable Content and give you a fresh and Clear Variable. You can think of making Variable "Subroutine local". **Think of Encapsulation of code.**

`SAV.` is like brackets in Math. (3+(4+5)) There is always a fitting Closing Bracket to an opening bracket.

In the same way **you need to call a `SAV.Restore` for each `SAV.Save`**. If you do not call a `SAV.Restore` for each `SAV.Save` there is a danger that the internal Stack which holds all the Variables may run over with time..

In Short: You can make a
`SAV.Save ( Sub-Script) SAV.Restore`
like a Encapsulation-Shell around your Subprograms.
This will make sure that all used (and specified) Variables will be the same value and state that they had before the Subprogram was called.

```
SAVe - Variables (DO whatever)  SAV.Restore Variables
```

`SAV.` will:
1. Save all specified Variables, whether they are currently defined or not.
2. Variables that are currently not defined (not in use) will be SAV.ed and Cleared, but deleted at the SAV.Restore.
   Therefore `SAV.` will create Variables that are not in use at that time and clear them.
3. Restore all SAVed Variables deleting the Values that may have been in these Variables.
   When there are Variables that have not been defined before, these will be deleted at the Restore.
4. Has no depth limit. You can go as many levels deep as you want.
5. `SAV.` uses a LIFO (LAST IN FIRST OUT)-System. Calling `SAV.Restore` will therefore restore all Variables that have been saved with the last `SAV.Save` statement. And the next call will restore the Variables from the `SAV.Save` before this one.

Lets see an example:

```
:Test
' $$TXT will be saved and cleared
SAV.Save|$$TXT
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  GVT.$$PAA|$$RES
  VAR.$$TXT=$$PAA-$$PAB->Type is:$$RES
  DBP.$$TXT
' $$TXT will be restored and get the original Value and Type
SAV.Restore
RET.
```

In this Subrprogramm we use the Variable `$$TXT`. At the time of writing, we do not know if we will use this Variable in a Script that may call this Subprogram later.
Now we just make `$$TXT` "local" to this Subprogramm using the `SAV.`-Command..

`SAV.` **has unlimited Levels**. Therefore you can call Subprogrammes that are protected with `SAV.` in a recursive way.
Or call a Subprogram that uses such Variables, and calls another that uses such variables.
`SAV.` accepts up to 70 Variables, if you need more just use more successive `SAV.`-Statements.

Just keep in mind that `SAV.` uses a LIFO (LAST IN FIRST OUT)-System.

```
VAN.$$PAA=5.56
VAN.$$PAB=7
' Level 1
SAV.Save|$$PAA|$$PAB|$$PAC
 MBX.After SAV. the Variables are Cleared:$$PAA-$$PAB
 VAR.$$PAA=Hallo
 VAR.$$PAB=Peter
 ' Level 2
 SAV.Save|$$PAA|$$PAB|$$PAC
   VAR.$$PAA=Inside
   VAR.$$PAB=SPR
   GSB.Test
' Restore Level 1
   SAV.Restore
 GSB.Test
 ' Restore Original Values
SAV.Restore
GSB.Test
END.
'---------------------
:Test
SAV.Save|$$TXT|$$TAX
GVT.$$PAA|$$RES
VAR.$$TXT=$$PAA-$$PAB->Type is:$$RES
DBP.$$TXT
SAV.Restore
RET.
ENR.

'--------------------------------
' This is a Subprogram that will change the Format of a date from
' 20181204 -> 2018-12-04
' Called like this:
' GSB.DateFormat|$$RES
:DateFormat
SAV.Save|$$YEA|$$MON|$$DAY|$$INP
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$INP=$$_01
GSS.1|4|$$INP|$$YEA
FMT.$$YEA|0000
GSS.5|6|$$INP|$$MON
FMT.$$MON|00
GSS.7|8|$$INP|$$DAY
FMT.$$DAY|00
VAR.$$RES=$$YEA-$$MON-$$DAY
SAV.Restore
RET.
```

Syntax

SAV.s|P1[|P2..|Px]
SAV.Save|P1[|P2..|Px]

Parameter Explanation

P1 **-** Variable-name of Source and Target variable

P2...Px **-** ***(optional)*** any Number of Variables to preserve.

SAV.r
SAV.Restore

Parameter Explanation

No Parameters are supported in Restore-Mode.
The Command will always restore all Variables that have been saved with the ***LAST*** *matching Save-Command.*

Example

```
'*********************************
' SAV.-Sample
'*********************************
VAN.$$PAA=5.56
VAN.$$PAB=7
SAV.Save|$$PAA|$$PAB|$$PAC
MBX.After SAV. the Variables are Cleared:$$PAA-$$PAB
VAR.$$PAA=Hallo
VAR.$$PAB=Peter
SAV.Save|$$PAA|$$PAB|$$PAC
VAR.$$PAA=Inside
VAR.$$PAB=SPR
GSB.Test
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SAV.Restore
GSB.Test
SAV.Restore
GSB.Test

END.
:Test
SAV.Save|$$TXT
GVT.$$PAA|$$RES
VAR.$$TXT=$$PAA-$$PAB->Type is:$$RES
DBP.$$TXT
SAV.Restore
RET.
ENR.
ENR.
'*********************************
```

Remarks

`SAV.` can be nested to any depth.

`SAV.` is like brackets in Math. (3+(4+5)) There is always a fitting Closing Bracket to an opening bracket.

In the same way **you need to call a `SAV.Restore` for each `SAV.Save`**. If you do not call a `SAV.Restore` for each `SAV.Save` there is a danger that the internal Stack which holds all the Variables may run over with time..

Limitations:

Note that currently Variables will normally loose their Variable-Type (and get Type 1 String) if they are assigned to another Variable. You can avoid this by using the `VAO.`-Command:

```
' This will preserve the Variable Type
VAO.$$ABC=$$EFG
```

The overall maximum length of variables depend on your available RAM and your actual Memory fragmentation

3.81.12 VAB. - Variable Binary

MiniRobotLanguage (MRL)

VAB. Command

Variable binary

Intention

This command can be used to assign a Value to a Variable.
It will not resolve any variable-names that are given on the value side.
It will not resolve any specialfolders or systemvariables on the value side.

It will just take the right side and put it into the variable name on the left "as it is".
Therefore its binary compatible.

If there is a variable-name on the right side, it will not be resolved with `VAB.`

```
VAB.$$NAM=Rainer
VAB.$$TXT=$$NAM
DBP.$$TXT
```

If you want the value-side to go through a one-time variable-resolution instead, use `VAO.`

As `VAB.` does not go through any variable-resolution process, its possibly the fastest way to clear a variable.

```
' This will clear a variable
VAB.$$TXT=
```

Syntax

VAB.P1=P2

Parameter Explanation

P1 - Variable-name

P2 - Value that will be assigned to the variable. If P2 is omitted,
the variable will be set to empty.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*********************************
' VAB.
'*********************************
'DBM.2
'This will clear the variable:
VAB.$$ABC=

' This will assign the variable $$ABC the
' string:
: $$AAA=Hans
: $$AAB=Peter
' The following specialfolder will not
' be resolved using VAB.
VAB.$$ABC=?path\$$AAA$$AAB.txt
MBX.$$ABC
END.
'*********************************
```

Remarks

Its important to understand that the VAB.-Command will not resolve Special-Folders and Special Variables, while it will resolve any other local or global variable names.

Limitations:

-

See also:

- VAB. - Variable Binary 3544
- VBA. - Variable Binary Append 3569

3.81.13 VAC. - Variable reCt

MiniRobotLanguage (MRL)

VAC. Command

Variable rectangular

Intention

This command can be used to assign Rectangular Coordinates to a Variable.
It is possible to use calculations if they are enclosed in brackets.

Variables of type RECT are currently not used in the engine, but may be used in future versions. If you use a RECT variable, the variable will actually most often just be converted into a text-variable. You can assign an zero RECT by just leaving the data-part empty:

```
VAC.$$REC=
DBP.$$REC
END.
' Will assign 0,0,0,0 as RECT to $$REC
```

Syntax

VAC.P1=P2,P3,P4,P5

Parameter Explanation

Rectangular Coordinates (**Rect**) are defined as (P2 to P5):

P1 - Variable-name

P2 - Value: left X coordinate

P3 - Value: top Y coordinate

P4 - Value: right X coordinate

P5 - Value: bottom Y coordinate

All coordinates (**P2** - **P5**) can contain variables, system-variables and formulas in (..)

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*********************************
' VAC.
'*********************************
VAR.§§IVA=1
VAP.$$MYP=(100+§§IVA*2),(-13+(2*§§IVA))
VAC.§§KOR=(100+§§IVA*2),(-13+(2*§§IVA)),$$MYP
DBP.§§KOR
END.
'*********************************
```

Remarks

-

Limitations:

-

3.81.14 VAF. - Variable Filename

MiniRobotLanguage (MRL)

VAF. Command

VAriable with Filename

Intention

This command can be used to assign a Filename to a variable.

```
'*********************************
' VAF.
'*********************************
VAF.$$FIL=Hallo
DBP.$$FIL
END.
'*********************************
```

Important: If the variable does not contain any path, `?path\` is automatically added to the variable content, to make it a valid path.

The `VAF.`- command makes a special folder, system-variables and variable-resolution. It will add `?path\` if there is no valid path given on the value-side. It will not resolve formulas.

Syntax

VAF.P1=[P2]

Parameter Explanation

P1 - `Variable-name`

P2 - ***(optional)*** `will be assigned to the variable. If P2 is omitted,`
`the variable will be set to empty.`

Speed in Ticks:

This command uses typically around 108 Ticks.

Example

```
'This will clear the variable:
VAF.$$ABC=
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' and systemvariables:
VAF.$$ABC=?path\$$AAA.txt
VAF.$$ABC=Hallo
```

© 2023 Theo Gottwald * https://www.smart-package.com

3.81.15 VAI. - Variable Indirekt

MiniRobotLanguage (MRL)

VAI. Command

VAriable Indirekt

Intention

This command can be used to assign a Value to a Variable which Name is stored inside another Variable.
The purpose of this command is to be able, to tell a Subprogramm that is called with `GSB.` or `JNF.` etc.
where to put the result of the Operation. Also it can be used to emulate Arrays of Variables from 0 to 99.
For example $$H00 to $$H99.

Here is an example.

```
' Variable gets the Name of another Variable.
' Always use VAB. for that!
VAB.$$OUT=$$INA
' Now here comes VAI.
VAI.$$OUT=1232
' Look what we got.
MBX.$$INA

' This Sample shows what its really good for.
VAB.$$INB=$$INC

GSB.CommandX|$$INB
MBX.$$INC

GSB.CommandX|$$IND
MBX.$$IND

ENR.
'============================================================

:CommandX
VAO.$$TXT=$$_01
DBP.$$TXT
VAI.$$TXT=123
RET.
```

Here is another example that shows how you can write to Variables `$$H01` to `$$H99` in a loop using `VAI`.

```
FOR.$$LOP|1|99
  VAN.$$CNT=$$LOP
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
    FMT.$$CNT|00
    VAR.$$HLT=$$H$$CNT
    VAI.$$HLT=$$LOP
  NEX.
```

Syntax

VAI.P1=P2

Parameter Explanation

P1 – Variable-name of a Variable that contains the name of another Variable.

P2 – Value that will be assigned to the variable that is inside the P1-Variable. If P2 is omitted,
the variable will be set to empty.

Example

```
'*********************************
' VAI.
'*********************************
  ' This Sample shows what its really good for.
  VAB.$$INB=$$INC
  GSB.CommandX|$$INB
  MBX.$$INC

  ' $$IND was not defined before
  GSB.CommandX|$$IND
  MBX.$$IND

  ENR.
  '============================================================

  :CommandX
  ' Important to use VAO. here!
  VAO.$$TXT=$$_01
  DBP.$$TXT
  ' Here comes VAI.
  VAI.$$TXT=123
  RET.
```

Remarks

Use `VAI.` together with `VAB.` and `VAO.`

Limitations:

-

3.81.16 VAN. - Variable Numeric

MiniRobotLanguage (MRL)

VAN. Command

Variable numeric

Intention

This command can be used to assign a numeric Value or a formula in ( ) to a Variable.
Specialfolders 345 are not resolved. Systemvariables 334 are resolved.

```
'This will set the variable to zero:
VAN.$$ABC=0
```

You can assign **Hexadezimal**, **octal** or **binary, floating point** and **negative** numbers to a variable using `VAN`.

```
' Hexadezimal assignement
VAN.$$ABC=&h90

' Binary assignement
VAN.$$ABC=&B0100101101

' Octal assignement
VAN.$$ABC=&O4574514
```

You can assign the result of a **formula** to a variable using `VAN`.

```
' This will assign the result to the variable
VAN.$$ABC=(4*5.1+(8*8))

' Negative numbers and floating point numbers
VAN.$$ABC=-25.004*

' use System-variables
VAN.$$XPO=#iw#*2
```

Syntax

VAN . P1=P2

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 **-** Variable-name

P2 **-** Value/formula in (..) that will be assigned to the variable.
If P2 is omitted, the variable will be set to empty.

Speed in Ticks:
This command uses typically around 90 Ticks.

Example

```
'*********************************
' VAN.
'*********************************
'This will set the variable to zero:
VAN.$$ABC=0

' This will assign the result to the variable
VAN.$$ABC=(4*5.1+(8*8))
VAN.$$ABC=-25.004
' Hexadezimal assignement
VAN.$$ABC=&h90
' Binary assignement
VAN.$$ABC=&B0100101101
' Octal assignement
VAN.$$ABC=&O4574514

END.
'*********************************
```

Remarks

-

Limitations:

Binary, octal and hexadezimal numbers can not be negative and they can not be floating point numbers.

3.81.17 VAO. - Variable Once / Variable Clear

MiniRobotLanguage (MRL)

VAO. Command

Variable Once / Variable Clear

Intention

This command can be used to assign a Value to a Variable and iut can be used to completely delete a Variable (Variable Clear).

It will resolve only 1 variable that can be given on the value side, that is the first variable name on the value side.

The VAO.-command does **not** makes a special folder and system-variables resolution.

The VAO.-command can be used to assign Variables to other Variables, copying the content and preserving the Variable-Type.
For this on the Target-Side **P2** must be just a Variable.
Here are two examples for this.

```
   ' Copy Variable Content from one Variable to another
VAO.$$TGA=§§_01
VAO.$$TGA=§§ABC
```

To delete a Variable from Memory you can type:

```
VAO.$$TGA
```

or

```
VAO.$$TGA=
```

Both will do exactly the same. Unlike with other Commands, this will not only clear the content of a variable, but delete the variable completely from memory. This is sometimes necessary. For example when you want to use the variable to get a result from a MACRO-Function.
When using the second form like this:

```
VAO.$$TGA=
```

Make sure that there are no spaces on the right side of the = sign.
Otherwise the Variable will just be assigned those spaces.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

VAO.P1[=P2]

Parameter Explanation

P1 - Variable-name

P2 - Value that will be assigned to the variable. If **P2** is omitted, the variable will be set to empty. If **P2** is a Variable, then VAO. will just copy the content of **P1** into **P2**, this will preserve the original Type (Numeric, string etc.) of the **P2** - Variable.

Example

```
'*********************************
' VAO.
'*********************************
'DBM.2

'This will clear the variable:
VAO.$$ABC=

' This will assign the variable $$ABC the
' string:
' ?path\Hans$$AAB
: $$AAA=Hans
: $$AAB=Peter
VAO.$$ABC=?path\$$AAA$$AAB.txt

:over
MBX.Halt to read output

END.

3.81.18 VAP. - Variable Point

VAP. - Variable-Point Previous 3556 Top 41 Next 3562

MiniRobotLanguage (MRL)

VAP. Command

VAriable Point

Intention

This command can be used to assign Point-Coordinates to a Variable-name.

It is possible to use calculations if they are enclosed in brackets.

Point Coordinate-variables can be used in most Mouse-Actions,
like `MPO., MMV., MLC.` and many more etc.

If you want to assign a zero coordinate, just leave the data part empty:

```
VAP.$$POI=
DBP.$$POI
END.
' Will assigne 0,0 to the variable $$POI
```

Syntax

VAP.[P1]=[P2,P3]

Parameter Explanation

P1 - Variable-name

P2 - X- Coordninate

P3 - Y- Coordninate

Speed in Ticks:

This command uses typically between 90 to 200 Ticks.

Example

```
'****************************************
'  VAP. - Sample
'****************************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAP.$$MYP=12,13
MMV.$$MYP
' We make 4 mousemoves
FOR.§§IVA|1|200|50
VAP.§§KOR=(100+§§IVA*2),(-13+(2*§§IVA))
PAU.1
' relative mousemoves
MMV.$$MYP
MMV.r|§§KOR
NEX.
END.
```

3.81.19 VAR. - Variable Set Value/Clear

MiniRobotLanguage (MRL)

VAR. Command

VARiable set value or clear

Intention

This command can be used to assign a Value to a Variable.

There are three forms, please look at the examples.
The VAR.-command makes a complete variable-resolution, this includes any special-folder or system-variables on the value-side.

Therefore it may be a bit less efficient then the VAB. command, which does not make a variable resolution.

There is an "Implicit VAR."-Command, from the preprocessor, if you just omit the VAR. and write:

```
$$AAA=12
$$BBB=99
```

In this case, the Preprocessor will just add the "VAR." in front of the Line for you. Therefore at runtime the Line would look like this:

```
VAR.$$AAA=12
VAR.$$BBB=99
```

To get a complete resolution of the target side, including formulas, you can use the 2.1 : - Definiton-Command 361.

Syntax

VAR.[P1]=[P2]

Parameter Explanation

P1 - Variable-name

P2 - Value that will be assigned to the variable. If P2 is omitted,
the variable will be set to empty.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'This will clear the variable:
VAR.$$ABC=

' This will assign the variable a value or string and replace
all special-folders
' and systemvariables:
VAR.$$ABC=Hallo

' This will assign a Value without Specialfolder-Processing
 : $$ABC=Hallo
```

Remarks

3.81.20 VAS. - Variable with String

VAS. - Variable with String Previous 3562 Top 41 Next 3566

MiniRobotLanguage (MRL)

VAS. Command

VAriable with String

Intention

This command can be used to assign a String/text value to a variable.

The VAS.-command makes a special folder and system-variables and variable-resolution.
Unlike VAF. it will not add anything to the string to make it a valid path.

Syntax

VAS.P1=[P2]

Parameter Explanation

P1 - Variable-name

P2 - ***(optional)*** will be assigned to the variable. If P2 is omitted,
the variable will be set to empty.

Example

```
'This will clear the variable:
VAS.$$ABC=

' This will assign the variable string $$AAA
' no matter, if $$AAA is a valid Variable or not.
' it would replace all special-folders
' and systemvariables:
VAS.$$ABC=?path\$$AAA.txt
VAS.$$ABC=Hallo
```

imitations:

3.81.21 VAV. - Variables with Variables

MiniRobotLanguage (MRL)

VAV. Command

VAriables with Variables

Intention

This command can be used to assign a Value to a Variable.

It will resolve variables that are with a given variable up to any Level.

The normal `VAR.` command does not touch already resolved variable bytes, to be binary compatible to some degree, and to avoid dead-locks.

`VAV.` will also resolve special folders and variables to `MaxVarRes` which is 255 by default. `MaxVarRes` is set using the `OPT.`-command). Lets see an example:

```
'*********************************
' VAR. / VAV. comparison
'*********************************
VAB.$$TXA=Theo
VAB.$$TXB=$$TXA
VAB.$$TXC=$$TXB

VAV.$$TXD=$$TXC
DBV.$$TXD
' VAV. returns "Theo"

VAR.$$TXD=$$TXC
DBV.$$TXD
' VAR. returns "$$TXB"

END.
'*********************************
```

As you can see, `VAR.` does not resolve to any depth, while `VAV.` will.

If there are variables that will resolve to variables which resolve to variables in a circular way, `VAV.` may resolve again and again until `MaxDepth` is reached. See this example:

```
'*********************************
' VAR. / VAV.
'*********************************
'
' We set maximum resolution depth for variables
' to 255 (which is the default value)
OPT.MaxVarRes|255
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAB.$$TXA=Theo $$TXB
VAB.$$TXB=$$TXA

VAV.$$TXD=$$TXB
DBV.$$TXD
' VAV. returns "Theo Theo Theo Theo Theo Theo Theo Theo" etc.

VAR.$$TXD=$$TXB
DBV.$$TXD
' VAR. returns "$$TXB"

END.
'*********************************
```

Please see the difference in the example below.

Syntax

VAV.[P1]=[P2]

Parameter Explanation

P1 - Variable-name

P2 - Value that will be assigned to the variable. If P2 is omitted,
the variable will be set to empty.

Example

```
'*********************************
' VAV.
'*********************************
VAB.$$TXA=Theo
VAB.$$TXB=$$TXA
VAB.$$TXC=$$TXB
VAV.$$TXD=$$TXC
DBV.$$TXD
END.
VAR.$$ABC=->$$AAA
MBX.$$ABC
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

Its important to understand that the VAV.-Command should not be used for binary content which is for example loaded using CFF. Use VAB. or VAO or even VAR. instead.

Limitations:

-

3.81.22 VBA. - Variable Binary Append

MiniRobotLanguage (MRL)

VBA. Command

Variable binary

Intention

This command can be used to append up to 21 variables into variable **P1**.
Normally you would think of doing an variable-append like this:

```
VAV.$$ALL=$$T01$$T02$$T03 .... etc.
```

This is going to work, as long as these variables do not contain any binary data that could resolve to special folders, variable or system-variables.

If that is the case, `VAV.` and such commands would try to resolve these binary patterns and possibly do unwanted changes to your data.

This is where `VBA.` enters the scene. `VBA.` will just resolve each parameter one time!
That is called "binary compatible variable resolution". BEcause the variable will be resolved, but the binary data is not going to be changed.

Then `VBA.` will append all those strings into **P1**.

If **P1** was not empty, the content of P1 will will also be part of the new string.
If you do not want this, clear P1 before calling this command.

There are few thing to watch out for:

1. **P1** will also be appended
2. You need to specify a variable for each parameter. It must be a variable.
   Additional characters which are not part of a variable name will have the command run
   into an (timeout) error.
3. You can specify up to 21 parameters, but you need to specify at least two parameters.

How do i clear a variable P1 before using VBA. ?

As `VAB.` does not go through any variable-resolution process, its possibly the fastest way to clear a variable.

```
' This will clear a variable
' Be sure that you do not have a SPACE behind the = sign.
VAB.$$TXT=
```

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

VBA.P1|P2[|P3] ...[|PX]

Parameter Explanation

P1 **-** Variable-name of Source and Target variable

P2 **-** Variable which will be resolved and then appended to P1

P3 ... Px **-** ***(optional)*** more variables that will be resolved (binary comaptible) and then appended to **P1**.

Example

```
'**********************************
' VBA.
'**********************************
: $$T01=Hallo
: $$T02=$sp$
: $$T03=Rolf
VBA.$$T01|$$T02|$$T03
DBV.$$T01
ENR.
'**********************************
```

Remarks

-

Limitations:

The overall maximum length of variables depend on your available RAM and your actual Memory fragmentation. String memory needs to be in one piece and can not be fragmented. As a raw assumption, 500 MB maximum size for strings should always be possible. If you stay below you should be on the safe side. The theoretical maximum is about ~2 GB.

```
An A-Z Index of Windows VBScript commands

   Abs(number)      Absolute (positive) value of number
  .AppActivate      Activate running command
  .Application      BrowseForFolder/Open
   Array(el1,el2,el3)   Add values to an Array variable
   Arguments        Command line arguments
   Asc(String)      Return ASCII code for string
   AscW(String)     Return Unicode code for string
  .BrowseForFolder Prompt the user to select a folder
C
   Call subroutine (arguments) or  subroutine arguments
   CBool(expression)  Convert expression to Boolean (True/False) •
   CByte(expression)  Convert expression to Byte (0-255) •
   CCur(expression)   Convert expression to Currency (numeric) •
   CDate(expression)  Convert expression to Date •
   CDbl(expression)   Convert expression to Double (up to 1.79x10308) •
   Chr(ChrCode)       Return the string character for ChrCode (ASCII code)
   ChrB(ChrCode)      Return the string character for ChrCode (Byte code)
   ChrW(ChrCode)      Return the string character for ChrCode (Unicode/DBCS)
   CInt(expression)   Convert expression to Integer •
   CLng(expression)   Convert expression to long •
   CSng(expression)   Convert expression to single •
   CStr(expression)   Convert expression to a string •
  .CreateObject     Create an automation object / run an external command
  .CreateShortcut   Create Shortcut
   cscript          Run a VBScript .vbs file
  .CurrentDirectory Retrieve or change the current directory
D
   Date()          The current system date
   DateAdd         Add a time interval to a Date
   DateDiff        Return the time interval between two dates
   DatePart        Return part of a given date
   DateSerial      Return a Date from a numeric Year, Month and Day
   DateValue       Return a Date from a string expression
   Day(date)       Return the day component of date (1-31)
   Dim             Declare a new variable or array variable
   Do..Loop        Repeat a block of statements
   Drives
   Drive Map      .MapNetworkDrive - .Enum - .Remove
E
  .Echo            Echo text to screen, also StdOut.Write /.Popup
   End             End a procedure or code block
   Environment Variables  - Expand - .Delete/Remove
   Escape(String) Return only ASCII characters from a Unicode string.
   Eval(expr)      Evaluate an expression
  .Exec            Run a command
   Execute         Execute one or more  statements
   Exp(n)          Return e (base of natural logs) raised to a power n.
   Exit            Exit a block of code immediately
F
   FileSystemObject Work with Drives, Folders and Files
   Filter          Produce an array by filtering an existing array
   Fix(number)     Return the integer portion of a number
   For...Next      Repeat a block of statements a given number of times
   For Each...     Loop through the items in a collection or array
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
   FormatCurrency Format a number with a currency symbol
   FormatNumber   Format a number
   FormatPercent  Format a number with a % symbol
   FormatDateTime Format a Date/Time value
   Function       Define a function procedure
G
   GetLocale()    Return the Regional LocaleID
  .GetObject      Get an Automation object
H
   Hex(number)    Return the hex value of number
   Hour(time)     Return the hour component of time
I
   If..Then       Conditionally execute a block of statements
   InputBox       Prompt for user input
   InStr          Find one string within another
   InStrRev       Find one string within another, starting from the end
   Int(number)    Return the integer portion of a number
   IsArray(varname)      Is varname an array?
   IsDate(expression)    Is expression a DateTime?
   IsEmpty(expression)   Is expression initialised?
   IsNull(expression)    Is expression NULL?
   IsNumeric(expression) Is expression a Numeric?
   IsObject(expression)  Is expression an object?
   Join           Combine the contents of an array into a single variable.
L
   LBound             Return the smallest subscript for an array.
   LCase(String)      Return String in lower case
   Left(String,len)   Return the leftmost len characters of string
   LeftB(String,len)  Return the leftmost len bytes of string
   Len(String)    Return length of string in characters
   LenB(String)   Return length of string in Bytes
   Log(number)    Return natural log of number
  .LogEvent       Log an item in the Event log
   LTrim(String)  Remove any leading spaces from a string expression
M
  .MapNetworkDrive Drive Map
   Mid            Return a mid-section from a string
   Minute(time)   Return the minute component of time
   Month(date)    Return the month component of date
   MonthName      Convert a month number to a descriptive Month
   MsgBox         Display a dialogue box message
N
  .Network        Access network resources
   Now            Return the current Date and Time
O
   On Error       Error handling
   Option Explicit   Force all variables to be defined
P
  .AddPrinterConn / .AddWindowsPrConn Add Printer connection
  .EnumPrinterConnections   List Printer connections
  .SetDefaultPrinter        Set default printer
  .RemovePrinterConnection  Remove printer connection
   Private VarName          Declare a local variable/array variable
   Public VarName           Declare a public variable/array variable
Q
  .Quit            Quit
R
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
   Randomize(number)   Initialise the random number generator
  .ReadLine        Accept user text input
   ReDim           Resize a dynamic array
   RegExp          Regular expression search object
  .RegDelete       Registry, delete
  .RegRead         Registry, read
  .RegWrite        Registry, write
   REM             Add a Comment
   Replace         Find and replace text
   RGB(Red,Green,Blue) Return a system color code
   Right(String,len)   Return the rightmost len characters of string
   RightB(String,len)  Return the rightmost len bytes of string
   Rnd             Return a random number
   Round           Round a number to n decimal places
   RTrim(String)   Remove any trailing spaces from a string expression
  .Run a command
S
   Second(time)    Return the second component of time
   Select...Case   Conditionally execute a block of statements
  .SendKeys
   Set variable = object   Assign an object reference
   SetLocale(LocaleID)     Set the Regional LocaleID
   Sgn(number)             The sign of a number
  .Shell + Shell.Application objects/methods
  .ShellExecute    Run a script/application in the Windows Shell
   Shortcut create .CreateShortcut
  .Sleep
   Space           Return a string consisting of spaces.
  .SpecialFolders Path to Desktop,Start menu, Programs...
   Split           Parse a string of delimited values into an array
   Sqr(number)     Square root
   StrComp         Compare two strings
   String          Create a string with a single character repeated
   StrReverse      Reverse a string
   Sub             Declare a sub procedure
T
   Time()          The current system time
   Timer()         The number of seconds since midnight
   TimeSerial      Construct a Time value from Hours, Minutes and seconds
   TimeValue       Convert a string to a Time value
   Trim(String)    Remove leading and trailing spaces from string
   TypeName        Return variable type (variant subtype).
U
   UBound          Return the largest subscript for an array dimension
   UCase(String)   Uppercase String
   UnEscape(Str)   Return Unicode characters from an escaped ASCII string
W
   Weekday         Return the day of the week (1-7)
   WeekdayName     Return the named day of the week
   While...Wend    Conditionally repeat a block of statements
   With            Assign multiple properties of an object
   Year(date)      Return the year component of date (1-12)
   ' Remark        Add a Comment

3.82.2 VBE. - VB-Script End

MiniRobotLanguage (MRL)

VBE. Command

Visual Basic Script End

Intention

This command is used to end a block with VB-Script. It is always used paired with `VBS.`
The statements between a `VBS.` and a `VBE.` are ignored by the SPR-Preprocessor. They are also ignored by the "Pretty-Printer" in the Editor.

`VBS.` and `VBE.` enable you, to include a VB-Script or Java-Script Code inline into the SPR-Script. You can use it to check for System-Objects (See Sample 2 below), or you can use it to call WMI-Functions.

You can also transfer Variable-Content into `VB-Script`-Variables (see example 1 below). And use them in your VB-Script.

And with `VBE.` you can get a single result value from the VB-Script back into your SPR-Script (see example 2 below).

Syntax

```
VBS.P1|P2[|P3...|Px]
...
VBE.P1
```

Parameter Explanation for VBE

P1 **-** `(out) - will hold to the result of the VB-Script Function that was called before.`

Example

```
'*******************************************
' VBS./VBE. - Sample
' You will get two Messageboxes.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
' One from inside VB-Script, one from MR.
'*******************************************
DBP.This is a MiniRobots-Script.
' Now starts the VB-Script-Part.
' IMPORTANT:
' The MSGBOX from VB is not TopMost and may be
' hidden behind the EDITOR!
' Keep Editor on the Right side,
' and Keep center of the screen free.
VBS.VB|Multiply|123|124
  Function Multiply(vPrms)
  Dim result
  result = vPrms(0) * vPrms(1)
  msgbox vPrms(0) * vPrms(1),,"from Inside VB-Script"
  Multiply = result
  End Function
VBE.$$RET
MBX.Result: $$RET
END.

'*******************************************
' VBS./VBE. - Sample 2
' Test if CDO is available
'*******************************************
DBP.Hallo
VBS.VB|Multiply|123|124
  Function Multiply(vPrms)
  Dim c
  Dim msg
  On Error Resume Next
  set c = CreateObject("MAPI.Session")
  If Err <> 0 then
  msg = "CDO ist auf diesem System nicht installiert."
  else
  msg = "CDO-Version " & c.Version & " steht zur Verfügung."
  end if
  msgbox msg
  Multiply = msg
  End Function
VBE.$$RET
MBX.Result: $$RET|from SPR
END.
```

Remarks

The VBS.-/JS.-Scripts will not be written to the harddisk prior to execution.
Therefore they are permanently crypted together
with the SPR-Script using the `'#CRY:`-Option.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

It is possible to start the VB-Scripts from inside `PRR./PRE`.
There are no Limitations about Multithreading here.

See also:

- VBS. - VB-Script Start

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.82.3 VBS. - VB-Script Start

MiniRobotLanguage (MRL)

VBS. Command

Visual Basic Script Start

Intention

This command is used to start a block with VB-Script. It is always used paired with VBE.

The statements between a VBS. and a VBE. are ignored by the SPR-Preprocessor. They are also ignored by the "Pretty-Printer" in the Editor.

VBS. and VBE. enable you, to include a VB-Script or Java-Script Code inline into the SPR-Script. You can use it to check for System-Objects (See Sample 2 below), or you can use it to call WMI-Functions.

You can also transfer Variable-Content into VB-Script-Variables (see example 1 below). And use them in your VB-Script.

And with VBE. you can get a single result value from the VB-Script back into your SPR-Script (see example 2 below).

Syntax

```
VBS.P1|P2[|P3...|Px]
...
VBE.P1
```

Parameter Explanation for VBS

P1 - (in) - VB or JS - this way you can choose between VB-Script
and JScript.

P2 - (in) - Name of the first function to start, without (). The function must have one single parameter which is an ARRAY of Variant.

P3-Px - (in) - these are the Parameters to transfer into the VB-Script. They will be transfered into the VARIANT-ARRAY.
You can use up to 20 Parameters.

© 2023 Theo Gottwald * https://www.smart-package.com

P4 **-** Value*

P5 **-** (out) Variable for Success-flag 1/0.*

Parameter Explanation for VBE

P1 **-** (out) - will be set to the result of the VB-Script Function called before.

Example

```
'*******************************************
' VBS./VBE. - Sample
' You will get two Messageboxes.
' One from inside VB-Script, one from MR.
'*******************************************

```
  msgbox msg
  Multiply = msg
  End Function
VBE.$$RET
MBX.Result: $$RET|from SPR
END.
```

Remarks

The VBS.-/JS.-Scripts will not be written to the harddisk prior to execution.
Therefore they are permanently crypted together
with the SPR-Script using the `'#CRY:`-Option.

Limitations:

It is possible to start the VB-Scripts from inside `PRR./PRE`.
There are no Limitations about Multithreading here.

3.83.2 CAW. - Close-All-Windows

MiniRobotLanguage (MRL)

CAW. Command

Close all Windows

Intention

This command will close all windows that meet the given specification.

There are two modes, in which you can operate this command.
In Mode 1, you give just two parameters, the window-text, and the window-class.
Then all such windows will be **asked to close**.

In Mode 2, you use 3 parameters.The third parameters is the runtime in seconds.
In this mode, `CAW.` will be like a "Close New Windows" and close only Windows that appear NEW while it is running. You can also run it as a background robot using `PRR.` and `PRE.` See example 2.

Unlike most other window-commands, `CAW.` will only take Window-Text and Window-Class as parameters. `CAW.` has a "**deadlock-protection**" against windows which can not be closed.

Once it runs against such a window that can not be closed, it will stop execution.
Such windows are for example windows which have dialogs open or hang. In such cases you should use `CPR.` or `KPN.` to get rid of the hanging program.

Syntax

CAW.[P1][|P2][|P3]

Parameter Explanation

P1 - Windows-Class

P2 - Window-Text

P3 - Timeout in seconds if window can not be closed

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
' CAW.-Demo
' In this Mode, all such windows will be closed.
'**********************************
'DBM.2

FOR.§§LOP|1|§§NUM
  EXS.iexplore|www.fa2.de
  PAU.0.5
NEX.
RET.
```

Remarks

*© 2023 Theo Gottwald * https://www.smart-package.com*

`CAW`. is generally better then `KPN`. or `CPR`. because it will close the applications through the surface.

Limitations:

-

See also:

- CLW. - Close-Window 3592
- CTR. - Close-ThRead 2884
- CPR. - Close-PRocess 2882

3.83.3 CFW. - Copy-From-Window

CFW. - Copy from Window Previous 3586 Top 41 Next 3592

MiniRobotLanguage (MRL)

CFW. Command

Copy from Window

Intention

Reads the Text from the actual localized Window. If this is a Top-Window you get the Window-Title. If this is a child-window you may get something useful or not. It is faster then `GAI`. If `CFW`. fails, try `GAI`.

`CFW`. has four Modes of operation:

```
' No parameter
CFW.
```

Will copy the text from the actual window to the TOS.

```
CFW.$$TXT
```

Will just read the text from the actual window. In this Mode, CRLF, as well as leading and trailing spaces are filtered. Also all leading and trailing ASCII Characters below 33 are fitlered. This will not happen if you add the "u"-flag. Like this:

```
CFW.$$TXT|u
```

Will read the text "unfiltered".

```
CFW.|u
```

Will read the text "unfiltered" and put it on the TOS.

Syntax

CFW.[P1]

Parameter Explanation

`CFW`. works an most common controls.It does not work in any browser, use `GAI`. then.

P1 – Variable for Text which is read from the window. If omitted TOS is used.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'************************************
' CFW.-Sample
' Please run TestApp from SAmples Folder
'************************************

STS.CLEAR
STW.ct|PBWindowClass:0|TestApp
CFW.
STS.DUMP.
MBX. Got window title on TOS

STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Button|Button 2
CFW.$$TXT
PRT.Got Window-Text into Variable: $$TXT
' Clear Variable
VAR.$$TXT=

STW.ct|PBWindowClass:0|TestApp
SCW.nc|1|SysIPAddress32
CFW.$$TXT|u
PRT.Got Text from IP-Control: $$TXT

STS.CLEAR
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Edit
CFW.|u
STS.DUMP
MBX.Got Text from Edit-Control (unfiltered) on TOS.

STS.CLEAR
STW.ct|PBWindowClass:0|TestApp
SCW.nct|1|Edit
CFW.$$TXT
PRT.Got Text from Edit-Control, filtered:$crlf$+$$TXT
MBX.Got Text from Edit-Control filtered on Into VAR.

ENR.
'------------------------------------------------------------
```

Remarks

Uses the Windows-Engine.

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.4 CLW. - Close-Window

CLW. - Close Window **Previous** 3589 **Top** 41 **Next** 3619

MiniRobotLanguage (MRL)

CLW. Command

Close Window

Intention

This command will close the last localized window. If a Window-Handle is specified as parameter, this window will be closed. It will close **Top-windows or child-windows** via direct-engine 231.

Syntax

CLW.[P1]

Parameter Explanation

P1 – First Parameter is a Variable, local or Global. If omitted the actual window is been close.

Example

```
'************************************
' Example 1
'************************************
' Using CLW. without parameter
DBM.2
STW.t|TestApp
' The next line will close the Window.
CLW.
DMP.
END.

'************************************
' Example 2
'************************************
' Using CLW. using a window-handle as parameter
DBM.2
STW.t|TestApp
HTV.$$HWN
' You can work with other windows here
' We vlosethe window by its handle
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
CLW.$$HWN
DMP.
END.
```

Remarks

Limitations:

This command has no "compatible engine" equivalent.
It will always directly close the window. It does not need a mouse or a desktop.

3.83.5 DTI.-Desktop & Mouse Commands

Geben Sie hier den Text ein.

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.5.1 DTI.Count Desktops

MiniRobotLanguage (MRL)

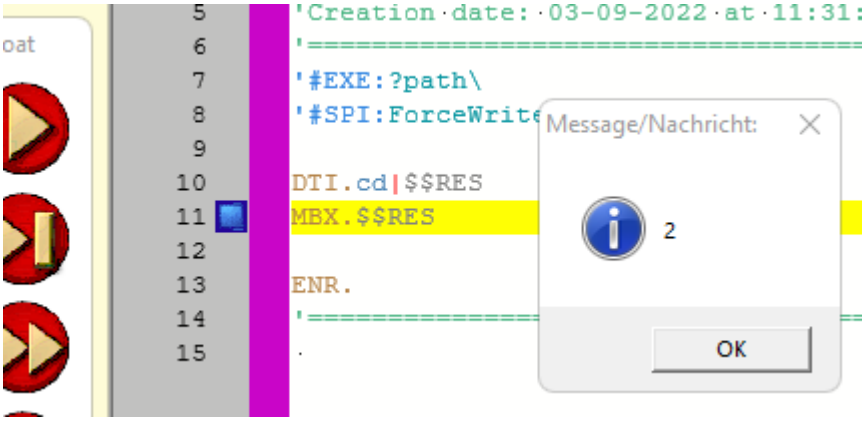
DTI.Count Desktops

Count Desktop-Screens (Monitors)

Intention

This command will find our how many "Monitors" (Desktops) are connected to your Computer.

```
DTI.cd|$$RES
MBX.$$RES
ENR.
```



Syntax

DTI.Count Desktops|[P1]

Parameter Explanation

P1 – (optional) Variable, local or Global. If omitted the Result will be placed on TOS.

Example

```
'************************************
' Example 1
'************************************
DTI.cd
DMP.6
MBX.!
END.
```

3.83.5.2 DTI.DCoord

MiniRobotLanguage (MRL)

DTI.DCoord

Get Desktop-Screens Coordinates (Monitors)

Intention

This command will find our on which Coordinates "Monitors" (Desktops) starts (upper left corner).
If you have "Dual Screen", the result will look like that, because Desktop 2 is to the right of Desktop 1.

```
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DTI.DC|$$NUA|$$HAA|$$WAA
  DBP.Desktop Positon of upper, left corner of Monitor $$NUA is at: $$HAA,$$WAA
NEX.
ENR.
```

```
[15:49:59] Position on 1 is  at: 0,0
[15:50:00] Position on 2 is  at: 4096,0
```

Syntax

DTI.DCoord|P1[|P2][|P3]

Parameter Explanation

P1 – Number of Desktop/Screen as given using `DTI.Count Desktops`.
P2 – (optional) Variable, will return the X-Coordinate of the upper left corner of this Desktop. If omitted the Result will be placed on TOS.
P3 – (optional) Variable, will return the Y-Coordinate of the upper left corner of this Desktop If omitted the Result will be placed on TOS.

Example

```
'************************************
' Example 1
'************************************
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DTI.DC|$$NUA|$$HAA|$$WAA
  DBP.Desktop Positon of upper, left corner of Monitor $$NUA is at: $$HAA,$$WAA
NEX.
ENR.
```

3.83.5.3 DTI.Depth

MiniRobotLanguage (MRL)

DTI.Depth

Count Desktop-Screens (Monitors)

Intention

This command will find our the Screen-Depth (how many Bits per Pixel) for each connected "Monitors" (Desktops).

```
' Get number of Desktops
DTI.cd|$$NUM
' Loop over all Desktops and get Depth
FOR.$$NUA|1|$$NUM
  DTI.dd|$$NUA|$$DEP
  DBP. Monitor $$NUA has a Depth of: $$DEP
NEX.
ENR.
```

```
[15:25:37] Monitor 1 has a Depth of: 32
[15:25:37] Monitor 2 has a Depth of: 32
```

Syntax

DTI.Depth|[P1]

Parameter Explanation

P1 – (optional) Variable, local or Global. If omitted the Result will be placed on TOS.

Example

```
'************************************
' Example 1
'************************************
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DTI.dd|$$NUA|$$DEP
  DBP. Monitor $$NUA has a Depth of: $$DEP
  DTI.df|$$NUA|$$FRE
  DBP. Monitor $$NUA has a Frequency of: $$FRE
NEX.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

Limitations:

3.83.5.4 DTI.Frequency

MiniRobotLanguage (MRL)

DTI.Frequency

Get Screen Refresh Frequency per Monitor

Intention

This command will find our how many "Monitors" (Desktops) are connected to your Computer.

```
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DTI.df|$$NUA|$$FRE
  DBP. Monitor $$NUA has a Frequency of: $$FRE
NEX.
ENR.
```

Syntax

DTI.Frequency|P1[|P2]

Parameter Explanation

P1 – Desktop/Monitor number 1-based
P2 – (optional) Variable for the result, local or Global. If omitted the Result will be placed on TOS.

Example

```
'************************************
' Example 1
'************************************
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DTI.dd|$$NUA|$$DEP
  DBP. Monitor $$NUA has a Depth of: $$DEP
  DTI.df|$$NUA|$$FRE
  DBP. Monitor $$NUA has a Frequency of: $$FRE
NEX.
ENR.
```

Remarks

3.83.5.5 DTI.Height

MiniRobotLanguage (MRL)

DTI.Height

Get physical Height in Pixel of Desktop-Screens (Monitors)

Intention

This command will get the physical Height of each connected Monitor.

```
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DBP. Monitor $$NUA has a Height of: $$HEI
  DTI.dw|$$NUA|$$WID
  DBP. Monitor $$NUA has a Width of: $$WID
  DTI.sz|$$NUA|$$HAA|$$WAA
  DBP. Monitor $$NUA has a Size of: $$HAA,$$WAA
NEX.
ENR.
```

```
[15:36:56] Monitor 1 has a Height of: $$HEI
[15:36:56] Monitor 1 has a Width of: 4096
[15:36:56] Monitor 1 has a Size of: 2160,4096
[15:36:56] Monitor 2 has a Height of: $$HEI
[15:36:56] Monitor 2 has a Width of: 3840
[15:36:56] Monitor 2 has a Size of: 2160,3840
```

Syntax

DTI.Height[|P1]

Parameter Explanation

P1 – (optional) Variable, local or Global. If omitted the Result will be placed on TOS.

Example

```
'************************************
' Example 1
'************************************
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DTI.dd|$$NUA|$$DEP
  DBP. Monitor $$NUA has a Depth of: $$DEP
  DTI.df|$$NUA|$$FRE
  DBP. Monitor $$NUA has a Frequency of: $$FRE
  DTI.dh|$$NUA|$$HEI
```

© 2023 Theo Gottwald * https://www.smart-package.com

```

3.83.5.6 DTI.MousePos

MiniRobotLanguage (MRL)

DTI.MousePos

Get X and Y Position of the Mouse Pointer on the total Desktop (all Monitors)

Intention

This command will return the X, and Y-Position of the Mousepointer in Screen-Coordinates.

```
DOL.1
  DTI.mp|$$XPO|$$YPO
  PRT.Position on $$MYH is  at: $$XPO,$$YPO
  PAU.0.1
OOP.
```

Syntax

DTI.MousePos[|P1][|P2]

Parameter Explanation

P1 – (optional) Variable for X-Result. If omitted the Result will be placed on TOS.
P2 – (optional) Variable for Y-Result. If omitted the Result will be placed on TOS.

Example

```
'************************************
' Example 1
'************************************
DOL.1
  DTI.mp|$$XPO|$$YPO
  PRT.Position on $$MYH is  at: $$XPO,$$YPO
  PAU.0.1
OOP.
```

3.83.5.7 DTI.Name

MiniRobotLanguage (MRL)

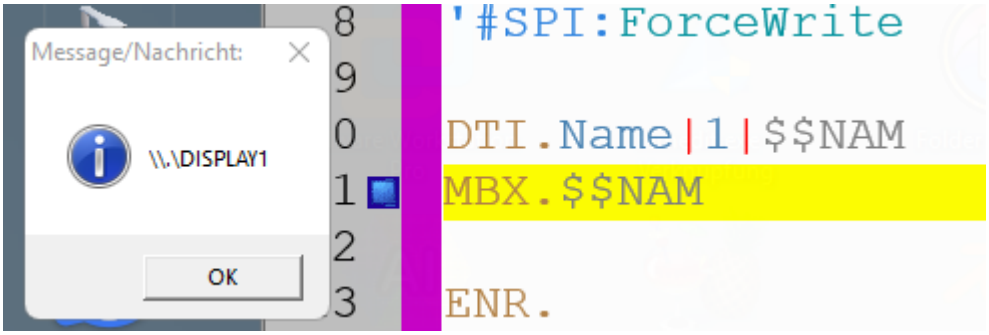
DTI.Name

Get Internal Windows-Name of Desktop-Screens (Monitors)

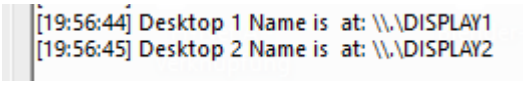
Intention

This command will the "Name" of the Display. Each Display "Monitor" has another Name.
The Display-Monitors are numbered starting with 1. Therefore "1" is always the Main Monitor.

```
DTI.cd|$$RES
MBX.$$RES
ENR.
```



```
' Example showing all connected Monitors
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DTI.dn|$$NUA|$$NAM
  DBP.Desktop $$NUA Name is  at: $$NAM
NEX.
ENR.
```



Syntax

DTI.Name|P1[|P2]

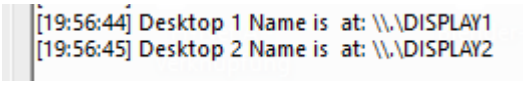
Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P1 – 1-based Number of the Monitor to return the name.
P2 – (optional) Variable,for result. If omitted the Result will be placed on TOS.

Example

```
'************************************
' Example 1
'************************************
DTI.cd|$$NUM
FOR.$$NUA|1|$$NUM
  DTI.dn|$$NUA|$$NAM
  DBP.Desktop $$NUA Name is  at: $$NAM
NEX.
ENR.
```



Remarks

Limitations:

3.83.5.8 DTI.ScaleFactor

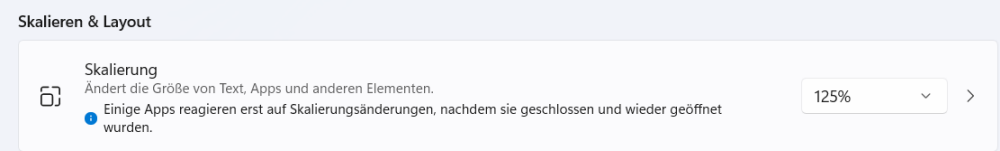
MiniRobotLanguage (MRL)

DTI.ScaleFactor

Return DPI-Scaling Factor for the primary Screen (Monitor)

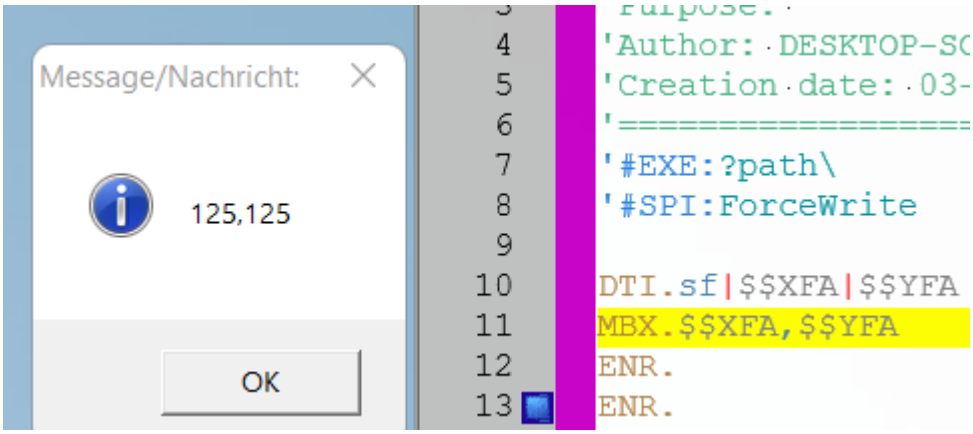
Intention

This command will give you the Scale-Factor of the primary Monitor. You will get the X- and the Y-Scale.
This Command is for the primary Monitor-Screen. You can not get the Factor for other connected Monitors if the are different.



.

```
DTI.sf|$$XFA|$$YFA
MBX.$$XFA,$$YFA
ENR.
```



Syntax

DTI.ScaleFactor[|P1][|P2]

Parameter Explanation

P1 – (optional) Variable, X-Result, If omitted the Result will be placed on TOS.
P2 – (optional) Variable, Y-Result, If omitted the Result will be placed on TOS.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'************************************
' Example 1
'************************************
DTI.sf|$$XFA|$$YFA
MBX.$$XFA,$$YFA
END.
```

3.83.5.9 DTI.ScalePos

MiniRobotLanguage (MRL)

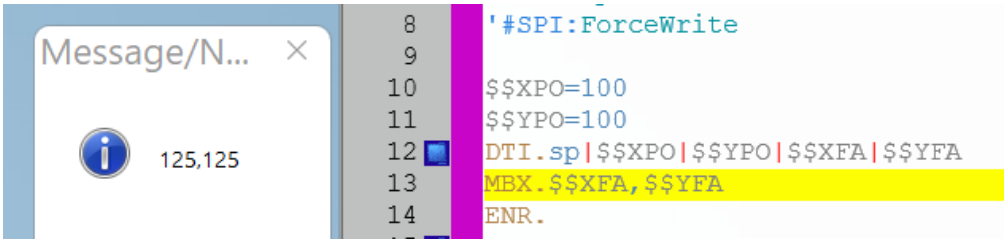
DTI.ScalePos

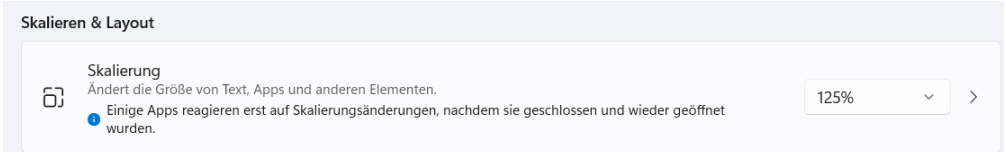
Calculate the real Position of a Pixel on the Screen using the Scale-Factor of the primary Screen (Monitor)

Intention

This command will return the scaled Pixel-Position using the Scale-Factor of the primary Screen.
If this is set to - for example 125% - then a Pixel that was originally at 100,100 will move to 125,125.

```
$$XPO=100
$$YPO=100
DTI.sp|$$XPO|$$YPO|$$XFA|$$YFA
MBX.$$XFA,$$YFA
ENR.
```





Syntax

DTI.ScalePos|P1|P2[|P3][|P4]

Parameter Explanation

P1 – Input-Position X,numeric or variable.
P2 – Input-Position Y,numeric or variable
P3 – (optional) Variable, X-Result, If omitted the Result will be placed on TOS.
P4 – (optional) Variable, Y-Result, If omitted the Result will be placed on TOS.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'************************************
' Example 1
'************************************
$$XPO=100
$$YPO=100

3.83.6 GAR. - Get actual Rectangle

MiniRobotLanguage (MRL)

GAR. Command

Get actual RECT

Intention

The GAR-Command can be used to get the actual localized rectangle of any window or object in screen coordinates. It may also return the type of localized object and the actual localized window-handle.

All windows or accessible objects or graphical objects that are localized have a rectangle outline. This command will return their rectangle coordinates, in this format:

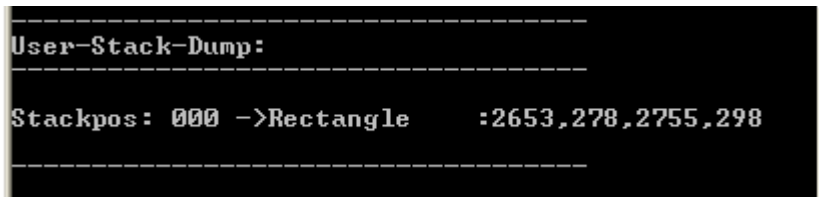
```
left,top,right,bottom
```

as screen coordinates.

The simplest mode of using GAR. is just writing

```
GAR.
```

then it may leave coordinates like these on the Stack:



Here is a example that uses P1 instead of the stack for the return-RECT coordinates:

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
GAR.$$REC
DBP.$$REC
ENR.
' Result is: 2653,278,2755,298
```

You can also find out, if the last localized Object was a window or something else:

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
SAO.r|42
GAR.$$REC|$$TYP
DBP.$$TYP
ENR.
' Result is "1" - accessible Object
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
SAO.r|42
GAR.$$REC|$$TYP
DBP.$$TYP
ENR.
' Result is "0" - window type object
```

In the following example we will use the command to retrieve the actual located window handle - if any.

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}
GAR.$$REC|$$TYP|$$HWN
DBP.$$REC-$$TYP-$$HWN

SAO.r|42
GAR.$$REC|$$TYP|$$HWN
DBP.$$REC-$$TYP-$$HWN
ENR.
```

Result is:

```
[09:41:05] [16] 2653,278,2755,298-0-265108
[09:41:06] [20] 2655,280,2753,296-1-0
```

Syntax

GAR.[P1][|P2][|P3]

Parameter Explanation

P1 - (optional) Variable that will get the Rectangle coordinates, if omitted, Stack is used.

P2 - (optional) Variable that will receive the type of the last localized Object.

These types are:

```
0 - Window-Object
1 - accessible (web/office) Object
2 - graphical object
```

P3 - (optional) Variable that receives the handle of the actual localized window, if any.
If the last localized object is not of type "window", this variable will be set to zero.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
STW.ct|MyClassName|Sample Application
SCW.nct|1|Edit|{&NOTEXT:}

GAR.$$REC|$$TYP|$$HWN
DBP.$$REC-$$TYP-$$HWN

SAO.r|42
GAR.$$REC|$$TYP|$$HWN
DBP.$$REC-$$TYP-$$HWN

ENR.
```

3.83.7 GCT. - Get-Childs-TopWindows

MiniRobotLanguage (MRL)

GCT. Command

Get Childs Topwindow

Intention

The GCT-Command can be used to return the Top-Window of the currently located Window, whether it is a child or a Top-Window.

If you have multiple equal Top-Windows, and you need to locate a "Non-unique" button in just one of them, GCT. and SCW. will help you to do the trick.

First use the SCW.-command 3752 with the "T"-Flag to search directly a "unique child-window" (static, button etc.) in the proper application-window. Next use GCT. to get the Top-Window of it. From that point you can locate another control in that window, using SCW..

You can use SAO to search a Desktop-Element and get the Top-Window using GCT.

GCT. will also set the Backjump-Line 3764 to its line number. Therefore all following SCW. will rollback to GCT.

Syntax

GCT.[P1][|P2]

Parameter Explanation

P1 - Variable with a Window-Handle
P2 - Variable P2 is been loaded with the Handle of the Top-Window from P1.

If P1 is given, the Top-Window of P1 is been calculated and located.

If P1 and P2 is given, Variable P2 is been loaded with the Handle of the Top-Window from P1. The Top-Window is NOT located in this case.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.t|Internet Explorer
SCW.c|msctls_
'Locate the Top-Window of the actual selected Window..
GCT.
' Mouse moves just as if we would not have been doing the SCW.
MMV.
```

3.83.8 GFW. - Get Foreground Window

MiniRobotLanguage (MRL)

GFW. Command

Get Foreground Window

Intention

The `GFW.` Command retrieves a handle to the foreground window (that is the window with which the user is currently working).
The handle of the window is returned and the window is been immediately located.
If the handle can not be returned, for whatever reason, the command returns a zero.

Usage is as simple as:

```
' Top Enabled Window
GFW.$$REA
DBP.$$REA
```

Syntax

GFW.[P1]

Parameter Explanation

P1 **-** ***(optional)*** variable that will returns the window handle, if omitted TOS is use.
If the window is found, it is localized.

Example

```
GFW.$$REA
DBP.$$REA
```

3.83.9 GRW. - Get Related Window

MiniRobotLanguage (MRL)

GRW. Command

Get Related Window

Intention

The `GRW.` Command can be used to return the handle of windows, that are in a specified relation to the given input window. That is for example, a parent, an owner or a child-windows.

The handle is returned and the window is been immediately located.

If the handle can not be returned, for whatever reason, the command returns a zero.

Usage is as simple as:

```
' Locate the taskbar window above to the Start Button (XP
only)
GSW.sb|$$RET
GRW.pr|$$RET|$$REA
DBP.$$REA
```

What is the "Z-Order"?
The z-order of a window indicates the window's position in a stack of overlapping windows. This window stack is oriented along an imaginary axis, the z-axis, extending outward from the screen. The window at the top of the z-order overlaps all other windows. The window at the bottom of the z-order is overlapped by all other windows.
The system maintains the z-order in a single list. It adds windows to the z-order based on whether they are topmost windows, top-level windows, or child windows. A topmost window overlaps all other non-topmost windows, regardless of whether it is the active or foreground window. A topmost window has the TOPMOST style. All topmost windows appear in the z-order before any non-topmost windows. A child window is grouped with its parent in z-order.

For more Infos see: MSDN Windows

Syntax

GRW.[P1][|P2][|P3]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 - (optional) specifies the window that shall be returned, out of the following:

"parent","pr"
Retrieves a handle to the specified window's parent or owner. To retrieve a handle to a specified ancestor, use the Ancestor commands ("pa","ra","oa").

"child","ch"
The retrieved handle identifies the child window at the top of the Z order, if the specified window is a parent window; otherwise, the command returns zero. The function examines only child windows of the specified Input-window. It does not examine descendant windows.

"first","gf"
The retrieved handle identifies a window of the same type that is highest in the Z order. If the specified window is a topmost window, the handle identifies a topmost window. If the specified window is a top-level window, the handle identifies a top-level window. If the specified window is a child window, the handle identifies a sibling window.

"last","gl"
The retrieved handle identifies a window of the same type that is lowest in the Z order. If the specified window is a topmost window, the handle identifies a topmost window. If the specified window is a top-level window, the handle identifies a top-level window. If the specified window is a child window, the handle identifies a sibling window.

"next","gn"
The retrieved handle identifies a window below the specified window in the Z order. If the specified window is a topmost window, the handle identifies a topmost window. If the specified window is a top-level window, the handle identifies a top-level window. If the specified window is a child window, the handle identifies a sibling window.

"previouse","gp"
The retrieved handle identifies a window above the specified window in the Z order. If the specified window is a topmost window, the handle identifies a topmost window. If the specified window is a top-level window, the handle identifies a top-level window. If the specified window is a child window, the handle identifies a sibling window.

"owner","ow"
The retrieved handle identifies the specified window's owner window, if any.

"parent ancestor","pa"
Retrieves the parent window. This does not include the owner-window.

"root ancestor","ra"
Retrieves the root window by walking the chain of parent windows.

© 2023 Theo Gottwald * https://www.smart-package.com

"owner ancestor","oa"
Retrieves the owned root window by walking the chain of parent and owner windows returned, using "parent" command above.

"popup","po"
May retrieve the handle of an owned PopUp-Window to that window, if any.

"toplevel","tl"
Retrieves the window's top-level parent or owner window.

"topparent","tp"
Retrieves the window's top-level parent window.

"formhandle","fh"
Finds the handle of the top-level window or MDI child window that is the ancestor of the
specified window handle. The reference handle is the handle of any control on the form.

"childtop","ct"
Examines the Z order of the child windows associated with the specified parent window
and retrieves a handle to the child window at the top of the Z order.

P2 - (optional) P2 can be the window handle of the input window.
If its omitted, the actual window is used.
If there is no actual window, the function will return zero.

P3 - (optional) Variable P3 is been loaded with the Handle of the
Window if it is found. If the window is not found a zero is
returned. If P2 is omitted, the result is been placed on TOS.

If the window is found, it is localized.

Example

```
' Click the volume icon in the System-Notification Area.
GSW.sb|$$RET
AGR.43|Volume
MLC.
```

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.10 GSW. - Get Special Window

MiniRobotLanguage (MRL)

GSW. Command

Get Special Window

Intention

The `GSW.` Command can be used to return the handle of special windows, like the desktop, the Traybar or the Quick-Launch.

The handle is returned and the window is been immediately located.

If the handle can not be returned, because - for example - there is no explorer loaded, the command returns a zero.

Using this command is safer then locating these windows in another way, because it uses internal methods that are mostly safer for international or newer windows versions.

To be safe, test your script on the OS that it finally should run on.

Usage is as simple as:

```
' Click the volume icon in the System-Notification Area.
GSW.sb|$$RET
AGR.43|Volume
MLC.
```

Syntax

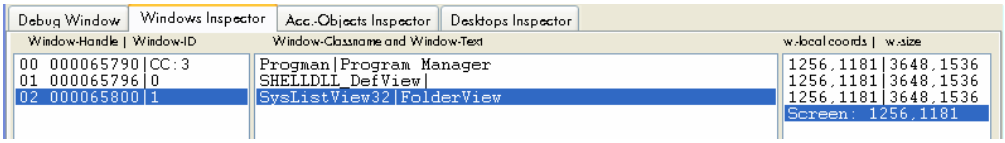
GSW.[P1][|P2]

Parameter Explanation

P1 - (optional) `specifies the window that shall be returned, out of the following:`

`"shell desktop","sd"` – locate the shell-desktop-Top-Window. In the example below it has the handle `65790`. On a dual-screen system, this window has the X-Size over both screens, and the Y-Size of the larger of both screens.

© 2023 Theo Gottwald * https://www.smart-package.com

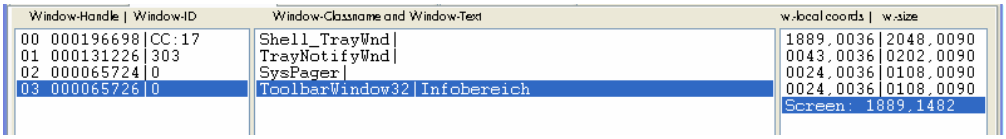


"desktop","dt" - locates the actual Input Desktop. On a dual-screen system it covers
only the main desktop with the taskbar and the start-menu. Its not visible in the windows
-analyzer when you move the mouse over the desktop.

"sc","shell child" - locate the shell-desktop-Top-Window and then the next child-window. In the example above it has the handle 65796 and the window-class "SHELLDLL_DefView".

"dtl","desktop listview" - locate the shell-desktop-Top-Window and then the desktop-listview. In the example above it has the handle 65800 and the window-class "syslistview32".

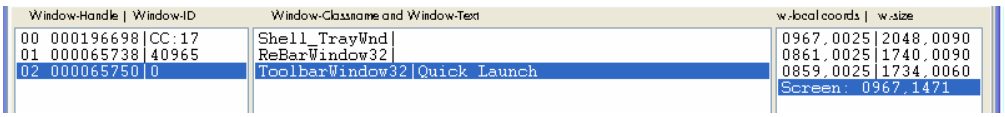
"tw","tray" - locate the Shell-Tray-Top-Window. In the example below it has the handle 196698 and the window-class "Shell_TrayWnd". On the primary desktop
this window covers the complete taskbar.



"tb","traybar" - locate the Desktop Traybar-User Notification Area-Toolbar-Window. This is the window that contains the Traybar Notification-Icons. In the example
above it has the handle 65726 and the window-class "toolbarwindow32".

"sb","start button" - locate the Shell-Tray-Top-Window and then the START-Button.. This option may currently only work under Windows XP.

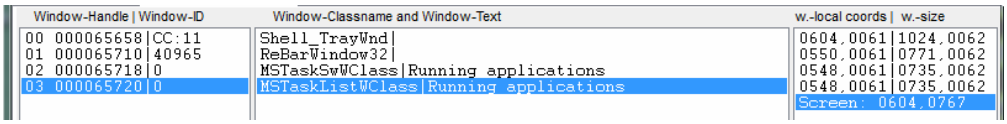
"ql","quick launch" - locate the Shell-Tray-Top-Window and then the Quicklaunch Area. This option may only work under Windows XP.



"ab","application bar"- locate the Shell-Tray-Top-Window and then the application
run-area Taskbar). In the picture below that is the window wit hthe handle 65718 and

© 2023 Theo Gottwald * https://www.smart-package.com

the class **"MSTaskSwWClass**.". The window on Level 3 seems to be a toolbar on XP
and a "MSTaskListWClass" under Windows 7.



P2 **-** ***(optional)*** Variable P2 is been loaded with the Handle of the
Window if it is found. If the window is not found a zero is
returned. If P2 is omitted, the result is been placed on TOS.

If the window is found, it is localized.

Example

```
' Click the volume icon in the System-Notification Area.
GSW.sb|$$RET
AGR.43|Volume
MLC.
```

Remarks

Tested with Windows XP and Windows 7. There may be changes needed for Windows 8 and higher.

3.83.11 GWP. - Get Window Position/Size

GWP. - Get Window Position and Size Previous 3630 Top 41 Next 3636

MiniRobotLanguage (MRL)

GWP. Command

Get Window Position and Size

Intention

The GWP.-Command can be used to get the position or the size of the actual selected Top- or Child-Window.

The window position is been calculated from the top-left corner of the window or child-window. To change window-position and size, use SWP. - Set Window Position and Size 3884

Syntax

GWP.[P1][,P2][|P3][,P4][|T]

Parameter Explanation

P1 - Left-Position
P2 - Top-Position
P3 - X-Size
P4 - Y-Size
T - if used, the Top_window of the actual selected Window is taken, no matter
if a Top- or a child-Window is the actual located window.

You can omit any of the Parameters.
In that case the results will be placed on the stack in the following Order:

```
TOS:  §§000 - Window-Centerpoint, X - Coordinate
      §§001 - Window-Centerpoint, Y - Coordinate

      §§002 - Window- Upper, left Corner, X - Coordinate
      §§003 - Window- Upper, left Corner, Y - Coordinate

      §§004 - Window-Size, X
      §§005 - Window-Size, Y

      §§006 - Window- Lower, right Corner, X - Coordinate
      §§007 - Window- Lower, right Corner, Y - Coordinate
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*******************************************
' GWP. Sample 2
'*******************************************
'

3.83.12 HTV. - Handle-to-Variable

MiniRobotLanguage (MRL)

HTV. Command

Handle to Variable

Intention

This command returns the Window-Handle of previous localized windows into the given variable or on TOS 369.

Examples for usage:

```
' place handle of last localized window on TOS
HTV.

' place handle of last localized window in $$HWN
HTV.$$HWN

' place handle of last localized top-window in $$HWN
HTV.$$HWN|t

' place handle of last localized child-window in $$HWN
HTV.$$HWN|c
```

Syntax

HTV.[P1][|P2]

Parameter Explanation

P1 – First Parameter is a Variable, local or Global. If invalid, or **-**, Stack is used.
P2 – Second Parameter (Flag) is optional, it can be
a - Handle from last localized Window,Top- or Childwindow.
c - Handle from last localized Childwindow.
t - Handle from last localized Topwindow.

Example

```
'*****************************************************
' EXAMPLE : HTV
'*****************************************************
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
STW.ct|#32770|Sample App

3.83.13 HWI. - Hide Window

MiniRobotLanguage (MRL)

HWI. Command

Hide Window or unhide Window using Transparency

Intention

You want to hide your Setup-Program from the user while installation?
`HWI.` can make windows invisible while you can still click all of their buttons!
`HWI.` can also make Windows transparent, that you can see through these windows.

This command can make Windows transparent or invisible.
It can also reverse that effect.
It can also make Windows from any applications that are already transparent, invisible or opaque.

Examples for usage:

```
' make last localized Topwindow get invisible
HWI.0

' make last localized Topwindow get opaque
HWI.255

' make last localized Topwindow half transparent
HWI.128

' make TopWindow with Handle $$HWN half transparent
HWI.125|$$HWN
```

This command can also be used to make windows appear softly from invisibility ("blend-in effect").

Syntax

HWI.[P1][|P2]

Parameter Explanation

P1 – numerical Parameter 0-255.
0 - Window is completely invisible
255 - Window is opaque (completely visible)
All values between make the window more or less transparent.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P2 – ***(Optional)*** If given it is a Handle from a Top-Window.
If omitted, the last localized Top-Window is used.
This command works only with Top-Windows, if you want to make
Child-Windows, Buttons etc. invisible, use the SWS.-command instead.

Example

```
'******************************************************
' EXAMPLE : HWI
'******************************************************
STW.ct|#32770|Sample App
' Blend a window "in" slowly
FOR.$$CNT|0|255
 HWI.$$CNT
PAU.0.1
NEXT
```

Remarks

-

Limitations:

Requires Windows XP or higher.
This command works only with Top-Windows, if you want to make
Child-Windows, Buttons etc. invisible, use the SWS.-command instead.

See also:

- !. STW. - Description 3814
- 1.8. Selecting the Application (Topwindow) 150

3.83.14 ICW. - If-Child-Window

3.83.14.1 ! ICW. - If-Child-Window

MiniRobotLanguage (MRL)

ICW. Command

Seach Child Window

Intention

This command localizes a specified Child-Window (Control, Button etc.) within a previous localized Top-Window (Application-Window).

To understand this command, be sure to read the chapters:
1.8. Selecting the Application (Topwindow) 150
and
1.9. Locating Child-Windows 162
first.

It will then sets the Mouse-Target Point into the window-center.

`ICW.` has a lot of features, which are controlled using the 1.4. The Prototype Parameter System 73 .Be sure you have read and understand that chapter before trying to understand `ICW.`

Unless using the "T"-Option, the `ICW.`-command needs a Top-Window being localized first. Therefore please read the section 1.8. Selecting the Application (Topwindow) 150 carefully.

The Command has a "Rollback" Feature, when the Child-Window is not found in few Seconds. It jumps back to the `STW.` (Search Top-Window) and tries to get a new Top-Window, which possibly has the wanted button or control.
This will continue, until its time has run out.
If you use the `DBM.1` -command, you can see these "Rollback-Jumps" in the Debugging-Console. See the example below.

```
DBM.1
STW.Act|PBWindowClass:0|TestApp
' This button/childwindow does not exist
ICW.nctb|2|Button|Button 23|.5
MLE.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
[10:13:11] STW.Act|PBWindowClass:0|TestApp
[10:13:11] SCW.nctb|2|Button|Button 23|.5
[10:13:12] STW.Act|PBWindowClass:0|TestApp
[10:13:12] SCW.nctb|2|Button|Button 23|.5
[10:13:12] STW.Act|PBWindowClass:0|TestApp
[10:13:12] SCW.nctb|2|Button|Button 23|.5
[10:13:13] STW.Act|PBWindowClass:0|TestApp
[10:13:13] SCW.nctb|2|Button|Button 23|.5
```

You can control this Feature using the "b" - Backjump-Time Flag 3764.

Syntax

ICW.[Prototypes|][Parameters|]

Parameter Explanation

Parameter

```
 a - (np) "all" - search all windos, includes
     invisible and disabled windows.
 b - (p) "backjump"-flag, time in seconds, 0 disables the jump
 c - (p)  window-class
 d - (p) window-depth
 e - (np) enabled, window must be enabled
 f - (np) disabled, window must be disabled
 g - (p) Goto on found
 h - (p) handle. Immediately locate the window with given
handle.
     All other prototypes will be ignored.
 i - (p) window-id
 j - (p) WaitForInputIdle (Value)
 k - (np) WaitForInputIdle (no Value), use value
      from last Call/default-value
 n - (p) Fensternumber in der Ebene ("WR->SWC")
 o - (p) on not found goto (Label)
 p - (p) Process-ID (PID 137)
 q - (p) Thread-ID (TID)
 r - (p) result number ("WR-SPC-Count")
 s - (np) internal reversing at child windows search
 t - (p) text
 u - (np) invisible, window must be invisible
 v - (np) visible, window must be visible
 w - (p) total waiting-time in Seconds, fractions (0.5)
     are possible, zero is possible.

 E - (np) Add Window to Exclude List after localization
 I - (p) p = handle. Locate window and remove window
     from Exclude list.
 K - (n) Immediately clear Exclude-List before specified
search
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
Q - (n) use previous Prototypes
S - (n) Search only next Level (SWC-Option)
T - (n) Search desktopwide, ignore localized Top-Window
V - (p/Label) Gosub on not found
W - (p/Label) Gosub on  found
X - (n) Run without Error on not found
```

Explanation:
(np) -> only prototype, no additional parameter required
(p) -> prototype requires additional parameter
(NUM/VAR) - window handle/variable
(p/Label) - Label-Parameter required, can also be a variable that contains the label

P2 **-** Parameters, separated by | according to the prototypes

Example

```
STW.Act|PBWindowClass:0|TestApp
ICW.nctE|2|Button|Button 2
' Coordinates relative to left, upper corner of button
MPO.o|42,22
MLE.
EIF.
```

Remarks

When using `ICW.` to check if a child-window is available or not, it makes sense that you use the "b"-flag with a value of "0" to disable the backjump.

3.83.15 IEW. / NEW. - If Exist Window

MiniRobotLanguage (MRL)

IEW. Conditional Statement

If Exist Window

Intention

Conditional Statement. Test if one or more (up to 20) a specified window handle(s) is valid or not. A window handle is valid until the corresponding window has been closed (destroyed).

`IEW.` tells you, if the actual window is still available or has been closed.
If no parameter is given, the actual window is been tested. If you give parameter, these must be window handles, or the letters "**c**" or "**t**".
These letters stand for "child" and "Top". If given they will be replaced with the last window of that kind that has been localized.

c - last localized child-window

t - last localized Top-Window

Please note, that if the actual window is a child-window (e.g. a button), you need to specify "**t**" as parameter,if you want to test the actual top-window. Some examples:

```
'Get first window handle
STW.ct|CabinetWClass|F:\00_RPGM
HTV.$$HAA
'Get second window handle
STW.ct|Chrome_WidgetWin_0|meebo.com
HTV.$$HAB
'Test both handles
IEW.$$HAA|$$HAB
  DBP.All windows are alive
ELS.
  DBP.At least one of the windows is history
EIF.
ENR.
```

Other modes of operation are:

```
' Check actual located window
IEW.

' check last located child window
IEW.c

' check actual Top-window
IEW.t
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' check window with handle in $$MYH
IEW.$$MYH
```

NEW. is the negative version "Not Exist Window".

Syntax

IEW.P1[..|Px] ... ELS. ... EIF.

Parameter Explanation

P1 **- numeric or "c" or "t".** Can be Variable that contains a window handle. If omitted actual window is taken. You can also use these letters:

- **c** - last localized child-window
- **t** - last localized Top-Window

If you add multiple handles, they are AND'ed with IEW. If ANY of the given handles is invalid, the instruction will fail.

If you give multiple handles with NEW. (negative form of the command), the opposite will happen. If all of the given handles are valid, the instruction will fail.

IEW.'s can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or FEX. (Enumerations) to unlimited Depth.

Speed in Ticks:

This command uses typically around 290 Ticks.

Example

```
'*********************************
' IEW./NEW.-Sample
'*********************************
STW.t|Sample
MMV.
IEW.
 MBX.Ok
ELS.
 MBX.Diabled!
EIF.
END.
```

3.83.16 ITW. - If Top Window

3.83.16.1 ! ITW. / NTW. -If Top-Window

MiniRobotLanguage (MRL)

ITW. Conditional Statement

If Top Window

Intention

This conditional statement works like the `STW.`-command, and also has all options (prototypes) from the `STW.`-command.
Unlike `STW.`, `ITW.` does not wait for a window to appear by default.
If the window is not there it will choose the `ELS.`-case.

If you want `ITW.` to wait for a window, you can specify the "w"-Flag and the waiting time manually.

It forms conditional statement to make structured scripts more readable.

`ITW.` localizes a specified Top-Window and sets the actual point into its center.

All following `SCW`-commands will be within this window.

`ITW.` has a default window-treatment 3814 to ensure that any further action in that window will be effective. This default treatment will do following:
- normalize minimized windows (like the "D"-Flag
- windows that are outside the desktop-work area will be moved to 0,0 (like "G"-Flag)
- The window will be moved in front of all other (non-TopMost 3838)-windows.
- The window will receive the input focus. (like the "J"-Flag)

This default window-treatment can be completely deactivated using the "A" - Flag - ITW. 3651.

This makes sense, for example when working with Menu's or other windows which disappear when the default treatment is being applied.

Alternatively the default window treatment can be influenced using other flags, like "B" or "G".

If the window should be brought into work area, without other treatment, use the "B"-Flag. "G", will just prevent the repositioning of the window and let the other treatment-steps happen.

All window search operations change the Timeout System Variables `#tio#` and `#til#`. Using these you can find out if a window was found or not, even if you have used the"X" Flag (X - run without Error).

*© 2023 Theo Gottwald * https://www.smart-package.com*

Hint: Please note that the Flags have a priority from left to right (highest Priority). If you add other flags after the "A" there may be a treatment. Because the more right the flags, the higher their priority. If you place the "A" last inside the prototypes, all involved treatment will be disabled.

See two examples.
In this first case the "A" Flag has priority over the "C" Flag, because its right of it.

```
ITW.tCA|explorer
  MMV.
EIF.
```

In this case the "C" Flag is right of the "A" Flag and therefore has priority over the "A" Flag.

```
ITW.tAC|explorer
MMV.
EIF.
```

Some Flags deactivate the default treatment or parts of it. See description below.

Hint: If you omit all parameters like this:
`ITW.`
the command will automatically restore the parameters from the previous call. This makes it easy to always locate the same Top-Window.Note that this also applies to `STW.` as both use the same parameters-store.

Syntax

ITW.P1[|P2]...[|Px]

Parameter Explanation

P1 – Prototype
P2 .. **PX** - Parameters according to prototypes

```
A - (np) Switch off default window treatment completely
B - (np) disables following parts of "default treatment":
     NO Restore from Minimized, NO Set Input-Focus,
     NO Bring to Front
C - (np) If the window i maximized, it will be restored to
    normal size
D - (np) If the window is minimized,  will be restored to its
    previous size, before it was minimized,
E - (np) Put Localize window, then add window to
    Search Exclude List.
F - (np) Move window to center of primary desktop
G - (np) disable default window-treatment-"repositioning if
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
     outside"
H - (np) a window that is outside the primary desktop working
area
    will be repositioned. Default is that the window can be
also
    on a second desktop.
I - (NUM/VAR) Remove window with the given window-handle from
the
    search-exclude-list.
J - (np) Bring window to Front. Does not switch off default
window
    treatment.
K - Immediately clear Exclude-List before specified search
M - (np) Set window to TOPMOST. Such windows will be on Top
of all
    other Non-TOPMOST windows. DANGER - even Messageboxes may
be
    hidden behind a TOPMOST window. Use this with caution!
N - (np) remove the TOPMOST Property from a window.
Q - use previous Prototypes (only prototypes)
V - (p/Label) Gosub Line/Label if the window was NOT found
W - (p/Label) Gosub Line/Label if the window was found
X - (np) run without error if window was not found. Timeout
Flag
    #tio# and #til# will anyway be set and can be used.

a - (np) changes internal settings that "all" windows will be
    found. This includes invisible and disabled windows.
b - (np) "back" - moves window to the back, behind other
windows.
c - (p) "class", window-class parameter
e - (np) enabled, the window must be enabled or it will
ignored.
f - (np) disabled, the window must be disabled or it will
ignored.
g - (p/Label) Goto Line/Label if the window was found
h - (p) localize the window directly using a given window
handle.
    Note, if "h" is given, other search conditions will
    be ignored.
j - (p) WaitForInputIdle, you can specify the WII timeout
k - (np) WaitForInputIdle - no parameter, use the default
    WII timeout.
o - (Label/Variable) on not found goto (Label)
p - (p) process-ID, search only windows from process with
this
    given PID
q - (p) ThreadID,, search only windows from process with this
    given TID
r - (p) No. of result to choose (Result-Number for Top-
Windows)
t - (p) text, window-text (often the window caption)
u - (np) invisible, search only invisible windows
v - (np) visible, search only visible windows
w - (p) total waiting-time in Seconds, 0.5 (FP-numbers) is
    possible.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Explanation:
(np) -> only prototype, no additional parameter required
(p) -> prototype requires additional parameter
(NUM/VAR) - window handle/variable
(p/Label) - Label-Parameter required, can also be a variable that contains the label

P2 - Px - Data according to the prototypes, separated by |

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
' We use ITW here to test if the Application is already
running
' in that case we jump over the EXE-command and contine.
' We use the following flags:
' w ... 0 - Set waiting time to 0 seconds
' t ... "BCS - Testform" - this is the caption text of the
window we search for
'
NTW.wt|0|BCS - Testform
  EXE.?exepfad\Sample Apps\BSC-Testform.exe
EIF.

' Now we can use the Application and press Buttons
' No STW, - needed, as ITW. locates the window already
SCW.nctb|1|Button|Next|0
' Compatible Button Click
MLC.

'-------------------------------------------------------------
ENR.
```

3.83.16.2 "A" - Flag - ITW.

"A" - Flag "No windows treatment" Previous 3646 Top 41 Next 3653

MiniRobotLanguage (MRL)

"A" - Flag "No windows treatment"

If Top Window

Intention

ITW. has a default window-treatment to ensure that any further action in that window will be effective. This default treatment will do following:
- normalize minimized windows (like the "D"-Flag
- windows that are outside the desktop-workarea will be moved to 0,0 (like "G"-Flag)
- The window will be moved in front of all other (non-TopMost)-windows.
- The window will receive the input focus. (like the "J"-Flag)

This default window-treatment can be completely deactivated using the "A"-Flag.

This makes sense, for example when working with Menu's or volatile windows, which disappear when the default treatment is being applied.

Usage:

```
ITW.cA|#32768
 MMV.
EIF.
```

Please note that the Flags are internally analyzed in the order in which they are given. If you add other flags after the "A" there may be a treatment.
If you place the "A" last inside the prototypes, all such treatment will be disabled.

In this case the "A" Flag has priority over the "C" Flag, because its right of it.

```
ITW.tCA|explorer
 MMV.
EIF.
```

In this case the "C" Flag is right of the "A" Flag and therefore has priority over the "A" Flag.

```
STW.tAC|explorer
MMV.
```

Example

```
'#EXE:?pfad\
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'#SPI:ForceWrite
'
' Click on the OK Button in a messagebox
' Locate the Application (Top-)Window
' If its available
ITW.cA|#32767
 MMV.
EIF.
ENR.
```

Remarks

Alternatively the default window treatment can be influenced using other flags, like "B" or "G".

If the window should be brought into work area, without other treatment, use the "B"-Flag. "G", will just prevent the repositioning of the window and let the other treatment-steps happen.

Limitations:

3.83.16.3 "B" - Flag - ITW.

"B" - Flag "partial treatment" Previous 3651 Top 41 Next 3655

MiniRobotLanguage (MRL)

"B" - Flag "partial treatment"

If Top Window

Intention

ITW. has a default window-treatment to ensure that any further action in that window will be effective. This default treatment will be reduced, when the "B" - Flag is set.

When the "B" Flag is in effect, windows that are outside the desktop-workarea will be moved to the upper, left corner of the desktop - that is position 0,0. That is the only treatment that will be done.

Also this can be disabled with the "G"-Flag. Means, that the flags "G" and "B" together are just like the "A" flag,

Example:

```
ITW.Bc|WindowClass
 MMV.
EIF.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
ITW.cB|#32767
 ' Locate the button
 SCW.t|Ok
 ' Click the button
 MLE.
EIF.
ENR.
```

3.83.16.4 "C" - Flag - ITW.

"C" - Flag "restore if maximized" Previous 3653 Top 41 Next 3656

MiniRobotLanguage (MRL)

"C" - Flag "restore if maximized"

If Top Window

Intention

If the window is maximized, this flag will bring the window back to its normal size.
You can maximize, minimize and restore windows using the SWS. - Set Window State 3889 command.

It does not matter, if the window was minimzed before it was maximized.
The window will be normal size after this flag.

Example

```
ITW.ct|PBWindowClass:0|TestApp
' Maximize Window
SWS.z
' Wait 1 Second
PAU.1
EIF.
' Window will be restore to normal size
STW.ACct|PBWindowClass:0|TestApp
ENR.
```

Remarks

Limitations:

3.83.16.6 "E" - Flag - ITW.

"E" - Exclude window" Previous 3656 Top 41 Next 3659

MiniRobotLanguage (MRL)

"E" - Flag "Exclude window"

If Top Window

Intention

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with STW. and not with ITW. It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
STW.cE|WindowClass
MMV.
```

And how do you get the window out the "Exclude List"?
This is what the "I"-Flag is good for.

```
' Remove window from exclude List
STW.I|$$HWN
```

The "I"-Flag however need a window handle as parameter and will not work in any other constellation. Therefore keep the handles of those excluded windows, if you want to have them back later.

Example

```
' Use Exclude List

' Add window to exclude list
ITW.tE|TestAP
MMV.
VAR.$$HWN=#hwn#

' Remove window from exclude List
ITW.I|$$HWN
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' If you comment the ITW. above the window can not be found
here:
ITW.t|TestApp

ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag.
To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using SCW. there is also Exclude-List availabe. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

See also:

- "I" - Flag - ITW. 3665
- "K" - Flag - ITW. 3669

3.83.16.7 "F" - Flag - ITW.

"F" - Flag "center window on desktop" Previous 3657 Top 41 Next 3661

MiniRobotLanguage (MRL)

"F" - Flag "Center on Desktop"

Move Window to center of primary desktop

Intention

If the "F"-Flag is given, the window will be move to the center of the primary desktop. The "F"-Flag will override the default windows treatment, which would move the window to 0,0 if its outside of the desktop.
The "F"-Flag will always move the window to the center, no matter where the window was before.

```
ITW.Fc|WindowClass
 MMV.
EIF.
```

Example

```
'
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
ITW.cF|Myclass
' Move Mouse to Center of window
' in center of desktop
 MMV.
EIF.
ENR.
```

Remarks

Limitations:

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.16.8 "G" - Flag - ITW.

MiniRobotLanguage (MRL)

"G" - Flag "don't move window"

don't move the Top Window

Intention

This flag prevents the default window treatment from moving the window around. Without this Flag, a Top-Window that is outside the working area, will be move to position 0,0, that is the upper left corner of the desktop.

Having the "G"-Flag set, the window will just not be moved, no matter if its outside the working area or not.

```
ITW.cG|WindowClass
 MMV.
EIF.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window if its available
ITW.cG|#32768
...
EIF.
ENR.
```

Remarks

Please note that other prototypes may influence the power of the "G"-Flag, especially, if the are right of the "G"-Flag which means they have a higher priority.

Limitations:

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.16.9 "H" - Flag - ITW.

"H" - Flag "stay in primary desktop" Previous 3661 Top 41 Next 3665

MiniRobotLanguage (MRL)

"H" - Flag "primary desktop"

If Top Window

Intention

This flag will move a window to position 0,0, that is the upper left corner, if the window is full or partial outside the primary desktop workarea.

It will override the default window treatment.
While by default also a Dual-Screen Desktop will be accepted as workarea, this will not be the case here.

The "H"-Flag makes sure the window is complete on the primary desktop.

```
ITW.cH|WindowClass
 MMV.
EIF.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Click on the OK Button in a messagebox
' Locate the Application (Top-)Window
ITW.tH|word
 MMV.
EIF.
ENR.
```

Remarks

Limitations:

3.83.16.1("I" - Flag - ITW.

MiniRobotLanguage (MRL)

"I" - Flag "remove from Exclude List"

If Top Window

Intention

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with `ITW.` and not with `STW.` It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
ITW.cE|WindowClass
 MMV.
ELS.
'...
EIF.
```

And how do you get the window out the "Exclude List"?
This is what the "I"-Flag is good for.

```
' Remove window from exclude List
ITW.I|$$HWN
```

The "I"-Flag however need a window handle as parameter and will not work in any other constellation. Therefore keep the handles of those excluded windows, if you want to have them back later.

There is another way, how to search windows which are currently excluded from search?
You can also use the "K"-Flag.

```
' clear whole exclude List
ITW.Kc|WindowClass
```

The "K"-Flag will immediately, even before the search starts, clear the exclude list. No matter if a window is found or not, using the prototype "K" will clear the exclude list.

© 2023 Theo Gottwald * https://www.smart-package.com

After this all previously "exclude listed" windows can be found again.

Example

```
' Use Exclude List
' Add window to exclude list
ITW.tE|TestApp
 VAR.$$HWN=#hwn#
EIF.
' Remove window from exclude List
ITW.I|$$HWN
'...
EIF.
' If you comment the ITW. above the window can not be found
here:
ITW.t|TestApp
'...
EIF.
ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag. To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using `SCW`. there is also Exclude-List available. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.16.1."J" - Flag - ITW.

MiniRobotLanguage (MRL)

"J" - Flag "window to front"

If Top Window

Intention

The window comes to front already with the default window treatment, without any additional flags. But you can disable that, and select yourself exactly what you want. Like this:

```
ITW.AJc|WindowClass
 MMV.
EIF.
```

The "A" Flag will switch of all default window treatment. Then comes the "J"-Flag and tells the robot to bring the window to front. Be careful with the operator priority. If you place the prototypes like this:

```
ITW.JAc|WindowClass
 MMV.
EIF.
```

then the "A"-Flag will switch of the "J"-Flag because it is more right and therefore has a higher priority.

The "J"-Flag itself will not disable the default window treatment. Therefore something like:

```
ITW.Jc|WindowClass
 MMV.
EIF.
```

```
is possibly a waste of letters, as the default behavior of
ITW. is already to bring the window to front.

Note that the Flag "B" does not switch off the "J"-Flag,
therefore when using "B", the sequence of the prototypes "B"
and "J" should not be a issue.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ITW.AJc|#32768
 ' Locate the button
 MMV.
 MBX. Compare with this:
EIF.
ITW.Ac|#32768
 ' Locate the button
 MMV.
EIF.
ENR.
```

Remarks

3.83.16.1 "K" - Flag - ITW.

"K" - Flag "Clear Exclude List and search" Previous 3667 Top 41 Next 3671

MiniRobotLanguage (MRL)

"K" - Flag "Clear Exclude List"

Clear Exclude List and search

Intention

Immediately clear Exclude-List before specified search.

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with `ITW.` and not with `STW.` It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
ITW.cE|WindowClass
 MMV.
EIF.
```

And how do you search windows which are currently excluded from search?
This is what the "K"-Flag is good for.

```
' clear whole exclude List
ITW.Kc|WindowClass
```

The "K"-Flag will immediately, even before the search starts, clear the exclude list. No matter if a window is found or not, using the prototype "K" will clear the exclude list.

After this all previously "exclude listed" windows can be found again.

Example

```
' Use Exclude List

' Add window to exclude list
ITW.Et|TestApp
 MMV.
 VAR.$$HWN=#hwn#
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Remove all windows from exclude List
' and search

' If you remove the "K" below, the window can not be found!
ITW.Kt|TestApp
 MBX.Hello
EIF.
ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag.
To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using `SCW`. there is also Exclude-List available. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Currently you can not check which windows are exclude-listed. There is also no way of showing the content of an exclude-list.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

MiniRobotLanguage (MRL)

"M" - Flag "TopMost"

If Top Window

Intention

In windows, there is a property of Top-Windows that will make them stay always in front of all other windows.

This property is called "TopMost". A window that is "TopMost" is always on top of all other windows, that are not TopMost.

Only another TopMost window can be in front of an TopMost window.

For example the MR-Editor can be set to TopMost.

Now you may think "this sounds good!". Be warned. This is an advanced feature for advanced users.

Programs have Messageboxes and also open up other windows. In case they have been made TopMost, you may not be able to see those Messages or PopUp windows. This may lead for you to think that the program hangs.

Why don't you see those messages?
Because they will not be TopMost and therefore they will appear behind the TopMost window!

Therefore use TopMost style only when really needed and when you know what you are doing.

Using the Flag "M", the window will be made TopMost immediately after it was localized.

```
ITW.cM|WindowClass
 MMV.
EIF.
```

Use the "N"-Flag to remove the TopMost-property from a TopMost window.

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
ITW.Mc|#32768
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$HWN=#hwn#

' Remove the TopMost Property
ITW.hN|$$HWN
 '
ENR.
```

3.83.16.14"N" - Flag - ITW.

MiniRobotLanguage (MRL)

"N" - Flag "No TopMost"

No more TopMost

Intention

In windows, there is a property of Top-Windows that will make them stay always in front of all other windows.

This property is called "TopMost".

A window that is "TopMost" is always on top of all other windows, that are not TopMost.

Only another TopMost window can be in front of an TopMost window.

For example the MR-Editor can be set to TopMost.

Now you may think "this sounds good!". Be warned. This is an advanced feature for advanced users.

Programs have Messageboxes and also open up other windows. In case they have been made TopMost, you may not be able to see those Messages or PopUp windows. This may lead for you to think that the program hangs.

Why don't you see those messages?
Because they will not be TopMost and therefore they will appear behind the TopMost window!

Therefore use TopMost style only when really needed and when you know what you are doing.

Using the Flag "M", the window will be made TopMost immediately after it was localized.

```
ITW.cM|WindowClass
 MMV.
EIF.
```

Use the "N"-Flag to remove the TopMost-property from a TopMost window.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window

3.83.16.1 "Q" - Flag - ITW.

"Q" - Flag "Repeat Prototype" Previous 3673 Top 41 Next 3677

MiniRobotLanguage (MRL)

"Q" - Flag "Repeat Prototype"

If Top Window

Intention

This flag will just repeat the Prototype that was last used with `ITW.` or `STW.` or any other Top-Window search instruction.

```
ITW.c|WindowClass
 MMV.
EIF.
' this will do the same
ITW.Q|WindowClass
 MMV.
EIF.
```

Note that there is another way of repeating the last ITW. or ITW.. That is, to just leave the whole parameter part empty.

```
ITW.c|WindowClass
 MMV.
EIF.
' this will do the same
ITW.
 MMV.
EIF.
```

While "Q" will only retype the prototypes internally. Leaving the parameters away, will retype the whole parameters, including the prototypes, using those from last time the command was called.

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
ITW.c|WindowClass
 MMV.
EIF.
' this will do the same
ITW.Q|WindowClass
 MMV.
EIF.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

`ITW.` and `ITW.` share the same parameter store. Therefore if you have localized the window with `ITW.` then you can also use these parameters for `ITW.` and vice versa.

3.83.16.1("V" - Flag - ITW.

"V" - Flag "GoSub if not found. " Previous 3675 Top 41 Next 3679

MiniRobotLanguage (MRL)

"V" - Flag "GoSub if not found"

Gosub if not found

Intention

If the window you are looking for is not found within the specified waiting time, several things can happen. Normally you will get an error-message.

But that does not necessarily be what you want. Maybe you want just to see if the window is there and if not start the program in a Subroutine.

```
' "V" - Flag - on not found Gosub
ITW.ctVw|PBWindowClass:0|BCS|Sub|1
 ' Move Mouse to the Install Button
 SCW.ct|butt|Install
 MMV.
EIF.
ENR.
'-------------------------------------------------------------
' This Subprogram will be called if the window is not found
:Sub
EXE.?exepfad\Sample Apps\BSC-Testform.exe
ITW.ct|PBWindowClass:0|BCS
 '
EIF.
RET.
```

The script above will try to locate the "BCS - Testform" and if its not yet started, it will be started and localized.

Example

```
ITW.ctVw|PBWindowClass:0|TestAppx|Sub|1
 MBX.Ready
EIF.
ENR.
'-------------------------------------------------------------
:Sub
MBX.Error - Program not found
RET.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

You can not mix the "V" and the "W"-Flag. If both are found, the "W"-Flag takes priority

3.83.16.17 "W" - Flag - ITW.

MiniRobotLanguage (MRL)

"W" - Flag "GoSub if found"

If Top Window

Intention

If the window you are looking for is found within the specified waiting time, normally the script just continues. You can however ask the robot to first call a Subprogram in that case and then continue with the script. This is done using the "W"-Flag.

```
ITW.ctW|PBWindowClass:0|BCS|Sub
 MMV.
EIF.
ENR.
:Sub
MBX.!
RET.
```

The "W"-Flag can be used together with the "V"-Flag, while only one of these will be called. In case you use the "g"-Flag "on found Goto", the "W"-Flag will be ignored.

Example

```
'
' And then open a new instance
EXE.?exepfad\Sample Apps\BSC-Testform.exe

' If found close that window.
ITW.ctw|PBWindowClass:0|BCS|1
 CAW.PBWindowClass:0|BCS
 ' Wait until its gone
 MTW.
EIF.

' And then open a new instance
EXE.?exepfad\Sample Apps\BSC-Testform.exe

ITW.ct|PBWindowClass:0|BCS
 SCW.ct|butt|Install
 MMV.
EIF.
ENR.
'------------------------------------------------------------
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

The "W"-Flag can be used together with the "V"-Flag, while only one of these will be called. In case you use the "g"-Flag "on found Goto", the "W"-Flag will be ignored.

Limitations:

"X" - Flag "run without error" Previous 3679 Top 41 Next 3683

MiniRobotLanguage (MRL)

"X" - Flag "run without error"

If Top Window

Intention

If the window you are looking for is not found within the specified waiting time, several things can happen. Normally you will just get an error-message. If you do not want to get an error, but just have the script continue running, use the "X"-Flag.

You can use the `#tio#` 3.1 Systemvariables 334 to check if the window was found or not. Also you can use the "V","W","g" and "o" Flags to react inside the `ITW`.

For example in such a script:

```
ITW.cXg|WindowClass|found
 MMV.
EIF.
:found
MPO.
```

This script will invert the normal behavior of `ITW`. It will continue running in case of the window is not found. And in case the window is found, it will jump to the Label "found".

Example

```
'-------------------------------------------------------
' "X"-Flag Sample 1
' Run only if its not yet running ...
'-------------------------------------------------------
'
' Run application only if the window is not found
'
' t - text (caption of the window)
'

3.83.16.19 "a" - Flag - ITW.

"a" - Flag "all windows" Previous 3681 Top 41 Next 3685

MiniRobotLanguage (MRL)

"a" - Flag "all windows"

If Top Window

Intention

In most cases, we want to act on visible and enabled window only.
Therefore the !ITW. command ignores by default windows, if they are disabled or invisible.

The "a" flag changes this behavior. Using the "a"-Flag, the ITW. command will locate "all windows". This includes Top-Window which are invisible or disabled, or both.
Using the Flag "a" ALL Top windows will be found if they meet the search criteria.

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
ITW.at|BCS - Testform
  EXE.?exepfad\Sample Apps\BSC-Testform.exe
EIF.

' Next we make the thing invisible
SWS.i
' Wait a second
PAU.1
' Locate it using "all"
ITW.wt|0|BCS - Testform
 ' Locate the Button using "all"
 SCW.anctb|1|Button|Next|0
 ' CLick the button, while its invisible
 MLE.
 ' Get the Top-Handle
 GCT.
 ' Make it visible again
 SWS.v
EIF.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

If you definitely know that the window is invisible, you can use the "u" - Flag - ITW. 3712 which will only search for invisible windows and ignore visible windows.

The same applies for disabled windows, and the "f" - Flag - ITW. 3691 .

Limitations:

-

3.83.16.2("b" - Flag - ITW.

MiniRobotLanguage (MRL)

"b" - Flag "window to back"

window to back

Intention

In most cases we want the window to come in front of other windows. so we can use it. For this we do not need any `ITW.`-flag, as this is the default behavior of the `ITW.`-command.

In some cases, we want just the opposite. We want a window to go behind all other windows. We sent a "window to back". For this we use the "b"-Flag.

It will locate the window "on Top" and sent it to back. See the example below.

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

' Open 5 Terstforms and position them nicely
FOR.$$CNT|1|5
  EXE.?exepfad\Sample Apps\BSC-Testform.exe
  ITW.p|#pid#
   SWP.(100+55*$$CNT),(200+55*$$CNT)
  EIF.
NEX.

FOR.$$CNT|1|50
'Move Testform "On top" to back
  ITW.ctb|PBWindowClass:0|BCS - Testform
  ' Make small rest of 0.1 seconds so we can see it
  PAU.0.1
  EIF.
NEX.

' Close all Testforms
CAW.PBWindowClass:0|BCS - Testform
ENR.
```

3.83.16.2."c" - Flag - ITW.

"c" - Flag "class" Previous 3685 Top 41 Next 3689

MiniRobotLanguage (MRL)

"c" - Flag "class"

If Top Window

Intention

Window-Class" value. This is the "window class" of the window we are looking for.

This flag needs a parameter. It supports 3.2 Standard-Search Pattern 341 and therefore its enough to give a unique part of the value. By default the value is not case sensitive.

```
ITW.c|WindowClass
 MMV.
EIF.
```

Example

```
'
' Click on the OK Button in a messagebox
' Locate the Application (Top-)Window
ITW.c|#32768
 ' Locate the button
 SCW.t|Ok
 ' Click the button
 MLE.
EIF.
ENR.
```

3.83.16.27 "e" - Flag - ITW.

"e" - Flag "enabled windows" Previous 3687 Top 41 Next 3691

MiniRobotLanguage (MRL)

"e" - Flag "enabled windows"

If Top Window

Intention

To ignore disabled windows is one of the default settings of the `ITW.` command. Therefore you will not need to specify the "e"-Flag often.

It can however make sense, to override the default behavior by using the "f"-flag which will make `ITW.` to ignore enabled windows and just look for disabled windows.

If you want to catch both, the "a"-flag is what you need.
However the "a"->Flag will automatically also enable the search for invisible windows. If you do not want that, just add a prototype "v" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "e" - flag together with the "a" to search only windows that are enabled. No matter if they are visible or not.

Lets take a look, on "what will work and what will not work".
This will search only for enabled windows.

```
ITW.ce|WindowClass
 MMV.
EIF.
```

Since this is a default behavior of `ITW.`, we have wasted the "e" at this place. Its not needed.

Now we would like to search for windows which are enabled, as well for disabled windows. We can do that in two ways.The first way is like this:

```
ITW.cef|WindowClass
 MMV.
EIF.
```

The robot understands that we want enabled and disabled windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
ITW.cav|WindowClass
 MMV.
EIF.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the invisible windows. We do this by adding the "v"-Flag after the "a". In this case the "v"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
' Start an Application only, if that Application is not yet
running.
'
ITW.wt|BCS - Testform
 EXE.?exepfad\Sample Apps\BSC-Testform.exe
EIF.

' Next we disable the whole window
SWS.d
' Wait half of a second
PAU.0.5
' Try to locate it using "e"
' Will not work

"f" - Flag "disabled windows" Previous 3689 Top 41 Next 3693

MiniRobotLanguage (MRL)

"f" - Flag "disabled windows"

If Top Window

Intention

To ignore disabled windows is one of the default settings of the `ITW.` command. Therefore if you want to search for a window that has been disabled, you will need the "f"-flag.

The "f"-Flag will override the default behavior. It will make `STW.` to ignore enabled windows and just look for disabled windows, only.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also enable the search for invisible windows. If you do not want that, just add a prototype "v" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "f" - flag together with the "a" to search only windows that are disabled. No matter if they are visible or not.

Lets take a look, on this. This will search only for disabled windows.

```
ITW.cf|WindowClass
 MMV.
EIF.
```

Now we would like to search for windows which are enabled, as well for disabled windows. We can do that in two ways.The first way is like this:

```
ITW.cef|WindowClass
 MMV.
EIF.
```

The robot understands that we want enabled and disabled windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```

3.83.16.2 "g" - Flag - ITW.

"g" - Flag "goto if found" Previous 3691 Top 41 Next 3695

MiniRobotLanguage (MRL)

"g" - Flag "Goto if found"

Goto if found

Intention

If the window you are looking for is found within the specified waiting time, normally the script just continues. You can however ask the robot to jump to a Label in that case.
And you can use the "X"-Flag to tell the robot to just continue with the script in case of error - if the window is not found.
This would change the behavior of the command, but sometimes this can be a good solution. Take this example:

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - goto Label "GoOn" if the window was found
' X - continue the script as normal, without error,
'     if the window is not found
ITW.tgXw|BCS|GoOn|0
 EXE.?exepfad\Sample Apps\BSC-Testform.exe
EIF.
:GoOn
MBX.Ready
ENR.
```

In case you use the "g"-Flag, together with the "W" -Flag ("on Found Gosub"), the "W"-Flag will be ignored. The "g"-Flag has a generally higher priority.

Example

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - gotoLabel "Sub" if thewindow was found
' X - continue the script as normal, without error,
'     if the window is not found
ITW.tgXw|BCS|GoOn|0
 EXE.?exepfad\Sample Apps\BSC-Testform.exe
EIF.
:GoOn
MBX.Ready

3.83.16.2("j" - Flag - ITW.

"j" - Flag "WII. by number" Previous 3695 Top 41 Next 3699

MiniRobotLanguage (MRL)

"j" - Flag "WII. by number"

Wait for Input Idle and tell how long

Intention

"Wait for Input Idle" halts script execution until the localized window is ready to process our Input.

This Command can be seen as a dynamic Pause-Statement, it waits only if our target window is busy. The maximum waiting time must be given as a numeric value or variable.

Note the value you specify will replace the default internal value for "WII. without parameter", used for the "k" - Flag - STW. 3865 . But also for WII. if no parameters are given.

Unlike a fixed pause statement which would always wait for a fixed time. `WII.` is the better solution.

If the process is a console application or does not have a message queue, "Wait For Input Idle" returns immediately.

The given time is in seconds. Fractions are allowed. For example:

```
' Will wait no longer then a half second
ITW.cj|WindowClass|0.5
 MMV.
EIF.
```

Technically the "j"-Flag does the same like the WII. - Wait-for-Input-Idle 2909 statement. Just that it is integrated and does not need a separate line of code.

Example

```
' j - wait 5 Seconds maximum
ITW.cj|WindowClass|5
 MMV.
EIF.
```

Remarks

-

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

The maximum number for the waiting time is the equivalent for 23100 days. In short: you can not ask the robot to wait longer for a window then ~63 years. Anything below will be just fine. Note that negative waiting times will be rounded to zero.

3.83.16.27 "k" - Flag - ITW.

MiniRobotLanguage (MRL)

"k" - Flag "WII. default"

If Top Window

Intention

"Wait for Input Idle" halts script execution until the localized window is ready to process our Input.

This Command can be seen as a dynamic Pause-Statement, it waits only if our target window is busy. The maximum waiting time is taken from an internal value that is been set with the last `WII.` statement or with the "j" - Flag - ITW. 3697.

Unlike a fixed pause statement which would always wait for a fixed time. `WII.` is the better solution.

If the process is a console application or does not have a message queue, "Wait For Input Idle" returns immediately.

The given time is in seconds. Fractions of a second are allowed.

```
ITW.cj|WindowClass|5
 MMV.
EIF.

' Will do the same without repeating the value
ITW.ck|WindowClass
 MMV.
EIF.
```

Technically the "k"-Flag does the same like the WII. - Wait-for-Input-Idle 2909 statement without a parameter. Just that it is integrated and does not need a separate line of code.

Example

```
' Demonstrate the "j" and the "k" Flag
ITW.cj|WindowClass|5
 MMV.
EIF.
' Will do the same without repeating the value
ITW.ck|WindowClass

3.83.16.2 "o" - Flag - ITW.

MiniRobotLanguage (MRL)

"o" - Flag "on not found Goto"

If Top Window

Intention

If the window you are looking for is not found within the specified waiting time, normally you will end up with an error-message.

Maybe you want just to jump at another place in the script the, and start a program. Or react in another way. That is where the "o" Flag enters the game. The script just continues. The window is not found and we tell the robot to jump to a Label in that case.

Take this example:

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' o - goto Label "GoOn" if the window was NOT found
' X - continue the script as normal, without error,
'     if the window is not found
ITW.toXw|BCS|GoOn|0
 GTO.weit
EIF.

:GoOn
 EXE.?exepfad\Sample Apps\BSC-Testform.exe

:weit

MBX.Ready
ENR.
```

In case you use the "o-Flag, together with the "V" -Flag ("on not Found Gosub"), the "V"-Flag will be ignored. The "o"-Flag has a generally higher priority.

Example

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' o - goto Label "GoOn" if the window was NOT found
' X - continue the script as normal, without error,
'     if the window is not found
```

3.83.16.2 "p" - Flag - ITW.

MiniRobotLanguage (MRL)

"p" - Flag "Process ID"

If Top Window

Intention

You can localize a window safely, if you have the PID (Process ID) of the application behind that window.

Be sure that you have read and understood the chapter 1.7. Application and PID 137.

Hint: If you have localized a window, you also have the PID of the process behind that window in `#pid#`. You can save it for later use in a variable. Like this:

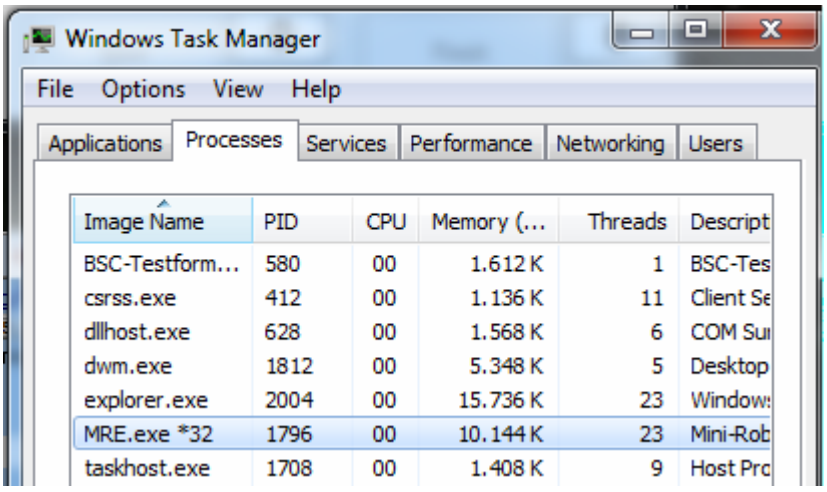
```
ITW.c|pbwind
: §§PID=#pid#
EIF.

or use:

ITW.c|pbwind
 HTV.§§PID
EIF.
```

In both cases, you get the PID of that process into the local variable §§PID 366.

You can see the PID of a process in the task-manager::



The `PID` value is a normal search parameter and can be used alone or together with other search parameters.

```
' Search a window from process with ID 3435
' and the given window class.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'
ITW.ch|pbwind|580
 MMV.
EIF.
```

Example

```
' Locate window only by PID
ITW.p|580
 MMV.
EIF.

ENR.
```

3.83.16.3("q" - Flag - ITW.

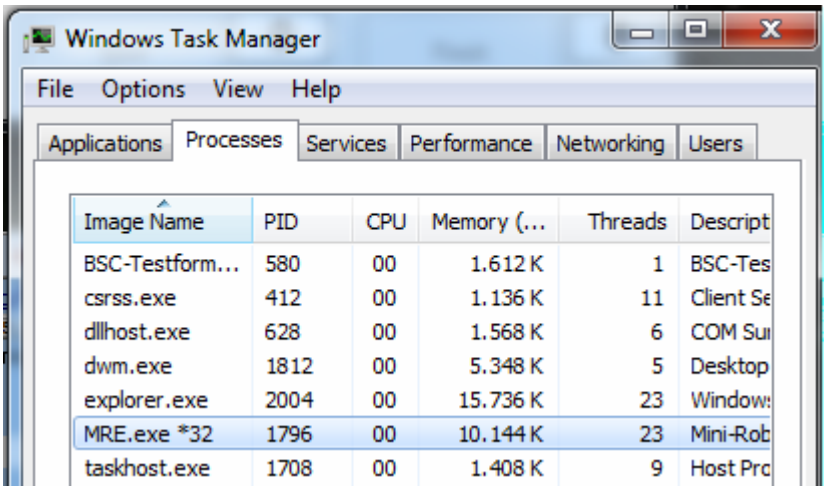
MiniRobotLanguage (MRL)

"q" - Flag "Thread ID"

If Top Window

Intention

This is an advanced parameter. The chances are that you will never need it.
Processes have a number of Threads. See this picture here:



On the left side you can see the name of the process. Right of it the PID of the process. Later you see "Threads".
In a very simplified form, a Thread is a subprogram of that process, that runs an own small program. Generally the more threads a program has, the better it will scale up on multiple CPU-Core's.
While all Threads of a process belong to that process and therefore have the same PID, they have a different Thread-ID. In case you may need to separate between windows of the same process, which is "Multi-threaded", the "q"-flag is for you.

```
ITW.cq|WindowClass|109872
 MMV.
EIF.
```

Hint: If you have localized a window, you also have the TID of the process behind that window in `#tid#`. You can save it for later use in a variable. Like this:

```
ITW.c|pbwind
 : $$TID=#tid#
EIF.
```

This way, you get the TID of that Thread into the local variable §§PID 366.

© 2023 Theo Gottwald * https://www.smart-package.com

If you don't "understand a word", or don't have very special cases, just ignore this flag.

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

EXE.?exepfad\Sample Apps\BSC-Testform.exe
' Locate the window
ITW.p|#pid#
' Show the Thread-ID
MBX.#tid#
EIF.

ENR.
```

3.83.16.3."r" - Flag - ITW.

"r" - Flag "result number" Previous 3705 Top 41 Next 3709

MiniRobotLanguage (MRL)

"r" - Flag "result number"

If Top Window

Intention

There may be multiple results in a window-search with `ITW.`. Normally you get the first result that fits to your search parameters.
Using the "r"-Flag you can define which result you want, Nr.1, Nr.2 or Nr. 20. Just add the "r"-Flag and the result number.

If omitted, always result Nr.1 is returned.

Note: If there are not enough results, your search will fail!
Therefore you can also use this feature to count windows.

```
'We'll get the 3rd result with that window class
ITW.cr|WindowClass|3
 MMV.
EIF.
```

Example

```
'We'll get the 4th result
' with that window class
'
ITW.cr|WindowClass|4
 MMV.
EIF.
ENR.
```

3.83.16.3 "t" - Flag - ITW.

"t" - Flag "text" Previous 3707 Top 41 Next 3712

MiniRobotLanguage (MRL)

"t" - Flag "text"

If Top Window

Intention

This flag is one of the most important search parameters. It is the window-text. Most often you can even see the text of a top-window without using the windows-Inspector.
Here is the simplest case how you can grab a window.

```
ITW.t|TestApp
MMV.
```

The text parameter is a string-value and therefore supports 3.2 Standard-Search Pattern 341.
Let us try some of these.

As always with Search patterns, it is enough to give a unique part of the value. By default the text is not case sensitive. You can change that behavior using the search patterns. Take the sample-script below and replace the line:

```
' Locate the window
ITW.t|Testf
```

with the following lines. This will help you to understand the use of Patterns for text search.

```
' Lets start with this
ITW.t|{&DOCAPS:Testf}
```

This will force the text to be case-sensitive! Try this:

```
' This will not find the window
' because of case-sensitivity!
ITW.t|{&DOCAPS:testf}
```

It does not find the window because the &DOCAPS: switches case-sensitivity on.
Now how about this:

```
ITW.t|{&EXACT:bcs - Testform}
```

It does find the window. But then whats the "&EXACT:" good for?
Try this:

```
ITW.t|{&EXACT:bcs - Testf}
```

© 2023 Theo Gottwald * https://www.smart-package.com

It does not find the window because the &EXACT: switches off the default behavior that a part of the text is enough. CAn it be combined with the &DOCAPS: ?

We try. This should work:
```
ITW.t|{&EXACT:&DOCAPS:BCS - Testform}
```

and this should not work:
```
ITW.t|{&EXACT:&DOCAPS:bCS - Testform}
```

Yes, everything work as expected.

Do you know the old times, when you had simple Wildcards as patterns? The"*****" and the "**?**" ?

You can have them back if you want. Try this:

```
ITW.t|{&WILDC:b?? - Testform}
```

Yes, it works. And how about:

```
ITW.t|{&WILDC:b?? - Tes*orm}
or
ITW.t|{&WILDC:b?? - *s*or?}
```

It works.
We kept them for you.
You can still use even the old DOS-Patterns if you really want.
But there is much more if you use the new patterns.

How about a fuzzylogic and a OR'ed combination of two patterns?

```
ITW.t|{&WILDC:b?? }&OR:{BCS-tesform&FUZZY:6}
```

and you can not only combine two patterns, you can combine as many patterns using &OR: as you like! If you want to support many languages, this is the way to go.

No matter if there is a "YES" on that button or a "Qui" or whatever. So long you know it, or at least a bit of it, you can locate it using Search patterns.

Important Note:
Never forget the `EIF.` when using `ITW.`. Of course you can also use `ELS.` We have left this away in the examples above, to explain things shorter.

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

EXE.?exepfad\Sample Apps\BSC-Testform.exe
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Locate the window
ITW.t|Testf
 ' Close the window
 CAW.PBWindowClass:0|BCS - Testform
EIF.
ENR.
```

3.83.16.3 "u" - Flag - ITW.

"u" - Flag "invisible" Previous 3709 Top 41 Next 3714

MiniRobotLanguage (MRL)

"u" - Flag "invisible"

If Top Window

Intention

To ignore invisible windows is one of the default settings of the `ITW.` command. Therefore if you want to search for a window that has is invisible, you will need the "u"-flag.

The "u"-Flag will override the default behavior. It will make `ITW.` to ignore visible windows and look for invisible windows, only.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also enable the search for disabled windows. If you do not want that, just add a prototype "e" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "u" - flag together with the "a" to search only windows that are invisible. No matter if they are enabled or not.

Lets take a look, on this. This will search only for invisible windows.

```
ITW.cu|WindowClass
 MMV.
EIF.
```

Now we would like to search for windows which are visible, as well as for invisible windows. We can do that in two ways.The first way is like this:

```
ITW.cuv|WindowClass
 MMV.
EIF.
```

The robot understands that we want visible and invisible windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
ITW.cae|WindowClass
 MMV.
EIF.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
CAW.PBWindowClass:0|BCS - Testform
'
' Start an Application only,
' if that Application is not yet running.
'
ITW.wtUX|0|BCS - Testform|found
 EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found
EIF.
ITW.p|#pid#
 ' Next we make the window invisible
 SWS.i
 ' Wait half of a second
 PAU.2.5
EIF.
' We locate it even though its invisible
ITW.wtu|1|BCS - Testform
 ' and make it visible again
 SWS.v
EIF.
ENR.
```

3.83.16.3 "v" - Flag - ITW.

"v" - Flag "visible" Previous 3712 Top 41 Next 3716

MiniRobotLanguage (MRL)

"v" - Flag "visible"

If Top Window

Intention

To ignore invisible windows is one of the default settings of the `ITW.` command. Therefore you will not need to specify the "v"-Flag often.

It can however make sense, to override the default behavior by using the "u"-flag which will make `ITW.` to visible windows and just look for invisible windows.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also switch on the search for disabled windows. If you do not want that, just add a prototype "e" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "v" - flag together with the "a" to search only windows that are visible. No matter if they are enabled or not.

Lets take a look, on how to do this. This will search only for visible windows.

```
ITW.cv|WindowClass
 MMV.
EIF.
```

Since this is a default behavior of `ITW.`, we have wasted the "v" at this place. Its not needed.

Now we would like to search for windows which are visible, as well for invisibble windows. We can do that in two ways.The first way is like this:

```
ITW.cuv|WindowClass
 MMV.
EIF.
```

The robot understands that we want visible and invisible windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
ITW.cae|WindowClass
 MMV.
EIF.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

3.83.16.3 "w" - Flag - ITW.

"w" - Flag "wait time" Previous 3714 Top 41 Next 3718

MiniRobotLanguage (MRL)

"w" - Flag "wait time"

If Top Window

Intention

How long do we wait if a window will appear or not?
Let's try it.

```
: $$TIM=#dtime#
ITW.tX|nix
EIF.
 : $$TIM=#dsince#
 MBX.$$TIM
EIF.
ENR.
```

The answer is that `ITW.` will not wait and immediately continue.
Unless you specify a waiting time.

It's currently about 15 seconds. When you read this it can be another value.
In fact this is the default time that we wait for a window before we run into an error-message or do something else (like in this script).

Now, its very important to understand that we do not generally wait 15 seconds, and then look if the window has appeared.
What we do is, we try ... try ... and try and check permanently, if the window has appeared. If the window appears any time, the script will immediately continue.

If the time is over, we do something else.

Now 15 seconds is enough for some cases, in many cases the window will appear after 45 seconds or any other time. Now this is where the "w"-flag enters the game.

Using the "w"-flag we can tell the robot how long he should wait. It can be 0 seconds like this:

```
ITW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found
EIF.
```

or 360 seconds like here.

```
ITW.wtu|360|BCS - Testform
```

and there is no real limitation.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

-

Remarks

-

Limitations:

The maximum number for the waiting time is the equivalent for 23100 days. In short: you can not ask the robot to wait longer for a window then ~63 years. Anything below will be just fine. Note that negative waiting times will be rounded to zero.

3.83.17 IWE. / NWE. - If Window Enabled

MiniRobotLanguage (MRL)

IWE. Conditional Statement

If Windows Enabled

Intention

Conditional Statement.

Test if one or more specified window(s) are enabled or not. If no parameter is given, the actual window is been tested.

You can enable or disable child- or top-windows using the SWS. - Set Window State 3889 .-command.

`IWE.` tells you, if the actual window is enabled or has been disabled. If no parameter is given, the actual window is been tested. If you give parameter, these must be window handles, or the letters "**c**" or "**t**".

These letters stand for "child" and "Top". If given they will be replaced with the last window of that kind that has been localized.

c - last localized child-window

t - last localized Top-Window

Please note, that if the actual window is a child-window (e.g. a button), you need to specify "**t**" as parameter,if you want to test the actual top-window. Some examples:

```
'Get first window handle
STW.ct|CabinetWClass|c:
HTV.$$HAA
'Get second window handle
STW.ct|Chrome_WidgetWin_0|meebo.com
HTV.$$HAB
'Test both handles
IWE.$$HAA|$$HAB
  DBP.All windows are enabled
ELS.
  DBP.At least one of the windows is disabled
EIF.
ENR.
```

Other modes of operation are:

```
' Check actual located window
IWE.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' check last located child window
IWE.c

' check actual Top-window
IWE.t

' check window with handle in $$MYH
IWE.$$MYH
```

NWE. is the negative version "Not Window Enabled".

Syntax

IWE.[P1][|P2]... ELS. ... EIF.

Parameter Explanation

P1 - numeric/variable or "c" or "t". If omitted actual window is taken.

P2 - optional parameters which are also tested for enabled. If one of them is disabled the test fails (implicit=AND). Can be up to 20 additional parameters.

IWE.'s can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or FEX. (Enumerations) to unlimited Depth.

Example

```
'*********************************
' IWE./NWE.-Sample
'*********************************
STW.t|Sample
MMV.
IWE.
 MBX.Ok
ELS.
 MBX.Diabled!
EIF.
END.
```

3.83.19 IWS. / NWS. - If Window State

MiniRobotLanguage (MRL)

IWS. Conditional Statement

If Window State

Intention

Conditional Statement.

What is a "windows state"?

- windows can be
- enabled, disabled
- minimized, normal
- maximized
- visible or invisible

Test these windows states using IWS.

Using `IWS.` you can test the last localized or any specified child- or top-window for its states.

As you can specify multiple states, you can completely check out a window in one run.

`IWS.` is the counterpart to `SWS.` Using SWS. - Set Window State 3889 you can set the states of a window.

If no parameter is given, the actual window is been tested.

`NWS.` is the negative version "Not Window State".

Syntax

```
IWS.[P1][|P2]... ELS. ... EIF.
```

Parameter Explanation

P1 - prototype

```
  Use the following letters for P1:

' e - enabled
' d - disabled
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' v - visible
' i - invisble
' m - minimzed
' n - normal (not minimized)
' z - zoomed (maximized)
' u - unzoomed
' t - use actual Top-Window instead of actual window
```

If no parameters are specified, "**evn**" is taken to the actual window.
Multiple states can be given. In that case they are connected with AND. All given states MUST be set as given to let the condition evaluate to true.

P2 - (optional) parameter which can be a window-handle.
When given, this window is tested.

Example

```
'**********************************
' IWS./NWS.-Sample
'**********************************
STW.t|Sample
MMV.
IWS.ev
 MBX.Ok
ELS.
 MBX.No
EIF.

STW.t|Sample
HTV.$$HWN
STW.t|anotherwindows
MMV.
' Note that the first window is going to be tested.
IWS.ev|$$HWN
 MBX.Ok
ELS.
 MBX.Diabled!
EIF.
END.
```

Intention

Conditional Statement.

Test if one or more specified window(s) are visible or not. If no parameter is given, the actual window is been tested.

You can make windows (includes child-windows) visible or invisible using the SWS. - Set Window State 3889 .-command.

`IWV.` tells you, if the actual window is visible or has been made invisible. If no parameter is given, the actual window is been tested. If you give parameter, these must be window handles, or the letters "**c**" or "**t**".

These letters stand for "child" and "Top". If given they will be replaced with the last window of that kind that has been localized.

c - last localized child-window

t - last localized Top-Window

Please note, that if the actual window is a child-window (e.g. a button), you need to specify "**t**" as parameter,if you want to test the actual top-window. Some examples:

```
'Get first window handle
STW.ct|CabinetWClass|c:
HTV.$$HAA
'Get second window handle
STW.ct|Chrome_WidgetWin_0|meebo.com
HTV.$$HAB
'Test both handles
IWV.$$HAA|$$HAB
  DBP.All windows are visible
ELS.
  DBP.At least one of the windows is invisible
EIF.
ENR.
```

Other modes of operation are:

```
' Check actual located window
IWV.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' check last located child window
IWV.c

' check actual Top-window
IWV.t

' check window with handle in $$MYH
IWV.$$MYH
```

NWV. is the negative version "Not Window Visible".

Syntax

IWV.[P1][|P2...|P20]… ELS. … EIF.

Parameter Explanation

P1 - numeric/variable or "c" or "t". If omitted actual window is taken.

P2 - optional parameters which are also tested for enabled. If one of them is disabled the test fails (implicit=AND). Can be up to 20 additional parameters.

IWV.'s can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or FEX. (Enumerations) to unlimited Depth.

Example

```
'*********************************
' IWV.-Sample
'*********************************
STW.t|Sample
MMV.
IWV.
 MBX.Ok
ELS.
 MBX.No
EIF.
END.
```

3.83.22 MAW. - Missing-Active-Window

MiniRobotLanguage (MRL)

MAW. Command

Missing Active Window

Intention

Stops script execution at the given Line until the last localized window disappears (is closed). The command has possible prototypes for advanced usage.

Syntax

MAW.[P1][|P2][|P3]

Parameter Explanation

P1 - optional: Prototypes

```
 h - handle, if specified, you need to supply the window-
handle
     of the window to wait for.

 t - timeout, if specified the command will only wait the
specified
     amount of time in seconds and then go on with the next
command.
     The timeout flag is set in that case, otherwise its
cleared.

 p - Top-Window from actual window has to be closed..

 a - continues if the window becomes invisible or disabled.

 v - continues if the window becomes invisible.

 e - continues if the window becomes disabled.
```

P2 - optional: Variable
P3 - optional: time to pause in seconds

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*********************************************
' This Example will locate a Window and wait till
' it is removed.
' Please note that you need to have such a window.
'*********************************************
DBM.2
STW.c|#32770
MAW.
PRT. Window was removed
DMP.
END.

'*********************************************
' This Example will locate a Window and wait till
' it is removed. It will use a timeout of 5 Seconds.
' Please note that you need to have such a window.
'*********************************************
DBM.2
STW.c|#32770
HTV.$$MYW
' Locating another window
STW.c|ieframe
' We use the handle therefore we wait
' until the #32770 window is been closed.
MAW.ht|$$MYW|5
PRT. Window was removed or timeout happened
DMP.
END.

'*********************************************
' This Example will wait till the IE 6 is ready
'*********************************************
STW.c|ieframe
SCW.cw|explorer_server|360
SCW.cdw|msctls_progress32|2|160
HTV.§§HTC
MAW.v
MBX.IE is ready.
END.
```

3.83.23 SAW. - Set Active Window

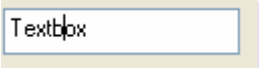
MiniRobotLanguage (MRL)

SAW. Command

Set Active Window

Intention

The SAW.-Command will give an edit control the input-focus. As a result you may see a blinking cursor inside.



The input focus can only be in one window/control at the same time.
If you type something on the Keyboard, the control with the input focus will reveive the typing. The same happens, if you simulate typing using SKP. Send-Key-Press 2289 and such commands. That's why SAW. can be used before you type into a textbox.

When using the Direct Engine 231 (commands for example: RST. and SDT.) the input-focus is not needed and therefore SAW. is not needed.

In most cases you will not give a parameter to SAW., but just locate the child window before using ! SCW - Search-Child-Window 3738 .

You can however add a variable with a window handle from a child-window.
The the robot tries to give the input-focus to that child-window.

SAW. will also try to bring the window to front, if it is behind other windows.
Usage is simple. Just write:

```
STW.Act|PBWindowClass:0|TestApp
SCW.cn|edit|2
SAW.
```

Syntax

SAW.[P1]

Parameter Explanation

P1 **-** ***(optional)*** VAR or formula in (..).
Must be a valid Window handle

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
STW.AgXctw|over|PBWindowClass:0|TestApp|0
EXE.?exepath\Sample Apps\TestApp_01.exe
:over
'Move pointer to Window-Area.
STW.Act|PBWindowClass:0|TestApp
SCW.cn|edit|2
SAW.
ENR.
```

Remarks

To move a Application window (Top-window) to front, use SFW. - Set Foreground WIndow3812. or ! STW. -Search Top-Window3814.

Limitations:

-

See also:

- SFW. - Set Foreground WIndow3812

3.83.24 SCW. - Search-Child-Window

3.83.24.1 ! SCW. - Search-Child-Window

MiniRobotLanguage (MRL)

SCW. Command

Seach Child Window

Intention

This command localizes a specified Child-Window (Control, Button etc.) within a previous localized Top-Window (Application-Window).

To understand this command, be sure to read the chapters:
1.8. Selecting the Application (Topwindow) 150
and
1.9. Locating Child-Windows 162
first.

It will then sets the Mouse-Target Point into the window-center.

`SCW.` has a lot of features, which are controlled using the 1.4. The Prototype Parameter System 73 .Be sure you have read and understand that chapter before trying to understand `SCW.`

Unless using the "T"-Option, the `SCW.`-command needs a Top-Window being localized first. Therefore please read the section 1.8. Selecting the Application (Topwindow) 150 carefully.

The Command has a "Rollback" Feature, when the Child-Window is not found in few Seconds. It jumps back to the `STW.` (Search Top-Window) and tries to get a new Top-Window, which possibly has the wanted button or control.
This will continue, until its time has run out.
If you use the `DBM.1` -command, you can see these "Rollback-Jumps" in the Debugging-Console. See the example below.

```
DBM.1
STW.Act|PBWindowClass:0|TestApp
' This button/childwindow does not exist
SCW.nctb|2|Button|Button 23|.5
MLE.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
[10:13:11] STW.Act|PBWindowClass:0|TestApp
[10:13:11] SCW.nctb|2|Button|Button 23|.5
[10:13:12] STW.Act|PBWindowClass:0|TestApp
[10:13:12] SCW.nctb|2|Button|Button 23|.5
[10:13:12] STW.Act|PBWindowClass:0|TestApp
[10:13:12] SCW.nctb|2|Button|Button 23|.5
[10:13:13] STW.Act|PBWindowClass:0|TestApp
[10:13:13] SCW.nctb|2|Button|Button 23|.5
```

You can control this Feature using the "b" - Backjump-Time Flag 3764.

Syntax

SCW.[Prototypes|][Parameters|]

Parameter Explanation

Parameter

```
 a - (np) "all" - search all windos, includes
     invisible and disabled windows.
 b - (p) "backjump"-flag, time in seconds, 0 disables the jump
 c - (p)  window-class
 d - (p) window-depth
 e - (np) enabled, window must be enabled
 f - (np) disabled, window must be disabled
 g - (p) Goto on found
 h - (p) handle. Immediately locate the window with given
handle.
     All other prototypes will be ignored.
 i - (p) window-id
 j - (p) WaitForInputIdle (Value)
 k - (np) WaitForInputIdle (no Value), use value
      from last Call/default-value
 n - (p) Fensternumber in der Ebene ("WR->SWC")
 o - (p) on not found goto (Label)
 p - (p) Process-ID (PID 137)
 q - (p) Thread-ID (TID)
 r - (p) result number ("WR-SPC-Count")
 s - (np) internal reversing at child windows search
 t - (p) text
 u - (np) invisible, window must be invisible
 v - (np) visible, window must be visible
 w - (p) total waiting-time in Seconds, fractions (0.5)
     are possible, zero is possible.

 E - (np) Add Window to Exclude List after localization
 I - (p) p = handle. Locate window and remove window
     from Exclude list.
 K - (n) Immediately clear Exclude-List before specified
search
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
Q - (n) use previous Prototypes
S - (n) Search only next Level (SWC-Option)
T - (n) Search desktopwide, ignore localized Top-Window
V - (p/Label) Gosub on not found
W - (p/Label) Gosub on  found
X - (n) Run without Error on not found
```

Explanation:
(np) -> only prototype, no additional parameter required
(p) -> prototype requires additional parameter
(NUM/VAR) - window handle/variable
(p/Label) - Label-Parameter required, can also be a variable that contains the label

P2 **-** Parameters, separated by | according to the prototypes

Example

```
STW.Act|PBWindowClass:0|TestApp
SCW.nctE|2|Button|Button 2
' Coordinates relative to left, upper corner of button
MPO.o|42,22
MLE.
```

Remarks

When using `SCW.` to check if a child-window is available or not, it makes sense that you use the "b"-flag with a value of "0" to disable the backjump.

3.83.24.2 "E" - Flag - SCW.

MiniRobotLanguage (MRL)

"E" - Flag "Exclude window"

Search Child Window

Intention

Imagine you have several equal buttons or controls, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number), or the "n"-Flag "leveled window number".

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". In fact there is one such list for Top-windows and there is one such list for child-windows.

Once in that list, a window can not be found by STW. or SCW. in a window search.

Now if you add a window to this "Exclude List", it will not be found any more. Not with SCW. and not with ICW. It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
STW.c|WindowClass
' Will add a button to the Exclude-List
SCW.cE|button
MMV.
```

And how do you remove a window from the "Search Exclude List"?
This is what the "I"-Flag is good for.

```
' Remove window from exclude List
STW.I|$$HWN
```

The "I"-Flag however need a window handle as parameter and will not work in any other constellation. Therefore keep the handles of those excluded windows, if you want to have them back later.

Can you clear the whole list with one strike?

Yes, you can also use the "K"-Flag.

```
' clear whole exclude List
STW.c|WindowClass
SCW.K
```

© 2023 Theo Gottwald * https://www.smart-package.com

The "K"-Flag will immediately, even before the search starts, clear the exclude list. No matter if a window is found or not, using the prototype "K" will clear the exclude list. Unlike the "I"-Flag, the "K"-Flag can be combined with any other window search.

After this all previously "exclude listed" windows can be found again.

Short Examples:

-

Example

-

Remarks

Windows which have been closed, and all their child-windows, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag.
To completely clear the Exclude list, use the "K"-Flag.

When locating Top-Windows using STW. there is also Exclude-List available. The Exclude List for Top-Windows is a separate list and will therefore survive if you clear the exclude list for Child-Windows.

Currently you can not check which windows are exclude-listed. There is also no way of showing the content of an exclude-list.

Limitations:

See also:

3.83.24.5 "Q" - Flag - SCW.

"Q" - Flag "Repeat Prototype" Previous 3745 Top 41 Next 3750

MiniRobotLanguage (MRL)

"Q" - Flag "Repeat Prototype"

Search Child Window

Intention

This flag will just repeat the Prototype that was last used with SCW. or ICW.

```
STW.c|WindowClass
SCW.ct|button|Next
MMV.
' this will do the same
STW.Q|WindowClass
SCW.Q|button|Next
MMV.
```

Note that there is another way of repeating the last SCW. or ICW.. That is, to just leave the whole parameter part empty.

```
STW.c|WindowClass
SCW.ct|button|Next
MMV.

' this will do the same
STW.
SCW.
MMV.
```

While "Q" will only retype the prototypes internally. Leaving the parameters away, will retype the whole parameters, including the prototypes, using those from last time the command was called.

3.83.24.6 "S" - Flag - SCW.

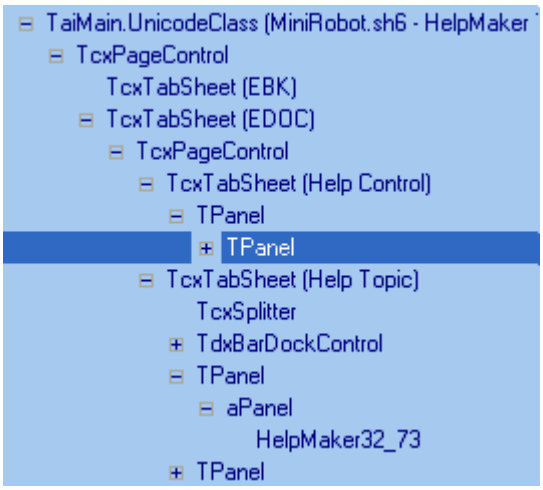
MiniRobotLanguage (MRL)

"S"-Flag "only next level"

Search Child Window

Intention

This is an advanced command. When locating child windows that are hidden in a child-window tree, with multiple branches, the recording programs will sometimes record the way "how to get there". Take a look at this tree:



The child-window is somewhere deep in a tree, we can not just locate it like this:

```
SCW.c|tpanel
```

because there are multiple child windows with that class. Also we have no valid child-window ID. And we can not really use the text ("t"-flag) because this child window does not offer a text for us. Here is a way to get there:

```
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.Sct|TcxPageControl|{&NOTEXT:}
SCW.Sct|TcxTabSheet|EDOC
SCW.Sct|TcxPageControl|{&NOTEXT:}
SCW.Sct|TcxTabSheet|Help Topic
SCW.Snct|2|TPanel|{&NOTEXT:}
MBX.#hwn#
ENR.
```

Using the "S"-Flag we can build a copy of the window tree in our script. This way, we can really locate the child window that we are looking for. Alternative you can also use the "n"-Flag which has a similar effect and allows numbering of the results.

3.83.24.7 "T" - Flag - SCW.

"T" - Flag "(total search) Search desktopwide" Previous 3750 Top 41 Next 3754

MiniRobotLanguage (MRL)

"T"-Flag "total, desktopwide"

Search Child Window

Intention

There are cases when you may not want to specify the Top-Window. In these cases you can directly search for a specific child-window using the "T"-flag.

The "T"-Flag searches "desktopwide" in all windows for the specified control, child-window.

Short Examples:

```
SCW.Tctr|button|cancel|1
MMV.
ENR.
```

Example

-

Remarks

-

Limitations:

-

3.83.24.8 "V" - Flag - SCW.

"V" - Flag "GoSub if not found. " Previous 3752 Top 41 Next 3756

MiniRobotLanguage (MRL)

"V" - Flag "GoSub if not found"

Search Child Window

Intention

If the child-window (button, control etc.) is not found within the specified waiting time, several things can happen. Normally you will get an error-message and the script will end.

But that does not necessarily be what you want. Maybe you want just to see if the window is there and if not start a Subroutine to do something.

```
' "V" - Flag - on not found Gosub
STW.ctw|PBWindowClass:0|BCS|1
' This button is not found
' so we try anotehr one in the subprogram
SCW.ctVw|Button|InstaX|Sub|0
' Move Mouse to the Install Button
MMV.
ENR.
'-------------------------------------------------------------
' This Subprogram will be called if the window is not found
:Sub
' Try another button
SCW.ct|Button|Install
MLC.
RET.
```

The script above will try to locate the "BCS - Testform" and if its not yet started, it will be started and localized.

Short Examples:

```
' Code example for "V"-Flag (on not found GoSub)
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.wSctV|0|TPanelx|{&NOTEXT:}|notf
MBX.#hwn#
ENR.

:notf
MBX.did not find this one!
RET.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

_

Remarks

In case you use the "o-Flag, together with the "V" -Flag ("on not Found Gosub"), the "V"-Flag will be ignored. The "o"-Flag has a generally higher priority.

Limitations:

3.83.24.9 "W" - Flag - SCW.

"W" - Flag "GoSub if found" Previous 3754 Top 41 Next 3758

MiniRobotLanguage (MRL)

"W" - Flag "GoSub if found"

Search Child Window

Intention

If the child- you are looking for is found within the specified waiting time, normally the script just continues. You can however ask the robot to first call a Subprogram in that case and then continue with the script. This is done using the "W"-Flag.

```
STW.ct|PBWindowClass:0|BCS
SC.ctW|Button|Install|Sub
MMV.
ENR.
:Sub
MBX.!
RET.
```

The "W"-Flag can be used together with the "V"-Flag, while only one of these will be called. In case you use the "g"-Flag "on found Goto", the "W"-Flag will be ignored.

Short Examples:

```
'
' And then open a new instance
EXE.?exepfad\Sample Apps\BSC-Testform.exe

' If found close that window.
STW.ctWw|PBWindowClass:0|BCS|Sub|1

' And then open a new instance
EXE.?exepfad\Sample Apps\BSC-Testform.exe

STW.ct|PBWindowClass:0|BCS
SCW.ct|butt|Install
MMV.

ENR.
'------------------------------------------------------------
:Sub
CAW.PBWindowClass:0|BCS
' Wait until its gone
MTW.
RET.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

_

Remarks

The "W"-Flag can be used together with the "V"-Flag, while only one of these will be called. In case you use the "g"-Flag "on found Goto", the "W"-Flag will be ignored.

Limitations:

-

3.83.24.1("X" - Flag - SCW.

MiniRobotLanguage (MRL)

"X" - Flag "run without error"

Search Child Window

Intention

If the child-window you are looking for is not found within the specified waiting time, several things can happen. Normally you will just get an error-message. If you do not want to get an error, but just have the script continue running, use the "X"-Flag.

You can use the `#tio#` 3.1 Systemvariables 334 to check if the window was found or not. Also you can use the "V","W","g" and "o" Flags to react inside the STW.

For example in such a script:

```
STW.c|WindowClass
' This button does not exist
SCW.Xcw|ButtonX|0
' We'll just move the mouse inside the Top-Window
MMV.

ENR.
```

This script will invert the normal behavior of STW. It will continue running in case of the window is not found. And in case the window is found, it will jump to the Label "found".

Short Examples:

```
'-------------------------------------------------------
' "X"-Flag Sample 1
' Run only if its not yet running ...
'-------------------------------------------------------
'
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - gotoLabel "Sub" if thewindow was found
' X - continue the script as normal, without error,
'     if the window is not found
STW.tgXw|BCS|GoOn|0
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:GoOn
MBX.Ready
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'-------------------------------------------------------
' "X"-Flag Sample 2
'-------------------------------------------------------
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
' We use STW here to test if the Application is already
running
' in that case we jump over the EXE-command and contine.
' We use the following flags:
' w ... 0 - Set waiting time to 0 seconds
' t ... "BCS - Testform" - this is the caption text of the
window we search for
' g ... "found" - jump to Label ":found" if the window already
exists
' X ... continue without errormessage if the window was not
found in time
'
STW.wtgX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Now we can use the Application and press Buttons
STW.wt|0|BCS - Testform
SCW.nctb|1|Button|Next|0
' Compatible Button Click
MLC.

'-------------------------------------------------------------
ENR.
```

Remarks

You can use the `#tio#` 3.1 Systemvariables 334 to check if the window was found or not. Also you can use the "V","W","g" and "o" Flags to react inside the SCW.

Limitations:

See also:

3.83.24.1 "a" - Flag - SCW.

"a" - Flag "all child-windows" Previous 3758 Top 41 Next 3764

MiniRobotLanguage (MRL)

"a" - Flag "all child-windows"

Search Child Window

Intention

In most cases, we want to act on visible and enabled child-window (buttons, controls ...) only. Therefore the SCW. command ignores by default child-windows, if they are disabled or invisible.

The "a" flag changes this behavior. Using the "a"-Flag, the SCW. command will locate "all child-windows". This includes child-windows which are invisible or disabled, or both.
Using the Flag "a" all child-windows will be found if they meet the search criteria.

Example

```
'*********************************************
' SCW-Sample 1
'*********************************************
DBM.1

' Start TestApp only, if it's is not yet running.
'
STW.wtUXg|0|TestApp|found
EXE.?exepfad\Sample Apps\TestApp_01.exe
:found

STW.Act|PBWindowClass:0|TestApp
SCW.ct|Button|Button 1
HTV.$$MYC
' Make button invisible
SWS.i

' Show handle of the childwindow
DBP.$$MYC

' Locate Topwindow again with previous parameters
GCT.
' Locate Button even though its invisible
SCW.wcta|0|Button|Button 1

FOR.$$CNT|1|10
' Press that button 10 times using direct engine
  MLE.
NEX.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PAU..5

' Make the button visible again
SCW.h
SWS.v
ENR.

'*********************************************
' SCW-Sample 2
'*********************************************
' Start TestApp only, if it's is not yet running.
'
STW.wtUXg|0|TestApp|found
EXE.?exepfad\Sample Apps\TestApp_01.exe
:found

STW.t|testapp

SCW.to|button 1|ero
SWS.i

GCT.
SCW.tuo|button 1|ero
SWS.vd

GCT.
SCW.tfo|button 1|ero
SWS.id

GCT.
SCW.tufo|button 1|ero

SWS.

ENR.
:ero
MBX.Window not found!
ENR.
```

Remarks

If you definitely know that the child-window is invisible, you can use the "u"-Flag. 3878 which will only search for invisible child- windows and ignore visible child-windows.

The same applies for disabled windows, and the "f"-Flag.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.24.1 "b" - Flag - SCW.

"b" - Flag "backjump" Previous 3761 Top 41 Next 3767

MiniRobotLanguage (MRL)

"b"-Flag "backjump"

Search Child Window

Intention

What is the "**backjump**"?
It's some kind of "**rollback**", that is done, when a child-window is not immediately found.
If a Child-window (for example a button) is not found, there is a slight danger, that we are inside the wrong Top-Window. Because the SCW. always searches inside the current Top-Window, this behavior could lead to problems. Even if a fitting window with our button would appear, we could not grab it, because we are only searching in a previous window that had the right title.
To prevent this problem and also check new windows if they appear, the SCW.-command may initiate a so called "Backjump" to the previous STW. A Backjump means that the SCW. jumps back to the STW. and this way looks for new windows that may potentially have the button we are looking for.

The "b"-flag controls the "Backjump" behavior. It describes the backjump-time in seconds. You can specify fractions of seconds like this "0.5".
And you can completely disable the backjump, if you set the "b"-flag to a value of zero.

Short Examples:

```
' We use just the button caption and the backjump-flag
SCW.tb|Cancel|0
SCW.bt|0|Cancel

' Here we set the backjump to 250 ms
' all three commands do technically the same
' we have just changed the order of the parameters
SCW.ctb|Button|Cancel|250
SCW.tbc|Cancel|250|Button
SCW.btc|250|Cancel|Button
```

Example

```
'MR Script-file:

```
'Purpose: STW.-Features Demo
'Author: Theo Gottwald
'Creation date: 09.12.11
'============================================================
' In the following script we'll make three sorts of backjumps.
' Fast, slow and no backjump.
' Run it from the Editor and follow the script.
'
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Close Testform if already there
CAW.PBWindowClass:0|BCS - Testform

' Wait 200 ms
PAU.0.2

' Start an Application only, if that Application
' is not yet running.
'
' We use STW here to test if the Application is already
running
' in that case we jump over the EXE-command and contine.
' We use the following flags:
' w ... 0 - Set waiting time to 0 seconds
' t ... "BCS - Testform" - this is the caption text of the
window we search for
' U ... "found" - jump to Label ":found" if the window already
exists
' X ... continue without errormessage if the window was not
found in time
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Now we can use the Application and press Buttons
' we use the following flags:
' w ... 0 - set waiting time to zero
' t ... "BCS - Testform" - caption of the window we are
looking for
STW.wt|0|BCS - Testform
'
' We use the following flags in SCW.:
'
' "c" ... "Button" - window-class (its a button control)
' "t" ... "Cancel" - text on the button we search for
' "b" ... "backjump" is set to 120 ms
' "X" - Flag - no error if not found
' "w" - set waiting time to 5 seconds
SCW.ctbXw|Button|notthere|120|5
' Just move to the button, no click.

' We make another STW. or else the Backjump would go to the
STW. in Line 34
STW.wt|0|BCS - Testform
' We set the backjump now to 1 second (=1000 ms)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
SCW.ctbXw|Button|notthere|1000|5

' We make another STW. or else the Backjump would go to the
STW. in Line 34
STW.wt|0|BCS - Testform
' We disable the backjump now
SCW.ctbXw|Button|notthere|0|5

MBX. Ready
'-------------------------------------------------------------
ENR.
```

Remarks

You can specify rollback times smaller then a second. Use in that case floating point notation, like "0.25".

Limitations:

3.83.24.1 "c" - Flag - SCW.

"c" - Flag "class" Previous 3764 Top 41 Next 3769

MiniRobotLanguage (MRL)

"c"-Flag "class"

Search Child Window

Intention

Child-Window-Class" value. This is the "window class" of the child-window (button,control etc.) we are looking for. Some typical window classes for child-windows are:

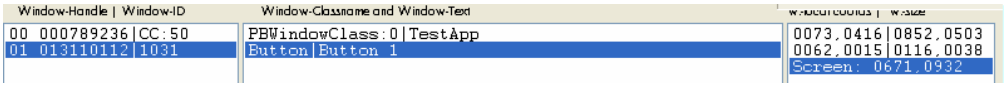
- button (button or checkmark)
- edit (editable text)
- static (static text)
- systabcontrol32 (Tab-Control)
- systreeview32 (Tree-Control)

But there are many more, see example below.

This flag needs a parameter. It uses the 1.4. The Prototype Parameter System 73.
As all text-parameters, the "class" parameter supports the 3.2 Standard-Search Pattern 341.
Therefore you do not always need to type the whole class string.
Its enough to give a unique part of the value. By default the value is not case sensitive.

How do you get the window-class?

If you drive with the mouse over the button or control, then you can see the class as well as other informations about the control in the "windows inspector". See example picture below. The Inspector is integrated in the MR-Editor. Possibly you need to switch the "windows inspector" on before he appears at the bottom of the Editor..



Use the class flag most often together with other flags, like the "t"-flag, to locate the Child-Window of your choice.

```
STW.c|WindowClass
SCW.ct|Button|Ok
MMV.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Short Examples:

```
SCW.ct|button|Cancel|0
```

Example

```
' c - class
' n - number
' t - text
  STW.ct|Tai0470.UnicodeClass|Power Editor
  SCW.nct|1|TPanel|{&NOTEXT:}
  SCW.nct|1|TeePageControl|{&NOTEXT:}
  SCW.nct|1|TeeTabSheet|{&NOTEXT:}
  SCW.nct|2|TPanel|{&NOTEXT:}
  SCW.nct|1|TAdvGlowButton|Apply
  MLE.
```

Remarks

-

Limitations:

See also:

- SCW - Search-Child-Window 3738
- 1.4. The Prototype Parameter System 73
- 3.2 Standard-Search Pattern 341
- "t" - Flag - SCW. 3801

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.24.14 "d" - Flag - SCW.

MiniRobotLanguage (MRL)

"d"-Flag "depth"

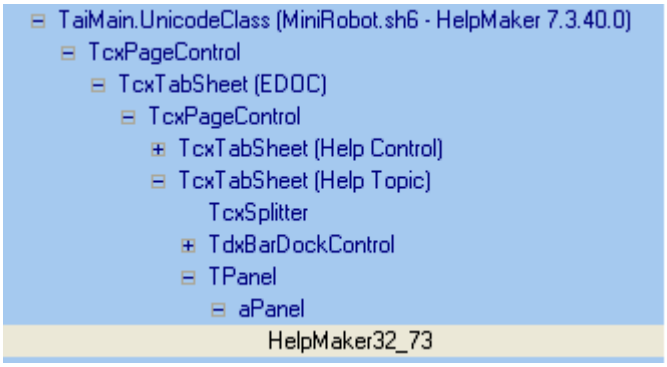
Search Child Window

Intention

This is the "depth" parameter. It needs a numeric value according to the 1.4. The Prototype Parameter System 73.

What is the "depth" of a child-window?

Child-windows are organized below a Top-Window because that's what makes the Child-windows. They belong to a Top-Window from an application. If that would be the whole story, all child-window would have a depth of 1.
Because that means that they are in the next level below the Top-Window. Now in reality a child window can also be below another child window. It can even for a "tree of child-windows". See the example in the picture below.



In this example, this would be some of the the window depths:

```
Top-Level: TaiMain.UnicodeClass | MiniRobot.sh6
1. TcxPageControl | {&NOTEXT:}
2. TcxTabSheet | EDOC
3. TcxPageControl | {&NOTEXT:}
4. TcxTabSheet | Help Topic
5. TPanel | {&NOTEXT:}
```

Therefore we could try to locate the **`TcxTabSheet|Help`** Topic like this:

```
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.nct|1|TcxPageControl|{&NOTEXT:}
SCW.nct|1|TcxTabSheet|EDOC
SCW.nct|1|TcxPageControl|{&NOTEXT:}
SCW.nct|1|TcxTabSheet|Help Topic
MBX.#hwn#
```

© 2023 Theo Gottwald * https://www.smart-package.com

but if we use the depth parameter, we could try this shorter version:

```
STW.ct|TaiMain.UnicodeClass|MiniRobot.sh6 - HelpMaker 7.3.40.0
SCW.dct|4|TcxTabSheet|Help Topic
MBX.#hwn#
```

which will also locate the right window.

In case there are more windows of the same window-class in the same depth, use the "n"-flag to have them numbered. Then select the right number to get the child window you want.

Short Examples:

-

Example

'

Remarks

-

Limitations:

The robot will search windows up to any depth.

See also:

- 1. STW. - Decription 3814
- SCW - Search-Child-Window 3738
- 3.2 Standard-Search Pattern 341

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.24.1 "e" - Flag - SCW.

MiniRobotLanguage (MRL)

"e"-Flag "enabled"

Search Child Window

Intention

The picture shows an enabled button (Install) and a disabled button (Next).

To ignore disabled child-windows (button, controls etc.) is the default behavior of the SCW. command. Therefore you will not need to specify the "e"-Flag often.
It can however make sense, to override the default behavior by using the "f"-flag which will make SCW. to ignore enabled child-windows and just look for disabled child-windows. This could be an button that is disabled, for example.

If you want to catch both, enabled and disabled child-windows, the "a"-flag is what you need. However the "a"->Flag will automatically also enable the search for invisible child-windows.

If you do not want that, just add a prototype "v" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "e" - flag together with the "a" to search only child-windows that are enabled. No matter if they are visible or not.

For example. This will search only for enabled child-windows.

```
STW.c|WindowClass
SCW.ect|button|ok
MMV.
```

Since this is a default behavior of `SCW.`, we have wasted the "e" at this place. Its not needed. Now we would like to search for child-windows which are enabled, as well for disabled windows. We can do that in two ways.The first way is like this:

```
STW.c|WindowClass
SCW.efct|button|ok
MMV.
```

If we give all two prototypes, the robot understands that we want enabled and disabled child-windows. But there is another way to do it. We can do this:

```
STW.c|WindowClass
SCW.aect|button|ok
MMV.
```

© 2023 Theo Gottwald * https://www.smart-package.com

The "a" Flag says "search all child-windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled child-windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want enabled child-windows.".

Short Examples:

-

Example

```
'*********************************************
' SCW-Sample
'*********************************************
' Start TestApp only, if it's is not yet running.
'
STW.wtUXg|0|TestApp|found
EXE.?exepfad\Sample Apps\TestApp_01.exe
:found

STW.t|testapp

SCW.to|button 1|ero
SWS.i

GCT.
SCW.tuo|button 1|ero
SWS.vd

GCT.
SCW.tfo|button 1|ero
SWS.id

GCT.
SCW.tufo|button 1|ero

SWS.

ENR.
:ero
MBX.Window not found!
ENR.
```

Remarks

You can enable buttons if they are disabled. You do this, using the `SWS.e` -command. This way you can click buttons, you would normally not be able to click.

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.24.1("f" - Flag - SCW.

MiniRobotLanguage (MRL)

"f"-Flag "disabled"

Search Child Window

Intention

The picture shows an enabled button (Install) and a disabled button (Next).

To ignore disabled child-windows (button, controls etc.) is the default behavior of the SCW. command. While the robot can work with disabled controls as well as with enabled controls.

What can you do with disabled controls (Buttons, etc.)?
You can do nearly everything with them, that you can do with enabled controls. But the most important thing is, that you can enable them, using the `SWS.e` - command.

It can however make sense, to override the default behavior by using the "f"-flag which will make SCW. to ignore enabled child-windows and just look for disabled child-windows. This could be an button that is disabled, for example.

If you want to catch both, enabled and disabled child-windows, the "a"-flag is what you need. However the "a"->Flag will automatically also enable the search for invisible child-windows.

If you do not want that, just add a prototype "v" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "f" - flag together with the "a" to search only child-windows that are disabled. No matter if they are visible or not.

For example. This will search only for disabled child-windows.

```
STW.c|WindowClass
SCW.fct|button|ok
MMV.
```

Now we would like to search for child-windows which are enabled, as well for disabled. We can do that in two ways.The first way is like this:

```
STW.c|WindowClass
SCW.efct|button|ok
MMV.
```

If we give all two prototypes, the robot understands that we want enabled and disabled child-windows. But there is another way to do it. We can do this:

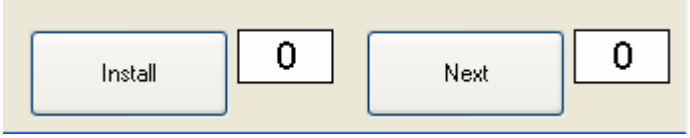
© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.c|WindowClass
SCW.afct|button|ok
MMV.
```

The "a" Flag says "search all child-windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the enabled child-windows. We do this by adding the "f"-Flag after the "a". In this case the "f"-Flag will override the "a"-Flag. And tell the robot "we just want disabled child-windows.".

Short Examples:

```
' You can try yourself to enable an disabled button
' Use this script and the "BCS-Testform"
' from the Sample Application
' use this example script
STW.ct|PBWindowClass:0|BCS - Testform
SCW.nctf|1|Button|next
SWS.e
```



Example

```
'*********************************************
' SCW-Sample
'*********************************************
' Start TestApp only, if it's is not yet running.
'
STW.wtUXg|0|TestApp|found

MiniRobotLanguage (MRL)

"g"-Flag "Goto on found"

Search Child Window

Intention

If the child-window (button/control .. etc.) you are looking for is found within the specified waiting time, normally the script just continues. You can however ask the robot to jump to a Label in that case.

If you also use the "X"-Flag to tell the robot to just continue with the script in case of an error - if the window is not found, then you can just reverse the normal behavior of the SCW.-command..

Sometimes this can be a perfect solution - depending on the process flow, that you want to implement.

Note that the 3.1 Systemvariables 334 #tio# and #til# will always flag if the child-window was found or not. This does not depend on the usage of the "o" or "g" or "X"-Flags. Therefore you can later still find out what happened.

Here is an example

```
SCW.Xtg|OK|found
MBX. The OK-Button was not found!
END.
:found
MBX.The OK-Button was found.
ENR.
```

In case you use the "g"-Flag, together with the "W" -Flag ("on Found Gosub"), the "W"-Flag will be ignored. The "g"-Flag has a generally higher priority.

Short Examples:

```
SCW.Xtg|OK|found
MBX. The OK-Button was not found!
END.
:found
MBX.The OK-Button was found.
ENR.
```

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'*********************************************
' SCW-Sample
'*********************************************
' Start TestApp only, if it's is not yet running.
'
STW.wtUXg|0|TestApp|found
EXE.?exepfad\Sample Apps\TestApp_01.exe
:found

STW.t|testapp

SCW.tog|button 1|ero|found
' Script will nver get here!
END.

:found
GCT.
SCW.to|button 1|ero
SWS.vd

ENR.
:ero
MBX.Window not found!
ENR.
```

Remarks

If you specify the "g"-Flag "on found Goto" together with the "W"-Flag (on found GoSub), then the "g"-Flag takes priority and the "W"-Flag will be ignored.

Limitations:

-

3.83.24.18 "h" - Flag - SCW.

"h" - Flag "handle" Previous 3777 Top 41 Next 3782

MiniRobotLanguage (MRL)

"h"-Flag "handle"

Search Child Window

Intention

This flag is an exception. In fact it must not search the window, it will just localize the window "by handle". Of course this is a very efficient solution. Therefore if you have already localized your child-window before, keep the handle. You can keep the handle for example in a variable. Or on the stack.And then just feed it back to SCW. when you need that window again, using the "h"-flag.
As the "h"-flag does not search anything but immediately localizes the window, you should not combine it with other search flags, like "p","c","t" or these. It will just take priority and ignore these. You can combine the "h"-flag with the flags like "o","g",V" and "W". For example:

```
SCW.hg|123|notfound
```

Is completely Ok.

When using the "h"-flag with a valid child-window handle, there is no need to first use STW. to get a Top-Window. You can immediately locate a child-window. If you then need the Top-Window from that child window, you can use the GCT.-command.

```
' Localize by handle
STW.t|TestApp
' We grab the handle in a variable
SCW.t|button 1
HTV.$$MYC

' Later we can always get definitely this window,
' without further parameters
' No need to first localize a Top-Window!
SCW.h|$$MYC
MMV.
'
' Work with another window
STW.h|52367
MMV.

' jump immediately back to this child-window without
' the need to localize a Top-window first.
SCW.h|$$MYC
MMV.

ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Short Examples:

```
STW.ct|PBWindowClass:0|BCS - Testform
SCW.nct|1|Button|Install
HTV.$$MYC

SCW.t|invisi
MMV.

SCW.hg|123|notfound
ENR.

:notfound
MBX.Notfound!
ENR.
```

Example

```
'*********************************************
' SCW-Sample
'*********************************************
' Start TestApp only, if it's is not yet running.
'
STW.wtUXg|0|TestApp|found
EXE.?exepfad\Sample Apps\TestApp_01.exe
:found

STW.t|testapp

SCW.to|button 1|ero
' Keep the child-window handle in $$MYC
: $$MYC=#hwn#

' Get the Top-Window
GCT.
' Press another button
SCW.to|button 2|ero
MLE.

' Immediately locate the button via "h" again and press it.
SCW.h|$$MYC|ero
MLE.

ENR.

:ero
MBX.Window not found!
ENR.
```

Remarks

Locating child-windows using the "H"-Flag is not a windows-search, but a direct localization.

3.83.24.19 "i" - Flag - SCW.

MiniRobotLanguage (MRL)

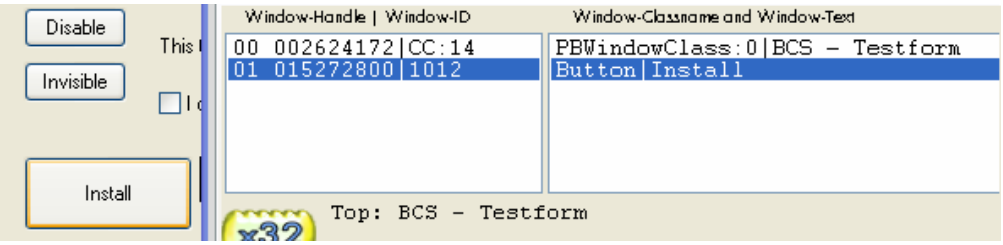
"i"-Flag "child-window ID"

Search Child Window

Intention

The child-window ID is traditionally a internal number, that the programmer assigns a window control at design-time. Therefore it can be used to locate a window in many cases. But be careful, not all child-windows ID's are really consistent.

You can see the window ID in the windows-Inspector.



In this case the button "Install" has a ID of 1012. Such an ID looks good and the chances are good that you can use it for the localization of the button. Therefore it must be permanent, means, that if you start the program many times, the ID must be always the same.

This is not always the case. Watch out if:

- the child-window ID is higher then 32000
- the child-window ID is zero or -1
- the child-window has a class name that starts with "t" like "tnewcheckmark" or "tnewlistbox".

In all these cases, the chances are that the id is not the same between multiple starts of the application, and therefore unusable for a safe window localisation.

How do you localize a window using the ID?

```
' First get the Top-Window:
STW.t|testap
' then get the child-window
SCW.i|1012
' now you can click it!
MLC.
```

Normally there should not be multiple child-windows with the same ID in the same dialog. Therefore if you have a valid child-window ID, you do not need to specify a "c"-class or "t"-text to locate the window. The ID is enough.
Unless you want. A "t"- with text can improve readability of your script.

© 2023 Theo Gottwald * https://www.smart-package.com

While it should not be needed, the "i" is a normal search flag and can be combined with all other search flags .

Short Examples:

-

Example

```
'*********************************************
' SCW-Sample
'*********************************************
' Start TestApp only, if it's is not yet running.
'
STW.wtUXg|0|TestApp|found
EXE.?exepfad\Sample Apps\TestApp_01.exe
:found

STW.t|testapp

SCW.to|button 1|ero
SWS.i

GCT.
SCW.tuo|button 1|ero
SWS.vd

GCT.
SCW.tfo|button 1|ero
SWS.id

GCT.
SCW.tufo|button 1|ero

SWS.

ENR.
:ero
MBX.Window not found!
ENR.
```

Remarks

Normally there should not be multiple child-windows with the same ID in the same dialog. Therefore if you have a valid child-window ID, you do not need to specify a "c"-class or "t"-text to locate the window. The ID is enough.

While it should not be needed, the "i" is a normal search flag and can be combined with all other search flags, including "c" or "t".

3.83.24.2("j" - Flag - SCW.

MiniRobotLanguage (MRL)

"j"-Flag "WII. by number"

Search Child Window

Intention

"Wait for Input Idle" halts script execution until the localized child-window is ready to process our Input.

This Command can be seen as a dynamic Pause-Statement, it waits only if our target child-window (-process) is busy. The maximum waiting time must be given as a numeric value or variable.

If you have specified the `WII. command or the` "j"-Flag in the STW.-statement, then there is no need to specify it again in the SCW., as internally the WII. works based on the process behind the window. And the process is the same for the Top- and the child-window.

Note the value you specify will replace the default internal value for "WII. without parameter", used for the "k" - Flag - STW. 3865 . But also for WII. if no parameters are given.

Unlike a fixed pause statement which would always wait for a fixed time. `WII.` is the better solution.

If the process is a console application or does not have a message queue, "Wait For Input Idle" returns immediately.

The given time is in seconds. Fractions are allowed. For example:

```
' WII. wait no longer then a half second
STW.c|WindowClass
SCW.tj|OK|0.5
MMV.

' Will do the same as "k" will repeat
' the value from "j" internally.
STW.c|WindowClass
SCW.tk|OK
MMV.
```

Technically the "j"-Flag does the same like the WII. - Wait-for-Input-Idle 2909 statement. Just that it is integrated and does not need a separate line of code.

Short Examples:

3.83.24.2."k" - Flag - SCW.

MiniRobotLanguage (MRL)

"k"-Flag "WII. default"

Search Child Window

Intention

"Wait for Input Idle" halts script execution until the localized window is ready to process our Input.

This Command can be seen as a dynamic Pause-Statement, it waits only if our target window is busy. The maximum waiting time is taken from an internal value that is been set with the last WII. statement or with the "j" - Flag - STW. 3863.

Unlike a fixed pause statement which would always wait for a fixed time. `WII.` is the better solution.

If the process is a console application or does not have a message queue, "Wait For Input Idle" returns immediately.

The given time is in seconds. Fractions are allowed. For example:

```
' WII. wait no longer then a half second
STW.c|WindowClass
SCW.tj|OK|0.5
MMV.

' Will do the same as "k" will repeat
' the value from "j" internally.
STW.c|WindowClass
SCW.tk|OK
MMV.
```

Technically the "k"-Flag does the same like the WII. - Wait-for-Input-Idle 2909 statement without a parameter. Just that it is integrated and does not need a separate line of code.

3.83.24.2 "n" - Flag - SCW.

MiniRobotLanguage (MRL)

"n"-Flag "Count on level"

Search Child Window

Intention

The "n"-flag needs a numeric parameter. This parameter specifies a number of a window that is exactly one level below the window that is the actual window. No matter if its a child- or a top-window.

There may be multiple results in a window-search with `SCW.`. Normally you get the first result that fits to your search parameters.

Using the "n"-Flag you can define which result you want, Nr.1, Nr.2 or Nr. 20. Just add the "n"-Flag and the result number that you are looking for.

In child-window search, the "r"-flag searches all child-windows below the Top-window.
That differs from the "n"-flag, which only looks at the child-windows that are directly below the actual located Top- or child-window.

If "r" (and "n") is omitted, always result Nr.1 from the rest of search parameters is returned.

Note: If there are not enough results, your search will fail!
Therefore you can also use this feature to count child-windows.

```
STW.c|WindowClass
' give me the third button on the next level
SCW.cn|button|3
MMV.
```

Short Examples:

-

Example

3.83.24.2 "o" - Flag - SCW.

"o" - Flag "on not found Goto" Previous 3789 Top 41 Next 3793

MiniRobotLanguage (MRL)

"o"-Flag "on not found Goto"

Search Child Window

Intention

If the child-window (button, control etc.) is not found within the specified waiting time, normally you will end up with an error-message and the script will stop.

Maybe you want something else.
Using the "o"-Flag you can avoid the error and instead jump to another place in the script.
Using the "o"-Flag, the script just continues in that case. The window is not found and we tell the robot to jump to a Label in that case.

Take this example:

```
' t - text (caption of the window)
' o - goto Label "GoOn" if the window was NOT found
' X - continue the script as normal, without error,
'     if the window is not found
STW.t|BCS
SCW.toXw|Next|GoOn|0
GTO.weit

:GoOn
 MBS: The Next Button was not found!

:weit

MBX.Ready
ENR.
```

In case you use the "o-Flag, together with the "V" -Flag ("on not Found Gosub"), the "V"-Flag will be ignored. The "o"-Flag has a generally higher priority.

Short Examples:

```
' t - text (caption of the window)
' o - goto Label "GoOn" if the window was NOT found
' X - continue the script as normal, without error,
'     if the window is not found
STW.t|BCS
SCW.toXw|Next|GoOn|0
GTO.weit

:GoOn
```

3.83.24.2 "p" - Flag - SCW.

MiniRobotLanguage (MRL)

"p" - Flag "Process ID"

Search Child Window

Intention

The "p"-flag ist mostly used with Top-Windows. Within a Top-window all child-windows have the same PID. You can however use it in very special cases for child-windows also.

Especially if you use the "T"-Flag, which does search through all windows (desktopwide).

You can localize a window safely, if you have the PID (Process ID) of the application behind that window.

Be sure that you have read and understood the chapter 1.7. Application and PID 137.

Hint: If you have localized a window, you also have the PID of the process behind that window in `#pid#`. You can save it for later use in a variable. Like this:

```
STW.c|pbwind
: §§PID=#pid#

or use:

STW.c|pbwind
HTV.§§PID
```

In both cases, you get the PID of that process into the local variable §§PID 366.

You can see the PID of a process in the task-manager::

 © 2023 Theo Gottwald * https://www.smart-package.com

The PID value is a normal search parameter and can be used alone or together with other search parameters.

```
' Search a window from process with ID 3435
' and the given window class.
'
STW.ch|pbwind|580
MMV.
```

Short Examples:

```
' Locate window only by PID
STW.p|580
MMV.

ENR.

SCW.btc|250|Cancel|Button
```

Example

-

Remarks

3.83.24.2 "q" - Flag - SCW.

MiniRobotLanguage (MRL)

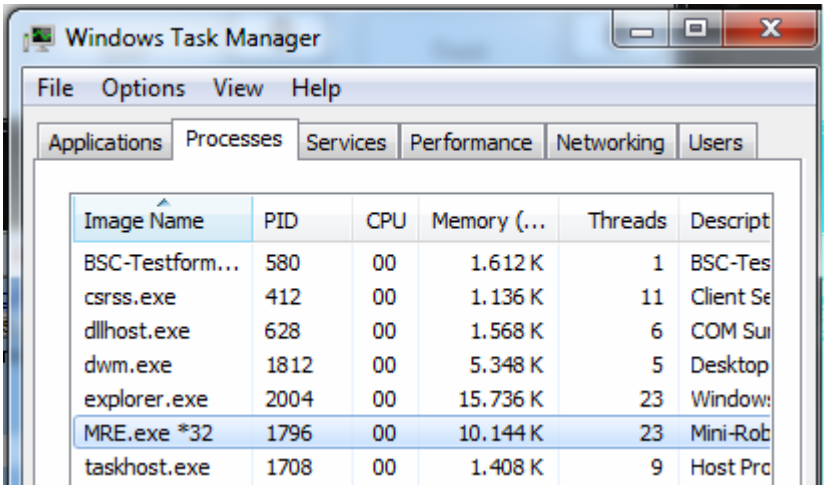
"q" - Flag "Thread ID"

Search Child Window

Intention

Top-Windows belong to a single Thread therefore this parameter is only for very special cases in SCW.

This is an advanced parameter. The chances are, that you will never need it. Processes have a number of Threads. See this picture here:



On the left side you can see the name of the process. Right of it the PID of the process. Later you see "Threads".
In a very simplified form, a Thread is a subprogram of that process, that runs an own small program. Generally the more threads a program has, the better it will scale up on multiple CPU-Core's.
While all Threads of a process belong to that process and therefore have the same PID, they have a different Thread-ID. In case you may need to separate between windows of the same process, which is "Multi-threaded", the "q"-flag is for you.

```
STW.cq|WindowClass|109872
MMV.
```

Hint: If you have localized a window, you also have the TID of the process behind that window in `#tid#`. You can save it for later use in a variable. Like this:

```
STW.c|pbwind
: §§TID=#tid#
```

This way, you get the TID of that Thread into the local variable §§PID 366.

© 2023 Theo Gottwald * https://www.smart-package.com

If you don't "understand a word", or don't have very special cases, just ignore this flag.

3.83.24.2("r" - Flag - SCW.

MiniRobotLanguage (MRL)

"r"-Flag "result number"

Search Child Window

Intention

There may be multiple results in a window-search with `SCW.`. Normally you get the first result that fits to your search parameters.

Using the "r"-Flag you can define which result you want, Nr.1, Nr.2 or Nr. 20. Just add the "r"-Flag and the result number.

In child-window search, the "r"-flag searches all child-windows below the Top-window.

That differs from the "n"-flag, which only looks at the child-windows that are directly below the actual located Top- or child-window.

If "r" (and "n") is omitted, always result Nr.1 is returned.

Note: If there are not enough results, your search will fail!
Therefore you can also use this feature to count child-windows.

```
STW.c|WindowClass
' give me the third button
SCW.cr|button|3
MMV.
```

Short Examples:

-

Example

-

Remarks

3.83.24.27 "s" - Flag - SCW.

"s" - Flag "reverse direction" Previous 3797 Top 41 Next 3801

MiniRobotLanguage (MRL)

"s"-Flag "reverse direction"

Search Child Window

Intention

The "s"-Flag will reverse the internal search direction of child-windows. Example:
If there are four child-windows on a level. You would specify these like that:

```
SCW.ctn|Button|Cancel|1
...
SCW.ctn|Button|Cancel|4
```

```
now after adding the "s"-Flag, the child-window Nr.1 will be
Nr.4, the Ne.3 will be Nr.2. They will just completely reverse
their search order.
This can be handy if you have a large number of child windows
and you want to "grab them from the other end".

This way you may be less dependent on changes within those
other child-windows.

Also this flag is needed for compatibility with some
WinRobots-Scripts, as WinRobots does use a reverse search
direction sometimes.
```

Short Examples:

-

Example

-

Remarks

-

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.24.2 "t" - Flag - SCW.

"t" - Flag "text" Previous 3799 Top 41 Next 3804

MiniRobotLanguage (MRL)

"t" - Flag "text"

Search Child Window

Intention

This flag is one of the most important search parameters. It is the window-text. Most often you can even see the text of a top-window without using the windows-Inspector.
Here is the simplest case how you can grab a button or child-window.

```
SCW.t|Yes
MMV.
```

The text parameter is a string-value and therefore supports 3.2 Standard-Search Pattern 341.
Let us try some of these.

As always with Search patterns, it is enough to give a unique part of the value. By default the text is not case sensitive. You can change that behavior using the search patterns. Take the sample-script below and replace the line:

```
' Locate the window
SCW.t|next
```

with the following lines. This will help you to understand the use of Patterns for text search.

```
' Lets start with this
SCW.t|{&DOCAPS:Next}
```

This will force the text to be case-sensitive! Try this:

```
' This will not find the window
' because of case-sensitivity!
STW.t|{&DOCAPS:next}
```

It does not find the button because the &DOCAPS: switches case-sensitivity on.
Now how about this:

```
SCW.nct|2|Button|{&EXACT:&next}
```

It does find the button. But then whats the "&EXACT:" good for?
Try this:

```
STW.t|{&EXACT:ext}
```

© 2023 Theo Gottwald * https://www.smart-package.com

It does not find the window because the &EXACT: switches off the default behavior that a part of the text is enough. Can it be combined with the `&DOCAPS:` ?

We'll try this with Top-Windows here, because its less to type. The patterns work in the same way with child-windows.

We try. This should work:
```
STW.t|{&EXACT:&DOCAPS:BCS - Testform}
```
and this should not work:
```
STW.t|{&EXACT:&DOCAPS:bCS - Testform}
```

Yes, everything work as expected.

Do you know the old times, when you had simple Wildcards as patterns? The"*" and the "?" ?

You can have them back if you want. Try this:

```
STW.t|{&WILDC:b?? - Testform}
```

Yes, it works. And how about:

```
STW.t|{&WILDC:b?? - Tes*orm}
```
or
```
STW.t|{&WILDC:b?? - *s*or?}
```

It works. We kept them for you.

You can still use even the old DOS-Patterns if you really want.
But there is much more if you use the new patterns.

How about a fuzzylogic and a OR'ed combination of two patterns?

```
STW.t|{&WILDC:b?? }&OR:{BCS-tesform&FUZZY:6}
```

and you can not only combine two patterns, you can combine as many patterns using &OR: as you like! If you want to support many languages, this is the way to go.

No matter if there is a "YES" on that button or a "Qui" or whatever. So long you know it, or at least a bit of it, you can locate it using Search patterns.

Short Examples:

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

EXE.?exepfad\Sample Apps\BSC-Testform.exe

' Locate the window
STW.t|Testf

' Close the window
CAW.PBWindowClass:0|BCS - Testform
```

3.83.24.2 "u" - Flag - SCW.

MiniRobotLanguage (MRL)

"u" - Flag "invisible"

Search Child Window

Intention

To ignore invisible windows is one of the default settings of the SCW. command. Therefore if you want to search for a child-window that has is invisible, you will need the "u"-flag.

The "u"-Flag will override the default behavior. It will make SCW. to ignore visible windows and look for invisible windows, only.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also enable the search for disabled windows. If you do not want that, just add a prototype "e" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "u" - flag together with the "a" to search only windows that are invisible. No matter if they are enabled or not.

Lets take a look, on this. We'll show it with Top-Windows (STW.) here, but the system is completely equal for SCW. and ICW. This will search only for invisible windows.

```
STW.cu|WindowClass
MMV.
```

Now we would like to search for windows which are visible, as well as for invisible windows. We can do that in two ways.The first way is like this:

```
STW.cuv|WindowClass
MMV.
```

The robot understands that we want visible and invisible windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cae|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

Short Examples:

-

3.83.24.3("v" - Flag - SCW.

"V" - Flag "GoSub if not found. " Previous 3804 Top 41 Next 3809

MiniRobotLanguage (MRL)

"v" - Flag "visible"

Search Child Window

Intention

To ignore invisible windows is one of the default settings of the SCW. command. Therefore you will not need to specify the "v"-Flag often.

It can however make sense, to override the default behavior by using the "u"-flag which will make SCW. to visible windows and just look for invisible windows.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also switch on the search for disabled windows. If you do not want that, just add a prototype "e" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "v" - flag together with the "a" to search only windows that are visible. No matter if they are enabled or not.

Lets take a look, on how to do this. In this case we will look at it with `STW.`, but its equal for `SCW.` and `ICW.` This will search only for visible windows.

```
STW.cv|WindowClass
MMV.
```

Since this is a default behavior of `SCW.`, we have wasted the "v" at this place. Its not needed.

Now we would like to search for windows which are visible, as well for invisible windows. We can do that in two ways.The first way is like this:

```
STW.cuv|WindowClass
MMV.
```

The robot understands that we want visible and invisible windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cae|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

3.83.24.3."w" - Flag - SCW.

MiniRobotLanguage (MRL)

"w" - Flag "wait time"

Search Child Window

Intention

How long do we wait if a window will appear or not?
Let's try it.

```
: $$TIM=#dtime#
STW.tX|nix
: $$TIM=#dsince#
MBX.$$TIM
ENR.
```

This i what we get.

It's currently about 15 seconds. When you read this it can be another value.
In fact this is the default time that we wait for a window before we run into an error-message or do something else (like in this script).

Now, its very important to understand that we do not generally wait 15 seconds, and then look if the window has appeared.
What we do is, we try ... try ... and try and check permanently, if the window has appeared. If the window appears any time, the script will immediately continue.

If the time is over, we do something else.

Now 15 seconds is enough for some cases, in many cases the window will appear after 45 seconds or any other time. Now this is where the "w"-flag enters the game.

Using the "w"-flag we can tell the robot how long he should wait. It can be 0 seconds like this:

```
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found
```

or 360 seconds like here.

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.wtu|360|BCS - Testform
```

and there is no real limitation.

Short Examples:

-

Example

```
'*******************************************
' SCW-Sample
'*******************************************
' Start TestApp only, if it's is not yet running.
'

3.83.25 SFW. - Set Foreground WIndow

MiniRobotLanguage (MRL)

SFW. Command

Set Foreground window

Intention

The `SFW.`.-Command will bring the last localize Application-window (Top-Window) in front of all other non-TopMost windows.

Usage is simple:

```
' Normally STW. already includes a SFW.
' We have disabled this here, using the "A"-Flag
STW.Act|PBWindowClass:0|TestApp
SFW.
SCW.cn|edit|2
```

`STW.` already contains an implicit `SFW.` if the "A"-Flag is not given therefore you will most often not need to explicitly call this command.

Important note: Windows that are **TopMost** will always stay in front of all non TopMost windows. An example for a TopMost windows is the Script-Editor, if the Menu Entry "Display always on Top" is checked.

To make a Window "TopMost", use "M" - Flag - STW. 3838

Syntax

SFW.[P1]

Parameter Explanation

P1 - ***(optional)*** `VAR or formula in (..).`
`Must be a valid Window handle`

Example

```
STW.AgXctw|over|PBWindowClass:0|TestApp|0
EXE.?exepath\Sample Apps\TestApp_01.exe
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
:over

' Normally STW. already includes a SFW.
' We have disabled this here, using the "A"-Flag
STW.Act|PBWindowClass:0|TestApp
SCW.cn|edit|2
SFW.
ENR.
```

Remarks

Will set the timeout-flag if the operation was not successful.

Limitations:

-

3.83.26 STW. - Search Top Window

3.83.26.1 ! STW. -Search Top-Window

MiniRobotLanguage (MRL)

STW. Command

Search Top Window

Intention

This command localizes a specified Top-Window and sets the actual point into its center.
All following SCW-commands will be within this window.
STW. has a default window-treatment 3814 to ensure that any further action in that window will be effective. This default treatment will do following:
- normalize minimized windows (like the "D"-Flag
- windows that are outside the desktop-work area will be moved to 0,0 (like "G"-Flag)
- The window will be moved in front of all other (non-TopMost 3838)-windows.
- The window will receive the input focus. (like the "J"-Flag)

This default window-treatment can be completely deactivated using the "A"-Flag 3819.

This makes sense, for example when working with Menu's or other windows which disappear when the default treatment is being applied.

Alternatively the default window treatment can be influenced using other flags, like "B" or "G".

If the window should be brought into work area, without other treatment, use the "B"-Flag. "G", will just prevent the repositioning of the window and let the other treatment-steps happen.

All window search operations change the Timeout System Variables `#tio#` and `#til#`. Using these you can find out if a window was found or not, even if you have used the"X" Flag (X - run without Error).

Hint: Please note that the Flags have a priority from left to right (highest Priority). If you add other flags after the "A" there may be a treatment. Because the more right the flags, the higher their priority. If you place the "A" last inside the prototypes, all involved treatment will be disabled.

See two examples.
In this first case the "A" Flag has priority over the "C" Flag, because its right of it.

```
STW.tCA|explorer
MMV.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

In this case the "C" Flag is right of the "A" Flag and therefore has priority over the "A" Flag.

```
STW.tAC|explorer
MMV.
```

Some Flags deactivate the default treatment or parts of it. See description below.

Hint: If you omit all parameters like this:
`STW.`
the command will automatically restore the parameters from the previous call. This makes it easy to always locate the same Top-Window.Note that this also applies to `ITW.` as both use the same parameters-store.

Syntax

STW.P1[|P2]...[|Px]

Parameter Explanation

P1 – Prototype
P2 .. PX - Parameters according to prototypes

```
A - (np) Switch off default window treatment completely
B - (np) disables following parts of "default treatment":
     NO Restore from Minimized, NO Set Input-Focus,
     NO Bring to Front
C - (np) If the window i maximized, it will be restored to
    normal size
D - (np) If the window is minimized,  will be restored to its
    previous size, before it was minimized,
E - (np) Put Localize window, then add window to
    Search Exclude List.
F - (np) Move window to center of primary desktop
G - (np) disable default window-treatment-"repositioning if
     outside"
H - (np) a window that is outside the primary desktop working
area
    will be repositioned. Default is that the window can be
also
    on a second desktop.
I - (NUM/VAR) Remove window with the given window-handle from
the
    search-exclude-list.
J - (np) Bring window to Front. Does not switch off default
window
    treatment.
K - Immediately clear Exclude-List before specified search
M - (np) Set window to TOPMOST. Such windows will be on Top
of all
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
    other Non-TOPMOST windows. DANGER - even Messageboxes may
be
    hidden behind a TOPMOST window. Use this with caution!
N - (np) remove the TOPMOST Property from a window.
Q - use previous Prototypes (only prototypes)
V - (p/Label) Gosub Line/Label if the window was NOT found
W - (p/Label) Gosub Line/Label if the window was found
X - (np) run without error if window was not found. Timeout
Flag
    #tio# and #til# will anyway be set and can be used.

a - (np) changes internal settings that "all" windows will be
    found. This includes invisible and disabled windows.
b - (np) "back" - moves window to the back, behind other
windows.
c - (p) "class", window-class parameter
e - (np) enabled, the window must be enabled or it will
ignored.
f - (np) disabled, the window must be disabled or it will
ignored.
g - (p/Label) Goto Line/Label if the window was found
h - (p) localize the window directly using a given window
handle.
    Note, if "h" is given, other search conditions will
    be ignored.
j - (p) WaitForInputIdle, you can specify the WII timeout
k - (np) WaitForInputIdle - no parameter, use the default
    WII timeout.
o - (Label/Variable) on not found goto (Label)
p - (p) process-ID, search only windows from process with
this
    given PID
q - (p) ThreadID,, search only windows from process with this
    given TID
r - (p) No. of result to choose (Result-Number for Top-
Windows)
t - (p) text, window-text (often the window caption)
u - (np) invisible, search only invisible windows
v - (np) visible, search only visible windows
w - (p) total waiting-time in Seconds, 0.5 (FP-numbers) is
    possible.
```

Explanation:

(np) -> only prototype, no additional parameter required

(p) -> prototype requires additional parameter

(NUM/VAR) - window handle/variable

(p/Label) - Label-Parameter required, can also be a variable that contains the label

P2 - Px - Data according to the prototypes, separated by |

Example

```
'MR Script-file:
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'Version:
'Purpose: STW.-Features Demo
'Author: Theo Gottwald
'Creation date: 09.12.11
'============================================================
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
' We use STW here to test if the Application is already
running
' in that case we jump over the EXE-command and contine.
' We use the following flags:
' w ... 0 - Set waiting time to 0 seconds
' t ... "BCS - Testform" - this is the caption text of the
window we search for
' g ... "found" - jump to Label ":found" if the window already
exists
' X ... continue without errormessage if the window was not
found in time
'
STW.wtgX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Now we can use the Application and press Buttons
STW.wt|0|BCS - Testform
SCW.nctb|1|Button|Next|0
' Compatible Button Click
MLC.

'------------------------------------------------------------
ENR.
```

Remarks

To select/locate a Top- Window, you will most often use `STW.` or in few cases `LAP.`

3.83.26.2 "A" - Flag - STW.

"A" - Flag "No windows treatment" Previous 3814 Top 41 Next 3821

MiniRobotLanguage (MRL)

"A" - Flag "No windows treatment"

Search Top Window

Intention

STW. has a default window-treatment to ensure that any further action in that window will be effective. This default treatment will do following:
- normalize minimized windows (like the "D"-Flag
- windows that are outside the desktop-workarea will be moved to 0,0 (like "G"-Flag)
- The window will be moved in front of all other (non-TopMost)-windows.
- The window will receive the input focus. (like the "J"-Flag)

This default window-treatment can be completely deactivated using the "A"-Flag.

This makes sense, for example when working with Menu's or volatile windows, which disappear when the default treatment is being applied.

Usage:

```
STW.cA|#32768
MMV.
```

Please note that the Flags are internally analyzed in the order in which they are given. If you add other flags after the "A" there may be a treatment.
If you place the "A" last inside the prototypes, all such treatment will be disabled.

In this case the "A" Flag has priority over the "C" Flag, because its right of it.

```
STW.tCA|explorer
MMV.
```

In this case the "C" Flag is right of the "A" Flag and therefore has priority over the "A" Flag.

```
STW.tAC|explorer
MMV.
```

Example

```
'MR Script-file:
'Version:
'Purpose: STW.-Features Demo
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'Author: Theo Gottwald
'Creation date: 09.12.11

3.83.26.3 "B" - Flag - STW.

"B" - Flag "partial treatment" Previous 3819 Top 41 Next 3823

MiniRobotLanguage (MRL)

"B" - Flag "partial treatment"

Search Top Window

Intention

STW. has a default window-treatment to ensure that any further action in that window will be effective. This default treatment will be reduced, when the "B" - Flag is set.

When the "B" Flag is in effect, windows that are outside the desktop-workarea will be moved to the upper, left corner of the desktop - that is position 0,0. Thats the only treatment that will be done.

Also this can be disabled with the "G"-Flag. Means, that the flags "G" and "B" together are just like the "A" flag,

Example:

```
STW.Bc|WindowClass
MMV.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
STW.cB|#32767
' Locate the button
SCW.t|Ok
' Click the button
MLE.
ENR.
```

Remarks

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.26.4 "C" - Flag - STW.

MiniRobotLanguage (MRL)

"C" - Flag "restore if maximized"

Search Top Window

Intention

If the window is maximized, this flag will bring the window back to its normal size.
You can maximize, minimize and restore windows using the SWS. - Set Window State 3889 command.

It doesn't matter, if the window was minimzed before it was maximized.
The window will be normal size after this flag.

Example

```
STW.ct|PBWindowClass:0|TestApp
' Maximize Window
SWS.z
' Wait 1 Second
PAU.1
' Window will be restore to normal size
STW.ACct|PBWindowClass:0|TestApp
ENR.
```

Remarks

Limitations:

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.26.5 "D" - Flag - STW.

"D" - Flag "restore if minimzed" Previous 3823 Top 41 Next 3825

MiniRobotLanguage (MRL)

"D" - Flag "restore if minimized"

Search Top Window

Intention

If the window is minimized, this flag will bring the window back to its normal size.
You can maximize, minimize and restore windows using the SWS. - Set Window State 3889 command.

It does not matter, if the window was maximized before it was minimized.
The window will be normal size after this flag.

Example

```
STW.Act|PBWindowClass:0|TestApp
SWS.z
SWS.m
PAU.1
STW.ADct|PBWindowClass:0|TestApp
ENR.
```

Remarks

Limitations:

See also:

3.83.26.6 "E" - Flag - STW.

"E" - Exclude window" Previous 3824 Top 41 Next 3827

MiniRobotLanguage (MRL)

"E" - Flag "Exclude window"

Search Top Window

Intention

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with STW. and not with ITW. It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
STW.cE|WindowClass
MMV.
```

And how do you get the window out the "Exclude List"?
This is what the "I"-Flag is good for.

```
' Remove window from exclude List
STW.I|$$HWN
```

The "I"-Flag however need a window handle as parameter and will not work in any other constellation. Therefore keep the handles of those excluded windows, if you want to have them back later.

Example

```
' Use Exclude List

' Add window to exclude list
STW.tE|TestAP
MMV.
VAR.$$HWN=#hwn#

' Remove window from exclude List
STW.I|$$HWN
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' If you comment the STW. above the window can not be found
here:
STW.t|TestApp

ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag.
To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using SCW. there is also Exclude-List availabe. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

See also:

- "I" - Flag - STW. 3832
- "K" - Flag - STW. 3836

3.83.26.7 "F" - Flag - STW.

"F" - Flag "center window on desktop" Previous 3825 Top 41 Next 3829

MiniRobotLanguage (MRL)

"F" - Flag "Center on Desktop"

Move Window to center of primary desktop

Intention

If the "F"-Flag is given, the window will be move to the center of the primary desktop. The "F"-Flag will override the default windows treatment, which would move the window to 0,0 if its outside of the desktop.
The "F"-Flag will always move the window to the center, no matter where the window was before.

```
STW.Fc|WindowClass
MMV.
```

Example

```
'
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.cF|Myclass
' Move Mouse to Center of window
' in center of desktop
MMV.
ENR.
```

Remarks

Limitations:

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.26.8 "G" - Flag - STW.

MiniRobotLanguage (MRL)

"G" - Flag "don't move window"

don't move the Top Window

Intention

This flag prevents the default window treatment from moving the window around. Without this Flag, a Top-Window that is outside the working area, will be move to position 0,0, that is the upper left corner of the desktop.

Having the "G"-Flag set, the window will just not be moved, no matter if its outside the working area or not.

```
STW.cG|WindowClass
MMV.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.cG|#32768

ENR.
```

Remarks

Please note that other prototypes may influence the power of the "G"-Flag, especially, if the are right of the "G"-Flag which means they have a higher priority.

Limitations:

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.26.9 "H" - Flag - STW.

"H" - Flag "stay in primary desktop" Previous 3829 Top 41 Next 3832

MiniRobotLanguage (MRL)

"H" - Flag "primary desktop"

Search Top Window

Intention

This flag will move a window to position 0,0, that is the upper left corner, if the window is full or partial outside the primary desktop workarea.

It will override the default window treatment.
While by default also a Dual-Screen Desktop will be accepted as workarea, this will not be the case here.

The "H"-Flag makes sure the window is complete on the primary desktop.

```
STW.cH|WindowClass
MMV.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Click on the OK Button in a messagebox
' Locate the Application (Top-)Window
STW.tH|word
MMV.
ENR.
```

3.83.26.1("I" - Flag - STW.

MiniRobotLanguage (MRL)

"I" - Flag "remove from Exclude List"

Search Top Window

Intention

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with STW. and not with ITW. It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
STW.cE|WindowClass
MMV.
```

And how do you get the window out the "Exclude List"?
This is what the "I"-Flag is good for.

```
' Remove window from exclude List
STW.I|$$HWN
```

The "I"-Flag however need a window handle as parameter and will not work in any other constellation. Therefore keep the handles of those excluded windows, if you want to have them back later.

There is another way, how to search windows which are currently excluded from search?
You can also use the "K"-Flag.

```
' clear whole exclude List
STW.Kc|WindowClass
```

The "K"-Flag will immediately, even before the search starts, clear the exclude list. No matter if a window is found or not, using the prototype "K" will clear the exclude list.

After this all previously "exclude listed" windows can be found again.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
' Use Exclude List
' Add window to exclude list
STW.tE|TestApp
VAR.$$HWN=#hwn#

' Remove window from exclude List
STW.I|$$HWN

' If you comment the STW. above the window can not be found
here:
STW.t|TestApp

ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag. To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using SCW. there is also Exclude-List availabe. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

3.83.26.1."J" - Flag - STW.

"J" - Flag "window to front" Previous 3832 Top 41 Next 3836

MiniRobotLanguage (MRL)

"J" - Flag "window to front"

Search Top Window

Intention

The window comes to front already with the default window treatment, without any additional flags. But you can disable that, and select yourself exactly what you want. Like this:

```
STW.AJc|WindowClass
MMV.
```

The "A" Flag will switch of all default window treatment. Then comes the "J"-Flag and tells the robot to bring the window to front. Be careful with the operator priority. If you place the prototypes like this:

```
STW.JAc|WindowClass
MMV.
```

then the "A"-Flag will switch of the "J"-Flag because it is more right and therefore has a higher priority.

The "J"-Flag itself will not disable the default window treatment. Therefore something like:

```
STW.Jc|WindowClass
MMV.
```

```
is possibly a waste of letters, as the default behavior of
STW. is already to bring the window to front.

Note that the Flag "B" does not switch off the "J"-Flag,
therefore when using "B", the sequence of the prototypes "B"
and "J" should not be a issue.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.AJc|#32768
' Locate the button
MMV.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX. Compare with this:
STW.Ac|#32768
' Locate the button
MMV.
ENR.
```

3.83.26.1 "K" - Flag - STW.

"K" - Flag "Clear Exclude List and search" Previous 3834 Top 41 Next 3838

MiniRobotLanguage (MRL)

"K" - Flag "Clear Exclude List"

Clear Exclude List and search

Intention

Immediately clear Exclude-List before specified search.

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with STW. and not with ITW. It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
STW.cE|WindowClass
MMV.
```

And how do you search windows which are currently excluded from search?
This is what the "K"-Flag is good for.

```
' clear whole exclude List
STW.Kc|WindowClass
```

The "K"-Flag will immediately, even before the search starts, clear the exclude list. No matter if a window is found or not, using the prototype "K" will clear the exclude list.

After this all previously "exclude listed" windows can be found again.

Example

```
' Use Exclude List

' Add window to exclude list
STW.Et|TestApp
MMV.
VAR.$$HWN=#hwn#

' Remove all windows from exclude List
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' and search

' If you remove the "K" below, the window can not be found!
STW.Kt|TestApp

ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag.
To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using SCW. there is also Exclude-List available. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Currently you can not check which windows are exclude-listed. There is also no way of showing the content of an exclude-list.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

3.83.26.1 "M" - Flag - STW.

"M" - Flag "TopMost" Previous 3836 Top 41 Next 3840

MiniRobotLanguage (MRL)

"M" - Flag "TopMost"

Search Top Window

Intention

In windows, there is a property of Top-Windows that will make them stay always in front of all other windows.

This property is called "TopMost". A window that is "TopMost" is always on top of all other windows, that are not TopMost.

Only another TopMost window can be in front of an TopMost window.

For example the MR-Editor can be set to TopMost.

Now you may think "this sounds good!". Be warned. This is an advanced feature for advanced users.

Programs have Messageboxes and also open up other windows. In case they have been made TopMost, you may not be able to see those Messages or PopUp windows. This may lead for you to think that the program hangs.

Why don't you see those messages?
Because they will not be TopMost and therefore they will appear behind the TopMost window!

Therefore use TopMost style only when really needed and when you know what you are doing.

Using the Flag "M", the window will be made TopMost immediately after it was localized.

```
STW.cM|WindowClass
MMV.
```

Use the "N"-Flag to remove the TopMost-property from a TopMost window.

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.Mc|#32768
VAR.$$HWN=#hwn#
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Remove the TopMost Property
STW.hN|$$HWN

ENR.
```

Remarks

Limitations:

3.83.26.14"N" - Flag - STW.

MiniRobotLanguage (MRL)

"N" - Flag "No TopMost"

No more TopMost

Intention

In windows, there is a property of Top-Windows that will make them stay always in front of all other windows.

This property is called "TopMost".

A window that is "TopMost" is always on top of all other windows, that are not TopMost.

Only another TopMost window can be in front of an TopMost window.

For example the MR-Editor can be set to TopMost.

Now you may think "this sounds good!". Be warned. This is an advanced feature for advanced users.

Programs have Messageboxes and also open up other windows. In case they have been made TopMost, you may not be able to see those Messages or PopUp windows. This may lead for you to think that the program hangs.

Why don't you see those messages?
Because they will not be TopMost and therefore they will appear behind the TopMost window!

Therefore use TopMost style only when really needed and when you know what you are doing.

Using the Flag "M", the window will be made TopMost immediately after it was localized.

```
STW.cM|WindowClass
MMV.
```

Use the "N"-Flag to remove the TopMost-property from a TopMost window.

Example

```
'#EXE:?pfad\
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.Mc|#32768

"M" - Flag - STW. 3838

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.26.1!"Q" - Flag - STW.

MiniRobotLanguage (MRL)

"Q" - Flag "Repeat Prototype"

Search Top Window

Intention

This flag will just repeat the Prototype that was last used with STW. or ITW. or any otehr Top-Window search instruction.

```
STW.c|WindowClass
MMV.
' this will do the same
STW.Q|WindowClass
MMV.
```

Note that there is another way of repeating the last STW. or ITW.. That is, to just leave the whole parameter part empty.

```
STW.c|WindowClass
MMV.
' this will do the same
STW.
MMV.
```

While "Q" will only retype the prototypes internally. Leaving the parameters away, will retype the whole parameters, including the prototypes, using those from last time the command was called.

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
STW.c|WindowClass
MMV.
' this will do the same
STW.Q|WindowClass
MMV.
ENR.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

`STW.` and `ITW.` share the same parameter store. Therefore if you have localized the window with ITW. then you can also use these parameters for STW. and vice versa.

3.83.26.1("V" - Flag - STW.

"V" - Flag "GoSub if not found. " Previous 3842 Top 41 Next 3846

MiniRobotLanguage (MRL)

"V" - Flag "GoSub if not found"

Gosub if not found

Intention

If the window you are looking for is not found within the specified waiting time, several things can happen. Normally you will get an error-message.

But that does not necessarily be what you want. Maybe you want just to see if the window is there and if not start the program in a Subroutine.

```
' "V" - Flag - on not found Gosub
STW.ctVw|PBWindowClass:0|BCS|Sub|1
' Move Mouse to the Install Button
SCW.ct|butt|Install
MMV.
ENR.
'-------------------------------------------------------------
' This Subprogram will be called if the window is not found
:Sub
EXE.?exepfad\Sample Apps\BSC-Testform.exe
STW.ct|PBWindowClass:0|BCS
RET.
```

The script above will try to locate the "BCS - Testform" and if its not yet started, it will be started and localized.

Example

```
STW.ctVw|PBWindowClass:0|TestAppx|Sub|1
MBX.Ready
ENR.
'-------------------------------------------------------------
:Sub
MBX.Error - Program not found
RET.
```

Remarks

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

You can not mix the "V" and the "W"-Flag. If both are found, the "W"-Flag takes priority

See also:

- "g" - Flag - STW. 3859

3.83.26.1 "W" - Flag - STW.

"W" - Flag "GoSub if found" Previous 3844 Top 41 Next 3848

MiniRobotLanguage (MRL)

"W" - Flag "GoSub if found"

Search Top Window

Intention

If the window you are looking for is found within the specified waiting time, normally the script just continues. You can however ask the robot to first call a Subprogram in that case and then continue with the script. This is done using the "W"-Flag.

```
STW.ctW|PBWindowClass:0|BCS|Sub
MMV.
ENR.
:Sub
MBX.!
RET.
```

The "W"-Flag can be used together with the "V"-Flag, while only one of these will be called. In case you use the "g"-Flag "on found Goto", the "W"-Flag will be ignored.

Example

```
'
' And then open a new instance
EXE.?exepfad\Sample Apps\BSC-Testform.exe

' If found close that window.
STW.ctWw|PBWindowClass:0|BCS|Sub|1

' And then open a new instance
EXE.?exepfad\Sample Apps\BSC-Testform.exe

STW.ct|PBWindowClass:0|BCS
SCW.ct|butt|Install
MMV.

ENR.
'-------------------------------------------------------------
:Sub
CAW.PBWindowClass:0|BCS
' Wait until its gone
MTW.
RET.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

The "W"-Flag can be used together with the "V"-Flag, while only one of these will be called. In case you use the "g"-Flag "on found Goto", the "W"-Flag will be ignored.

Limitations:

-

See also:

- "g" - Flag - STW. 3859

3.83.26.18 "X" - Flag - STW.

"X" - Flag "run without error" Previous 3846 Top 41 Next 3850

MiniRobotLanguage (MRL)

"X" - Flag "run without error"

Search Top Window

Intention

If the window you are looking for is not found within the specified waiting time, several things can happen. Normally you will just get an error-message. If you do not want to get an error, but just have the script continue running, use the "X"-Flag.

You can use the `#tio#` 3.1 Systemvariables 334 to check if the window was found or not. Also you can use the "V","W","g" and "o" Flags to react inside the STW.

For example in such a script:

```
STW.cXg|WindowClass|found
MMV.

:found
MPO.
```

This script will invert the normal behavior of STW. It will continue running in case of the window is not found. And in case the window is found, it will jump to the Label "found".

Example

```
'-------------------------------------------------------
' "X"-Flag Sample 1
' Run only if its not yet running ...
'-------------------------------------------------------
'
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - gotoLabel "Sub" if thewindow was found
' X - continue the script as normal, without error,
'     if the window is not found
STW.tgXw|BCS|GoOn|0
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:GoOn
MBX.Ready
ENR.

'-------------------------------------------------------
' "X"-Flag Sample 2
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'-------------------------------------------------------
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
' We use STW here to test if the Application is already
running
' in that case we jump over the EXE-command and contine.
' We use the following flags:
' w ... 0 - Set waiting time to 0 seconds
' t ... "BCS - Testform" - this is the caption text of the
window we search for
' g ... "found" - jump to Label ":found" if the window already
exists
' X ... continue without errormessage if the window was not
found in time
'
STW.wtgX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Now we can use the Application and press Buttons
STW.wt|0|BCS - Testform
SCW.nctb|1|Button|Next|0
' Compatible Button Click
MLC.

'-------------------------------------------------------------
ENR.
```

Remarks

3.83.26.1 "a" - Flag - STW.

"a" - Flag "all windows" Previous 3848 Top 41 Next 3852

MiniRobotLanguage (MRL)

"a" - Flag "all windows"

Search Top Window

Intention

In most cases, we want to act on visible and enabled window only.
Therefore the STW. command ignores by default windows, if they are disabled or invisible.

The "a" flag changes this behavior. Using the "a"-Flag, the STW. command will locate "all windows". This includes Top-Window which are invisible or disabled, or both.
Using the Flag "a" ALL Top windows will be found if they meet the search criteria.

Example

```
'MR Script-file:
'Version:
'Purpose: STW.-Features Demo
'Author: Theo Gottwald
'Creation date: 09.12.11
'============================================================
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Next we make the thing invisible
SWS.i
' Wait a second
PAU.1
' Locate it using "all"
STW.wt|0|BCS - Testform
' Locate the Button using "all"
SCW.anctb|1|Button|Next|0

' CLick the button, while its invisible
MLE.
' Get the Top-Handle
GCT.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Make it visible again
SWS.v
ENR.
```

Remarks

If you definitely know that the window is invisible, you can use the "u" - Flag - STW. 3878 which will only search for invisible windows and ignore visible windows.

The same applies for disabled windows, and the "f" - Flag - STW. 3857

Limitations:

See also:

3.83.26.2("b" - Flag - STW.

MiniRobotLanguage (MRL)

"b" - Flag "window to back"

window to back

Intention

In most cases we want the window to come in front of other windows. so we can use it. For this we do not need any STW.-flag, as this is the default behavior of the STW.-command.

In some cases, we want just the opposite. We want a window to go behind all other windows. We sent a "window to back". For this we use the "b"-Flag.

It will locate the window "on Top" and sent it to back. See the example below.

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

' Open 5 Terstforms and position them nicely
FOR.$$CNT|1|5
  EXE.?exepfad\Sample Apps\BSC-Testform.exe
  STW.p|#pid#
  SWP.(100+55*$$CNT),(200+55*$$CNT)
NEX.

FOR.$$CNT|1|50
'Move Testform "On top" to back
  STW.ctb|PBWindowClass:0|BCS - Testform
  ' Make small rest of 0.1 seconds so we can see it
  PAU.0.1
NEX.

' Close all Testforms
CAW.PBWindowClass:0|BCS - Testform
ENR.
```

Remarks

Limitations:

3.83.26.2."c" - Flag - STW.

MiniRobotLanguage (MRL)

"c" - Flag "class"

Search Top Window

Intention

Window-Class" value. This is the "window class" of the window we are looking for.

This flag needs a parameter. It supports 3.2 Standard-Search Pattern 341 and therefore its enough to give a unique part of the value. By default the value is not case sensitive.

```
STW.c|WindowClass
MMV.
```

Example

```
'
' Click on the OK Button in a messagebox
' Locate the Application (Top-)Window
STW.c|#32768
' Locate the button
SCW.t|Ok
' Click the button
MLE.
ENR.
```

Remarks

Limitations:

See also:

- 3.2 Standard-Search Pattern 341

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.26.2 "e" - Flag - STW.

"e" - Flag "enabled windows" Previous 3854 Top 41 Next 3857

MiniRobotLanguage (MRL)

"e" - Flag "enabled windows"

Search Top Window

Intention

To ignore disabled windows is one of the default settings of the STW. command.
Therefore you will not need to specify the "e"-Flag often.
It can however make sense, to override the default behavior by using the "f"-flag which will make STW. to ignore enabled windows and just look for disabled windows.
If you want to catch both, the "a"-flag is what you need.
However the "a"->Flag will automatically also enable the search for invisible windows. If you do not want that, just add a prototype "v" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "e" - flag together with the "a" to search only windows that are enabled. No matter if they are visible or not.

Lets take a look, on "what will work and what will not work".
This will search only for enabled windows.

```
STW.ce|WindowClass
MMV.
```

Since this is a default behavior of `STW.`, we have wasted the "e" at this place. Its not needed.

Now we would like to search for windows which are enabled, as well for disabled windows. We can do that in two ways.The first way is like this:

```
STW.cef|WindowClass
MMV.
```

The robot understands that we want enabled and disabled windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cav|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the invisible windows. We do this by adding the "v"-Flag after the "a". In this case the "v"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Start an Application only, if that Application is not yet
running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Next we disable the whole window
SWS.d
' Wait half of a second
PAU.0.5
' Try to locate it using "e"
' Will not work, but give an error
STW.wte|0|BCS - Testform
ENR.
```

3.83.26.23 "f" - Flag - STW.

MiniRobotLanguage (MRL)

"f" - Flag "disabled windows"

Search Top Window

Intention

To ignore disabled windows is one of the default settings of the STW. command. Therefore if you want to search for a window that has been disabled, you will need the "f"-flag.

The "f"-Flag will override the default behavior. It will make STW. to ignore enabled windows and just look for disabled windows, only.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also enable the search for invisible windows. If you do not want that, just add a prototype "v" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "f" - flag together with the "a" to search only windows that are disabled. No matter if they are visible or not.

Lets take a look, on this. This will search only for disabled windows.

```
STW.cf|WindowClass
MMV.
```

Now we would like to search for windows which are enabled, as well for disabled windows. We can do that in two ways.The first way is like this:

```
STW.cef|WindowClass
MMV.
```

The robot understands that we want enabled and disabled windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cav|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the invisible windows. We do this by adding the "v"-Flag after the "a". In this case the "v"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Start an Application only, if that Application is not yet
running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Next we disable the whole window

3.83.26.2 "g" - Flag - STW.

"g" - Flag "goto if found" Previous 3857 Top 41 Next 3861

MiniRobotLanguage (MRL)

"g" - Flag "Goto if found"

Goto if found

Intention

If the window you are looking for is found within the specified waiting time, normally the script just continues. You can however ask the robot to jump to a Label in that case.
And you can use the "X"-Flag to tell the robot to just continue with the script in case of error - if the window is not found.
This would change the behavior of the command, but sometimes this can be a good solution. Take this example:

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - goto Label "GoOn" if the window was found
' X - continue the script as normal, without error,
'     if the window is not found
STW.tgXw|BCS|GoOn|0
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:GoOn
MBX.Ready
ENR.
```

In case you use the "g"-Flag, together with the "W" -Flag ("on Found Gosub"), the "W"-Flag will be ignored. The "g"-Flag has a generally higher priority.

Example

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - gotoLabel "Sub" if thewindow was found
' X - continue the script as normal, without error,
'     if the window is not found
STW.tgXw|BCS|GoOn|0
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:GoOn
MBX.Ready
ENR.
```

3.83.26.2!"h" - Flag - STW.

"h" - Flag "handle" Previous 3859 Top 41 Next 3863

MiniRobotLanguage (MRL)

"h" - Flag "handle"

Search Top Window by handle

Intention

This flag is an exception. In fact it must not search the window, it will just localize the window "by handle". Of course this is a very efficient solution. Therefore if you have already localized your window, keep the handle in a variable and just feed it back to STW. when you need that window again.

```
' Localize by handle
STW.cta|ieframe|Update
' We grab the handle in a variable
HTV.$$MYW

' Later we can always get definitely this window,
' without further parameters
STW.h|$$MYW
MMV.

' Some more examples
STW.h|52367
MMV.

STW.h|#hnw#
MMV.
```

Example

```
'
' Localize by handle
STW.cta|ieframe|Update
' We grab the handle in a variable
: $$MYW=#hwn#

' Later we can always get definitely this window,
' without further parameters
STW.h|$$MYW
MMV.

ENR.
```

"E" - Flag - STW. 3825

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.26.2("j" - Flag - STW.

"j" - Flag "WII. by number" Previous 3861 Top 41 Next 3865

MiniRobotLanguage (MRL)

"j" - Flag "WII. by number"

Wait for Input Idle and tell how long

Intention

"Wait for Input Idle" halts script execution until the localized window is ready to process our Input.

This Command can be seen as a dynamic Pause-Statement, it waits only if our target window is busy. The maximum waiting time must be given as a numeric value or variable.

Note the value you specify will replace the default internal value for "WII. without parameter", used for the "k" - Flag - STW. 3865 . But also for WII. if no parameters are given.

Unlike a fixed pause statement which would always wait for a fixed time. `WII.` is the better solution.

If the process is a console application or does not have a message queue, "Wait For Input Idle" returns immediately.

The given time is in seconds. Fractions are allowed. For example:

```
' WIll wait no longer then a half second
STW.cj|WindowClass|0.5
MMV.
```

Technically the "j"-Flag does the same like the WII. - Wait-for-Input-Idle 2909 statement. Just that it is integrated and does not need a separate line of code.

Example

```
' j - wait 5 Seconds maximum
STW.cj|WindowClass|5
MMV.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

The maximum number for the waiting time is the equivalent for 23100 days. In short: you can not ask the robot to wait longer for a window then ~63 years. Anything below will be just fine. Note that negative waiting times will be rounded to zero.

3.83.26.27 "k" - Flag - STW.

MiniRobotLanguage (MRL)

"k" - Flag "WII. default"

Search Top Window

Intention

"Wait for Input Idle" halts script execution until the localized window is ready to process our Input.

This Command can be seen as a dynamic Pause-Statement, it waits only if our target window is busy. The maximum waiting time is taken from an internal value that is been set with the last WII. statement or with the "j" - Flag - STW. 3863.

Unlike a fixed pause statement which would always wait for a fixed time. `WII.` is the better solution.

If the process is a console application or does not have a message queue, "Wait For Input Idle" returns immediately.

The given time is in seconds. Fractions of a second are allowed.

```
STW.cj|WindowClass|5
MMV.
' Will do the same without repeating the value
STW.ck|WindowClass
MMV.
```

Technically the "k"-Flag does the same like the WII. - Wait-for-Input-Idle 2909 statement without a parameter. Just that it is integrated and does not need a separate line of code.

Example

```
' Demonstrate the "j" and the "k" Flag
STW.cj|WindowClass|5
MMV.
' Will do the same without repeating the value
STW.ck|WindowClass
MMV.
ENR.
```

3.83.26.2 "o" - Flag - STW.

"o" - Flag "on not found Goto" Previous 3865 Top 41 Next 3869

MiniRobotLanguage (MRL)

"o" - Flag "on not found Goto"

Search Top Window

Intention

If the window you are looking for is not found within the specified waiting time, normally you will end up with an error-message.

Maybe you want just to jump at another place in the script the, and start a program. Or react in another way. That is where the "o" Flag enters the game. The script just continues. The window is not found and we tell the robot to jump to a Label in that case.

Take this example:

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' o - goto Label "GoOn" if the window was NOT found
' X - continue the script as normal, without error,
'     if the window is not found
STW.toXw|BCS|GoOn|0
GTO.weit

:GoOn
 EXE.?exepfad\Sample Apps\BSC-Testform.exe

:weit

MBX.Ready
ENR.
```

In case you use the "o-Flag, together with the "V" -Flag ("on not Found Gosub"), the "V"-Flag will be ignored. The "o"-Flag has a generally higher priority.

Example

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' o - goto Label "GoOn" if the window was NOT found
' X - continue the script as normal, without error,
'     if the window is not found
' w - set waiting time to 0 seconds
```

© 2023 Theo Gottwald * https://www.smart-package.com

```

3.83.26.2 "p" - Flag - STW.

MiniRobotLanguage (MRL)

"p" - Flag "Process ID"

Search Top Window

Intention

You can localize a window safely, if you have the PID (Process ID) of the application behind that window.

Be sure that you have read and understood the chapter 1.7. Application and PID 137.

Hint: If you have localized a window, you also have the PID of the process behind that window in `#pid#`. You can save it for later use in a variable. Like this:

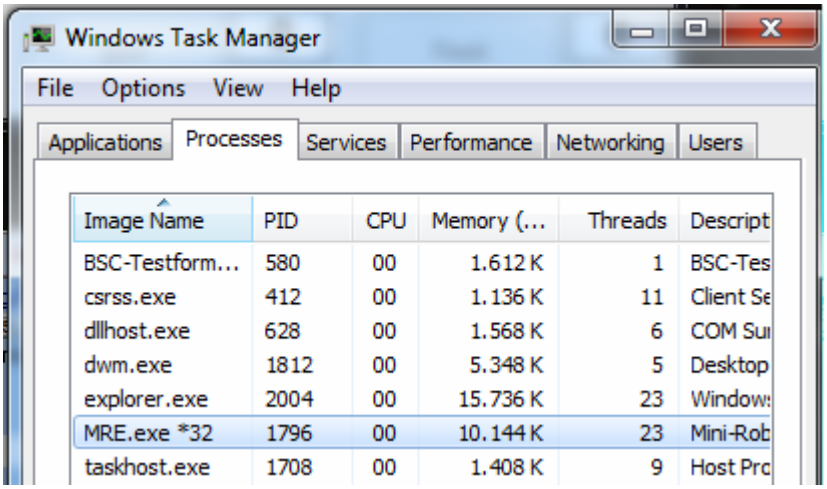
```
STW.c|pbwind
: §§PID=#pid#

or use:

STW.c|pbwind
HTV.§§PID
```

In both cases, you get the PID of that process into the local variable §§PID 366.

You can see the PID of a process in the task-manager::



The PID value is a normal search parameter and can be used alone or together with other search parameters.

```
' Search a window from process with ID 3435
' and the given window class.
'
STW.ch|pbwind|580
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MMV.
```

Example

```
' Locate window only by PID
STW.p|580
MMV.

ENR.
```

3.83.26.3("q" - Flag - STW.

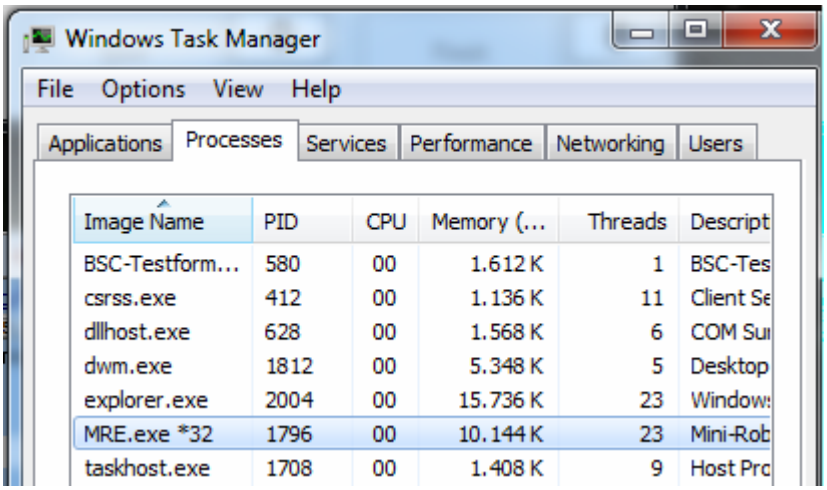
MiniRobotLanguage (MRL)

"q" - Flag "Thread ID"

Search Top Window

Intention

This is an advanced parameter. The chances are that you will never need it.
Processes have a number of Threads. See this picture here:



On the left side you can see the name of the process. Right of it the PID of the process. Later you see "Threads".
In a very simplified form, a Thread is a subprogram of that process, that runs an own small program. Generally the more threads a program has, the better it will scale up on multiple CPU-Core's.
While all Threads of a process belong to that process and therefore have the same PID, they have a different Thread-ID. In case you may need to separate between windows of the same process, which is "Multi-threaded", the "q"-flag is for you.

```
STW.cq|WindowClass|109872
MMV.
```

Hint: If you have localized a window, you also have the TID of the process behind that window in `#tid#`. You can save it for later use in a variable. Like this:

```
STW.c|pbwind
: §§TID=#tid#
```

This way, you get the TID of that Thread into the local variable §§PID 366.

If you don't "understand a word", or don't have very special cases, just ignore this flag.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

EXE.?exepfad\Sample Apps\BSC-Testform.exe
' Locate the window
STW.p|#pid#
' Show the Thread-ID
MBX.#tid#
ENR..

ENR.
```

3.83.26.3."r" - Flag - STW.

"r" - Flag "result number" Previous 3871 Top 41 Next 3875

MiniRobotLanguage (MRL)

"r" - Flag "result number"

Search Top Window

Intention

There may be multiple results in a window-search with `STW.`. Normally you get the first result that fits to your search parameters.
Using the "r"-Flag you can define which result you want, Nr.1, Nr.2 or Nr. 20. Just add the "r"-Flag and the result number.

If omitted, always result Nr.1 is returned.

Note: If there are not enough results, your search will fail!
Therefore you can also use this feature to count windows.

```
'We'll get the 3rd result with that window class
STW.cr|WindowClass|3
MMV.
```

Example

```
'We'll get the 4th result
' with that window class
'
STW.cr|WindowClass|4
MMV.
ENR.
```

3.83.26.3 "t" - Flag - STW.

"t" - Flag "text" Previous 3873 Top 41 Next 3878

MiniRobotLanguage (MRL)

"t" - Flag "text"

Search Top Window

Intention

This flag is one of the most important search parameters. It is the window-text. Most often you can even see the text of a top-window without using the windows-Inspector.
Here is the simplest case how you can grab a window.

```
STW.t|TestApp
MMV.
```

The text parameter is a string-value and therefore supports 3.2 Standard-Search Pattern 341.
Let us try some of these.

As always with Search patterns, it is enough to give a unique part of the value. By default the text is not case sensitive. You can change that behavior using the search patterns. Take the sample-script below and replace the line:

```
' Locate the window
STW.t|Testf
```

with the following lines. This will help you to understand the use of Patterns for text search.

```
' Lets start with this
STW.t|{&DOCAPS:Testf}
```

This will force the text to be case-sensitive! Try this:

```
' This will not find the window
' because of case-sensitivity!
STW.t|{&DOCAPS:testf}
```

It does not find the window because the &DOCAPS: switches case-sensitivity on.
Now how about this:

```
STW.t|{&EXACT:bcs - Testform}
```

It does find the window. But then whats the "&EXACT:" good for?
Try this:

```
STW.t|{&EXACT:bcs - Testf}
```

© 2023 Theo Gottwald * https://www.smart-package.com

It does not find the window because the &EXACT: switches off the default behavior that a part of the text is enough. CAn it be combined with the &DOCAPS: ?

We try. This should work:
```
STW.t|{&EXACT:&DOCAPS:BCS - Testform}
```
and this should not work:
```
STW.t|{&EXACT:&DOCAPS:bCS - Testform}
```

Yes, everything work as expected.

Do you know the old times, when you had simple Wildcards as patterns? The"*****" and the "**?**" ?

You can have them back if you want. Try this:

```
STW.t|{&WILDC:b?? - Testform}
```

Yes, it works. And how about:

```
STW.t|{&WILDC:b?? - Tes*orm}
or
STW.t|{&WILDC:b?? - *s*or?}
```

It works.
We kept them for you.
You can still use even the old DOS-Patterns if you really want.
But there is much more if you use the new patterns.

How about a fuzzylogic and a OR'ed combination of two patterns?

```
STW.t|{&WILDC:b?? }&OR:{BCS-tesform&FUZZY:6}
```

and you can not only combine two patterns, you can combine as many patterns using &OR: as you like! If you want to support many languages, this is the way to go.

No matter if there is a "YES" on that button or a "Qui" or whatever. So long you know it, or at least a bit of it, you can locate it using Search patterns.

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

EXE.?exepfad\Sample Apps\BSC-Testform.exe

' Locate the window
STW.t|Testf

' Close the window
CAW.PBWindowClass:0|BCS - Testform
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

Limitations:

See also:

- 3.2 Standard-Search Pattern 341
- "c" - Flag - STW. 3854

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.26.3 "u" - Flag - STW.

MiniRobotLanguage (MRL)

"u" - Flag "invisible"

Search Top Window

Intention

To ignore invisible windows is one of the default settings of the STW. command. Therefore if you want to search for a window that has is invisible, you will need the "u"-flag.

The "u"-Flag will override the default behavior. It will make STW. to ignore visible windows and look for invisible windows, only.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also enable the search for disabled windows. If you do not want that, just add a prototype "e" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "u" - flag together with the "a" to search only windows that are invisible. No matter if they are enabled or not.

Lets take a look, on this. This will search only for invisible windows.

```
STW.cu|WindowClass
MMV.
```

Now we would like to search for windows which are visible, as well as for invisible windows. We can do that in two ways.The first way is like this:

```
STW.cuv|WindowClass
MMV.
```

The robot understands that we want visible and invisible windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cae|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
CAW.PBWindowClass:0|BCS - Testform
'
' Start an Application only,
' if that Application is not yet running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

STW.p|#pid#
' Next we make the window invisible
SWS.i
' Wait half of a second
PAU.2.5
' We locate it even though its invisible
STW.wtu|1|BCS - Testform
' and make it visible again
SWS.v
ENR.
```

Remarks

Limitations:

3.83.26.34 "v" - Flag - STW.

"v" - Flag "visible" Previous 3878 Top 41 Next 3882

MiniRobotLanguage (MRL)

"v" - Flag "visible"

Search Top Window

Intention

To ignore invisible windows is one of the default settings of the STW. command. Therefore you will not need to specify the "v"-Flag often.

It can however make sense, to override the default behavior by using the "u"-flag which will make STW. to visible windows and just look for invisible windows.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also switch on the search for disabled windows. If you do not want that, just add a prototype "e" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "v" - flag together with the "a" to search only windows that are visible. No matter if they are enabled or not.

Lets take a look, on how to do this. This will search only for visible windows.

```
STW.cv|WindowClass
MMV.
```

Since this is a default behavior of `STW.`, we have wasted the "v" at this place. Its not needed.

Now we would like to search for windows which are visible, as well for invisibble windows. We can do that in two ways.The first way is like this:

```
STW.cuv|WindowClass
MMV.
```

The robot understands that we want visible and invisible windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cae|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
CAW.PBWindowClass:0|BCS - Testform
'
' Start an Application only,
' if that Application is not yet running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

STW.p|#pid#
' Next we make the window invisible
SWS.i
' Wait half of a second

3.83.26.3!"w" - Flag - STW.

MiniRobotLanguage (MRL)

"w" - Flag "wait time"

Search Top Window

Intention

How long do we wait if a window will appear or not?
Let's try it.

```
: $$TIM=#dtime#
STW.tX|nix
: $$TIM=#dsince#
MBX.$$TIM
ENR.
```

This i what we get.

It's currently about 15 seconds. When you read this it can be another value.
In fact this is the default time that we wait for a window before we run into an error-message or do something else (like in this script).

Now, its very important to understand that we do not generally wait 15 seconds, and then look if the window has appeared.
What we do is, we try ... try ... and try and check permanently, if the window has appeared. If the window appears any time, the script will immediately continue.

If the time is over, we do something else.

Now 15 seconds is enough for some cases, in many cases the window will appear after 45 seconds or any other time. Now this is where the "w"-flag enters the game.

Using the "w"-flag we can tell the robot how long he should wait. It can be 0 seconds like this:

```
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found
```

or 360 seconds like here.

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.wtu|360|BCS - Testform
```

and there is no real limitation.

Example

Remarks

-

Limitations:

The maximum number for the waiting time is the equivalent for 23100 days. In short: you can not ask the robot to wait longer for a window then ~63 years. Anything below will be just fine. Note that negative waiting times will be rounded to zero.

3.83.27 SWP. - Set Window Position and Size

MiniRobotLanguage (MRL)

SWP. Command

Set Window Position and Size

Intention

The `SWP.`-Command can be used to set the position or to change the size of the actual
selected Top- or Child-Window. You need to select/locate a child or Top-Window using the STW. or the `LAP.` command before you can use `SWP.`

The window position is been calculated from the top-left corner of the window or child-window.

The `SWP.` command has a lot of additional features. If you want to place the window just in the middle of the screen, without changing the size, you can just write:

```
' Place the actual localized window in the middle of the
screen
SWP.mid
```

You can still resize the window if you do this:

```
' Place the actual localized window in the middle of the
screen
' and resize it to 600x400 Pixel
SWP.mid|600,400
```

Using some more tricks, you can for example make the window to quarter of its current size while not changing the position of the window at all.

```
SWP.|hw,hw
```

Here are some more complete examples:

```
' locate / select the Window that shall be resized using STW.
STW.c|ieframe
' The window is moved to position 0,0|640,400
' and resized to 640x400
SWP.0,0|640,400

' The window is resized to 500x500 pixel
SWP.|500,500

' The window is resized to 100x200 and vertically moved to
y=300
SWP.,300|100,200
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
' The window is only moved, not resized.
SWP.100,200
```

Syntax

SWP.[P1][,P2][|P3][,P4][|T]

Parameter Explanation

P1 - Left-Position
P2 - Top - Position
P3 - X - Size
P4 - Y - Size

You can specify three special Options as [|T]:
T - use Top-Window and whole Desktop Area of primary Monitor
M - use Top-Window and whole Desktop Area of all Monitors
F - use Desktop without Traybar and Top-Window
C - use actual localized window and whole Desktop Area. If you do not specify any of these additional Options, the actual window is used, and the whole-Desktop Area.

If you want to place the window just in the middle of the screen, without changing the size, you can just write:

```
' Place the actual localized window in the middle of the
screen
SWP.mid
```

For the position parameters **P1** (Left-Position) you can specify these words:

- **"mid"**
- **"lb"** (left bound) equals to zero
- **"rb"** (right bound) moves the window to the right border of the primary desktop

or just the first letter of these. They will take the actual size and calculate the new size as expected.

For the position parameters P2 (Top-Position) you can specify these words:

- **"mid"**
- **"tb"** (top bound)
- **"bb"** (bottom bound)

or just the first letter of these. They will take the actual size and calculate the new size as expected.

For the size parameters P3 and P4),you can specify the following words, which are based on the desktop size. Note that these calculations are influenced by adding the special options "**|T**" or "**|F**".

© 2023 Theo Gottwald * https://www.smart-package.com

- "half" - half desktop size
- "full" - full desktop size
- "quarter" - quarter desktop size

or use these, which calculate the new size based on the current window size. Note that these options are influenced by adding special options "**|T**" or "**|C**" to the command.

- "halfwin","hw"
- "doublewin","dw"
- "quarterwin","qw"

They will take the actual size of the desktop and calculate the new size of the window as a part of the desktop size. It will use the size of the primary desktop, no matter if you have dual- or multi-screen.

You can omit any of the Parameters or just write "**x**".. In these cases, the parameters will be internally substituted with the current values. If you write for example:

```
' The window is horizontally moved to position 100, the
vertical position is not changed
SWP.100,x

' The window is moced into the center of the desktop
SWP.mid,mid

' The window is only resized to half of its size in both
directions
SWP. half,half

' The window is only moved, not resized. It's move to the left
desktop border.
SWP.lb,x
```

Example

```
'-------------------------------------------
' SWP.-Example 1
'-------------------------------------------
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

EXE.?exepfad\Sample Apps\BSC-Testform.exe
' Locate the window
STW.p|#pid#
' Position it "around"
SWP.lb,tb

SWP.mid,mid
PAU..1
SWP.rb,bb
PAU..1
SWP.|(#iw#/2)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.

'-------------------------------------------
' SWP.-Example 2
'-------------------------------------------
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

' Open 5 Terstforms and position them nicely
FOR.$$CNT|1|5
  EXE.?exepfad\Sample Apps\BSC-Testform.exe
  STW.p|#pid#
  SWP.(100+55*$$CNT),(200+55*$$CNT)
NEX.

FOR.$$CNT|1|50
'Move Testform "On top" to back
  STW.ctb|PBWindowClass:0|BCS - Testform
  ' Make small rest so we can see it
  PAU..1
NEX.

' Close all Testforms
CAW.PBWindowClass:0|BCS - Testform
ENR.
```

Remarks

Additional to the features that SWP. delivers, you can always use these 3.1 Systemvariables 334 for size or position calculations.
They are based on the last located object (window or whatever).
As always, use mathematical brackets () to enclose calculations. 80

```
#ssx#,#ssy# -   Screen size X,Y
#cwh#   -       Debug Console Window-Handle
#wsx#,#wsy# -   Work-area-Size X,Y
#sbp#   -       Screen-bits per pixel (Colordepth)
#fex#   -       FEX - Elements left on the FEX-Stack
#fxd#   -       FEX - Nesting-Depth
#il#            -       actual Element, left side X
#it#            -       actual Element, upper side Y
#ir#            -       actual Element, right side X
#ib#            -       actual Element, bottom side y
#iw#            -       actual Element, width X
#ih#            -       actual Element, height Y
#icx#   -       actual Element, Centerpoint X
#icx#   -       actual Element, Centerpoint Y
```

Example for this:

```
' Will make the x-size of the window half of current x-size
SWP.|(#iw#/2)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Will move the window to its own centerpoint
SWP.(#icx#)
```

Limitations:

Not all Windows can be resized to exactly any size. This depends on the Internals of the target software as well as possibly on the used OS.
Using Windows 7, for example:

```
PRT.Output-Window. $crlf$ Close the Utility with this window!
' Console Fenster rechts anlehnen
STW.ctwAXo|consolewindowclass|system mess|2|Lab_nocon
SWP.0,0|600,400
PAU.15
:Lab_nocon
```

This window will be sizes to the nearest possible size, which is 605,395 in my testcase.

- "b" - Flag - STW. 3852
- SWS. - Set Window State 3889

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.28 SWS. - Set Window State

SWS. - Set Window State Previous 3884 Top 41 Next 3584

MiniRobotLanguage (MRL)

SWS. Command

Set Window State

Intention

Make a window invisible. Or enable or disable a button.
Minimze a window, or restore it, if it was minimized or maximized before.

These and more such things can be done using `SWS.`

SWS. changes the State of the actual Top- or Child-window. If you give multiple prototypes they will apply in the order from left to right.

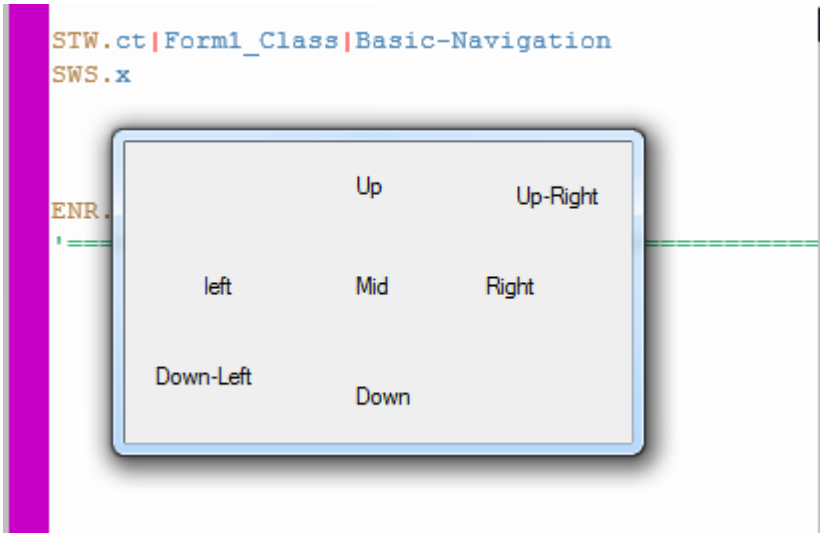
Example:
```
SWS.evna
```

Example, this will make a localized window invisible:
```
SWS.i
```

Example, this will make a localized window visible again:
```
SWS.v
```

Normally all of the SWS. Options can be changed back to their originasl state. Unlike **c** and **x**. These are **two special Options** that can remove the Window-Caption or give a Window a Caption. However these two Options should be used with care, as they can damage a running application-window in a way that you may need to restart the application.
Therefore test first if you can use them in your special case,.

```
SWS.x
```



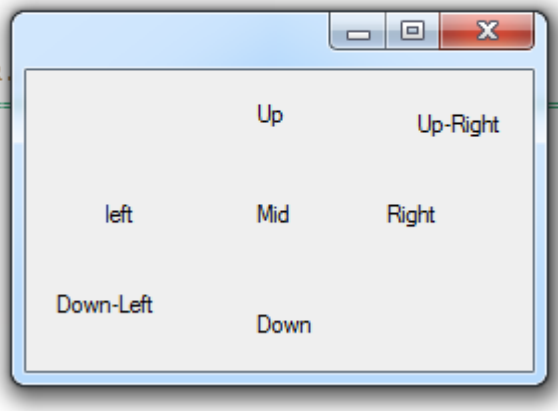
© 2023 Theo Gottwald * https://www.smart-package.com

This is how a window may look after you have removed the Caption using `SWS.x`.
This may not work with any window. Its for those cases, where you do not want the User to be able to move windows on the desktop around. Also there is no close Gadget anymore.

`SWS.c`

```
STW.ct|Form1_Class|Basic-Navigation
SWS.c

ENR
'=
```



Here the Caption is back, using `SWS.c`
Note that the window can not be totaly restored like it was before.
While there is a caption, the window may still have a different behavior when being resized.
Here is the window as it looked before.
As you can see it looks a bit different.

Syntax

SWS.[P1][|P2]

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** Prototype(s)

```
' a - activates the window after setting the state.
' e - enabled
' d - disabled
' v - visible
' i - invisble
' m - minimzed
' n - normal (not minimized)
' z - zoomed (maximized)
' u - unzoomed
' t - use actual Top-Window instead of actual window
' c - add Caption to Window (c<>x)
' x - remove caption from Window (c<>x)
```

Multiple states can be given. In that case they are connected with AND.

If no parameters are specified, "evn" is the default parameter.

P2 **-** (NUM/VAR) optional parameters, window-handle. When given, this window is used instead of the actual localized window.

Example

```
'**********************************
' SWS.-Sample 1
'**********************************
STW.t|Sample
MMV.
SWS.evna

STW.t|Sample
HTV.$$HWN

STW.t|anotherwindows
MMV.
' Note that the first window is going to be tested.
SWS.eva|$$HWN
END.

'**********************************
' SWS.-Sample 2
'**********************************

'#EXE:?pfad\
'#SPI:ForceWrite
'
```

3.83.29 WCW. - Wait for new Child-Window

3.83.29.1 ! WCW. - Wait for new Child-Window

MiniRobotLanguage (MRL)

WCW. Command

Wait for new Child Window

Intention

This command localizes a specified Child-Window (Control, Button etc.) within a previous localized Top-Window (Application-Window).

Unlike SCW. the WCW. Command will only recognize new Childwindows or Child-Windows that change after the Command was called.

To understand this command, be sure to read the chapters:
1.8. Selecting the Application (Topwindow) 150
and
1.9. Locating Child-Windows 162
first.

It will then sets the Mouse-Target Point into the window-center.

WCW. has a lot of features, which are controlled using the 1.4. The Prototype Parameter System 73 .Be sure you have read and understand that chapter before trying to understand WCW.

Unless using the "T"-Option, the WCW.-command needs a Top-Window being localized first. Therefore please read the section 1.8. Selecting the Application (Topwindow) 150 carefully.

The Command has a "Rollback" Feature, when the Child-Window is not found in few Seconds. It jumps back to the STW. (Search Top-Window) and tries to get a new Top-Window, which possibly has the wanted button or control.
This will continue, until its time has run out.
If you use the DBM.1 -command, you can see these "Rollback-Jumps" in the Debugging-Console. See the example below.

```
DBM.1
STW.Act|PBWindowClass:0|TestApp
' This button/childwindow does not exist
WCW.nctb|2|Button|Button 23|.5
MLE.
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
[10:13:11] STW.Act|PBWindowClass:0|TestApp
[10:13:11] SCW.nctb|2|Button|Button 23|.5
[10:13:12] STW.Act|PBWindowClass:0|TestApp
[10:13:12] SCW.nctb|2|Button|Button 23|.5
[10:13:12] STW.Act|PBWindowClass:0|TestApp
[10:13:12] SCW.nctb|2|Button|Button 23|.5
[10:13:13] STW.Act|PBWindowClass:0|TestApp
[10:13:13] SCW.nctb|2|Button|Button 23|.5
```

You can control this Feature using the "b" - Backjump-Time Flag 3764.

Syntax

WCW.[Prototypes|][Parameters|]

Parameter Explanation

Parameter

```
 a - (np) "all" - search all windos, includes
     invisible and disabled windows.
 b - (p) "backjump"-flag, time in seconds, 0 disables the jump
 c - (p)  window-class
 d - (p) window-depth
 e - (np) enabled, window must be enabled
 f - (np) disabled, window must be disabled
 g - (p) Goto on found
 h - (p) handle. Immediately locate the window with given
handle.
     All other prototypes will be ignored.
 i - (p) window-id
 j - (p) WaitForInputIdle (Value)
 k - (np) WaitForInputIdle (no Value), use value
      from last Call/default-value
 n - (p) Fensternumber in der Ebene ("WR->SWC")
 o - (p) on not found goto (Label)
 p - (p) Process-ID (PID 137)
 q - (p) Thread-ID (TID)
 r - (p) result number ("WR-SPC-Count")
 s - (np) internal reversing at child windows search
 t - (p) text
 u - (np) invisible, window must be invisible
 v - (np) visible, window must be visible
 w - (p) total waiting-time in Seconds, fractions (0.5)
     are possible, zero is possible.

 E - (np) Add Window to Exclude List after localization
 I - (p) p = handle. Locate window and remove window
     from Exclude list.
 K - (n) Immediately clear Exclude-List before specified
search
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
Q - (n) use previous Prototypes
S - (n) Search only next Level (SWC-Option)
T - (n) Search desktopwide, ignore localized Top-Window
V - (p/Label) Gosub on not found
W - (p/Label) Gosub on  found
X - (n) Run without Error on not found
```

Explanation:
(np) -> only prototype, no additional parameter required
(p) -> prototype requires additional parameter
(NUM/VAR) - window handle/variable
(p/Label) - Label-Parameter required, can also be a variable that contains the label

P2 **-** Parameters, separated by | according to the prototypes

Example

```
STW.Act|PBWindowClass:0|TestApp
WCW.nctE|2|Button|Button 2
' Coordinates relative to left, upper corner of button
MPO.o|42,22
MLE.
```

Remarks

When using `WCW.` to check if a child-window is available or not, it makes sense that you use the "b"-flag with a value of "0" to disable the backjump.

Limitations:

-

- !. STW. - Description 3814

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.30 WTW. - Wait new Top Window

3.83.30.1 ! WTW. -Wait New Top-Window

MiniRobotLanguage (MRL)

WTW. Command

Wait for New Top Window

Intention

This command localizes a specified Top-Window and sets the actual point into its center.
Unlike STW., the WTW.-Commandwill ignore Windows that are already open!
The WTW.-Command will wait for a Window that appears after the Command has been called.

All following `SCW`-commands will be within this window.

`WTW`. has a default window-treatment 3814 to ensure that any further action in that window will be effective. This default treatment will do following:
- normalize minimized windows (like the "D"-Flag
- windows that are outside the desktop-work area will be moved to 0,0 (like "G"-Flag)
- The window will be moved in front of all other (non-TopMost 3838)-windows.
- The window will receive the input focus. (like the "J"-Flag)

This default window-treatment can be completely deactivated using the "A"-Flag 3819.

This makes sense, for example when working with Menu's or other windows which disappear when the default treatment is being applied.

Alternatively the default window treatment can be influenced using other flags, like "B" or "G".

If the window should be brought into work area, without other treatment, use the "B"-Flag. "G", will just prevent the repositioning of the window and let the other treatment-steps happen.

All window search operations change the Timeout System Variables `#tio#` and `#til#`. Using these you can find out if a window was found or not, even if you have used the"X" Flag (X - run without Error).

Hint: Please note that the Flags have a priority from left to right (highest Priority). If you add other flags after the "A" there may be a treatment. Because the more right the flags, the higher their priority. If you place the "A" last inside the prototypes, all involved treatment will be disabled.

See two examples.

*© 2023 Theo Gottwald * https://www.smart-package.com*

In this first case the "A" Flag has priority over the "C" Flag, because its right of it.

```
WTW.tCA|explorer
MMV.
```

In this case the "C" Flag is right of the "A" Flag and therefore has priority over the "A" Flag.

```
WTW.tAC|explorer
MMV.
```

Some Flags deactivate the default treatment or parts of it. See description below.

Hint: If you omit all parameters like this:
`WTW.`
the command will automatically restore the parameters from the previous call. This makes it easy to always locate the same Top-Window.Note that this also applies to `ITW.` as both use the same parameters-store.

Syntax

WTW.P1[|P2]...[|Px]

Parameter Explanation

P1 – Prototype
P2 .. **PX** - Parameters according to prototypes

```
A - (np) Switch off default window treatment completely
B - (np) disables following parts of "default treatment":
     NO Restore from Minimized, NO Set Input-Focus,
     NO Bring to Front
C - (np) If the window i maximized, it will be restored to
    normal size
D - (np) If the window is minimized,  will be restored to its
    previous size, before it was minimized,
E - (np) Put Localize window, then add window to
    Search Exclude List.
F - (np) Move window to center of primary desktop
G - (np) disable default window-treatment-"repositioning if
     outside"
H - (np) a window that is outside the primary desktop working
area
    will be repositioned. Default is that the window can be
also
    on a second desktop.
I - (NUM/VAR) Remove window with the given window-handle from
the
    search-exclude-list.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
J - (np) Bring window to Front. Does not switch off default
window
    treatment.
K - Immediately clear Exclude-List before specified search
M - (np) Set window to TOPMOST. Such windows will be on Top
of all
    other Non-TOPMOST windows. DANGER - even Messageboxes may
be
    hidden behind a TOPMOST window. Use this with caution!
N - (np) remove the TOPMOST Property from a window.
Q - use previous Prototypes (only prototypes)
V - (p/Label) Gosub Line/Label if the window was NOT found
W - (p/Label) Gosub Line/Label if the window was found
X - (np) run without error if window was not found. Timeout
Flag
    #tio# and #til# will anyway be set and can be used.

a - (np) changes internal settings that "all" windows will be
    found. This includes invisible and disabled windows.
b - (np) "back" - moves window to the back, behind other
windows.
c - (p) "class", window-class parameter
e - (np) enabled, the window must be enabled or it will
ignored.
f - (np) disabled, the window must be disabled or it will
ignored.
g - (p/Label) Goto Line/Label if the window was found
h - (p) localize the window directly using a given window
handle.
    Note, if "h" is given, other search conditions will
    be ignored.
j - (p) WaitForInputIdle, you can specify the WII timeout
k - (np) WaitForInputIdle - no parameter, use the default
    WII timeout.
o - (Label/Variable) on not found goto (Label)
p - (p) process-ID, search only windows from process with
this
    given PID
q - (p) ThreadID,, search only windows from process with this
    given TID
r - (p) No. of result to choose (Result-Number for Top-
Windows)
t - (p) text, window-text (often the window caption)
u - (np) invisible, search only invisible windows
v - (np) visible, search only visible windows
w - (p) total waiting-time in Seconds, 0.5 (FP-numbers) is
    possible.
```

Explanation:

(np) -> only prototype, no additional parameter required

(p) -> prototype requires additional parameter

(NUM/VAR) - window handle/variable

(p/Label) - Label-Parameter required, can also be a variable that contains the label

P2 - Px - Data according to the prototypes, separated by |

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'MR Script-file:
'Version:
'Purpose: STW.-Features Demo
'Author: Theo Gottwald
'Creation date: 09.12.11
'============================================================
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
' We use STW here to test if the Application is already
running
' in that case we jump over the EXE-command and contine.
' We use the following flags:
' w ... 0 - Set waiting time to 0 seconds
' t ... "BCS - Testform" - this is the caption text of the
window we search for
' g ... "found" - jump to Label ":found" if the window already
exists
' X ... continue without errormessage if the window was not
found in time
'
STW.wtgX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Now we can use the Application and press Buttons
STW.wt|0|BCS - Testform
SCW.nctb|1|Button|Next|0
' Compatible Button Click
MLC.

'------------------------------------------------------------
ENR.
```

Remarks

To select/locate a Top- Window, you will most often use `STW.` or in few cases `LAP.`

Limitations:

-

3.83.30.2 "a" - Flag - WTW.

"a" - Flag "all windows" Previous 3848 Top 41 Next 3852

MiniRobotLanguage (MRL)

"a" - Flag "all windows"

Search Top Window

Intention

In most cases, we want to act on visible and enabled window only.
Therefore the STW. command ignores by default windows, if they are disabled or invisible.

The "a" flag changes this behavior. Using the "a"-Flag, the STW. command will locate "all windows". This includes Top-Window which are invisible or disabled, or both.
Using the Flag "a" ALL Top windows will be found if they meet the search criteria.

Example

```
'MR Script-file:
'Version:
'Purpose: STW.-Features Demo
'Author: Theo Gottwald
'Creation date: 09.12.11
'============================================================
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Next we make the thing invisible
SWS.i
' Wait a second
PAU.1
' Locate it using "all"
STW.wt|0|BCS - Testform
' Locate the Button using "all"
SCW.anctb|1|Button|Next|0

' CLick the button, while its invisible
MLE.
' Get the Top-Handle
GCT.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Make it visible again
SWS.v
ENR.
```

Remarks

If you definitely know that the window is invisible, you can use the "u" - Flag - STW. 3878 which will only search for invisible windows and ignore visible windows.

The same applies for disabled windows, and the "f" - Flag - STW. 3857

Limitations:

See also:

- "e" - Flag - STW. 3855
- "f" - Flag - STW. 3857
- "u" - Flag - STW. 3878
- "v" - Flag - STW. 3880

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.30.3 "A" - Flag - WTW.

"A" - Flag "No windows treatment" Previous 3814 Top 41 Next 3821

MiniRobotLanguage (MRL)

"A" - Flag "No windows treatment"

Search Top Window

Intention

STW. has a default window-treatment to ensure that any further action in that window will be effective. This default treatment will do following:
- normalize minimized windows (like the "D"-Flag
- windows that are outside the desktop-workarea will be moved to 0,0 (like "G"-Flag)
- The window will be moved in front of all other (non-TopMost)-windows.
- The window will receive the input focus. (like the "J"-Flag)

This default window-treatment can be completely deactivated using the "A"-Flag.

This makes sense, for example when working with Menu's or volatile windows, which disappear when the default treatment is being applied.

Usage:

```
STW.cA|#32768
MMV.
```

Please note that the Flags are internally analyzed in the order in which they are given. If you add other flags after the "A" there may be a treatment.
If you place the "A" last inside the prototypes, all such treatment will be disabled.

In this case the "A" Flag has priority over the "C" Flag, because its right of it.

```
STW.tCA|explorer
MMV.
```

In this case the "C" Flag is right of the "A" Flag and therefore has priority over the "A" Flag.

```
STW.tAC|explorer
MMV.
```

Example

```
'MR Script-file:
'Version:
'Purpose: STW.-Features Demo
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'Author: Theo Gottwald
'Creation date: 09.12.11
'============================================================
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Click on the OK Button in a messagebox
' Locate the Application (Top-)Window
STW.cA|#32767
MMV.
ENR.
```

Remarks

Alternatively the default window treatment can be influenced using other flags, like "B" or "G".

If the window should be brought into work area, without other treatment, use the "B"-Flag. "G", will just prevent the repositioning of the window and let the other treatment-steps happen.

Limitations:

See also:

3.83.30.4 "b" - Flag - WTW.

"b" - Flag "window to back" Previous 3850 Top 41 Next 3854

MiniRobotLanguage (MRL)

"b" - Flag "window to back"

window to back

Intention

In most cases we want the window to come in front of other windows. so we can use it. For this we do not need any STW.-flag, as this is the default behavior of the STW.-command.

In some cases, we want just the opposite. We want a window to go behind all other windows. We sent a "window to back". For this we use the "b"-Flag.

It will locate the window "on Top" and sent it to back. See the example below.

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

' Open 5 Terstforms and position them nicely
FOR.$$CNT|1|5
  EXE.?exepfad\Sample Apps\BSC-Testform.exe
  STW.p|#pid#
  SWP.(100+55*$$CNT),(200+55*$$CNT)
NEX.

FOR.$$CNT|1|50
'Move Testform "On top" to back
  STW.ctb|PBWindowClass:0|BCS - Testform
  ' Make small rest of 0.1 seconds so we can see it
  PAU.0.1
NEX.

' Close all Testforms
CAW.PBWindowClass:0|BCS - Testform
ENR.
```

3.83.30.5 "B" - Flag - WTW.

"B" - Flag "partial treatment" Previous 3819 Top 41 Next 3823

MiniRobotLanguage (MRL)

"B" - Flag "partial treatment"

Search Top Window

Intention

STW. has a default window-treatment to ensure that any further action in that window will be effective. This default treatment will be reduced, when the "B" - Flag is set.

When the "B" Flag is in effect, windows that are outside the desktop-workarea will be moved to the upper, left corner of the desktop - that is position 0,0. Thats the only treatment that will be done.

Also this can be disabled with the "G"-Flag. Means, that the flags "G" and "B" together are just like the "A" flag,

Example:

```
STW.Bc|WindowClass
MMV.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
STW.cB|#32767
' Locate the button
SCW.t|Ok
' Click the button
MLE.
ENR.
```

3.83.30.6 "C" - Flag - WTW.

MiniRobotLanguage (MRL)

"C" - Flag "restore if maximized"

Search Top Window

Intention

If the window is maximized, this flag will bring the window back to its normal size.
You can maximize, minimize and restore windows using the SWS. - Set Window State 3889 command.

It doesn't matter, if the window was minimzed before it was maximized.
The window will be normal size after this flag.

Example

```
STW.ct|PBWindowClass:0|TestApp
' Maximize Window
SWS.z
' Wait 1 Second
PAU.1
' Window will be restore to normal size
STW.ACct|PBWindowClass:0|TestApp
ENR.
```

Remarks

Limitations:

3.83.30.7 "c" - Flag - WTW.

"c" - Flag "class" Previous 3852 Top 41 Next 3855

MiniRobotLanguage (MRL)

"c" - Flag "class"

Search Top Window

Intention

Window-Class" value. This is the "window class" of the window we are looking for.

This flag needs a parameter. It supports 3.2 Standard-Search Pattern 341 and therefore its enough to give a unique part of the value. By default the value is not case sensitive.

```
STW.c|WindowClass
MMV.
```

Example

```
'
' Click on the OK Button in a messagebox
' Locate the Application (Top-)Window
STW.c|#32768
' Locate the button
SCW.t|Ok
' Click the button
MLE.
ENR.
```

Remarks

3.83.30.9 "e" - Flag - WTW.

MiniRobotLanguage (MRL)

"e" - Flag "enabled windows"

Search Top Window

Intention

To ignore disabled windows is one of the default settings of the STW. command.
Therefore you will not need to specify the "e"-Flag often.
It can however make sense, to override the default behavior by using the "f"-flag which will make STW. to ignore enabled windows and just look for disabled windows.
If you want to catch both, the "a"-flag is what you need.
However the "a"->Flag will automatically also enable the search for invisible windows. If you do not want that, just add a prototype "v" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "e" - flag together with the "a" to search only windows that are enabled. No matter if they are visible or not.

Lets take a look, on "what will work and what will not work".
This will search only for enabled windows.

```
STW.ce|WindowClass
MMV.
```

Since this is a default behavior of `STW.`, we have wasted the "e" at this place. Its not needed.

Now we would like to search for windows which are enabled, as well for disabled windows. We can do that in two ways.The first way is like this:

```
STW.cef|WindowClass
MMV.
```

The robot understands that we want enabled and disabled windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cav|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the invisible windows. We do this by adding the "v"-Flag after the "a". In this case the "v"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Start an Application only, if that Application is not yet
running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Next we disable the whole window
SWS.d
' Wait half of a second
PAU.0.5
' Try to locate it using "e"
' Will not work, but give an error
STW.wte|0|BCS - Testform
ENR.
```

Remarks

3.83.30.1("E" - Flag - WTW.

MiniRobotLanguage (MRL)

"E" - Flag "Exclude window"

Search Top Window

Intention

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with STW. and not with ITW. It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
STW.cE|WindowClass
MMV.
```

And how do you get the window out the "Exclude List"?
This is what the "I"-Flag is good for.

```
' Remove window from exclude List
STW.I|$$HWN
```

The "I"-Flag however need a window handle as parameter and will not work in any other constellation. Therefore keep the handles of those excluded windows, if you want to have them back later.

Example

```
' Use Exclude List

' Add window to exclude list
STW.tE|TestAP
MMV.
VAR.$$HWN=#hwn#

' Remove window from exclude List
STW.I|$$HWN
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' If you comment the STW. above the window can not be found
here:
STW.t|TestApp

ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag.
To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using SCW. there is also Exclude-List availabe. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

See also:

- "I" - Flag - STW. 3832

3.83.30.1."F" - Flag - WTW.

"F" - Flag "center window on desktop" Previous 3825 Top 41 Next 3829

MiniRobotLanguage (MRL)

"F" - Flag "Center on Desktop"

Move Window to center of primary desktop

Intention

If the "F"-Flag is given, the window will be move to the center of the primary desktop. The "F"-Flag will override the default windows treatment, which would move the window to 0,0 if its outside of the desktop.
The "F"-Flag will always move the window to the center, no matter where the window was before.

```
STW.Fc|WindowClass
MMV.
```

Example

```
'
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.cF|Myclass
' Move Mouse to Center of window
' in center of desktop
MMV.
ENR.
```

3.83.30.17 "f" - Flag - WTW.

"f" - Flag "disabled windows" Previous 3855 Top 41 Next 3859

MiniRobotLanguage (MRL)

"f" - Flag "disabled windows"

Search Top Window

Intention

To ignore disabled windows is one of the default settings of the STW. command. Therefore if you want to search for a window that has been disabled, you will need the "f"-flag.

The "f"-Flag will override the default behavior. It will make STW. to ignore enabled windows and just look for disabled windows, only.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also enable the search for invisible windows. If you do not want that, just add a prototype "v" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "f" - flag together with the "a" to search only windows that are disabled. No matter if they are visible or not.

Lets take a look, on this. This will search only for disabled windows.

```
STW.cf|WindowClass
MMV.
```

Now we would like to search for windows which are enabled, as well for disabled windows. We can do that in two ways.The first way is like this:

```
STW.cef|WindowClass
MMV.
```

The robot understands that we want enabled and disabled windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cav|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the invisible windows. We do this by adding the "v"-Flag after the "a". In this case the "v"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Start an Application only, if that Application is not yet
running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Next we disable the whole window
SWS.d
' Wait half of a second
PAU.0.5
' Try to locate it using "e"
' Will work, we get the window
STW.wtd|0|BCS - Testform

ENR.
```

3.83.30.13 "g" - Flag - WTW.

MiniRobotLanguage (MRL)

"g" - Flag "Goto if found"

Goto if found

Intention

If the window you are looking for is found within the specified waiting time, normally the script just continues. You can however ask the robot to jump to a Label in that case.
And you can use the "X"-Flag to tell the robot to just continue with the script in case of error - if the window is not found.
This would change the behavior of the command, but sometimes this can be a good solution. Take this example:

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - goto Label "GoOn" if the window was found
' X - continue the script as normal, without error,
'     if the window is not found
STW.tgXw|BCS|GoOn|0
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:GoOn
MBX.Ready
ENR.
```

In case you use the "g"-Flag, together with the "W" -Flag ("on Found Gosub"), the "W"-Flag will be ignored. The "g"-Flag has a generally higher priority.

Example

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - gotoLabel "Sub" if thewindow was found
' X - continue the script as normal, without error,
'     if the window is not found
STW.tgXw|BCS|GoOn|0
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:GoOn
MBX.Ready
ENR.
```

3.83.30.14"G" - Flag - WTW.

"G" - Flag "don't move window" Previous 3827 Top 41 Next 3830

MiniRobotLanguage (MRL)

"G" - Flag "don't move window"

don't move the Top Window

Intention

This flag prevents the default window treatment from moving the window around. Without this Flag, a Top-Window that is outside the working area, will be move to position 0,0, that is the upper left corner of the desktop.

Having the "G"-Flag set, the window will just not be moved, no matter if its outside the working area or not.

```
STW.cG|WindowClass
MMV.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.cG|#32768

ENR.
```

Remarks

Please note that other prototypes may influence the power of the "G"-Flag, especially, if the are right of the "G"-Flag which means they have a higher priority.

Limitations:

See also:

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.30.1!"H" - Flag - WTW.

"H" - Flag "stay in primary desktop" Previous 3829 Top 41 Next 3832

MiniRobotLanguage (MRL)

"H" - Flag "primary desktop"

Search Top Window

Intention

This flag will move a window to position 0,0, that is the upper left corner, if the window is full or partial outside the primary desktop workarea.

It will override the default window treatment.
While by default also a Dual-Screen Desktop will be accepted as workarea, this will not be the case here.

The "H"-Flag makes sure the window is complete on the primary desktop.

```
STW.cH|WindowClass
MMV.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Click on the OK Button in a messagebox
' Locate the Application (Top-)Window
STW.tH|word
MMV.
ENR.
```

Remarks

3.83.30.1("h" - Flag - WTW.

MiniRobotLanguage (MRL)

"h" - Flag "handle"

Search Top Window by handle

Intention

This flag is an exception. In fact it must not search the window, it will just localize the window "by handle". Of course this is a very efficient solution. Therefore if you have already localized your window, keep the handle in a variable and just feed it back to STW. when you need that window again.

```
' Localize by handle
STW.cta|ieframe|Update
' We grab the handle in a variable
HTV.$$MYW

' Later we can always get definitely this window,
' without further parameters
STW.h|$$MYW
MMV.

' Some more examples
STW.h|52367
MMV.

STW.h|#hnw#
MMV.
```

Example

```
'
' Localize by handle
STW.cta|ieframe|Update
' We grab the handle in a variable
: $$MYW=#hwn#

' Later we can always get definitely this window,
' without further parameters
STW.h|$$MYW
MMV.

ENR.
```

3.83.30.17 "I" - Flag - WTW.

"I" - Flag "remove from Exclude List" Previous 3830 Top 41 Next 3834

MiniRobotLanguage (MRL)

"I" - Flag "remove from Exclude List"

Search Top Window

Intention

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with STW. and not with ITW. It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
STW.cE|WindowClass
MMV.
```

And how do you get the window out the "Exclude List"?
This is what the "I"-Flag is good for.

```
' Remove window from exclude List
STW.I|$$HWN
```

The "I"-Flag however need a window handle as parameter and will not work in any other constellation. Therefore keep the handles of those excluded windows, if you want to have them back later.

There is another way, how to search windows which are currently excluded from search?
You can also use the "K"-Flag.

```
' clear whole exclude List
STW.Kc|WindowClass
```

The "K"-Flag will immediately, even before the search starts, clear the exclude list. No matter if a window is found or not, using the prototype "K" will clear the exclude list.

After this all previously "exclude listed" windows can be found again.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
' Use Exclude List
' Add window to exclude list
STW.tE|TestApp
VAR.$$HWN=#hwn#

' Remove window from exclude List
STW.I|$$HWN

' If you comment the STW. above the window can not be found
here:
STW.t|TestApp

ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag. To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using SCW. there is also Exclude-List availabe. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

3.83.30.18 "J" - Flag - WTW.

MiniRobotLanguage (MRL)

"J" - Flag "window to front"

Search Top Window

Intention

The window comes to front already with the default window treatment, without any additional flags. But you can disable that, and select yourself exactly what you want. Like this:

```
STW.AJc|WindowClass
MMV.
```

The "A" Flag will switch of all default window treatment. Then comes the "J"-Flag and tells the robot to bring the window to front. Be careful with the operator priority. If you place the prototypes like this:

```
STW.JAc|WindowClass
MMV.
```

then the "A"-Flag will switch of the "J"-Flag because it is more right and therefore has a higher priority.

The "J"-Flag itself will not disable the default window treatment. Therefore something like:

```
STW.Jc|WindowClass
MMV.
```

```
is possibly a waste of letters, as the default behavior of
STW. is already to bring the window to front.

Note that the Flag "B" does not switch off the "J"-Flag,
therefore when using "B", the sequence of the prototypes "B"
and "J" should not be a issue.
```

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.AJc|#32768
' Locate the button
MMV.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX. Compare with this:
STW.Ac|#32768
' Locate the button
MMV.
ENR.
```

3.83.30.19 "j" - Flag - WTW.

MiniRobotLanguage (MRL)

"j" - Flag "WII. by number"

Wait for Input Idle and tell how long

Intention

"Wait for Input Idle" halts script execution until the localized window is ready to process our Input.

This Command can be seen as a dynamic Pause-Statement, it waits only if our target window is busy. The maximum waiting time must be given as a numeric value or variable.

Note the value you specify will replace the default internal value for "WII. without parameter", used for the "k" - Flag - STW. 3865 . But also for WII. if no parameters are given.

Unlike a fixed pause statement which would always wait for a fixed time. `WII.` is the better solution.

If the process is a console application or does not have a message queue, "Wait For Input Idle" returns immediately.

The given time is in seconds. Fractions are allowed. For example:

```
' WIll wait no longer then a half second
STW.cj|WindowClass|0.5
MMV.
```

Technically the "j"-Flag does the same like the WII. - Wait-for-Input-Idle 2909 statement. Just that it is integrated and does not need a separate line of code.

Example

```
' j - wait 5 Seconds maximum
STW.cj|WindowClass|5
MMV.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

The maximum number for the waiting time is the equivalent for 23100 days. In short: you can not ask the robot to wait longer for a window then ~63 years. Anything below will be just fine. Note that negative waiting times will be rounded to zero.

See also:

- WII. - Wait-for-Input-Idle 2909

3.83.30.2("k" - Flag - WTW.

MiniRobotLanguage (MRL)

"k" - Flag "WII. default"

Search Top Window

Intention

"Wait for Input Idle" halts script execution until the localized window is ready to process our Input.

This Command can be seen as a dynamic Pause-Statement, it waits only if our target window is busy. The maximum waiting time is taken from an internal value that is been set with the last WII. statement or with the "j" - Flag - STW. 3863.

Unlike a fixed pause statement which would always wait for a fixed time. `WII.` is the better solution.

If the process is a console application or does not have a message queue, "Wait For Input Idle" returns immediately.

The given time is in seconds. Fractions of a second are allowed.

```
STW.cj|WindowClass|5
MMV.
' Will do the same without repeating the value
STW.ck|WindowClass
MMV.
```

Technically the "k"-Flag does the same like the WII. - Wait-for-Input-Idle 2909 statement without a parameter. Just that it is integrated and does not need a separate line of code.

Example

```
' Demonstrate the "j" and the "k" Flag
STW.cj|WindowClass|5
MMV.
' Will do the same without repeating the value
STW.ck|WindowClass
MMV.
ENR.
```

3.83.30.2."K" - Flag - WTW.

"K" - Flag "Clear Exclude List and search" Previous 3834 Top 41 Next 3838

MiniRobotLanguage (MRL)

"K" - Flag "Clear Exclude List"

Clear Exclude List and search

Intention

Immediately clear Exclude-List before specified search.

Imagine you have several equal windows, which you want to handle one after the other.
Yes, there are features available to do that, for example the "r"-Flag (Window-number). Or your could use FEW.

But how about excluding those windows which you have already handled from further window searches?

To understand this you need to know that there is a Window Search "Exclude-List". Now if you add a window to this "Exclude List", it will not be found any more. Not with STW. and not with ITW. It will be there but it will be ignored.

How do you add a window to the "Exclude List"?

```
STW.cE|WindowClass
MMV.
```

And how do you search windows which are currently excluded from search?
This is what the "K"-Flag is good for.

```
' clear whole exclude List
STW.Kc|WindowClass
```

The "K"-Flag will immediately, even before the search starts, clear the exclude list. No matter if a window is found or not, using the prototype "K" will clear the exclude list.

After this all previously "exclude listed" windows can be found again.

Example

```
' Use Exclude List

' Add window to exclude list
STW.Et|TestApp
MMV.
VAR.$$HWN=#hwn#

' Remove all windows from exclude List
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' and search

' If you remove the "K" below, the window can not be found!
STW.Kt|TestApp

ENR.
```

Remarks

Windows which have been closed, will automatically be removed from the exclude list. There is no need to remove them manually from the exclude list.
If anyway you want to remove a window from the exclude list, you can use the "I"-Flag.
To completely clear the Exclude list, use the "K"-Flag.

When locating Child-Windows using SCW. there is also Exclude-List available. The Exclude List for Child-Windows is a separate list and will therefore survive if you clear the exclude list for Top-Windows.

Currently you can not check which windows are exclude-listed. There is also no way of showing the content of an exclude-list.

Limitations:

There are no limitations about the number of windows you may add to the exclude list.

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.30.2 "M" - Flag - WTW.

MiniRobotLanguage (MRL)

"M" - Flag "TopMost"

Search Top Window

Intention

In windows, there is a property of Top-Windows that will make them stay always in front of all other windows.

This property is called "TopMost". A window that is "TopMost" is always on top of all other windows, that are not TopMost.

Only another TopMost window can be in front of an TopMost window.

For example the MR-Editor can be set to TopMost.

Now you may think "this sounds good!". Be warned. This is an advanced feature for advanced users.

Programs have Messageboxes and also open up other windows. In case they have been made TopMost, you may not be able to see those Messages or PopUp windows. This may lead for you to think that the program hangs.

Why don't you see those messages?
Because they will not be TopMost and therefore they will appear behind the TopMost window!

Therefore use TopMost style only when really needed and when you know what you are doing.

Using the Flag "M", the window will be made TopMost immediately after it was localized.

```
STW.cM|WindowClass
MMV.
```

Use the "N"-Flag to remove the TopMost-property from a TopMost window.

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.Mc|#32768
VAR.$$HWN=#hwn#
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Remove the TopMost Property
STW.hN|$$HWN

ENR.
```

Remarks

Limitations:

3.83.30.2 "N" - Flag - WTW.

MiniRobotLanguage (MRL)

"N" - Flag "No TopMost"

No more TopMost

Intention

In windows, there is a property of Top-Windows that will make them stay always in front of all other windows.

This property is called "TopMost".

A window that is "TopMost" is always on top of all other windows, that are not TopMost.

Only another TopMost window can be in front of an TopMost window.

For example the MR-Editor can be set to TopMost.

Now you may think "this sounds good!". Be warned. This is an advanced feature for advanced users.

Programs have Messageboxes and also open up other windows. In case they have been made TopMost, you may not be able to see those Messages or PopUp windows. This may lead for you to think that the program hangs.

Why don't you see those messages?
Because they will not be TopMost and therefore they will appear behind the TopMost window!

Therefore use TopMost style only when really needed and when you know what you are doing.

Using the Flag "M", the window will be made TopMost immediately after it was localized.

```
STW.cM|WindowClass
MMV.
```

Use the "N"-Flag to remove the TopMost-property from a TopMost window.

Example

```
'#EXE:?pfad\
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'#SPI:ForceWrite
'
' Locate the Application (Top-)Window
STW.Mc|#32768

3.83.30.2 "o" - Flag - WTW.

MiniRobotLanguage (MRL)

"o" - Flag "on not found Goto"

Search Top Window

Intention

If the window you are looking for is not found within the specified waiting time, normally you will end up with an error-message.

Maybe you want just to jump at another place in the script the, and start a program. Or react in another way. That is where the "o" Flag enters the game. The script just continues. The window is not found and we tell the robot to jump to a Label in that case.

Take this example:

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' o - goto Label "GoOn" if the window was NOT found
' X - continue the script as normal, without error,
'     if the window is not found
STW.toXw|BCS|GoOn|0
GTO.weit

:GoOn
 EXE.?exepfad\Sample Apps\BSC-Testform.exe

:weit

MBX.Ready
ENR.
```

In case you use the "o-Flag, together with the "V" -Flag ("on not Found Gosub"), the "V"-Flag will be ignored. The "o"-Flag has a generally higher priority.

Example

```
' Run application only if the window is not found
'
' t - text (caption of the window)
' o - goto Label "GoOn" if the window was NOT found
' X - continue the script as normal, without error,
'     if the window is not found
' w - set waiting time to 0 seconds
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'
STW.toXw|BCS|GoOn|0
GTO.weit

:GoOn
 EXE.?exepfad\Sample Apps\BSC-Testform.exe

:weit

MBX.Ready
ENR.
```

Remarks

In case you use the "o-Flag, together with the "V" -Flag ("on not Found Gosub"), the "V"-Flag will be ignored. The "o"-Flag has a generally higher priority.

Limitations:

-

3.83.30.2 "p" - Flag - WTW.

MiniRobotLanguage (MRL)

"p" - Flag "Process ID"

Search Top Window

Intention

You can localize a window safely, if you have the PID (Process ID) of the application behind that window.

Be sure that you have read and understood the chapter 1.7. Application and PID 137.

Hint: If you have localized a window, you also have the PID of the process behind that window in `#pid#`. You can save it for later use in a variable. Like this:

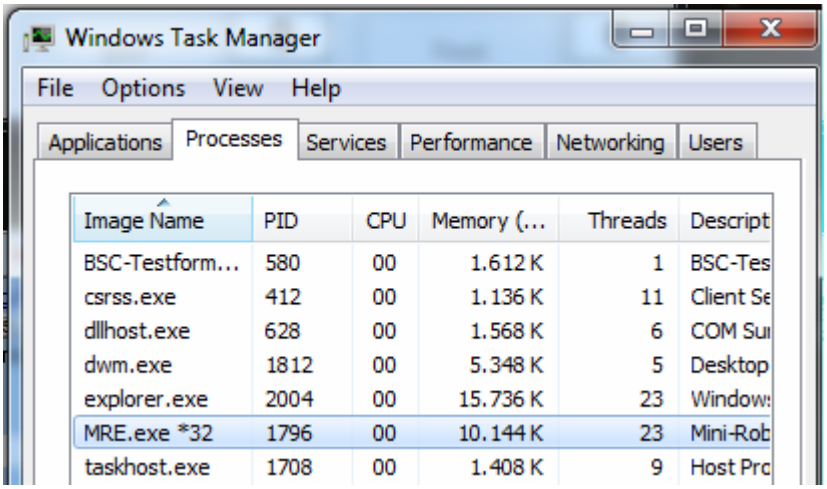
```
STW.c|pbwind
: §§PID=#pid#

or use:

STW.c|pbwind
HTV.§§PID
```

In both cases, you get the PID of that process into the local variable §§PID 366.

You can see the PID of a process in the task-manager::



The PID value is a normal search parameter and can be used alone or together with other search parameters.

```
' Search a window from process with ID 3435
' and the given window class.
'
STW.ch|pbwind|580
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MMV.
```

Example

```
' Locate window only by PID
STW.p|580
MMV.

ENR.
```

Remarks

3.83.30.2("q" - Flag - WTW.

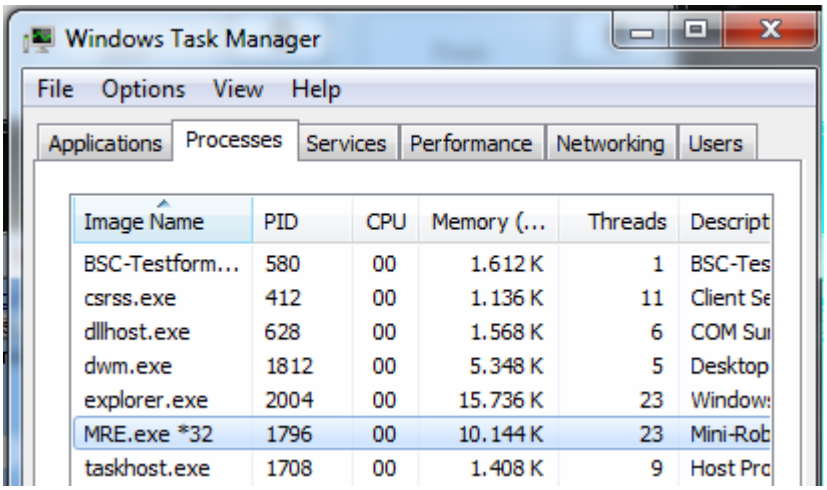
MiniRobotLanguage (MRL)

"q" - Flag "Thread ID"

Search Top Window

Intention

This is an advanced parameter. The chances are that you will never need it.
Processes have a number of Threads. See this picture here:



On the left side you can see the name of the process. Right of it the PID of the process. Later you see "Threads".
In a very simplified form, a Thread is a subprogram of that process, that runs an own small program. Generally the more threads a program has, the better it will scale up on multiple CPU-Core's.
While all Threads of a process belong to that process and therefore have the same PID, they have a different Thread-ID. In case you may need to separate between windows of the same process, which is "Multi-threaded", the "q"-flag is for you.

```
STW.cq|WindowClass|109872
MMV.
```

Hint: If you have localized a window, you also have the TID of the process behind that window in `#tid#`. You can save it for later use in a variable. Like this:

```
STW.c|pbwind
: §§TID=#tid#
```

This way, you get the TID of that Thread into the local variable §§PID 366.

If you don't "understand a word", or don't have very special cases, just ignore this flag.

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

EXE.?exepfad\Sample Apps\BSC-Testform.exe
' Locate the window
STW.p|#pid#
' Show the Thread-ID
MBX.#tid#
ENR..

ENR.
```

Remarks

Limitations:

3.83.30.27 "Q" - Flag - WTW.

MiniRobotLanguage (MRL)

"Q" - Flag "Repeat Prototype"

Search Top Window

Intention

This flag will just repeat the Prototype that was last used with STW. or ITW. or any otehr Top-Window search instruction.

```
STW.c|WindowClass
MMV.
' this will do the same
STW.Q|WindowClass
MMV.
```

Note that there is another way of repeating the last STW. or ITW.. That is, to just leave the whole parameter part empty.

```
STW.c|WindowClass
MMV.
' this will do the same
STW.
MMV.
```

While "Q" will only retype the prototypes internally. Leaving the parameters away, will retype the whole parameters, including the prototypes, using those from last time the command was called.

Example

```
'#EXE:?pfad\
'#SPI:ForceWrite
'
STW.c|WindowClass
MMV.
' this will do the same
STW.Q|WindowClass
MMV.
ENR.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

`STW.` and `ITW.` share the same parameter store. Therefore if you have localized the window with ITW. then you can also use these parameters for STW. and vice versa.

Limitations:

-

-

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.83.30.2 "r" - Flag - WTW.

MiniRobotLanguage (MRL)

"r" - Flag "result number"

Search Top Window

Intention

There may be multiple results in a window-search with `STW.`. Normally you get the first result that fits to your search parameters.
Using the "r"-Flag you can define which result you want, Nr.1, Nr.2 or Nr. 20. Just add the "r"-Flag and the result number.

If omitted, always result Nr.1 is returned.

Note: If there are not enough results, your search will fail!
Therefore you can also use this feature to count windows.

```
'We'll get the 3rd result with that window class
STW.cr|WindowClass|3
MMV.
```

Example

```
'We'll get the 4th result
' with that window class
'
STW.cr|WindowClass|4
MMV.
ENR.
```

Remarks

-

Limitations:

3.83.30.29 "t" - Flag - WTW.

MiniRobotLanguage (MRL)

"t" - Flag "text"

Search Top Window

Intention

This flag is one of the most important search parameters. It is the window-text. Most often you can even see the text of a top-window without using the windows-Inspector.
Here is the simplest case how you can grab a window.

```
STW.t|TestApp
MMV.
```

The text parameter is a string-value and therefore supports 3.2 Standard-Search Pattern 341.
Let us try some of these.

As always with Search patterns, it is enough to give a unique part of the value. By default the text is not case sensitive. You can change that behavior using the search patterns. Take the sample-script below and replace the line:

```
' Locate the window
STW.t|Testf
```

with the following lines. This will help you to understand the use of Patterns for text search.

```
' Lets start with this
STW.t|{&DOCAPS:Testf}
```

This will force the text to be case-sensitive! Try this:

```
' This will not find the window
' because of case-sensitivity!
STW.t|{&DOCAPS:testf}
```

It does not find the window because the &DOCAPS: switches case-sensitivity on.
Now how about this:

```
STW.t|{&EXACT:bcs - Testform}
```

It does find the window. But then whats the "&EXACT:" good for?
Try this:

```
STW.t|{&EXACT:bcs - Testf}
```

© 2023 Theo Gottwald * https://www.smart-package.com

It does not find the window because the &EXACT: switches off the default behavior that a part of the text is enough. CAn it be combined with the &DOCAPS: ?

We try. This should work:
```
STW.t|{&EXACT:&DOCAPS:BCS - Testform}
```
and this should not work:
```
STW.t|{&EXACT:&DOCAPS:bCS - Testform}
```

Yes, everything work as expected.

Do you know the old times, when you had simple Wildcards as patterns? The"*****" and the "**?**" ?

You can have them back if you want. Try this:

```
STW.t|{&WILDC:b?? - Testform}
```

Yes, it works. And how about:

```
STW.t|{&WILDC:b?? - Tes*orm}
or
STW.t|{&WILDC:b?? - *s*or?}
```

It works.
We kept them for you.
You can still use even the old DOS-Patterns if you really want.
But there is much more if you use the new patterns.

How about a fuzzylogic and a OR'ed combination of two patterns?

```
STW.t|{&WILDC:b?? }&OR:{BCS-tesform&FUZZY:6}
```

and you can not only combine two patterns, you can combine as many patterns using &OR: as you like! If you want to support many languages, this is the way to go.

No matter if there is a "YES" on that button or a "Qui" or whatever. So long you know it, or at least a bit of it, you can locate it using Search patterns.

Example

```
' Close all such windows if there are some open
CAW.PBWindowClass:0|BCS - Testform

EXE.?exepfad\Sample Apps\BSC-Testform.exe

' Locate the window
STW.t|Testf

' Close the window
CAW.PBWindowClass:0|BCS - Testform
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

Limitations:

- 3.2 Standard-Search Pattern 341
- "c" - Flag - STW. 3854

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.30.3("u" - Flag - WTW.

MiniRobotLanguage (MRL)

"u" - Flag "invisible"

Search Top Window

Intention

To ignore invisible windows is one of the default settings of the STW. command. Therefore if you want to search for a window that has is invisible, you will need the "u"-flag.

The "u"-Flag will override the default behavior. It will make STW. to ignore visible windows and look for invisible windows, only.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also enable the search for disabled windows. If you do not want that, just add a prototype "e" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "u" - flag together with the "a" to search only windows that are invisible. No matter if they are enabled or not.

Lets take a look, on this. This will search only for invisible windows.

```
STW.cu|WindowClass
MMV.
```

Now we would like to search for windows which are visible, as well as for invisible windows. We can do that in two ways.The first way is like this:

```
STW.cuv|WindowClass
MMV.
```

The robot understands that we want visible and invisible windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cae|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
CAW.PBWindowClass:0|BCS - Testform
'
' Start an Application only,
' if that Application is not yet running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

STW.p|#pid#
' Next we make the window invisible
SWS.i
' Wait half of a second
PAU.2.5
' We locate it even though its invisible
STW.wtu|1|BCS - Testform
' and make it visible again
SWS.v
ENR.
```

Remarks

3.83.30.3."V" - Flag - WTW.

"V" - Flag "GoSub if not found. " Previous 3842 Top 41 Next 3846

MiniRobotLanguage (MRL)

"V" - Flag "GoSub if not found"

Gosub if not found

Intention

If the window you are looking for is not found within the specified waiting time, several things can happen. Normally you will get an error-message.

But that does not necessarily be what you want. Maybe you want just to see if the window is there and if not start the program in a Subroutine.

```
' "V" - Flag - on not found Gosub
STW.ctVw|PBWindowClass:0|BCS|Sub|1
' Move Mouse to the Install Button
SCW.ct|butt|Install
MMV.
ENR.
'-------------------------------------------------------------
' This Subprogram will be called if the window is not found
:Sub
EXE.?exepfad\Sample Apps\BSC-Testform.exe
STW.ct|PBWindowClass:0|BCS
RET.
```

The script above will try to locate the "BCS - Testform" and if its not yet started, it will be started and localized.

Example

```
STW.ctVw|PBWindowClass:0|TestAppx|Sub|1
MBX.Ready
ENR.
'-------------------------------------------------------------
:Sub
MBX.Error - Program not found
RET.
```

Remarks

Limitations:

© 2023 Theo Gottwald * https://www.smart-package.com

You can not mix the "V" and the "W"-Flag. If both are found, the "W"-Flag takes priority

See also:

3.83.30.3 "v" - Flag - WTW.

MiniRobotLanguage (MRL)

"v" - Flag "visible"

Search Top Window

Intention

To ignore invisible windows is one of the default settings of the STW. command. Therefore you will not need to specify the "v"-Flag often.

It can however make sense, to override the default behavior by using the "u"-flag which will make STW. to visible windows and just look for invisible windows.

If you want to catch both, the "a"-flag is what you need.

However the "a"->Flag will automatically also switch on the search for disabled windows. If you do not want that, just add a prototype "e" after the "a". As the prototype on the right has a higher priority, you get exactly what you want this way.

In the same way, you can use the "v" - flag together with the "a" to search only windows that are visible. No matter if they are enabled or not.

Lets take a look, on how to do this. This will search only for visible windows.

```
STW.cv|WindowClass
MMV.
```

Since this is a default behavior of `STW.`, we have wasted the "v" at this place. Its not needed.

Now we would like to search for windows which are visible, as well for invisibble windows. We can do that in two ways.The first way is like this:

```
STW.cuv|WindowClass
MMV.
```

The robot understands that we want visible and invisible windows. If we just give all two prototypes. But there is another way to do it. We can do this:

```
STW.cae|WindowClass
MMV.
```

The "a" Flag says "search all windows", enabled, disabled, visible and invisible. Now we just need to tell the robot that we do not want to get the disabled windows. We do this by adding the "e"-Flag after the "a". In this case the "e"-Flag will override the "a"-Flag. And tell the robot "we just want visible windows.".

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
CAW.PBWindowClass:0|BCS - Testform
'
' Start an Application only,
' if that Application is not yet running.
'
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

STW.p|#pid#
' Next we make the window invisible
SWS.i
' Wait half of a second
PAU.2.5
' We locate it even though its invisible
STW.wtu|1|BCS - Testform
' and make it visible again
SWS.v

3.83.30.3 "W" - Flag - WTW.

"W" - Flag "GoSub if found" Previous 3844 Top 41 Next 3848

MiniRobotLanguage (MRL)

"W" - Flag "GoSub if found"

Search Top Window

Intention

If the window you are looking for is found within the specified waiting time, normally the script just continues. You can however ask the robot to first call a Subprogram in that case and then continue with the script. This is done using the "W"-Flag.

```
STW.ctW|PBWindowClass:0|BCS|Sub
MMV.
ENR.
:Sub
MBX.!
RET.
```

The "W"-Flag can be used together with the "V"-Flag, while only one of these will be called. In case you use the "g"-Flag "on found Goto", the "W"-Flag will be ignored.

Example

```
'
' And then open a new instance
EXE.?exepfad\Sample Apps\BSC-Testform.exe

' If found close that window.
STW.ctWw|PBWindowClass:0|BCS|Sub|1

' And then open a new instance
EXE.?exepfad\Sample Apps\BSC-Testform.exe

STW.ct|PBWindowClass:0|BCS
SCW.ct|butt|Install
MMV.

ENR.
'-------------------------------------------------------------
:Sub
CAW.PBWindowClass:0|BCS
' Wait until its gone
MTW.
RET.
```

Remarks

© 2023 Theo Gottwald * https://www.smart-package.com

The "W"-Flag can be used together with the "V"-Flag, while only one of these will be called. In case you use the "g"-Flag "on found Goto", the "W"-Flag will be ignored.

© 2023 Theo Gottwald * https://www.smart-package.com

3.83.30.34 "w" - Flag - WTW.

MiniRobotLanguage (MRL)

"w" - Flag "wait time"

Search Top Window

Intention

How long do we wait if a window will appear or not?
Let's try it.

```
: $$TIM=#dtime#
STW.tX|nix
: $$TIM=#dsince#
MBX.$$TIM
ENR.
```

This i what we get.

It's currently about 15 seconds. When you read this it can be another value.
In fact this is the default time that we wait for a window before we run into an error-message or do something else (like in this script).

Now, its very important to understand that we do not generally wait 15 seconds, and then look if the window has appeared.
What we do is, we try ... try ... and try and check permanently, if the window has appeared. If the window appears any time, the script will immediately continue.

If the time is over, we do something else.

Now 15 seconds is enough for some cases, in many cases the window will appear after 45 seconds or any other time. Now this is where the "w"-flag enters the game.

Using the "w"-flag we can tell the robot how long he should wait. It can be 0 seconds like this:

```
STW.wtUX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found
```

or 360 seconds like here.

© 2023 Theo Gottwald * https://www.smart-package.com

```
STW.wtu|360|BCS - Testform
```

and there is no real limitation.

Example

Remarks

-

Limitations:

The maximum number for the waiting time is the equivalent for 23100 days. In short: you can not ask the robot to wait longer for a window then ~63 years. Anything below will be just fine. Note that negative waiting times will be rounded to zero.

3.83.30.3!"X" - Flag - WTW.

"X" - Flag "run without error" Previous 3846 Top 41 Next 3850

MiniRobotLanguage (MRL)

"X" - Flag "run without error"

Search Top Window

Intention

If the window you are looking for is not found within the specified waiting time, several things can happen. Normally you will just get an error-message. If you do not want to get an error, but just have the script continue running, use the "X"-Flag.

You can use the `#tio#` 3.1 Systemvariables 334 to check if the window was found or not. Also you can use the "V","W","g" and "o" Flags to react inside the STW.

For example in such a script:

```
STW.cXg|WindowClass|found
MMV.

:found
MPO.
```

This script will invert the normal behavior of STW. It will continue running in case of the window is not found. And in case the window is found, it will jump to the Label "found".

Example

```
'-------------------------------------------------------
' "X"-Flag Sample 1
' Run only if its not yet running ...
'-------------------------------------------------------
'
' Run application only if the window is not found
'
' t - text (caption of the window)
' g - gotoLabel "Sub" if thewindow was found
' X - continue the script as normal, without error,
'     if the window is not found
STW.tgXw|BCS|GoOn|0
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:GoOn
MBX.Ready
ENR.

'-------------------------------------------------------
' "X"-Flag Sample 2
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'-------------------------------------------------------
'#EXE:?pfad\
'#SPI:ForceWrite
'
' Start an Application only, if that Application is not yet
running.
'
' We use STW here to test if the Application is already
running
' in that case we jump over the EXE-command and contine.
' We use the following flags:
' w ... 0 - Set waiting time to 0 seconds
' t ... "BCS - Testform" - this is the caption text of the
window we search for
' g ... "found" - jump to Label ":found" if the window already
exists
' X ... continue without errormessage if the window was not
found in time
'
STW.wtgX|0|BCS - Testform|found
EXE.?exepfad\Sample Apps\BSC-Testform.exe
:found

' Now we can use the Application and press Buttons
STW.wt|0|BCS - Testform
SCW.nctb|1|Button|Next|0
' Compatible Button Click
MLC.

'-------------------------------------------------------------
ENR.
```

3.84 XML-Parser

3.84.1 ! Sample-XML Data

MiniRobotLanguage (MRL)

Sample XML-Data

XML-Data that is used for the following Help Pages

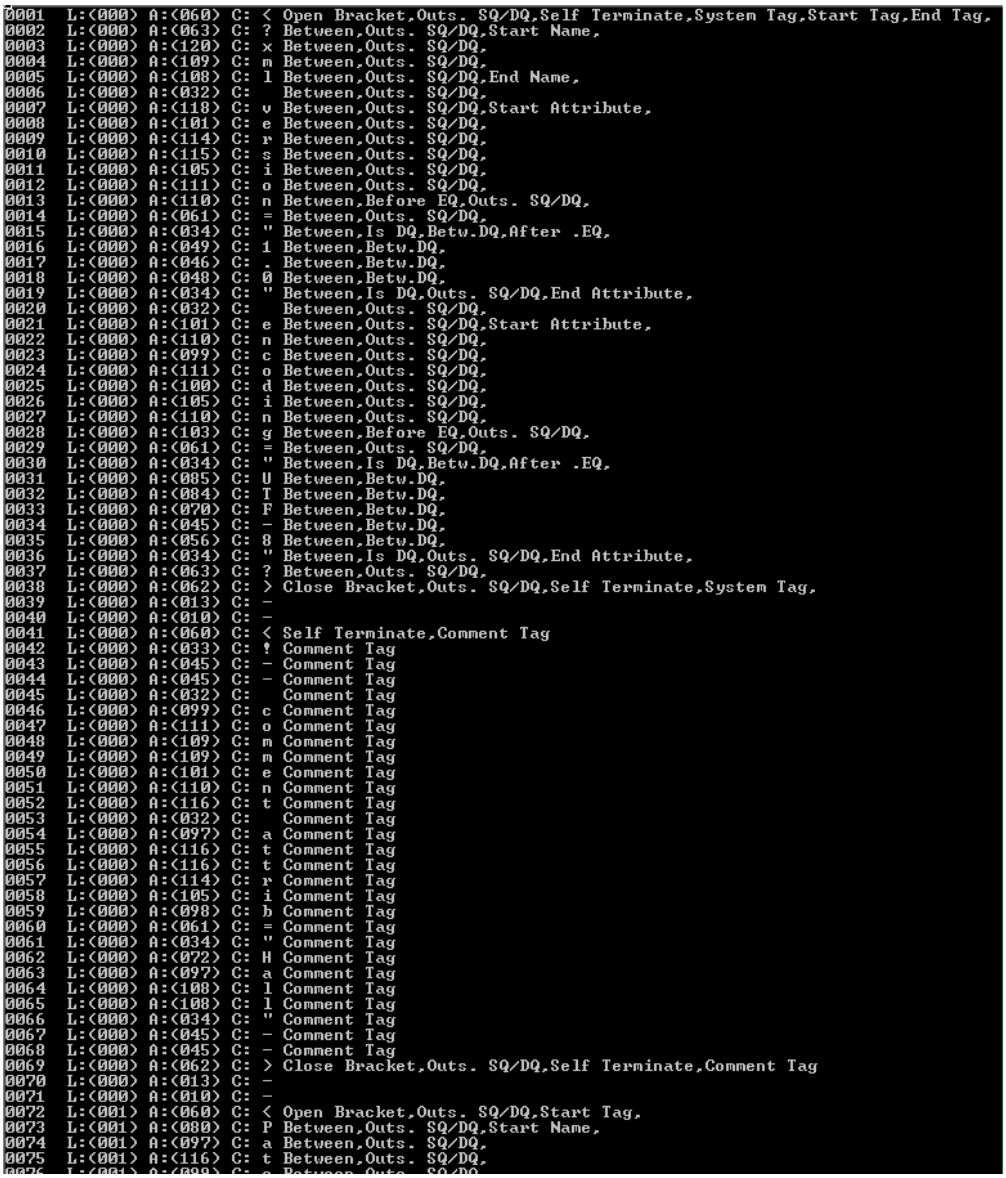
Intention

We will use this Sample XML-Data for all the commands on the following help pages.
Below you will find the sample-Data as well as a XML-Flags Dump.
This shows you how the Commands and queries work.

XML-Flags-Dump

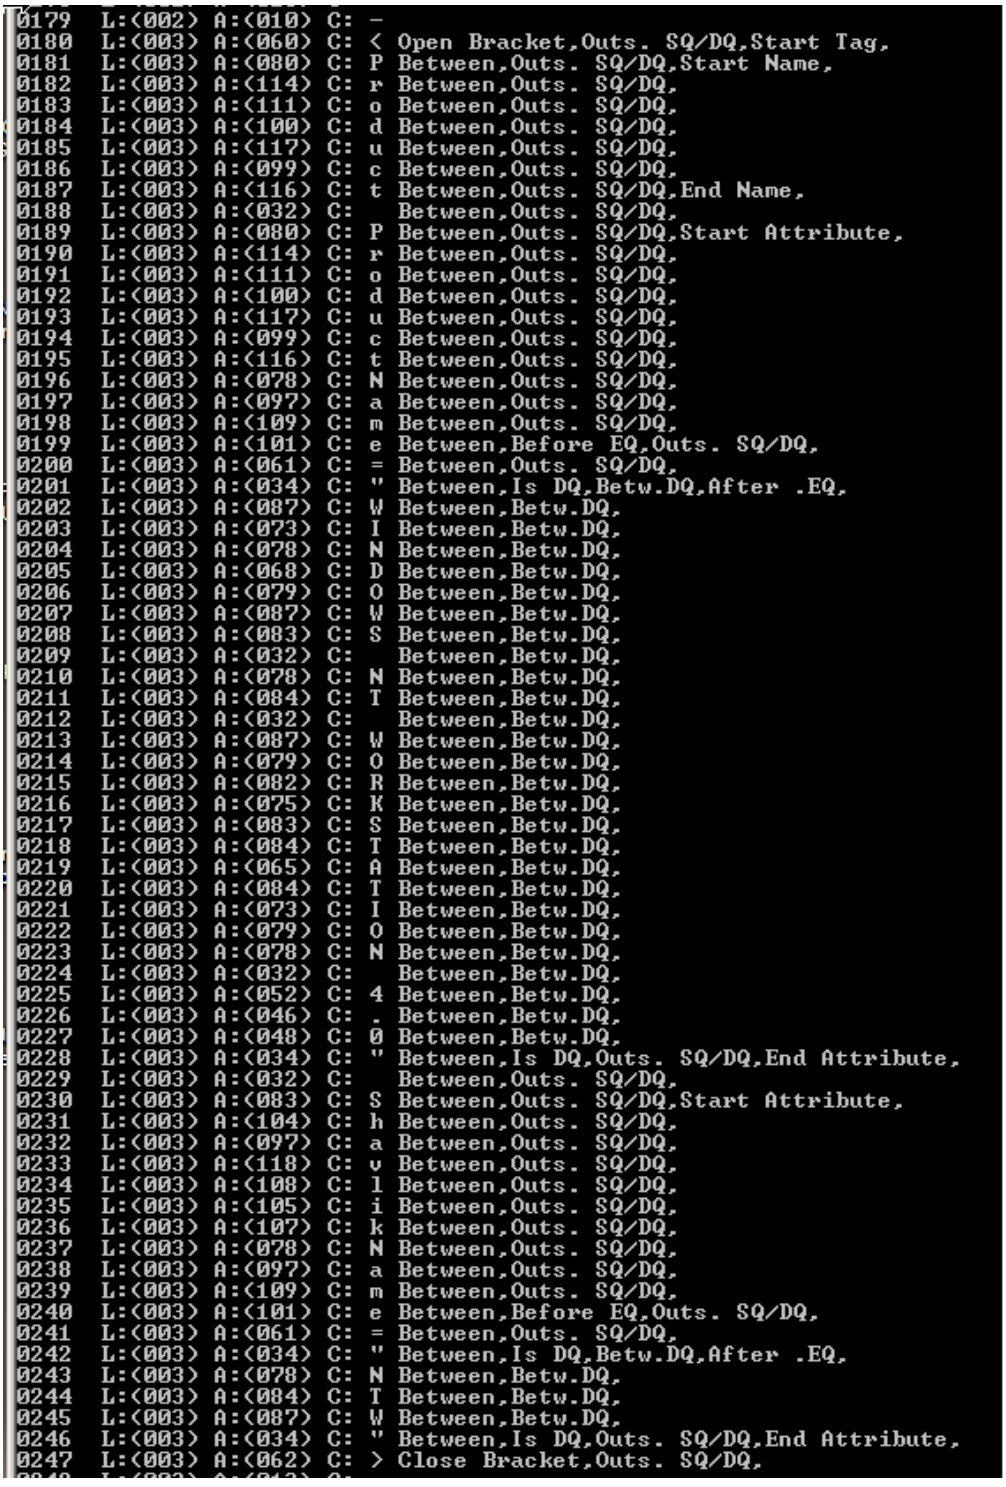
This is an XML-Flags Dump of the used XML-Data. You can see the Flags that is set for any of the Bytes in the XML-Data.

*© 2023 Theo Gottwald * https://www.smart-package.com*

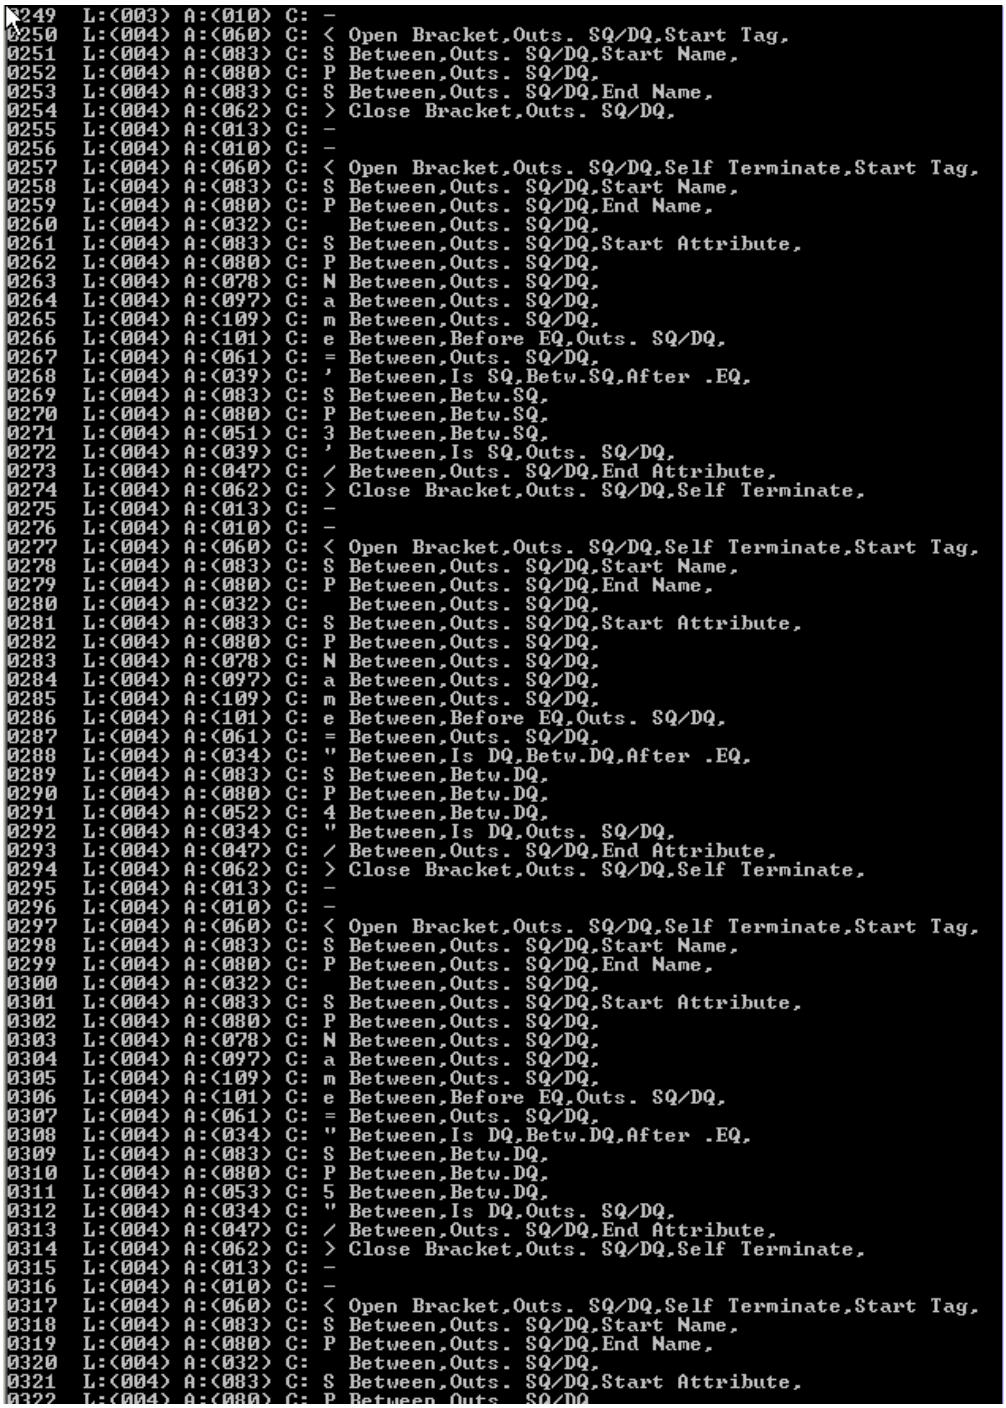


Here is another one:

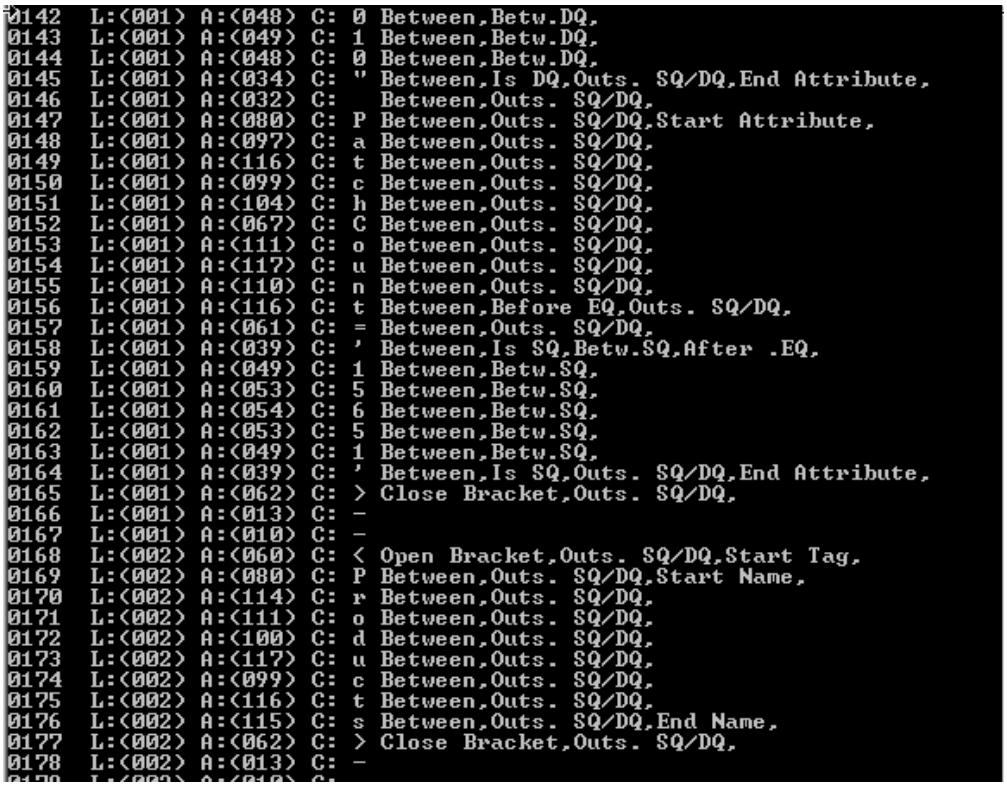
© 2023 Theo Gottwald * https://www.smart-package.com



© 2023 Theo Gottwald * https://www.smart-package.com



*© 2023 Theo Gottwald * https://www.smart-package.com*



In this above Dump you can see a part that is delimited by Single Quotes (SQ).
Below you can see the used XML-Data.

Example-XML-Data

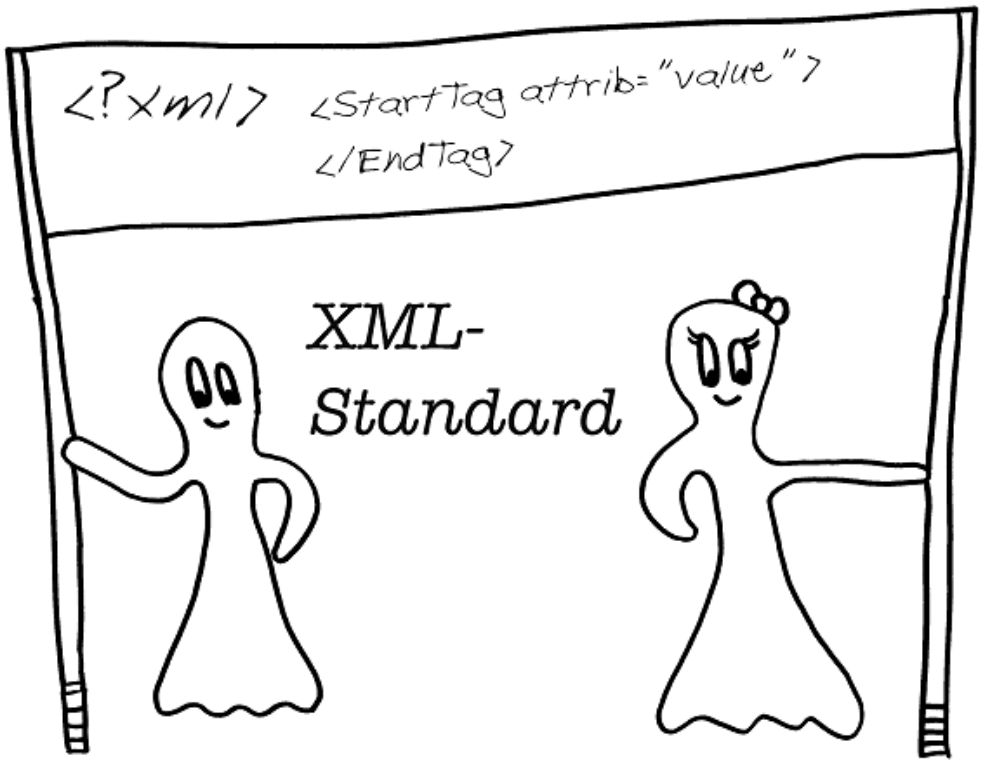
3.84.2 ! Smarty's XML-Features

Smarty's XML-Commands



What is XML good for?

XML stands for Extensible Markup Language. It was developed at the World Wide Web Consortium, by a group of people who wanted to improve on HTML and SGML. It was defined as a formal specification in February 1998.

Possibly you have XML Data files as output from other software.
Possibly you want to generate or analyze XML Data from whatever sources.

The question is "how can you (re-)act up on these data files?"

The answer is now implemented in the XML.-Commands.
These commands make it easy for you to go through these XML-Files.

What can you do with these XML-Commands?

- Parse the XML-File and search for Tags, Attributes or data in these files.
- Generate new XML Files and copy parts of the old files to these new files.

Here are some more Infos about XML.

A simple XML-Data could look like this:

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<note>
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
  <to>Peter</to>
  <from>Ralph</from>
  <heading>Reminder</heading>
  <body>Don't forget making your skript!</body>
</note>
```

Clean and UnClean your Data

As you can see, we have data that is enclosed and described using "tags".
We have "Start-Tags" like `<note>`
and we have "End-Tags" like `</note>`
between these we have data that can itself be XML or other data.
Note that there are some characters that should not be in this data, because they are reserved for tags. These characters are:

& - should be replace by &
< - should be replace with <
> - should be replace with >
" - should be replace with "
' - should be replace with &spos;

For this purpose the `XML.` command has the "`Clean`"-Option.
It will prepare your data to be valid as XML-Data.
And if you want your data back to the original state, just use the "`unclean`" option.

Here is an example:

```
'**********************************
' XML.-Clean/UnClean Sample
'**********************************
'
$$XMF=My current <XML\> is &new
' Now we are going to parse it
XML.Clean|$$XMF|$$XMC
XML.UnClean|$$XMC|$$XMU
PRT.Original:    $$XMF
PRT.After CLean: $$XMC
PRT.--------------
PRT.UnCLeaned:   $$XMU
MBX.!
ENR.
```

Self terminated Tags

© 2023 Theo Gottwald * https://www.smart-package.com

Some XML-Tags do not have a closing tag because they are "Self-Terminated".
They look like this:

```
' This is "self terminated" tag.
<Name/>
```

The first tag, also known as "Root-Tag" is a system tag, because it starts with "<?".
System Tags are always self terminated. They do not have an explicit close tag.

```
' This is a system tag, its also "self terminated".
<?xml version="1.0" encoding="ISO-8859-1"?>
```

Also comment tags are self terminated:

```
<!-- this is a comment tag -->
```

If you want to learn more about XML, see the www-resource below.

Here are a few important notes:

1. XML is not HTML, it has stricter format rules

2. XML Tags are Case Sensitive

3. All XML Elements Must Have a Closing Tag unless they are "self terminated".

4. You must correctly nest, your tag. This is *not* allowed:
   <B><I>Something</B></I>

5. It *must* be nested correctly, like this:
   <B><I><Something</I></B>

6. XML Documents Should Have a Root Element
   The built in parser however will take the first < he finds as the root-element.

7. Currently the XML-Parser is not an XML-Validator. It will instead try to do its best
   to understand what YOU want. Instead of complaining if you have not hold
   on all the rules of XML. You may however find error-messages in the process if you do not
   obey the rules. If problems appear, the XML-Commands will always set the "Timeout-Flag"
   and will store the error. You can get the stored errors description using:

```
XML.load|$$MYF
' Test the timeout-flag for errors
' and jump to a LAbel if there were problems
JIT.Lab_Error

Lab_Error:
' Get the Error-Message in to a variable
XML.get error|$$ERT
DBP.$$ERT
END.
```

Possibly you will get an additional error number that is easier to react up on using:

© 2023 Theo Gottwald * https://www.smart-package.com

```
XML.get error|$$ERT|$$ERN
```

8. White space and carriage returns are preserved

9. Attribute values of tags must be enclosed in either single or double quotes.
If you use a single quote, then double quotes are allowed in the value.
Vice versa is also true.

10. Non-tag data is expected to be free of <, >, and &. While the parser may still parse it properly,
this goes for attribute values as well. You should replace these like described above using the
supplied "clean" and "unclean" options..

Using the `CVF.` (Convert File) -Command, you can convert XML-Files to better readable Text-Files. These files can be displayed in any text-editor. For this most often, just replace all "><" with ">$crlf<".

Generally you could also work with XML files by just using the available String-Commands.
Using the XML-Commands makes things much easier.

In the following tutorials we will show you how it works, and why its much easier this way.

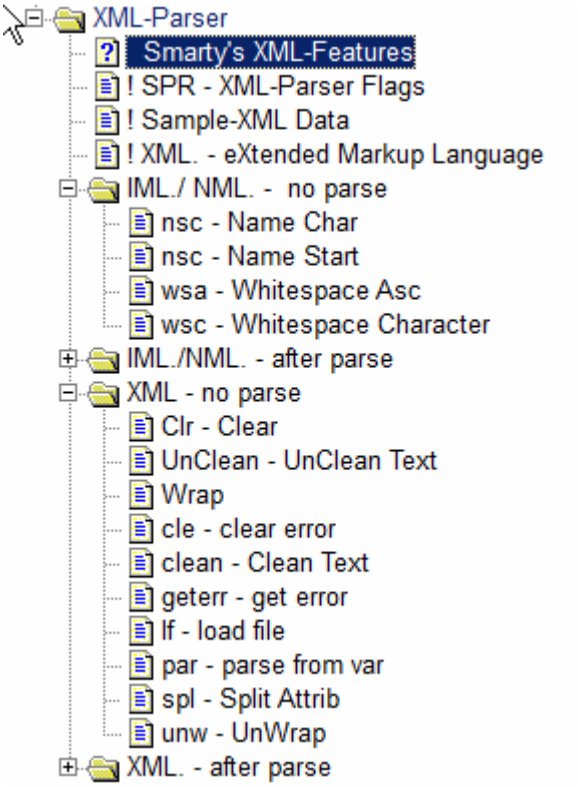
How does it work generally?

There are few commands that can always be used, even if no XML-File has been parsed. These are:

- Parse - parse a file that is inside a variable
- Load - load a file from file-system
- Clear - clear / delete the previous loaded XML File and all Flags.
- Clean Text - used to prepare a text as XML-Data
- Unclean Text - undo the "clean" command
- Get Error - retrieve the XML-Error - Status
- Clear Error - clear the XML-Error Status and all error flags and variables

also there are some `IML.`-commands that can be used on any text.
Currently these are (see under "no parse"):

© 2023 Theo Gottwald * https://www.smart-package.com



All the other `XML/IML.`-Commands require an XML-File or XML-Data to be loaded first.

At the process of loading/parsing, the XML-Parser Engine adds internal tags to any of the loaded characters. Loading an XML.-File is as simple as:

```
$$MYF=C:\filename.xml
XML.load|$$MYF
```

The loading command will automatically call the parsing command.
If you have already loaded the XML-file into a variable.you can use the command:

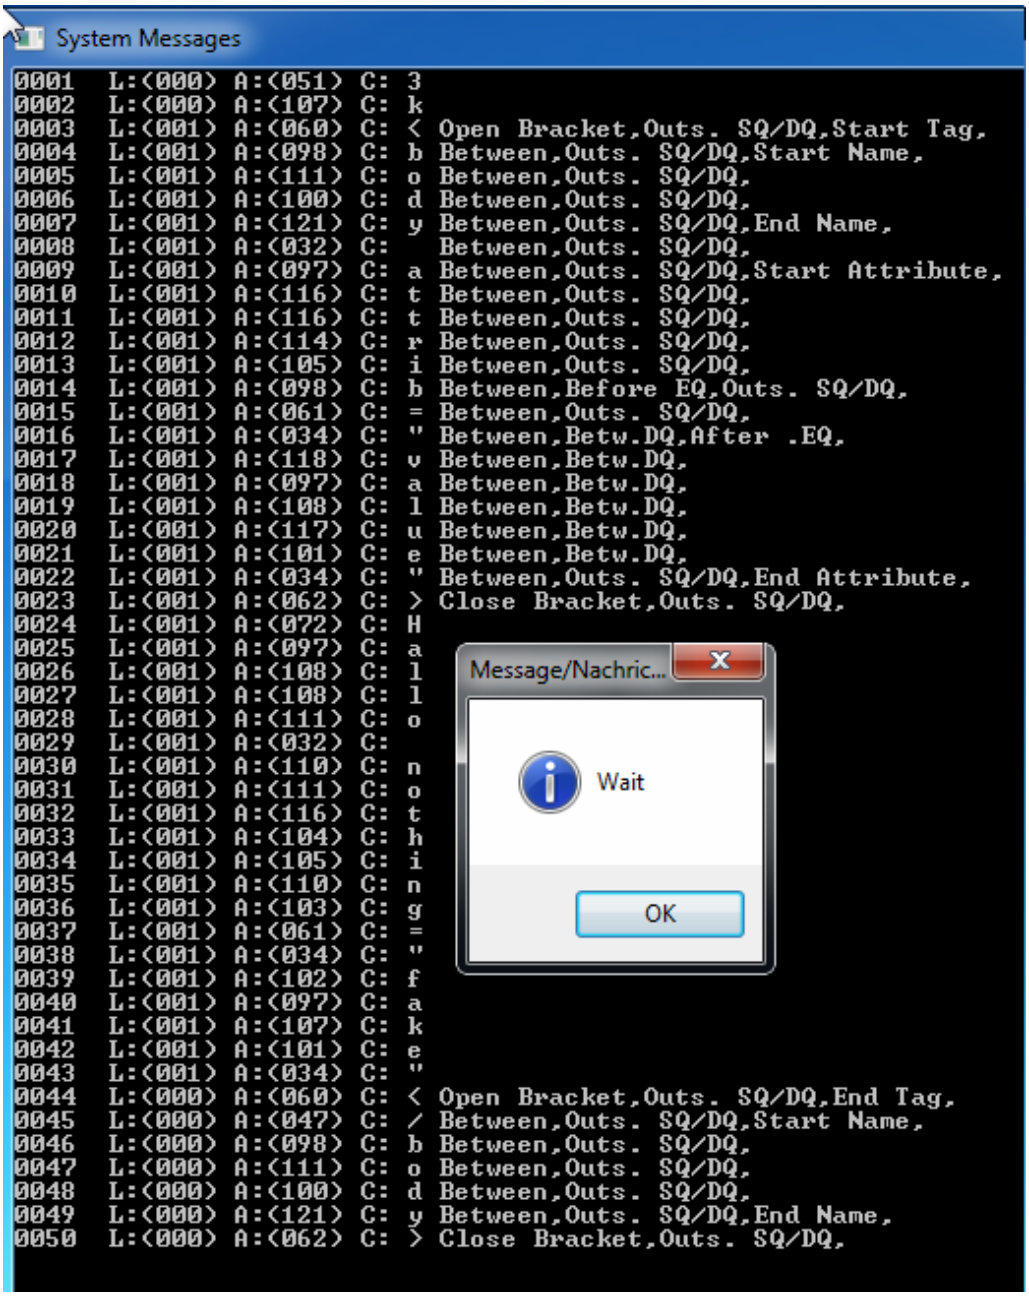
```
$$XML=3k<body attrib="value">Hallo nothing="fake"</body>
XML.parse|$$XML
```

After this, the file is in the internal XML Memory and it has been tagged with "Flags" in a way that you can much easier work with the file. You can read more details about these "Flags" below.
Using these Flags you can later more easily navigate inside the XML-Document.
You can see this using the

```
XML.dump
```

Command. Lets see an example, using the built in "dump" option.

© 2023 Theo Gottwald * https://www.smart-package.com



```
' This is a XML-"One-Liner"
$$XML=3k<body attrib="value">Hallo nothing="fake"</body>
' First we need to parse it
XML.parse|$$XML
' Here we check if there was an error during the parsing
JIT.Lab_Err
' Now we display the internal tables
XML.dump
' This is just to wait until want to close the script
MBX.Wait
ENR.

' This is the part that would be called if there would be an
error
' during the parsing of the XML
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

Above is the result output of this script.

In the above picture we see on the very left the "address" of each byte of XML-Code,

It starts basically with the first character on the left as 1 and counts up until the length of the file.

Note that several XML commands will never go beyond the root-address that is the first "<" in the file. In our case the root-address is 3. Which is the address of the very first start tag.

None of the XML commands will go above the end address of the last byte in the XML-File.
Doing so would lead to a `GPF (Windows General Protection Fault)` and is therefore prevented.

The second number from the left shows the "Level" "**`L:`**" of the character.
Each Start Tag increases the level by 1, while each end tag decreases the level by one.

Then comes "**`A:`**" the ASC-value of the letter(code) and the "**`C:`**" Character.
Note that some .characters are replaced by a "-" if they are not printable.

After that, on the right you will see a comma separated list with flags that are being assigned to each byte in the XML-code. You can work with these flags using the commands:

```
XML.search inside down|$$FLG
XML.search inside up|$$FLG
```

These two commands search "Inside" that is between the "<" and the ">" brackets.

If you want to search for anythingthat is outside (including the "<"">" themselves, you need to use these commands.

```
XML.search all down|$$FLG
XML.search all up|$$FLG
```

To search something you simply define `$$FLG` as one of the SPR XML-Flags below.
For example:

```
$$FLG=open bracket
XML.search all down|$$FLG
```

will search a "open bracket" in the "down" direction. Note that if the current position is on a "open bracket", then this one will be found!
Therefore you may want to use the

```
XML.increment position
```

command before you start search. The position that is found, is placed on the TOS (Top of Stack) unless you specify a return variable. Like this:

© 2023 Theo Gottwald * https://www.smart-package.com

```
XML.increment position
$$FLG=open bracket
XML.search all down|$$FLG|$$POS
```

But even if you do not use a return variable, all searches remember the "actual position" internally. Like you locate a window, also the XML-Parser has always a "actual position".
Immediately after parsing the XML-File, the actual position is set to the "Root-Position". That is the first "<" in the file.

Now if you search something then it can be found or it can not be found. If nothing is found, then the actual position is not assigned!
The search command will return a zero in this case.
If you want to find out the actual position, you can use the

```
XML.get position|$$POS
```

command. In the same way you can set the actual position to another place in the XML-File using the

```
$$POS=79
XML.set position|$$POS
```

commands. This way you can jump up and down in the XML file like you desire.

Note that this is just the "basics". There are multiple command that make it more easy for you to find specified places or data inside the XML-File.

To understand the internals of the XML-Parser better you can read the Chapter:

SPR - XML-Parser Flags 3981

At this place we will not explain more details about XML, as you can get this information easily in the World Wide Web. For example here:

1. XML-Basics
2. XML-Schools
3. XML-Validator

© 2023 Theo Gottwald * https://www.smart-package.com

3.84.3 ! SPR - XML-Parser Flags

Smarty's XML-Parser Flags

During the Parsing, the XML-Parser will assign Flags to each byte of the XML-Code.
These flags are the base of nearly all builtin XML-Commands.

You can see these flags using the

```
XML.Dump
```

Command. There is an example Output in the picture below.

The SPR-XML-Flags

Here is a complete list with all **SPR-XML Flags** and their corresponding numbers.

```
"open bracket"    =   1
"close bracket"   =   2
"between"         =   4
"is sq"           =   8
"between sq"      =  16     = &H10
"is dq"           =  32     = &H20
"between dq"      =  64     = &H40
"before eq"       = 128     = &H80
"after eq"        = 256     = &H100
"outside sdq"     = 512     = &H200
"self terminate"  = 1024    = &H400
"system tag"      = 2048    = &H800
"start name"      = 4096    = &H1000
"end name"        = 8192    = &H2000
"start attribute" = 16384   = &H4000
"end attribute"   = 32768   = &H8000
"start tag"       = 65536   = &H10000
"end tag"         = 131072  = &H20000
"comment"         = 262144  = &H40000
```

Note that you can specify whether the flag name, or the flag number, or the hexadecimal flag number. You can also combine Flags using the "+" Operator.

How to use this flags:

You can use these flags in several ways.

Assume we are at the Root-Adress and we are looking for the first "**=**" Sign.
This is also called "EQ" from "Equal Sign".
The other Shortcuts are "DQ" for "Double Quote" and "SQ" for "Single Quote".

*© 2023 Theo Gottwald * https://www.smart-package.com*

In this file, the first real "=" is at position 14. is at position 14 as you can see in the Dump below.
We can use the "Before EQ" Flag to get the position..

like this:

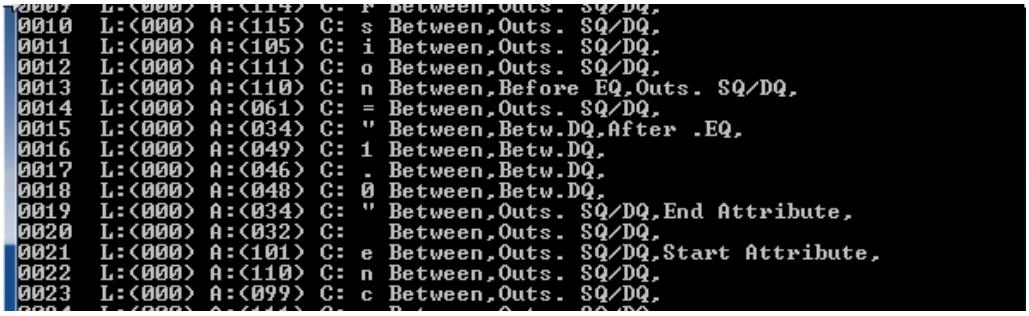
1. You can specify the flag number in a search command,

```
XML.search all down|128|$$RES
```

We have specified the "128" here as its the number for this flag.

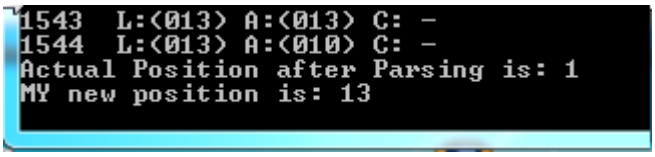
Example:
512 is the flag number for the "outside sdq" Flag.
128 is the flag number for the "before eq"

You can find these numbers above where the flags are.



2. You can specify a hexadezimal flag number as well:

```
XML.search all down|&H80|$$RES
PRT.MY new position is: $$RES
```



3. You can add multiple numbers using the "+" sign to search for combinations of flags:

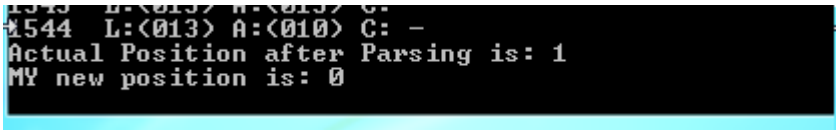
```
XML.search all down|&H80+&H200|$$RES
PRT.MY new position is: $$RES
```

In this case, ALL of the given flags must be available, otherwise the result will be zero.
Like in this example:

```
XML.search all down|&H80+12|$$RES
PRT.MY new position is: $$RES
```

We have an AND-Operation, if you use multiple flags,
As you can see, you can intermix hexadezimal and other numbers.

© 2023 Theo Gottwald * https://www.smart-package.com



4. You can specify the flag-name for better readablity.

```
PRT.Actual Position after Parsing is: $$POS
XML.search all down|"before eq"|$$RES
PRT.MY new position is: $$RES
```

It doesn't matter, if you specify the DQ's or not. You can also write:

```
XML.search all down|before eq|$$RES
```

which will do all the same. You can as well add Flags this way, using:

```
XML.search all down|"before eq","between"|$$RES
```

or you can do it like this:

```
XML.search all down|before eq+between|$$RES
```

theoretically the instructions run a bit slower if you use this text-form then if you use the numbers.
If you are not going to work on hundred thousands of Tags, this should not be of any interest to you.

You can directly access these flags using the command:

```
XML.gef flags|$$BYT|$$FLG
PRT.Byte Nr.$$BYT contains these flags: $$FLG
```

Note that these flags are cumulated to one number.
To work on these flags you can also use these commands:

```
' This will return the Flags as text like with Dump.
XML.gef flags as text|$$BYT|$$FLT
```

More features:

You can also retrieve the Level of a XML-Address like this:

```
XML.get level|234|$$LEV
PRT. The Level (234) is: $$LEV
```

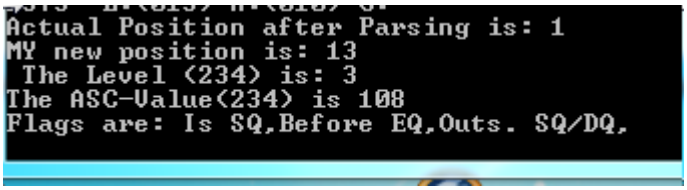
And of course you can retrieve the ASC-Value of any Address:

```
XML.get asc|234|$$ASC
PRT.The ASC-Value(234) is $$ASC
```

If you have a flag-value and you want to convert it to the appropriate Flags as text, you can use:

```
XML.flags to text|$$FLG|$$FTX
PRT.Flags are: $$FTX
```

© 2023 Theo Gottwald * https://www.smart-package.com



Here is a explanation of these flags:

1. This Flag is assigned to any real open bracket "<" from any used tag.
"Open Bracket" = 1

2. This Flag is assigned to any real close bracket ">" from any used tag.
"Close Bracket" = 2

4. This Flag is assigned to any character that is inside a tag. Inside a tag means, between a
open bracket ">" and a close bracket ">".
"Between" = 4

8. This Flag is assigned to any SQ (Single Quote) that encloses an attribute.
This flag is not assigned to other SQ's for example in an data-part or inside an DQ-delimited
value of an attribute.
"Is SQ" = 8

16.. This Flag is assigned to any character that is between SQ as an attribute value.
Between SQ" = 16

32. This Flag is assigned to any real DQ (Double Quote) that encloses an attribute.
This flag is not assigned to other DQ's for example in an data-part or inside an SQ-delimited
"is dq" = 32

64.. This Flag is assigned to any character that is between DQ as an attribute value.
"Between DQ" = 64

128. This Flag is assigned to the last letter (non whitespace character) that is before an
EQ Sign that is interpreted to be part of an attribute.
"before eq" = 128

256. This Flag is assigned to the first SQ or DQ , that is after an
EQ Sign that is interpreted to be part of an attribute.
"after eq" = 256

512. This Flag is assigned to to characters inside tags only. If they are not between SQ or DQ.
This means that they are not part of the value of an attribute, if this flag is set.
"outside sdq" = 512

© 2023 Theo Gottwald * https://www.smart-package.com

1024. This Flag is assigned to the open- and to the close-bracket of a self terminated tag.
These are comments, system-tags or dedicated "self terminated" tags.
See example XML-Dump below.
`"self terminate" = 1024`

2048 This Flag is assigned to the open- and to the close-bracket of a system-tag.
See example XML-Dump below.
`"system tag" = 2048`

4096. This Flag is assigned to the first letter of the tag name.
See example XML-Dump below.
`"start name"=4096`

8192. This Flag is assigned to the last letter of the tag name.
`"end name" = 8192`

16384. This Flag is assigned to the first letter of any found attribute.
See example XML-Dump below.
`"start attribute" = 16384`

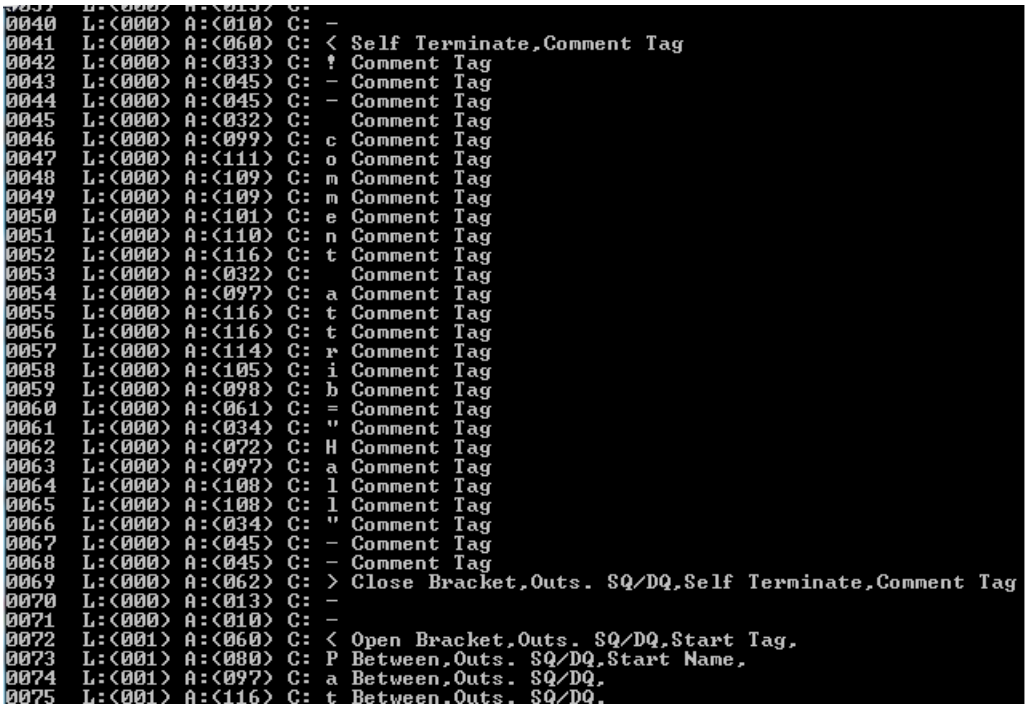
32768. This Flag is assigned to the last letter of any found attribute.
Regularly this is a SQ or a DQ-Sign.
See example XML-Dump below.
`"end attribute" = 32768`

65536. This Flag is assigned to the first "<" that starts a new Start-Tag. Its the opposite of an End-Tag-Flag (below). See example XML-Dumps below.
`"start tag" = 65536`

131072. This Flag is assigned to the first "<" that starts a new End-Tag. Its the opposite of an Start-Tag-Flag (above). See example XML-Dumps below.
`"end tag" = 131072`

262144. This Flag is assigned to any character that is inside a comment-tag.
There is an picture below that shows the Dump of an comment tag.
`"comment" = 262144`

© 2023 Theo Gottwald * https://www.smart-package.com

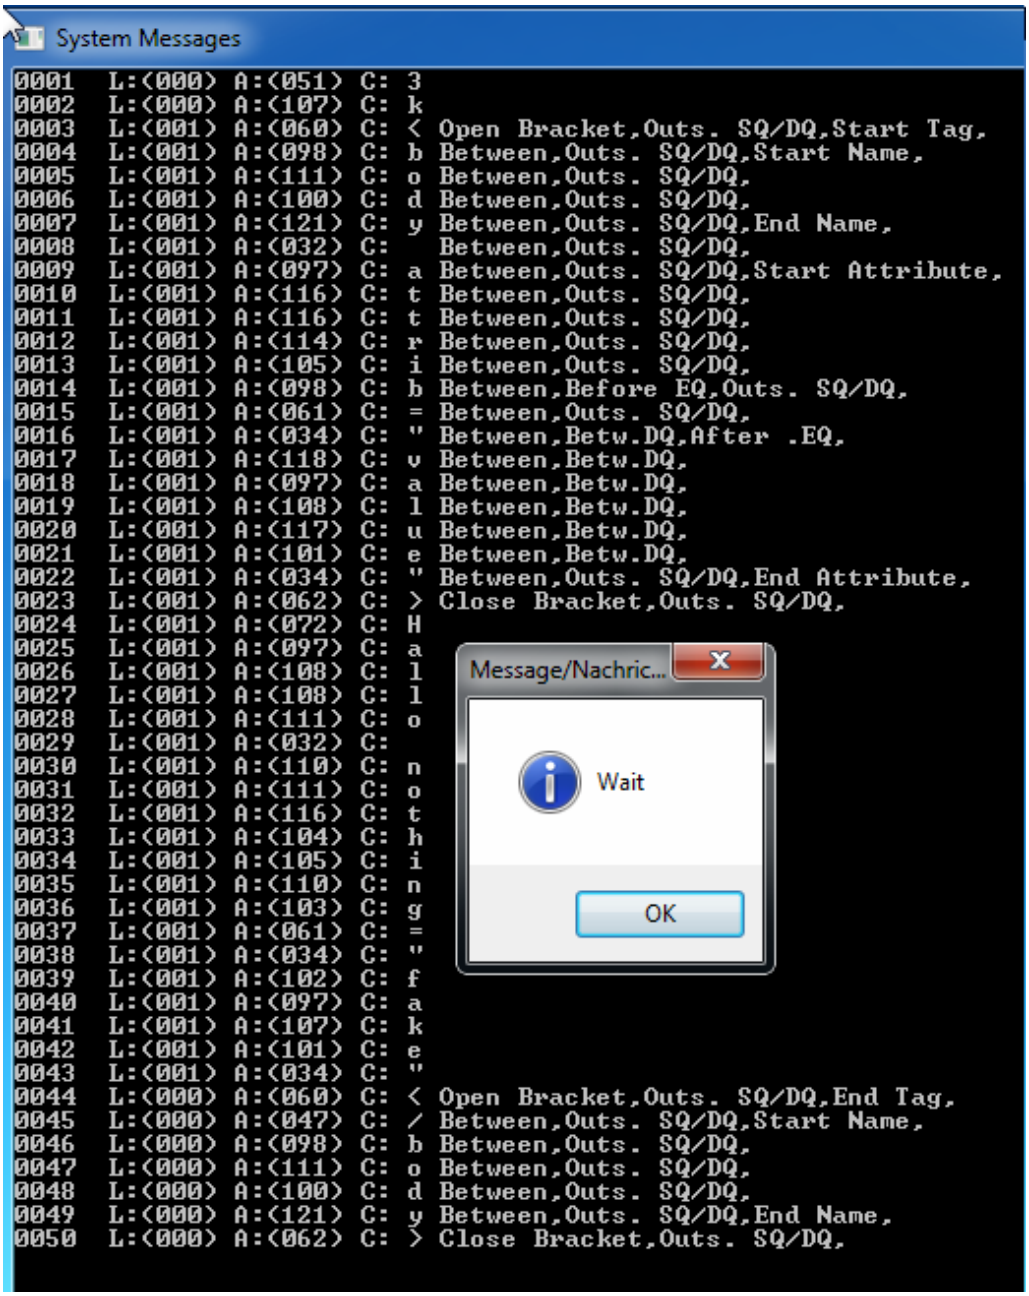


Below is another XML-Dump, where you can see the flags.

```
' This is a XML-"One-Liner"
$$XML=3k<body attrib="value">Hallo nothing="fake"</body>
' First we need to parse it
XML.parse|$$XML
' Here we check if there was an error during the parsing
JIT.Lab_Err
' Now we display the internal tables
XML.dump
' This is just to wait until want to close the script
MBX.Wait
ENR.

' This is the part that would be called if there would be an
error
' during the parsing of the XML
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com



Above is the result output of this script.

Below is another XML-Dump showing several SPR XML-Flags.

3.84.4 ! XML. - eXtended Markup Language

MiniRobotLanguage (MRL)

XML. Command

Load, Parse and Analyze XML-Data

Intention

This command is a universal command to load, parse and analyze XML-Files and XML-Data.
Depending on the used Subcommand, more then 50 commands are available to handle your XML-Files.

There are 2 general sort of Sub-commands.

1. Commands that can be used anytime.

2. Commands that require an XML-File to be loaded or parsed before they can be used.
   Most commands are in this group.
   We can split these second sort of commands in further three groups:

a) Complex commands like:
```
XML.search name and attribute|$$NAM|$$ATN
```

b) Low level commands. These are all commands that work directly with the XML-Flags, like :
```
XML.search all up|$$FLG
```

c) Simple commands like:
```
XML.get asc|$$NUM|$$RES
```

Debugging XML-Scripts

You can use the commands:

```
XML.Print
XML.Dump
```

to get more or less detailed Print-Outs of your XML-Data. There is an example Script below in the examples section.

Internal notes

© 2023 Theo Gottwald * https://www.smart-package.com

Additionally there are few commands that enable you to change the loaded XML-Data.
Here is an important rule:

Changing the internal XML.-Data after Parsing is supported, but any change in Size would invalidate all previous XML-Parsing from that changed byte down to the end of the XML-Data. Therefore a "ReParsing" Option is available and will sometimes be automatically called.
This is due to the 1:1 Synchronity of the **XML-Flags** with the **XML-Data** Bytes that is eventually getting lost.

Even if you change large portions of XML-Data without changing the size, you may need to re-parse the XML-Data to have valid XML-Flags.

Note: If you do not change the XML-Data Size, the re-parsing is not done automatically!
You can make a manual "ReParse" of the changed XML-Data using the Subcommand:

```
XML.ReParse
```

Here is an example for an automatic ReParse. If you use (example):

```
XML.set xml part|6|6|sy
```

the Subcommand will automatically "re-parse" the XML-Data because the size of the XML-Data was changed during the command execution.

On very large XML-Files this may take always a few seconds, On small files the delay should not be noticed. Also problems while parsing the XML-Data will be reported just as if you had been called the "Parse" Subcommand.

You can make all changes in a way that the size of the data is not changed and the XML-Flags stay valid. This will prevent an internal Re-Parsing. You could for example change

```
<namex >
```

to

```
<namey >
```

using

```
XML.set chr|5|y
```

this will not change the size of the XML-Data and therefore the synchronity between the XML-Data and the flags will stay intact.

Here is another example that show where the problem is. If you change:

```
<namex >
```

to

```
<namesy >
```

© 2023 Theo Gottwald * https://www.smart-package.com

using

```
$$XML=<namex >
XML.parse|$$XML
XML.Print

XML.set xml part|6|6|sy
XML.Print
MBX.!
```

then downward from the "s", all XML-Flag Data would loose their "Flags" and therefore the whole Data is being Re-Parsed".

if you plan to make a completely changed XML-Data version of a very large XML-File, i would recommend to just extract portions of the original data, and rebuild it using variables.

Syntax

XML.P1[|P2..Px]

Parameter Explanation

P1 - (optional) Subcommand, one of the following:

See Subfolders in Index

P2 - Px (depend on used Subcommand P1)

Example

```
'-----------------------------
' Demonstrate XML.-Debug Commands
'-----------------------------
$$XMF=?pfad\Small_XML.txt
XML.load|$$XMF
JIT.Lab_Err
XML.Print
MBX.This is an XML-Printout
XML.Print|$$TXT
DBP.$$TXT
MBX.It can be directed to the Editor-Debug Window.
XML.Dump|20|100
MBX.This is a partial XML-Dump.
XML.Dump
MBX.This is a complete XML-Dump.
```

3.84.5 IML./ NML. - no parse

3.84.5.1 nsc - Name Char

MiniRobotLanguage (MRL)

IML.Name Char
IML.nsc

Check if XML-"Name"-Data complies with Standards

Intention

This command is used to verify if a single character, or any character in P1 is a valid XML-Character to define a XML-Name.

As this is a String Command, no parsing is required before using this command.

Here is an usage example:

```
$$XMF=SML<_Name
NML.ncc|$$XMF
  PRT.$$XMF is not a valid XML-Name.
  PRT.It contains an invalid character at position $$000.
EIF.
```

Syntax

IML.Name Char|P2[|P3]

Parameter Explanation

P2 – Variable with XML-Data. XML-Data can contain $cr, $lf or not.

P3 – ***(optional)*** Variable can contain a Position, then only the character at this position is been tested. If omitted or zero, all characters are tested. Only in this case, and if a character is found that does not apply to the Standards for a "XML name letter" then the position of the character is been placed on TOS (Top of Stack).

Example

```
'*********************************
' IML./NML. - Sample Script
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
' Valid Name
$$XMF=SML_Name
IML.ncc|$$XMF
  PRT. $$XMF is a valid XML-Name
EIF.
PRT.----------------------
' Not a valid Name-Char at Position 4
$$XMF=SML<_Name
NML.ncc|$$XMF
  PRT. $$XMF is not a valid XML-Name.$crlf$It contains an
invalid character at position $$000.
EIF.
PRT.----------------------
$$XMF=SML_Name
$$POS=4
IML.ncc|$$XMF|$$POS
  PRT. Character at Pos. $$POS is a a valid XML-Name Character
EIF.
PRT.----------------------
' Not a valid Name-Char at Position 3
$$POS=3
$$XMF=SL<_Name
NML.ncc|$$XMF|$$POS
  PRT. $$XMF is not a valid XML-Name.$crlf$It contains an
invalid character at position $$POS.
EIF.
MBX.!
ENR.
```

This is the result of the sample script:

3.84.5.2 nsc - Name Start

MiniRobotLanguage (MRL)

IML.Name Start
IML.nsc

Verify if a String contains only valid XML Name-Start characters

Intention

This command is used to verify if a single character, or any character in P1 is a valid XML-Character to define a XML-Name Start Letter.

As this is a String Command, no parsing is required before using this command.

Here is an usage example:

```
$$XMF=SML<_Name
NML.nsc|$$XMF
  PRT.$$XMF is not a valid XML-Name Start letter.
  PRT.It contains an invalid character at position $$000.
EIF.
```

Syntax

IML.Name Start|P2[|P3]

Parameter Explanation

P2 – Variable with XML-Data. XML-Data can contain $cr, $lf or not.

P3 – ***(optional)*** Variable can contain a Position, then only the character at this position is been tested. If omitted or zero, all characters are tested. Only in this case, and if a character is found that does not apply to the Standards for a "XML name start letter" then the position of the character is been placed on TOS (Top of Stack).

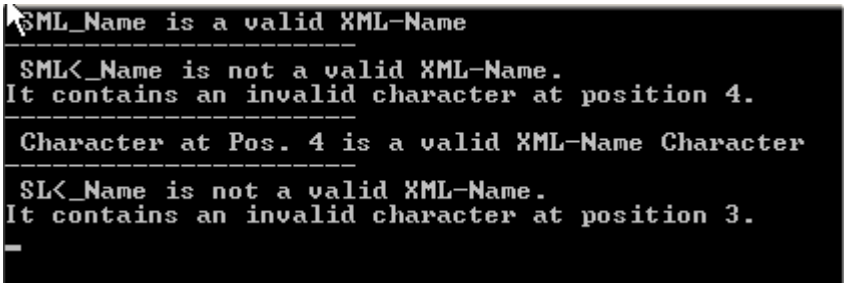
Example

```
'*********************************
' Valid Name Start Character(s)
'*********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$XMF=SML_Name
IML.nsc|$$XMF
  PRT. $$XMF is a valid XML-Name
EIF.
PRT.----------------------
' Not a valid Name-Char at Position 4
$$XMF=SML<_Name
NML.nsc|$$XMF
  PRT. $$XMF is not a valid XML-Name.$crlf$It contains an
invalid character at position $$000.
EIF.
PRT.----------------------
$$XMF=SML_Name
$$POS=4
IML.nsc|$$XMF|$$POS
  PRT. Character at Pos. $$POS is a valid XML-Name Character
EIF.
PRT.----------------------
' Not a valid Name-Char at Position 3
$$POS=3
$$XMF=SL<_Name
NML.nsc|$$XMF|$$POS
  PRT. $$XMF is not a valid XML-Name.$crlf$It contains an
invalid character at position $$POS.
EIF.
MBX.!
ENR.
```

This is the result of thios sample Script:



.

Remarks

As this is a String Command, no parsing is required before using this command.

3.84.5.3 wsa - Whitespace Asc

MiniRobotLanguage (MRL)

IML.Whitespace Asc
IML.wsa

Verify if a numeric number evaluates to a ASCII Code that is a valid XML Whitespace character

Intention

This command is used to check ASC-Values whether they are valid XML-Whitespaces or not.

As this is a String Command, no parsing is required before using this command.

Usage is simple:

```
$$XMF=64
IML.wsa|$$XMF
  PRT.Yes $$XMF is a valid XML-Whitespace character-code!
ELS.
  PRT.No, $$XMF is not a valid XML-Whitespace character-code!
EIF.
```

Syntax

IML.Whitespace Asc|P2

Parameter Explanation

P2 – Variable with an numeric ASC value (0-255).

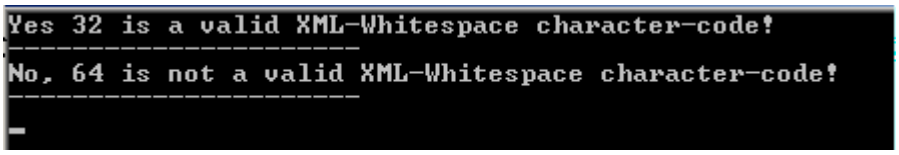
Example

```
'**********************************
' Valid Whitespace Character-ASC Numbers
'**********************************
'
$$XMF=32
GSB.test
$$XMF=64
GSB.test
MBX.!
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
ENR.
:test
IML.wsa|$$XMF
  PRT.Yes $$XMF is a valid XML-Whitespace character-code!
ELS.
  PRT.No, $$XMF is not a valid XML-Whitespace character-code!
EIF.
PRT.----------------------
RET.
```

This is the result of the sample script:



Remarks

As this is a String Command, no parsing is required before using this command.

Limitations:

3.84.5.4 wsc - Whitespace Character

MiniRobotLanguage (MRL)

IML./NML.Whitespace Character
IML./NML.wsc

Verify if a String contains only valid XML Whitespace characters

Intention

This command is used to verify if a single character, or any character in P1 is a valid XML-Whitespace Character.

As this is a String Command, no parsing is required before using this command.

Here is an usage example:

```
$$XMF=  $crlf$SL-Name
NML.wsc|$$XMF
  PRT.This is not a valid XML-Whitespace.$crlf$It contains an
invalid character at position $$000.
EIF.
```

Syntax

IML.Whitespace Character|P2[|P3]

Parameter Explanation

P2 – Variable with XML-Data. XML-Data can contain $cr, $lf or not.

P3 – ***(optional)*** Variable can contain a Position, then only the character at this position is been tested. If omitted or zero, all characters are tested. Only in this case, and if a character is found that does not apply to the Standards for a "XML name start letter" then the position of the character is been placed on TOS (Top of Stack).

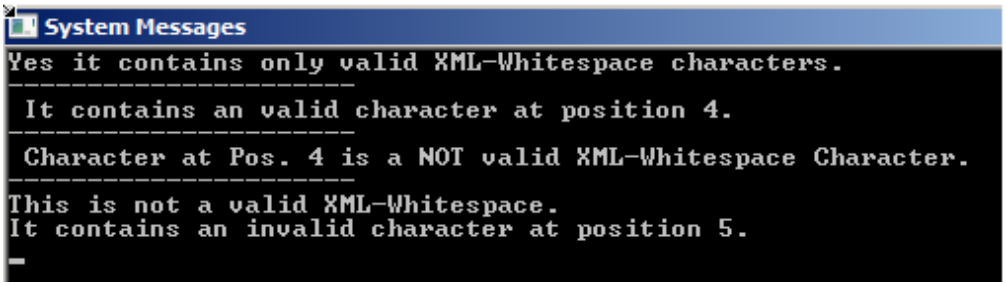
Example

```
'*********************************
' Valid Whitespace Characters
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
'
$$XMF=$sp$$crlf$
IML.wsc|$$XMF
  PRT.Yes it contains only valid XML-Whitespace characters.
EIF.
PRT.----------------------
' Is a valid Name-Char at Position 4
$$XMF=SML _Name
IML.wsc|$$XMF|4
  PRT. It contains an valid character at position 4.
EIF.
PRT.----------------------
$$XMF=    _Name
$$POS=4
NML.wsc|$$XMF|$$POS
  PRT. Character at Pos. $$POS is a NOT valid XML-Whitespace
Character.
EIF.
PRT.----------------------
' Not a valid Name-Char at Position 3
$$POS=3
$$XMF=  $crlf$SL-Name
NML.wsc|$$XMF
  PRT.This is not a valid XML-Whitespace.$crlf$It contains an
invalid character at position $$000.
EIF.
MBX.!
ENR.
```

This is the result of the sample script:



Remarks

As this is a String Command, no parsing is required before using this command.

3.84.6 IML./NML. - after parse

3.84.6.1 aeq - After EQ

MiniRobotLanguage (MRL)

IML.After EQ
IML.aeq
IML.After EQZ
IML.aeqz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is part of an attribute, and "after an Equal-Sign" "=" or not.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.aeq
  PRT. Pos. 30 is after an Equal Sign.
EIF.

' With One parameter IML. will check just the given Byte
IML.aeq|30
  PRT. Pos. 30 is after an Equal Sign.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.aeq|20|40
  PRT. Pos. $$000 is after an Equal Sign.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.aeqz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

As always NML. is the negative Form of IML.

Syntax

IML.After EQ[|P2][|P3]
IML.After EQZ[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

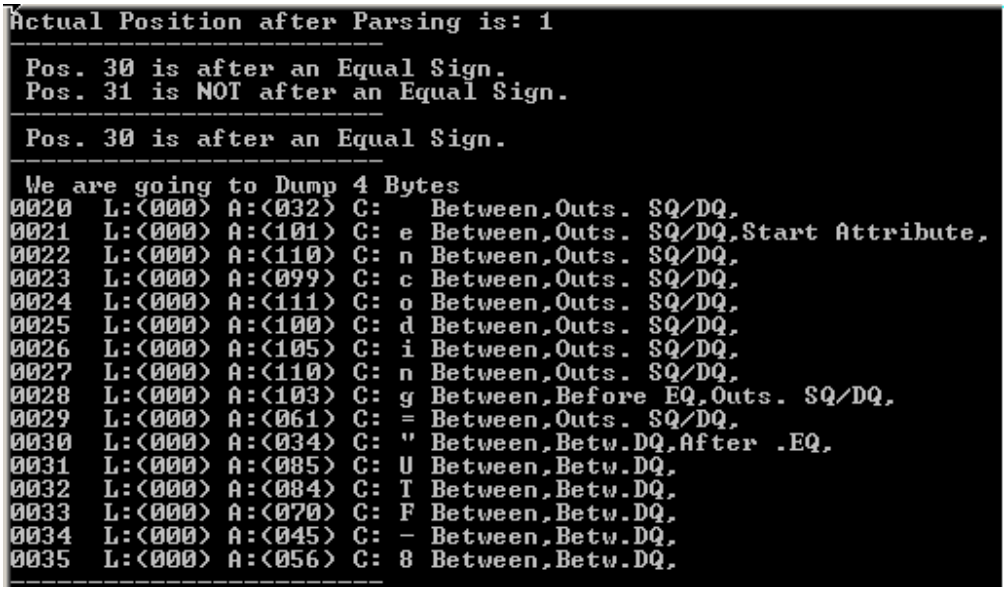
Example

```
'**********************************
' IML.Sample
'**********************************
'
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
PRT.------------------------
IML.aeq|30
  PRT. Pos. 30 is after an Equal Sign.
EIF.
IML.aeq|31
  PRT. Pos. 31 is after an Equal Sign.
ELS.
  PRT. Pos. 31 is NOT after an Equal Sign.
EIF.
PRT.------------------------
IML.aeq|20|40
  PRT. Pos. $$000 is after an Equal Sign.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EIF.
PRT.------------------------
' Now we are scanning for "Bit not set"
IML.aeqz|30|40
  PRT. Pos. $$000 is the first byte after that.
EIF.
PRT.------------------------
PRT. We are going to Dump 4 Bytes
XML.Dump|20|35
PRT.------------------------
MBX.!
:enx
ENR.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

This is the result of the sample script:



Remarks

This command needs the XML-Data to be parsed first, using the
par - parse from var 4117
or the
If - load file 4113
Command.
In this process the XML-Parser builds a Table with flags that is analyzed using this commands. You can see a XML-Dump of such XML-Data Flags here:
! Sample-XML Data 3966

© 2023 Theo Gottwald * https://www.smart-package.com

3.84.6.2 afs - Any Flags Set

MiniRobotLanguage (MRL)

IML.Any Flags Set
IML.afs

Find out if the specified XML-Flag is set or Not set.

Intention

This command is used to analyze XML-Flags. Using this command, you can check more complex conditions by using multiple XML-Flags at once.
These XML-Flags will be AND'ed not OR'ed.

Any result will only be found, if ALL of the given XML-Flags are set at that target byte.

For example:

```
' This will search for a combination of the two flags
' starting at byte 1 until byte 500
IML.afs|Close Bracket+self terminate|1|500
  $$ERG=$$000
  PRT. Pos. $$ERG is "$$TXT".
EIF.

' Instead of the + you can also use the ,
IML.afs|Close Bracket,self terminate|1|500

' You can use the numbers directly
IML.afs|2+1024|1|500
```

or

```
IML.afs|2,1024|1|500
```

or

```
' This version is a few microseconds faster :-)
' if you are working on hundred thousands of tags in few
seconds
' use this one
IML.afs|1026|1|500
```

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
XML.Set Pos|30
IML.afs|8,2,2048
  PRT. Pos. 30 is flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.afs|(1024+8+6+2)|30
  PRT. Pos. 30 is flagged.
EIF.

' With three parameters, IML. will start searching for a Byte
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.afs|Close Bracket+self terminate|20|40
  PRT. Pos. $$000 is after an Equal Sign.
EIF.
```

As always `NML.` is the negative Form of `IML.`

Syntax

IML.Any Flags Set|P2[|P3][|P4]

Parameter Explanation

P2 - Variable with XML-Data. XML-Data Flags, see below.

P3 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P4 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

XML-Data Flags, to be used as P2:

- You can combine as many of the following flags as you want
- You can use the numeric value of the flag, or the better readable description

1. This Flag is assigned to any real open bracket "**<**" from any used tag.
   `"Open Bracket" = 1`

2. This Flag is assigned to any real close bracket "**>**" from any used tag.
   `"Close Bracket" = 2`

4. This Flag is assigned to any character that is inside a tag. Inside a tag means, between a

© 2023 Theo Gottwald * https://www.smart-package.com

open bracket ">" and a close bracket ">".
"Between" = 4

8. This Flag is assigned to any SQ (Single Quote) that encloses an attribute.
This flag is not assigned to other SQ's for example in an data-part or inside an DQ-delimited value of an attribute.
"Is SQ" = 8

16.. This Flag is assigned to any character that is between SQ as an attribute value.
Between SQ" = 16

32. This Flag is assigned to any real DQ (Double Quote) that encloses an attribute.
This flag is not assigned to other DQ's for example in an data-part or inside an SQ-delimited
"is dq" = 32

64.. This Flag is assigned to any character that is between DQ as an attribute value.
"Between DQ" = 64

128. This Flag is assigned to the last letter (non whitespace character) that is before an EQ Sign that is interpreted to be part of an attribute.
"before eq" = 128

256. This Flag is assigned to the first SQ or DQ , that is after an EQ Sign that is interpreted to be part of an attribute.
"after eq" = 256

512. This Flag is assigned to to characters inside tags only. If they are not between SQ or DQ. This means that they are not part of the value of an attribute, if this flag is set.
"outside sdq" = 512

1024. This Flag is assigned to the open- and to the close-bracket of a self terminated tag.
These are comments, system-tags or dedicated "self terminated" tags.
See example XML-Dump below.
"self terminate" = 1024

2048 This Flag is assigned to the open- and to the close-bracket of a system-tag.
See example XML-Dump below.
"system tag" = 2048

4096. This Flag is assigned to the first letter of the tag name.
See example XML-Dump below.
"start name"=4096

8192. This Flag is assigned to the last letter of the tag name.
"end name" = 8192

16384. This Flag is assigned to the first letter of any found attribute.
See example XML-Dump below.
"start attribute" = 16384

32768. This Flag is assigned to the last letter of any found attribute.

© 2023 Theo Gottwald * https://www.smart-package.com

Regularly this is a SQ or a DQ-Sign.
See example XML-Dump below.
"end attribute" = 32768

65536. This Flag is assigned to the first "<" that starts a new Start-Tag. Its the opposite of an End-Tag-Flag (below). See example XML-Dumps below.
"start tag" = 65536

131072. This Flag is assigned to the first "<" that starts a new End-Tag. Its the opposite of an Start-Tag-Flag (above). See example XML-Dumps below.
"end tag" = 131072

262144. This Flag is assigned to any character that is inside a comment-tag.
There is an picture below that shows the Dump of an comment tag.
"comment" = 262144

Example

```

3.84.6.3 afz - Any Flags Zero

MiniRobotLanguage (MRL)

IML.Any Flags Zero
IML.afz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can check more complex conditions by using multiple XML-Flags at once.
These XML-Flags will be AND'ed not OR'ed.

Any result will only be found, if ALL of the given XML-Flags are NOT set (are zero) at that target byte.

For example:

```
' This will search for a combination of the two flags
' starting at byte 1 until byte 500
IML.afz|Close Bracket+self terminate|1|500
  $$ERG=$$000
  PRT. Pos. $$ERG is "$$TXT".
EIF.

' Instead of the + you can also use the ,
IML.afz|Close Bracket,self terminate|1|500

' You can use the numbers directly
IML.afz|2+1024|1|500
```

or

```
IML.afz|2,1024|1|500
```

or

```
' This version is a few microseconds faster :-)
' if you are working on hundred thousands of tags in few
seconds
' use this one
IML.afz|1026|1|500
```

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
IML.afz|8,2,2048
  PRT. Pos. 30 is flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.afz|(1024+8+6+2)|30
  PRT. Pos. 30 is flagged.
EIF.

' With three parameters, IML. will start searching for a Byte
with
' the specified Flag NOT set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.afz|Close Bracket+self terminate+8|20|40
  PRT. Pos. $$000 is after an Equal Sign.
EIF.
```

As always `NML.` is the negative Form of `IML.`

Syntax

IML.Any Flags Zero|P2[|P3][|P4]

Parameter Explanation

P2 – Variable with XML-Data. XML-Data Flags, see below..

P3 – ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P4 – ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

XML-Data Flags, to be used as P2:

- You can combine as many of the following flags as you want
- You can use the numeric value of the flag, or the better readable description

1. This Flag is assigned to any real open bracket "<" from any used tag.
   `"Open Bracket" = 1`

2. This Flag is assigned to any real close bracket ">" from any used tag.
   `"Close Bracket" = 2`

4. This Flag is assigned to any character that is inside a tag. Inside a tag means, between a
   open bracket ">" and a close bracket ">".

© 2023 Theo Gottwald * https://www.smart-package.com

```
"Between"  =  4
```

8. This Flag is assigned to any SQ (Single Quote) that encloses an attribute.
This flag is not assigned to other SQ's for example in an data-part or inside an DQ-delimited value of an attribute.

```
"Is SQ"  =  8
```

16.. This Flag is assigned to any character that is between SQ as an attribute value.

```
Between SQ"  =  16
```

32. This Flag is assigned to any real DQ (Double Quote) that encloses an attribute.
This flag is not assigned to other DQ's for example in an data-part or inside an SQ-delimited

```
"is dq"  =  32
```

64.. This Flag is assigned to any character that is between DQ as an attribute value.

```
"Between DQ"  =  64
```

128. This Flag is assigned to the last letter (non whitespace character) that is before an EQ Sign that is interpreted to be part of an attribute.

```
"before eq"  =  128
```

256. This Flag is assigned to the first SQ or DQ , that is after an EQ Sign that is interpreted to be part of an attribute.

```
"after eq"  =  256
```

512. This Flag is assigned to to characters inside tags only. If they are not between SQ or DQ. This means that they are not part of the value of an attribute, if this flag is set.

```
"outside sdq"  =  512
```

1024. This Flag is assigned to the open- and to the close-bracket of a self terminated tag.
These are comments, system-tags or dedicated "self terminated" tags.
See example XML-Dump below.

```
"self terminate"  =  1024
```

2048 This Flag is assigned to the open- and to the close-bracket of a system-tag.
See example XML-Dump below.

```
"system tag"  =  2048
```

4096. This Flag is assigned to the first letter of the tag name.
See example XML-Dump below.

```
"start name"=4096
```

8192. This Flag is assigned to the last letter of the tag name.

```
"end name"  =  8192
```

16384. This Flag is assigned to the first letter of any found attribute.
See example XML-Dump below.

```
"start attribute"  =  16384
```

32768. This Flag is assigned to the last letter of any found attribute.
Regularly this is a SQ or a DQ-Sign.
See example XML-Dump below.

```
"end attribute"  =  32768
```

© 2023 Theo Gottwald * https://www.smart-package.com

65536. This Flag is assigned to the first "<" that starts a new Start-Tag. Its the opposite of an End-Tag-Flag (below). See example XML-Dumps below.
"start tag" = 65536

131072. This Flag is assigned to the first "<" that starts a new End-Tag. Its the opposite of an Start-Tag-Flag (above). See example XML-Dumps below.
"end tag" = 131072

262144. This Flag is assigned to any character that is inside a comment-tag. There is an picture below that shows the Dump of an comment tag.
"comment" = 262144

Example

```
'**********************************

3.84.6.4 bdq - Between DQ

MiniRobotLanguage (MRL)

IML.Between DQ
IML.bdq
IML.Between DQZ
IML.bdqz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is part of an attribute and is "between Double Quotes" or not.
You can also scan for the first byte that is outside of these double quotes (DQ).
DQ inside an attribute value that is delimited using SQ are not real DQ and are therefore not flagged.

```
' Here is an example:
' These DQ's will not be flagged
' also the "=" after "Liste" will not be flagged
<Hallo first='Liste="1234'"ok'>

' These DQ's will be flagged
<Hallo first="Liste='1234'ok">
```

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.bdq
  PRT. Pos. 30 is flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.bdq|30
  PRT. Pos. 30 is between DQ's
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.bdq|20|40
  PRT. Pos. $$000 is flagged.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z". This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.bdqz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

As always `NML.` is the negative Form of `IML.`

Syntax

IML.Between DQ[|P2][|P3]
IML.bdq[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```
'**********************************
$$PRO=Between DQ

3.84.6.5 beq - Before EQ

MiniRobotLanguage (MRL)

IML.Before EQ
IML.beq
IML.Before EQZ
IML.beqz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is part of an attribute, and "before an Equal-Sign" "=" or not.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.beq
  PRT. Pos. 30 flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.beq|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.beq|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.beqz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

As always `NML.` is the negative Form of `IML.`

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

IML.Before EQ[|P2][|P3]
IML.beq[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```
'**********************************

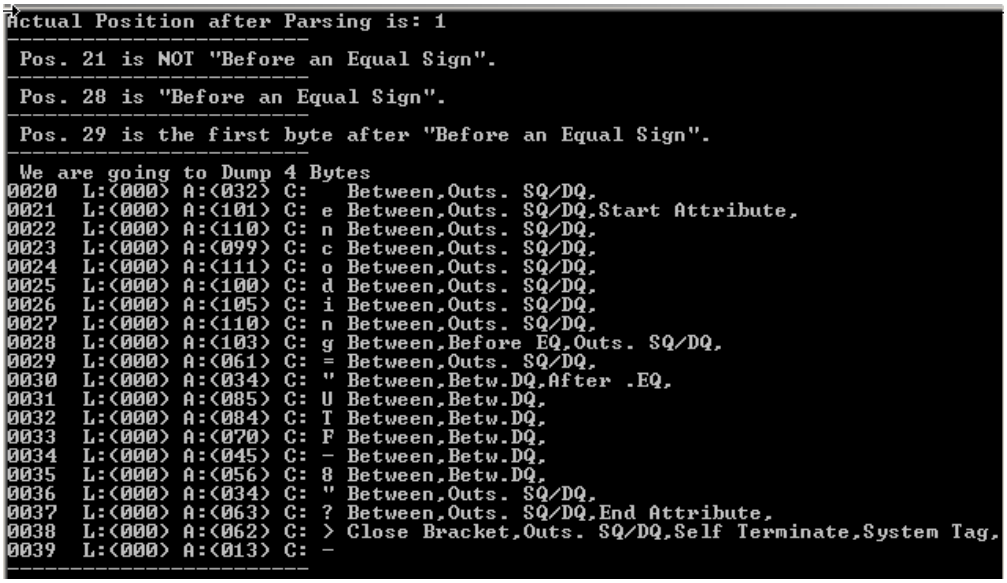
This is the result of the sample script:



Remarks

This command needs the XML-Data to be parsed first, using the
par - parse from var 4117
or the
If - load file 4113
Command. In this process the XML-Parser builds a Table with flags that is analyzed using this commands. You can see a XML-Dump of such XML-Data Flags here:
! Sample-XML Data 3966

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

3.84.6.6 bsq - Between SQ

MiniRobotLanguage (MRL)

IML.Between SQ
IML.bsq
IML.Between SQZ
IML.bsqz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is part of an attribute, and "between real Single Quotes" "=" or not.
Single Quotes inside of an Attribute Value that is delimited with Double Quotes are not "real" Single Quotes, and are not flagged.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.bsq
  PRT. Pos. 30 flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.bsq|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.bsq|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.bsqz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
EIF.
```

As always `NML.` is the negative Form of `IML.`

Syntax

IML.Between SQ[|P2][|P3]
IML.bsq[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.

3.84.6.8 cbt - Close Bracket

MiniRobotLanguage (MRL)

IML.Close Bracket
IML.cbt
IML.Close BracketZ
IML.cbtz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is flagged as a real > or not.
Close brackets (while not really conform with standards) inside attribute values are ignored and would not be flagged as a close bracket. Also close brackets are only valid after an < open bracket first. Duplicate > are not flagged.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.cbt
  PRT. Pos. 30 flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.cbt|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.cbt|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.cbtz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

As always `NML.` is the negative Form of `IML.`

Syntax

IML.close bracket[|P2][|P3]
IML.cbt[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

3.84.6.9 cmt - Comment

MiniRobotLanguage (MRL)

IML.Comment
IML.cmt
IML.CommentZ
IML.cmtz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is flagged as a comment or not.

In XML comments look like this:

```
<!-- comment attrib="Hall"-->
```

All characters inside this comment Tag are flagged as a comment.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.cmt
  PRT. Pos. 30 flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.cmt|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.cmt|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
IML.cmtz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

As always `NML.` is the negative Form of `IML.`

Syntax

IML.Comment[|P2][|P3]
IML.cmt[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```

Remarks

This command needs the XML-Data to be parsed first, using the
par - parse from var 4117
or the
If - load file 4113
Command. In this process the XML-Parser builds a Table with flags that is analyzed using this commands. You can see a XML-Dump of such XML-Data Flags here:
! Sample-XML Data 3966

Limitations:

-

3.84.6.10 eat - End Attribute

MiniRobotLanguage (MRL)

IML.End Attribute
IML.eat
IML.End AttributeZ
IML.eatz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is part of an attribute, and in fact the "End of an attribute" or not.
This flag is normally given to DQ (Double Quote) or SQ (Single Quote) Signs at the end of an attribute value.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.eat
  PRT. Pos. 30 flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.eat|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.eat|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.eatz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

As always `NML.` is the negative Form of `IML.`

Syntax

IML.End Attribute[|P2][|P3]
IML.eat[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$PRO=End Attribute
$$TXT=the end of a attribute
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
' Hier gehts los

3.84.6.14 isq - Is SQ

MiniRobotLanguage (MRL)

IML.Is SQ
IML.isq
IML.Is SQZ
IML.isqz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is part of an attribute, and "after an Equal-Sign" "=" or not.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.isq
  PRT. Pos. 30 is is flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.isq|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.isq|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.isqz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

As always `NML.` is the negative Form of `IML.`

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

IML.Is SQ[|P2][|P3]
IML.isq[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$PRO=Is SQ
$$TXT=is a real Single Quote
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it

3.84.6.15 obt - Open Bracket

MiniRobotLanguage (MRL)

IML.Open Bracket
IML.obt
IML.Open BracketZ
IML.obtz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is flagged as a real < or not.
Open brackets (while not really conform with standards) inside attribute values are ignored and would not be flagged as a open bracket. Also open brackets are not valid after an < open bracket before. Duplicate < are not flagged.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.obt
  PRT. Pos. 30 flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.obt|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.obt|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.obtz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

As always `NML.` is the negative Form of `IML.`

Syntax

IML.Open Bracket[|P2][|P3]
IML.obt[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```

3.84.6.17 sta - Start Attribute

MiniRobotLanguage (MRL)

IML.Start Attribute
IML.sta
IML.Start AttributeZ
IML.staz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is part of an attribute, and in fact the "Start of an attribute" or not.
This flag is normally given to the first Non-whitespace character inside a tag, after the name and an additional whitespace character.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.sta
  PRT. Pos. 30 flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.sta|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.sta|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.staz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

As always NML. is the negative Form of IML.

Syntax

IML.Start Attribute[|P2][|P3]
IML.sta[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```

3.84.6.18 stg - Start Tag

MiniRobotLanguage (MRL)

IML.Start Tag
IML.stg
IML.Start TagZ
IML.stgz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is the start of a real Start-Tag or not.

Example:

```
<Hallo> is a Start-Tag then
</Hallo> is the End-Tag of this.
```

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.stg
  PRT. Pos. 30 is flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.stg|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.stg|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.stgz|30|40
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
  PRT. Pos. $$000 is the first byte after that Flag is set.
EIF.
```

As always `NML.` is the negative Form of `IML.`

Syntax

IML.Start Tag[|P2][|P3]
IML.stg[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```
'*********************************

IML.Self TerminateZ
IML.stmz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is marked as a part of a "self terminated tag" (could for example be a system tag) or not.

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|30
IML.stm
  PRT. Pos. 30 is flagged
EIF.

' With One parameter IML. will check just the given Byte
IML.stm|30
  PRT. Pos. 30 is flagged
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.stm|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.stmz|30|40
  PRT. Pos. $$000 is not flagged.
EIF.
```

As always `NML.` is the negative Form of `IML.`

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

IML.Self Terminate[|P2][|P3]
IML.stm[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

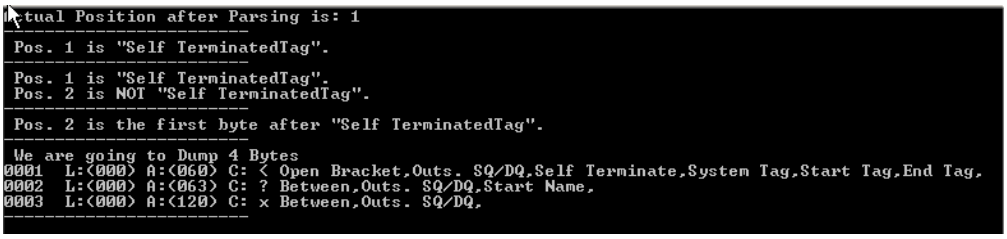
Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$PRO=Self Terminate
$$TXT=Self TerminatedTag
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
' Hier gehts los
PRT.------------------------
IML.$$PRO|1|500
  $$ERG=$$000
  PRT. Pos. $$ERG is "$$TXT".
EIF.
PRT.------------------------
IML.$$PRO|$$ERG
  PRT. Pos. $$ERG is "$$TXT".
EIF.
IML.$$PRO|($$ERG+1)
```

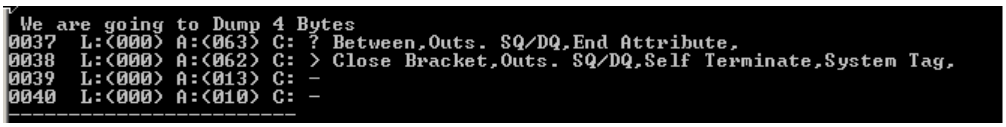
© 2023 Theo Gottwald * https://www.smart-package.com

```
  CAL.$$PLU=$$ERG+1
  PRT. Pos. $$PLU is "$$TXT".
ELS.
  CAL.$$PLU=$$ERG+1
  PRT. Pos. $$PLU is NOT "$$TXT".
EIF.
PRT.------------------------
' Now we are scanning for "Bit not set"
IML.$$PROz|$$ERG|($$ERG+50)
  $$RES=$$000
  PRT. Pos. $$RES is the first byte after "$$TXT".
EIF.
PRT.------------------------
PRT. We are going to Dump 4 Bytes
XML.Dump|($$ERG-1)|($$RES+1)
PRT.------------------------
MBX.!
:enx
ENR.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

This is the result of the sample script:



In the second Dump, you can see that also the End-> is flagged as "self-terminate".



Remarks

This command needs the XML-Data to be parsed first, using the
par - parse from var 4117
or the
If - load file 4113
Command.
In this process the XML-Parser builds a Table with flags that is analyzed using this commands. You can see a XML-Dump of such XML-Data Flags here:

3.84.6.21 stt - System Tag

MiniRobotLanguage (MRL)

IML.System Tag
IML.stt
IML.System TagZ
IML.sttz

Find out if the specified XML-Flag is set.

Intention

This command is used to analyze XML-Flags. Using this command, you can find out if the actual XML-Data-Byte is the < or the > of a System Tag.

System Tags look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
```

To understand this better, see the XML-Sample-Data and XML-Flags-Dump here:
! Sample-XML Data 3966

There are 6 ways of using this command, depending on the number of Parameters.

```
' With no Parameter, IML. will use the current position
XML.Set Pos|1
IML.stt
  PRT. Pos. 1 flagged.
EIF.

' With One parameter IML. will check just the given Byte
IML.btw|30
  PRT. Pos. 30 is flagged.
EIF.

' With two parameters, IML: will start searching for a Bate
with
' the specified Flag set, and if one is found, place that
' Bytes Number on the TOS (Top of Stack).
IML.stt|20|40
  PRT. Pos. $$000 is flagged.
EIF.
```

Additionally you can suffixe in all three cases above the subcommand with a "z".
This will change the internal search to "***Bit not set***" (Z= Bit=Zero).

```
' Now we are scanning for "Bit not set"
IML.sttz|30|40
  PRT. Pos. $$000 is the first byte after that Flag is set.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EIF.
```

As always `NML.` is the negative Form of `IML.`

Syntax

IML.System Tag[|P2][|P3]
IML.stt[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** ***Variable*** with the Position, where to test the XML-Flag.
If **P3** is specified, then this is the Start-Byte to scan at.
If the value in P3<P2 then the Scan is done in reverse order.

P3 - ***(optional)*** ***Variable*** with the ending position for the scan.
If **P3** is specified, then P3 is the End-Byte to scan.
If the value in P3<P2 then the Scan is done in reverse order.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$PRO=System Tag
$$TXT=a System Tag
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors

3.84.7 XML - no parse

3.84.7.1 Clr - Clear

MiniRobotLanguage (MRL)

XML.Clear
XML.clr

Clear all internal XML-Data and "undo" XML.-Parsing

Intention

This command is used to clear all internal XML-Data from a previously parsed XML-file and return the memory to the system.
During the loading/parsing of XML-Data, the SPR collects internal data-tables and flags to speed up the later commands.

```
XML.Clear
```

Deletes all collected Data and puts the SPR into the state right before parsing any XML-Data from new. It will also delete all Error-Messages, therefore you do not need to call

```
XML.Clear Error
```

explicitly after this command. If you load or parse a new XML-File, this command is transparently executed, therefore you do not need to call it before parsing an new XML-File.

In most cases, you do not need to call this command as its automatically called.

Even if the script ends, the robot will automatically free all memory automatically. Therefore this command is not really needed in most cases.

Syntax

XML.Clear

Parameter Explanation

-

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
'**********************************
' XML.Clear Sample
'**********************************
$$XMF=?pfad\Small_XML.txt
' We load the XML-Data into a Vaariable
CFF.$$XMF|$$XML
' Now we are going to parse it
XML.Parse|$$XML
'XML.Dump
' We check if there are errors
JIT.Lab_Err

' Now we clear the parsing.
XML.Clear

' We try an XML.-Command that will of course run into an
error.
XML.get pos|$$POS
' We jump to the error-handler
JIT.Lab_Err
PRT.Actual Position after Parsing is: $$POS
PRT.------------------------
MBX.!
'-------------------------------------------------------------
ENR.
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

This is the result of the sample script:

```
[11:35:15] [33]
XML.-Error: Before you can use XML-Commands, you need to load or parse an valid XML-File.
[11:35:15] MRE: Robot ended: XML_Clear.mrt
```

Remarks

-

Limitations:

-

© 2023 Theo Gottwald * https://www.smart-package.com

- par - parse from var 4117
- If - load file 4113
- cle - clear error 4106

© 2023 Theo Gottwald * https://www.smart-package.com

3.84.7.2 UnClean - UnClean Text

MiniRobotLanguage (MRL)

XML.UnClean Text
XML.UnClean

Prepare Textual Data for inclusion in XML-Documents

Intention

This There are special characters that are not valid inside XML-Documents, because they have a special meaning. You find them below.

In XML-Files, we have data that is enclosed and described using "tags".
We have "Start-Tags" like `<note>`
and we have "End-Tags" like `</note>`
between these we have data that can itself be XML or other data.

Because of this, there are some characters that should not be used in the XML-data, because they are reserved for tags. These characters are:

& - should be replace by &
< - should be replace with <
> - should be replace with >
" - should be replace with "
' - should be replace with &spos;

For this purpose the `XML.` command has the "`Clean`"-Option.

It will prepare your data to be valid as XML-Data.

And if you want your data back to the original state, just use the "`unclean`" option.

Here is an example:

```
' Prepare Data for use in XML-Files
$$XMD=>&XMLData>&<<>
XML.clean|$$XMD|$$XMO
DBP. the ready for use XML-Data is in $$XMO
$$XMD=
XML.unclean|$$XMO|$$XMD
DBP.$$XMD contains the original data
END.
```

Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

XML.UnClean Text|P2[|P3]

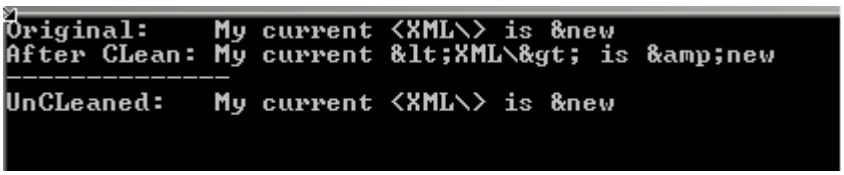
Parameter Explanation

P2 – Variable with XML-Data that is going to be cleaned.
P3 – Variable to return the result. If omitted the result is placed on TOS.

Example

```
'*********************************
' XML.-Clean/UnClean Sample
'*********************************
'
$$XMF=My current <XML\> is &new
' Now we are going to parse it
XML.Clean|$$XMF|$$XMC
XML.UnClean|$$XMC|$$XMU
PRT.Original:    $$XMF
PRT.After CLean: $$XMC
PRT.--------------
PRT.UnCLeaned:   $$XMU
MBX.!
ENR.
```

This is the result of the sample script:



Remarks

Unlike other commands, XML.Clean and XML.UnCLean can be used without the need to first parse or load an XML-File. They are basically String/Text Replace-Operations.

Limitations:

-

See also:

- ! Smarty's XML-Features 3973

© 2023 Theo Gottwald * https://www.smart-package.com

- ! SPR - XML-Parser Flags 3981
- **XML. - eXtended Markup Language** 3990
- **par - parse from var** 4117
- **clean - Clean Text** 4108

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.84.7.3 Wrap

MiniRobotLanguage (MRL)

XML.Wrap

Wrap a text into <>

Intention

This command is used to generate an XML-Tag.

As Input you give it any Text, as the result you will get an XML-Tag.
Wrap is intelligent, look what it really does.

```
' We do a simple Wrap
$$XMF=Hallo
XML.Wrap|$$XMF
PRT.1. Wrapped: $$XMF
PRT.------------------------
' We do a more complex WRAP
$$XMF=<Hallo
XML.Wrap|$$XMF
PRT.2. Wrapped: $$XMF
PRT.------------------------
' We do a even more complex WRAP (Notice the space left of the
<)
$$XMF= <Hallo
XML.Wrap|$$XMF
PRT.3. Wrapped: $$XMF
PRT.------------------------
' We do a even more complex WRAP (Notice the spaces left of
the <)
$$XMF=   <<Hallo
XML.Wrap|$$XMF
PRT.4. Wrapped: $$XMF
PRT.------------------------
' We do a even more complex WRAP (Notice the space right of
the >)
VAR.$$XMF=$sp$<Hallo>$sp$
XML.Wrap|$$XMF
PRT.5. Wrapped: $$XMF
PRT.------------------------
' We do a maximum complex WRAP (Notice the space right of the
>)
VAR.$$XMF=$sp$   <<<Hallo>>>    $sp$
XML.Wrap|$$XMF
PRT.6. Wrapped: $$XMF
PRT.------------------------
```

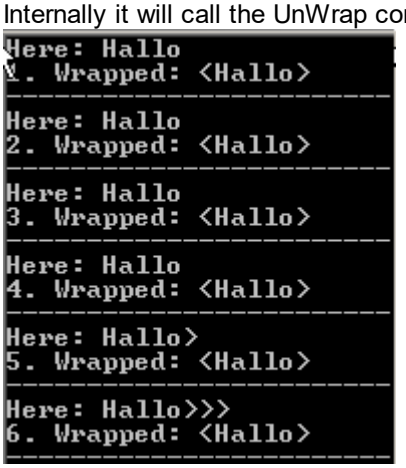
As you can see in the Output below, the Wrap command is intelligent in what its doing.
It will not "just place <> around".

© 2023 Theo Gottwald * https://www.smart-package.com

It will first check

- does the text need to be trimmed?
- are there already brackets around?
- Whitespaces inside the Tag are preserved
- Whitespaces before the < or
- after the > are trimmed
- it will trim all XML Whitespaces and Tabs, these are ASCII:
  `&H20,&H9,&HD,&HA`

Internally it will call the UnWrap command first and then Wrap the text.



Syntax

XML.Wrap|P2[|P3]

Parameter Explanation

P2 – Variable with XML-Data that is to be Wrapped into <>.
If P3 is omitted, the result it stored into this variable.

P3 – ***(Optional)*** Variable to return the result.

Example

```
'***********************************
' XML.Warp/Unwrap Sample
'***********************************
' We do a simple Wrap
$$XMF=Hallo
XML.Wrap|$$XMF
PRT.1. Wrapped: $$XMF
PRT.------------------------
' We do a more complex WRAP
$$XMF=<Hallo
XML.Wrap|$$XMF
PRT.2. Wrapped: $$XMF
PRT.------------------------
```

© 2023 Theo Gottwald * https://www.smart-package.com

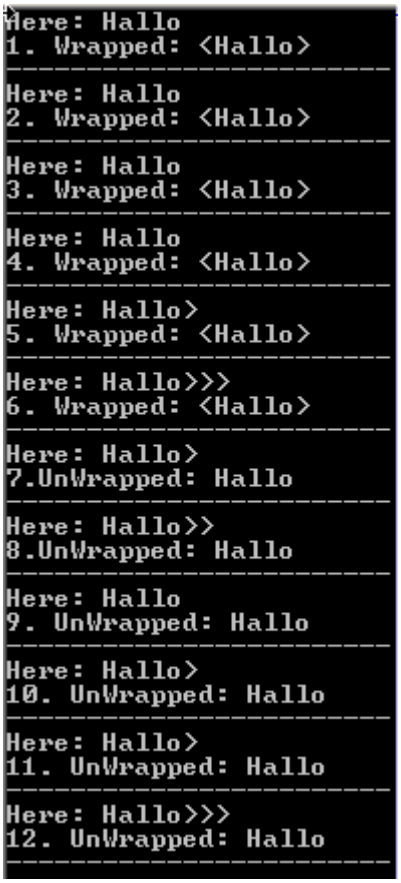
```
' We do a even more complex WRAP (Notice the space left of the
<)
$$XMF= <Hallo
XML.Wrap|$$XMF
PRT.3. Wrapped: $$XMF
PRT.------------------------
' We do a even more complex WRAP (Notice the spaces left of
the <)
$$XMF=   <<Hallo
XML.Wrap|$$XMF
PRT.4. Wrapped: $$XMF
PRT.------------------------
' We do a even more complex WRAP (Notice the space right of
the >)
VAR.$$XMF=$sp$<Hallo>$sp$
XML.Wrap|$$XMF
PRT.5. Wrapped: $$XMF
PRT.------------------------
' We do a maximum complex WRAP (Notice the space right of the
>)
VAR.$$XMF=$sp$   <<<Hallo>>>    $sp$
XML.Wrap|$$XMF
PRT.6. Wrapped: $$XMF
PRT.------------------------
' We do a simple UnWrap
$$XMF=Hallo>
XML.UnWrap|$$XMF
PRT.7.UnWrapped: $$XMF
PRT.------------------------
' We do a more complex UnWRAP
$$XMF=<Hallo>>
XML.UnWrap|$$XMF
PRT.8.UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the space left of
the <)
$$XMF= <Hallo
XML.UnWrap|$$XMF
PRT.9. UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the spaces left of
the <)
$$XMF=   <<Hallo>
XML.UnWrap|$$XMF
PRT.10. UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the space right of
the >)
VAR.$$XMF=$sp$<Hallo>$sp$
XML.UnWrap|$$XMF
PRT.11. UnWrapped: $$XMF
PRT.------------------------
' We do a maximum complex UnWRAP (Notice the space right of
the >)
VAR.$$XMF=$sp$   <<<Hallo>>>    $sp$
XML.UnWrap|$$XMF
PRT.12. UnWrapped: $$XMF
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRT.------------------------
MBX.!
ENR.
```

below is the result of the sample script:

You can see that the Wrap and the UnWrap commands are smart and deliver you exactly what you need.



Remarks

Wrap does not automatically "Clean" the Text, if needed use the "`XML.Clean`" Command first.

Limitations:

3.84.7.4 cle - clear error

MiniRobotLanguage (MRL)

XML.Clear Error
XML.cle

Clear internal Error flags

Intention

This command is used to clear all internal XML.-Error-Flags.

Usage is:

```
XML.Clear Error
```

Typically it can be used after the Error has been handled.

When loading or parsing a new XML-File, all Error Flags are automatically cleared, therefore no need to use this command for initilization.

Syntax

XML.Clear Error

Parameter Explanation

-

Example

```
''''''''''''''''''''''''''''''''''''
' XML.Clear Error-Sample
'
''''''''''''''''''''''''''''''''''''
$$XMF=?pfad\Small_XMLx.txt
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
:enx
MBX.!
ENR.
'------------------------------------------------------------
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' Error Handler
:Lab_Err
' Get Error
XML.get error|$$ERT
PRT.$$ERT
' Clear Error
XML.cle
' Error is cleared
XML.get error|$$ERT
PRT. Error cleared! $$ERT
GTO.enx
ENR.
```

You can find the XML-Sample-Data file in the Installation folder in the Samples-Folder "XML".

3.84.7.5 clean - Clean Text

MiniRobotLanguage (MRL)

XML.Clean Text
XML.Clean

Prepare Textual Data for inclusion in XML-Documents

Intention

This There are special characters that are not valid inside XML-Documents, because they have a special meaning. You find them below.

In XML-Files, we have data that is enclosed and described using "tags".
We have "Start-Tags" like `<note>`
and we have "End-Tags" like `</note>`
between these we have data that can itself be XML or other data.

Because of this, there are some characters that should not be used in the XML-data, because they are reserved for tags. These characters are:

& - should be replace by &
< - should be replace with <
> - should be replace with >
" - should be replace with "
' - should be replace with &spos;

For this purpose the `XML.` command has the "`Clean`"-Option.

It will prepare your data to be valid as XML-Data.

And if you want your data back to the original state, just use the "`unclean`" option.

Here is an example:

```
' Prepare Data for use in XML-Files
$$XMD=>&XMLData>&<<>
XML.clean|$$XMD|$$XMO
DBP. the ready for use XML-Data is in $$XMO
$$XMD=
XML.unclean|$$XMO|$$XMD
DBP.$$XMD contains the original data
END.
```

Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

XML.Clean Text|P2[|P3]

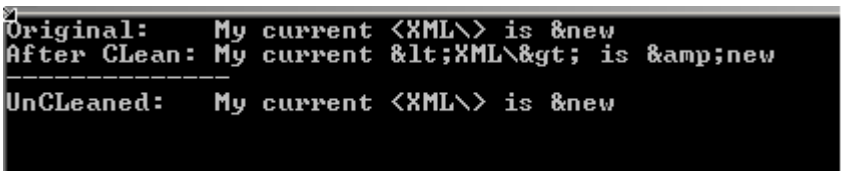
Parameter Explanation

P2 – Variable with XML-Data that is going to be cleaned.
P3 – Variable to return the result. If omitted the result is placed on TOS.

Example

```
'*********************************
' XML.-Clean/UnClean Sample
'*********************************
'
$$XMF=My current <XML\> is &new
' Now we are going to parse it
XML.Clean|$$XMF|$$XMC
XML.UnClean|$$XMC|$$XMU
PRT.Original:    $$XMF
PRT.After CLean: $$XMC
PRT.-------------
PRT.UnCLeaned:   $$XMU
MBX.!
ENR.
```

This is the result of the sample script:



Remarks

Unlike other commands, XML.Clean and XML.UnCLean can be used without the need to first parse or load an XML-File. They are basically String/Text Replace-Operations.

Limitations:

-

3.84.7.6 geterr - get error

MiniRobotLanguage (MRL)

XML.Get Error
XML.geterr

Read internal Error flags to get informations about parsing Errors

Intention

This command is used to read all internal XML.-Error-Flags.
As the XML-Parser does not display Error-Messages, you need to use `JIT.` and this commands to find out about possible parsing problems.

It does only read Errors that happen during XML.-Parsing.
Usage is:

```
XML.Get Error|$$ERT
```

Typically it can be used during Error handling.

When loading or parsing a new XML-File, all Error Flags are automatically cleared.

Below is a complete example Script that shows Error handling.

Syntax

XML.Get Error|P2[|P3]

Parameter Explanation

P2 – Variable to return the Error-Messages that happened during the execution of an XML.-Command. Messages are stacked and collected until you use `XML.Clear Error.`

P3 – Variable to return a Error-Number. Currently not fully implemented.

Example

```
''''''''''''''''''''''''''''''''''''
' XML.Get Error/Clear Error-Sample
'
''''''''''''''''''''''''''''''''''''
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$XMF=?pfad\Small_XMLx.txt
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
:enx
MBX.!
ENR.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
' Get Error
XML.get error|$$ERT
PRT.$$ERT
' Clear Error
XML.cle
' Error is cleared
XML.get error|$$ERT
PRT. Error cleared! $$ERT
GTO.enx
ENR.
```

You can find the XML-Sample-Data file in the Installation folder in the Samples-Folder "XML".

Remarks

3.84.7.7 If - load file

MiniRobotLanguage (MRL)

XML.Load File
XML.Load
XML.lf

Get XML-Data from a file

Intention

This command is used to Load XML-Data from a file. During execution of this command, the XML-Parser will "Interpret" the XML-Data and decide

- Where Tags Start and End
- where Attributes start and end
- where names of tags and attributes start and end

It will then internally create a internal set of flags that is a 1:1 description of the interpreted XML-Data. Based on these flags all the complex XML.-Subcommands do their work.

Therefore most of the XML.-Subcommands require a XML-File to be loaded or Parsed prior they can set to work.
Note that the Load-Command will transparently call the Parse command, after having first load the XML-File into internal Memory.

Usage is very simple:

```
$$XMF=?pfad\Small_XML.txt
' Now we are going to load and parse it
XML.Load File|$$XMF
```

We can find out if we had errors during parsing using the TImeout-Flag.
Or we can add a third Parameter that will be zero if there are any errors.

```
XML.Load File|$$XMF|$$RES
```

If the Parsing was successfiul, `$$RES` will contain a value for `XML-Root`,
that is the Byte-Adress of the first "<" in the XML-Data. It will always be larger then zero.

If the result `$$RES` is zero, then the parsing was not successful. In this case you may find an Parsing Error on the TOS (To of Stack).

Always make sure that the file you are going to load, really exists.

You can use the
IEF. / NEF. - If - exist - File 1050
Query for this.

© 2023 Theo Gottwald * https://www.smart-package.com

```
IEF.$$FIL
$$XMF=?pfad\Small_XML.txt
  ' Now we are going to load and parse it
  XML.Load File|$$FIL
ELS.
  PRT.File $$FIL not found.
EIF.
```

Syntax

XML.Load|P2[|P3]

Parameter Explanation

P2 - Variable with XML-Data. XML-Data can contain $cr, $lf or not.
P3 - Variable to return the result. The result is 0 in case of parsing errors. Otherwise the result is >0 and contains the value XML_Root.

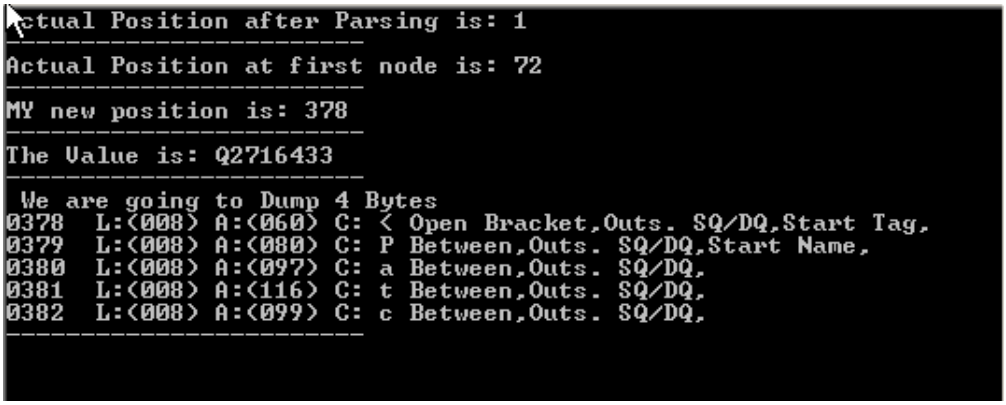
Example

```
'**********************************
' XML.Load-Sample
' We are looking for the Tag below, extracting an attribute-value
' "SQNumber".
' <Patch
'  PatchName="SQLServer2008-KB2716433-x86.exe"
SQNumber="Q2716433">
'**********************************
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
PRT.------------------------
XML.goto first node
XML.get pos|$$POS
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRT.Actual Position at first node is: $$POS
PRT.-----------------------
' We use a Hi-Level Search here.
XML.search name and attribute|{&EXACT:Patch}|SQNumber
$$REA=$$000
PRT.MY new position is: $$REA
PRT.-----------------------
XML.attrib value by name|SQNumber|$$RES
PRT.The Value of the attribute is: $$RES
PRT.-----------------------
PRT. We are going to Dump 4 Bytes
XML.Dump|$$REA|($$REA+4)
PRT.-----------------------
MBX.!
:enx
ENR.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

This is the result of the sample script:



Here is the important part of the used XML-Data that is analyzed here:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment attrib="Hall"-->

© 2023 Theo Gottwald * https://www.smart-package.com

3.84.7.8 par - parse from var

MiniRobotLanguage (MRL)

XML.Parse from Var
XML.Parse
XML.Par

Get XML-Data that is already inside a Variable

Intention

This command is used to Load XML-Data from a Variable. During execution of this command, the XML-Parser will "Interpret" the XML-Data and decide

- Where Tags Start and End
- where Attributes start and end
- where names of tags and attributes start and end

It will then internally create a internal set of flags that is a 1:1 description of the interpreted XML-Data. Based on these flags all the complex XML.-Subcommands do their work.

Therefore most of the XML.-Subcommands require a XML-File to be loaded or Parsed prior they can set to work.
Note that the Load-Command will transparently call the Parse command, after having first load the XML-File into internal Memory.

Usage is very simple:

```
$$XMF=?pfad\Small_XML.txt
' We load the XML-Data into a Vaariable
CFF.$$XMF|$$XML
' Now we are going to parse it
XML.Parse|$$XML
```

We can find out if we had errors during parsing using the TImeout-Flag.
Or we can add a third Parameter that will be zero if there are any errors.

```
XML.Parse|$$XML|$$RES
```

If the Parsing was successful, `$$RES` will contain a value for `XML-Root`,
that is the Byte-Adress of the first "<" in the XML-Data. It will always be larger then zero.

If the result `$$RES` is zero, then the parsing was nut successful. In this case you may find an Parsing Error on the TOS (To of Stack).

© 2023 Theo Gottwald * https://www.smart-package.com

Syntax

XML.Parse|P2[|P3]

P2 - Variable with XML-Data. XML-Data can contain $cr, $lf or not.
P3 - Variable to return the result. The result is 0 in case of parsing errors. Otherwise the result is >0 and contains the value XML_Root.

Parameter Explanation

-

Example

```
'***********************************
' XML.Parse.-Sample
' We are looking for the Tag below, extracting an attribute-value

3.84.7.9 spl - Split Attrib

MiniRobotLanguage (MRL)

XML.Split Attrib
XML.spl

Split a String (Attribute) into "Name" and Value"

Intention

This command is used to easily split an attribute String into its components, name and value. This is a pure String-Operation and does not need a previous parsing.

```
'Usage is simple:
$$XMF=encoding="UTF-8?"
' We are going to split this in Name and Value
XML.Split Attrib|$$XMF|$$NAM
DBP.$$NAM--$$000
'-------------------------------------------------------------
XML.Split Attrib|$$XMF|$$NAM|$$VAL
DBP.$$NAM--$$VAL
ENR.
```

Syntax

XML.spl|P2[|P3][|P4]

Parameter Explanation

P2 – Variable with XML-Data. XML-Data can contain $cr, $lf or not.

P3 – Variable to return the result. The result is 0 in case

P4 – Variable to return the result value. If omitted this value is placed on TOS (Top of Stack).

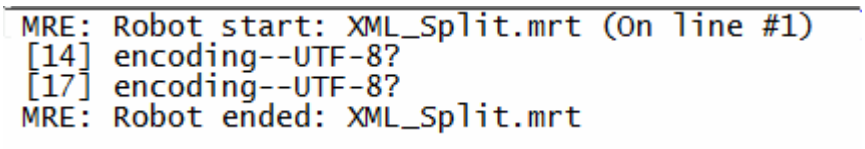
Example

```
'****************************
'  XML.-Split Attrib - Sample
'****************************
$$XMF=encoding="UTF-8?"
' We are going to split this in Name and Value
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
XML.Split Attrib|$$XMF|$$NAM
DBP.$$NAM--$$000
'-------------------------------------------------------------
XML.Split Attrib|$$XMF|$$NAM|$$VAL
DBP.$$NAM--$$VAL
ENR.
```

This is the result of the sample script:



Remarks

3.84.7.10 unw - UnWrap

MiniRobotLanguage (MRL)

XML.UnWrap

UnWrap a tag / remove the <>

Intention

This command is used to extract the inside from an XML-Tag.
In short this command will remove the < > from the tag.

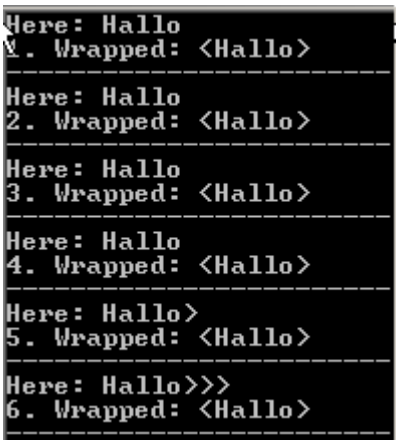
As Input you give it any Tag, as the result you will get an Text.
UnWrap is intelligent, look what it really does.

```
' We do a simple UnWrap
$$XMF=Hallo>
XML.UnWrap|$$XMF
PRT.7.UnWrapped: $$XMF
PRT.------------------------
' We do a more complex UnWRAP
$$XMF=<Hallo>>
XML.UnWrap|$$XMF
PRT.8.UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the space left of
the <)
$$XMF= <Hallo
XML.UnWrap|$$XMF
PRT.9. UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the spaces left of
the <)
$$XMF=   <<Hallo>
XML.UnWrap|$$XMF
PRT.10. UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the space right of
the >)
VAR.$$XMF=$sp$<Hallo>$sp$
XML.UnWrap|$$XMF
PRT.11. UnWrapped: $$XMF
PRT.------------------------
' We do a maximum complex UnWRAP (Notice the space right of
the >)
VAR.$$XMF=$sp$   <<<Hallo>>>    $sp$
XML.UnWrap|$$XMF
PRT.12. UnWrapped: $$XMF
PRT.------------------------
MBX.!
ENR.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

As you can see in the Output below, the UnWrap command is intelligent in what its doing.
It will not "just remove any <>.
It will first check

- does the text need to be trimmed?
- are there brackets around?
- Whitespaces inside the Tag are preserved
- Whitespaces before the < or
- after the > are trimmed
- it will trim all XML Whitespaces and Tabs, these are ASCII:
  `&H20,&H9,&HD,&HA`



Syntax

XML.UnWrap|P2[|P3]

Parameter Explanation

P2 – Variable with XML-Data that is to be UnWrapped from the <>.
If P3 is omitted, the result it stored into this variable.
P3 – ***(Optional)*** Variable to return the result.

Example

```
'***********************************
' XML.Warp/Unwrap Sample
'***********************************
' We do a simple Wrap
$$XMF=Hallo
XML.Wrap|$$XMF
PRT.1. Wrapped: $$XMF
PRT.------------------------
' We do a more complex WRAP
$$XMF=<Hallo
```

© 2023 Theo Gottwald * https://www.smart-package.com

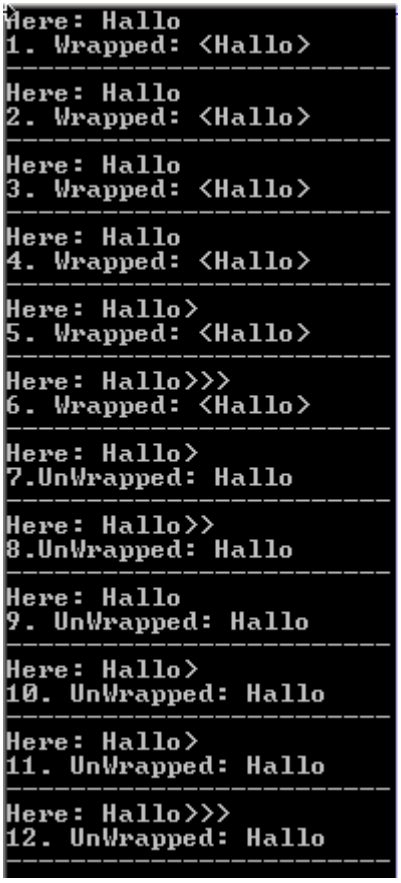
```
XML.Wrap|$$XMF
PRT.2. Wrapped: $$XMF
PRT.------------------------
' We do a even more complex WRAP (Notice the space left of the
<)
$$XMF= <Hallo
XML.Wrap|$$XMF
PRT.3. Wrapped: $$XMF
PRT.------------------------
' We do a even more complex WRAP (Notice the spaces left of
the <)
$$XMF=   <<Hallo
XML.Wrap|$$XMF
PRT.4. Wrapped: $$XMF
PRT.------------------------
' We do a even more complex WRAP (Notice the space right of
the >)
VAR.$$XMF=$sp$<Hallo>$sp$
XML.Wrap|$$XMF
PRT.5. Wrapped: $$XMF
PRT.------------------------
' We do a maximum complex WRAP (Notice the space right of the
>)
VAR.$$XMF=$sp$   <<<Hallo>>>    $sp$
XML.Wrap|$$XMF
PRT.6. Wrapped: $$XMF
PRT.------------------------
' We do a simple UnWrap
$$XMF=Hallo>
XML.UnWrap|$$XMF
PRT.7.UnWrapped: $$XMF
PRT.------------------------
' We do a more complex UnWRAP
$$XMF=<Hallo>>
XML.UnWrap|$$XMF
PRT.8.UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the space left of
the <)
$$XMF= <Hallo
XML.UnWrap|$$XMF
PRT.9. UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the spaces left of
the <)
$$XMF=   <<Hallo>
XML.UnWrap|$$XMF
PRT.10. UnWrapped: $$XMF
PRT.------------------------
' We do a even more complex UnWRAP (Notice the space right of
the >)
VAR.$$XMF=$sp$<Hallo>$sp$
XML.UnWrap|$$XMF
PRT.11. UnWrapped: $$XMF
PRT.------------------------
' We do a maximum complex UnWRAP (Notice the space right of
the >)
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
VAR.$$XMF=$sp$    <<<Hallo>>>     $sp$
XML.UnWrap|$$XMF
PRT.12. UnWrapped: $$XMF
PRT.------------------------
MBX.!
ENR.
```

below is the result of the sample script:

You can see that the Wrap and the UnWrap commands are smart and deliver you exactly what you need.



Remarks

Wrap does not automatically "`UnClean`" the Text, if needed use the "`XML.UnClean`" Command first.

Limitations:

3.84.8 XML. - after parse

3.84.8.1 abm - Attrib by Number

XML.Attrib by Number **Previous** 4123 **Top** 41 **Next** 4131

MiniRobotLanguage (MRL)

XML.Attrib by Number
XML.abm

Get complete attributes from an XML-Tag "by number"

Intention

This command is used to retrieve an attribute from an XML-Data Tag.

```
<Product ProductName="STATION 10" Name="Value">
```

This Tag has two attributes:

Number 1:
`ProductName="STATION 10"`

and Number 2:

```
Name="Value"
```

You could retrieve then using

```
XML.abm|1|$$RES
```

to get Attribute Nr.1 into `$$RES`

or

```
XML.abm|2|$$RES
```

to get Attribute Nr.2 into `$$RES`

To Split the attributes you can use the

```
XML.spl|$$ERG|$$NAM|$$VAL
PRT.It can be splitted into: $$NAM and $$VAL
```

command.

After this command, the actual position is on the attributes End.
To get back to the start of the attribute, use:

```
XML.siu|start attribute
```

This will set the actual position to the start of the attribute.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

XML.Attrib by Number|P2[|P3]

Parameter Explanation

P2 – Variable with the number of the attribute that you want.

P3 – ***(optional)*** Variable to return the result. The result is "" in case no such attribute was found. If P3 was omitted the result is placed on TOS.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
XML.get len|$$LEN
PRT.Actual Size of XML-Data is: $$LEN
' Hier gehts los
PRT.------------------------
XML.abm|2|$$ERG
PRT. The second attribute is: $$ERG
XML.spl|$$ERG|$$NAM|$$VAL
PRT. It can be splitted into: $$NAM and $$VAL
XML.abm|1|$$ERG
PRT. The first attribute is: $$ERG
XML.spl|$$ERG|$$NAM|$$VAL
PRT. It can be splitted into: $$NAM and $$VAL
XML.sdn|{&EXACT:Product}
XML.get pos|$$POS
PRT.Actual Position after Search is: $$POS
XML.abm|2|$$ERG
PRT. The second attribute is: $$ERG
XML.spl|$$ERG|$$NAM|$$VAL
PRT. It can be splitted into: $$NAM and $$VAL
XML.abm|1|$$ERG
PRT. The first attribute is: $$ERG
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
XML.spl|$$ERG|$$NAM|$$VAL
PRT. It can be splitted into: $$NAM and $$VAL
MBX.!

3.84.8.2 abn - Attrib by Name

MiniRobotLanguage (MRL)

XML.Attrib by Name
XML.abn

Get complete attributes from an XML-Tag "by name"

Intention

This command is used to retrieve an attribute from an XML-Data Tag.

```
<Product ProductName="STATION 10" Name="Value">
```

This Tag has two attributes:

Number 1:
`ProductName="STATION 10"`

and Number 2:

```
Name="Value"
```

You could retrieve then using

```
XML.abm|productname|$$RES
```

to get Attribute Nr.1 into `$$RES`

or

```
XML.abm|&EXACT:Name|$$RES
```

to get Attribute Nr.2 into `$$RES`

As you can use "Parts of a Name" to specify the name of the attribute, simply writing "Name" would possibly bring you the first attribute instead of the second.

You can and need to use 3.2 Standard-Search Pattern 341 to specify the name of the attribute that you want. For example, you can use:

```
XML.abm|{Pro&NDTHEN:Name}&OR:PName|$$RES
```

to specify a Name of an attribute. THis way you can also specify alternative names, for exaple if you have to analyze different languages.

To Split the attributes you can use the

```
XML.spl|$$ERG|$$NAM|$$VAL
PRT.It can be splitted into: $$NAM and $$VAL
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

command.

After this command, the actual position is on the attributes End.
To get back to the start of the attribute, use:

```
XML.siu|start attribute
```

This will set the actual position to the start of the attribute.

Syntax

XML.Attrib by Name|P2[|P3][|P4]

Parameter Explanation

P2 - Variable with the name of the attribute that should be retrieved.
You can and need to use 3.2 Standard-Search Pattern 341 to specify the name of the attribute that you want.

P3 - ***(optional)*** Variable to return the result. The result is "" in case no such attribute was found. If P3 was omitted the result is placed on TOS.

P4 - ***(optional)*** Count. In case there are multiple variables with the same name, you
can specify the number of the attribute that you want. If omitted "1" is the default number.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
XML.get len|$$LEN
```

3.84.8.3 abv - Get Attrib by Value

MiniRobotLanguage (MRL)

XML.Get Attrib by Value
XML.abv

Get attribute value by specifying the attribute name

Intention

This command is used to retrieve an attribute from an XML-Data Tag.

```
<Product ProductName="STATION 10" Name="Value">
```

This Tag has two attributes:

Number 1:
`ProductName="STATION 10"`

and Number 2:

```
Name="Value"
```

You could retrieve then using

```
XML.abv|statio|$$RES
```

to get Attribute Nr.1 into `$$RES`

or

```
XML.abv|valu|$$RES
```

to get Attribute Nr.2 into `$$RES`

You can use "Parts of a Value" to specify the Value of the attribute that you want.

You can and need to use 3.2 Standard-Search Pattern 341 to specify the value of the attribute that you want. For example, you can use:

```
XML.abv|Va&AND:e|$$RES
```

to specify a Value of an attribute. This way you can also specify alternative Values, for exaple if you have to analyze different languages.

To Split the attributes you can use the

```
XML.spl|$$ERG|$$NAM|$$VAL
PRT.It can be splitted into: $$NAM and $$VAL
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

command.

After this command, the actual position is on the attributes End.
To get back to the start of the attribute, use:

```
XML.siu|start attribute
```

This will set the actual position to the start of the attribute.

Syntax

XML.Get abv|P2[|P3][|P4]

Parameter Explanation

P2 - Variable with the Value of the attribute that should be retrieved.
You can and need to use 3.2 Standard-Search Pattern 341 to specify the name of the attribute that you want.

P3 - ***(optional)*** Variable to return the result. The result is "" in case no such attribute was found. If P3 was omitted the result is placed on TOS.

P4 - ***(optional)*** Count. In case there are multiple variables with the same value, you
can specify the number of the attribute that you want. If omitted "1" is the default number.

Example

```

3.84.8.4 acnt - Get Attrib Count

MiniRobotLanguage (MRL)

XML.Get Attrib Count
XML.acnt

Get number of attributes

Intention

This command is used to retrive the number of attributes of the Tag that is at the actual position. The actual position is the position that you can set using any search command or

```
XML.set pos|$$POS
```

Usage is simple:

```
XML.acnt|$$ERG
PRT. Here we have $$ERG attributes
```

Syntax

XML.Get Attrib Count[|P2]

Parameter Explanation

P2 - ***(optional)*** Variable to return the result. If omitted, the result is been placed on TOS.

Example

```
'*********************************
'
'*********************************
'Prototype für IML.
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
```

3.84.8.5 avbn - Attrib Value by Name

MiniRobotLanguage (MRL)

XML.Attrib Value by Name
XML.avbn

Get an attributes value by specifying the attributes name

Intention

This command is used to retrieve an attributes value from an XML-Data Tag.
For this you have to set the current position to the Tag that has these attributes, that you want. Then you can use this command.

Here is an example for an XML-Tag with two attributes.

```
<Product ProductName="STATION 10" Name="Value">
```

This Tag has two attributes:

Number 1:
`ProductName="STATION 10"`

and Number 2:
`Name="Value"`

You could retrieve these attributes values using

```
XML.avbn|productname|$$RES
```

to get the value of Attribute Nr.1 into `$$RES`

or

```
XML.avbn|&EXACT:Name|$$RES
```

to get the value of Attribute Nr.2 into `$$RES`

As you can use "Parts of a Name" to specify the name of the attribute, simply writing "Name" would possibly bring you the value of the first attribute instead of the second.

You can and need to use 3.2 Standard-Search Pattern 341 to specify the name of the attribute that you want. For example, you can use:

```
XML.avbn|{Pro&NDTHEN:Name}&OR:PName|$$RES
```

to specify a Name of an attribute. This way you can also specify alternative names, for example if you have to analyze different languages.

*© 2023 Theo Gottwald * https://www.smart-package.com*

Syntax

XML.avbn|P2[|P3][|P4]

Parameter Explanation

P2 - Variable with the name of the attribute that should be retrieved.
You can and need to use 3.2 Standard-Search Pattern 341 to specify the name of the attribute that you want.

P3 - ***(optional)*** Variable to return the result. The result is "" in case no such attribute was found. If P3 was omitted the result is placed on TOS.

P4 - ***(optional)*** Count. In case there are multiple variables with the same name, you
can specify the number of the attribute that you want. If omitted "1" is the default number.

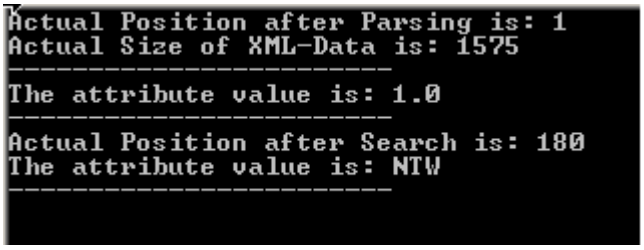
Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
XML.get len|$$LEN
PRT.Actual Size of XML-Data is: $$LEN
'Here we start
PRT.------------------------
XML.avbn|ver|$$ERG
PRT.The attribute value is: $$ERG
PRT.------------------------
XML.sdn|{&EXACT:Product}
XML.get pos|$$POS
PRT.Actual Position after Search is: $$POS
XML.avbn|Sha|$$ERG
PRT.The attribute value is: $$ERG
PRT.------------------------
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
MBX.!
:enx
ENR.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
ENR.
```

This is the result of the sample script:



Here is the important part of the used XML-Data that is analyzed here:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment attrib="Hall"-->
<PatchInformation XMLVersion="1.0000.0000.4918"
XMLLastUpdated="1/30/2010" PatchCount="1261">
<Products>
<Product ProductName="WINDOWS NT 4.0" SName="NTW">
```

You can find the XML-Sample-Data file in the Installation folder in the Samples-Folder "XML".

3.84.8.6 dec pos - Decrement Position

MiniRobotLanguage (MRL)

XML.Decrement Position
XML.dec pos

Decrement current position Pointer

Intention

This command is used to change the internal "actual position Pointer". It will decrement this pointer by 1. If **P2** is given, the actual position will be decremented by the number in P2.

Immediately after parsing, the actual position is at the Root of the Document.
After any successful search, the actual position is at the start tag of the found tag.

To find out the actual position, you can use the gpo - Get Position 4182 command.
To set the position to another value you can use the spo - Set Position 4273 command.

Syntax

XML.Decrement Position[|P2]

Parameter Explanation

P2 **-** ***(optional)*** Variable or numeric parameter, that is decremented from current position. If omitted, 1 is used.

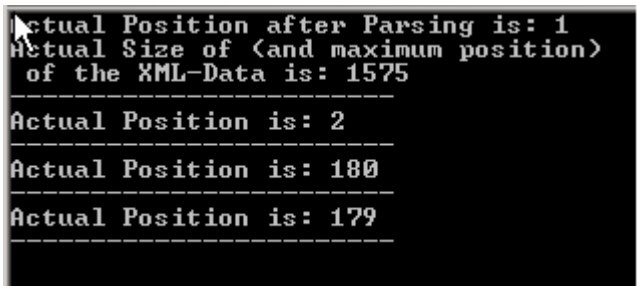
Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
XML.get len|$$LEN
PRT.Actual Size of (and maximum position)
PRT. of the XML-Data is: $$LEN
'Here we start
PRT.------------------------
XML.inc pos
GSB. pos
PRT.------------------------
XML.sdn|{&EXACT:Product}
GSB.pos
PRT.------------------------
XML.dec pos
GSB. pos
PRT.------------------------
MBX.!
:enx
ENR.
'-------------------------------------------------------------
:pos
XML.get pos|$$POS
PRT.Actual Position is: $$POS
RET.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

This is the result of the sample script:



Remarks

You can not Increment the actual position to values that are outside of the current loaded XML-File. The command will prevent this internally. The valid values range from 1 to XML-Length.

3.84.8.7 dmp - Dump

MiniRobotLanguage (MRL)

XML.Dump
XML.dmp

Show the actual loaded XML-Data

Intention

This command is used to show the actual loaded XML-Data together with the XML-Data-Flags. You can see a sample of such a XML-Data Dump here:

```
0297  L:(004) A:(060) C: < Open Bracket,Outs. SQ/DQ,Self Terminate,Start Tag,
0298  L:(004) A:(083) C: S Between,Outs. SQ/DQ,Start Name,
0299  L:(004) A:(080) C: P Between,Outs. SQ/DQ,End Name,
0300  L:(004) A:(032) C:   Between,Outs. SQ/DQ,
0301  L:(004) A:(083) C: S Between,Outs. SQ/DQ,Start Attribute,
0302  L:(004) A:(080) C: P Between,Outs. SQ/DQ,
0303  L:(004) A:(078) C: N Between,Outs. SQ/DQ,
0304  L:(004) A:(097) C: a Between,Outs. SQ/DQ,
0305  L:(004) A:(109) C: m Between,Outs. SQ/DQ,
0306  L:(004) A:(101) C: e Between,Before EQ,Outs. SQ/DQ,
0307  L:(004) A:(061) C: = Between,Outs. SQ/DQ,
0308  L:(004) A:(034) C: " Between,Is DQ,Betw.DQ,After .EQ,
0309  L:(004) A:(083) C: S Between,Betw.DQ,
0310  L:(004) A:(080) C: P Between,Betw.DQ,
0311  L:(004) A:(053) C: 5 Between,Betw.DQ,
0312  L:(004) A:(034) C: " Between,Is DQ,Outs. SQ/DQ,
0313  L:(004) A:(047) C: / Between,Outs. SQ/DQ,End Attribute,
0314  L:(004) A:(062) C: > Close Bracket,Outs. SQ/DQ,Self Terminate,
0315  L:(004) A:(013) C: -
```

At the very left side you can see the sequential **Byte-number** (Address) of the Data Bytes.
These start at 1 and go up to the Length of your XML-Data in Bytes.
Then you can see the "**Level**" of the current Data-Byte.
Next you can see the **ASCII-Value** of the Data Byte itself.
Next, after the C: you can see the **Character String** of that Data-Byte.
Finally there are the **XML-Flags** of each Data Byte.

Syntax

XML.Dump[|P2][|P3]

Parameter Explanation

P2 - (optional) numeric Parameter - Start-Byte

P3 - (optional) numeric Parameter - End-Byte

3.84.8.8 dncb - Down Close Bracket

MiniRobotLanguage (MRL)

XML.Down Close Bracket
XML.dncb

Move position to close bracket in down direction

Intention

This command is used to move the actual position to the next > Closing bracket in down direction.

Usage:

```
' The new position will be in $$ERG
' if nothing found $$ERG=0
XML.dncb|$$ERG

' One Parameter will also work.
XML.dncb
XML.get pos|$$POS
PRT.Actual Position is: $$POS
```

Syntax

XML.Down Close Bracket[|P2]

Parameter Explanation

P2 **-** ***(optional)*** Variable to return the result, that is the new position or zero, if nothing was found. . The result is 0 in case nothing was found.
If something was found, the actual position will be set to this new position.
If P2 is omitted the result is been placed on TOS.

Example

```
'*********************************
'
'*********************************
'Prototype für IML.
$$PRO=Open Bracket
$$TXT=a real Open Bracket
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

3.84.8.9 dnob - Down Open Bracket

MiniRobotLanguage (MRL)

XML.Down Open Bracket
XML.dnob

Move position to open bracket in down direction

Intention

This command is used to move the actual position to the next < Open bracket in down direction.

Usage:

```
' The new position will be in $$ERG
' if nothing found $$ERG=0
XML.dnob|$$ERG

' One Parameter will also work.
XML.dnob
XML.get pos|$$POS
PRT.Actual Position is: $$POS
```

Syntax

XML.Down Open Bracket[|P2]

Parameter Explanation

P2 - ***(optional)*** Variable to return the result, that is the new position or zero, if nothing was found. . The result is 0 in case nothing was found.
If something was found, the actual position will be set to this new position.
If P2 is omitted the result is been placed on TOS.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$PRO=Open Bracket
$$TXT=a real Open Bracket
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
' Hier gehts los
PRT.------------------------
XML.dnob|$$ERG
XML.get pos|$$POS
PRT.Actual Position is: $$POS
PRT.------------------------
PRT. We are going to Dump these Bytes.
PRT.------------------------
XML.Dump|($$ERG-5)|($$ERG+5)
PRT.------------------------
MBX.!
:enx
ENR.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
ENR.
```

3.84.8.10 ftxt - Flags to Text

MiniRobotLanguage (MRL)

XML.Flags to Text
XML.ftxt

Convert numeric XML-Data Flags to textual readable flags

Intention

This command is used to convert a numeric expression into the textual equivalent of the XML-Data-Flags.

Example:

```
XML.ftxt|2|$$ERG
PRT.$$ERG
```

```
XML.ftxt|127|$$ERG
PRT.$$ERG
```

If you use

```
XML.ftxt
PRT.$$ERG
```

Then the command will use the flags from the actual position as input.
Therefore this operation will need a XML-File to be parsed or loaded first.

Syntax

XML.Flags to Text[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** numeric parameter that is converted to the equivalent flags. If omitted, the current position's flags are being used.

P3 - ***(optional)*** Variable for the result. If omitted TOS is used..

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$PRO=Open Bracket
$$TXT=a real Open Bracket
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
' Hier gehts los
PRT.------------------------
XML.dnob|$$ERG
XML.get pos|$$POS

3.84.8.11 gbl - Get Block

MiniRobotLanguage (MRL)

XML.Get Block
XML.gbl

Get a complete XML-Data Block

Intention

This command is used to retrieve the start- and end-position of the XML-Data-Block that we are in. They will be placed in **P2** and **P3**.

You can extract the block using the `XML.gxp`-command.
Here is an example:

```
XML.gbl|$$BSA|$$BSE
PRT.Current Block starts at: $$BSA
PRT.Current Block ends at: $$BSE
' Now we get the data from the block into $$BLO
XML.gxp|$$BSA|$$BSE|$$BLO
PRT.------------------------
PRT. This is the Block:
PRT.$$BLO
```

Syntax

XML.Get Block[|P2][|P3]

Parameter Explanation

P2 - (optional) Variable to return the start-byte of the block.
P3 - (optional) Variable to return the end-byte of the block.

The results are 0 in case of parsing errors. Otherwise the results of both parameters are
>0 and contain the start- and end-byte number, of that block where we are currently in.
If omitted any of the values are being placed on TOS (Top of Stack).

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$PRO=Open Bracket
$$TXT=a real Open Bracket

3.84.8.12 gend - Goto End Tag

MiniRobotLanguage (MRL)

XML.Goto End Tag
XML.GEnd

Goto nearest End-Tag

Intention

This command will set actual position to the **nearest `</xxx >` `End`**-Tag. It will jump over Tags that are self terminated.

The found End-Tag is just the "<" open bracket od the nearest End-Tag that is nearest to the current position.

Usage:

```
XML.GEnd|$$END

or

' We give the starting Position, that should be corrected to
' the start-position of the nearest End-Tag.
VAR.$$STA=199
XML.GEnd|$$END|$$STA
```

Hint:
If you need **the End-Tag of your current Tag**, use
`XML.gbl|$$STA|$$END`
instead. You will have the End-Tag Position in `$$END`.

Syntax

XML.Goto End Tag[|P2][|P3]

Parameter Explanation

P2 **-** ***(optional)*** Variable to return the result. The result is 0 in case of parsing errors.
Otherwise the result is >0 and contains the position of the End-Tag of our current positions start-tag.

*© 2023 Theo Gottwald * https://www.smart-package.com*

P3 **-** ***(optional)*** Numeric value that is taken as the start-tag position.
If omitted, current position is used.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.

3.84.8.13 gfl - Get Flags

MiniRobotLanguage (MRL)

XML.Get Flags
XML.gfl

Get XML-Flags

Intention

This command is used to retrieve the numerical XML-Flag Data for any Byte of the loaded XML-Code.

Usage is simple:

```
' Result will be on TOS (Top of Stack)
XML.gfl
' We take it drom TOS into Variable $$ERG
$$ERG=$$000
' We display the numeric value
PRT.Flags are: $$ERG
' This converts the number into a textual representation
XML.Ftxt|$$ERG|$$TXT
' We display the text
PRT. As Text: $$TXT
' Now we esamine the location $$POS+1
' Result comes into $$ERG
XML.gfl|($$POS+1)|$$ERG
' We convert and display its
XML.Ftxt|$$ERG|$$TXT
PRT. Next Byte as Text: $$TXT
```

Syntax

XML.Get Flags|P2[|P3]

Parameter Explanation

P2 - ***(optional)*** numeric parameter that is a byte address of the XML-Data. If omitted, the current position's flags are being used.

P3 - ***(optional)*** Variable for the result. If omitted TOS is used..

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

```
'**********************************
'
'**********************************
'Prototype für IML.

3.84.8.14 gfn - Get First Node

MiniRobotLanguage (MRL)

XML.Get First Node
XML.gfn

Get Position of first node in XML-Data

Intention

This command is used to move actual position to the fist "<" first node in the XML-Data.
If your XML-Data looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment attrib="Hall"-->
<PatchInformation XMLVersion="1."'>
<Products>
```

then the black marked < is the actual position after a call to "First node".
All System- and comment-Tags will be ignored.

It will return the found position as a result in **P2 (if P2 is specified)** or leave the address on the TOS.

Syntax

XML.Get First Node[|P2]

Parameter Explanation

P2 - (optional) Variable to return the result. The result is 0 in case of parsing errors.
Otherwise the result is >0 and contains the byte-address of the first node..

Example

```
'*********************************
'
'*********************************
'Prototype für IML.
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
$$PRO=Open Bracket
$$TXT=a real Open Bracket

3.84.8.15 gftxt - Get Flags as Text

MiniRobotLanguage (MRL)

XML.Get Flags as Text
XML.gftxt

Get XML-Flags as text

Intention

This command will retrieve the XML-Flags from a specified Byte-Address (**P2**) of the XML-Data. The result will be converted to readable text.

```
Usage is simple:

XML.gftxt
$$TXT=$$000
PRT.Actual Flags are: $$TXT
PRT.------------------------
XML.gftxt|($$POS+1)|$$TXT
PRT.Actual Flags are: $$TXT
PRT.------------------------
```

```
------------------------
Actual Flags are: Open Bracket,Outs. SQ/DQ,Self Terminate,System Tag,Start
------------------------
Actual Flags are: Between,Outs. SQ/DQ,Start Name,
------------------------
0001  L:(000) A:(060) C: < Open Bracket,Outs. SQ/DQ,Self Terminate,System
```

Syntax

XML.Get Flags as Text[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** *numeric Byte address of the XML-Data Byte from which you want the flags.*

P3 - ***(optional)*** *Variable for the textual result. If omitted, teh result is been placed on TOS.*

Example

```

3.84.8.17 glev - Get Level

MiniRobotLanguage (MRL)

XML.Get Level
XML.glev

Get XML-Nesting Level

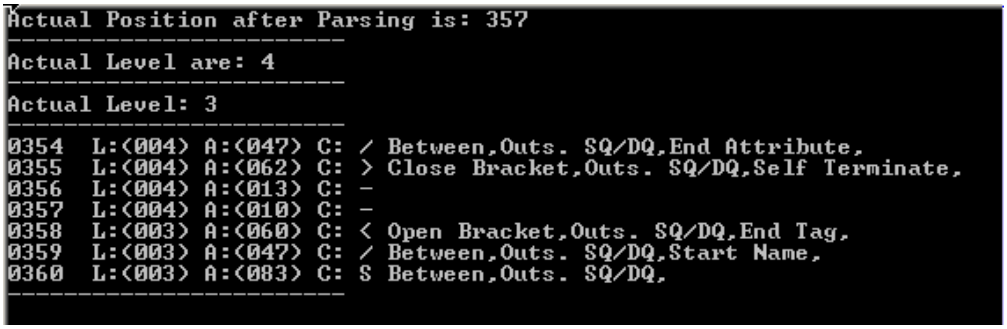
Intention

This command is used to retrieve the nesting level of any position in the XML-File. Note that Self-Terminating Tags do not increase or decrease the nesting level.

```
' Example for nesting Level.
<Level 0>
  <Level 1>
     <Level 2>

     <Level 2>
  <Level 1>
<Level 0>
```

You can see the nesting Level in the XML-Data Dump, behind the "L:" :



Syntax

XML.Get Level[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** *numeric Byte address of the XML-Data Byte from which you want the nesting Level.*

P3 - ***(optional)*** *Variable for the textual result.*

 © 2023 Theo Gottwald * https://www.smart-package.com

If omitted, teh result is been placed on TOS.

Example

3.84.8.18 gpo - Get Position

MiniRobotLanguage (MRL)

XML.Get Position
XML.gpo

Get or range check actual Position in XML-Data

Intention

This command is used to retrieve the actual position inside the XML-Data.
The actual position is automatically set to XML_Root (see gro - Get Root 4188) after Parsing.
It is changed by any successful search command to the search result position.
You can directly set the actual position using spo - Set Position 4273.

The XML Position or "actual position" is a number between 1 and XML-Lenght (see gle - Get Len 4177). Its simply a Byte Number in the XML-Data.

If **P3** is specified, the command will correct the numeric parameter in **P3** and make sure that it is in a valid positional range for the actual XML-Data.

The only difference between
`XML.gpo|$$RE|$$POS`
and
`XML.gpr|$$RE|$$POS`
is, that if **P3**< XML-Root then "`gpr`" will return XML-Length as **P2,** while "`gpo`" will return XML_Root as **P2**.

Syntax

XML.Get Position[|P2][|P3]

Parameter Explanation

P2 – ***(optional)*** *Variable for the numeric result of the actual XML-Position, or (if **P3** is specified), for the corrected value that was in **P3**..*
*If omitted, the result is been placed on **TOS***

P3 – ***(optional)*** *numeric Byte address of the XML-Data Byte that should be taken as position.*
*If **P3** is given, the number in **P3** and the value is been verified against the real size of the actual XML-Data. If **P3** is within the actual XML-Data size,*

 *© 2023 Theo Gottwald * https://www.smart-package.com*

it is returned unchanged. If P3 is not a valid XML-Address because its lower then
XML-Root or higher then XML-Length then its changed to the highest or lowest allowed value. The result is always in ***P2****. If P3 is given, the result is the "corrected"*
value in P3 and not necessarily the actual XML-Position.
.

Example

```
'**********************************
'
'**********************************
'
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
XML.Set Pos|357
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
' Hier gehts los
PRT.------------------------
XML.gpr
PRT.Position for Previous is: $$000

3.84.8.19 gpr - Get Position for Previous

MiniRobotLanguage (MRL)

XML.Get Position for Previous
XML.gpr

Get or range check actual Position in XML-Data

Intention

This command is used to retrieve the actual position inside the XML-Data.
The actual position is automatically set to XML_Root (see gro - Get Root 4188) after Parsing.
It is changed by any successful search command to the search result position.
You can directly set the actual position using spo - Set Position 4273.

The XML Position or "actual position" is a number between 1 and XML-Lenght (see gle - Get Len 4177). Its simply a Byte Number in the XML-Data.

If **P3** is specified, the command will correct the numeric parameter in **P3** and make sure that it is in a valid positional range for the actual XML-Data.

The only difference between
```
XML.gpr|$$RE|$$POS
```
and
```
XML.gpo|$$RE|$$POS
```
is, that if P3< XML-Root then "gpr" will return XML-Length as **P2,** while **"gpo"** will return XML_Root as **P2**.

Syntax

XML.gpr[|P2][|P3]

Parameter Explanation

P2 – ***(optional)*** *Variable for the numeric result of the actual XML-Position, or (if **P3** is specified), for the corrected value that was in **P3**..*
*If omitted, the result is been placed on **TOS***

P3 – ***(optional)*** *numeric Byte address of the XML-Data Byte that should be taken as position.*
*If **P3** is given, the number in **P3** and the value is been verified against the real size of the actual XML-Data. If **P3** is within the actual XML-Data size,*

© 2023 Theo Gottwald * https://www.smart-package.com

it is returned unchanged. If P3 is not a valid XML-Address because its lower then
*XML-Root or higher then XML-Length then its changed to the highest or lowest allowed value. The result is always in **P2**. If P3 is given, the result is the "corrected"*
value in P3 and not necessarily the actual XML-Position.

3.84.8.20 gro - Get Root

MiniRobotLanguage (MRL)

XML.Get Root
XML.gro

Get Root Position in XML-Data

Intention

This command is used to retrieve the position of the first open bracket in the XML-Data, which is called "XML-Root".

If for example, your XML-Code starts like this:

```
3w<?xml version="1.0" encoding="UTF-8"?>
```

then XML-Root would be at Position 3. If your XML looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
```

Then XML-Root will be at position 1.
After Parsing, the actual Position will always be XML-Root.

This command will not change the "actual position". It will just return the value of XML-Root whether in **P2** or on TOS.

Syntax

XML.Get Root[|P2]

Parameter Explanation

P2 ***- (optional)*** Variable to return the result. The result is 0 in case of parsing errors. Otherwise the result is >0 and contains the value XML_Root.

Example

```
'*********************************
'
'*********************************
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
'
$$XMF=3w<?xml version="1.0" encoding="UTF-8"?>

3.84.8.21 gsc - Get Asc

MiniRobotLanguage (MRL)

XML.Get Asc
XML.gsc

Get XML-Data from a file

Intention

This command is used to retrieve the ASCII-Value of any byte position of the XML-Data.
Usage:

```
$$POS=5
XML.gsc|$$POS|$$ASC
PRT.ASCII at $$POS is: $$ASC
```

Syntax

XML.Get Asc[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** *numeric Byte address of the XML-Data Byte that should be taken as position. If omitted, actual position is taken. If **P3** is given, the number in **P3** is used instead of the actual XML-Position.*

P3 - ***(optional)*** *Variable for the numeric result that is the ASCII-value of the Character at the actual position. If P3 is specified the ASCII value at that position is returned instead. If omitted, the result is been placed on **TOS***

Example

```
'*********************************
'
'*********************************
'
$$XMF=3w<?xml version="1.0" encoding="UTF-8"?>
' Now we are going to parse it
XML.Parse|$$XMF
```

3.84.8.22 gse - Get Start End Tags

MiniRobotLanguage (MRL)

XML.Get Start End Tags
XML.gse

Get Stat-/End-Tag position of actual Position's Tag

Intention

This command is used to get the Start- and End-Position of the XML-Data Block at the actual position. Thhs command will return the Start- and End-Tag that corresponds together.

Example:

```
<Tag_A>
     <Tag_B>
       Content
     </Tag_B>
</Tag_A>
```

If we are in Tag_A then we will get the position of the bold marked Characters of the XML-Data. This command is very useful if you want to retrieve a complete part of the XML-Data.

See also gbl - Get Block 4161 to retrieve directly the content inside the Start- and End-Tags..

Syntax

XML.Get Start End Tags[|P2][|P3]

Parameter Explanation

P2 **-** ***(optional)*** Variable to return the start-byte of the Tag.
P3 **-** ***(optional)*** Variable to return the end-byte of the Tag.

Example

3.84.8.23 gst - Goto Start Tag

MiniRobotLanguage (MRL)

XML.Goto Start Tag
XML.gst

Move actual Position to nearest upward Start-Tag

Intention

This command is used to change the actual position to the nearest Start-Tag in upward direction.If the actual position is already on a Start-Tag, the position will not be changed.

```
XML.gst
```

or

```
XML.gst|$$POS
```

In the second sample, the variable $$POS will return the new position or the unchanged position, if we are already on a start-Tag.

If you specify P3 like this;

```
XML.gst|$$POS|$$NPO
```

then **P3** will be used, instead of the actual position.

Syntax

XML.Goto Start Tag[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** Variable to return the result. The result is >0 and contains the actual position that is on a Start-Tag.
*If omitted, the result is been placed on **TOS***

P3 - ***(optional)*** *numeric Byte address of the XML-Data Byte that should be taken as position. If P3 is given, the result in **P2** is the "corrected" value from P3 on teh nearest Start-Tag in upward direction (previous)..*

*© 2023 Theo Gottwald * https://www.smart-package.com*

Example

3.84.8.24 gtfn - Goto First Node

MiniRobotLanguage (MRL)

XML.Goto First Node
XML.gtfn

Move actual Position to the first node in the XML-Data

Intention

This command is used to move actual position to the fist "<" first node in the XML-Data.
If your XML-Data looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment attrib="Hall"-->
<PatchInformation XMLVersion="1."'>
<Products>
```

then the black marked < is the actual position after a call to "First node".
All System- and comment-Tags will be ignored.

This is similar like `XML.gfn` but will not return a result and not place anything on the stack.

Syntax

XML.Goto First Node

Parameter Explanation

-

Example

```
'*********************************
'
'*********************************
'
$$PRO=Open Bracket
$$TXT=a real Open Bracket
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
```

3.84.8.25 gtn - Get this Name

MiniRobotLanguage (MRL)

XML.Get this Name
XML.gtn

Get the name of the Tag at the actual position

Intention

This command is used to retrieve the Tag's name a t the actual position.

Here are two examples for Tag-Names:

```
' The name of this Tag is "Patch"
<Patch PatchName="SQLServer2">

' The name of this Tag is SP
<SP SPName='SP3'/>
```

Usage is simpe:

```
XML.gtn
PRT.Name is: $$000
```

or

```
XML.gtn|$$BAB|$$POS
PRT. The Tag name at position $$POS is $$BAB.
```

Syntax

XML.Get this Name[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** Variable to return the result. The result is the name of the Tag or "" if no name could be retrieved.
*If **P2** is omitted, the result is been placed on **TOS***

P3 - ***(optional)*** *numeric Byte address of the XML-Data Byte that should be taken as position. If **P3** is omitted, the actual position is taken instead.*

3.84.8.26 gtr - Goto Root

MiniRobotLanguage (MRL)

XML.Goto Root
XML.gtr

Goto Root Position in XML-Data

Intention

This command is used to position the internal "actual position" onto the first open bracket in the XML-Data, which is called "XML-Root".

If for example, your XML-Code starts like this:

```
3w<?xml version="1.0" encoding="UTF-8"?>
```

then XML-Root would be at Position 3. If your XML looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
```

Then XML-Root will be at position 1.

After Parsing, the actual Position will always be XML-Root.
Therefore you only need to call this function if you want to go back to a defined position.

This command will set the actual position and additionally return the value of XML-Root whether in **P2** or on TOS.

Syntax

XML.Goto Root[|P2]

Parameter Explanation

P2 - (optional) Variable to return the result. The result is 0 in case of parsing errors. Otherwise the result is >0 and contains the value XML_Root.

Example

© 2023 Theo Gottwald * https://www.smart-package.com

```
'**********************************
'
'**********************************
'
$$XMF=3w<?xml version="1.0" encoding="UTF-8"?>

3.84.8.27 gxp - Get XML Part

MiniRobotLanguage (MRL)

XML.Get XML Part
XML.gxp

Get a part of the XML-Data into a variable

Intention

This command is used to retrieve a specified part or all of the XML-Data into a variable or onto TOS.

You can specify the start- and end-position of the XML-Data-Block that we want. They will be placed in **P2** and **P3**. Here is an example:

```
XML.gbl|$$BSA|$$BSE
PRT.Current Block starts at: $$BSA
PRT.Current Block ends at: $$BSE
' Now we get the data from the block into $$BLO
XML.gxp|$$BSA|$$BSE|$$BLO
PRT.------------------------
PRT. This is the Block:
PRT.$$BLO
```

To get all of the XML-Data into a variable, just use **P4**, and leave **P2** and **P3** empty or fill them with a zero. Having all XML-Data in a variable, enables you to use all SPR String-Commands on the XML-Data, to search or replace things.
After that you can just "`XML.Parse`" that variable and work on the changed XML-Data.

Syntax

XML.Get XML Part|P2[|P3][|P4]

Parameter Explanation

P2 - ***(optional)*** Variable to specify the start-byte of the block.
If omitted or zero, XML-Root will be used.

P3 - ***(optional)*** Variable to specify the end-byte of the block.
If omitted or zero, XML-Length will be used.

© 2023 Theo Gottwald * https://www.smart-package.com

P4 **-** ***(optional)*** Variable to return the result. The result is "" (empty) in case of parsing errors. Otherwise the result is the XML-Data-Part..

To get all of the XML-Data into a variable, just use **P4**, and leave **P2** and **P3** empty or fill them with a zero. Having all XML-Data in a variable, enables you to use all SPR String-Commands on the XML-Data, to search or replace things.
After that you can just "`XML.Parse`" that variable and work on the changed XML-Data.

Example

```
'**********************************
'
'**********************************
'Prototype für IML.
$$PRO=Open Bracket
$$TXT=a real Open Bracket
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF

3.84.8.28 inc pos - Increment Position

MiniRobotLanguage (MRL)

XML.Increment Position
XML.inc pos

Get XML-Data from a file

Intention

This command is used to change the internal "actual position Pointer". It will increment this pointer by 1. If **P2** is given, the actual position will be incremented by the number in P2.

Immediately after parsing, the actual position is at the Root of the Document.
After any successful search, the actual position is at the start tag of the found tag.

To find out the actual position, you can use the gpo - Get Position 4182 command.
To set the position to another value you can use the spo - Set Position 4273 command.

Syntax

XML.Increment Position[|P2]

Parameter Explanation

P2 **-** ***(optional)*** Variable or numeric parameter, that is incremented from current position. If omitted, 1 is used.

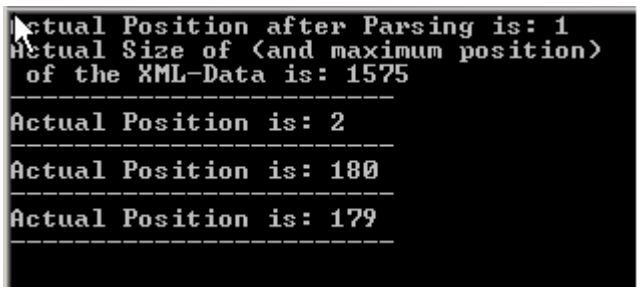
Example

```
'*********************************
'
'*********************************
'Prototype für IML.
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
XML.get len|$$LEN
PRT.Actual Size of (and maximum position)
PRT. of the XML-Data is: $$LEN
'Here we start
PRT.------------------------
XML.inc pos
GSB. pos
PRT.------------------------
XML.sdn|{&EXACT:Product}
GSB.pos
PRT.------------------------
XML.dec pos
GSB. pos
PRT.------------------------
MBX.!
:enx
ENR.
'-------------------------------------------------------------
:pos
XML.get pos|$$POS
PRT.Actual Position is: $$POS
RET.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

This is the result of the sample script:



Remarks

You can not Increment the actual position to values that are outside of the current loaded XML-File. The command will prevent this internally. The valid values range from 1 to XML-Length.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

3.84.8.29 ixp - Insert XML-Part

MiniRobotLanguage (MRL)

XML.Insert XML Part
XML.ixp

Insert Text at a specified place into the XML-Data (and reparse if needed)

Intention

This command is used to insert Text or Data parts into the XML-Data.

If you do change the total length of the XML-Data then the Parser will automatically re-parse the data and set all flags from new.
If you do not change the total length of the XML-Data then its up to you, if you want a Re-Parse or not.
See the command: **rpa - Reparse** 4232 .

If you want to remove or replace parts of the XML-Data, you can either use

- ssc - Set Asc 4280
- scr - Set Chr 4242
- sxp - Set XML Part 4293

Or transfer the complete XML-Data into a Variable, then use the normal "String Commands, and then Parse the Variable again using the XML-Parse command.

To get all of the XML-Data into a variable, use
`XML.gxp|||$$ALL`
just use **P4**, and leave **P2** and **P3** empty or fill them with a zero.

Having all XML-Data in a variable, enables you to use all SPR String-Commands on the XML-Data, to search or replace things.

After that you can just "`XML.Parse`" that variable and work on the changed XML-Data.

Syntax

XML.Insert XML Part|P2|P3|P4

Parameter Explanation

 *© 2023 Theo Gottwald * https://www.smart-package.com*

P2 – **Text** that is inserted at Place P3 - or if P3 is omitted, at the actual position into
the XML-Data.

P3 – ***(optional) numeric position*** where the text shall be inserted into the XML-Data. If zero, the actual position is taken.
If negative, it will count position from the end of the XML-Data backwards.

Example

```
'**********************************
'
'**********************************
'
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!

3.84.8.30 met - My End Tag

MiniRobotLanguage (MRL)

XML.My End Tag
XML.met

Get the End-Tag from the Tag at actual position

Intention

This command is used to set actual position to the End-Tag of the actual Start-Tag.
This command will return the End-Tag that corresponds with the actual Start-Tag.

Example:

```
<Tag_A>
     <Tag_B>
       Content
     </Tag_B>
</Tag_A>
```

If we are in <Tag_A then we will get the position of the bold marked Character
`</Tag_A>` from the End-Tag .

See also gbl - Get Block 4161 to retrieve directly the content inside the Start- and End-Tags..
See also gse - Get Start End Tags 4194 if you want both Tags with one command.

Syntax

XML.My End Tag[|P2]

Parameter Explanation

P2 - (optional) Variable to return the result. If nothing is found, the variable will be 0.

If omitted, the result will also be placed on TOS. The actual position will be changed, if something was found.

Example

*© 2023 Theo Gottwald * https://www.smart-package.com*

3.84.8.31 mst - My Start Tag

MiniRobotLanguage (MRL)

XML.My Start Tag
XML.mst

Get the Start-Tag from the Tag at actual position

Intention

This command is used to set actual position to the Start-Tag of the actual End-Tag. This command will return the Start-Tag that corresponds with the actual located End-Tag.

Example:

```
<Tag_A>
     <Tag_B>
       Content
     </Tag_B>
</Tag_A>
```

If we are in `</Tag_A>` then we will get the position of the bold marked Character `<Tag_A>` from the Start-Tag .

See also gbl - Get Block 4161 to retrieve directly the content inside the Start- and End-Tags..
See also gse - Get Start End Tags 4194 if you want both Tags with one command.

Syntax

XML.My Start Tag[|P2]

Parameter Explanation

P2 - (optional) Variable to return the result. If nothing is found, the variable will be 0.

If omitted, the result will also be placed on TOS. The actual position will be changed, if something was found.

Example

3.84.8.32 prt - Print

MiniRobotLanguage (MRL)

XML.Print
XML.prt

Pretty Print the whole XML-Data into a Variable or a debug console

Intention

This command will print the whole XML-Data into a Debug- Console window, or if a variable is given, into the variable.
It will try to produce XML-Text that is loadable into a text-editor program, by inserting
Linefeeds between the Tags.

```
XML.Print|$$END
$$FIL=?desktop\PrintOut.txt
DEL.$$FIL
CTF.$$FIL|$$END
```

if you omit the variable, the Printout will go into a debug console window.

```
XML.Print
```

Syntax

XML.Print[|P2]

Parameter Explanation

P2 **-** Variable to return the XML-Listing.

Example

```
'*********************************
'
'*********************************
'
$$XMF=?pfad\Small_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
```

3.84.8.33 ptse - Position to Start or End Tag

MiniRobotLanguage (MRL)

XML.Position to Start or End Tag
XML.ptse

Get or change current position to nearest Start- or End-Tag

Intention

This command is used to locate the nearest Start- or End-Tag to the actual position.
It will change the actual position, and it will return the found Tag-Position,
if you specify **P2**.
If you specify **P3**, then **P3** will be taken instead of the actual position.

If the actual position is already on a Start-Tag or End-Tag, the position will not be changed.

```
XML.ptse
```

or

```
XML.ptse|$$POS
```

In the second sample, the variable $$POS will return the new position or the unchanged position, if we are already on a start-Tag.

If you specify P3 like this;

```
XML.ptse|$$POS|$$NPO
```

then **P3** will be used, instead of the actual position.

Syntax

XML.ptse[|P2][|P3]

Parameter Explanation

P2 - ***(optional)*** Variable to return the result. The result is >0 and contains the actual position that is on a Start-Tag.

*© 2023 Theo Gottwald * https://www.smart-package.com*

*If omitted, the result is been placed on **TOS***

P3 *- **(optional)** numeric Byte address of the XML-Data Byte that should be taken as position. If P3 is given, the result in **P2** is the "corrected" value from P3 on teh nearest Start-Tag in upward direction (previous)..*

Example

```
'**********************************
'
'**********************************
'
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx

3.84.8.34 rpa - Reparse

MiniRobotLanguage (MRL)

XML.Reparse
XML.rpa

Parse changed XML-Data and re-generate XML-Flags

Intention

This command is used to Parse already loaded or parsed XML-Data again.
This is only needed in very few cases, after you have changed the XML-Data using any of the commands that change the XML-Data, like:

- ssc - Set Asc 4280
- scr - Set Chr 4242
- sxp - Set XML Part 4293

If you use sxp - Set XML Part 4293 and change the total length of the XML-Data then the reparse will be done automatically.

I other cases, when you just change a few characters, you may want to make the reparse manually, because in these cases its not done automatically (because it takes time on large XML-files).

Syntax

XML.Reparse

Parameter Explanation

-

Example

```
'**********************************
'
'**********************************
'
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err

3.84.8.35 sad - Search All Down

MiniRobotLanguage (MRL)

XML.Search All Down
XML.sad

Search XML-Flags in down direction

Intention

This command is used to search specified XML-Data Flags, starting from the actual position, in downward direction. You can use all these flags (See Link):

! SPR - XML-Parser Flags 3981

Usage:

```
XML.sad|start tag+open bracket+self terminate
XML.get pos|$$POA
PRT.Actual Position is: $$POA
```

`XML.sad` will always start from the actual position.

Syntax

XML.Search All Down|P2[|P3]

Parameter Explanation

P2 – *numeric or textual Flag-Description. For Details see here:*
. ! SPR - XML-Parser Flags 3981

P3 – ***(optional)*** Variable to return the result. The result is >0 and contains the actual position that matched all of the specified flags.
If omitted, the result is been placed on ***TOS***

Example

```
'*********************************
'
```

3.84.8.37 scr - Set Chr

MiniRobotLanguage (MRL)

XML.Set Chr
XML.scr

Change a Byte in the XML-Data to a specified Character

Intention

This command is used to change a Single Character inside the XML-Data to a specified other character.
You may need a Reparse, if this change will influence the XML-Structure.
Reparse is done using: rpa - Reparse 4232

```
' These lines are doing the same thing:
' as 62=ASCII of ">"
XML.scr|$$BSA|>
XML.ssc|$$BSA|62
```

Hints:
To specify an ASCII Value instead of a CHaracter, use:
ssc - Set Asc 4280

To replace whole words or Data-Blocks, use
sxp - Set XML Part 4293

Syntax

XML.Set Chr|P2[|P3]

Parameter Explanation

P2 - ***(optional)*** *numeric Byte address of the XML-Data Byte that should be taken as position. If zero, the actual position is taken.*

P3 - ***(optional)*** *Variable* with just one character that is been placed inside the XML-Data at the position which is specified in ***P2.***

3.84.8.38 sdn - Search Down Tag Name

MiniRobotLanguage (MRL)

XML.Search Down Tag Name
XML.sdn

Get XML-Data from a file

Intention

This command is used to search a XML-Tag with a specified Tag-Name in downward direction.

It is important that you understand that you can use "Parts of a Name" to specify the name of the Tag you search for.
This may have unwanted side effects that you have to be aware of.
Take this example.

```
<PName>
     <Name>
       Nametext
     </Name>
</PName>
```

Searching like this:

```
XML.sdn|Name
```

will bring up the next such Tag, that can be the Tag

```
</PName>
```

because the name contains the ward "Name".

To specify exactly what you are looking for, you have to use the
3.2 Standard-Search Pattern 341

In this case you would write
`XML.sdn|&EXACT:Name`
to really get what you want.

In the same way you could specify multiple valid words and connect them with `&OR:`
`XML.sdn|{&EXACT:Name}&OR:{&EXACTnombre}`
and use this feature to build international scripts.

Syntax

© 2023 Theo Gottwald * https://www.smart-package.com

XML.Search Down Tag Name|P2[|P3]

Parameter Explanation

P2 – Variable with Tag-Name to search for, use: 3.2 Standard-Search Pattern 341

P3 – Variable to return the result. The result is 0 in case nothing was found.
Otherwise the result is >0 and contains the position of the found Open-Tag "<"..

Example

```
'**********************************
'

3.84.8.41 sna - Search Name and Attribute

MiniRobotLanguage (MRL)

XML.Search Name and Attribute XML.sna

Search specified Tags with specified attributes

Intention

This command is used to search a defined Place in the XML-Data. To specify this place, you can give the Tag-Name and the name of an attribute inside of the Tag.

To search the following Tag:

```
<Patch PatchName="SQLServer" SQNumber="Q2716433">
```

you could use this line:

```
XML.sna|Patch|SQNum
```

For this command you need to provide the name as well as the attribute-Name.
If you want to search only "by Name" you can use the

- sun - Search Up Tag Name 4290
- sdn - Search Down Tag Name 4247

commands.

This command will search from the current position downwards.

If you have several fitting Tags or attributes with the same name, you can specify a count in **P3** and **P4**.

```
XML.sna|Patch|SQNum|2|3
```

In this case, the 2nd Tag with a name and attribute that matches the specification is a valid result.
Only the 3rd attribute that matches the attribute specification will be valid in this case.

It is important to understand that the first counter - in this case **P2** will count the total match of both - name and attribute . while the second counter **P3** only defines the count of the attribute in the actual examined tag.

Example:

```
<Patch PatchName="SQLServer" SQNumber="Q2716433"
SANumber="Q2716433" SCNumber="Q2716433">
```

Assume that you do not know the exact name of the third attribute of the tag you are looking for. You could write:

© 2023 Theo Gottwald * https://www.smart-package.com

```
XML.sna|Patch|S&ANDTHEN:Num|1|3
```

Note the use of 3.2 Standard-Search Pattern 341 that are perfect for these cases. Using the Pattern, any attribute Name that starts with a "S" and then has following the word "Num" will be fine.

Syntax

XML.sna|P2|P3[|P4][|P5]

Parameter Explanation

P2 – Variable with the name of the Tag that should be searched for.
You can and need to use 3.2 Standard-Search Pattern 341 to specify the Tag-Name.

P3 – Variable with the name of the attribute that should be retrieved.
You can and need to use 3.2 Standard-Search Pattern 341 to specify the name of the attribute that you want.

P3 – ***(optional)*** Count. In case there are multiple Tags and attributes with names that fit the description, you can specify the number of the Tag Name that you want.If omitted "1" is the default number.
P3 does not only count "valid Tag Names" but valid results that have a fitting Tag name as well as a fitting attribute name.

P4 – ***(optional)*** Count. In case there are multiple attributes with the same name, you
can specify the number of the attribute that you want. If omitted "1" is the default number.

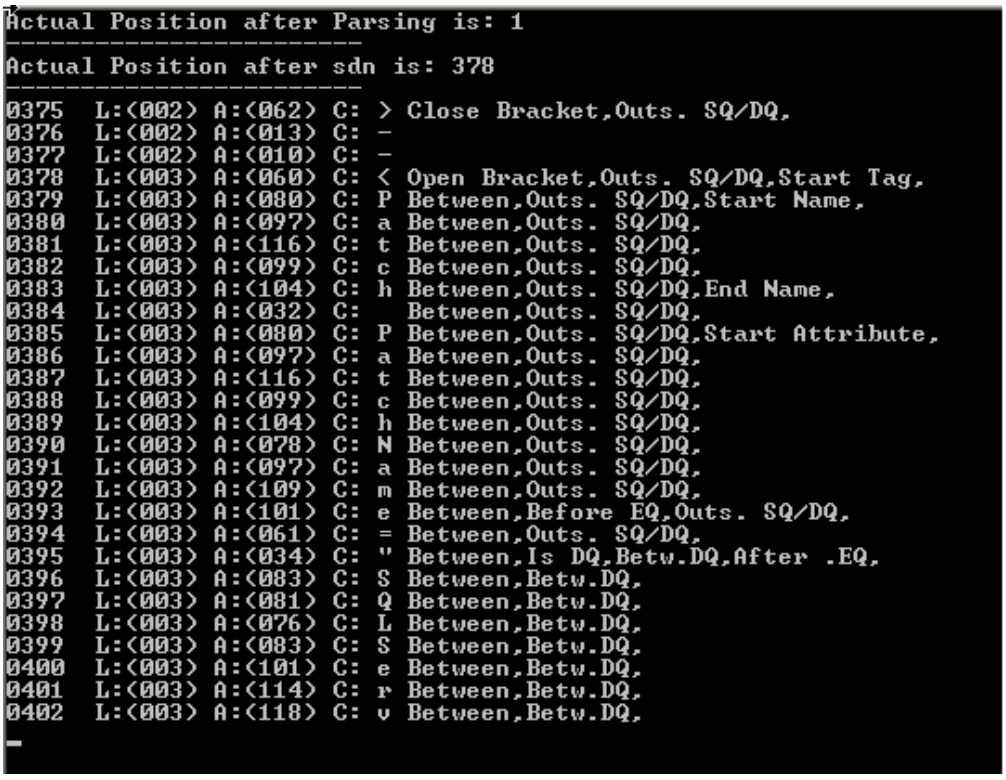
Example

```
'**********************************
'
'**********************************
'
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRT.Actual Position after Parsing is: $$POS
' Here we search ...
PRT.------------------------
XML.sna|Patch|SQNumb
XML.get pos|$$POA
PRT.Actual Position after sdn is: $$POA
PRT.------------------------
XML.Dump|($$POA-3)|($$POA+24)
MBX.!
:enx
ENR.
'-------------------------------------------------------------
' Error Handler
:Lab_Err
XML.get error|$$ERT
DBP.$$ERT
ENR.
```

This is the result of the sample script:



Remarks

Currently there is no search in upward direction like `XML.sna`.

Limitations:

3.84.8.42 snaup - Search Name and Attribute Up

XML.Search Name and Attribute upwards ***Previous*** 4258 ***Top*** 41 ***Next*** 4267

MiniRobotLanguage (MRL)

XML.Search Name and Attribute up
XML.snaup

Search specified Tags with specified attributes

Intention

This command is used to search a defined Place in the XML-Data. To specify this place, you can give the Tag-Name and the name of an attribute inside of the Tag.

To search the following Tag:

```
<Patch PatchName="SQLServer" SQNumber="Q2716433">
```

you could use this line:

```
XML.snaup|Patch|SQNum
```

For this command you need to provide the name as well as the attribute-Name.
If you want to search only "by Name" you can use the

- sun - Search Up Tag Name 4290
- sdn - Search Down Tag Name 4247

commands.

This command will search from the current position upwards.
To search downwards, use: sna - Search Name and Attribute 4258

If you have several fitting Tags or attributes with the same name, you can specify a count in **P3** and **P4**.

```
XML.sna|Patch|SQNum|2|3
```

In this case, the 2nd Tag with a name and attribute that matches the specification is a valid result.
Only the 3rd attribute that matches the attribute specification will be valid in this case.

It is important to understand that the first counter - in this case **P2** will count the total match of both - name and attribute . while the second counter **P3** only defines the count of the attribute in the actual examined tag.

Example:

```
<Patch PatchName="SQLServer" SQNumber="Q2716433"
SANumber="Q2716433" SCNumber="Q2716433">
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

Assume that you do not know the exact name of the third attribute of the tag you are looking for. You could write:

```
XML.snaup|Patch|S&ANDTHEN:Num|1|3
```

Note the use of 3.2 Standard-Search Pattern 341 that are perfect for these cases. Using the Pattern, any attribute Name that starts with a "S" and then has following the word "Num" will be fine.

Syntax

XML.sna|P2|P3[|P4][|P5]

Parameter Explanation

P2 – Variable with the name of the Tag that should be searched for.
You can and need to use 3.2 Standard-Search Pattern 341 to specify the Tag-Name.

P3 – Variable with the name of the attribute that should be retrieved.
You can and need to use 3.2 Standard-Search Pattern 341 to specify the name of the attribute that you want.

P3 – ***(optional)*** Count. In case there are multiple Tags and attributes with names that fit the description, you can specify the number of the Tag Name that you want.If omitted "1" is the default number.
P3 does not only count "valid Tag Names" but valid results that have a fitting Tag name as well as a fitting attribute name.

P4 – ***(optional)*** Count. In case there are multiple attributes with the same name, you
can specify the number of the attribute that you want. If omitted "1" is the default number.

Example

```
'**********************************
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors

3.84.8.43 spa - Split Attrib at

MiniRobotLanguage (MRL)

XML.Split Attrib at
XML.spa

Split attribute at actual position into name and value

Intention

This command is used to split an attribute at the current position into name and value.
For this command you need to have the actual position inside of an attribute name.

For this you can use the

- abm - Attrib by Number 4128
- abn - Attrib by Name 4131
- abv - Get Attrib by Value 4135

After these commands, the actual position is on the attributes End.
To get back to the start of the attribute, use:

```
XML.siu|start attribute
```

This will set the actual position to the start of the attribute.Then you can use

```
XML.spa
```

Unlike `XML.spl` you do not give a text string as parameter, but just two variables that will be filled with the name and value of the attribute at the actual position.

Technically the command will look for a "start attribute"-Flag upwards first.
If one is found, that attribute will be taken. If none is found, the command will search an attribute in downward direction. All of these must be inside the Tag at the actual position. This command will not search into other tags, outside of the Tag at the actual position.

Syntax

XML.Split Attrib at[|P2][|P3]

Parameter Explanation

© 2023 Theo Gottwald * https://www.smart-package.com

P2 - ***(optional)*** Variable to return the name of the attribute. If omitted the result is placed on TOS.

P3 - ***(optional)*** Variable to return the value of the attribute. If omitted this value is placed on TOS (Top of Stack).

Example

```
'**********************************
'
'**********************************
'
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
' Here we search ...
PRT.------------------------
XML.sna|Patch|SQNum
XML.abn|SQNum
XML.siu|start attribute
XML.get pos|$$POA
PRT.Actual Position after sdn is: $$POA
XML.spa|$$NAM|$$VAL
PRT. The attributes Name is: $$NAM
PRT. The attributes Value is: $$VAL

PRT.------------------------

3.84.8.44 spdn - Search Pattern Down

MiniRobotLanguage (MRL)

XML.Search Pattern Down
XML.spdn

Search a textual pattern in downward direction

Intention

This command is a textual search that will search "brute force" through the tags for any matching textual pattern.
As usual, you can use 3.2 Standard-Search Pattern 341 that are perfect for these cases.

Technically this command will start at the next "Start Tag" in downward direction, and then scan inside of "Open Bracket" to "Close Bracket" for the wanted Textual Pattern..

This way you can search any combination of attribute and values or other Tag combinations, like multiple attributes or values.

You can use spup - Search Pattern Up 4276 for the same type of search in reverse direction.

In case the search was successful, the actual position will be changed to the Start-Tag (Open Bracket) of the Tag that contains the textual pattern.

Syntax

XML.spdn|P2[|P3][|P4]

Parameter Explanation

P2 **-** ***Pattern*** to search for. Use 3.2 Standard-Search Pattern 341 or a part of the wanted text.
P3 **-** ***(optional)*** Result, numeric position
P4 **-** ***(optional)*** Count, in case there are multiple fitting matches per Tag.

Example

```
'*************************************
'
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

```
'**********************************
'
$$XMF=?pfad\SQ_XML.txt

3.84.8.45 spo - Set Position

MiniRobotLanguage (MRL)

XML.Set Position
XML.spo

Manually set the actual position (pointer to actual position)

Intention

This command is used to set the actual position to y byte-position in the XML-Data, that starts at (Byte Nr.) 1 and goes up to Byte Nr. "XML-Length".

You can specify a negative position, in this case, the bytes are counted reverse, starting at the end of the XML-Data, that is XML-Length.

```
-1 = Byte "XML-Lenght",
-2 = "XML-Lenght"-1
-3 = "XML-Lenght"-2
```
etc.

To find out where the actual position is, you can use:
gpo - Get Position 4182

Usage:

```
XML.Set Pos|357
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
```

Syntax

XML.Set Position[|P2]

Parameter Explanation

P2 **-** ***(optional)*** numeric parameter that contains a valid position inside the XML-Data.
If omitted or zero, the actual position is used.
If the given number is larger then XML-Length, the number is set to XML-Length.

*© 2023 Theo Gottwald * https://www.smart-package.com*

You can specify a negative position, in this case, the bytes are counted reverse, starting at the end of the XML-Data, that is XML-Length.

```

3.84.8.46 spup - Search Pattern Up

MiniRobotLanguage (MRL)

XML.Search Pattern Up
XML.spup

Search a textual pattern in upward direction

Intention

This command is a textual search that will search "brute force" through the tags for any matching textual pattern.

As usual, you can use 3.2 Standard-Search Pattern 341 that are perfect for these cases.

Technically this command will start at the next "Start Tag" or "End Tag" in upward direction, And then scan inside of "Open Bracket" to "Close Bracket" for the wanted Textual Pattern..

This way you can search any combination of attribute and values or other Tag combinations, like multiple attributes or values.

You can use spdn - Search Pattern Down 4270 to have the same search for a downward search.

In case the search was successful, the actual position will be changed to the Start-Tag (Open Bracket) of the Tag that contains the textual pattern.

Syntax

XML.spup|P2[|P3][|P4]

Parameter Explanation

P2 - ***Pattern*** to search for. Use 3.2 Standard-Search Pattern 341 or a part of the wanted text.
P3 - ***(optional)*** Result, numeric position
P4 - ***(optional)*** Count, in case there are multiple fitting matches per Tag.

Example

3.84.8.47 ssc - Set Asc

MiniRobotLanguage (MRL)

XML.Set Asc
XML.ssc

Change a Byte in the XML-Data to a specified ASCII-value

Intention

This command is used to change a Single Character inside the XML-Data to a specified other character. Unlike with

you can specify the character here, using the ASCII-value.

```
' These lines are doing the same thing:
' as 62=ASCII of ">"
XML.scr|$$BSA|>
XML.ssc|$$BSA|62
```

You may need a Reparse, if this change will influence the XML-Structure.
Reparse is done using: rpa - Reparse 4232

Hints:
To specify an Character instead of an ASCII Value, use:
scr - Set Chr 4242

To replace whole words or Data-Blocks, use
sxp - Set XML Part 4293

Syntax

XML.Set Asc|P2|P3

Parameter Explanation

P2 – numeric parameter that contains a valid position inside the XML-Data.
If omitted or zero, the actual position is used.
If the given number is larger then XML-Length, the number is set to XML-Length.
You can specify a negative position, in this case, the bytes are counted reverse, starting at the end of the XML-Data, that is XML-Length.

© 2023 Theo Gottwald * https://www.smart-package.com

```
-1 = Byte "XML-Lenght",
-2 = "XML-Lenght"-1
-3 = "XML-Lenght"-2
```
etc.

P3 – Single Character (can be in a variable also) that is been placed inside the XML-Data
at the specified position.

Example

```
'*********************************
'
'*********************************
'
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx
EIF.
' Now we are going to parse it
XML.Load File|$$XMF
' We check if there are errors
JIT.Lab_Err
' We get the "actual position" - after parsing.
XML.get pos|$$POS
PRT.Actual Position after Parsing is: $$POS
' Hier gehts los
PRT.------------------------
XML.sdn|&EXACT:SURLS
XML.get pos|$$POS
PRT.Actual Position is: $$POS
XML.gbl|$$BSA|$$BSE
PRT.Current Block starts at: $$BSA
PRT.Current Block ends at: $$BSE
PRT.------------------------
PRT.This is the block before change:
PRT.------------------------
XML.Print
PRT.------------------------
PRT.Now we use Set-XML-Part to change the block
$$TXT=!!!!!!!! New Block-Text !!!!!!!!!!
XML.sxp|$$BSA|$$BSE|$$TXT
PRT.------------------------
XML.Print
PRT.------------------------
PRT. In this case the Reparse was done internally.
PRT.------------------------
PRT.Now we will make a character change in the XML-Data
XML.scr|$$BSA|>
' This line is doing the same again! (62=ASCII of ">" )
XML.ssc|$$BSA|62
XML.ReParse
PRT.------------------------
XML.Print
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
PRT.------------------------
PRT. We Dump Positions
XML.Dump|($$BSA-3)|($$BSA+3)
PRT.------------------------
XML.Dump|($$BSB-3)|($$BSB+3)
MBX.!
:enx

3.84.8.50 sun - Search Up Tag Name

MiniRobotLanguage (MRL)

XML.Search Up Tag Name
XML.sun

Get XML-Data from a file

Intention

This command is used to search a XML-Tag with a specified Tag-Name in upward direction.
It is important that you understand that you can use "Parts of a Name" to specify the name of the Tag you search for.
This may have unwanted side effects that you have to be aware of.
Take this example.

```
<PName>
    <Name>
      Nametext
    </Name>
</PName>
```

Searching like this:

```
XML.sun|Name
```

will bring up the next such Tag, that can be the Tag

```
</PName>
```

because the name contains the ward "Name".

To specify exactly what you are looking for, you have to use the
3.2 Standard-Search Pattern 341

In this case you would write
`XML.sun|&EXACT:Name`
to really get what you want.

In the same way you could specify multiple valid words and connect them with `&OR:`
`XML.sun|{&EXACT:Name}&OR:{&EXACTnombre}`
and use this feature to build international scripts.

Syntax

*© 2023 Theo Gottwald * https://www.smart-package.com*

XML.Search Up Tag Name|P2[|P3]

Parameter Explanation

P2 – Variable with Tag-Name to search for, use: 3.2 Standard-Search Pattern 341.

P3 – Variable to return the result. The result is 0 in case nothing was found.
Otherwise the result is >0 and contains the position of the found Open-Tag "<".

Example

```
'***********************************
'
'***********************************
'
$$XMF=?pfad\SQ_XML.txt
NEF.$$XMF
  MBX.File $$XMF was not found!
  GTO.enx

3.84.8.51 sxp - Set XML Part

MiniRobotLanguage (MRL)

XML.Set XML Part
XML.sxp

Remove/Replace Text at a specified place of the XML-Data (and reparse if needed)

Intention

This command is used to change parts of the XML-Data.
You can replace XML-Parts with other parts.

If you just want to remove a part of the XML-Data, then leave **P4** empty.

If you do change the total length of the XML-Data then the Parser will automatically re-parse the data and set all flags from new.
If you do not change the total length of the XML-Data then its up to you, if you want a Re-Parse or not.

See the command: rpa - Reparse 4232 .

Syntax

XML.Set XML Part|P2|P3|P4

Parameter Explanation

P2 – ***numeric Start-position*** of the text that is going to be replaced with the new text in ***P4***. ***If zero, XML-Root is taken.***
If negative, it will count position from the end of the XML-Data backwards.

P3 – ***numeric End-position*** of the text that is going to be replaced with the new text in ***P4***. ***If zero, XML-Length is used.***
If negative, it will count position from the end of the XML-Data backwards.
P3 must always be larger then P2.

P4 – **Text** that is inserted, replacing the text in the XML-Data that is between **P2** and **P3**.

3.84.8.52 upcb - Up Close Bracket

MiniRobotLanguage (MRL)

XML.Up Close Bracket
XML.upcb

Move position to close bracket in upward direction

Intention

This command is used to move the actual position to the next > Close bracket in upward direction.

Usage:

```
' The new position will be in $$ERG
' if nothing found $$ERG=0
XML.upcb|$$ERG

' One Parameter will also work.
XML.upcb
XML.get pos|$$POS
PRT.Actual Position is: $$POS
```

Syntax

XML.Up Close Bracket[|P2]

Parameter Explanation

P2 - ***(optional)*** Variable to return the result, that is the new position or zero, if nothing was found. . The result is 0 in case nothing was found.
If something was found, the actual position will be set to this new position.
If P2 is omitted the result is been placed on TOS.

Example

3.85 ZIP. - Handle Archives

3.85.1 ! Smarty's ZIP-Commands

Smarty's ZIP-Commands Previous 937 Top 41 Next 946

Smarty's ZIP Commands

Smarty can work with ZIP-Archives.
You can:

- extract Archives with Folders and files. (`ZIP.`)
- compress complete foiders into a single ZIP-File. (`ZIP.`)
- compress and uncompress Text-Data that is available in a variable. (`ZIP.`)
- Test if a specified **filename or foldername exists inside an Archive** or not. (`IFZ.`)

You can also apply these methods to groups of files, using `FEF`.

*© 2023 Theo Gottwald * https://www.smart-package.com*

If you see this Logo, then you can use "Wildcards" in the Filesystem-Commands.

These are the well-known "*" and "?" - Wildcards.
Using Wildcards in the Pathname is not recommended, use them only in the Filename or extension.
Note that the first file or folder that fits to the wildcard is been taken.
Use Wildcards with extreme caution, as this may lead to unexpected results if there are multiple fitting files.

Here is a code Sample that will do a simple ZIP.- Operation.

```
'
'SPR Script-file: ZIP:-Sample
'Purpose:
'Author: Theo Gottwald
'

3.85.2 IFZ. / NFZ. - If File in ZIP

MiniRobotLanguage (MRL)

IFZ./NFZ. Conditional Statement

If Exist File/Folder in Zip-Archive

Intention

Conditional Statement. Test if a specified **filename or foldername exists inside an Archive** or not.
To specify an Folder-Name, suffix it with an "\.

Example:

```
$$FOL=Target\
```

You can specify additional Parameters to test if something is a file or a dir.

To search for a file that is inside an Subfolder, you have to specify the whole path of the file as it is inside the Archive.

Example:

```
$$FIB=Testing\readme2.txt
```

When you specify the filename / directory path, the robot will check if the last sign of the name/path is a \ (backslash). If the last sign is a backlash, then the command will check for a directory (NOT for a file!). If the last sign is NOT a backslash, the command will check for a file NOT for a directory.

```
' You can use a wildcard-sign from
' ? - single character
' * - one or more characters
' # - single digit
'
$$FIA=Document.*
$$FIB=?path\Target.zip

IFZ.$$FIA|$$FIB
  MBX. File $$FIB xistiert in ZIP-Archiv
ELS.
  MBX. File $$FIB xistiert NICHT in ZIP-Archiv
EIF.
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

You can use NFZ.(Not Exists File in ZIP) as the negative Form of the command.

Syntax

IFZ.P1|P2 ... ELS. ... EIF.

Parameter Explanation

P1 **-** Variable/filename/path that should be searched for.
Pathes must be ending with a \ (backslash)

```
' You can use a wildcard-sign from these
' ? - single character
' * - one or more characters
' # - single digit
```

P2 **-** The path to the Archive (ZIP-File) that should be examined.

Example

```
'*********************************************
' IFZ-Sample
'*********************************************
§§FIA=?path\Target.zip
§§FIB=*readme2.txt

IFZ.§§FIB|§§FIA
  MBX. File §§FIB xistiert in ZIP-Archiv
ELS.
  MBX. File §§FIB xistiert NICHT in ZIP-Archiv
EIF.

END.
```

Remarks

IFZ. and other IXX. can be nested to unlimited Depth, and they can also enclose Sub-Program Calls or FEX. (Enumerations) to unlimited Depth.

Limitations:

The use of wildcards should be limited to one wildcard-character.

3.85.3 ZIP. - Handle Archives

MiniRobotLanguage (MRL)

ZIP. Command

Compress or uncompress Files / Archives

Intention

The `ZIP.`-Command can be used to compress or uncompress files or folders to or from a ZIP-File. It can be used to extract files from a Standard ZIP-files that has been created using another ZIP-Tool.

Possible Uses:
You can add a single ZIP-FIle to your Executable and unzip it at RunTime.
Or download a ZIP-File from WEB and unpack it at Runtime.
You can have zipped Archives on a network share and load and install them on clients in your network.

`ZIP.` can be used to extract Archives with Folders and files.
`ZIP.` can be used to compress complete foiders into a single ZIP-File.
`ZIP.` can be used to compress and uncompress Text-Data that is available in a variable.

Limitations:
`ZIP.` can be used to compress complete folders into a single ZIP-File.
In this case, empty Sub-Folders are ignored and not included in the archive.

`ZIP.` can be used to compress and uncompress Text-Data that is available in a variable.
In this case the result is in a own format, and therefore not compatible with any unzip, other then the ZIP.-Command itself.

Note that you can split very large files using these commands before "Zipping" them:

- **FIL.Split File** 1001
- **FIL.Join File** 994 **and**
- **FIL.Join Delete** 990

Its recommended that you turn the builtin compression in the `FIL.Split File` command off, before using ZIP on these files. Otherwise the ZIP compression can not be effective because these files would already be compressed.

Syntax

ZIP.P1|P2[|P3][|P4][|P5]

*© 2023 Theo Gottwald * https://www.smart-package.com*

Change Settings etc.:

"sdc", "set default compression" - used to set the compression / speed ratio for all compress-operations. The Ratio is been set using a numeric value between 0 and 10.

```
0 -> use default compression
1 -> no compression
10 -> maximum compression
```

"gtfn","get zip filename" - used to create a filename with the ending ".zip" from another filename or foldername.

```
Listing.txt -> Listing.zip
```

Pack and Unpack Zipped Archives:

"zf","zip folder" - used to compress a complete folder with all subfolders into a single "zip"-Archive. The ZIP-File is compatible to any standard ZIP-Tool. Any empty Folders in teh Source folder will be ignored.

```
ZIP.zf|$$FOL[|...P5]
```

"cf","compress file" - used to create a file with the ending ".zip" from another filename.
Will automatically generate the Target Filename. If the Target "zip"-File exists, the File is added to that archive. Note that ZIP-Archives can hold multiple times the same filename, therefore Files inside the Archive are not overwritten if you add a file with the same name.
Unlike "**cftf**" will only take one Parameter:

```
ZIP.cf|$$FIL
ZIP.cf|C:\File.txt|c:\File.zip
```

"uf","unzip file" - uncompress / unzip a ZIP-File to a destination folder. Can be used to uncompress complete ZIP-Archives including all Subfolders. Generally the folder-structure of the ZIP-Archive is preserved, with the exception that empty folders, from inside the zip-file are ignored. Is the unpack command for both of the above commands "**zf**" and "**cf**".

```
ZIP.uf|$$FIL|?path\Extracted_Zip\
```

(Un-)Compress Data:

"cv","compress var" - used to compress the content of a Variable. The result van be uncompressed only using "**uv**". The result is not compatible with the standard "zip" Format.

"uv","uncompress var" - used to uncompress the content of a Variable. The source must have been compressed using "**cv**". The command is not compatible with the standard "zip" Format.

"**deb**","**debug exe**" - this is a special case that takes no parameter. Called from an compiled executable, it will ZIP the actual Runtime-Folder, and place it as a file named "Debug.zip" on the common desktop.

```
' Its a shortcut for this:
§§FIF=?path\
§§FIB=?cdesktop\Debug.zip
ZIP.zf|§§FIF|§§FIB|*.*|sho
```

© 2023 Theo Gottwald * https://www.smart-package.com

Parameter Explanation

P1 **-** Prototype, one from, the following:

P2 **-** P4 Parameter depending on Type of Operation

Example

```
'************************************************
' Sample: ZIP.
'************************************************
'
$$FIL=?path\readme.txt
CFF.$$FIL|$$TXT
FOR.§§LOP|0|10
  ZIP.sdc|§§LOP
  DBP.Compression is §§LOP
  CFF.$$FIL|$$TXT
  LEN.$$TXT|$$LEA
  DBP.Original=$$LEA
  $$TIA=#dtime#
  ZIP.cv|$$TXT|$$TAR
  $$TIB=#dsince#
  CAL.$$TIT=$$TIB|r
  LEN.$$TAR|$$LEB
  DBP.Compressed=$$LEB / Time: $$TIT sec.
  ZIP.uv|$$TAR
  LEN.$$TAR|$$LEC
  DBP.UnCompressed=$$LEC
NEX.
ENR.
```

Remarks

I get these3 values:

Original=94580480 Bytes

default Compression is 0
Compressed=590448 / Time: 1.37 sec.

Compression is 1
Compressed=94594916 / Time: 1.22 sec.

Compression is 2
Compressed=2764314 / Time: .85 sec.

Compression is 3
Compressed=2355309 / Time: .89 sec.

Compression is 4

© 2023 Theo Gottwald * https://www.smart-package.com

Compressed=2394226 / Time: .89 sec.

Compression is 5
Compressed=1258712 / Time: 1.39 sec.

Compression is 6
Compressed=622451 / Time: 1.38 sec.

Compression is 7
Compressed=590448 / Time: 1.34 sec.

Compression is 8
Compressed=560951 / Time: 1.4 sec

Compression is 9
Compressed=552086 / Time: 1.36 sec.

Compression is 10
Compressed=552086 / Time: 1.41 sec.

Limitations:

`ZIP.` can be used to compress complete foiders into a single `ZIP`-File.
In this case, empty Sub-Folders are ignored and not included in the archive.

`ZIP.` can be used to compress and uncompress Text-Data that is available in a variable.
In this case the result is not compatible with any unzip other then the `ZIP.`-Command here in the SPR.

© 2023 Theo Gottwald * https://www.smart-package.com

3.85.4 cf - compress file

MiniRobotLanguage (MRL)

ZIP.compress file

Compress the content of a file

Intention

The `ZIP.cf` - Command can be used to used to compress the content of a file.
This command will create a Standard ZIP-File that is compatible with the ZIP-Format.

There are generally two ways of usage.

```
' Give Source- and Target filename
ZIP.cf|$$TXT|$$TAR
```

or

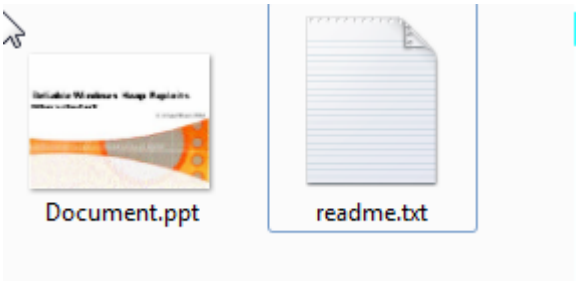
```
' ZIP the file and created a ZIP-Filename automatically
$$ZIP=?path\Myfile.txt
ZIP.cf|$$ZIP

' a ZIP-File wit the name "Myfile.zip" is been created in the
' ?path\ folder where the source file was.
```

You can find out about this constructed filename using the "**gtfn**" prototype.

```
$$FIA=?path\Test\Document.ppt
$$FIB=?path\Test\readme.txt
$$FID=?path\Test\Target.zip
```

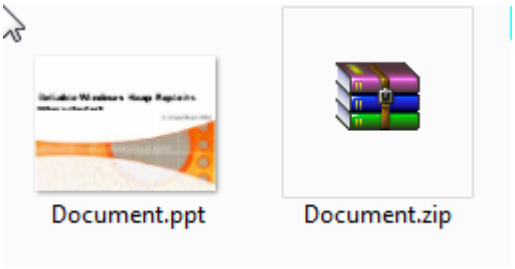
Here is a picture how it looks practically.



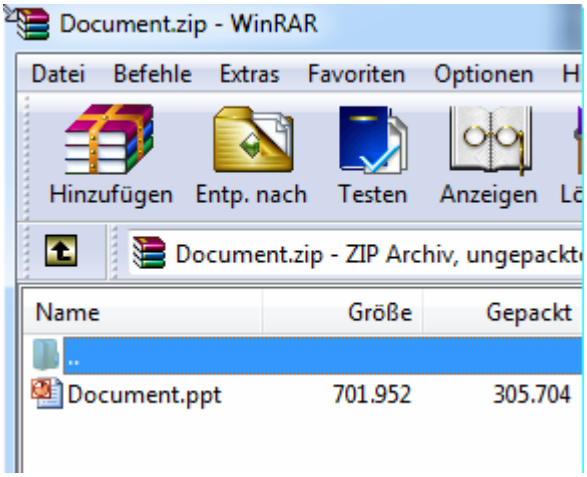
```
' Create a new "Document.zip" File
ZIP.cf|$$FIA
```

This is what we get:

© 2023 Theo Gottwald * https://www.smart-package.com



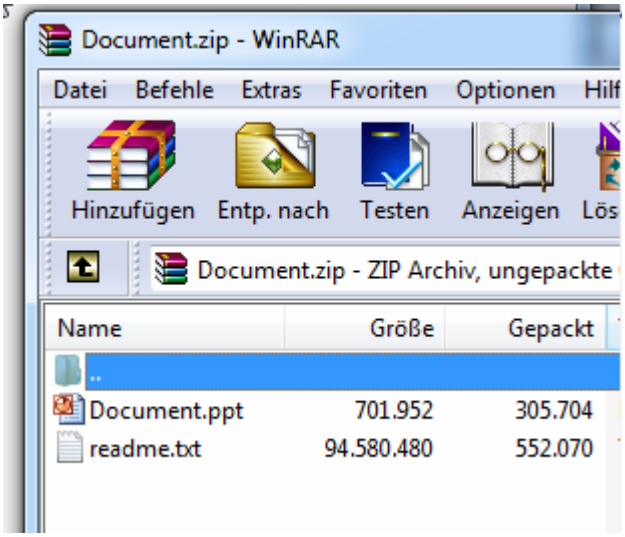
Looking into the File we can see this*:



```
' Find out the filename of the new Archive
ZIP.gtfn|§§FIA|§§FIX

' §§FIX will be the filename of the new ZIP-Archive

' Now we add a second File into the ZIP-File
ZIP.cf|§§FIB|§§FIX
```

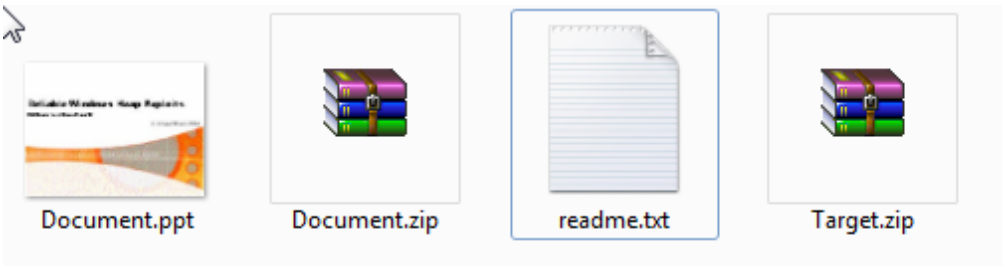


Now we are going to create a second ZIP-File using the **P3** Parameter.
This way we specify the Target-Filename.

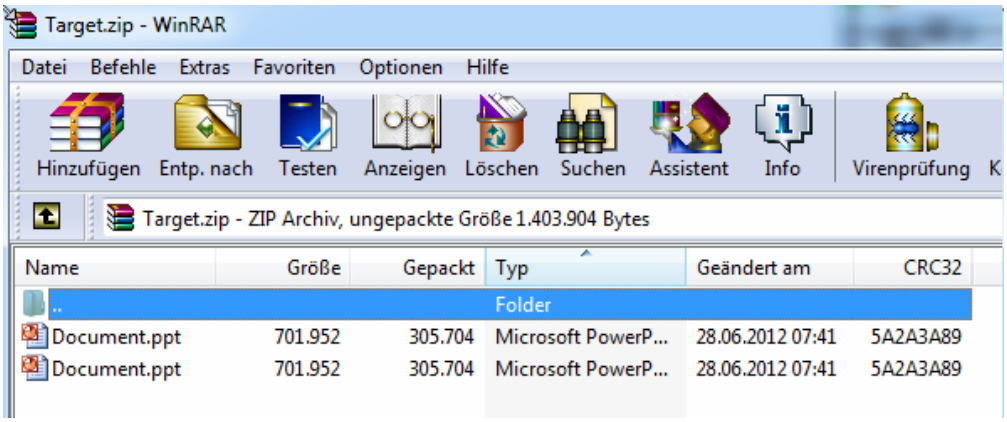
© 2023 Theo Gottwald * https://www.smart-package.com

```
' Creat e new ZIP-File §§FID
ZIP.cf|§§FIA|§§FID

' Add a file to §§FID
ZIP.cf|§§FIA|§§FID
```



The picture also shows that you can have multiple time the same file into a single ZIP-Archive.
Which is a not-recommended feature.



The "**cf**","**zf**" and the "**uv**" command are compatible with standard ZIP-Format.
If the Target-Zip File already exists, the File is added to the ZIP-File.

* We have used "WinRar to look into these files. WinRar is an external Program and not Part of the SPR Distribution.For more Infos on WinRar see
http://winrar-rog.de/

Syntax

ZIP.cf|P2[|P3]

The "**cf**" and the "**uf**" command are compatible with standard ZIP-Format.

Parameter Explanation

P1 - "cf" or "compress file"

© 2023 Theo Gottwald * https://www.smart-package.com

P2 - Variable with the filename of the file that is to be compressed. If **P3** is missing, a ZIP-FIle is been created like this:

```
ZIP.cf|Myfile.txt
' a ZIP-File wit the name "Myfile.zip" is been created in the
' same folder where the source file was.
```

You can find out about this filename using the "gtfn" prototype.

P3 - Variable with the target file-name and path.

Example

```
'*********************************************
' Sample 1: ZIP.
'*********************************************
$$FIA=?path\Document.ppt
$$FIB=?path\readme.txt
$$FID=?path\Target.zip

' Create a new "Document.zip" File
ZIP.cf|$$FIA

' Find out the filename of the new Archive
ZIP.gtfn|$$FIA|$$FIX

' Add a second File into the ZIP-File
ZIP.cf|$$FIB|$$FIX

' Creat e new ZIP-File $$FID
ZIP.cf|$$FIA|$$FID

' Add a file to $$FID
ZIP.cf|$$FIA|$$FID

ENR.
```

Remarks

The "**cf**","**zf**" and the "**uf**" command are compatible with standard ZIP-Format.
If the Target-Zip File already exists, the File is added to the ZIP-File.

Limitations:

There is a size limitation that depends on the available 32-bit Memory in the WOW64.
Its somewhere between 1 GB and 2 GB.

© 2023 Theo Gottwald * https://www.smart-package.com

3.85.5 cv - compress var

MiniRobotLanguage (MRL)

ZIP.compress var

Compress the content of a variable

Intention

The `ZIP.cv` - Command can be used to used to compress the content of a variable. There are generally two ways of usage.

```
' Give Source- and Target variable
ZIP.cv|$$TXT|$$TAR
```

or

```
' ZIP the Content of the given variable
ZIP.cv|$$TXT
```

The "**cv**" and the "**uv**" command are not compatible with standard ZIP-Format.

Syntax

ZIP.cv|P2[|P3]

The "cv" and the "uv" command are not compatible with standard ZIP-Format.

Parameter Explanation

P1 - "cv" or "compress var"

P2 - Variable with Content to be compressed. If P3 is missing, Result is placed in this variable.

P3 - Variable for the compressed result.

Example

```
'*********************************************
' Sample 1: ZIP.
'*********************************************
'
$$FIL=?path\readme.txt

3.85.6 gtfn - get zip filename

MiniRobotLanguage (MRL)

ZIP.get Zip Filename

Compute an filename ending in ".zip"

Intention

The `ZIP.gtfn` - Command can be used to compute the Target-Filename of an ZIP.-Operation.
You just call the command with the Source-Path of the File or Folder to be Zipped.
As a result you will get the Target Filename of the ZIP-File that will be created.

```
' Only give the Path of the folder to ZIP.
ZIP.gtfn|$$FIF|$$FIP
' Will display the Filename that is expected to be used by a
following
' ZIP.cf|$$FIP - Operation
MBX.$$FIP
```

In this case the Folder-Name will be taken to construct the Name of the ZIP-Archive.
This operation is a pure String-Operation, it does not make any changes on files.

The "**cf**","**zf**" and the "**uv**" command are compatible with standard ZIP-Format.

Syntax

ZIP.gtfn|P2[|P3]

Parameter Explanation

P1 - "gtfn" or "Get Zip Filename"

P2 - Variable with the path or the filneame of the file or folder that is to be compressed with a later command.

P3 - (optional) Variable with the target file-name and path.
If omitted the result is placed on TOS.

Example

```
'*********************************************
' Sample 1: ZIP.
'*********************************************
ZIP.gtfn|$$FIF|$$FIP
MBX.$$FIP
```

 *© 2023 Theo Gottwald * https://www.smart-package.com*

ENR.

Remarks

This operation is a pure String-Operation, it does not make any changes on files.

Limitations:

-

See also:

- ZIP. - Handle Archives 4309

© 2023 Theo Gottwald * https://www.smart-package.com

3.85.7 sdk - set default compression

MiniRobotLanguage (MRL)

ZIP.set default compression

Set the default compression ratio for ZIP Operations

Intention

The `ZIP.sdc` - Command can be used to used to set the compression / speed ratio for all compress-operations. The Ratio is been set using a numeric value between 0 and 10.

```
0 -> use default compression
```

These are the compression ratios, the higher, the stronger the compression.

```
1 -> no compression
...
7 -> good compression
10 -> maximum compression
```

Here are some sample values to give you an idea what happens if you specify another value.

```
Original=94580480 Bytes

default Compression is 0
Compressed=590448 / Time: 1.37 sec.

Compression is 1 (No compression, just pack)
Compressed=94594916 / Time: 1.22 sec.

Compression is 2 (remove redundances)
Compressed=2764314 / Time: .85 sec.

Compression is 3
Compressed=2355309 / Time: .89 sec.

Compression is 4
Compressed=2394226 / Time: .89 sec.

Compression is 5
Compressed=1258712 / Time: 1.39 sec.

Compression is 6
Compressed=622451 / Time: 1.38 sec.

Compression is 7
Compressed=590448 / Time: 1.34 sec.

Compression is 8
Compressed=560951 / Time: 1.4 sec
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
Compression is 9
Compressed=552086 / Time: 1.36 sec.

Compression is 10 (maximum compression)
Compressed=552086 / Time: 1.41 sec.
```

Syntax

ZIP.sdc|P2

"sdc", "set default compression" - used to set the compression / speed ratio for all compress-operations. The Ratio is been set using a numeric value between 0 and 10.

```
0 -> use default compression
1 -> no compression
10 -> maximum compression
```

Parameter Explanation

P1 - "sdc" or "set default compression"

P2 - Value from 0 to 10 or numeric variable

Example

```
'***********************************************
' Sample: ZIP.
'***********************************************
'
$$FIL=?path\readme.txt
CFF.$$FIL|$$TXT
FOR.§§LOP|0|10
  ZIP.sdc|§§LOP

  CFF.$$FIL|$$TXT
  LEN.$$TXT|$$LEA
  DBP.Original=$$LEA
  $$TIA=#dtime#
  ZIP.cv|$$TXT|$$TAR
  $$TIB=#dsince#
  CAL.$$TIT=$$TIB|r
  LEN.$$TAR|$$LEB
  DBP.Compressed=$$LEB / Time: $$TIT sec.
  ZIP.uv|$$TAR
  LEN.$$TAR|$$LEC
  DBP.UnCompressed=$$LEC
NEX.
ENR.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Remarks

On modern computers, you can most often just use the highest compression without a large time penalty.

Limitations:

–

See also:

- ZIP. - Handle Archives 4309
- cf - compress file 4313
- zf - Zip Folder 4332
- uf - unzip file/folder 4326
- cv - compress var 4318
- uv - uncompress var 4329
- IFZ. / NFZ. - If File in ZIP 4306

© 2023 Theo Gottwald * https://www.smart-package.com

3.85.8 uf - unzip file/folder

MiniRobotLanguage (MRL)

ZIP.unzip file/folder

UnZip the content of a file or a complete Archive with Folders

Intention

The `ZIP.uf` - Command can be used to unZip (unpack) the content of a Standard ZIP-file, that is compatible with the ZIP-Format.
These Archives can be created with the ZIP.-Command "**`zf`**" or "**`cf`**" or with any available other Standard ZIP-Compression Utility.

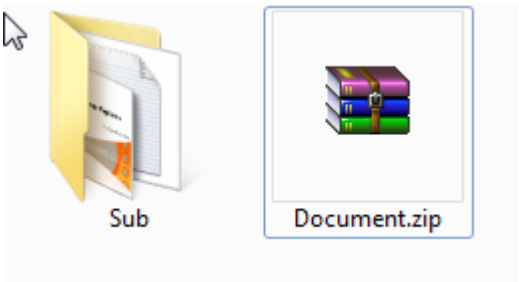
It can be used in two ways:

```
' This will extract the content of the Archive
' into ?path.
$$FID=?path\Test\Document.zip
ZIP.uf|$$FID

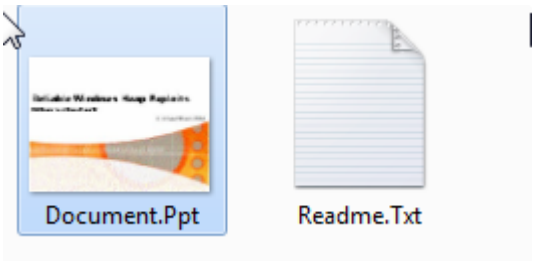
or

' Give Source-Filename and Target Folder
$$FID=?path\Test\Document.zip
$$FIP=?path\Test\Sub
ZIP.uf|$$FID|$$FIP
```

This is the result. Note that the Target Folder is been created if it does not exist.



Inside the "Sub" Folder we find the files, that have been unpacked from the Archive "`Document.zip`".



Important:

*© 2023 Theo Gottwald * https://www.smart-package.com*

If the Target-File does exist, the ZIP.-command **will try to delete any existing Target file**.
If this fails, the Target file will not be overwritten.
In case of such errors, the operation will continue without Error-Message.
Therefore its up to you to make sure that no (locked) target files exist before using the ZIP.-Command.

The "**cf**","**zf**" and the "**uv**" command are compatible with standard ZIP-Format.

Syntax

ZIP.uf|P2[|P3]

The "**cf**" and the "**uf**" command are compatible with standard ZIP-Format.

Parameter Explanation

P1 - "uf" or "unzip file"

P2 - Variable with the filename of the Source (Zip-)file that is to be unpacked.
If **P3** is missing, the Files will be extracted in the same path where **P2** is.:

P3 - (optional) Variable with the target file-path where the files from inside the Archive **P1**,
will be extracted. .

Example

```
'***********************************************
' Sample 1: ZIP.
'***********************************************
$$FIP=?path\Test\Sub
$$FID=?path\Test\Document.zip

' Unpack to ?path\
ZIP.uf|$$FID

' Unpack to $$FIP
ZIP.uf|$$FID|$$FIP

ENR.
```

Remarks

The "**cf**","**zf**" and the "**uf**" command are compatible with standard ZIP-Format.

© 2023 Theo Gottwald * https://www.smart-package.com

Limitations:

There is a size limitation that depends on the available 32-bit Memory in the WOW64.
Its somewhere between 1 GB and 2 GB.

3.85.9 uv - uncompress var

MiniRobotLanguage (MRL)

ZIP.uncompress var

Uncompress the content of a variable

Intention

The `ZIP.uv` - Command can be used to used to uncompress the content of a variable,
which has been compressed with the "**cv**" command before.
.
There are generally two ways of usage.

```
' Give Source- and Target variable
ZIP.uv|$$TXT|$$TAR
```

or

```
' ZIP the Content of the given variable
ZIP.uv|$$TXT
```

The "**cv**" and the "**uv**" command are not compatible with standard ZIP-Format.

Syntax

ZIP.uv|P2[|P3]

Parameter Explanation

P1 - "cv" or "compress var"

P2 - Variable with Content to be compressed. If P3 is missing, Result is placed in this variable.

P3 - Variable for the compressed result.

Example

```
'*********************************************
' Sample 1: ZIP.
'*********************************************
'
$$FIL=?path\readme.txt

3.85.10 zf - Zip Folder

MiniRobotLanguage (MRL)

ZIP.Zip Folder

Compress the entire content of a folder

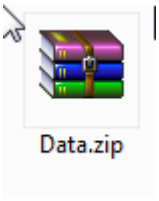
Intention

The `ZIP.zf` - Command can be used to used to compress the entire content of a folder and all Subfolders. Currently empty Folders and Subfolders are Ignored.
This command will create a Standard ZIP-File that is compatible with the ZIP-Format.

There are generally two ways of usage.

```
' Only give the Path of the folder to ZIP.
$$FIF=?path\Data\
ZIP.zf|$$FIF
```

In this case the Folder-Name will be taken to construct the Name of the ZIP-Archive. Also the Path of the Folder will the path where the Archive is been created. If the Archive does exist, files are added to the Archive. If the File is not a valid ZIP-File it will be deleted..



You can specify the name and path of the ZIP-Archive that is to be created.

```
$$FIF=?path\Data\
$$FIP=?path\Test\Sub\Hempel.zip
ZIP.zf|$$FIF|$$FIP
```

Or you can just specify the path where the ZIP-File is been created.

```
$$FIF=?path\MyData\
$$FIP=?path\
ZIP.zf|$$FIF|$$FIP
```

In this case the name of the Archive is been constructed from the name of the Source-Folder.

In case the Target Folder of the Archive that is to be created, does not exist, it will automatically be created.

If the Target-Zip File already exists, the Files are added to the existing ZIP-File.

*© 2023 Theo Gottwald * https://www.smart-package.com*

The "**cf**","**zf**" and the "**uv**" command are compatible with standard ZIP-Format.

Syntax

ZIP.zf|P2[|P3][|P4][|P5]

The "**zf**" and the "**uf**" command are compatible with standard ZIP-Format.

Parameter Explanation

P1 - "zf" or "Zip Folder"

P2 - Variable with the path of the folder that is to be compressed.

P3 - (optional) Variable with the target file-name and path.
If omitted the Target Zip-Name is constructed from the Source-Folder name,

P4 - (optional) Variable with a File-Pattern using Wildcards.
If omitted, "*** . ***" is used.

P5 - (optional) Flags, can be any of these:
s - also collect System-Files
z - do NOT recurse Subfolders
o - Sort Files Downwards
h - also collect hidden files
If omitted, Subfolders are recursed and collected. But none of the other options.

Example

```
'***********************************************
' Sample 1: ZIP.
'***********************************************
$$FIF=?path\MyData\
$$FIP=?path\
' Compress the MyData-Folder
' to a Zip-File "MyData.zip" in ?path\
ZIP.zf|$$FIF|$$FIP

$$FIF=?path\MyData\
$$FIP=?path\Test\MyZipData.zip
ZIP.zf|$$FIF|$$FIP

ENR.
```

Remarks

The "**cf**","**zf**" and the "**uf**" command are compatible with standard ZIP-Format.
If the Target-Zip File already exists, the Files are added to the existing ZIP-File.

4. AddOn Components

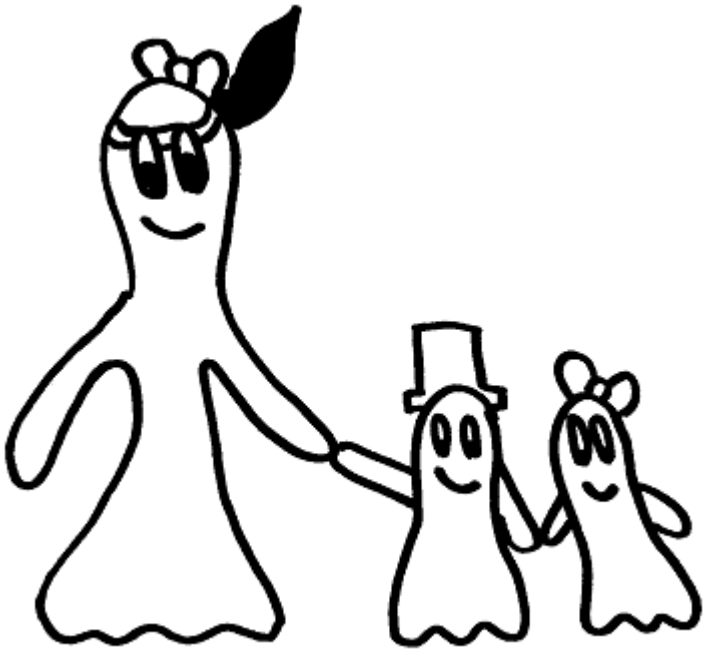
4 4. AddOn Components

4.86 MR Connect for use with SAP®

4.86.1 ! Smarty's Addon for use with SAP® (Connect to SAP®)

Smarty's Addon for use with SAP® (MCFS) ***Previous*** 4332 ***Top*** 41 ***Next*** 4342

Smarty's Addon's: MR Connect for use with SAP® (MCFS)



"MiniRobots Connect for use with SAP® " (In short: **MCFS**) is an AddOn which offers the possibility to connect the Smart Package Robot to SAP® GUI for Windows.

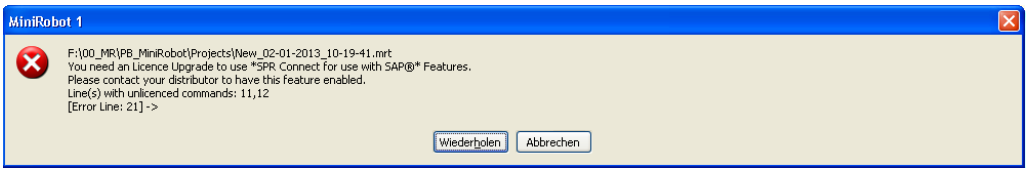
The communication between the SPR and the SAP® GUI for Windows is done via the SAP® GUI Scripting interface.

Therefore It is necessary to activate SAP® GUI Scripting, otherwise all commands from this AddOn would not work.

Important Hint:

This is an Third Party AddOn Component that is integrated into the SPR System as a AddOn.
It was developed by Stefan Schnell. Due to new developments from Stefan, the Add On will not need a separate licence any more.

*© 2023 Theo Gottwald * https://www.smart-package.com*



If a session is busy, it can't executes SAP® GUI Scripting. Each procedure inside "SPR Connect to SAP®" discovers the status of a session. If a session is busy, "Connect to SAP® " jumps over the command and will do nothing. In some cases you may get the timeout flag set.

Requirements

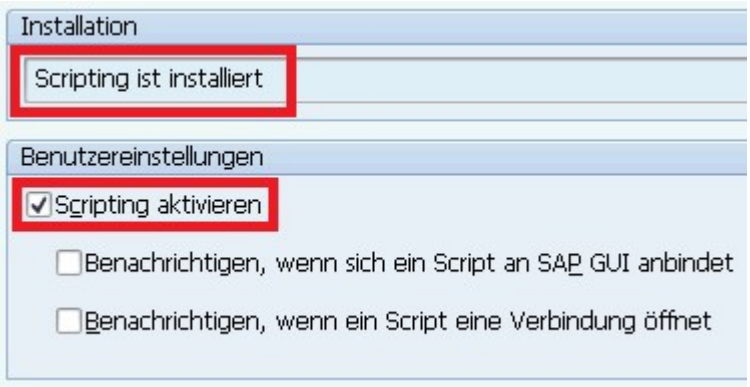
Operating system Windows 7 or higher.
Full standard installation of SAP GUI for Windows 7.30 or higher.

You need to enable GUI Scripting on Presentation Server, like this:

Choose the menu item Options... from the system menu of the SAP® Logon.

Choose the node Scripting.

© 2023 Theo Gottwald * https://www.smart-package.com



***Hint**: It is better to disable the notifications, otherwise you got a requester for each script execution.*

4.86.2 GSP. - Get SAP® Data

GSP. - Get Data from SAP®-Application Previous 4336 Top 41 Next 4349

MiniRobotLanguage (MRL)

GSP. Command

Get Data from SAP®-Application

Intention

The `GSP.`-Command is the command to retrieve information from the SAP®-System via SPR-Skript. It has multiple options that makes automation easier then ever before.

Usage is simple:

```
GSP.(subcommand)|(one or more parameters)|(Variable with
result of operation)
```

Syntax

GSP.subcommand[|P1][|P2][|P3]

Parameter Explanation

These general Rules apply:

1. If you omit the Variable for the Result of the command, the result will be stored on the stack.

2. Session numbers are counted from 1 to 6 as usual.

3. If you omit the connection number, a 1 is used as default number.

4. If there was a problem a session number of zero may be returned and the timeout flag will be set. Otherwise the timeout flag will be cleared.

5. All Subcommands have a long name that is better readable, and a short abbreviation that saves you typing. You can choose which one you prefer.

The following subcommands are currently supported:

*© 2023 Theo Gottwald * https://www.smart-package.com*

"About","a."
Shows a messagebox with information about "Connect to SAP® ".
This command needs and accepts no parameter.
Example:

```
GSP.about
```

"FirstFreeSession","ffs."
Delivers the first session number of the given connection which is not busy.
Example:

```
' $$CON - Number of SAP® connection
' $$RES - Result of Operation
'
GSP.ffs.|$$CON|$$RES

GSP.FirstFreeSession|5|$$SES
MBX.First free session of connection 5 is $$SES
```

"ExecScript","ExecSub","exs."
Executes SAP® GUI Scripting code without a return value. Example:

```
' $$CON = Number of SAP® connection
' $$SES = Number of SAP® session
' $$CMD = SAP® GUI Script code
'
GSP.exs.|$$CON|$$SES|$$CMD

$$CMD=session.findById("wnd[0]/usr/txtRSYST-MANDT").text =
"000"
$$CMD=$$CMD$crlf$
$$CMD=$$CMDsession.findById("wnd[0]/usr/txtRSYST-BNAME").text =
$$CMD=$$CMD"BCUSER" $crlf$
$$CMD=$$CMDsession.findById("wnd[0]/usr/pwdRSYST-BCODE").text =
$$CMD=$$CMD "minisap" $crlf$
$$CMD=$$CMDsession.findById("wnd[0]/usr/txtRSYST-LANGU").text =
"DE"
$$CMD=$$CMD$crlf$
$$CMD=$$CMDsession.findById("wnd[0]/tbar[0]/btn[0]").press
$crlf$

GSP.ExecSub|0|0|$$CMD
```

"Ping","p."
Sends a ping to a SAP® system. You need to specify these arguments:
If the ping is successful the return value is 1, otherwise 0.
If an error occurs the return value is -1.
Example:

```
' $$SAC - SAPClient = Number OF the CLIENT (Mandant)
' $$USN - SAPUser = NAME OF the USER
' $$SAW - SAPPassWord = Password OF the USER
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' $$SAL - SAPLanguage = Language, e.g. DE OR EN.
' $$SID - SAPSystem = System ID (SID)
' $$SAH - SAPHostName = NAME OF the HOST (Application SERVER)
' $$SSN - SAPSystemNumber = Number OF the system (INSTANCE
number)
' $$RES - Variable for Result
'
GSP.Ping|$$SAC|$$USN|$$SAW|$$SAL|$$SOD|$$SAH|$$SSN|$$RES

GSP.Ping|000|BCUSER|minisap|DE|NSP|192.168.145.130|0|$$PRC
IVV.$$PRC=1
      MBX.Ping successful
ELS.
      MBX.Ping not successful
EIF.
```

"SapGuiLaunch","sl."

Starts the program saplogon.exe or saplgpad.exe, which are the base of the SAP® GUI for Windows®. If the start is successful the return value is the process ID (PID) of the program, otherwise 0. `#PID#` is set by this command to the PID or if an error happened to zero..
Example:

```
GSP.sl.
```

"ScriptingVersion","sv."

Delivers the SAP® GUI Scripting version. The SAP® GUI Scripting version as string, e.g. 7300.249. The first number is the major and the second number is the minor version.
Example:

```
' Version number will be on TOS
GSP.sv.
' Version number will be in Variable
GSP.sv|$$RES
```

"SessionBusy","sb."

Checks if the session is busy. If the specified SAP® session is busy the return value is 1, otherwise 0. Example:

```
' $$CON = Number of the SAP® connection
' $$SES = Number of the SAP® session
' $$RES - Variable for Result
'
GSP.sb.|$$CON|$$SES|$$RES
```

"WhichConnectionHas","wch."

Delivers the connection number of first connection with the given property.Number of the connection, otherwise -1. If the session is busy, this function returns -1.
Example:

```
'
' $$PRO = Property
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
' $$VAL = Value of Property
' $$RES - Variable for Result
'
GSP.wch.|$$PRO|$$VAL|$$RES
```

"WindowToConnection","wtc.","WhichConnectionHwnd"

Delivers the connection number of the given window handle, or in case of error -1.
Example:

```
'
' $$HWN = Handle of a Window
' $$RES - Variable for Result
'
GSP.wtc.|$$PRO|$$RES
```

"WhichSessionHas","wsh."

Delivers the session number of first session (1-6) with the given connection and property, otherwise 0. Example:

```
'
' $$PRO = Property
' $$VAL = Value of Property
' $$RES - Variable for Result
'
GSP.wtc.|$$PRO|$$VAL|$$RES
```

"WindowToSession","wts.","WhichSessionHwnd"

Delivers the session number of the given window handle, or in case of error -1.
If you omit $$HWN the actual window is used.
If the command can not evaluate a valid window handle (no localized window and no handle given
Example:

```
' $$VAL = Value of Property
' $$RES - Variable for Result
'
GSP.wts.|$$HWN|$$RES
' If you omit $$HWN the actual window is used.
GSP.wts.||$$RES
' If you omit $$RES the TOS will contain the result
GSP.wts.
```

"WhichWindowHas","wwh."

Delivers the handle of first session window with the given property.Handle of the session window, otherwise 0. Example:

```
'
' $$PRO = Property
' $$VAL = Value of Property
' $$RES - Variable for Result
'
GSP.wwh.|$$PRO|$$VAL|$$RES

GSP.WhichConnectionHas|User|BCUSER|$$WND
MBX.Handle of the window is $$WND
```

© 2023 Theo Gottwald * https://www.smart-package.com

"DebugMode","dm."
Delivers the actual debugging state of the MRCS-AddOn.
For internal use only. Example:

```
GSP.dm.|$$RET
```

"FakeMode","fm."
Delivers the actual FakeMode state of the MRCS-AddOn.
For internal use only. Example:

```
GSP.fm.|$$RET
```

P1..Px - (optional) depending on the subcommand, there may be no or multiple parameters needed.

Examples

```
GSP.WhichConnectionhWnd|4711|$$CON
MBX.Connection is $$CON
END.

$$WND = 4711
GSP.WhichConnectionhWnd|$$WND|$$CON
GSP.WhichSessionhWnd|$$WND|$$SES
MBX.Window with handle $$WND is connection $$CON and session
$$SES
END.

GSP.WhichSessionHas|Program|SAPLWB_INITIAL_TOOL|$$WND
MBX.Handle of the window is $$WND
END.

GSP.WhichSessionhWnd|4711|$$SES
MBX.Session is $$SES
END.

$$WND = 4711
GSP.WhichConnectionhWnd|$$WND|$$CON
GSP.WhichSessionhWnd|$$WND|$$SES
MBX.Window with handle $$WND is connection $$CON and session
$$SES
END.

GSP.WhichWindowHas|Transaction|SE16|$$WND
MBX.Handle of the window is $$WND
END.

GSP.SessionBusy|0|0|$$BUS
```

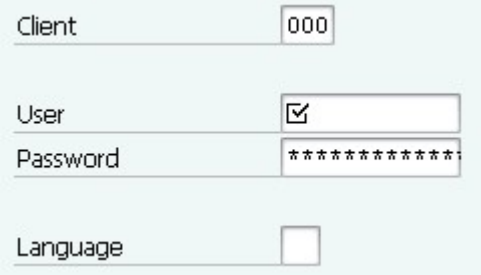
© 2023 Theo Gottwald * https://www.smart-package.com

```
IVV.$$BUS=1
    MBX.Session 0 of connection 0 is busy
ELS.
    MBX.Session 0 of connection 0 is not busy
EIF.
END.
```

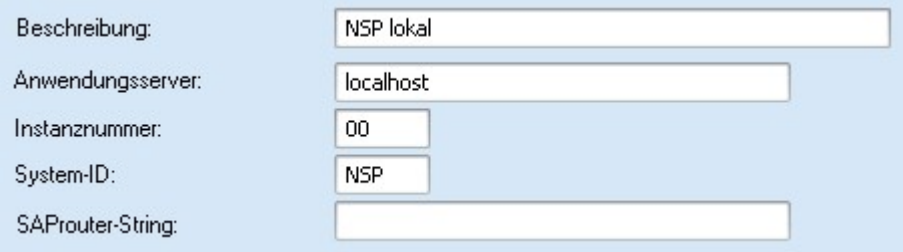
Remarks

Some of these Sub-commands will set the timeout-flag if the operation was not successful.

You get the arguments for the PING Subcommand as follows:



Also you get the information from the property item from the system of the SAP logon program.



Important hint:
Ping uses the ANSI version of the SAP® GUI ActiveX Controls.

Limitations:

If a session is busy, it can't executes SAP® GUI Scripting. Each procedure inside MCFS discovers the status of a session. If a session is busy, "Connect to SAP® " jumps over the command and will does nothing. In some cases you may get the timeout flag set.

4.86.3 ISP. / NSP. - If SAP® State

MiniRobotLanguage (MRL)

ISP. Conditional Statement

If SAP®- State

Intention

Conditional Statement.

Use this statement to test for several states around the SAP®- System.

```
ISP.connection exists
ISP.sapgui exists
ISP.SAPGUIInstalled
ISP.version>700.32
ISP.version=700.32
ISP.version!700.32
ISP.version=700.32
```

`NSP.` - is the negative form of this statement.

Syntax

ISP.Subcommand[|P1...|Px]

Parameter Explanation

These general Rules apply:

1. If you omit the Variable for the Result of the command, the result will be stored on the stack.

2. Session numbers are counted from 1 to 6 as usual.

3. If you omit the connection number, a 1 is used as default number.

4. If there was a problem a session number of zero may be returned and the timeout flag will be set. Otherwise the timeout flag will be cleared.

5. All Subcommands have a long name that is better readable, and a short abbreviation that saves you typing. You can choose which one you prefer.

The following subcommands are currently supported:

*© 2023 Theo Gottwald * https://www.smart-package.com*

"Connection","Connection Exists","ce."

Checks if a connection to an SAP® system exists.
Example:

```
ISP.ce.
      DBP.Connection exists!
ELS.
      DBP.No Connection exists!
EIF.

NSP.Connection Exists
MBX.Please open an SAP connection
EIF.
```

"Sapgui","Sapgui Exists","se."

Checks if SAP® Logon is loaded.Example:

```
NSP.SAPGUI Exists
      GSP.SAPGUILaunch
      $$PID=#pid#
      MBX.PID of SAP Logon is $$PID
ELS.
     DBP.SAPGUI is not loaded!
EIF.
```

"SapguiInstalled","si."

Checks if SAP® GUI for Windows® is installed.
Example:

```
ISP.SAPGUIInstalled
      MBX.SAP GUI is installed
ELS.
      MBX.SAP GUI is not installed
EIF.
```

"Version","Ve."

Test the SAP® GUI Scripting version against a given value. You can use the Operators:
= - Test for Equality (Version=)
! - Test for NOT Equal (Version NOT Equal to)
> - Test for Version higher then
< - Test for Version lower then

Example:

```
ISP.ve.>7300.248
     DBP.SAPGUI is loaded!
ELS.
     DBP.SAPGUI is not loaded!
EIF.
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'***********************************
' ISP.-Sample
'***********************************
'
ISP.
'...
ELS.
'...
EIF.
ENR.
```

Remarks

-

Limitations:

If a session is busy, it can't executes SAP® GUI Scripting. Each procedure inside **MCFS** discovers the status of a session. If a session is busy, "Connect to SAP® " jumps over the command and will does nothing. In some cases you may get the timeout flag set.

See also:

- SSP. - Set SAP® Data 4352

© 2023 Theo Gottwald * https://www.smart-package.com

4.86.4 SSP. - Set SAP® Data

MiniRobotLanguage (MRL)

SSP. Command

Set Data from SAP®-Application

Intention

The `SSP.`-Command is the command to set or change settings in the MCFS via SPR-Skript. Its currently only for internal use.

Usage is simple:

```
SSP.(subcommand)|(one or more parameters)|(Variable with
result of operation)
```

Syntax

SSP.subcommand[|P1][|P2][|P3]

Parameter Explanation

These general Rules apply:

1. If you omit the Variable for the Result of the command, the result will be stored on the stack.

2. Session numbers are counted from 1 to 6 as usual.

3. If you omit the connection number, a 1 is used as default number.

4. If there was a problem a session number of zero may be returned and the timeout flag will be set. Otherwise the timeout flag will be cleared.

5. All Subcommands have a long name that is better readable, and a short abbreviation that saves you typing. You can choose which one you prefer.

The following subcommands are currently supported:

"DebugMode","dm."
Set the actual debugging state of the MCFS-AddOn.
For internal use only. Example:

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
SSP.dm.|$$MOD
```

"FakeMode","fm."

Set the actual FakeMode state of the MCFS-AddOn.
For internal use only. Example:

```
SSP.fm.|$$MOD
```

P1..Px - (optional) depending on the subcommand, there may be no or multiple parameters needed.

Example

-

Remarks

-

Limitations:

If a session is busy, it can't executes SAP® GUI Scripting. Each procedure inside MCFS discovers the status of a session. If a session is busy, "Connect to SAP® " jumps over the command and will does nothing. In some cases you may get the timeout flag set.

See also:

- ! Smarty's Addon for use with SAP® (Connect to SAP®) 4336

- GSP. - Get SAP® Data 4342

© 2023 Theo Gottwald * https://www.smart-package.com

4.86.5 WSP. - Wait for SAP® State

MiniRobotLanguage (MRL)

WSP. Command

Wait For SAP® Event

Intention

This command is useful to have your script wait until certain conditions are met or not met.

Examples:

```
WSP.![Max. Wait]|connection exists
WSP.[Max. Wait]|sapgui exists
WSP.[Max. Wait]|version>700.32
WSP.[Max. Wait]|version=700.32
WSP.[Max. Wait]|version!700.32
```

Syntax

WSP.[Timeout in s]|Subcommand[P1]

Parameter Explanation

These general Rules apply:

1. If you omit the Variable for the Result of the command, the result will be stored on the stack.

2. Session numbers are counted from 1 to 6 as usual.

3. If you omit the connection number, a 1 is used as default number.

4. If there was a problem a session number of zero may be returned and the timeout flag will be set. Otherwise the timeout flag will be cleared.

5. All Subcommands have a long name that is better readable, and a short abbreviation that saves you typing. You can choose which one you prefer.

6. If the state does not change within a given time, the timeout-flag will be set.

*© 2023 Theo Gottwald * https://www.smart-package.com*

7. If you prefix the time-value with a "**!**" then the condition value is negated and we are waiting for just the opposite condition.

The following subcommands are currently supported:

"Connection","Connection Exists","ce."

Waits for a connection to an SAP® system to exist.
Example:

```
' Wait endless time
WSP.|ce.
' Wait 25 seconds
WSP.25|ce.
' Wait that connection breaks within 25 seconds
WSP.!25|ce.
```

"Sapgui","Sapgui Exists","se."

Waits for SAP® Logon to be loaded/unloaded.Example:

```
WSP.|se.
' Wait 25 seconds
WSP.25|se.
' Wait that it is unloaded within 25 seconds
WSP.!25|se.
```

"SapGuiInstalled","si."

Checks if SAP® GUI for Windows® is installed.
Example:

```
WSP.|si.
' Wait 25 seconds
WSP.25|si.
' Wait that it is uninstalled within 23 seconds
WSP.!(20+5)|si.
```

"Version","ve."

Wait for the SAP® GUI Scripting to have a specified version compared against a given value. You can use the Operators:
= - Test for Equality (Version=)
! - Test for NOT Equal (Version NOT Equal to)
> - Test for Version higher then
< - Test for Version lower then

Example:

```
WSP.ve.>7300.248
```

© 2023 Theo Gottwald * https://www.smart-package.com

Example

```
'*****************************************************
 WSP.!34|connection exists
 WSP.14|sapgui exists
 WSP.$$TIM|version>700.32
 WSP.$$SEC|version=700.32
 WSP.(($$AUT+4)*$$FAK)|version!(700.32+$$NUM)
```

Remarks

-

Limitations:

If a session is busy, it can't executes SAP® GUI Scripting. Each procedure inside **MCFS** discovers the status of a session. If a session is busy, "Connect to SAP® " jumps over the command and will does nothing. In some cases you may get the timeout flag set.

4.87 InstaRec - the Recorder

4.87.1 4.9.1 InstaRec - User-Templates

Customizing the InstaRec Outcome **Previous** 39 **Top** 41 **Next** 73

Technical Notes on "InstaRec"

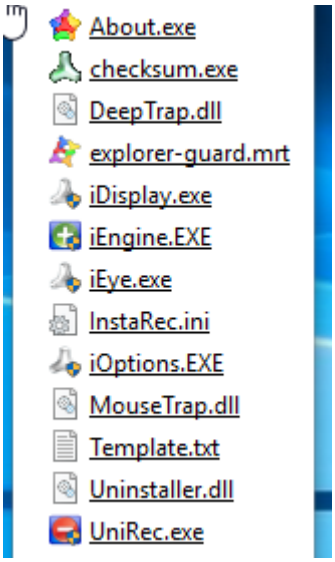
What you should know and don't see from outside

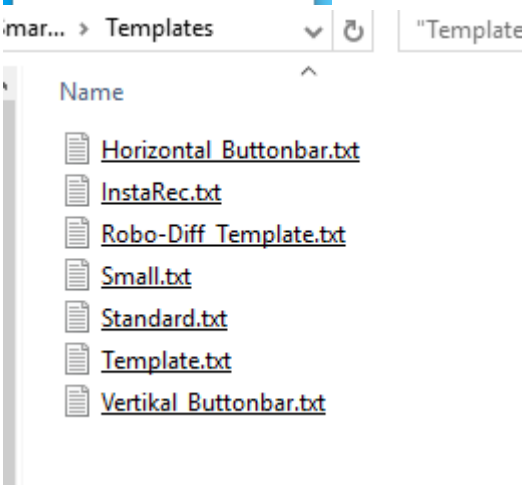
InstaRec was developed with the idea of "Just do your Installation,
InstaRec will do your Script".
We believe that its currently the best Scripting Recorder on the market.

This Chapter describes the more advanced topics:

Customizing your Scripts using "User-Templates".

*© 2023 Theo Gottwald * https://www.smart-package.com*





1. InstaRec-Installation folder "InstaRec.txt" (Template) with user-Template-File. (Contents may change)

2. General Template-folder with

InstaRec uses Templates

Using "Templates, you can easily customize the outcome of your Scripting-Recorder.
Generally the Template-Format is the same for "InstaRec" and for "SPR-Editor".

When creating a Scriptfile, InstaRec first tries to load a "Template-File".
The name of the Template-File is whether "`InstaRec.txt`" or "`Template.txt`", depending on where it is found.
The format of the file is always the same.

The path of this Template-file can be:
1. In the InstaRec-Installation folder for a file called "`Template.txt`"
2. In the "Templates-Folder" that is in the Main-Installation folder for a file called "`InstaRec.txt`"
3. If no Template is found, an internal predefined Template is used.

InstaRec will check these locations and take the first File that is found.

*© 2023 Theo Gottwald * https://www.smart-package.com*

The Template-file is the base for the later script. A Template may look like the one below.

Please note the first two lines. They are necessary!
If you omit these two lines, the first two lines from your template will be missing.

```
Default Template for InstaRec
.mrt
'SPR Script-file: <filename>
'Original Filename: <Fullfilename>
'Version: 1.00, saved at: [<path>]
'Purpose:
'Author: <user>
'Creation date: <date>,<time>
'============================================================
'#EXE:?pfad\
'#SPI:ForceWrite
'
'
```

InstaRec will delete the lower part of the Script, and insert its own generated Script-code instead.
Therefore you can omit the last lines that are normally in any Template.
In this example we have omitted these last lines already.

You can use the following Meta-Tags in these Template-Files:

<filename> -> "Myfile.mrt" or "Install_LuxRenderSetup.rem"
Note: ".rem" is an internal filetype which is later converted to ".mrt"

<Fullfilename> -> "C:\Users\UserA\Desktop\Projekt_04092016_065037\Install_Lux

<path> -> "C:\Users\UserA\Desktop\Projekt_04092016_065037\"

<user> -> "UserA" (Username)

<time> -> "04-09-2016" (mm-dd-yyyy)

<date> -> "06:50:54" (hh:mm:ss)

These Meta-Tags are replaced at Script creation time with the real filenames and pathes.
If you change the Template, the final Script will also change.

© 2023 Theo Gottwald * https://www.smart-package.com

4.87.2 4.9.2 InstaRec - AutoPatchSkript.exe

Using your own "PlugIns" with InstaRec Previous 39 Top 41 Next 73

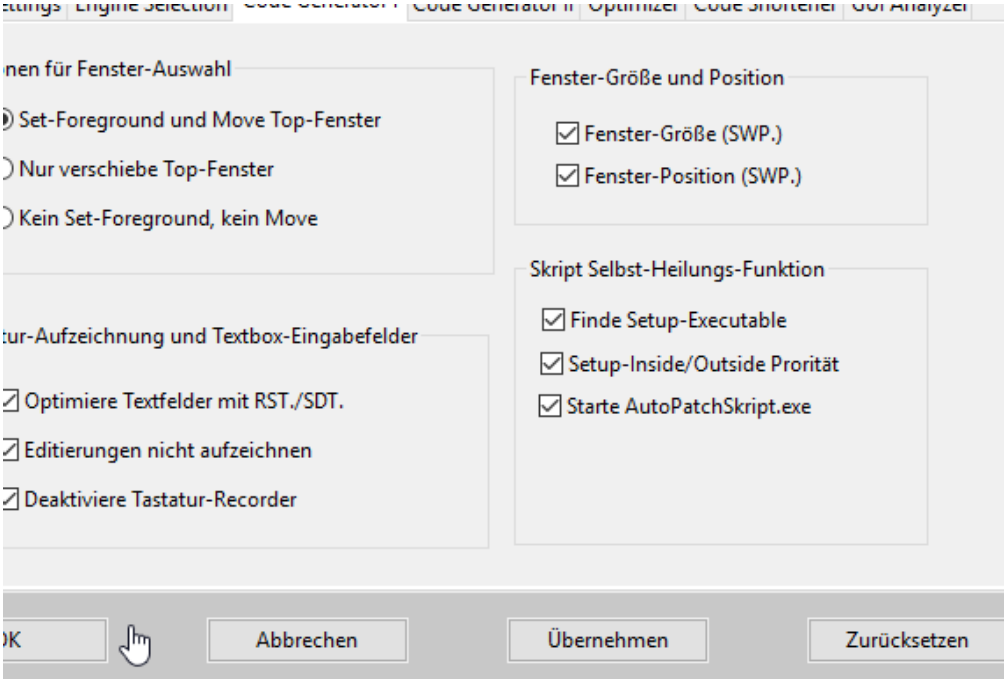
Using the "AutoPatchSkript.exe"

You can customize your final Skript before it is loaded into the editor.

InstaRec was developed with the idea of "Just do your Installation, InstaRec will do your Script".
We believe that its currently the best Scripting Recorder on the market.

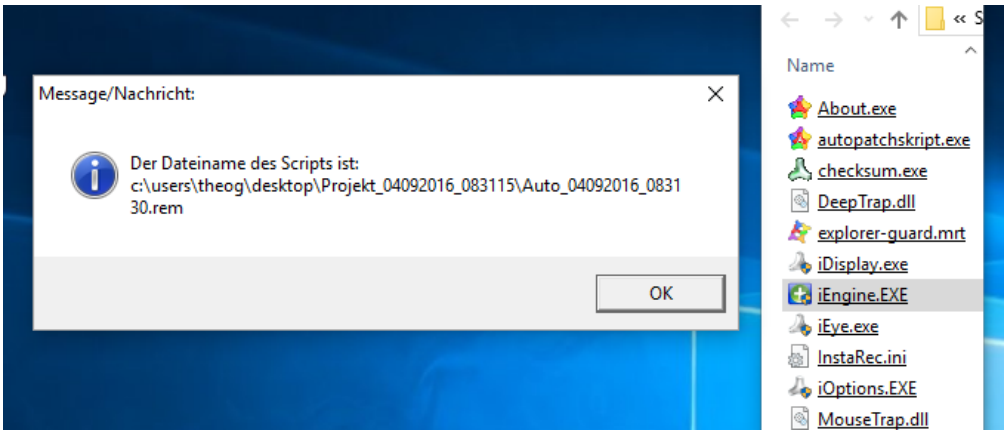
This Chapter describes the more advanced topics:

Customizing your Scripts using "AutoPatchSkript.exe".



1. iOptions Dialog with the "AutopatchSkript.exe" Option.
You need to check this to use the "AutoPatchSkript.exe".
(Contents may change)

*© 2023 Theo Gottwald * https://www.smart-package.com*



2. InstaRec Folder with the "AutopatchSkript.exe" File.
There is an "AutoPatchSkript.mrt" in the InstaRec-Folder as a Sample.
It can be compiled to the "AutoPatchSkript.exe" Executable.
Its just an starting point for your own PlugIns.
(Contents and Design may change in future releases)

InstaRec can use your own "PlugIn" to manipulate the Script after it was recorded.

Currently the way of the Skript is this:

1. You record the Script.
2. InstaRec loads the Template File
3. InstaRec inserts the Script into the Template
4. The Sciptfile is saved on Disk
5. If an "`AutoPatchSkript.exe`" file is available in the InstaRec-Installation Folder, InstaRec will start it with the Skript-Filename as Parameter
   and wait until the Executable has ended.
6. If available, your "AutoPatchSkript.exe" can now manipulate the Skriptfile. It must end however, because InstaRec will wait until you are ready.
7. Now InstaRec will start the ".rem" to ".mrt" Converter this will generate the final Script-File.
8. Next the SPR-Editor will load the Script-File.

4.88 GPX-Korrektor

What is the GPX-Korrektor?

Did you know that you can add your hometown or other regions of the world to "Google Street View"?
Even if they are already in Street View, you can update the Data with newer versions.

Of course you will need a 360 Degree Camera like these:
Necessary 360 Degree Cameras.

https://amzn.to/3X59Uko
or this one
https://amzn.to/3lePl88
or this one:
https://amzn.to/3juGRcg

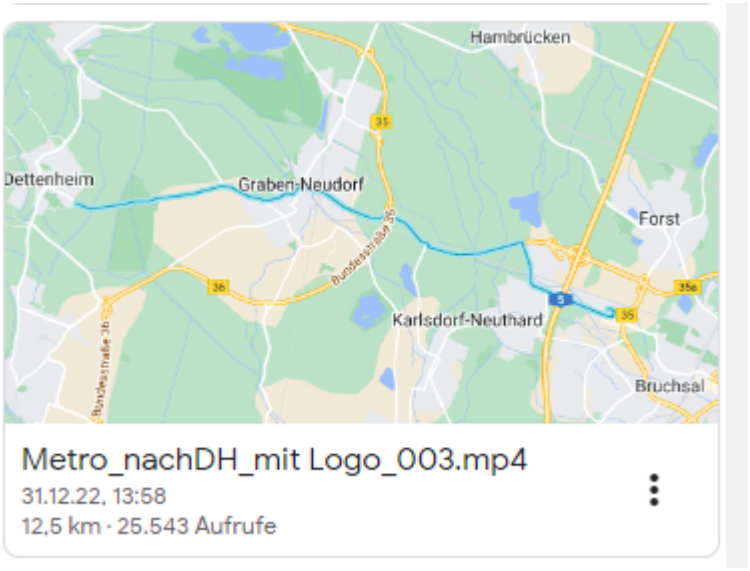
Next you will make a walk through the street or place that you want to add to/Update in Google Street View.
And you will record a 360 Degree Video, together with the necessary GPS-Data.
The GPS-Data will be stored in GPX-File.

For the first 2 Cameras it may be necessary to extract the GPS-Data using this free tool:
https://drive.google.com/drive/folders/1U7youYqqE4JTriF37Ac52h29tQGxM2p7
out of the Camera Video files.

Once you have the GPX-Files and you may have some ".mp4" Files that you have recorded.
Then you can go to:
https://streetviewstudio.maps.google.com/
and upload these files.

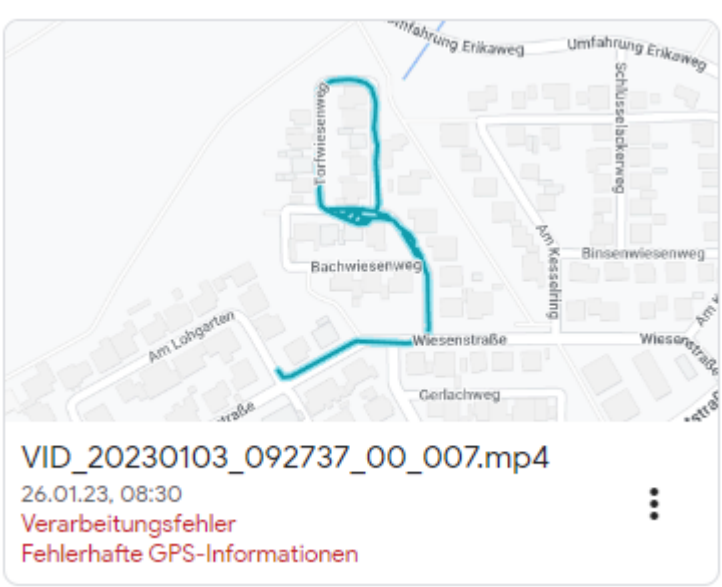
After some time (some days to 2 weeks) your Uploads will be visible in Google Street View.
You will also see, how many people have seen your Uploads.

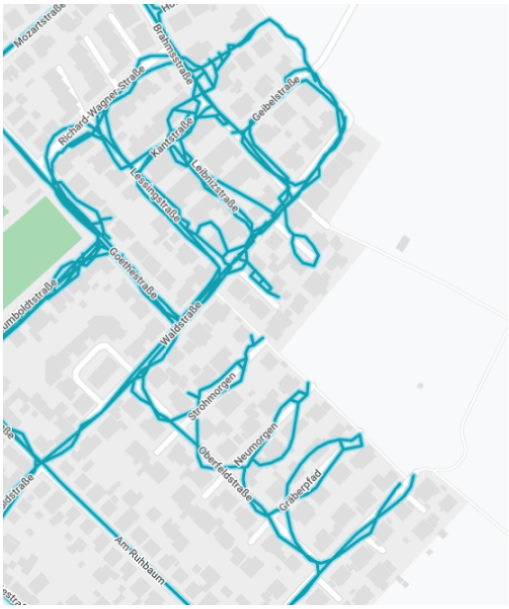
© 2023 Theo Gottwald * https://www.smart-package.com



Now in some cases, the GPS-Coordinates have not been good enough to add the material to Street View.
In such case, Google may "throw an error message" like this one. Or it may accept the file which may result in (Picture 2).

*© 2023 Theo Gottwald * https://www.smart-package.com*





Picture 1: Google is not satisfied with the GPS-Coordinates in the GPX-File.
Picture 2: Google took the unmodified Coordinates from the Camera/Smartphone and the result is not perfect.

This will show up in the Street-View, as the "Marks on the Floor" will be on the wrong places" and not "In a Line".

*© 2023 Theo Gottwald * https://www.smart-package.com*

Picture 3: The "Marks on the road" may be at the wrong place, if the uploaded Coordinates are not on the road.

This is where you can use the SPR or the GPX-Korrektor.

Also the SPR has now Scripting capabilities to work with XML-Files and Timestamps like "00:00:000", so if you can automate the process where possible.
If you can let an SPR-Script do "some corrections". This will be mostly the case if there are only corrections about the time-stamps.

In most cases the GPX-Extraktor is the tool of choice here, as you can move any Trackpoint
and you can also use the automatic corrections with the "Check and Repair" Button.

The GPX-Korrektor is an Add-On that can be used to interactively manipulate geograhical Coordiantes in a GPX-File.
The Program is optimized for usage with Google-Street View compatible Uploads.

So this program can help you to correct the GPS-Coordinates in a GPX-File before uploading the file to **Street View**.

The Program will need a BING-Maps Key to work. 4368

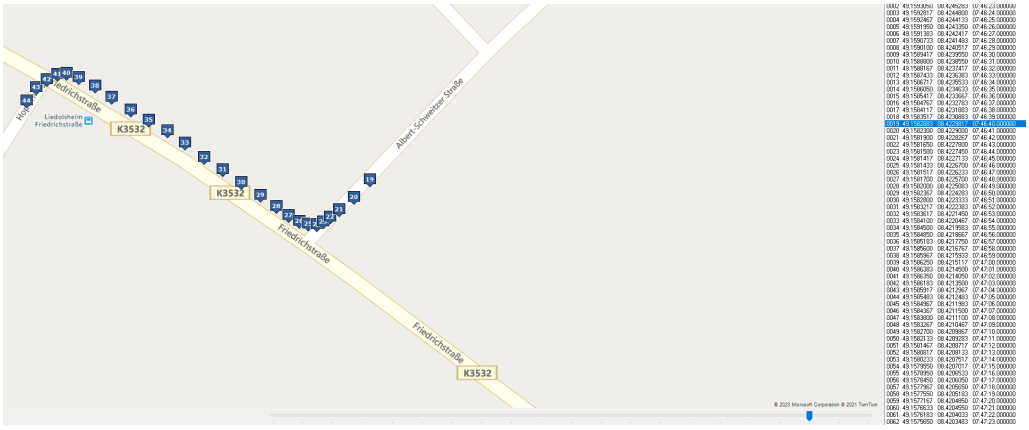
The Main-Window shows on the right side a list with numbered GPS-Coordinate.
The Selected Coordinate is the starting Coordinate unless other Settings.
When you start the program only 1 Coordinate is display and also only if a Point is selected.
You need to select on or more points to update the Map-Display.

*© 2023 Theo Gottwald * https://www.smart-package.com*

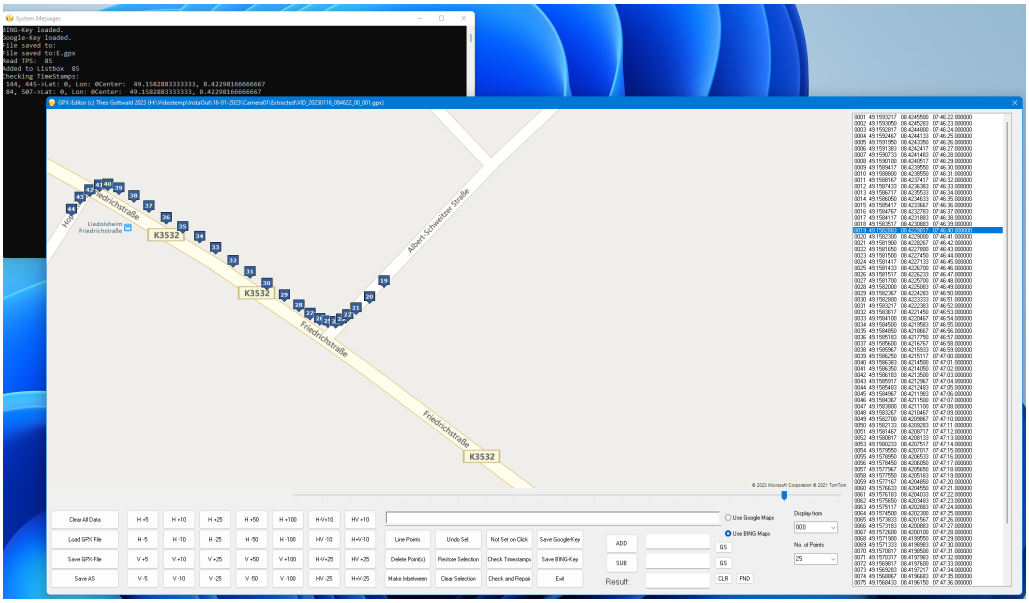
Even after changing Settings, it may be necessary to first select a Point to have the display updated.

You see on the Maps each GPX-Point as as Landmark with its number.

You have a **ZOOM-Switcher Slider** which you can use to **change the ZOOM** of the Map.



The following Picture shows the GPX-Korrektor Program with its 2 windows (Black Output Window, and Main Window).
Please do NOT Close the Output Window. Otherwise the Main Window will also be closed and all Data will be lost!



Here is my hometown "Dettenheim".
As you can see it is nearly completely added to Street View using the SPR and also did some Corrections, using the GPX Korrektor Utility.
In this process the Program was developed.

*© 2023 Theo Gottwald * https://www.smart-package.com*

© 2023 Theo Gottwald * https://www.smart-package.com

4.88.1 Eingabe des BING bzw. Goggle-API Keys

The Program will need a BING-Maps Key to work.

Here are the steps to get a Bing Maps key:

1. Create a Bing Maps account:
   Go to the Bing Maps website (https://www.bingmapsportal.com/) and sign up for a Bing Maps account.

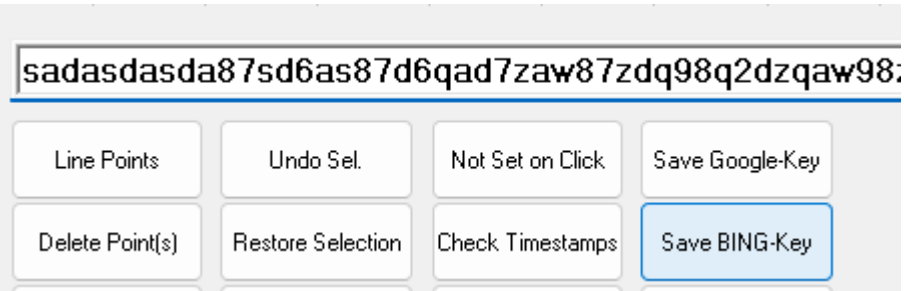
2. Get an API license:
   In the Bing Maps portal, go to the "**My Account**" section and select "**My keys**."
   Then click on "**Create a key**" to get a Bing Maps API license.

3. Choose the API:
   Select the Bing Maps Imagery API, which provides access to Bing Maps satellite and aerial imagery.

4. Add the Key to the Korrektor:
   Copy the API key generated in the portal into the large white Textbox and press "**Save BING Key**".

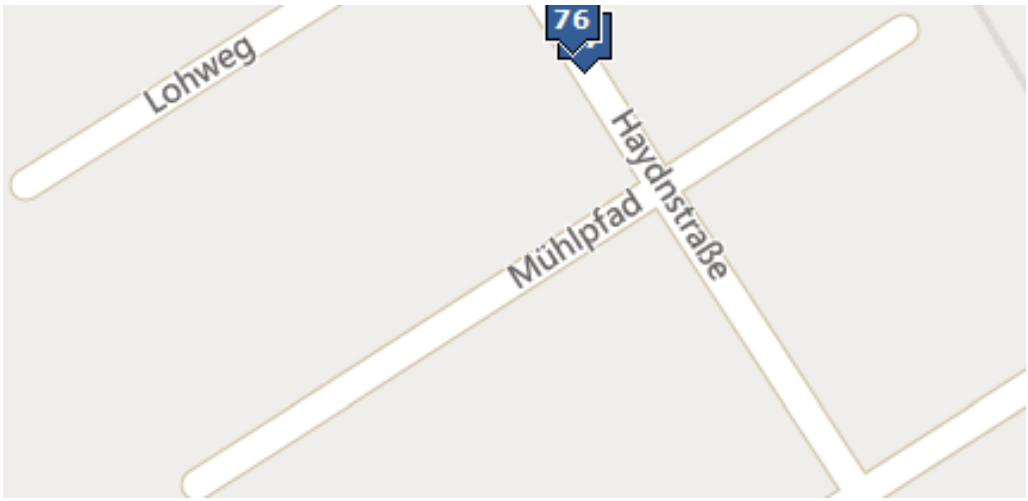
This is only done once, as the Key is been stored in a encrypted way in the Computer.

Note: You can also add an Google-Key but that is not of much use in the current version.



If you have added the Google-Maps API, you can check if the Map Information is similar to Google Maps or not - like in this case.
Currently the program will not display any Trackpoints on the Google-Maps.

© 2023 Theo Gottwald * https://www.smart-package.com



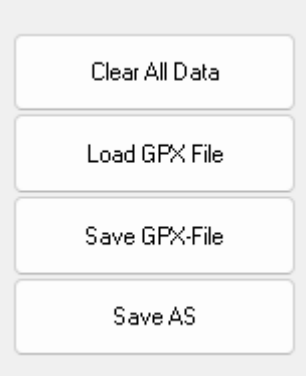
BING-Maps, Stand 01/2023

Google-Maps Stand 01/2023

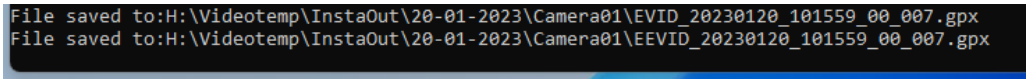
*© 2023 Theo Gottwald * https://www.smart-package.com*

4.88.2 FIle Load/Save-Buttons

These Buttons can be used to Load and Save the GPX-File.



After each File-Save, the File-Path and Filename is shown in the Console Window.



© 2023 Theo Gottwald * https://www.smart-package.com

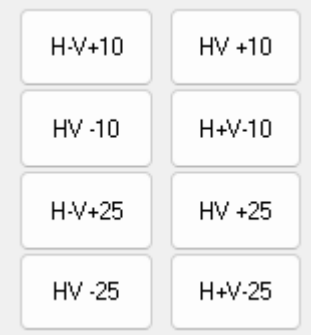
4.88.3 H-/V+- Buttons

These Buttons are used to MOVE the selected Trackpoint(s).

There are two sections:

1. The first Section will move the selected Trackpoint(s) only Left/Right or Up/Down:

2. The Second Section can move the selected TrackPoints Diagonal:



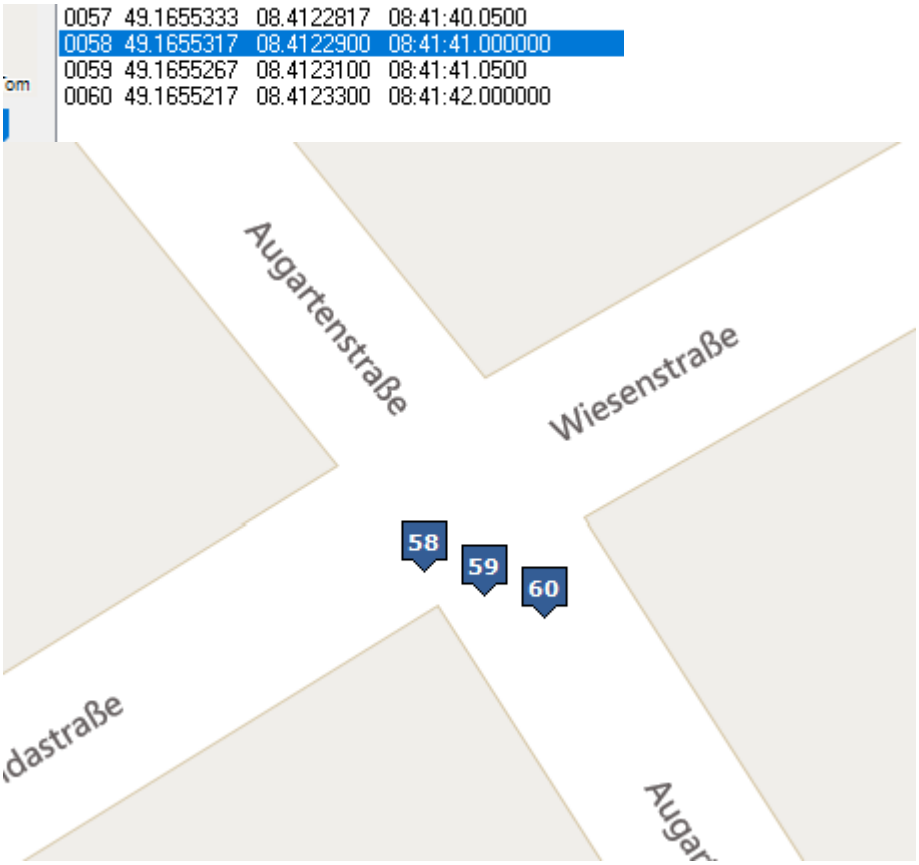
You can choose between 10 or 25 Movement Units.
The Amount of Movement is always the same, no matter, which ZOOM-Level is set.

Generally all selected Trackpoints will move by the same amount.

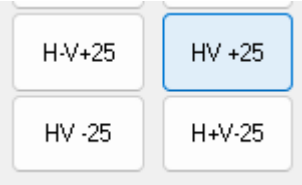
Also **V+** will move the Points "**Upwards**", while **V-** will move the Trackpoints "**Downwards**".
The **H-** will move to the **Left** Side, while **H+** will move the Trackpoints to the **Right** Side.

Lets take these Points. Trackpoint 58 is selected.

© 2023 Theo Gottwald * https://www.smart-package.com

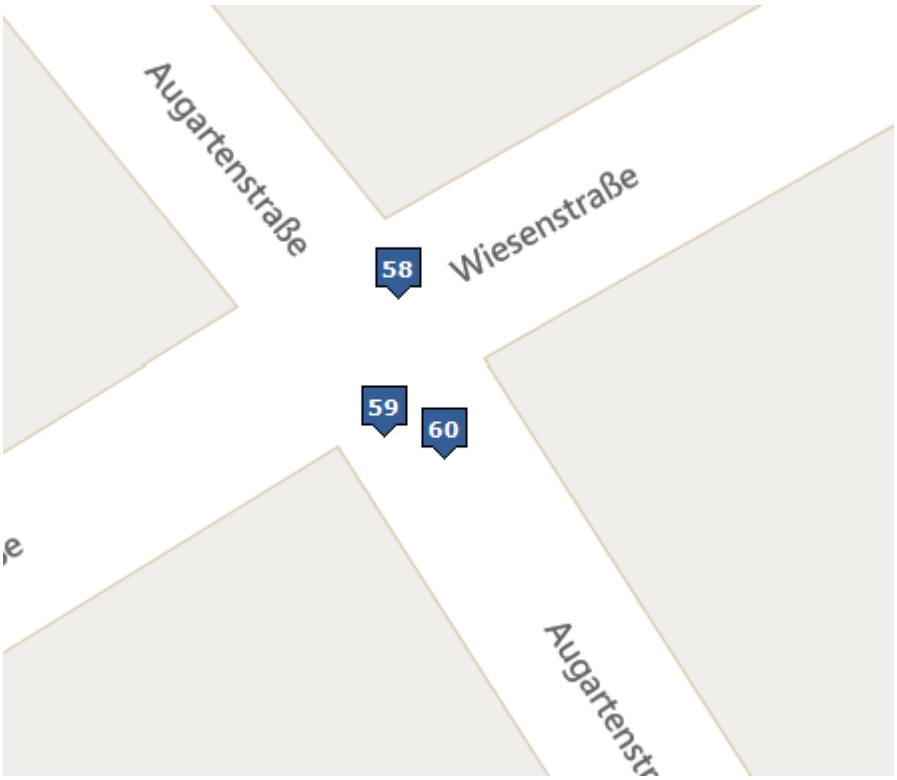


Now I press this Button:



Here is the result:

© 2023 Theo Gottwald * https://www.smart-package.com



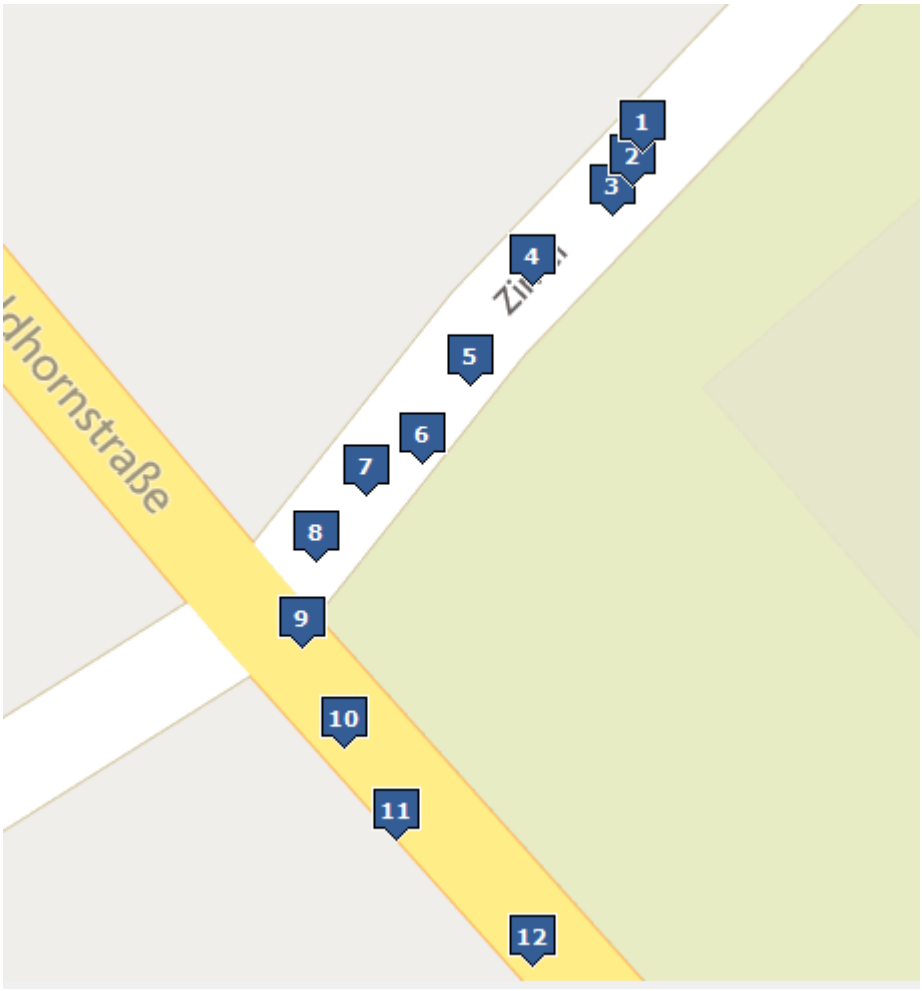
© 2023 Theo Gottwald * https://www.smart-package.com

4.88.4 Line Points - Button

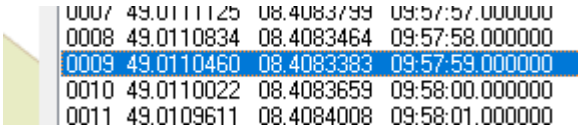
This Button is possibly the most important Button.
It can re-order Trackpoints on a L9ine between the two selected Points.

Let's see an Example.

We are in this Zoom-Level: 
Situation in the RAW GPX-File is this:

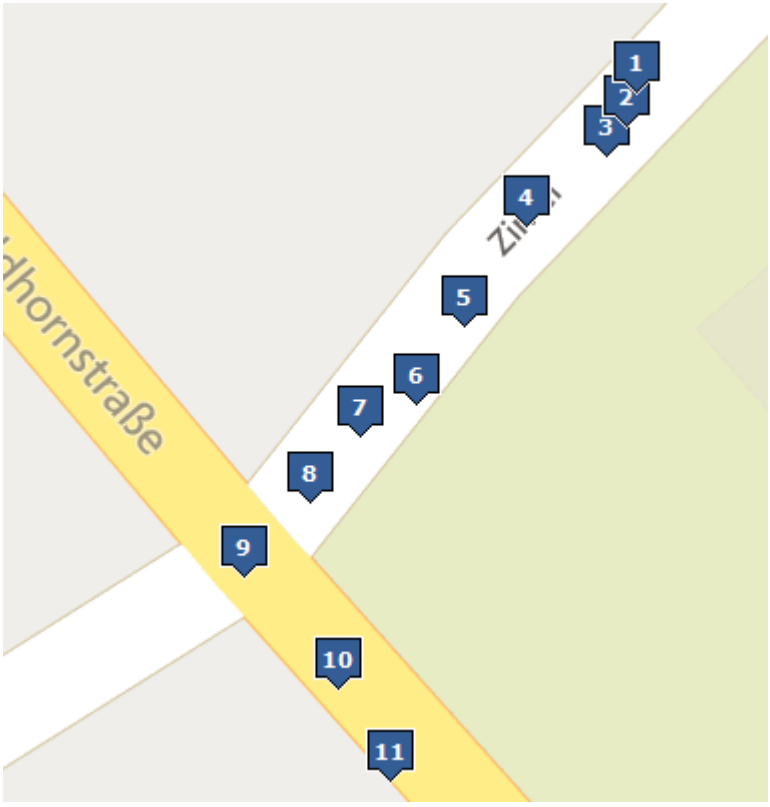


In the first step i will move Trackpoint 9 into the Center of the roads.
For this i will select TP 9 and then Move it using the H/V Buttons.



Now Situation looks like this:

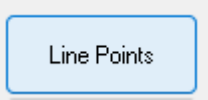
© 2023 Theo Gottwald * https://www.smart-package.com



Now I can use the "Line Points" Button, to move all Points between Trackpoint 1 and Trackpoint 9 on a Line.
For this i will select these two Trackpoints that mark the Start and End of the Line.
All Points between will be moved in a 90 Degree Angle towards this Line.
These Points are selected.

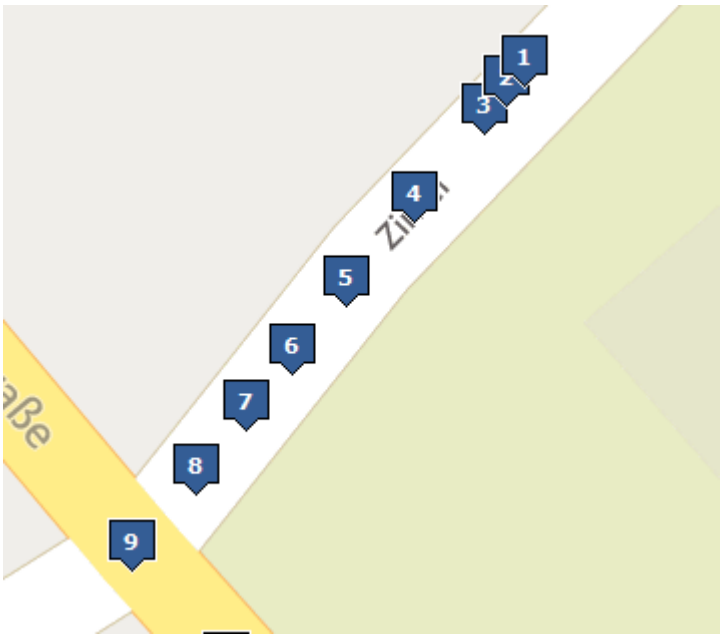
0001	49.0112642	08.4085655	09:57:51.000000
0002	49.0112494	08.4085585	09:57:52.000000
0003	49.0112355	08.4085457	09:57:53.000000
0004	49.0112048	08.4084915	09:57:54.000000
0005	49.0111611	08.4084510	09:57:55.000000
0006	49.0111271	08.4084178	09:57:56.000000
0007	49.0111125	08.4083799	09:57:57.000000
0008	49.0110834	08.4083464	09:57:58.000000
0009	49.0110510	08.4083033	09:57:59.000000

I press this Button:



Here we have the result. All Points between 1 and 9 are now on the Line.

© 2023 Theo Gottwald * https://www.smart-package.com



Here we have another example.

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

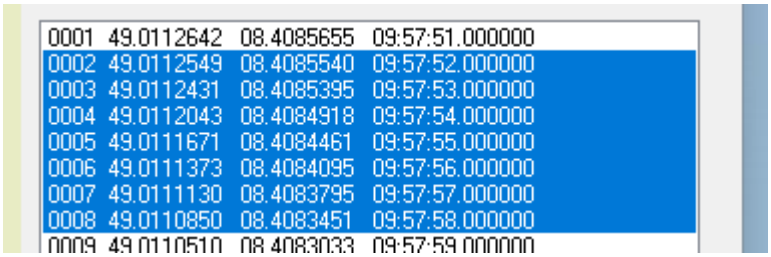
4.88.5 Make Inbetween / Delete Button

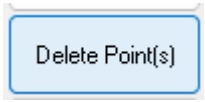
This Button will do 2 things:
1. It will set a new Trackpoint after each currently selected Point.
2. It will select all new created Points.

So what is it good for?

Lets take this situation:

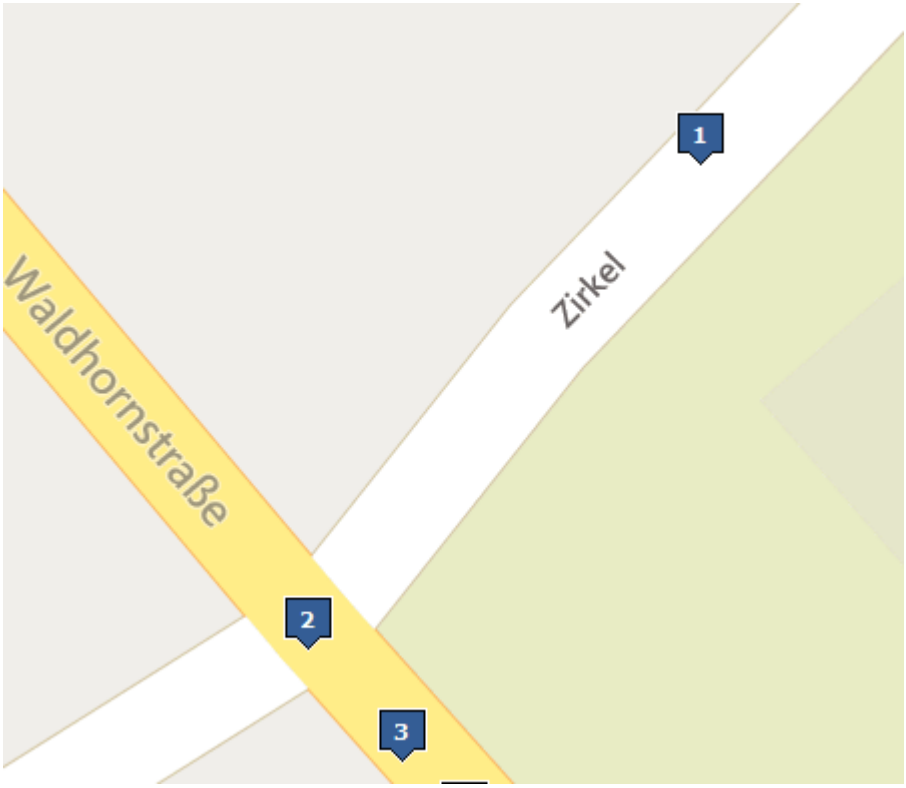
I am now going to delete the TrackPoints 2 to 8.



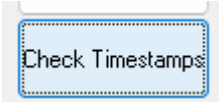


The situation looks like this:

© 2023 Theo Gottwald * https://www.smart-package.com



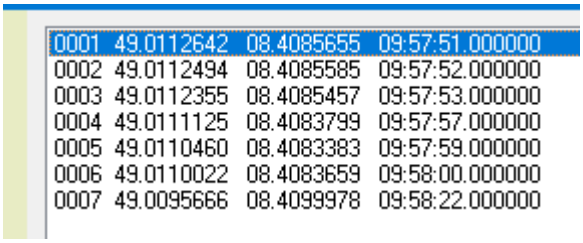
More important is that we have a time-problem because Street View will not accept a time distance larger then 5 Seconds.



And we have here a time distance of ...

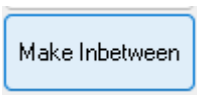
```
Checking TimeStamps:
Bad Time-Error between Stamps:  1/ 2=  8000
```

We can see it here also:



0001	49.0112642	08.4085655	09:57:51.000000
0002	49.0112494	08.4085585	09:57:52.000000
0003	49.0112355	08.4085457	09:57:53.000000
0004	49.0111125	08.4083799	09:57:57.000000
0005	49.0110460	08.4083383	09:57:59.000000
0006	49.0110022	08.4083659	09:58:00.000000
0007	49.0095666	08.4099978	09:58:22.000000

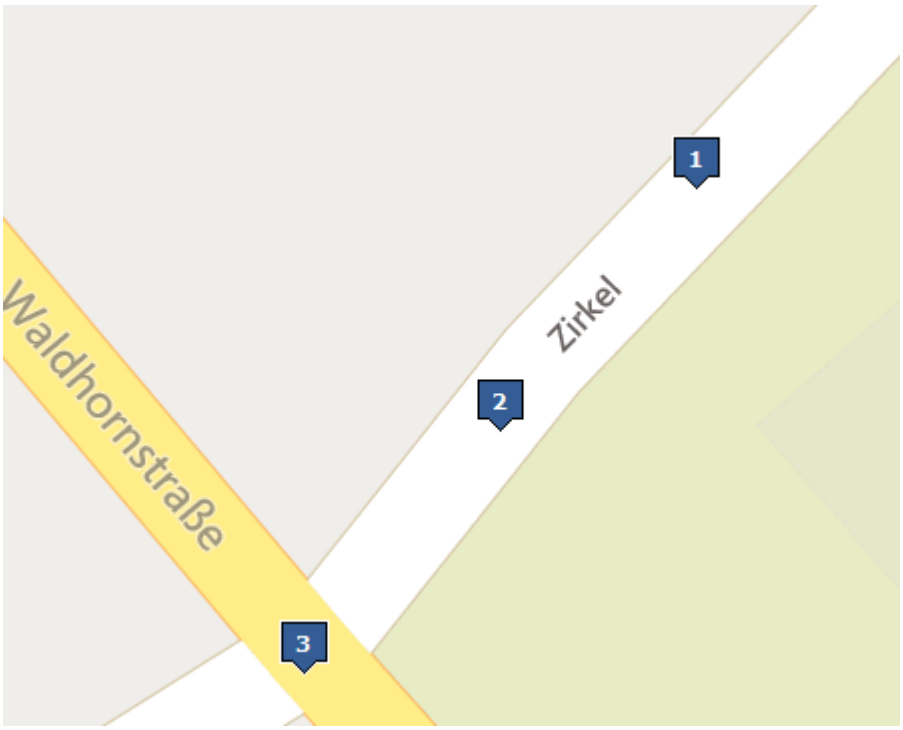
We can now select Trackpoint 1 - the point before the TP we want to insert - and press



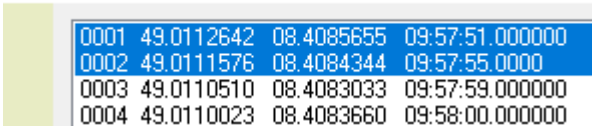
This will change the situation in 2 ways.

First we get one new Trackpoint here:

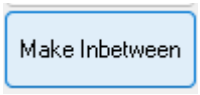
© 2023 Theo Gottwald * https://www.smart-package.com



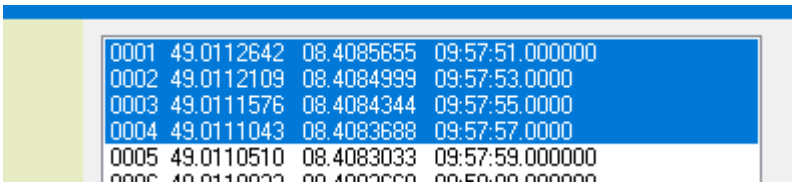
Second, the new TP is selected as well as the original TP.



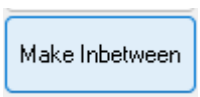
Now we can immediately press the Button again ...



Now we get this.

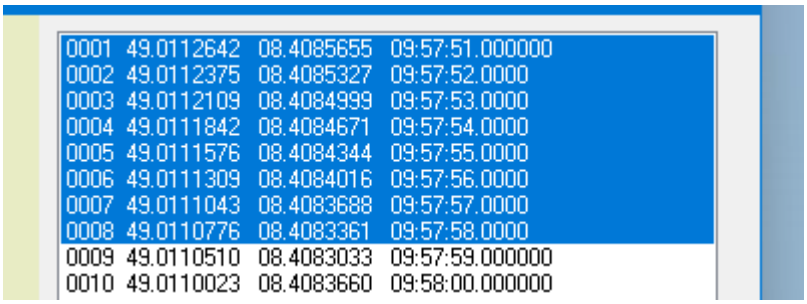


and we can immediately press the button once more.



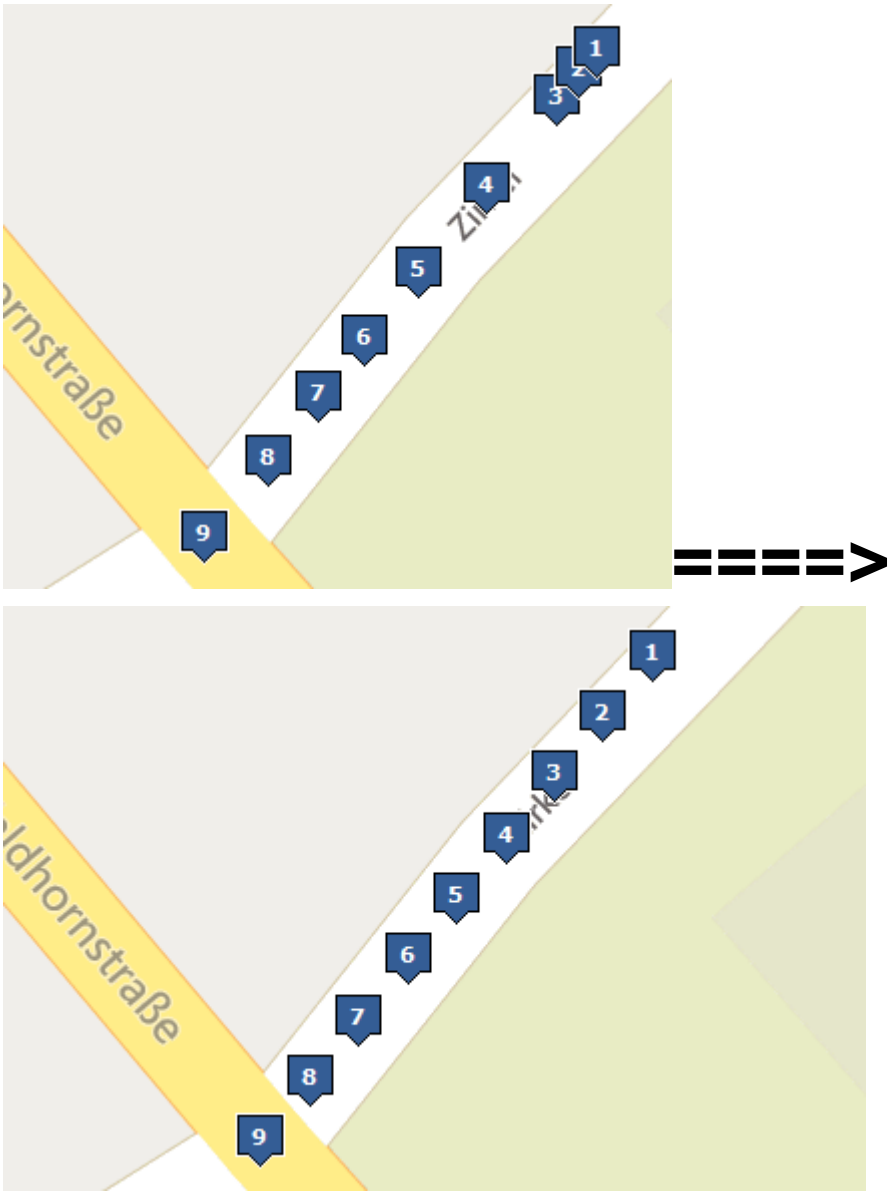
Now we get a Situation that looks like this:

© 2023 Theo Gottwald * https://www.smart-package.com



0001	49.0112642	08.4085655	09:57:51.000000
0002	49.0112375	08.4085327	09:57:52.0000
0003	49.0112109	08.4084999	09:57:53.0000
0004	49.0111842	08.4084671	09:57:54.0000
0005	49.0111576	08.4084344	09:57:55.0000
0006	49.0111309	08.4084016	09:57:56.0000
0007	49.0111043	08.4083688	09:57:57.0000
0008	49.0110776	08.4083361	09:57:58.0000
0009	49.0110510	08.4083033	09:57:59.000000
0010	49.0110023	08.4083660	09:58:00.000000

Where all (new) Points are perfectly distributed.
This should only be done in special cases because it may lead to pictures having wrong GPS Coordinates by some meters.
Therefore you should prefer the "Line Points" Button.

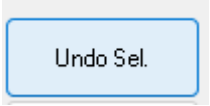


© 2023 Theo Gottwald * https://www.smart-package.com

© 2023 Theo Gottwald * https://www.smart-package.com

4.88.6 UNDO Selected - Button

During the Loading of the GPX File, the Program will make an internal Copy of the original file.
If you press this Button,

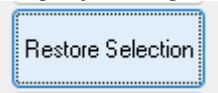


The program will replace actual values of ANY SELECTED TRACKPOINT with the original values that have been stored during the Loading of the file.
If you have added Trackpoints or deleted Trackpoints using this Button can lead to confusion.

*© 2023 Theo Gottwald * https://www.smart-package.com*

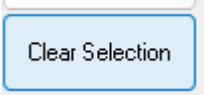
4.88.7 Restore/Clear Selection Buttons

During Operations, the Trackpoints-Listview may loose the Input-Focus and will not show properly which Trackpoints are selected.
Or it will show only one Trackpoint that is currently selected.
To get your original Selection back, press:



Then the Listview will display all currently selected Trackpoints.

If you want to clear any selection, use:

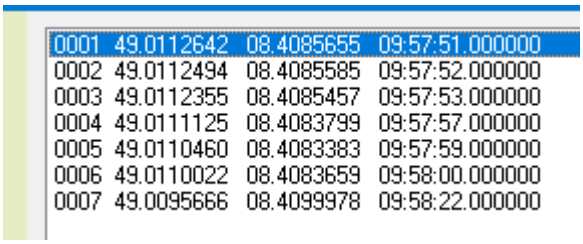


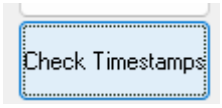
© 2023 Theo Gottwald * https://www.smart-package.com

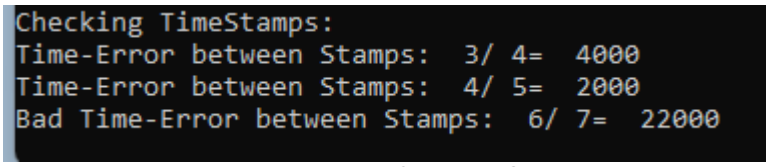
4.88.8 Check Timestamp Button

Generally Google-Street View will NOT accept GPX Files with Trackpoints taht are mor then 5 Seconds from each other.
This Function will do several Tests, if the Trackpoints are valid and the file is ready for Upload.

Here is an Example:







The results will be displayed in the Conso0le Output Windows.

The times that are displayed here are in ms. 4000 ms = 1 Second.

© 2023 Theo Gottwald * https://www.smart-package.com

4.88.9 Check and Repair Button

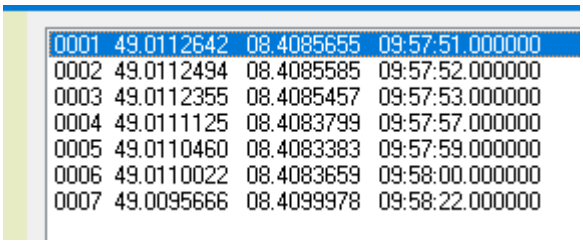
There are several Conditions, under which a GPX-File should not be uploaded because the results will not be as expected.

- Trackpoints must not be at the same time.
- And the time between Trackpoints must never exceed 5 Seconds.
- Trackpoints must be in the right Order -means a later trackpoint can not have an earlier time.

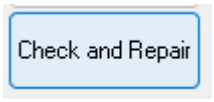
thee are several such conditions.
Using this button, all such Conditions are automatically checked and repaired using this Button.
The Button has some things in common with the "Check Timestamp Button",
but will automatically repair the Timestamps by adding Trackpoints and reordering if needed.

If there are Trackpoints added, these Trackpoints will always be positioned between current Trackpoints.

Here is an example.



0001	49.0112642	08.4085655	09:57:51.000000
0002	49.0112494	08.4085585	09:57:52.000000
0003	49.0112355	08.4085457	09:57:53.000000
0004	49.0111125	08.4083799	09:57:57.000000
0005	49.0110460	08.4083383	09:57:59.000000
0006	49.0110022	08.4083659	09:58:00.000000
0007	49.0095666	08.4099978	09:58:22.000000



```
Checking TimeStamps:
Checking for equal TimeStamps:
Added to Listbox  7
Inserting Trackpoints between:  3- 4
Added to Listbox  8
Added to Listbox  10
Inserting Trackpoints between:  7- 8
Added to Listbox  11
Inserting Trackpoints between:  10- 11
Added to Listbox  12
Added to Listbox  14
Added to Listbox  18
Added to Listbox  26
Added to Listbox  42
```

Resulting Time-Stamps after Repair:

© 2023 Theo Gottwald * https://www.smart-package.com

4.88.10 ADD / SUB / GS / CLR / FND Buttons

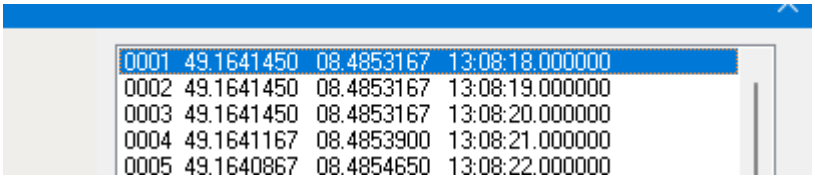
These Buttons will support you, if you CUT the Original Video at the start or End.
Using these features you can delete those Trackpoints that need be deleted if the Video is shorter.

Adapt a GPX-File to a Video where parts of the Start have been

Lets say you have a Video that is Originally starting from 13:08:18:0000
Now you need to delete 01:45 Seconds from the START.

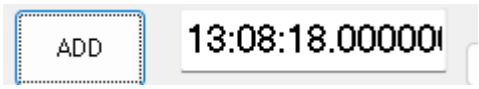
So you would do the following steps:

1. Select the Start-Timestamp (Nr.1)

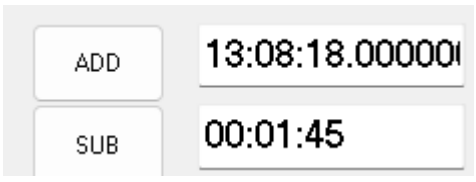


2. Click the "GS-Button to copy the Timestamp. (GS -> "Get Setting")

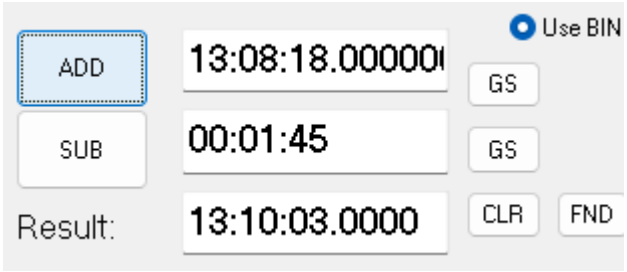
3. The result will be:



4. Now manually enter the Amount of time that you have cut of the start from the video, into the second field.



5. Now press the ADD-Button. The result will be:

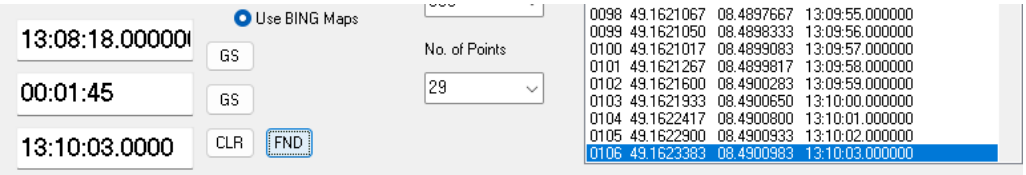


In the RESULT Field, you will see the new start of the GPX-File.

© 2023 Theo Gottwald * https://www.smart-package.com

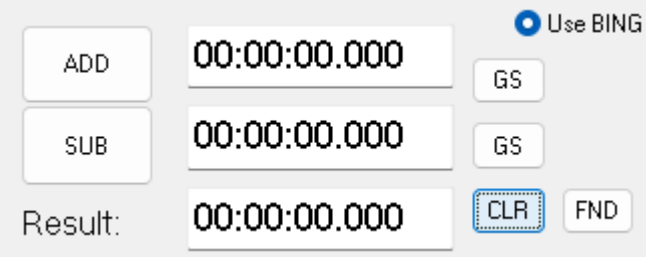
Now press the FND-Button to get the exact Trackpoint, that is the first Trackpoint in this video.
In the Listbox, the Trackpoint, that is the first Trackpoint in the video is now selected - in this Case it is Trackpoint Nr.16.

You will now delete all Trackpoints before this Trackpoint, then the GPX-File will fit o the Video.



Using the CLR-Button to clear all Fields

Next lets clear all field. Press

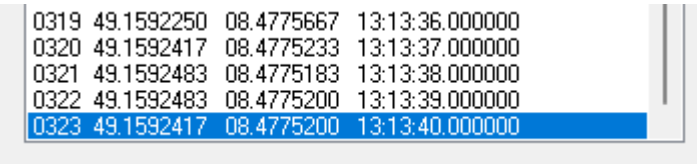


Adapt a GPX-File to a Video where parts of the End have been c

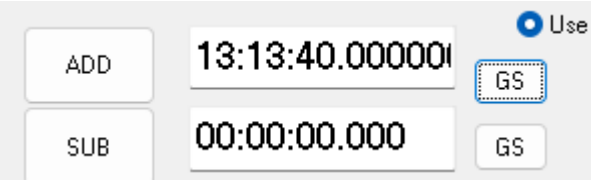
Lets say you have a Video that is Originally ending at 13:13:40:0000
Now you need to delete 01:45 Seconds from the END of the Video.

So you would do the following steps:

1. Select the END-Timestamp - the last Timestamp at the end of the Video.

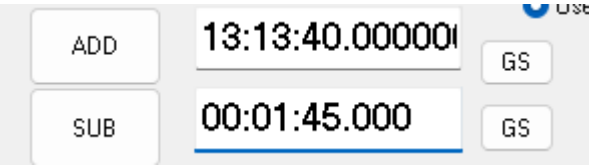


2. Click the "GS-Button to copy the Timestamp. (GS -> "Get Setting")

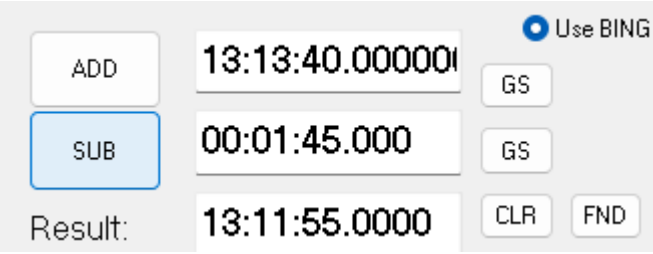


3. Enter the Time to "cut away" into Field 2

© 2023 Theo Gottwald * https://www.smart-package.com

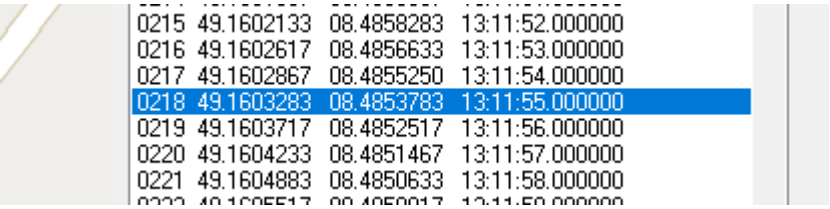


4. Press the SUB-Button to get this result:



In the RESULT Field, you will see the new END of the GPX-File.

Now press the FND-Button to get the exact Trackpoint, that is the last Trackpoint in this video.
In the Listbox, the Trackpoint, that is the last Trackpoint in the video is now selected - in this Case it is Trackpoint Nr.218.

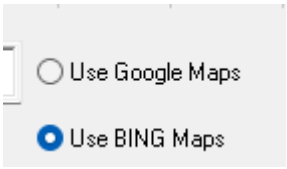


You will now delete all Trackpoints after this Trackpoint, then the GPX-File will fit to the Video.

© 2023 Theo Gottwald * https://www.smart-package.com

4.88.11 Choose between BING Maps and Google Maps

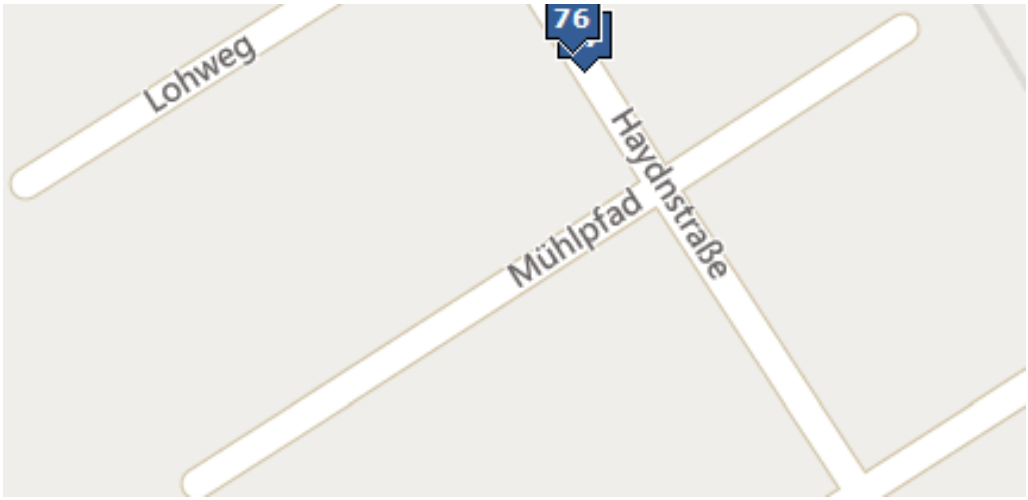
There is a option to choose between BING Maps API and Google Maps API.



Currently the Program only supports the BING Maps API, this is due to the fact that the resolution of the
Pictures we get from Google API is limited to 640x48 at the time of writing.
So just leave that on BING Maps.

You can add a Google API Key and the program will display a Google Map from that place. but currently without any GPX-Points.

If you have added the Google-Maps API, you can check if the Map Information is similar to Google Maps or not - like in this case.
Currently the program will not display any Trackpoints on the Google-Maps.



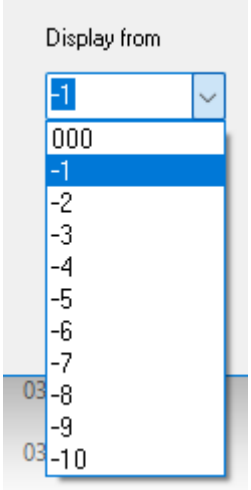
BING-Maps, Stand 01/2023

© 2023 Theo Gottwald * https://www.smart-package.com

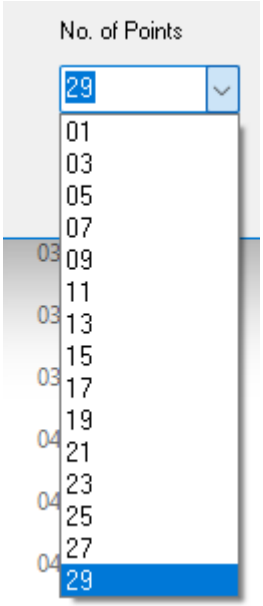
4.88.12 Display from / No. of Points

There are two Fields where you can select the number of Trackpoints, that are displayed, and you can decide in which Trackpoint to start.
Generally the display will always display 2 Trackpoint, the Selected Trackpoint and the next Trackpoint - if there is one.

To see which way the GPS-Data is going, it is recommended to set "**Number of Points**" on "29".
Most often there is no need to change the setting from "Display from".
If you work with the last selected Trackpoint, this setting comes in handy.



Choose the starting Trackpoint to display, always calculated from the first current selected Trackpoint.



Choose the number of Trackpoints that will be displayed, here a larger number is recommended.

© 2023 Theo Gottwald * https://www.smart-package.com

4.88.13 Additional Comments

Here are some additional Tipps on uploading to Google Street V

1. At the time of this writing, uploads are done at: Street View Studio

2. Stop Recording while turning the car. The Overlapping of Coordinates may lead to problems when uploading. All Coordinates should go in a clear direction.

3. Remove Trackpoints that are on the same location as other Trackponts. If needed make new Trackpoints just nearby.

4. Do not completely delete Trackpoints if not needed, because there is a dependence in the Timeline/Trackpoints of the GPX-File and the Pictures in the Video.

5. The "Marks on the road" will be at the **wrong place if the coordinates are not on the right place**. It looks like Google does not move these to the road at the time of writing.

Picture: The "Marks on the road" depend on the Coordinates that have been uploaded with the GPX-File.

Last Changes & Updates

5 Last Changes & Updates

Last Changes and Updates

02.05.2023
Help-File:
Many new Illustrations and improvements in the Starting Guide.

Added the correct Flags for the FIndpattern Commands:

```
About the P5 - Parameter ("Debug Flag"):
The Flag-Parameter meanwhile can do a lot more then just help Debuging.

1 - Enable Debug-Output in Console Window
2 - Snap last used Window again if not found
4 - Use "Difference Map Search"
8 - Disable Filtering (if set)
16 - Use "Invert Pattern"
32 - Use "Complement Pattern"
64 - Use "Extended Search" (takes longer, makes more evaluations)
```

SPR-Editor:
Removed a nasty bug in the SPR-Editor that was there for quite a while.
It could lead to a unexpected crash of the Editor when loading a lot of Subscripts.
Now the bug has been removed.
Breakpoints in Subscripts have been repaired.

GPX-Korrektor
Improved "GPX-Korrektor.exe", it has now a "Overview" Button.
Improved "GPX-Korrektor.exe", it can do Satellite View in 2 Modes.

SPR:
Changes: TXT.glx / CPC.f
Lots of Tests.

13.03.2023
Added new SFD. / Set File Date - Command (untested).
Added new Component "GPX-Korrektor.exe" in an Subfolder.
There is an own Chapter for this new Tool in the Help-File.

Update to the XML-Command. Internal Searches start now from (Pos+1). This may affect old Scripts that use XML-Commands.

What is a Timestamp?
A Timestamp is a Time-Value in the Format: `HH:MM:SS` or
`HH:MM:SS.mmm`
Using these new `TCA.` and more new Time-Stamp Commands you can work easily with Timestamps.

```
TCA.Add|P1|P2[|P3]
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
TCA.Dif|P1|P2[|P3]
TCA.Div|P1|P2[|P3]
TAC.Between|P1|P2[|P3]
TCA.Split|P1|P2|P3
TCA.Make|[P1][|P2][|P3]
TCA.Ovl|P1|P2[|P3]
```

also new:

```
IAT. / NAT.  If After Timestamp
IBT. / NBT.  If Before Timestamp
```

Using these new commands, TImestamps like "HH:MM:SS" can easily be **Added, Subtracted (Time-Difference),**
Divided, Split into Parts, Constructed and you can get the Timestamp between two Timestamps.

28.11.2022

New Command: GetGradientColor 1325 will calculate the Gradient color between two Colors with given Steps.

Error removed with

```
ANA.Color_Diff_MIN|$$C01|$$E05|$$ERA
```

Added Section with Graphical Subprograms 406 (Macros).
These Subprograms can be used for Picture Processing.

24.09.2022

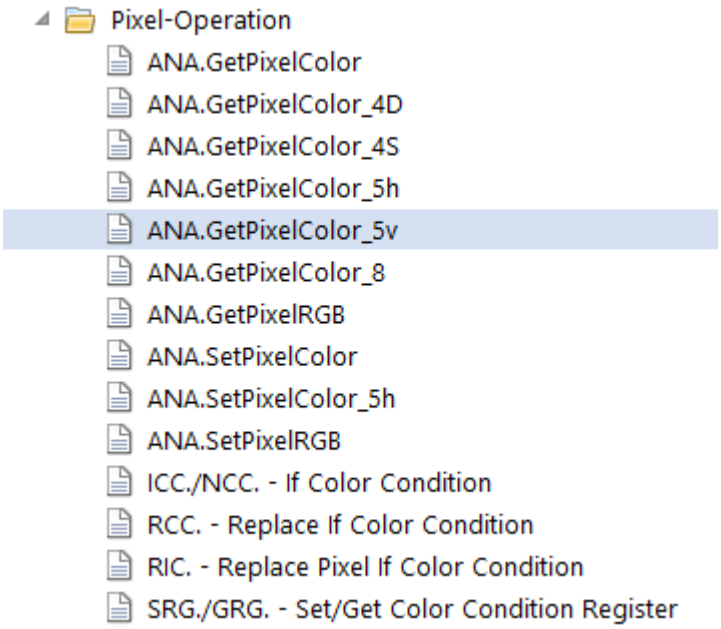
ANA.ReplaceColorT und ReplaceColorD have been improved.
Normally these Commands will replace a given Color with another color if the color fits the Color specification **P2 (+Tolerance)**.
Now there is the Option to prefix **P2** with an ! which make the Command switch to "Negative Mode", means it will replace all Colors that do NOT fit the specification in **P2**.

27.08.2022

Bugfix with DTV.
During the enhancement of DTV. to understand US-formatted Date's, there has been a little Bug which has now been removed.

New Chapter "Cleaning Scanned Writings" in the help-File.
You can use the SPR to clean-up bad scannings 1209.
For this there are new Commands

© 2023 Theo Gottwald * https://www.smart-package.com



These commands read and write the Colors of up to 8 Pixels in one run and therefore can speed up execution times of such Scripts.

03.08.2022

Added new commands:

```
DIC.Set_Multiple|$$RET|$$DEL|$$IND|$$VAL
DIC.Set_Value|$$REF|$$DEL|$$INX|$$VAL
DIC.Format_Numeric|$$LIN|$$DEL|$$IND|$$FMT|$$RES
```

These commands can be used to quickly change the Value/Data of one or more Cells of a csv-File or other delimited Data.

Changed:

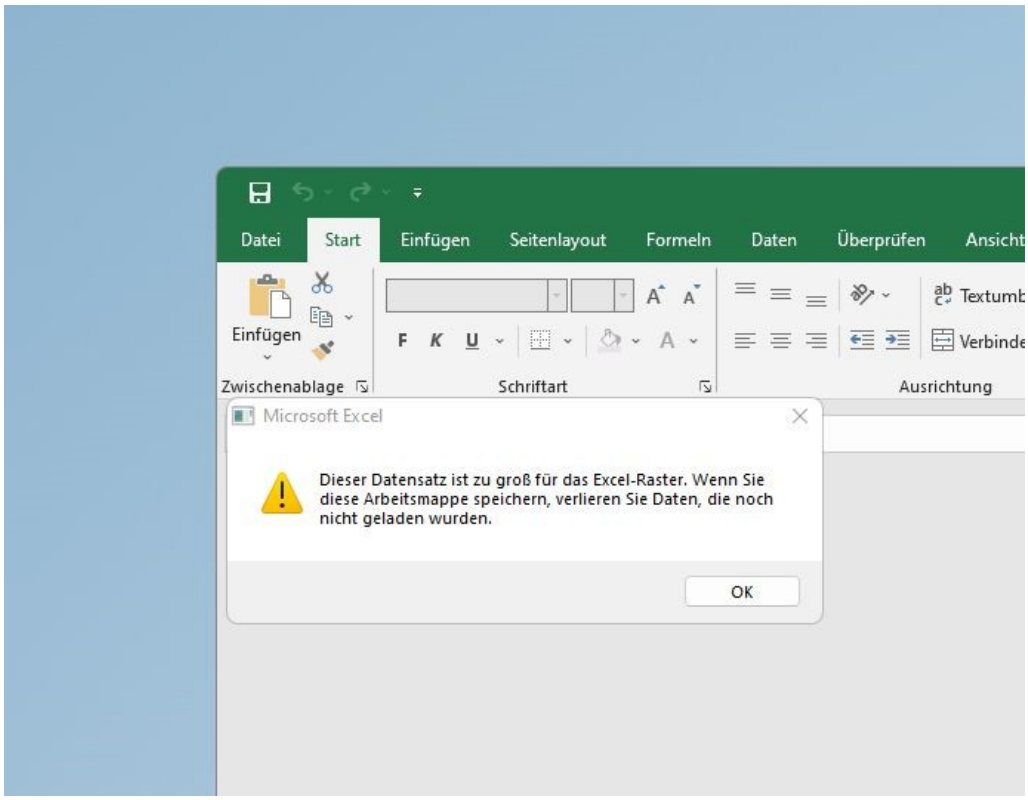
```
VDF. - Verfiy Date Format
```

Using this command, you can verify if a Variable contains a valid date. The command will now also convert a US-formatted Date like "2022/12/31" into a European type Date, that can be used with the other Date-Commands like `DTV.` and others. This was useful because in csv-Files there are often US-formatted Dates.

23.05.2022

Some smaller Corrections. Tests show that the SPR can handle csv-Files that are larger then Excel can handle.
A csv with more then 1.000.000 Lines can be processed using the SPR in less then 15 Seconds, while Excel will not accept it anymore.

© 2023 Theo Gottwald * https://www.smart-package.com



22.05.2022

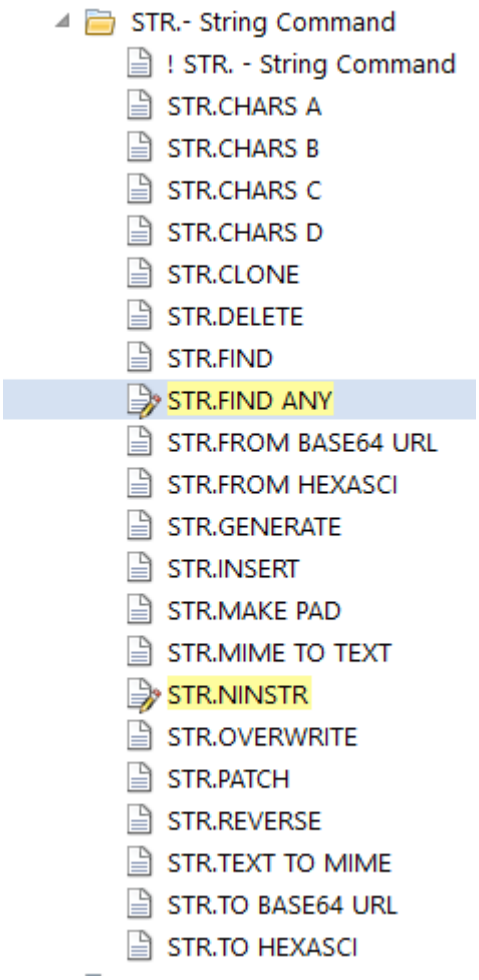
Added **many more commands to the TXT.-Command**, and also also the commands have been sorted by Type.
Some commands that are time intensive have been updated for Speed.
For example the TXT.Sort-Commands have been tested with a File with 354000 Lines and do their sort within a second or two.
Therefore the TXT.-Commands are now an own Category, not more in the String-Category.

`PRT.` Command improved. Can now print much larger Texts in one run.
Help for TXT.glp corrected.

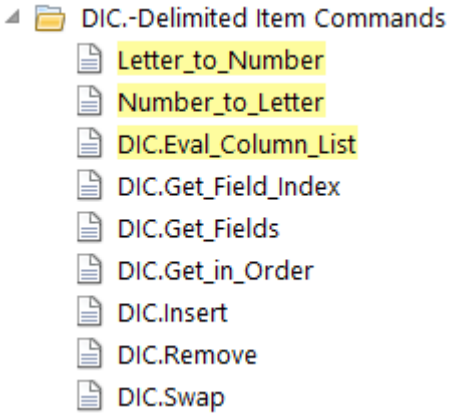
Excel-Function "`Excel_LetterToNumber`" and "`Excel_NumberToLetter`" have also been added to the DIC.-Command.
These have been changed internally and replaced by native programmed versions that will NOT call the Excel API.
This way these functions are much faster and do not rely on an Installation of Excel anymore.

New STR.-String Commands (Sort of Mulit-Instring):

© 2023 Theo Gottwald * https://www.smart-package.com



New DIC.-Commands



Many new commands for TXT.
These will complete the TXT.-Command-Set in a way that it can also be used as a virtual , multidimensional Array with Sorting capability.
It can be used as a Que, or as a Stack as well.

```
TXT.itas   and  TXT.insert_text_at_start
TXT.ilas   and  TXT.insert_line_at_start

TXT.itae   and  TXT.insert_text_at_end
TXT.ilae   and  TXT.insert_line_at_end
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
 TXT.itap   and  TXT.insert_text_at_pos
 TXT.ilap   and  TXT.insert_line_at_pos

 TXT.itbl   and  TXT.insert_text_before_line
 TXT.ilbl   and  TXT.insert_line_before_line

 TXT.ital   and  TXT.insert_text_after_line
 TXT.ilal   and  TXT.insert_line_after_line

TXT.sbcl   and  TXT.sort_by_column_letter
TXT.sbci   and  TXT.sort_by_column_integer
TXT.sbcf   and  TXT.sort_by_column_float

TXT.fic   and  TXT.find_first_in_column
TXT.flc   and  TXT.find_last_in_column
TXT.gcb   and  TXT.get_column_block
```

and much more.

30.04.2022

New Command:

`TXT.set_text_lines|$$LIA|$$LIB|$$REP`

Lines `$LIA` (from Begin of the line) bis `$$LIB` (until end of this line) will be removed/replaced with the content of `$$REP`

Change: `TXT.frv` is now `TXT.fov` as it was documented.

Sample:

```
:Lab_Remove_Cols
$$FIK=?exeloc\Test.txt
$$LIA="Q","M","K","I","H",F"
TXT.toc|$$BAK
TXT.Load_pure_Text|$$PAA|$$FIK
TXT.Delimited_Items_Remove|;|$$LIA
TXT.Get_pure_Text|$$PAA
TXT.fov|$$BAK
TXT.Get_Line_Count|$$NUL
RET.
```

24.04.2022

These commands are useful for Excel- and ***CSV-Files***. You can remove Columns, Insert Columns, or Swap Columns.
In real life many stuff is in Excel-Files, and often we have to work with these.
It was possible using SBD. before but now it becomes really easy.

Added:

```
TXT.crp / TXT.cr_to_crlf
TXT.lfp / TXT.lf_to_crlf
TXT.crr / TXT.crlf_to_cr
TXT.lfr / TXT.crlf_to_lf
TXT.gtls /TXT.Get_Text_Lines
TXT.gtb / TXT.Get_Text_Block
TXT.gdi / TXT.get_delimited_item_from_line
```

© 2023 Theo Gottwald * https://www.smart-package.com

```
TXT.gda / TXT.get_any_delimited_item_from_line
TXT.gdit /TXT.get_delimited_item_from_text
TXT.gdat /TXT.get_any_delimited_item_from_text
```

These 3 are also new. They will process not just a Line but the complete TXT.-Buffer.

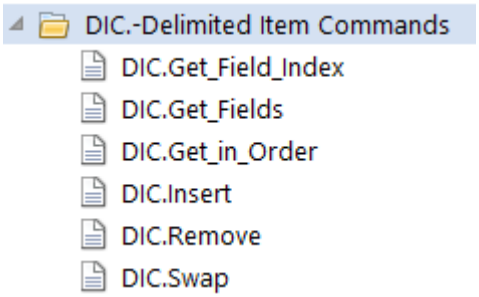
```
TXT.Delimited_Items_Insert
TXT.Delimited_Items_Remove
TXT.Delimited_Items_Swap
```

More new Command:

```
DIC. - Delitimed Item Command

DIC.Swap|$$DEL|$$LIN|$$INA|$$INB|$$RES
DIC.Insert|$$DEL|$$LIN|$$IND|$$RES
DIC.remove|$$DEL|$$LIN|$$IND|$$RES
DIC.Get_in_Order|$$DEL|$$LIN|$$IND|$$RES
DIC.Get_Fields|$$DEL|$$LIN|$$IND|$$RES
```

These commands can be found here3078.



24.04.2022
Many Changes and Bug Fixes with the Pattern-Search.
There were Bugs that could make the Patternsearch crash if used extensively (WFP. ?).
These Bugs have been removed.

Also Pattern-Search is now faster and has more Options like X-Ray and Extended Search.

Even searching for 5 Patterns at the same time will be in a second with an actual CPU.
Its amazing fast.
Internally the Engine can already search 6 Patterns at the same time, but we did not make a command for that at the time of this writing.

Added lots of new Pattern-Sizes1862 that are not yet supported from the Pattern-Recorder (HE-Recorder).
Looks like a completely new Pattern-Recorder would be fine.

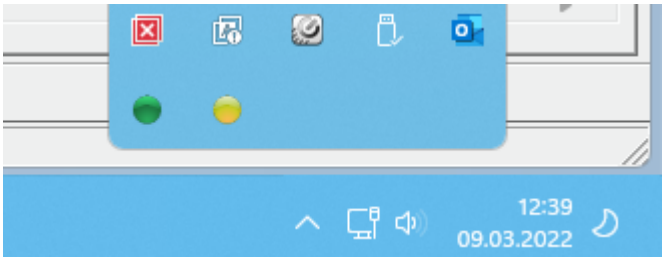
There are no more "Bad Patterns". If its a Pattern, you can use it. All Patterns are now fine.

Searching for more then 1 Pattern will now generally use IR 0 for the Target Bitmap, and IR 1 ... IR (number of Pattern to search for) for the Patterns. This is a general rule for a "Multi-Pattern Search Commands".
Therefore these "Multi-Pattern Search Commands" commands will overwrite IR 0 and the following IR's.

© 2023 Theo Gottwald * https://www.smart-package.com

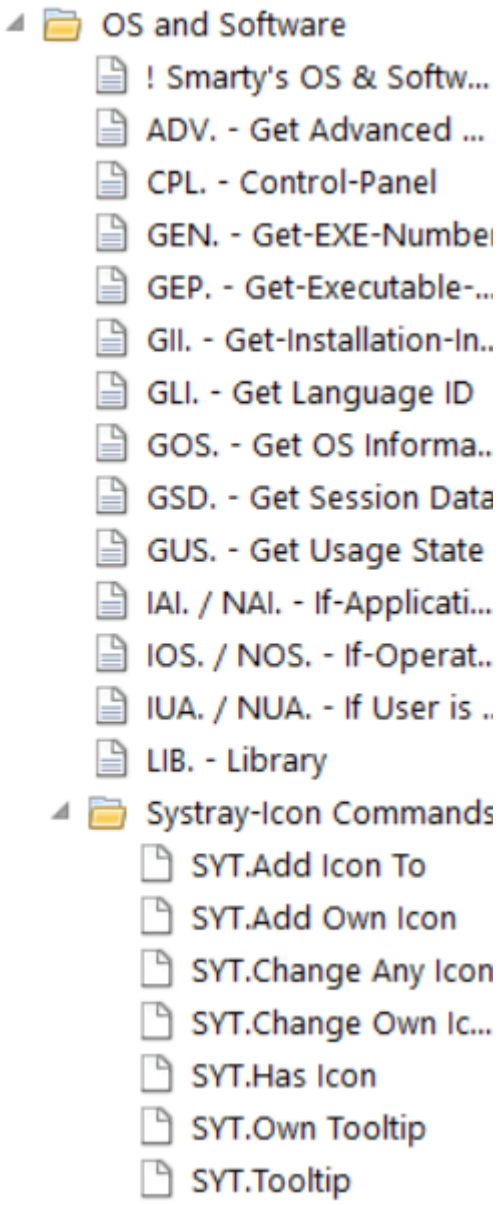
If you use these IR's save them somewhere (ANA.ToVar) or move them into higher IR's (ANA.Move)
that are unused - for example IR 10 and following.

09.03.2022
New Command `SYT.` (Systray-Icon) mostly completed.
You can now add an Systray-Icon, also a Tool-Tipp is supported, but not yet any menu.
You can also change the Icon (make it blink).



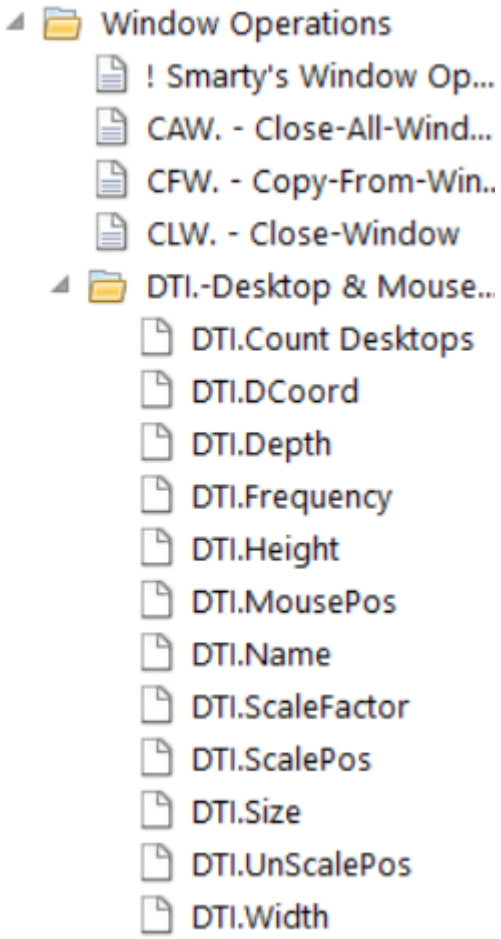
The new SYT.-Command can be found under "OS & Software".

© 2023 Theo Gottwald * https://www.smart-package.com



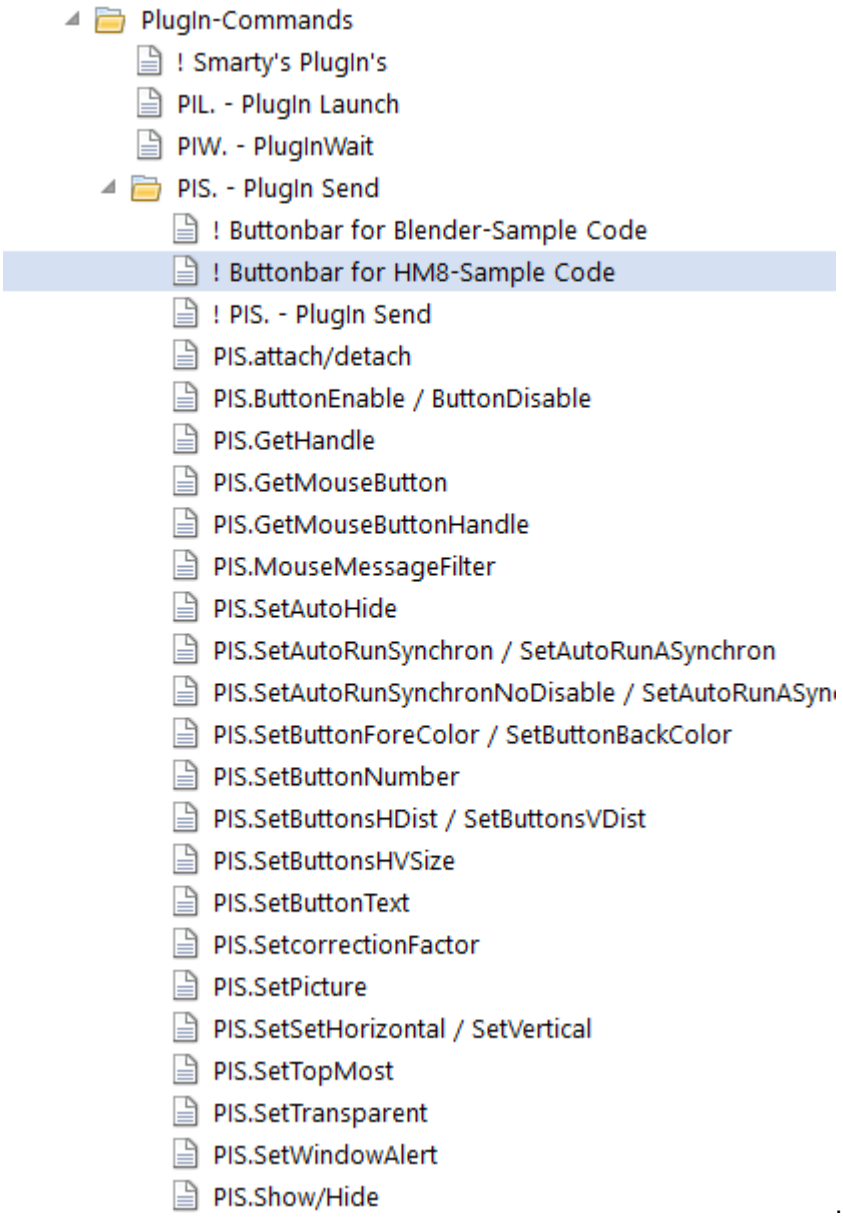
02.03.2022
New Command `DTI.` (Desktop-Information) completed.
This command will give all needed Information on number of visible Desktops, coordinates, DPI-Scaling etc.

*© 2023 Theo Gottwald * https://www.smart-package.com*



14.02.2022
In this Update i have revisited the "Plugin_01.exe" the Buttonbar.
The help was incomplete and is now completely documetned:

*© 2023 Theo Gottwald * https://www.smart-package.com*



New: `PIS.GetMouseButtonHandle`
New: `PIS.attach` - lots of more Options on how to attach the Buttonbar
Bei den PIS.Befehlen gab es Änderungen, bitte die Hilfe beachten, wenn etwas nicht geht.

```
PIS.inv -> PIS.Hid
PIS.vis -> PIS.Sho
PIS.SetVertikal -> PIS.SetVertical
PIS.SwitchTopMost->PIS.SetTopMost
```

Improved:
Help for PIS. has been updated and improved. Many new help-Pages.

Efficiency of the running Butonbar is improved (needs less CPU).
Behavior when Target WIndow was minimized has been improved.

`PIS.SetButtonBackColor`
now works properly and can permanently change the Button Color.

© 2023 Theo Gottwald * https://www.smart-package.com

Buttons in the Buttobar (Plugin_01) do not have any default Text by now.
Also you can now remove any Text using:
`PIS.$$REA|sBt|1|`
for Example if you want to display a Picture, using
`PIS.$$REA|SetPicture|1|$$FIX|32|5`
this command has been Improved.
It can now Scale the pictures to any size, if **P4** and **P5** are specified. This way you can use any pictures for the Buttonbar, just specify the size they should have on the Button.

New feature:
If Size or distance is specified with "zero" then the previous value is preserved.
For example:

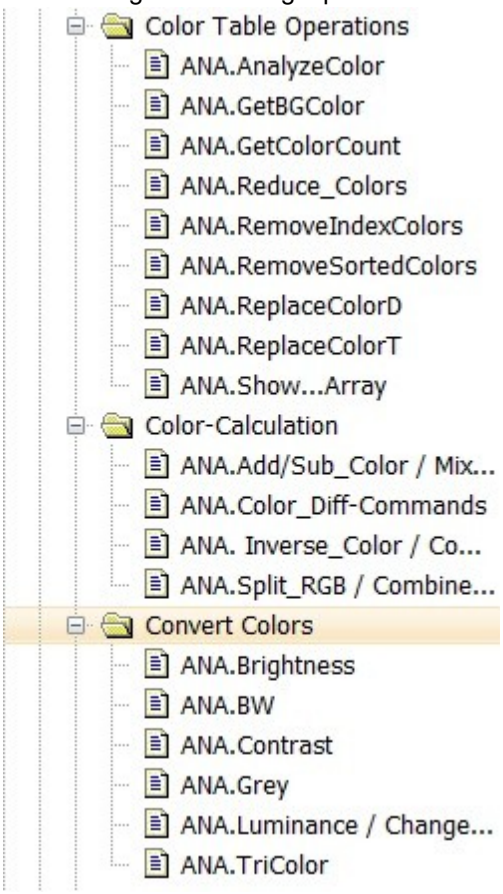
```
PIS.$$REA|SetButtonsHVSize|270|0
```

Here the Y-Size of the Buttons is not changed.

11.02.2022
1. Lots of Changes in the Help-File.
2. Undercover Graphics (UCV.) moved to Image Processing Topics.
3. Helpfile is now available as E_Book (PDF-Format) in the "E-Book-Helpfile" Folder.

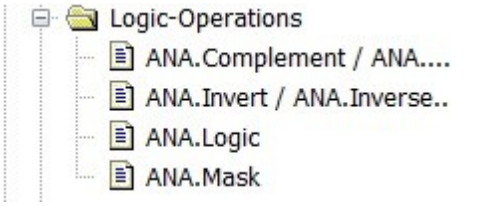
27.01.2022
Added: ANA.ColorDiffMap-Command
This commandcan be used to generate Outlines, it will find borders of an Object.

20.01.2022
Lots of Image Processing Options have been added:

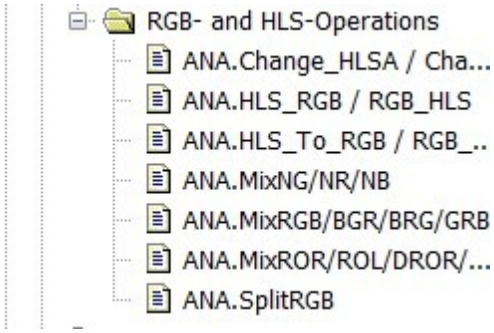


Also there were changes and addition with the Logic Operations that can be used to combine Images (IR's).

© 2023 Theo Gottwald * https://www.smart-package.com



And there is a bunch of RGB/ HSL-Operations



The SPR can now be used to snaphot, convert, resize, cut and process pictures in Brightness, Color and Contrast.
I have tested Image resolutions up to.10200x6800 Pixels*, which is a good resolution even for commercial pictures..
Using the SPR for commercial Pictures? Yes, is possible. Here is an example.

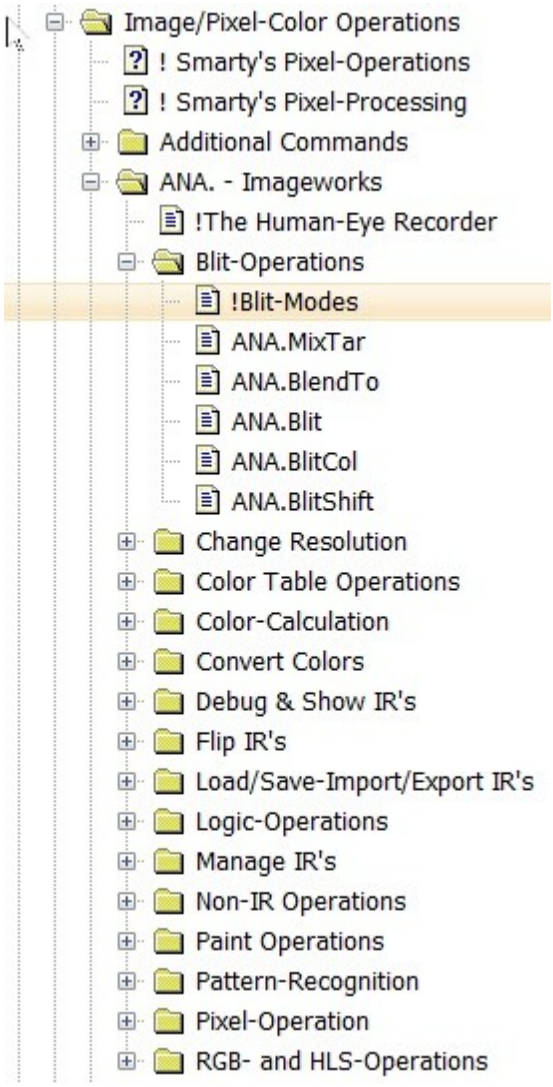
I have set this Picture for Sale on Dreamstime, see: "Color Wheel Background".

You can do all sorts of automated Image Processing using the SPR.

More examples:
- Remove or Add Artefacts or Watermarks
- Clean Up Pictures
- Change Color and Brightness
- Change Resolution
- Cut Borders of pictures
- a very strong side of the SPR is the **ability to Combine Pictures**
You can combine up to at least 20 Pictues in any logic way.
Using very fast commands like ANA-Logic, or use a Pixel-based Script using any of the other commands.
If the pictures do not originally have the same resolution, use ANA.EqualRes to stretch one of the IR's to the Target resolution.

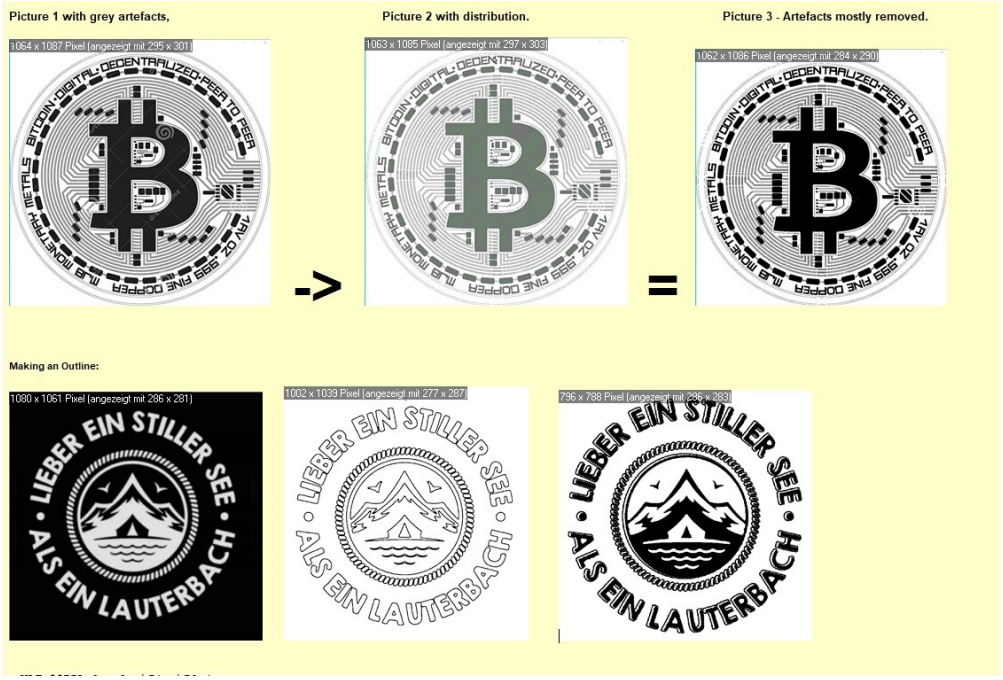
Here is an overview over the current Help-File Sections that are mostly new..

© 2023 Theo Gottwald * https://www.smart-package.com



The following examples are from ANA.Logic and ANA.Mask.

© 2023 Theo Gottwald * https://www.smart-package.com



For more details please see the command descriptions.

27.11.2021
Improved:
- GFP. and SFP. got new Option "LH", "LastHits" which returns the number of Pixel-Hits from the last find.

```
WTP.$$PAA|$$PAB|30,40|60
```

*© 2023 Theo Gottwald * https://www.smart-package.com*

```
GFP.LH|$$PAT
MBX.Pixelhits: $$PAT
```

- GFP. and SFP. got new Option "FA", "FlagA" which will set the internal "Flag A" to a value that is currently 0,1,2 or 3.
This will influence the behavior of the Fuzzy Logic during the Pattern-Search. The higher the number, the more Pixels will be evaluated, and therefore Patterns will be recognized.

Fixed
```
GFP.LastPattern|$$PAT
```
Now you can find out which of multiple Patterns was found for example with
```
WTP.$$PAA|$$PAB|30,40|60
GFP.LastPattern|$$PAT
MBX.$$PAT
```

26.11.2021
- Fixed: Patterncommands LTP. / WTP. etc. with Multiple Patterns when Patternsize was not 8x8
- Fixed: DMP.-Command since last change Numbers were not recognized

17.11.2021 Added:
- ANA.CutRect
- ANA.FromClipboard
- ANA.ToClipboard and ANA.ToClipboardRect
These commands place pictures in the WindowsClipboard.

########################
Release Date for Free and Visual Version
These Versions do not have all upcoming Updates.
########################

16.11.2021 Compiled Free/Sample Version
Therefore all Improvements after this date are not added to the Free-Version, as it will only be updated once a year.

07.11.2021
Improved Color-Analyzer in SPRE and HE-Recorder.

06.10.2021
Added new Option:
Inline-Data using VDA. and VDE.
New Option for Pattern-Search: "ID:" for direct use of Inline Data.
New Option for Pattern-Search: "IR:" for direct use of Image Register.

Changed:
SCS. now for String-Data and use SCN. now for numerical cases.

New:
CFP.-Command for SCS. Multiple-Choice
ESL. - ESL. - End SELECT Loop

Changed/Repaired:
NFC., NWC., NDC.,NLC. have been changed/repaired.
SPR-Editor: Problems with closing the Editor when using "auto-loaded files" solved.

Added SPRE:
Many new Commands and

© 2023 Theo Gottwald * https://www.smart-package.com

VDA.-VDE. to the SPR-Editor. It can be folded.

SPRE also:
Floaterbar got several new Buttons:
D - Datamaker / Q - Quadrant-Analyzer / H - HE-Recorder
U1, U2,U3 - for User-Scripts
Floaterbar is now resizable.
Improved Editor-Recording should work now.

SPR: New Commands:
IFP. - If FInd Pattern .. EIF.
NFP. - If Not FInd Pattern .. EIF.
ITP. - If Two Pattern
NTP. - Not If Two Pattern
LFP. - Locate FindPattern
LTP. - Locate Two Pattern
CFP. - CASE FindPattern
JFP. - Jump FindPattern
JTP. - Jump If any of Two Pattern
JTN. - Jump If none of Two Pattern was found
SFP. - Set FindPattern Parameter
GFP. - Get FindPattern Parameter
WFP. - WFP. - Wait For Pattern
WTP. - Wait For ANY of Two Patterns
JNP. - JNP. - Jump NOT FindPattern

Added several Multithreaded versions of Office- and Browser commands.
AVF. - similar Command like AMS. for Browser and Office
AFF. added to AFT.
AGF. - added to AGR.

New Mousecommand:
MDL. - Mouse Drag Left - Drag Items with the Mouse
MRM. - Mouse Move Right Click - Faster Mousemove and Right Click

Several changes around Screen DPI Settings.
Robot should now generally record and replay in 100% Mode.

New Keyboard-Commands:
Faster:
KBI. - Keyboard Input-Buffer Commands, all options from KBC. but typing is faster because characters are directly placed in the Input buffer.
SDH. - Send Key Hex-Code,easily access all hidden characters of a font using the "Alt-NumPad" Trick
SDA. - Send Key ANSI, Faster Typing using new Technology yet still compatible Engine
SDU. - Send Key Unicode, Faster Typing using new Technology yet still compatible Engine

Improved KBC.H-Paste-Over supports now Parameter to Paste over

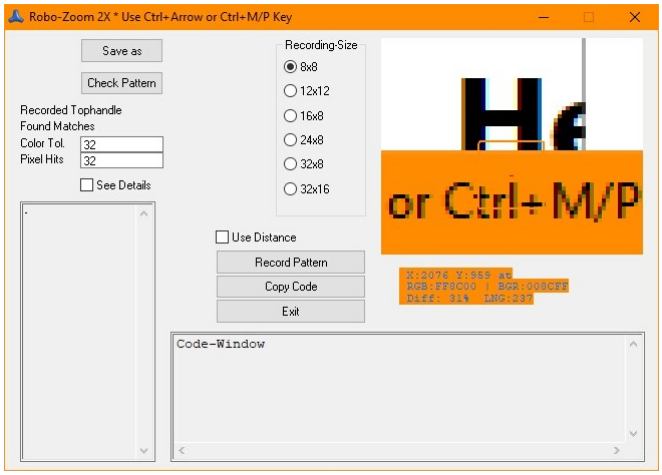
```
KBC.h-paste over|$$TXT
```

New Conversion Commands:
ATI. - Convert ANSI to UNICODE
UTA. - Convert UNICODE to ANSI

© 2023 Theo Gottwald * https://www.smart-package.com

14.072021
MAP. - Command changed so its compatible with MMV.
ANA.Snapfind1 Command is not the Simplest way to locate a Pattern in a window.
GAI. - did not work properly - now should work.
GFS. - neu codiert noch nicht alles getestet.

30.06.2021
Added "Human-Eye-Recorder"- Using this Tool you can make Snapshots of Patterns for use with the Find-Pattern Commands.
There is also a new Option "Use Distance" that will prevent "Mouse Over Effects" becauseyou Record while the Mouse is "far away".
The new Tool is currently lo0cated in the Main Folder.



There are multiple changes and enhancements with the ANA.-Command.

31.05.2021
Changes:
Changed to BSC: and BCS. Now these commands do have more Clicking-Options.
Additions in the Helpfile to these Commands.

ANA.-Command 1136 offers a lot of Options to recognize GUI Elements that could not have been recognized until now. In fact, ANA. con now find anything.

Added: `?pattern\` as equivalent to "?path\Pattern\". This is the default Path for Search Patterns, if no other path is given. It is used for example with the ANA.Load Command.
Added: ANA.findpclick
This command is complete package that will do all the work when you want to click whatever
on WEB-Sites. You just give the Pattern, and you say the details (how often to clock, how to click etc.).
And let it run.

Known Problems:

Robo-Diff:
Using Robo-Diff will only work on minimalistic Systems, with just Windows and the Application to watch.

© 2023 Theo Gottwald * https://www.smart-package.com

Due to the 32 bit-Architecture of Robo-Diff, the program can currently not handle the large Data Amount of heavily loaded 64 bit Systems.
This could only be changed if the Program would save its data while processing, and this would make the whole process much slower.
So there is currently the advice to use Robo-Diff only on minimalistic Systems with just Windows and the program to record.

Editor:
- Running a Script that uses a Macro-Library. Under some circumstances the Editor will switch into a library Macro File and show this file instead of the Script file that is executed. In such case close the Editor and load the Script file new.
