Welcome to the User Manual of Oxygen XML Author 19.1.

Oxygen XML Author is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful **Integrated Development Environment** and the intuitive **Graphical User Interface** of Oxygen XML Author is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with *XSLT* and *FOP* transformation technologies, Oxygen XML Author offers support for generating output to multiple target formats, including: *PDF*, *PS*, *TXT*, *HTML*, *JavaHelp*, *WebHelp*, and *XML*.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Author to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.

## Getting Started

### Topics:

- [What is Oxygen XML Author](#)
- [Getting Familiar with the Interface](#)
- [Supported Document Types](#)
- [Resources to Help You Get Started Using Oxygen XML Author](#)
- [Your First Document or Project](#)
- [Getting Help](#)
- [Frequently Used Shortcut Keys](#)

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Author would be to install the software. For detailed information about that process, see the [Installation chapter](#).

After installation, when you launch Oxygen XML Author for the first time, you are greeted with a **Welcome** dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

**Figure 1: Welcome Dialog Box**

If you do not want it to be displayed every time you launch Oxygen XML Author, deselect the **Show at startup** option in the bottom-left corner of the dialog box. To display it any time, go to **Help > Welcome**.

## What is Oxygen XML Author

Oxygen XML Author is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Author to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, Mac OS X, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Author, see the [Oxygen Website](#).

## Getting Familiar with the Interface

---

Oxygen XML Author includes several [perspectives](#) and [editing modes](#) to help you accomplish a wide range of tasks. Each *perspective* and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

There are various ways that you can [configure the layout of the views or editors](#), and you can [customize the toolbars](#).

Regardless of the [perspective](#) or [editing mode](#) that you are working with, the default layout consists of the following areas:

### Menus

Menu driven access to all the features and functions available in Oxygen XML Author. Most of the menus are common for all types of documents, but Oxygen XML Author also includes some context-sensitive and *framework*-specific menus and actions that are only available for a specific context or type of document.

### Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all *perspectives*, editing modes, and types of documents, while others are specific to the particular *perspective* or mode. Some toolbars are also *framework*-specific, depending on the type of document that is being edited. All the [toolbars can be configured](#) to suit your specific needs.

### Helper Views

Oxygen XML Author includes a large variety of [dockable](#) views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each *perspective* and editing mode are displayed by default and you can choose to display others to suit your specific needs. The [layout of the views can also be configured](#) according to your preferences.

### Editor Pane

The main editing area in the center of the application. Each [editing mode](#) provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each [editing mode](#) also includes a variety of contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane and there are [several ways to switch between tabs or move them](#).

### Perspectives

Oxygen XML Author includes [several different perspectives](#) that you can use to work with your documents. The **Editor perspective** is the most commonly used *perspective* used for displaying and editing the content of your XML documents, and it is the default *perspective* when you start Oxygen XML Author for the first time. Oxygen XML Author also includes a **Database perspective** that allows you to manage databases.

### Status Bar

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The [Unicode value](#) for the character directly to the right of the current cursor position.
- The status of the current document. The status of **Modified** is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In [Text editing mode](#), the current line and character position is displayed.
- If the [Check for notifications option](#) is selected, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Author

website, the announcement of upcoming webinars and conferences where the Oxygen XML Author team will participate, and more.

- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the [Show memory status option](#) is selected, a  **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

## Supported Document Types

---

You can use the main editing pane in Oxygen XML Author to edit a large variety of document types.

The supported document types include the following:

-  - XML documents
-  - JavaScript documents
-  - CSS documents
-  - LESS documents
-  - Markdown documents

## Resources to Help You Get Started Using Oxygen XML Author

---

### Configuring Oxygen XML Author

There are numerous ways that you can configure Oxygen XML Author to accommodate your specific needs.

- See the [Configuring Oxygen section](#) for details on the various ways that you can configure the application and its features.

### Video Tutorials

The Oxygen XML Author website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Author and show you how to complete specific tasks or how to use the various features.

- Go to the [Oxygen XML Author Videos Page](#) to see the list of video tutorials and webinars.

### Oxygen XML Author Documentation

The Oxygen XML Author documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the **F1** key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this *Getting Started* section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- [Text Editing Mode Section](#) - Provides information about the **Text** editor.
- [Author Editing Mode Section](#) - Provides information about the visual WYSIWYG-like **Author** editing mode.
- [Editing Documents Section](#) - Includes information about editing numerous different types of documents.
- [DITA Authoring and Publishing Section](#) - Provides information about using DITA to edit and structure your content.
- [WebHelp System Output Section](#) - Provides information about the WebHelp system that can be used for publishing content.
- [Importing Data Section](#) - Provides information about importing data from text files, MS Excel files, database data, and HTML files.

## Sample Documents

Your installation of Oxygen XML Author includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the **samples** folder that is located in the installation directory of Oxygen XML Author. You will find files and folders for various types of documents, including the following:

- **Sample project file (*sample.xpr*)** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the [Project view](#).
- **Sample files (*personal.xml, etc.*)** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between XML files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

## Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Author:

- See the [Oxygen XML Author Blog Site](#) for a large variety of current and archived blogs in regards to numerous features, requests, and instructional topics.
- Take advantage of the [Oxygen XML Author Forum](#) to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful [DITA Style Guide Best Practices for Authors](#).
- To learn about the WebHelp features in Oxygen XML Author, see the [Publishing DITA and DocBook to WebHelp](#) section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Author, see the [Tools section](#).
- See the [External Resource Page](#) for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the [Oxygen SDK](#) section for details about the SDK that allows you to extend and develop Oxygen XML Author [frameworks](#) and [plugins](#), and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Author, see the [What's New Section of the Website](#)
- You can select the [Tip of the Day](#) action in the [Help menu](#) to display a dialog box that includes a variety of tips for using Oxygen XML Author.
- You can select [Show Dynamic Help view](#) from the [Help menu](#) to dynamically opens a topic that is relevant to the focused editor, view, or dialog box.

## Your First Document or Project

---

This section includes several topics that will help you get started with your first document or project.

### Your First XML Document

To create your first XML document, select **File** >  **New** or click the  **New** button on the toolbar. The [New document wizard](#) is displayed:

**Figure 2: New Document Wizard**

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by choosing a template from the **Global templates** or **Framework templates** folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the **Framework templates** folder. If your company has created its own templates, you can also find them there. After you use this dialog box to create a few documents, those document types will appear in the **Recently used** folder, which allows you to easily create other new documents of those types.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

### Writing Your First Document

Depending on the type of document you choose, the Oxygen XML Author interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.

Also, depending on the type of document you choose, Oxygen XML Author may open your document in **Text** or **Author** mode. **Text** mode shows the raw XML source file, while **Author** mode shows a graphical view of the document.

The availability of **Author** mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the **Author** mode. Oxygen XML Author includes default **Author** mode views for most of the document types it supports. If your company has created its own document types, **Author** mode stylesheets may have also been created for that type. However, if you create a plain XML file, or one based on a schema that is not included in the Oxygen XML Author built-in support, you need to edit it in **Text** mode or [create your own Author mode style sheet](#) for it.

You can switch back and forth between **Author** mode and **Text** mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from **Author** to **Text** mode. **Text** and **Author** modes are just different views for the same XML document.

There is also a **Grid mode** available that displays all content in an XML document as a structured grid of nested tables. This is useful for certain kinds of documents, particularly those that are structured like databases. You can also use it when you want to display XML content in a table-like manner (for example, if you need to [extract XML content to a spreadsheet](#)).

If you use **Author** mode, you might find that it is similar to word processors that you are used to. Likewise, the **Text** mode is similar to many typical text editors. If you are new to XML, the biggest difference is that XML

documents have a particular structure that you have to follow. Oxygen XML Author assists you with a continuous validation of the XML markup.

## Structuring Your First Document

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you need to make sure that your document follows the particular structure for the document type you are creating. This means:

- At any given location in the document, there are only certain XML elements allowed. Oxygen XML Author helps you determine which elements are allowed. In **Author** mode, when you press **Enter**, Oxygen XML Author assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press **Enter** to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the **Model view** (**Window > Show View > Model**).
- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have just created requires certain other elements inside of it. Your document will be invalid until you create those elements. Oxygen XML Author does its best to help you with this. If there is only one possible element that can go inside the element you just created, Oxygen XML Author creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, Oxygen XML Author presents **XML Quick Fixes** that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

## Editing Your First Document

Once you have completed the first draft of your document, you may need to edit it. As with any editor, Oxygen XML Author provides the normal cut, copy, and paste options as well as drag and drop editing. However, when you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

Oxygen XML Author provides many tools to help you edit your structure and to keep your structure valid while editing text.

### The Document Breadcrumbs

Across the top of the editor window, there is a set of breadcrumbs that shows you exactly where the insertion point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

### Showing Tags

To see exactly where you are in the structure of the document, you can show the tags graphically in the **Author** view. There are several levels of tag visibility that you can choose using the **Tags Display Mode drop-down menu** on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

### Outline View

The **Outline view** shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.

**Figure 3: Outline View**

You can configure the **Outline** view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document types. You can also filter the **Outline** view to show only elements with a certain name.

**Figure 4: Outline View Filtered to only Show Element Names**

### Cut and Paste, Drag and Drop

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in **Author** view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.

A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or **Outline** view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Author warns you and tries to suggest actions that make it valid (such as by removing surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using **Author** mode, you can also switch to **Text** mode to see exactly which bits of XML you are selecting and moving.

### Refactoring actions

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the **Refactoring** menu of the contextual menu (or the **Document > Markup** menu). More advanced refactoring operations are also available using the **XML Refactoring tool** that is available in the **Tools** menu.

## Validating Your First Document

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Author knows how to find the schema, it validates the document for you as you type. Oxygen XML Author finds the schema automatically for most of the document types created from templates. However, in some cases you may have to [tell it how to find the schema](#).

When Oxygen XML Author validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Author also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Author cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the  **Validate** action from the  **Validation** toolbar drop-down menu or the **Document** > **Validate** menu. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.

**Note:** Be aware that the problem is sometimes in a different location from where the validator detects the error. To get more information about a validation error, right-click a validation error message, and select **Show Message**.

## Proofing Your First Document

Oxygen XML Author includes an [automatic \(as-you-type\) spell checking feature](#), as well as a manual spell checking action. To check the spelling of your document manually, use the  **Check Spelling** action on the toolbar or from the **Edit** menu.

## Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such as a DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Author uses [transformation scenarios](#) to control the transformation process. Depending on the document type you have created, there may be several transformation scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Author or ones created by your organization.

To see the list of transformations available for your document, select the  **Apply Transformation Scenario(s)** action from the toolbar or the **Document** > **Transformation** menu. A list of available transformation scenarios are displayed. Choose one or more scenarios to apply, and click **Apply associated**. Exactly how your transformed content appears depends on how the transformation scenario is configured.

## Your First DITA Topic

To create your first DITA topic, select **File** >  **New** or click the  **New** button on the toolbar. The [New Document Wizard](#) is displayed:

**Figure 5: New Document Wizard**

Go to **Framework templates > DITA > topic** and select the type of topic that you want to create.

**Note:** If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

Your DITA topic is an XML document, thus all [the editing features that Oxygen XML Author provides for editing XML documents](#) also apply to DITA topics. Oxygen XML Author also provides extensive additional support for [editing DITA topics, their associated DITA maps](#), and for [creating DITA output](#).

## Understanding DITA Topics

It is important to understand the role that a [DITA topic plays in a DITA project](#). A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Author works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Author helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Author, along with the features of DITA, in a variety of ways.

## Role of Maps

The basic method that DITA uses to express the relationship between topics is through a [DITA map](#). Other relationships between topics, such as cross references, generally need to be made between topics in the same map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a map to create each chapter and then organize the chapters in another map to create the book. If you are writing help topics, you might use a map to combine several DITA topics to create a single help topic and then create another map to organize your help topics in a help system. This allows you to reuse the content of a map in multiple projects.

## Creating a Map

To add topics to a map, you must first [create the map](#). A map is an XML document, similar to a topic. To create a map, select **File > New** or click the **New** button on the toolbar, go to **Framework templates > DITA Map > map** and select the type of map you want to create. Oxygen XML Author asks if you want to open your map in the editor or in the [DITA Maps Manager](#). Usually, opening it in the **DITA Maps Manager** is the best choice, but you can also open the map in the editor from the **DITA Maps Manager**. The **DITA Maps Manager** presents a view of the *DITA map* that is similar to a table of contents.

Figure 6: DITA Maps Manager View

## Adding Topics to a Map

To [add a topic to a map](#), add a topic reference to the map using a `topicref` element. The easiest way to do this is to open the topic in the editor, then right-click the *DITA map* in the [DITA Maps Manager view](#) and choose **Reference to the currently edited file** from the **Append Child, Insert Before, or Insert After** submenu. This opens the [Insert Reference dialog box](#) with all of the required fields already filled in for you. You can fill in additional information in the various tabs in this dialog box or add it to the map later. When you select **Insert and close**, a reference to your topic is added to the map.

**Figure 7: Insert Reference Dialog Box**

If you want to see what the resulting map looks like in XML, save your map and then double-click the *DITA map* in the [DITA Maps Manager view](#). The XML version of the map opens in the editor.

As you add topics to your map, you may want to make a topic the child or sibling of another topic. This is usually done at the map level. To create a child topic reference, right-click the parent topic in the **DITA Maps Manager** view and choose **Append Child**. To create a sibling topic reference, right-click a topic in the **DITA Maps Manager** view and choose **Insert After** or **Insert Before**. From any of these submenus you can then choose one of the following options:

- **New** - Opens the [New file wizard](#) for creating a new topic.
- **Reference** - Opens the [Insert Reference dialog box](#) that allows you to create a reference to an existing topic.
- **Reference to the currently edited file** - Opens the [Insert Reference dialog box](#) that helps you to easily create a reference to the file that is currently opened in the editor.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

## Child Maps

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can [break up the content into smaller submaps](#). A submap might represent a chapter of a book, a section of a user manual, or a page on a website.

To build a publication out of these smaller maps, you must add them to a map that represents the overall publication. To add a child map to the current map, right-click the parent *DITA map* and choose **Append child > Map reference**.

## Validating a Map

Just as it is with your individual topics, it is important to [validate your maps](#). Oxygen XML Author provides a validation function for *DITA maps* that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them. To validate a map, click the  **Validate and Check for Completeness** button in the [DITA Maps Manager view](#).

## Publishing Your Topics

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you [create published output](#) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Author uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Author manages them by using transformation scenarios.

To publish output for a map, select the transformation scenario you want to run and set any of the parameters it requires. To select a transformation, click the  **Configure Transformation Scenario(s)** button in the [DITA Maps Manager view](#). This opens the [Configure Transformation Scenario\(s\) dialog box](#).

**Figure 8: Configure Transformation Scenarios Dialog Box**

Choose the transformation scenarios you want to apply and click **Apply associated**. Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

**Related Information:**

[DITA Authoring and Publishing](#) on page 1466

[Editing XML Documents in Author Mode](#) on page 486

## Creating a New Project

Oxygen XML Author allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also [share your project settings and transformation/validation scenarios](#) with other users. Use the [Project view](#) to manage projects, and the files and folders contained within.

### Creating a New Project

To create a new project, select **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the [Project view](#).

### Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

### New > File

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

### New > Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

### New > Logical Folder

Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - .

### New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

### Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X .

### Add Files

Adds links to files on the local file system.

### Add Edited File

Adds a link to the currently edited file in the project.

## Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in you project. If you add new files to that folder, you can simply use the  **Refresh (F5)** action from the toolbar or contextual menu and the *Project view* will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting  **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the *Project view* with bold text. To create a file inside a linked folder, select the **New >  File** action from the contextual menu. The linked files presented in the *Project view* are marked with a special icon.

**Note:** Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project View](#) on page 199.

For more details about how you can share projects with other users, see [Sharing a Project - Team Collaboration](#) on page 416.

### Related Information:

[Using Projects to Group Documents](#) on page 407

## Getting Help

---

If you run into specific problems while using Oxygen XML Author you can take advantage of a variety of support related resources. Those resources include the following:

- [The Oxygen XML Author Support Section of the Website](#)
- [The Oxygen XML Author Forum](#)
- [The Oxygen XML Author Video Tutorials](#)

- [The Common Problems and Solutions Section of the User Manual](#)
- [The Online Technical Support Form](#)

The application also includes various specific help-related resources in the **Help** menu.

## Help Menu

The Oxygen XML Author **Help** menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

### Welcome

This option opens the **Welcome** screen that includes some resources to assist you with using Oxygen XML Author.

### Help (F1)

Use this action (or the **F1** key) to open a dialog box that presents a section in the User Manual that is appropriate for the context of the current cursor position. If the **Use online help** option is selected, this action will open the User Manual in an online mode.

### Use online help

If this option is selected, the **Help (F1)** action will open the Oxygen XML Author User Manual in an online mode.

### Show Dynamic Help view

Use this action to open a view that loads the latest online WebHelp version of the Oxygen XML Author User Manual, and dynamically opens a topic that is relevant to the focused editor, view, or dialog box. It requires Java 1.8 and an online connection. In Windows, if a Java 1.8 version is not detected, you will be advised to upgrade, while in Linux and Mac OS X with Java 1.7 and lower, Oxygen XML Author will attempt to load an offline version of the documentation. In all three operating systems, with Java 1.8, if an online connection is not detected, you will receive an error message advising you to check your proxy settings.

You can also open the **Dynamic Help** view by selecting it from the **Window > Show View** menu.

### Install new add-ons

Opens a dialog box that allows you to install new [add-ons](#) to extend the functionality of Oxygen XML Author.

### Check for add-ons updates

Opens a dialog box that allows you to check for updates on installed [add-ons](#).

### Manage add-ons

Opens a dialog box that allows you to manage installed [add-ons](#).

### Check for a New Version

Use this action to view information about the latest version of Oxygen XML Author.

### Browse Oxygen Website

Opens the Oxygen XML Author website in your default internet browser.

### Register

If you encounter problems with your Oxygen XML Author license, you can use this option to open a dialog box that provides options for obtaining or using a license key.

### Lock/Unlock floating license

If you are using a *Floating License*, you can lock it so that it does not get [released to the pool](#) unless you or the system administrator unlocks it.

### Report problem

You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

- **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.
- **Class Loader URLs** - You can choose whether or not to include the listed *Class Loader URLs* with your report.

- **System properties** - You can choose whether or not to include the listed system property details with your report.  
**Tip:** You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.
- **Plugins** - You can choose whether or not to include details about your installed [plugins](#) with your report.
- **Frameworks** - You can choose whether or not to include details about your installed [frameworks](#) with your report.

## Support Center

Use this option to open the [Oxygen XML Author Support Section of the Website](#).

## Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Author. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the Oxygen support team.

## Support Tools > Randomize XML text content

Use this action when you need to send samples to the Oxygen support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources for which the text content will be randomized. You can then save the resources and send them to the Oxygen support team without fear of compromising sensitive or private data. For more information, see [Randomize XML Text Content](#) on page 17.

**Warning:** Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then process this operation on the copies instead of the original files. Otherwise, you may lose your original content.

## Tip of the Day

Opens a dialog box that offers tips for using Oxygen XML Author.

## About

Use this option to open a dialog box that contains information about Oxygen XML Author and the installed version. This dialog box includes the following tabs:

- **Copyright** - This tab contains general information about the product and the version of the product you are using, along with contact details and the SGN number. Details regarding the memory usage are also presented at the bottom of the dialog box.
- **Libraries** - This tab presents the list of third party libraries that Oxygen XML Author uses. To view the End User Licence Agreement of each library, double-click it.
- **Frameworks** - This tab contains a list with the [framework](#) that are bundled with Oxygen XML Author.
- **System Properties** - This tab contains a list with system properties and their values. The contextual menu allows you to select and copy the properties.

[Details to Submit in a Request for Technical Support Using the Online Form](#) on page 1455

## Randomize XML Text Content

Oxygen XML Author includes an action that randomizes the text content of an XML document. This action is available in the **Help > Support Tools** menu. It is helpful if you need to send XML samples to the Oxygen support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources for which the text content will be randomized. You can then save the resources and send them to the Oxygen support team without fear of compromising sensitive or private data.

**Warning:** Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then perform this operation on the copies instead of the original files. Otherwise, you may lose your original content.

**Figure 9: Randomize XML Text Content Dialog Box**

The **Randomize XML Text Content** dialog box includes the following options:

**Scope**

Allows you to select the set of files whose text content will be randomized by the operation. You can select from predefined resource sets (such as the current file, your whole project, the current *DITA map* hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a *working set*.

**Filters**

This section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

## Frequently Used Shortcut Keys

Oxygen XML Author includes numerous shortcut keys that are assigned to actions to help you edit content. All the shortcuts that are assigned to actions are displayed in the table in the [Menu Shortcut Keys preference page](#).

For information about how to assign or configure shortcut keys, see [How to Assign a Shortcut Key or Edit an Existing Shortcut](#) on page 147.

**Table 1: Frequently Used Shortcut Keys in Oxygen XML Author**

Action	Windows/Linux Shortcut Keys	Mac/OS X Shortcut Keys	Description of Default Assigned Action
Attribute Editor	<b><u>Alt + Enter</u></b>	<b><u>Alt + Enter</u></b>	• Opens the in-place attribute editor
Beginning	<b><u>Ctrl + Home</u></b>	<b><u>Command + Home</u></b>	• Navigates to the beginning of the document

<b>Action</b>	<b>Windows/Linux Shortcut Keys</b>	<b>Mac/OS X Shortcut Keys</b>	<b>Description of Default Assigned Action</b>
Check Spelling	<b><u>F7</u></b>	<b><u>F7</u></b>	<ul style="list-style-type: none"> <li>• Opens the spell checking dialog box</li> </ul>
Check Well-Formedness	<b><u>Ctrl + Shift + W</u></b>	<b><u>Command + Shift + W</u></b>	<ul style="list-style-type: none"> <li>• Check well-formedness of current document</li> </ul>

- [Uninstalling](#)

Oxygen XML Author is available on Windows, Linux, and Mac OS X and there are a variety of methods and options for installing and running Oxygen XML Author on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing *add-ons*, and uninstalling.

## Choosing How Oxygen XML Author Runs

You can install Oxygen XML Author to run in several ways:

- As a desktop application (running standalone or as an Eclipse plugin) on Windows, Linux, or Mac OS X.
- As a desktop application (running standalone or as an Eclipse plugin) on a Unix or Linux server or on Windows Terminal Server.
- From within a browser though the Java Web Start technology.

## Choosing an Installer

You also have a choice of several different installers:

- The native installer for your platform (Windows, Linux, or Mac OS X).
- On Windows and Linux, the native installer can also run in unattended mode.

## Choosing a License Option

You must [obtain and register a license key](#) to run Oxygen XML Author.

You can choose from two types of licenses:

- A named-user license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

## Upgrading, transferring, and uninstalling.

You can also [upgrade](#) Oxygen XML Author, [transfer a license](#), or [uninstall](#) Oxygen XML Author.

## Getting help with installation

If you need help at any point during these procedures, please send us an email at [support@oxygenxml.com](mailto:support@oxygenxml.com).

# Installing Oxygen XML Author on Windows

---

## Choosing an Installation Method

You can install Oxygen XML Author on Windows using one of the following methods:

- [Windows installer](#)
- [Windows installer in unattended mode](#)

## System Requirements

### Operating systems

Windows Vista, Windows 7, Windows 8, Windows 10, Windows Server 2008, Windows Server 2012

### CPU

- Minimum - Intel Pentium III™ /AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

### Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

### Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

### Java

Oxygen XML Author requires Java. If you use the native Windows installer, Oxygen XML Author will be installed with its own copy of Java. If you use the all platforms installer, your system must have a compatible Java virtual machine installed.

Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.8) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that those implementations will work with future Oxygen XML Author updates and releases.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Author installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Author uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Author using the batch file, `oxygenAuthor.bat`, you can edit the batch file to specify a particular version to use.

## Windows Installer

To install Oxygen XML Author using the Windows installer, follow these steps:

1. Make sure that your system meets the [system requirements](#).
2. [Download](#) the Windows installer.
3. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.

4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Author using one of the following methods:
  - Use one of the shortcuts created by the installer.
  - Run `oxygenAuthor .bat`, which is located in the installation directory.
6. To license your copy of Oxygen XML Author go to **Help > Register** and enter your [license information](#).

### Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Author with the default options and does not overwrite existing files. You can change various options for the unattended installer using the installer [command line parameters](#).

### Windows Installer Command Line Reference

The Oxygen XML Author installer for Windows creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. The generated response file is found in the `[OXYGEN_INSTALL_DIR]/.install4j` folder. You can use the `response.varfile` to set the options for an [unintended install](#).

The following table describes some of the settings that can be used in the `response.varfile`:

**Table 2: `response.varfile` Options Parameters**

Parameter Name	Description	Values
<code>autoVersionChecking</code>	Automatic version checking.	<b>true / false</b> . Default setting is <b>true</b> .
<code>reportProblem</code>	Allows you to report a problem encountered while using Oxygen XML Author.	<b>true / false</b> . Default setting is <b>true</b> .
<code>downloadResources</code>	Allows Oxygen XML Author to download resources (links to video demonstrations, webinars, and upcoming events) from <a href="https://www.oxygenxml.com">https://www.oxygenxml.com</a> to populate the application welcome screen.	<b>true / false</b> . Default setting is <b>true</b> .

For more information about the `response.varfile` format, see [install4j site](#).

### Command Line Parameters

The Oxygen XML Author installer supports the following command line parameters:

Option	Meaning
<code>-q</code>	Run the installer in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a <code>response.varfile</code> is specified using the <code>-varfile</code> option or individual settings are specified using <b>- on Windows:</b> <pre>oxygenAuthor.exe -q</pre> <b>- on Linux:</b> <pre>oxygenAuthor.sh -q</pre>
<code>-overwrite</code>	In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Author is installed in the same folder.

Option	Meaning
	<p>The <code>-overwrite</code> parameter added after the <code>-q</code> parameter forces the overwriting of these files.</p> <p><b>- on Windows:</b></p> <pre>oxygenAuthor.exe -q -overwrite</pre> <p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q -overwrite</pre>
-console	<p>To display a console for the unattended installation, add a <code>-console</code> parameter to the command line.</p> <p><b>- on Windows:</b></p> <pre>start /wait oxygenAuthor.exe -q -console</pre> <p><b>Note:</b> The use of <code>start /wait</code> on Windows is required to make the installer run in the foreground. If you run it without <code>start /wait</code>, it will run in the background.</p> <p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q -console</pre>
-varfile	<p>Points to the location of a response <code>.varfile</code> to be used during an unattended installation. For example:</p> <p><b>- on Windows:</b></p> <pre>oxygenAuthor.exe -q -varfile response.varfile</pre> <p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q -varfile response.varfile</pre>
-V	<p>Is used to define a variable to be used by an unattended installation. For example:</p> <p><b>- on Windows:</b></p> <pre>oxygenAuthor.exe -q -VusageDataCollector=false</pre> <p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q -VusageDataCollector=false</pre>

## Installing Oxygen XML Author on Mac OS X

You can install Oxygen XML Author on Mac OS X by using the `oxygenAuthor.dmg` installation package.

### System Requirements

#### Operating system

OS X version 10.8 64-bit or later

## CPU

- Minimum - Intel-based Mac, 1 GHz
- Recommended - Dual Core class processor

## Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

## Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

## OS X Installation

To install Oxygen XML Author on OS X, follow these steps:

1. [Download](#) the OS X installation package (oxygenAuthor.dmg).
2. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
3. Double-click the oxygenAuthor.dmg disk image file to mount it.
4. Drag/Copy the *Oxygen XML Author* folder to your /Applications folder (or another location if you wish).  
**Important:** Do not copy the files/folders from within the *Oxygen XML Author* folder (always copy the folder itself), otherwise you will omit invisible files/folders and the application may no longer start.
5. Start Oxygen XML Author, using one of the following methods:
  - Double-click Oxygen XML Author .app.
  - Run `sh oxygenAuthor .sh` in the command line interface.
6. To license your copy of Oxygen XML Author, go to **Help > Register** to enter your [license key](#).

## Installing Oxygen XML Author on Linux

---

### Choosing an Installation Method

You can install Oxygen XML Author on Linux using one of the following methods:

- [Linux installer](#)
- [Linux installer in unattended mode](#)

### System Requirements

#### Operating system

Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.6.0 or later from Oracle

#### CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

#### Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

#### Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

## Java

Oxygen XML Author requires Java. Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.8) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Author updates and releases. Oxygen XML Author does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Author installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Author uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your `PATH` environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Author by editing the script file, `oxygenAuthor.sh`. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/usr/bin/jre1.6.0_45/bin/java -Xmx256m ...
```

## Linux Installer

To install Oxygen XML Author using the Linux installer, follow these steps:

1. Make sure that your system meets the [system requirements](#).
2. [Download](#) the Linux installer.
3. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.

**Note:** For example, open a shell, `cd` to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.

5. Start Oxygen XML Author using one of the following methods:
  - Use the author shortcut created by the installer.
  - From a command line, type `sh oxygenAuthor.sh`. This file is located in the installation folder.
6. To license your copy of Oxygen XML Author go to **Help > Register** and enter your [license information](#).

## Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Author with the default options and does not overwrite existing files. You can change various options for the unattended installer using the installer [command line parameters](#).

## Linux Installer Command Line Reference

The Oxygen XML Author installer for Linux creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. The generated response file is found in the `[OXYGEN_INSTALL_DIR]/.install4j` folder. You can use the `response.varfile` to set the options for an [unintended install](#).

The following table describes some of the settings that can be used in the `response.varfile`:

**Table 3: response.varfile Options Parameters**

Parameter Name	Description	Values
autoVersionChecking	Automatic version checking.	<b>true / false.</b> Default setting is <b>true</b> .
reportProblem	Allows you to report a problem encountered while using Oxygen XML Author.	<b>true / false.</b> Default setting is <b>true</b> .
downloadResources	Allows Oxygen XML Author to download resources (links to video demonstrations, webinars, and upcoming events) from <a href="https://www.oxygenxml.com">https://www.oxygenxml.com</a> to populate the application welcome screen.	<b>true / false.</b> Default setting is <b>true</b> .

For more information about the response.varfile format, see [install4j site](#).

### **Command Line Parameters**

The Oxygen XML Author installer supports the following command line parameters:

Option	Meaning
-q	<p>Run the installer in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a response.varfile is specified using the -varfile option or individual settings are specified using</p> <p><b>- on Windows:</b></p> <pre>oxygenAuthor.exe -q</pre> <p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q</pre>
-overwrite	<p>In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Author is installed in the same folder. The -overwrite parameter added after the -q parameter forces the overwriting of these files.</p> <p><b>- on Windows:</b></p> <pre>oxygenAuthor.exe -q -overwrite</pre> <p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q -overwrite</pre>
-console	<p>To display a console for the unattended installation, add a -console parameter to the command line.</p> <p><b>- on Windows:</b></p> <pre>start /wait oxygenAuthor.exe -q -console</pre> <p><b>Note:</b> The use of <i>start /wait</i> on Windows is required to make the installer run in the foreground. If you run it without <i>start /wait</i>, it will run in the background.</p>

Option	Meaning
	<p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q -console</pre>
-varfile	<p>Points to the location of a response .var file to be used during an unattended installation. For example:</p> <p><b>- on Windows:</b></p> <pre>oxygenAuthor.exe -q -varfile response.varfile</pre> <p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q -varfile response.varfile</pre>
-V	<p>Is used to define a variable to be used by an unattended installation. For example:</p> <p><b>- on Windows:</b></p> <pre>oxygenAuthor.exe -q -VusageDataCollector=false</pre> <p><b>- on Linux:</b></p> <pre>oxygenAuthor.sh -q -VusageDataCollector=false</pre>

## Installing Oxygen XML Author on Windows Server

### System Requirements

#### Operating systems

Windows Server 2008, Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2

#### CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

#### Memory

- Minimum values per user - 512 MB of RAM
- Recommended values per user - 2 GB of RAM

#### Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

#### Java

Oxygen XML Author requires Java. If you use the native Windows installer, Oxygen XML Author will be installed with its own copy of Java. If you use the all platforms installer, your system must have a compatible Java virtual machine installed.

Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.8) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that those implementations will work with future Oxygen XML Author updates and releases.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Author installation, the version in the `jr` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Author uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Author using the batch file, `oxygenAuthor.bat`, you can edit the batch file to specify a particular version to use.

## Windows Installer

To install Oxygen XML Author using the Windows installer, follow these steps:

1. Make sure that your system meets the [system requirements](#).
2. [Download](#) the Windows installer.
3. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Author using one of the following methods:
  - Use one of the shortcuts created by the installer.
  - Run `oxygenAuthor.bat`, which is located in the installation directory.
6. To license your copy of Oxygen XML Author go to **Help > Register** and enter your [license information](#).

## Configuring Windows Terminal Server

1. Install Oxygen XML Author on the server and make its shortcuts available to all users.
2. If you need to run multiple instances of Oxygen XML Author, make sure you add the `-Dcom.oxygenxml.MultipleInstances=true` parameter in the `.bat` startup script.
3. Make sure you allocate sufficient memory to Oxygen XML Author by adding the `-Xmx` parameter either in [the .bat startup script](#), or in [the .vmoptions configuration file](#) (if you start it from an executable launcher).

# Installing Oxygen XML Author on a Linux / UNIX Server

---

## System Requirements

### Operating system

Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.6.0 or later from Oracle

### CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

### Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

### Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

### Java

Oxygen XML Author requires Java. Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.8) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work

with future Oxygen XML Author updates and releases. Oxygen XML Author does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Author installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Author uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your `PATH` environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Author by editing the script file, `oxygenAuthor.sh`. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/usr/bin/jre1.6.0_45/bin/java -Xmx256m ...
```

## Linux Installer

To install Oxygen XML Author using the Linux installer, follow these steps:

1. Make sure that your system meets the [system requirements](#).
2. [Download](#) the Linux installer.
3. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.

**Note:** For example, open a shell, `cd` to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.

5. Start Oxygen XML Author using one of the following methods:
  - Use the author shortcut created by the installer.
  - From a command line, type `sh oxygenAuthor.sh`. This file is located in the installation folder.
6. To license your copy of Oxygen XML Author go to **Help > Register** and enter your [license information](#).

## Unix/Linux Server Configuration

1. Install Oxygen XML Author on the server and make sure the `oxygenAuthor.sh` script is executable and the installation directory is in the `PATH` of the users that need to use the application.
2. Make sure you allocate sufficient memory to Oxygen XML Author by setting an appropriate value for the `-Xmx` parameter in the `.sh` startup script.

**Note:** The default value of the `-Xmx` parameter is 512 MB. To avoid [performance issues with large documents](#), you may need to adjust it.

3. Make sure the X server processes located on the workstations allow connections from the server host. For this, use the `xhost` command.
4. Start telnet (or ssh) on the server host.
5. Start an `xterm` process with the **display** parameter set on the current workstation. For example: `xterm -display workstationip:0.0`.
6. Start Oxygen XML Author by typing `sh oxygenAuthor.sh` from the command line. This file is located in the installation folder.

## Installing Oxygen XML Author using the Java Web Start (JWS) Installer

---

Oxygen XML Author provides the tools to create your own JWS distribution that can be installed on a custom web server. The advantages of a JWS distribution include:

- Oxygen XML Author is run locally, not inside a web browser, overcoming many of the browser compatibility problems common to applets.

- JWS ensures that the most current version of the application will be deployed, as well as the correct version of JRE.
- Applications launched with Java Web Start are cached locally. Thus, an already downloaded application is launched on par with a traditionally installed application.
- You can preconfigure Oxygen XML Author and the rest of your team will use the same preferences and *frameworks*.

**Important:** If you want to create your own JWS distribution package, please [contact Syncro Soft](#) for permission through a *Value Added Reseller Agreement*.

**Note:** A code signing certificate is needed to sign the JWS distribution. The following procedure assumes that you already have such a certificate (for example, Thawte™, or Verisign™).

The following schematic depicts the Oxygen XML Author Java Web Start deployment procedure:

**Figure 10: Java Web Start Deployment Procedure**

To deploy an Oxygen XML Author installation on a server.

1. Go to <https://www.oxygenxml.com/InstData/Author/All/oxygenAuthor.tar.gz> and download the *All Platforms Installation* package to a local drive.
2. Expand the archive to a temporary location. The oxygenAuthor folder is created.
3. Optionally, you can customize your own *framework*.
4. Edit the oxygenAuthor\tools\jwsPackager\packager.properties configuration file. Adjust the following properties appropriately for your server:
  - **codebase** - Represents the location of the future JWS distribution.
  - **keystore** - The *keystore* location path.
  - **storepass** - The password for *keystore* integrity.
  - **storetype** - The type of the certificate file, such as PKCS12 or JKS.
  - **alias** - The *keystore* alias.

- **optionsDir** - Points to the options directory that may be distributed with the JWS installer. If the directory contains an XML document named `options.xml` or `default.xml` containing exported options, these options will be used. Otherwise, the structure of the options folder has to match the structure of a stand alone application options folder.

**Note:** This property is optional. It is provided only if [custom options](#) need to be delivered to the end users.

The values of **keystore**, **storepass**, and **alias** properties are all provided by the code signing certificate. For more information, see the documentation for your *jarsigner* tool.

5. If you want to modify the default settings, edit the JNLP `oxygenAuthor\tools\jwsPackager\dist\javawebstart\author\author.jnlp` template file. You can specify the list of files opened at startup by modifying the `<argument>` list. To pass system properties directly to Oxygen XML Author when it is started, add the `oxy` prefix to them (for example: `<property name="oxyPropertyName" value="testValue"/>`). The system property is passed to Oxygen XML Author with the prefix stripped.
6. Open a command-line console and run `ant` in the `oxygenAuthor\tools\jwsPackager` folder. The **ant** process creates the `oxygenAuthor\tools\jwsPackager\dist\InstData\authorJWS.zip` archive that contains the actual remote JWS installer.
7. Copy the expanded content of the archive to the folder specified in the **codebase** property, previously set in the **packager.properties** file.
8. Using your favorite web browser, go to the address specified in the **codebase** property or to its parent folder and start the remote installer.

**Important:** When running the Java Web Start distribution on OS X, due to changes in the [security release](#), clicking the link to the JNLP file does not start the application. The selected JNLP is downloaded locally. Right-click it and choose to open the resource.

## Site-Wide Deployment

---

If you are deploying Oxygen XML Author for a group, there are various things you can do to customize Oxygen XML Author for your users and to make the deployment more efficient.

### Creating custom default options

You can [create a custom set of default options](#) for Oxygen XML Author. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Author, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

### Creating default project files

[Oxygen XML Author project files](#) are used to configure a project. You can [create and deploy default project files](#) for your projects so that your users will have a preconfigured project file to begin work with.

### Shared project files

Rather than each user having their own project file, you can [create and deploy shared project files](#) so that all users share the same project configuration and settings and automatically inherit all project changes.

### Using the unattended installer

You can speed up the installation process by using the [unattended installer for Windows](#) or [Linux](#) installs.

### Using floating licenses

If you have a number of people using Oxygen XML Author on a part-time basis or in different time zones, you can use a [floating license](#) so that multiple people can share a license.

## Licensing

---

Oxygen XML Author is not free software. To activate and use Oxygen XML Author, you need a license.

For demonstration and evaluation purposes, a time limited license is available upon request at <https://www.oxygenxml.com/register.html>. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.

## Choosing a License Type

You can use one of the following license types with Oxygen XML Author:

1. A **Named-User License** may be used by a single *Named User* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of *named users*. It is your responsibility to keep track of the *named users* that each license is assigned to.
2. A **Floating License** may be used by any user on any machine. However, the total number of copies of Oxygen XML Author in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Author (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.
3. A **Subscription license** that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

For definitions and legal details of the license types, consult the End User License Agreement available at [https://www.oxygenxml.com/eula\\_author.html](https://www.oxygenxml.com/eula_author.html).

## Obtaining a License Key

You can obtain a license key for Oxygen XML Author in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Author website at <https://www.oxygenxml.com/buy.html>. A license key will be sent to you by email.
- If your company or organization has already purchased licenses, please contact your license administrator to obtain a license key.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from <https://www.oxygenxml.com/registerCode.html>. A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Author website at <https://www.oxygenxml.com/register.html>.

## Register a Named-User or Subscription License

To register a *Named-User License* or *Subscription License* on a machine owned by the *Named User*, follow these steps:

1. Purchase a license from the *Oxygen XML Author website*. You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Start Oxygen XML Author.  
If this is a new install of Oxygen XML Author, the registration dialog box is displayed. If the registration dialog box is not displayed, go to **Help > Register**.

**Figure 11: License Registration Dialog Box**

4. Select **Use a license key** as the licensing method.
5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Press **OK**.

**Related Information:**

[Oxygen XML Author End-User License Agreement](#)

## Floating Licenses

The floating license type is commonly used by organizations that have a large number of infrequent users who do not need to use Oxygen XML Author all at the same time. Instead of each user having their own individual license key to use at their discretion, there are a pool of licenses that are used one at a time by various users upon request.

To use floating licenses, a license server is required and the license key needs to be activated. Your system administrator will most likely be responsible for [setting up the license server](#). Then you will need to [request a floating license from the server](#). This process is designed to help you comply with the Oxygen End User License Agreement. This means that the license key will be locked to a particular license server deployment, and the same license key cannot be used with any other license server.

For information about releasing and returning a floating license to the pool for other users, see [Releasing a Floating License](#) on page 37.

For information about reserving (or locking) a floating license so that it does not get returned to the pool, see [Reserving a Floating License](#) on page 38.

### Requesting a Floating License from an HTTP License Server

To request a floating license from an HTTP license server, follow this procedure:

1. Contact your server administrator to make sure the license server has already been set up and get network address and login details for the license server.
2. Start Oxygen XML Author.
3. Go to **Help > Register**.  
The license registration dialog box is displayed.
4. Choose **Use a license server** as licensing method.
5. Select **HTTP/HTTPS Server** as server type.

6. In the *URL* field, enter the address of the license server.  
The URL address has the following format: `http://hostName:port/oxygenLicenseServlet/license-servlet`.
7. Complete the *User* and *Password* fields.
8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Author. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

**Related Information:**

[Setting up an HTTP Floating License Server](#) on page 39

### Requesting a Floating License from a TCP License Server

Use this procedure if your company uses an Oxygen XML Author TCP license server and the license server has already been set up by your server administrator:

1. Contact your server administrator to get network address and login details for the license server.
2. Start Oxygen XML Author.
3. Go to **Help > Register** .  
The license registration dialog box is displayed.
4. Choose **Use a license server** as licensing method.
5. Select **TCP server** as server type.
6. In the *Host* field, enter the host name or IP address of the license server.
7. In the *Port* field, enter the port number used to communicate with the license server.
8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Author. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

**Related Information:**

[Setting up a TCP Floating License Server Using a 32-bit Windows Installer](#) on page 44

Setting up the TCP floating license server as a Windows process.

[Setting up a TCP Floating License Server Using All-Platforms Distribution](#) on page 46

This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

### Releasing a Floating License

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- You exit the application running on your machine, and no other copies of Oxygen XML Author running on your machine are using your floating license.
- You register a [Named User](#) license with your copy of Oxygen XML Author, and no other copies of Oxygen XML Author running on your machine are using your floating license.
- Your computer idles for more than 2 hours.
- Your system administrator manually revokes the license.

**Tip:** To prevent your floating license from being released, you can use the **Lock floating license** action available in the **Help** menu. You can use the same action to unlock the license and your system administrator also has the ability unlock your license.

To release a floating license on demand, follow these steps:

1. Go to **Help > Register**.  
The license registration dialog box is displayed.
2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.

3. Make sure the **Use a license key** option is selected.
4. Click **OK**.  
A dialog box is displayed asking if you want to reset your license key.
5. Select between:
  - **Use the last one** - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a [Named User](#) license.
  - **Reset** - Removes your license key from your user account on the current computer.

The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Author.

### Reserving a Floating License

There are instances where you might want to reserve or lock a floating license. For example, you could lock a floating license if you want to use your floating license offline while traveling.

To reserve/lock a floating license, follow these steps:

1. Select **Lock floating license** from the **Help** menu.
2. Click **OK**.  
Your floating license is now locked. You can use the same action to unlock the license or you can contact your system administrator to unlock it.

### Transferring a License Key

If you want to transfer your Oxygen XML Author license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then [register your license](#) on the new computer in the normal way.

To transfer a license, follow this procedure:

1. Go to **Help > Register**.  
The license registration dialog box is displayed.
2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the **Use a license key** option is selected.
4. Click **OK**.  
A dialog box is displayed asking if you want to reset your license key.
5. Select between:
  - **Use the last one** - Falls back to your previous license key, if applicable.
  - **Reset** - Removes your license key from your user account on the current computer.

The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Author.

## Floating License Servers

---

### Installing a License Server to Manage Floating Licenses

If you are using floating licenses for Oxygen XML Author, you must set up an Oxygen XML Author floating license server. A floating license server can be installed as one of the following:

- An [HTTP server](#). This is the recommended method.
- A [TCP server](#) (deprecated).

**Note:** Oxygen XML Author version 17 or higher requires a license server version 17 or higher. License servers version 17 or higher can be used with any version of a floating license key.

## Activating Floating License Keys

To help you comply with the Oxygen XML Author EULA (terms of licensing), all floating licenses require activation. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your license server deployment is sent to the Oxygen XML Author servers, which in turn will sign the license key.

## Split or Combine License Keys to Work with Your License Servers

A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Author version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please [contact our support team](#) and ask for a new license key.

## Setting up an HTTP Floating License Server

**Figure 12: Floating License Server (HTTP Server)**

The Oxygen XML Author license server is available in several distributions, tailored for covering a variety of deployment configurations:

- **Windows installer** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, Mac, and Linux.
- **Web Archive (WAR) distribution** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

### Installation Steps for the HTTP License Server Installer Distribution for Windows

1. Download the HTTP license server installer from the [Oxygen XML Author website](#).
2. Run the installer and follow the on-screen instructions.
3. You need to configure two sets of credentials:
  - a. **Administrator credentials** - used for accessing the Oxygen XML Author license server administrative interface. Optionally you can choose to change the standard 8080 port.
  - b. **Standard user credentials** - used by an Oxygen XML Author application to connect to the license server.
4. Optionally you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

### Installation Steps for the HTTP License Server All-Platform Distribution

1. Download the HTTP license server all-platform archive from the [Oxygen XML Author website](#).

2. Unpack the archive.
3. Run the license server scripts suitable for your operating system (`licenseServer.bat` for Windows or `licenseServer.sh` for Linux and Mac).

**Note:** To specify a different port (other than the default 8080), you can pass the new port number as an argument to the scripts (for example, `licenseServer.bat 8082`).

4. On the first run, you will be prompted to set two sets of credentials:
  - a. **Administrator credentials** - used for accessing the Oxygen XML Author license server administrative interface.
  - b. **Standard user credentials** - used by an Oxygen XML Author application to connect to the license server.

### Installation Steps for the HTTP License Server WAR Distribution

1. Make sure that Apache Tomcat 5.5 or higher is running on the machine you have selected to be the license server. To get it, go to <http://tomcat.apache.org>.
2. Download the HTTP license server **Web ARchive (.war)** from the [Oxygen XML Author website](#).
3. Configure two Tomcat users:
  - a. One user with the role `user`, used by an Oxygen XML Author application to connect to the license server. In the subsequent example, this user name is **John**.
  - b. Another user with the roles `admin` and `manager-gui`, used for accessing the Oxygen XML Author license server administrative interface and the Tomcat management interface. In the subsequent example, this user name is **Mary**.

A typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat **zip/tar.gz** distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the two users, the configuration file might look like this:

```
<tomcat-users xmlns="http://tomcat.apache.org/xml"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
  version="1.0">
  <!-- ... other user and role definitions ... -->
  <role rolename="user"/>
  <role rolename="admin"/>
  <role rolename="manager-gui"/>
  <user username="John" password="user_pass" roles="user"/>
  <user username="Mary" password="admin_pass" roles="admin,manager-gui"/>
</tomcat-users>
```

4. Go to the Tomcat Web Application Manager page and log-in with the user you configured with the `manager-gui` role (**Mary** in the example above). In the **WAR file to deploy** section, choose the WAR file and click the **Deploy** button. The `oxygenLicenseServlet` application is now up and running, but the license key is not yet registered.
5. Go to the Oxygen license server administration page by clicking the `oxygenLicenseServlet` link in the manager page. You will need to authenticate with the user configured with the `admin` role (Mary in our example).
6. Activate the floating license key. This process involves binding your license key to your license server deployment. Once the process is completed you cannot activate the floating license with another license server. Follow these steps to activate the license:
  - a. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the `admin` or `manager` users.
 

**Result:** A page is displayed that prompts for a license key.
  - b. Paste your floating license key into the form and press **Submit**. The browser used in the activation process needs to have Internet access.
 

**Result:** You will be redirected to an online form hosted on the Oxygen XML Author website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

**Note:** If, for some reason, your browser does not take you to this activation form, refer to the [Manual Activation Procedure](#).
  - c. Press **Activate**.

If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Author client applications.

7. By default, the license server logs its activity in the `TomcatInstallDir/logs/oxygenLicenseServlet.log` file. To change the log file location, edit the `log4j.appender.R2.File` property from the `TomcatInstallDir/webapps/oxygenLicenseServlet/WEB-INF/lib/log4j.properties` configuration file.

### Manual License Activation Procedure

1. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. You will be taken to the license registration page.
2. Copy the license server activation code.
3. Go to the activation page at <http://www.oxygenxml.com/activation/>.
4. Paste the license server activation code and floating license key in the displayed form, then click **Activate**.
5. The activated license key is displayed on-screen. Copy the activated license key and paste it in the license registration page of the HTTP server.

### Automatic Subscription Renewal

If the HTTP license server is configured with a subscription license, then the license server will automatically check to see if a new subscription license was purchased and will automatically download and install it for you.

**Important:** This automatic checking procedure implies a connection to a web service located at `oxygenxml.com`. You can deactivate this automatic behavior by deselecting the **Automatically check for subscription renewal** option from the main management page of the license server.

If the automatic renewal process fails, you can try either of the following possible solutions:

- If your server uses a proxy to connect to the Internet, go to the main management page of the license server and configure the proxy settings by clicking the **Proxy settings** link in the **Management tasks** section.
- [Manually replace the floating license key](#).

### Floating License Server Management and Statistics Pages

A system administrator can manage and access information about the floating license server at: `http://hostName:port/oxygenLicenseServlet`.

This page provides access to several statistics reports and management tasks. It also shows the current status of the server and provides additional instructions for using the license server with Oxygen XML Author.

This page includes the following links for accessing statistics or managing tasks:

- **Current Allocated Licenses** - Opens the [Allocated License Report page](#).
- **Usage Statistics** - Opens the [Floating License Usage Statistics page](#).
- **View License Key** - Use this link to view details about the license key.
- **Replace License Key** - Use this link if you need to [replace a license key](#).
- **Configuration** - Opens a page where you can configure notification settings and specify whether or not users are allowed to lock licenses. This page can be used for setting up the mail server used for sending rejection emails.

### Allocated License Report Page

This report page provides a system administrator the ability to revoke or unlock current running instances of licenses and includes the following information:

- **License load** - A graphical indicator that shows how many licenses are available.
- **Floating license server status** - General information about the license server status, such as start time, license counts, rejected and acknowledged requests, average usage time, license refresh and timeout intervals, location of the license key, and the server version.

- **Current running instances** - Lists all currently acknowledged users, including user name, date and time when the license was granted, IP and MAC address of the computer where Oxygen XML Author runs, and lock status.
  - **Revoke** - A system administrator can click on the  **Revoke** icon next to a user name to release that particular license and return it to the pool.
  - **Unlock** - If a user has locked their floating license, the system administrator can also unlock it from this page.

**Note:** This report is also available in XML format at: <http://hostName:port/oxygenLicenseServlet/license-servlet/report-xml>.

### Floating License Usage Statistics Page

This report page provides some usage statistics for the floating licenses. It is helpful for determining the number of licenses that are needed and monitoring times when licenses are consumed. It includes the following information:

- **Maximum number of concurrent licenses** - Shows the maximum number of floating licenses that can be consumed at any given time.
- **Concurrent license consumption per day** - A chart that shows the peak number of licenses that were consumed and the total number of users that were rejected, on a daily basis. This chart can be used to detect the amount of concurrent licenses that are needed to avoid having rejected users.

**Tip:** You can click on any bar to see the license consumption per hour for that particular day.

**Figure 13: Concurrent License Consumption per Day Chart**

- **Concurrent license consumption per hour** - A chart that shows the peak number of licenses that were consumed per hour throughout that particular month. This is useful for identifying the time of day when the most licenses were consumed.

**Figure 14: Concurrent License Consumption per Hour Chart**

### Replacing a Floating License Key in an HTTP Floating License Server

The following procedure assumes that your Oxygen XML Author HTTP floating license server contains a previously [activated license key](#) and provides instructions for replacing it with another one. The goal of the procedure is to allow you to activate and configure the new license key without any downtime.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [that accommodates a different number of users](#).

To replace a floating license key that is activated on your HTTP floating license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page.
2. Click the **Replace license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Yes** button to begin the replacement procedure.
4. Paste the new floating license key in the displayed form, then click **Submit**. The browser used in the process needs to have Internet access.

You will be redirected to an online form hosted on the Oxygen XML Author website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

**Note:** If for some reason your browser does not take you to this activation form, refer to the [Manual Activation Procedure](#).

5. Press **Activate**.

If the activation process is completed successfully, your license server is now running using the new license key. You can click **View license key** to inspect the key currently used by the license server.

### Upgrading Your HTTP Floating License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the Oxygen XML Author HTTP floating license server to its latest version.

Follow this procedure:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the **admin** or **manager** credentials.
2. Click the **View license key** link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the **manager** role, and *Undeploy* the floating license server.

4. Go to Oxygen XML Author website and [download the HTTP license server](#).
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the **admin** or **manager** users.
7. Paste the license key into the form and register it.

### Registering a Floating License for Multiple Users

If you are an administrator registering floating licenses for multiple users, you can avoid having to open Oxygen XML Author on each machine and configuring the registration details by using the following procedure:

1. Reset the registration details:
  - a. Select **Register** from the **Help** menu.
  - b. Click **OK** without entering any information in this dialog box.
  - c. Click **Reset** and restart the application.
2. Register the license using one of the [floating license registration procedures](#).
3. Copy the `license.xml` file from the Oxygen XML Author [preferences directory](#) to the installation folder on each installation to be registered.

## Setting up a TCP Floating License Server Using a 32-bit Windows Installer

Setting up the TCP floating license server as a Windows process.

**Figure 15: TCP Floating License Server (Process in Windows)**

### Installation Steps

1. Download the license server installation kit for Windows from the [Oxygen XML Author website](#).
2. Run the downloaded installer and follow the on-screen instructions.

By default, the installer installs the license server as a Windows service. Optionally, you have the ability to start the Windows service automatically at Windows startup or create shortcuts on the **Start** menu for starting and stopping the Windows service manually. If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

- `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oxygenLicenseServer.vmoptions` file.
- `startWindowsService.bat [serviceName]` - Starts the Windows service.
- `stopWindowsService.bat [serviceName]` - Stops the Windows service.
- `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

**Note:** If you do not provide the `serviceName` argument, the default name `oxygenLicenseServer` is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:

- `outLicenseServer.log` - Standard output stream of the server.
- `errLicenseServer.log` - Standard error stream of the server.

3. Manually add the oXygenLicenseServer.exe file in the Windows Firewall list of exceptions. Go to **Control Panel > System and Security > Windows Firewall > Allow a program or feature through Windows Firewall > Allow another program** and browse for oXygenLicenseServer.exe from the Oxygen XML Author License Server installation folder.
4. Floating licenses require activation prior to use. More details are available either on-screen (if the license server is started in a command line interface) or in the outLicenseServer .log log file.

**Note:** A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Author version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please [contact our support team](#) and ask for a new license key.

### Replacing a Floating License Key in a TCP Floating License Server

The following procedure assumes that your Oxygen XML Author TCP floating license server contains a previously [activated license key](#) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [that accommodates a different number of users](#).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the service that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, [the server will fail to start](#).
4. Find the license activation procedure in the on-screen instructions (if the license server is started in a **command line interface**) or in the outLicenseServer .log log file.
5. After you copy the activated license key in the `license.txt` file, restart the license server.

### Upgrading Your TCP Floating License Server

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Author floating license server to its newest version.

Follow this procedure:

1. Go to the Oxygen XML Author website and download the [latest floating license server](#).
2. Run the installation kit.
3. Leave the default **Update the existing installation** option selected. This will ensure that some options set in the previous version (namely the installation folder, port number, and the floating license key in use) of the license server will be preserved.
4. Follow the on-screen instructions to complete the installation process.

### Common Problems

This section includes some common problems that may appear when setting up a TCP floating license server.

#### Windows Service Reports 'Incorrect Function When Started'

The "Incorrect Function" error message when starting the Windows service usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: <http://www.oracle.com/technetwork/java/javase/downloads/index.html>.

#### Machine Signature Mismatch

During the floating activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called *Machine Signature*) is sent to the Oxygen XML Author servers, which in turn will sign the license key. The *Machine Signature* is computed from the list of network interfaces of the machine where you deployed the floating license.

When starting the license server, if you receive an error stating that your server's Machine Signature does not match the one found in your license key, there are several possible causes:

- You have moved your floating license key to a new machine that hosts your license server.
- You have changed, added, or activated a new network interface in the machine that hosts your license server.

**Note:** A specific example of when this could happen, is if you activate/deactivate the Bluetooth module or the WiFi module.

**Solution:** Revert back to your previous configuration or if this is not possible, contact our [support team](#).

### Windows Service Reports 'Error 1067: Process Terminated Unexpectedly'

This error message appears if the Windows service launcher quits immediately after being started.

This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder). For more information, see the [Setting up a Floating License Server section](#).

## Setting up a TCP Floating License Server Using All-Platforms Distribution

This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

**Figure 16: TCP Floating License Server (All-Platforms Distribution)**

### Installation Steps

1. Ensure that a Java runtime version 6 or later is installed on the server machine.
2. Download the license server installation kit for your platform from the [Oxygen XML Author website](#).
3. Unzip the installation kit into a new folder.
4. Start the server using the startup script from a command line console.  
The startup script is called `licenseServer.sh` for OS X and Unix/Linux or `licenseServer.bat` for Windows. The following parameters are accepted:
  - `licenseDir` - The path of the directory where the license files will be placed. The default value is `license`.
  - `port` - The TCP port number used to communicate with Oxygen XML Author instances. The default value is **12346**.

**Example:** The following is an example of the command line for starting the license server on Unix/Linux and OS X:

```
sh licenseServer.sh myLicenseDir 54321
```

5. Floating licenses require activation prior to use. Follow the on-screen instruction to complete the license activation process.

### Replacing a Floating License Key in a TCP Floating License Server

The following procedure assumes that your Oxygen XML Author TCP floating license server contains a previously [activated license key](#) and provides instructions for replacing the activated license key with another one. The goal

of the procedure is to minimize the HTTP license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key *that accommodates a different number of users*.

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the process that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
4. Find the license activation procedure in the on-screen instructions.
5. After you copy the activated license key in the `license.txt` file, restart the license server.

### Upgrading Your TCP Floating License Server

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Author TCP floating license server to its newest version.

Follow this procedure:

1. Stop the current license server process.
2. Locate and open the floating server startup script. It should look like this:

```
sh licenseServer.sh pathToLicenseDir 54321
```

3. Make a note of the path to the license directory (in our example is `pathToLicenseDir`) and the port number (in our example is 54321).
4. Go to the license directory and copy the license key file (`license.txt`) for later use.
5. Go to the Oxygen XML Author website and download the [all-platforms floating license server installation kit](#).
6. Unzip the archive and overwrite the content of your current floating license server installation.
7. Copy the license key file (`license.txt`) saved in step 4 to license directory of the floating license server installation.
8. Edit the floating server startup script and configure with the info you made note of in step 3.
9. Start the floating license server process.

## Upgrading

---

From time to time, upgrades and patch versions of Oxygen XML Author are released to provide enhancements that fix problems and add new features.

By default, Oxygen XML Author automatically checks for new versions at start up. If a newer version is detected, a dialog box will automatically be displayed that provides information about the type of upgrade or update that is available. If the newer version includes a critical bug fix, this dialog box will continue to be displayed every time Oxygen XML Author is launched. To disable this check, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and deselect **Automatic Version Checking**.

To check for new versions manually, go to **Help > Check for New Versions**. This opens a dialog box that displays information about whether or not a newer version is available.

### Upgrading Oxygen XML Author on Windows/Linux

#### What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Author, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Author already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in *framework* files, XSLT stylesheets, *XML Catalogs*, and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* that were stored outside the installation directory (as configured in **Document type associations > Locations**) will be preserved and will be found by the new installation.

If you install in a new directory:

- All the files from the old install directory will be preserved, including any modification in *framework* files, XSLT stylesheets, *XML Catalogs*, and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* that were stored outside the installation directory (as configured in **Document type associations > Locations**) will be preserved and will be found by the new installation.

### How to Upgrade Oxygen XML Author on Windows or Linux

1. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select **Help > Check for New Version**. Note that the application needs an Internet connection to check the license compatibility.
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
4. Restart Oxygen XML Author.
5. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

## Upgrading Oxygen XML Author on OS X

### What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Author, first you need to remove or rename the old installation directory. By renaming the directory, it can coexist with the new installation and the following data will be preserved:

- All the files from the old install directory will be preserved, including any modification in *framework* files, XSLT stylesheets, *XML Catalogs*, and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* that were stored outside the installation directory (as configured in **Document type associations > Locations**) will be preserved and will be found by the new installation.

### How to Upgrade Oxygen XML Author on OS X

1. *Uninstall the current version of Oxygen XML Author* or rename the installation directory (for example, Oxygen XML Editor.old).
2. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select **Help > Check for New Version**. Note that the application needs an Internet connection to check the license compatibility.
3. Download and install the new version according to the instructions for your platform and the type of installer you selected.
4. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
5. Restart Oxygen XML Author.

6. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

## Installing and Updating Add-ons

---

Oxygen XML Author provides an [add-on](#) mechanism that can automatically discover and install [frameworks](#) and [plugins](#) from a remote location.

**Note:** *Frameworks* that you install through the add-ons system are read-only.

### Installing Add-ons

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to **Help > Install new add-ons**.
2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the **Show add-ons from** field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on **http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml**. If you want to see a list of all the default and sample add-ons that are available on the Oxygen remote update sites, choose **ALL AVAILABLE SITES** from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Author version, and the type of the add-on (either **framework**, or **plugin**). A short description of each add-on is presented under the add-ons list.

**Note:** To see all the versions of the add-ons, deselect **Show only compatible add-ons** and **Show only the latest version of the add-ons**. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.

3. Choose the add-ons you want to install, press the **Next** button, then follow the on-screen instructions.

**Note:** Accepting the license agreement of the add-on is a mandatory step in the installation process.

**Note:** All add-ons are installed in the extensions directory inside the Oxygen XML Author [preferences directory](#).

### Managing installed add-ons

To manage the installed add-ons, follow these steps:

1. Go to **Help > Manage add-ons**
2. The displayed dialog box presents a list of your installed add-ons along with various information (such as the installed version, the compatible Oxygen version, and more). The **Status** column will indicate if an update is available for a particular add-on. Also, you can click on the row for any particular add-on that has an update available to see details for the update (displayed in the preview pane below the list of add-ons).
3. To update an add-on, select the checkbox for the specific add-on, then press **Update** to update it (or **Uninstall** to remove it). If there is a newer version of the add-on available, Oxygen XML Author will download the package and install it. Follow the on-screen instructions to complete the installation process.

**Note:** Accepting the license agreement of the add-on is a mandatory step in the installation process.

### Checking for add-on updates

To check if there are available updates for the installed add-ons, go to **Help > Check for add-ons updates**. This action displays updates that are compatible with the current Oxygen XML Author version.

#### Related Information:

[Packing and Deploying Plugins or Frameworks as Add-ons](#) on page 1142

# Uninstalling

---

## How to Uninstall Oxygen XML Author

**CAUTION:** The following procedure will remove Oxygen XML Author from your system. **All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Make a back up of any data you want to keep before uninstalling Oxygen XML Author.**

1. Backup any data you want to keep from the Oxygen XML Author installation folder.
2. Remove the application according to your operating system:
  - **Windows** - Use the appropriate uninstaller shortcut provided with your OS.
  - **OS X or Linux** - Manually delete the installation folder and all its contents.
3. If you want to remove the user preferences:
  - **Windows** - Remove the directory: %APPDATA%\Roaming\com.oxygenxml.author (usually %APPDATA% has the value: [user-home-dir]\Application Data). Note that this directory is hidden.
  - **OS X** - Remove the directory: Library/Preferences/com.oxygenxml.author of the user home folder.
  - **On Linux**, remove the directory: .com.oxygenxml.author from the user home directory.

## Unattended Uninstall

The unattended uninstall procedure is available only on Windows and Linux.

1. Run the uninstaller executable from command line with the -q parameter.
  - **Windows** - The uninstaller executable is called `uninstall.exe` and is located in the Oxygen installation directory.
  - **Linux** - The uninstaller executable is called `uninstall` and is located in the Oxygen installation directory.

# Configuring Oxygen XML Author

---

## Topics:

- [Preferences](#)
- [Configuring Options](#)
- [Associating a File Extension with Oxygen XML Author](#)
- [Configuring the Layout of the Views and Editors](#)
- [Configuring Toolbars](#)
- [Import/Export Transformation or Validation Scenarios](#)
- [Editor Variables](#)
- [Custom System Properties](#)
- [Localizing the User Interface](#)
- [Setting a Java Virtual Machine Parameter when Launching Oxygen XML Author](#)
- [How to Increase the Amount of Available Memory](#)

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the *editor variables* that are available for customizing user-defined commands..

## Preferences

---

You can configure Oxygen XML Author options using the **Preferences** dialog box.

To open the preferences dialog box, go to **Options > Preferences**.

You can select the preference page you are interested in from the tree on the left of the **Preferences** dialog box. You can filter the tree by using the filter text box and the following buttons are available to the right of the text box:

-  **Expand All** - Expands the structure of the tree to show all preference pages.
-  **Collapse All** - Collapses the structure of the tree to show only the 1st level preference pages.
-  **Project-Level Options Only** - If toggled on, it filters the tree to only show the preference pages that are *saved at project level*.

**Figure 17: Preferences Dialog Box**

Press or **F1** for help on any preferences page.

Some preference pages include a option to control how the options are stored, either as **Global Options** or **Project Options**.

**Figure 18: Controlling the Storage of the Preferences**

You can restore options to their default values by pressing the **Restore Defaults** button, available in each preferences page.

### Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (com.oxygenxml) that is in the following locations:

- **Windows (Vista, 7, 8, 10)** - [user\_home\_directory]\AppData\Roaming\com.oxygenxml
- **Windows XP** - [user\_home\_directory]\Application Data\com.oxygenxml
- **Mac OS X** - [user\_home\_directory]/Library/Preferences/com.oxygenxml
- **Linux/Unix** - [user\_home\_directory]/.com.oxygenxml

## Global Preferences

The global options cover a number of aspects of the overall operation of Oxygen XML Author. To configure the **Global** options, *open the [Preferences dialog box \(Options > Preferences\)](#)* and go to **Global**.

The following options are available in the **Global** preferences page:

### Automatic Version Checking

If this option is selected, Oxygen XML Author will check for a new version on startup.

### Check for notifications

If selected (default value), the application will check for various types of messages from the Oxygen XML Author website and they will be displayed in the status bar. The types of messages include the addition of new videos on the website, the announcement of upcoming webinars and conferences where the Oxygen XML Author team will participate, and more.

### Language

This option specifies the language used in the user interface. You can choose between English, French, German, Dutch, or Japanese. You must restart Oxygen XML Author for the change to take effect.

### Other language

This option sets the language used in the user interface using an interface localization file. For details about creating this file, see *[Localizing the User Interface](#)* on page 173. You can use this option to set the language of the user interface to a language that is not shipped with Oxygen XML Author.

**Note:** If some interface labels are not rendered correctly after restarting the application, (for example, Chinese or Korean characters are not displayed correctly), make sure that your operating system has the appropriate language pack installed (for example, the East-Asian language pack).

### Line separator

This option sets the line separator used when saving files. Use **System Default** to select the normal line separator for your OS. If you want the existing file separator of a file to be maintained, regardless of your current OS, select **Detect the line separator on file open**.

### Detect the line separator on file open

When this option is selected, the editor detects the line separator when a file is loaded and it uses it when the file is saved. New files are saved using the line separator defined by the *[Line separator option](#)*.

### Default Internet browser

This option sets the Web browser that Oxygen XML Author will use to do the following:

- Open (X)HTML or PDF transformation results.
- Open a web page (for example, pointing to specific paragraphs in the W3C recommendation of XML Schema if there are XML Schema validation errors).

If you leave this setting blank, the system default browser will be used.

### Open last edited files from project

When this option is selected, Oxygen XML Author opens the files you had open the last time you used a project whenever you open the application or switch to that project.

### Check opened files for file system changes

When this option is selected, Oxygen XML Author checks the content of the all opened editors to see if they have been updated by another application. If the file has changed, Oxygen XML Author will ask you if you want to reload the file.

### Auto update unmodified editors on file system changes

If this option is selected, Oxygen XML Author automatically updates unmodified editors if the edited file changes externally.

### Beep on operation finished

When this option is selected, Oxygen XML Author beeps when a validation or transform action ends. Different tones are used for success and failure. The tones used may depend on the sound settings in your operating system.

### Show memory status

When this option is selected, the memory Oxygen XML Author uses is displayed in the status bar. To free memory, click the  **Free unused memory** button located at the right side of the status bar. The memory status bar turns yellow or red when Oxygen XML Author uses too much memory. You can change the amount of memory available to Oxygen XML Author by [changing the parameters of the application launcher](#).

### Show Java vendor warning at startup

If this option is selected, Oxygen XML Author displays a warning on startup if a non-recommended version of the Java virtual machine is being used.

### Order of switching between editor tabs

This option specifies the order for [switching between opened file tabs when using Ctrl + Tab \(Command + Tab on OS X\) or Ctrl + Shift + Tab \(Command + Shift + Tab on OS X\)](#). You can choose between:

- **Recently used order** - Switches to the most recently used tab.
- **Visual order** - Switches to the next tab in visual order.

### File Chooser Dialog

This options specifies the directory that will be shown when the [Open file dialog box](#) is displayed. You can choose between:

- **Directory of the edited file** - The folder where the currently edited file is stored will be displayed.
- **Last visited directory** - The last visited folder will be displayed.

### Show hidden files and directories

If this option is selected, Oxygen XML Author shows system hidden files and folders in the file browser dialog box and the folder browser dialog box.

**Tip:** On Mac OS X, you need to press **Command + Shift + Period** in the file browser to show hidden files.

## Appearance Preferences

This preferences page contains various options that allow you to change the appearance of the user interface of Oxygen XML Author. To configure the **Appearance** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Appearance**.

The following options are available in the **Appearance** preferences page:

### Look and Feel

This option allows you to change the graphic style (look and feel) of the user interface. Depending on the operating system, you can choose between various predefined style options.

### Theme

This option allows you to choose predefined color themes that will be applied over the entire user interface. You can select between the following:

- **Light** (default theme in Windows)
- **Classic** (default theme in MAC OS)

**Note:** In Windows, if a high contrast theme is detected and the **Theme** option is set to **Classic** and the [Look and Feel option](#) is set to **Default** or **Windows**, Oxygen XML Author inherits the high contrast theme colors that are set in the operating system.

- **Graphite**
- **Ultramarine**

You can also change various appearance related options in other preference pages for the selected theme by clicking on the various links in this section.

### Custom Themes

You can also create custom themes to share with others or use in other installations of Oxygen XML Author. To create a custom theme, follow these steps:

1. Select a **Theme** to use as a base.
2. Configure the desired options in any of the option pages listed in this preferences page.

3. Click **Export** and specify a name for your custom theme. If you save the theme to the default file path, your custom theme will immediately appear in the **Theme** drop-down list. Otherwise, if you save it to another location, you can use the **Import button** to make it appear in the drop-down list.

**Note:** In OS X (starting with Yosemite), if you choose Graphite for the **Theme**, it is recommended that you select the **Use dark menu and Dock** option that is found in **System Preferences > General**.

### Theme preview area

Displays a preview of the current **Theme selection** (available for predefined color themes).

### Theme management section

#### Reset

Resets the theme to its default values (this option is available when the theme is modified).

#### Rename

Changes the name of the theme (not available for default or predefined themes).

#### Delete

Removes the selected theme (not available for default or predefined themes).

#### Import

Allows you to import a color theme from an XML theme file. You can use this option to load an exported **custom theme**.

#### Export

Allows you to export the current color theme into an XML theme file that can then be shared with others or imported into another installation of Oxygen XML Author.

### Configure icon saturation and brightness link

This link is available if you are using a dark **theme** (such as **Graphite** or **Ultramarine**). It opens a dialog box that allows you to configure the saturation and brightness for all the icons in Oxygen XML Author.

**Figure 19: Configure Icon Saturation and Brightness Dialog Box**

### Colors Preferences

Oxygen XML Author allows you configure the colors for frames, dialog boxes, controls, and commands. To configure the **Colors**, **open the Preferences dialog box (Options > Preferences)** and go to **Appearance > Colors**.

Clicking the color button for any of the options opens a **Choose color** dialog box. It includes several tabs that allow you to configure the color in numerous ways. This page allows you to select and configure the color for the following:

#### Background Colors

##### Background

Background color for various general user interface items.

**Components background**

Background color for various components (such as text fields, views, tables, and dialog boxes).

**Components selection background**

Background color for the current selections in certain components, such as some views and panes.

**Components inactive selection background**

Background color for a selection in a view that is not the current focus.

**Menus, toolbars and frame background**

Background color for specific components such as menus, toolbars, and the application frame.

**Menus and toolbars selection background**

(This option is not available for Mac OS) Background color for menu selections and toolbar buttons.

**View titles background**

Background color for the titles of view and tabs.

**Status bar background**

Background color of the status bar at the bottom of the editor.

**Foreground Colors****Foreground**

Foreground color for various general user interface items.

**Component selection foreground**

Foreground color for the current selection.

**Disabled foreground**

Foreground color for various components that are not the current focus (such as views other than the currently selected one).

**Link foreground**

Foreground color for links in views and dialog boxes.

**View titles foreground**

Foreground color for the title bar of views.

**Status bar foreground**

Foreground color for the text in the status bar at the bottom of the editor.

**Other Colors****Borders and table grids**

Color for certain borders and table grid lines.

**Text component border**

Color for the borders of text fields and drop-down lists.

**View/Editor tabs border**

Color for the borders of views and tabs.

**Scroll bars, chevrons**

Color for scroll bars (navigation bars) and chevrons (button to expand a non-visible area).

**Separator**

Color for the separators in toolbars, menus, and dialog boxes.

**Note:** You must restart the application for your changes to be applied.

**Fonts Preferences**

Oxygen XML Author allows you to choose the fonts to be used in the **Text** and **Grid** editor modes, and fonts for the **Author** mode that are not specified in the associated CSS stylesheet. To configure the font options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Appearance > Fonts**.

The following options are available:

## Editor

Allows you to choose the font that will be used in the editor.

**Note:** On Mac OS X, the default font, Monaco, cannot be rendered in bold.

## Author mode default font

This option allows you to choose the default font that will be used in **Author** mode. The default font will be overridden by the fonts specified in any CSS file associated with the opened document.

## Text antialiasing

This option allows you to set the text anti-aliasing behavior:

- **Default** - Allows the application to use the setting of the operating system, if available.
- **On** - Sets the text anti-aliasing to pixel level.
- **Off** - Disables text anti-aliasing.
- Sub-pixel anti-aliasing modes, such as GASP, LCD\_HRGB, LCD\_HBGR, LCD\_VRGB, and LCD\_VBGR.

## Text components

This option allows you to choose the font to be used in text boxes within the interface.

## GUI

This option allows you to choose the font to be used for user interface labels.

## View titles font

This option allows you to choose the font to be used in the titles of the various views that are opened within the interface.

**Note:** You must restart the application for your changes to be applied.

## Related Information:

[Changing the Font Size in the Editor](#) on page 447

## Application Layout Preferences

Oxygen XML Author offers various [perspectives](#) and views that you can arrange in a variety of layouts to suit your needs.

To configure the application layout options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Application Layout**. The following options are available:

### Select application layout

You can choose between the following three layouts:

#### Default

Uses the default layout for all [perspectives](#). Any modification of this layout (such as closing views, displaying views, or a new view arrangement) is saved on exit and reloaded at start-up.

#### Predefined

Allows you to choose one of the predefined layouts:

- **Advanced** - All views are displayed.
- **Author** - An authoring-oriented layout that includes the following views: [Project](#), [Archive Browser](#), [DITA Maps Manager](#), [Outline](#), [Attributes](#), [Model](#), and [Elements](#).
- **Basic** - Only the [Project view](#) and [Outline view](#) are visible. Recommended when you edit XML content and you need maximum screen space.

#### Custom

Allows you to specify a custom layout to be used. You can save your preferred layout using **Window > Export Layout**, then enter the location of the saved layout file in this setting.

### Reset layout at startup

When this option is selected, Oxygen XML Author forgets any changes made to the layout during a session and reloads the default layout the next time it is started. This is useful when you want to keep a fixed layout from one session to another.

### Remember layout changes for each project

When this options is selected, Oxygen XML Author saves layouts individually for each project. When you switch projects, the layout you last used for that project is loaded automatically.

### Allow detaching of editors from main window

When this options is selected, you can drag and drop an editor window outside of the main screen. This is useful especially when you are using two monitors and you want to view files side by side.

**Note:** If the main screen is maximized, you cannot drag and drop an editor outside of it.

### View tab placement

Specifies whether the *View* tabs are located at the top or bottom of the window.

### Editor tab placement

Specifies whether the *Editor* tabs are located at the top or bottom of the window.

The changes you make to any layout are preserved between working sessions. The predefined *layout* files are saved in the preferences directory of Oxygen XML Author.

For more information about configuring the user interface of Oxygen XML Author, watch our video demonstration:

## Add-ons Preferences

You can use *add-ons* to enhance the functionality of Oxygen XML Author. To configure the **Add-ons** options, *open the Preferences dialog box (Options > Preferences)* and go to **Add-ons**.

The following options are available in this preferences page:

### Enable automatic updates checking

When this option is selected, Oxygen XML Author will automatically search for available updates.

### Add-on Sites URLs

This is a list of the URLs for the add-on sites. You can add, edit, and delete sites in this list by using the buttons below the list.

## Document Type Association Preferences

Oxygen XML Author uses *document type associations* to associate a *document type* with a set of functionality provided by a *framework*. To configure the **Document Type Association** options, *open the Preferences dialog box (Options > Preferences)* and go to **Document Type Association**.

The following actions are available in this preferences page:

### Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for *framework* add-on update sites.

### Document Type Table

This table presents the currently defined *frameworks* (*document type associations*), sorted by priority and alphabetically. Each edited document type has a set of association rules (used by the application to detect the proper document type association to use for an opened XML document). A rule is described by:

- **Namespace** - Specifies the namespace of the root element from the association rules set (\* (*any*) by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the **ANY\_VALUE** string).
- **Root local name** - Specifies the local name of the root element (\* (*any*) by default).
- **File name** - Specifies the name of the file (\* (*any*) by default).
- **Public ID** - Represents the Public ID of the matched document.
- **Java class** - Presents the name of the Java class, which is used to determine if a document matches the rule. This Java class should implement the `ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface.

### New

Opens a *Document type configuration dialog box* that allows you to add a new *framework*.

## Edit

Opens a [Document type configuration dialog box](#) that allows you to edit an existing *framework*.

**Note:** If you try to edit an existing *framework* when you do not have write permissions to its storage location, a dialog box will be shown asking if you want to extend it.

## Duplicate

Opens a [Document type configuration dialog box](#) that allows you to duplicate the configuration of an existing *framework*. This will create a snapshot of the *framework* in its current form. It is merely a copy of the document type and will not *evolve* along with the base document type like the **Extend** action does.

## Extend

Opens a [Document type configuration dialog box](#) that allows you to extend an existing *framework*. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

## Delete

Deletes the selected *framework* (document type).

## Enable DTD/XML Schema processing in document type detection

When this option is selected (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the DITAArchVersion attribute of the root element. This attribute is specified as default in the DTD and it is detected in the root element, helping Oxygen XML Author to correctly match the DITA customization.

## Only for local DTDs/XML Schemas

When this option is selected (default value), only the local DTDs / XML Schemas will be processed.

## Enable DTD/XML Schema caching

When this option is selected (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

## Related Information:

[Extending and Sharing a Framework \(Document Type\)](#) on page 1177

## Locations Preferences

Oxygen XML Author allows you to change the location where *frameworks* (document types) are stored, and to specify additional *framework* directories. The **Locations** preferences page allows you to specify the main *frameworks* folder location. You can choose between the **Default** directory (`[OXYGEN_INSTALL_DIR] / frameworks`) or a **Custom** specified directory. You can also change the current *frameworks* folder location value using the `com.oxygenxml.editor.frameworks.url` system property set in either the [.vmoptions configuration files](#) or in the [startup scripts](#).

A list of additional *frameworks* directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the **Add**, **Edit** and **Delete** buttons to manage the list of folders.

A document type configuration (*framework*) can be loaded from the following locations:

- Internal preferences - The document type configuration is stored in the application [Internal preferences](#).
- Additional *framework* directories - The document type configuration is loaded from one of the specified **Additional frameworks directories** list.
- Add-ons - An *add-on* can contribute a *framework*. You can manage the add-ons locations in the [Add-ons preferences page](#).
- The *frameworks* folder - The main folder containing *framework* configurations.

All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

### Document Type Configuration Dialog Box

The **Document Type** Configuration dialog box allows you to create or edit a *framework* (document type). It is displayed when you use the **New**, **Edit**, **Duplicate**, or **Extend** buttons in the [Document Type Association preferences page](#) (open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**).

The configuration dialog box includes the following fields and sections:

- **Name** - The name of the *framework*. This will be displayed as its name in the **Document Type** column in the [Document Type Association preferences page](#).
  - **Priority** - Depending on the priority level, Oxygen XML Author establishes the order in which the existing *frameworks* are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority to *frameworks* you want to be evaluated first.
  - **Description** - A detailed description of the *framework*.
  - **Storage** - Displays the type of location where the *framework* configuration file is stored. Can be one of: **External** (*framework* configuration is saved in a file) or **Internal** (*framework* configuration is stored in the application's internal options).
- Note:** If you set the **Storage** to **Internal** and the *framework* configuration is already stored in a *framework* file, the file content is saved in the application's internal options and the file is removed.
- **Initial edit mode** - Sets the default edit mode when you open a document for the first time.
  - **Configuration Tabs** - The bottom section of the dialog box includes various tabs where you can configure numerous options for the *framework*.

#### Related Information:

[Sharing a Framework \(Document Type\)](#) on page 1176

### Association Rules Tab

By combining multiple association rules you can instruct Oxygen XML Author to identify the type of a document. An Oxygen XML Author *association rule* holds information about **Namespace**, **Root local name**, **File name**, **Public ID**, **Attribute**, and **Java class**. Oxygen XML Author identifies the type of a document when the document matches at least one of the *association rules*. This tab give you access to a **Document type rule** dialog box that you can use to create *association rules* that activate on any document matching all the criteria defined in the dialog box.

To create a new association rule, click the **+ New** button at the bottom of the **Association Rules** tab, or to edit an existing rule, click the **Edit** button.

Document type rule

Activates on any document matching ALL the following criteria:

Namespace:

Root local name:

File name:

Public ID:

Attribute:

Java class:

Figure 20: Document Type Rule Dialog Box

**Tip:** You can use wildcards (? and \*) or [editor variables](#) in the **Document Type Rule** dialog box, and you can enter multiple values by separating them with a comma.

To open the **Association Rules** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button, and click on the **Association Rules** tab.

In the **Association rules** tab, you can perform the following actions:

**+ New**

Opens the **Document type rule** dialog box allowing you to create *association rules*.

**🔗 Edit**

Opens the **Document type rule** dialog box allowing you to edit the properties of the currently selected *association rule*.

**✖ Delete**

Deletes the currently selected *association rules* from the list.

**⬆ Move Up**

Moves the selected *association rule* up one spot in the list.

**⬇ Move Down**

Moves the selected *association rule* down one spot in the list.

### Schema Tab

In the **Schema** tab, you can specify a schema that Oxygen XML Author uses if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

To open the **Schema** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button, and click on the **Schema** tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

#### Schema type

Use this drop-down list to select the type of schema.

#### Schema URI

You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the [📄 Insert Editor Variables](#) button, or the browsing tools in the **📁 Browse** drop-down list.

**Tip:** It is a good practice to store all resources in the *framework* directory and use the `${framework}` [editor variable](#) to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

### Classpath Tab

The **Classpath** tab displays a list of folders and *JAR* libraries that hold implementations for API extensions, implementations for custom **Author** mode operations, various resources (such as stylesheets), and *framework* translation files. Oxygen XML Author loads the resources looking in the folders in the order they appear in the list.

To open the **Classpath** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button, and click on the **Classpath** tab.

The **Classpath** tab includes the following actions:

**+ New**

Opens a dialog box that allows you to add a resource to the table in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the [📄 Insert Editor Variables](#) button, or the browsing tools in the **📁 Browse** drop-down list.

**Tip:** The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

### **Edit**

Opens a dialog box that allows you to edit a resource in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

**Tip:** The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

### **Delete**

Deletes the currently selected resource from the list.

### **Move Up**

Moves the selected resource up one spot in the list.

### **Move Down**

Moves the selected resource down one spot in the list.

### **Use parent classloader from plugin with ID**

Use this option to specify the ID of a *plugin*. The current *framework* has access to the classes loaded for the *plugin*.

### **Related Information:**

[Extensions Tab](#) on page 76

[Author Tab](#) on page 62

[Localizing Frameworks](#) on page 1141

## **Author Tab**

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding *framework*-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the **Author** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Author** tab.

The options that you configure in the **Author** tab are grouped in subtabs.

### *CSS Subtab*

The **CSS** subtab contains the CSS files that Oxygen XML Author uses to render a document in the **Author** mode. In this subtab, you can set *main* and *alternate* CSS files. When you are editing a document in the **Author** mode, you can switch between these CSS files from the **Styles** drop-down menu on the **Author Styles** toolbar.

To open the **CSS** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **CSS** subtab.

The following actions are available in the **CSS** subtab:

### **New**

Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

### **Edit**

Opens a dialog box that allows you to edit the current selection.

### **Delete**

Deletes the currently selected CSS file.

### **Move Up**

Moves the selected CSS file up in the list.

### **Move Down**

Moves the selected CSS file down in the list.

## Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is selected by default for DITA document types.

### If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- **Ignore CSSs from the associated document type** - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.
- **Merge them with CSSs from the associated document type** - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

### Related Information:

[CSS Stylesheet](#) on page 1102

[Configuring and Managing Multiple CSS Styles](#) on page 1194

### Actions Subtab

The **Actions** subtab contains a sortable table that includes all the *framework*-specific actions. Each action has a unique ID, a name, a description, and a shortcut key.

To open the **Actions** subtab, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend button*, click on the **Author** tab, and then the **Actions** subtab.

The following actions are available in this subtab:

#### **New**

Opens the *Action dialog box* that allows you to add an action.

#### **Duplicate**

Duplicates the currently selected action.

#### **Edit**

Opens the *Action dialog box* that allows you to edit the existing action.

#### **Delete**

Deletes the currently selected action.

### Author Action Dialog Box

To edit an existing document type action or create a new one, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend button*, click on the

**Author** tab, and then the **Actions** subtab. At the bottom of this subtab, click  **New** to create a new action, or  **Edit** to modify an existing one.

**Figure 21: Action Dialog Box**

The following options are available in the **Action** dialog box:

**ID**

Specifies a unique action identifier.

**Name**

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

**Tip:** You can use the *editor variable* to allow for multiple translations of the name.

**Menu access key**

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *Letter* that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *Letter* in the name of the action that can be used to access the action.

**Description**

A description of the action. This description is displayed as a tooltip when hovering over the action.

**Tip:** You can use the *editor variable* to allow for multiple translations of the description.

**How to translate frameworks link**

Use this link to see more information about [Localizing Frameworks](#) on page 1141.

**Large icon**

Allows you to select an image for the icon that Oxygen XML Author uses for the toolbar action.

**Tip:** A good practice is to store the image files inside the *framework* directory and use the `${frameworks}` [editor variable](#) to make the image relative to the *framework* location. If the images are bundled in a *jar* archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the *class-path*.

### Small icon

Allows you to select an image for the icon that Oxygen XML Author uses for the contextual menu action.

**Note:** If you are using a Retina or HiDPI display, Oxygen XML Author automatically searches for higher resolution icons in the path specified in both the **Large icon** and **Small icon** options. For more information, see [Adding Retina/HiDPI Icons in a Framework](#) on page 1134.

### Shortcut key

This field allows you to configure a shortcut key for the action that you are editing. The + character separates the keys.

#### Enable platform-independent shortcut keys

If this checkbox is selected, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
- M2 represents the **Shift** key.
- M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
- M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.

### Operations section

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first selected operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: [Activate Multiple Functions for Actions using XPath Expressions](#) on page 65.

The following options are available in this section:

#### Activation XPath

An XPath 2.0 expression that applies to elements and attributes. For more details see: [Activate Multiple Functions for Actions using XPath Expressions](#) on page 65.

#### Operation

Specifies the invoked operation.

#### Arguments

Specifies the arguments of the invoked operation. The  **Edit** at the bottom of the table allows you to edit the arguments of the operation.

#### Operation priority

Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

-  **Add** - Adds an operation.
-  **Remove** - Removes an operation.
-  **Duplicate** - Duplicates an operation.

#### Evaluate activation XPath expressions even in read-only contexts

If this checkbox is selected, the action can be invoked even when the cursor is placed in a read-only location.

### Activate Multiple Functions for Actions using XPath Expressions

An **Author** mode action can have multiple functions, each function invoking an **Author** mode operation with certain configured parameters. Each function of an action has an XPath 2.0 expression for activating it.

For each function of an action, the application will check if the XPath expression is fulfilled (when it returns a not empty nodes set or a **true** result). If it is fulfilled, the operation defined in the function will be executed.

The following special XPath extension functions are provided:

- `oxy:allows-child-element()` - Use this function to check whether or not an element is valid child element in the current context, according to the associated schema.
- `oxy:allows-global-element()` - Use this function to check whether or not an element is a valid global element for the current *framework*, according to the associated schema.
- `oxy:current-selected-element()` - Use this function to get the currently selected element.
- `oxy:is-required-element()` - Use this function to check if the element returned by the given XPath expression is required (based on the rules declared in the schema).

#### `oxy:allows-child-element()` Function

The **oxy:allows-child-element()** function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

**oxy:allows-child-element(\$childName, (\$attributeName, \$defaultAttributeValue, \$contains?))?**

The following parameters are supported:

##### **childName**

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The child element with the specified local name that belongs to the default namespace.

```
oxy:allows-child-element("para")
```

The above example verifies if the `para` element (of the default namespace) is allowed in the current context.

- The child element with the local name specified by any namespace.

```
oxy:allows-child-element("*:para")
```

The above example verifies if the `para` element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.

```
oxy:allows-child-element("prefix:para")
```

The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the `para` local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-child-element("{namespaceURI}para")
```

The `namespaceURI` is the namespace of the element. The above example verifies if the `para` element (of the specified namespace) is allowed in the current context.

- Any element.

```
oxy:allows-child-element("*")
```

The above function verifies if any element is allowed in the current context.

**Note:** A common use case of `oxy:allows-child-element("*")` is in combination with the `attributeName` parameter.

##### **attributeName**

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-child-element("class", "topic/topic ")
```

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

```
oxy:allows-child-element("*:localname", "topic/topic ")
```

- A qualified name of an attribute.

```
oxy:allows-child-element("prefix:localname", "topic/topic ")
```

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of `false`.

### defaultAttributeValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

### contains

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

### oxy:allows-global-element() Function

The **oxy:allows-global-element()** function allows you to check whether or not an element that matches the arguments of the function is valid for the current *framework*, according to the associated schema. It has the following signature:

**oxy:allows-global-element(\$elementName, (\$attributeName, \$defaultAttributeValue, \$contains?))?**

The following parameters are supported:

#### elementName

The name of the element that you want to check if it is valid in the current *framework*. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.

```
oxy:allows-global-element("para")
```

The above example verifies if the `para` element (of the default namespace) is allowed in the current *framework*.

- The element with the local name specified by any namespace.

```
oxy:allows-global-element("*:para")
```

The above example verifies if the `para` element (of any namespace) is allowed in the current *framework*.

- A prefix-qualified name of an element.

```
oxy:allows-global-element("prefix:para")
```

The prefix is resolved in the context of the *framework*. The function matches on the element with the `para` local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-global-element("{namespaceURI}para")
```

The `namespaceURI` is the namespace of the element. The above example verifies if the `para` element (of the specified namespace) is allowed in the current *framework*.

- Any element.

```
oxy:allows-global-element("*")
```

The above function verifies if any element is allowed in the current *framework*.

### attributeName

The attribute of an element that you want to check if it is valid in the current *framework*. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-global-element("class", " topic/topic ")
```

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current *framework*.

- The attribute with the local name specified by any namespace.

```
oxy:allows-global-element("*:localname", " topic/topic ")
```

- A qualified name of an attribute.

```
oxy:allows-global-element("prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the *framework*. If the prefix is not resolved to a namespace, the function returns a value of `false`.

### defaultAttributeValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

### contains

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

### oxy:current-selected-element() Function

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

#### Example: *oxy:current-selected-element* Function

```
oxy:current-selected-element()[self::p]/b
```

This example returns the `b` elements that are children of the currently selected `p` element.

### oxy:is-required-element() Function

This function checks if the element returned by the given XPath expression is required (based on the rules declared in the schema). It has only one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

#### Example: *oxy:is-required-element* Function

```
oxy:is-required-element(.)
```

This example would check to see if the current element is required by the schema.

## Localizing Frameworks

Oxygen XML Author supports *framework* localization (translating *framework* actions, buttons, and menu entries to various languages). This lets you develop and distribute a *framework* to users that speak other languages without changing the distributed *framework*. Changing the language used in Oxygen XML Author in the Global preferences page is enough to set the right language for each *framework*.

To localize the content of a *framework*, create a `translation.xml` file that contains all the translation (key, value) mappings. The `translation.xml` has the following format:

```
<translation>
```

```

<languageList>
  <language description="English" lang="en_US"/>
  <language description="German" lang="de_DE"/>
  <language description="French" lang="fr_FR"/>
</languageList>
<key value="list">
  <comment>List menu item name.</comment>
  <val lang="en_US">List</val>
  <val lang="de_DE">Liste</val>
  <val lang="fr_FR">Liste</val>
</key>
.....
</translation>

```

Oxygen XML Author matches the GUI language with the language set in the `translation.xml` file. If this language is not found, the first available language declared in the `languageList` tag for the corresponding *framework* is used.

Add the directory where this file is located to the **Classpath** list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Use the **New** or **Edit** button to open the [Document type configuration dialog box](#), go to **Author > Actions**, and rename the bold action to `${i18n(translation_key)}`. Actions with a name format other than `${i18n(translation_key)}` are not localized. *Translation\_key* corresponds to the key from the `translation.xml` file.

Now open the `translation.xml` file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the `translation.xml` file:

```

<key value="translation_key">
  <comment>Bold action name.</comment>
  <val lang="en_US">Bold</val>
  <val lang="de_DE">Bold</val>
  <val lang="fr_FR">Bold</val>
</key>

```

To use a description from the `translation.xml` file in the Java code used by your custom *framework*, use the new [ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle\(\)](#) API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```

title:before{
  content:"${i18n(title.key)} : ";
}

```

**Note:** You can enter any language you want in the `languageList` tag and any number of keys.

The `translation.xml` file for the DocBook *framework* is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the **Classpath** list corresponding to the DocBook document type the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association > Author > Actions**. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the [Oxygen SDK](#) Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

## Menu Subtab

In the **Menu** subtab, you can configure which actions will appear in the *framework*-specific menu. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Menu** subtab, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend button*, click on the **Author** tab, and then the **Menu** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Author menu. To add an action in this section as a sibling of the currently selected action, use the  **Add as sibling** button. To add an image in this section as a child of the currently selected action use the  **Add as child** button.

The following actions are available in the **Current actions** section:

-  **Edit**  
Edits an item.
-  **Remove**  
Removes an item.
-  **Move Up**  
Moves an item up.
-  **Move Down**  
Moves an item down.

## Contextual Menu Subtab

In the **Contextual menu** subtab you configure what *framework*-specific action the *Content Completion Assistant* proposes. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Contextual Menu** subtab, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend button*, click on the **Author** tab, and then the **Contextual Menu** subtab.

Figure 22: Contextual Menu Subtab

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section contains the actions that are displayed in the contextual menu for documents that belong to the edited *framework*.

The following actions are available in this subtab:

#### **Add as sibling**

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a sibling of the selected action.

#### **Add as child**

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a child of the selected action.

#### **Edit**

This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

**Figure 23: Menu Action Configuration Dialog Box**

The following options are available in this dialog box:

#### **Name**

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

**Tip:** You can use the `$(i18n('key'))` editor variable to allow for multiple translations of the name.

#### **Menu access key**

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *Letter* that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *Letter* in the name of the action that can be used to access the action.

#### **Menu icon**

Allows you to select an image for the icon that Oxygen XML Author uses for the container (submenu).

#### **Promote items when in a table context**

If this option is selected, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the **Other actions** submenu when invoking the contextual menu within a table.

#### **Remove**

Removes the selected action or submenu from the **Current actions** section.

#### **Move Up**

Moves the selected item up in the list.

#### **Move Down**

Moves the selected item down in the list.

## Toolbar Subtab

In the **Toolbar** subtab you configure what *framework*-specific action the Oxygen XML Author toolbar holds. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Toolbar** subtab, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend button*, click on the **Author** tab, and then the **Toolbar** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Author toolbar when you work with a document belonging to the edited *framework*. To add an action in this section as a sibling of the currently selected action, use the  **Add as sibling** button. To add an action in this section as a child of the currently selected action use the  **Add as child** button.

The following actions are available in the **Current actions** section:

-  **Edit**  
Edits an item.
-  **Remove**  
Removes an item.
-  **Move Up**  
Moves an item up.
-  **Move Down**  
Moves an item down.

## Content Completion Subtab

In the **Content Completion** subtab you configure what *framework*-specific the *Content Completion Assistant* proposes. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Content Completion** subtab, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend button*, click on the **Author** tab, and then the **Content Completion** subtab.

### Available and Current Actions

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that the *Content Completion Assistant* proposes when you work with a document belonging to the edited *framework*. To add an action in this section as a sibling of the currently selected action, use the  **Add as sibling** button. To add an action in this section as a child of the currently selected action use the  **Add as child** button.

The following actions are available in the **Current actions** section:

-  **Edit**  
Edits an item.
-  **Remove**  
Removes an item.
-  **Move Up**  
Moves an item up.
-  **Move Down**  
Moves an item down.

### Filter Table

The **Filter** section presents a table that allows you to add elements to be filtered from the *Content Completion Assistant* or from some specific helper views or menus. Use the  **Add** button to add more filters to the table,

the  **Edit** button to modify an existing item in the table, or the  **Remove** button to remove a filtered item. The  **Add** and  **Edit** buttons open a **Remove item** dialog box.

**Figure 24: Remove Item Dialog Box**

Use this dialog box to add or configure the elements that will be filtered:

#### Item name

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered (<SPLIT> and <ENTER>).

#### Remove item from

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the *Content Completion Assistant*.
- **Elements View** - The element will not appear in the *Elements view*.
- **Element Insert Menus** - The element will not appear in the **Append Child**, **Insert Before**, or **Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the *Outline view*).
- **Entities View** - The element will not appear in the *Entities view*.

#### Related Information:

[Customizing the Content Completion Assistant](#) on page 1178

#### Templates Tab

The **Templates** tab specifies a list of directories where new file templates are located. These file templates are gathered from all the document types and presented in the various folders inside the **Framework templates** folder in the *New document wizard*.

To open the **Templates** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button, and click on the **Templates** tab.

The **Templates** tab includes the following actions:

#### **New**

Opens a dialog box that allows you to specify the path to the directory of the template. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

**Tip:** The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

#### **Edit**

Opens a dialog box that allows you to edit the path of the selected template. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

**Tip:** The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

#### **Delete**

Deletes the currently selected template from the list.

#### **Move Up**

Moves the selected template up one spot in the list.

#### **Move Down**

Moves the selected template down one spot in the list.

### **Catalogs Tab**

The **Catalogs** tab specifies a list of *XML Catalogs*, specifically for the edited *framework*, that are added to list of catalogs that Oxygen XML Author uses to resolve resources.

To open the **Catalogs** tab of the **Document type** configuration dialog box, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend button*, and click on the **Catalogs** tab.

You can perform the following actions:

#### **Add**

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the  *Insert Editor Variables* button, or the browsing tools in the  **Browse** drop-down list.

#### **Edit**

Opens a dialog box that allows you to edit the path of an existing catalog.

#### **Delete**

Deletes the currently selected catalog from the list.

#### **Move Up**

Moves the selected catalog up one spot in the list.

#### **Move Down**

Moves the selected catalog down one spot in the list.

### **Transformation Tab**

In the **Transformation** tab, you can configure the transformation scenarios associated with the particular *framework* you are editing. These transformation scenarios are presented in the *Configure Transformation Scenarios dialog box* when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the **Transformation** tab of the **Document type** configuration dialog box, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend button*, and click on the **Transformation** tab.

The **Transformation** tab offers the following options:

#### **Default checkbox**

You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the *Configure Transformation Scenarios dialog box*.

#### **New**

Opens the **New scenario** dialog box allowing you to *create a new transformation scenario for the particular document type*.

#### **Duplicate**

Allows you to duplicate the configuration of an existing transformation scenario. It opens the **Edit scenario** dialog box where you can *configure the properties of the duplicated scenario*.

### Edit

Opens the **Edit scenario** dialog box allowing you to *edit the properties of the currently selected transformation scenario*.

### Delete

Deletes the currently selected transformation scenario.

### Import scenarios

Imports transformation scenarios.

### Export selected scenarios

Export transformation scenarios.

### Move Up

Moves the selection to the previous scenario.

### Move Down

Moves the selection to the next scenario.

## Validation Tab

In the **Validation** tab, you can configure the validation scenarios associated with the particular *framework* you are editing. These validation scenarios are presented in the **Configure Validation Scenarios** dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

**Note:** If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see [Master Files Support](#) on page 418 or [Working with Modular XML Files in the Master Files Context](#) on page 644.

To open the **Validation** tab of the **Document type** configuration dialog box, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend* button, and click on the **Validation** tab.

The **Validation** tab offers the following options:

### Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the **Configure Validation Scenarios** dialog box.

### New

Opens the **New scenario** dialog box allowing you to *create a new validation scenario*.

### Duplicate

Allows you to duplicate the configuration of an existing validation scenario. It opens the **Edit scenario** dialog box where you can *configure the properties of the duplicated scenario*.

### Edit

Opens the **Edit scenario** dialog box allowing you to *edit the properties of the currently selected validation scenario*.

### Delete

Deletes the currently selected validation scenario.

### Import scenarios

Imports validation scenarios.

### Export selected scenarios

Export validation scenarios.

### ↑ Move Up

Moves the selected scenario up one spot in the list.

### ↓ Move Down

Moves the selected scenario down one spot in the list.

## Extensions Tab

The **Extensions** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the **Extensions** tab of the **Document type** configuration dialog box, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the *New, Edit, Duplicate, or Extend* button, and click on the **Extensions** tab.

Libraries containing the implementations must be present in the *classpath* of your document type. The Javadoc available at <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/> contains details about how each API implementation functions.

## Encoding Preferences

Oxygen XML Author lets you configure how character encodings are recognized when opening files and which encodings are used when saving files. To configure encoding options, *open the Preferences dialog box (Options > Preferences)* and go to **Encoding**.

The following encoding options are available:

### Fallback character encoding

Specifies the default character encoding of non-XML documents if their character encoding cannot be determined from other sources (for example, it is not specified in the document or determined by the file type).

**Note:** For certain document types, the following encoding detection rules are used:

- For XML, DTD, and CSS documents, Oxygen XML Author tries to collect the character encoding from the document. If no such encoding is found, then *UTF-8* is used.
- For JavaScript, JSON, SQL, XQuery, and RNC, the *UTF-8* encoding is used.

### UTF-8 BOM handling

This setting specifies how to handle the *Byte Order Mark* (BOM) when Oxygen XML Author saves a UTF-8 XML document:

- **Keep** (default) - Do not alter the BOM declaration of the currently open file.
- **Write** - Save the BOM bytes.
- **Don't Write** - Do not save the BOM bytes. Loaded BOM bytes are ignored.

**Note:** The UTF-16 BOM is always preserved. UTF-32 documents have a *big-endian* byte order.

### Encoding errors handling

This setting specifies how to handle characters that cannot be represented in the character encoding that is used when the document is opened. The available options are:

- **REPORT** (default) - Displays an error identifying the character that cannot be represented in the specified encoding. Unrecognized characters are rendered as an empty box.
- **REPLACE** - The character is replaced with a standard replacement character. For example, if the encoding is UTF-8, the replacement character has the Unicode code FFFD, and if the encoding is ASCII, the replacement character code is 63.
- **IGNORE** - The error is ignored and the character is not included in the document displayed in the editor.

**Attention:** If you edit and save the document, the characters that cannot be represented in the specified encoding are dropped.

## Encoding for Base64, Base32, Hex conversions

Specifies the encoding to be used when invoking the **Encode Selection** or **Decode Selection** actions for [Base64](#), [Base32](#), or [Hex conversions](#). The default setting is *UTF8*.

## Editor Preferences

Oxygen XML Author lets you configure the appearance of various components and features of the main editor. To access these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor**.

The following options are available:

### Selection background color

Allows you to set the background color of selected text.

### Selection foreground color

Allows you to set the color of selected text.

### Completion proposal background

Allows you to set the background color of the [Content Completion Assistant](#).

### Completion proposal foreground

Allows you to set the color of the text in the [Content Completion Assistant](#).

### Documentation window background

Allows you to set the background color of the documentation of elements suggested by the [Content Completion Assistant](#).

### Documentation window foreground

Allows you to set the color of the text for the documentation of elements suggested by the [Content Completion Assistant](#).

### Find highlight color

Allows you to set the color of the highlights generated by the **Find** and **Find all** actions.

### XPath highlight color

Allows you to set the color of the highlights generated when you run an XPath expression.

### Maximum number of highlights

Allows you to set the maximum number of highlights that Oxygen XML Author displays.

### Show TAB/NBSP/EOL/EOF marks

Makes the **TAB/NBSP/EOL/EOF** characters visible in the editor. You can use the color picker to choose the color of the marks.

### Show SPACE marks

Makes the space character visible in the editor.

### Can edit read-only files

If this option is selected, Oxygen XML Author will let you edit read-only files. When you try to save them, a **Save As** dialog box will be displayed to avoid overwriting the initial resource. If the option is not selected, a warning message is displayed when you try to edit a read-only file.

### Display quick-assist and quick-fix side hints

Displays the [Quick Assist](#) icon (💡) and [Quick Fix](#) icon (🔧) in the line number stripe on the left side of the editor.

### Undo history size

Allows you to set the maximum amount of undo operations you can perform in any of the editor modes (**Text**, **Author**, **Design**, **Grid**).

### Enable mouse-wheel zooming

If selected, you can use **Ctrl + MouseWheelForward (Command + MouseWheelForward on OS X)** to increase the editor font (zoom in) or **Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on OS X)** to decrease the editor font (zoom out). It is enabled by default on Windows and Linux, while it is disabled by default on Mac OS X, due to the way inertia affects the mouse wheel on this operating system.

## Print Preferences

Oxygen XML Author lets you configure how files are printed out of the editor. Note that these settings cover how files are printed directly from Oxygen XML Author itself, not how they are printed after the XML source has been transformed by a publishing stylesheet. To configure the **Print** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Print**.

This page allows you to customize the headers and footers added to a printed page when you print from the **Text mode** or **Author mode** editors. These settings do not apply to the **Grid** mode.

You can specify what is printed on the **Left**, **Middle**, and **Right** of the header and footer using plain text of any of the following variables:

- **\${currentFileURL}** - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- **\${cfne}** - Current file name with extension. The current file is the one currently opened and selected.
- **\${cp}** - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- **\${tp}** - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- **\${env(VAR\_NAME)}** - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **\${system(var.name)}** editor variable.
- **\${system(var.name)}** - Value of the `var.name` Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the **\${env(VAR\_NAME)}** editor variable instead.
- **\${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`;

**Note:** This editor variable supports both the `xs:date` and `xs:datetime` parameters. For details about `xs:date`, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about `xs:datetime`, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

For example, to show the current page number and the total number of pages in the top right corner of the page, write the following pattern in the **Right** text area of the **Header** section: `${cp} of ${tp}`.

You can also set the **Color** and **Font** used in the header and footer. Default font is `SansSerif`.

You can place a line below the header or above the footer by selecting **Underline/Overline**.

## Edit Modes Preferences

Oxygen XML Author lets you configure which *edit mode* a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes**.

### Allow Document Type specific edit mode setting to override the general mode setting

If selected, the initial edit mode setting set in the [Document Type configuration dialog box](#) overrides the general edit mode setting from the table below.

### Select the initial edit mode (page) for each editor

This table specifies the default editing mode that will be opened for each type of document when the **Allow Document Type specific edit mode setting to override the general mode setting** option is not selected. Use the **Edit** button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

- **Text**
- **Author**
- **Grid**
- **Design** (available only for the XSD editor).

**Editor / Edit modes**

Allow Document Type specific edit mode setting to override the general edit mode settings

Select the initial edit mode (page) for each editor

Editor	Edit Mode
XML Editor	Text
XSD Editor	Design
HTML Editor	Text
WSDL Editor	Text
XSL Editor	Text
NVDL Editor	Text
XProc Editor	Text
RNG Editor	Text
Schematron Editor	Text

**Figure 25: Edit Modes Preferences Page**

## Text Preferences

Oxygen XML Author lets you configure how the *Text mode editor* appears. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Text**.

The following options are available:

### Editor background color

Sets the background color for the **Text** editing mode, *Outline view*, and some external tool editors (*Large File Viewer, Compare Files, Compare Directories*).

### Editor cursor color

Sets the color for the cursor in **Text** mode.

### Highlight current line

If selected, the current line is highlighted with the foreground color specified with the color chooser.

### Show line numbers

If selected (default value), line numbers are shown in the editor panels. You can also specify the color for the line numbers using the color chooser. Printed output will also include the line numbers.

### Show print margin

If selected, it allows you to set a safe print limit in the form of a vertical line displayed in the right side of the editor pane. You can also customize the print margin line color.

### Print margin column

Allows you to specify a limit for the print width, measured in the number of characters.

### Line wrap

If selected, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use *new-line* characters to break long lines.

### Cut / Copy whole line when nothing is selected

If selected, **Cut** and **Copy** actions operate on the entire current line when nothing is selected in the editor.

### Enable folding

If selected (default value), the vertical stripe that holds the *folding markers* is displayed in **Text** mode.

### Highlight matching tag

If selected, when you place the cursor on a start or end tag, Oxygen XML Author highlights the corresponding member of the pair. You can also customize the highlight color.

## Lock the XML tags

If selected, XML are locked and cannot be edited in **Text** mode.

## Grid Preferences

Oxygen XML Author provides a *Grid view* of an XML document. To configure the **Grid** options, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Edit modes > Grid**.

The following options are available:

### Compact representation

If selected, the *compact representation* of the grid is used: a child element is displayed beside the parent element. In the *non-compact representation*, a child element is nested below the parent.

### Format and indent when passing from grid to text or on save

If selected, the content of the document is *formatted and indented* each time you switch from the **Grid** view to the **Text** view.

### Default column width (characters)

Sets the default width (in characters) of a table column of the grid. A column may contain the following:

- Element names
- Element text content
- Attribute names
- Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

### Active cell color

Allows you to set the background color for the *active cell* of the grid. The keyboard input always goes to the *active cell* and the selection always contains it.

### Selection color

Allows you to set the background color for the selected cells of the grid except the *active cell*.

### Border color

Allows you to set the color used for the lines that separate the grid cells.

### Background color

Allows you to set the background color of grid cells that are not selected.

### Foreground color

Allows you to set the text color of the information displayed in the grid cells.

### Row header colors

#### Background color

Allows you to set the background color of row headers that are not selected.

#### Active cell color

Allows you to set the background color of the row header cell that is currently active.

#### Selection color

Allows you to set the background color of the header cells corresponding to the currently selected rows.

### Column header colors

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

#### Background color

Allows you to set the background color of column headers that are not selected.

#### Active cell color

Allows you to set the background color of the column header cell that is currently active.

### Selection color

Allows you to set the background color of the header cells corresponding to the currently selected columns.

### Author Preferences

Oxygen XML Author provides an **Author editing mode** that provides a configurable graphical interface for editing XML documents. To configure the options for the **Author** mode, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author**.

The following options are available:

#### Author default background color

Sets the default background color of the **Author** editing mode. The background-color property set in the CSS file associated with the currently edited document overwrites this option.

#### Author default foreground color

Sets the default foreground color of the **Author** editing mode. The color property set in the CSS file associated with the current edited document overwrites this option.

#### Show XML comments

When this option is selected, XML comments are displayed in **Author** mode. Otherwise, they are hidden.

#### Show placeholders for empty elements

When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.

#### Show processing instructions

When this option is selected, XML processing instructions are displayed in **Author** mode. Otherwise they are hidden.

#### Show Author layout messages

When this option is selected, all errors reported while rendering the document in **Author** mode are presented in the **Errors** view at the bottom of the editor.

#### Show doctype

When this option is selected, the **doctype** declaration is displayed in **Author** mode. Otherwise it is hidden.

#### Show block range

When this option is selected, a *block range indicator* is displayed in a stripe located in the left side of the editor. It is displayed as a heavy line that spans from the first line to the last line of the block.

#### Display referenced content (entities, XInclude, DITA conref, etc.)

When selected, the references (such as entities, XInclude, DITA conrefs) also display the content of the resources they reference. If you toggle this option while editing, you need to reload the file for the modification to take effect.

### Images Section

The following options in regards to images in **Author** mode are available in this section:

#### Auto-scale images wider than (pixels)

Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.

#### Show very large images

When this option is selected, images larger than 6 megapixels are displayed in **Author** mode. Otherwise, they are not displayed.

**Important:** If you select this option and your document contains many such images, Oxygen XML Author may consume all available memory, throwing an **OutOfMemory error**. To resolve this, increase the [available memory limit](#). and restart the application.

### Tags Section

In this section you can configure the following options in regards to tags that are displayed in **Author** mode:

## Tags display mode

Sets the default display mode for element tags presented in **Author** mode. You can choose between the following:

- **Full Tags with Attributes** - All XML tags are displayed, with attribute names and values, making it easier to transition from a Text-based editing to **Author** mode editing.
- **Full Tags** - All XML tags are displayed, but without attributes.
- **Block Tags** - The XML tags that enclose *block elements* are displayed in full. Compact tags (no element names) are displayed for *inline elements*.
- **Inline Tags** - The XML tags that enclose *inline elements* are displayed in full. *Block* tags are not displayed.
- **Partial Tags** - Partial tags (no names) are displayed for all elements.
- **No Tags** - No tags are displayed. This representation is as close as possible to a word-processor view.

## Sort attributes alphabetically for "Full Tags with Attributes"

When selected, if you choose  **Full Tags with Attributes for the Tags Display Mode**, the attributes will be displayed in alphabetical order. Otherwise, they are displayed in the order that they appear in the XML source code.

## Tags background color

Sets the **Author** mode tags background color.

## Tags foreground color

Sets the **Author** mode tags foreground color.

## Tags font

Allows you to change the font used to display tags text in the **Author** visual editing mode. The *default* font is computed based on the setting of the **Author default font option**.

## Compact tag layout

If this option is not selected, the **Author** mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

## Serialization Section

In this section you can configure options in regards to the formatting and indenting that is applied when a document is saved in **Author** mode, or when switching the editing mode from **Author** to **Text**. The following options are available:

### Format and indent

Use this option to specify what should be formatted and indented when you save a document (or switch from **Author** to **Text** mode). You can choose between the following two options:

#### Only the modified content

The **Save** operation only formats the nodes that were modified in the **Author** mode. The rest of the document preserves its original formatting.

**Note:** This option also applies to the *DITA maps* opened in the **DITA Maps Manager**.

#### The entire document

The **Save** operation applies the formatting to the entire document regardless of the nodes that were modified in **Author** mode.

#### Also apply the format and indent options that are set for Text mode

If this option is selected, the result of the **Format and indent** operation will be the same as when it is applied in **Text** editing mode. Thus, the content of the document is formatted by applying the **Format and Indent** rules from the **Editor/Format** and **Editor/Format/XML** preference pages. You can use the **Format and indent options** link to navigate to those options.

### Compatibility with other tools

Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:

- **None** - Choose this option if compatibility with other tools can be ignored.
- **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

**Note:** New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this option automatically disables the [Also apply the format and indent options that are set for Text mode option](#), since the formatting from **Text** mode does not take the CSS styles into account.

- **Break lines only after elements displayed as blocks, do not indent** - Choose this option to instruct Oxygen XML Author to insert new lines only after elements that have a CSS display property set to anything other than `inline` or `none` (for example, `block`, `list-item`, `table`, etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

**Note:** New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this option automatically disables the [Also apply the format and indent options that are set for Text mode option](#), since the formatting from **Text** mode does not take the CSS styles into account.

### For advanced Author configuration see the Document Type Association settings

Click this link to open the [Document Type Association preferences page](#).

#### Cursor Navigation Preferences

Oxygen XML Author allows you to configure the appearance and behavior of the cursor in the [Author mode editor](#). To set cursor navigation preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Author > Cursor Navigation**.

The following options are available:

#### Highlight elements near cursor

When this option is selected, the element containing the cursor is highlighted. You can use the color picker to choose the color of the highlight.

#### Show cursor position tooltip

Oxygen XML Author uses [tool tips in Author mode to indicate the position of the cursor in the element structure](#) of the underlying document. Depending on context, the tool tips may show the current element name or the names of the elements before and after the current cursor position.

#### Show location tooltip on mouse move

When this option is selected, Oxygen XML Author displays [Location Tooltips](#) when you are editing the document in certain tags display modes (**Inline Tags, Partial Tags, No Tags**) or when the mouse pointer is moved between [block elements](#).

#### Quick up/down navigation

This option is deselected by default and this means that when you navigate using the up and down arrow keys in **Author** mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is selected, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

#### Quick navigation in tables

This option is selected by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is not selected, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

#### Arrow keys move the cursor in the writing direction

This setting determines how the left and right arrow keys behave in **Author** mode for bidirectional (BIDI) text. When this option is selected (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Oxygen XML Author can use the schema of your XML language to improve the way the **Author** mode editor handles your content. To configure the **Schema Aware** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Schema Aware**.

The following options are available:

### Schema aware normalization, format, and indent

When you open or save a document in **Author** mode, white space is normalized using the `display` property of the current CSS stylesheet and the values of the [settings](#) for **Preserve space elements**, **Default space elements**, and **Mixed content elements**. When this option is selected, the schema will also be used to normalize white space, based on the content model (*element-only*, *simple-content*, or *mixed*). Note that the schema information takes precedence.

### Indent blocks-only content

To avoid accidentally introducing inappropriate white space around *inline elements*, Oxygen XML Author does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Author will apply indenting to the source of mixed content elements that only contain *block elements*.

### Schema Aware Editing

The options in this section determine how Oxygen XML Author will use the schema of a document to control the behavior of the **Author** mode.

- **On** - Enables all schema-aware editing options.
- **Off** - Disables all schema-aware editing options.
- **Custom** - Allows you to select custom schema-aware editing options from the following:

### Schema Aware Actions section

#### Delete element tags with backspace and delete

Controls what happens when you attempt to delete an element tag. The two options are:

- **Smart delete** - If deleting the tag would make the document invalid, Oxygen XML Author will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of the list container. However, the content could be appended to a preceding list items.
- **Reject action when its result is invalid** - A deletion that would leave the document in an invalid state is rejected.

#### Paste and Drag and Drop

Controls the behavior for paste and drag and drop actions. Available options are:

- **Smart paste and drag and drop** - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Author tries to find an appropriate insert position. The possibilities include:
  - Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).
  - Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below an existing list).
  - Inserting the content into an ancestor element where it would be valid.
- **Reject action when its result is invalid** - If selected, Oxygen XML Author will not let you paste content into a position where it would be invalid.

#### Typing

Controls the behavior that takes place when typing. Available options are:

- **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.

- **Reject action when its result is invalid** - If selected, and the result of the typing action is invalid, the action will not be performed.

### Content Completion

Controls the behavior that takes place when inserting elements using the [Content Completion Assistant in Author mode](#). Available options are:

- **Press ENTER to show available content completion proposals** - If selected, pressing **Enter** will open the *Content Completion Assistant*. If deselected, there are three possibilities:
  - The current element will be split (if possible).
  - A new element with the same name will be inserted (if possible).
  - Otherwise, a new paragraph will be inserted.
- **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Author will attempt to find a valid location to insert it and may present you with several options.
- **Allow only insertion of valid elements and attributes** - If selected, you can only select elements in the content completion list that are valid (according to the schema) at the current position.
- **Allow only insertion of valid attribute values** - If selected, you cannot enter an attribute value that is not valid (according to the schema) in the [Attributes view](#) or [In-place Attributes Editor](#). If the attribute has a choice of values, you can select a possible value from a drop-down list in the combo box, but you cannot enter a value manually.

### Warn on invalid content when performing action

A warning message will be displayed when performing an action that will result in invalid content. Available options are:

- **Delete Element Tags** - If selected, a warning message will be displayed if the [Delete Element Tags](#) action will result in an invalid document. You will be asked to confirm the deletion.
- **Join Elements** - If selected, a warning message will be displayed if the [Join Elements](#) action will result in an invalid document. You will be asked to confirm the join.

### Automatically apply the best schema-aware insertion operation

If selected, Oxygen XML Author automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If not selected, Oxygen XML Author will ask the user to choose from a list of proposed solutions.

### Convert external content on paste

If selected, the [Smart Paste feature](#) is enabled when external content is pasted in **Author** mode.

### Convert even when pasting inside space-preserve elements

If selected, the [Smart Paste feature](#) will be used even when external content is pasted inside a *space-preserve* element (such as a codeblock).

### Convert pasted URLs to links

If selected, when a URL is pasted into **Author** mode, a link will be inserted (the type of link depends on the type of document). For example, in DITA documents, an `xref` is inserted.

### Related Information:

[Smart Paste Mechanism](#) on page 503

[Customizing Smart Paste Support](#) on page 1149

### Review Preferences

Oxygen XML Author allows you to [add review comments and track changes](#) in your documents. The **Review** preferences page allows you to control how the Oxygen XML Author review features work. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Review**.

The available options are as follows:

## Author

Specifies the name to be attached to all comments and to changes made while **Track Changes** is active. By default, Oxygen XML Author uses the system user name.

### Track Changes section (applies for all authors)

#### Initial State

Specifies whether or not the *Track Changes feature* is enabled when you open a document. You may have the *Track Changes* feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:

- **Stored in document** - The current state of the *Track Changes* feature is stored in the document itself, meaning that it is on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it will make it obvious to other authors that changes have been made in the document.
- **Always On** - The *Track Changes* feature is always on when you open a document. You can turn it off for an opened document, but it will be turned on for the next document you open.
- **Always Off** - The *Track Changes* feature is always off when you open a document. You can turn it on for an opened document, but it will be turned off for the next document you open.

#### Display changed lines marker

A changed line maker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, deselect this option.

#### Inserted content color

When the *Track Changes feature* is on, the newly inserted content is highlighted with an *insertion marker* that uses a color to adjust the following display properties of the inserted content: *foreground*, *background*, and *underline*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Author automatically assigns a color to each user who inserted content in the current document. The colors are picked from the *Colors for automatic assignment list*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Author uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Author uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the inserted content.
- **Use same color for background** - If selected, Oxygen XML Author uses the color defined above (**Automatic** or **Fixed**) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

#### Deleted content color

When the *Track Changes feature* is on, the deleted content is highlighted with a *deletion marker* that uses a color to adjust the following display properties of the deleted content: *foreground*, *background*, and *strikethrough*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Author automatically assigns a color to each user who deleted content in the current document. The colors are picked from the *Colors for automatic assignment list*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Author uses the specified color for all deletion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Author uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the deleted content.
- **Use same color for background** - If selected, Oxygen XML Author uses the color defined above (**Automatic** or **Fixed**) to render the background of the deleted content. A slider control allows you to set the transparency level of the background.

### Comments color section (applies for all authors)

Sets the background color of the text that is commented on. The options are:

- **Automatic** - If this option is selected, Oxygen XML Author automatically assigns a color to each user who adds a comment in the current document. The colors are picked from the [Colors for automatic assignment list](#), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Author uses the specified color for all changes, regardless of who the author is. A slider control allows you to set the transparency level of the background.

### Colors for automatic assignment list

These are the colors that will be automatically assigned for tracked insertion changes, tracked deletion changes, and comments if the **Automatic** option is selected in any of the sections in this preferences page.

The colors are assigned in the order that you see in this list. You can use the **Add**, **Edit**, or **✕ Remove** buttons to modify the list of colors.

### Related Information:

[Reviewing Documents](#) on page 518

## Callouts Preferences

Oxygen XML Author can display *callouts* for *review items such as comments and tracked changes*. To customize options for review callouts, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Edit modes > Author > Review > Callouts**.

The available options are as follows:

### Show Review Callouts section

#### Comments

If selected, callouts are displayed for comments, including comments that are added to *tracked changes*. This option is selected by default.

#### Track Changes deletions

If selected, callouts are displayed for *tracked change* deletions and the following additional option becomes available:

##### Show deleted content in callout

If selected, the deleted content is also displayed in the callout.

#### Track Changes insertions

If selected, callouts are displayed for *tracked change* insertions and the following additional option becomes available:

##### Show inserted content in callout

If selected, the inserted content is also displayed in the callout.

### Rendering section

#### Show review time

When selected, timestamp information is displayed in callouts.

#### Show all connecting lines

When selected, lines are shown that connect the callout to the location of the change.

#### Initial width (px)

Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.

#### Text lines count limit

Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the full comment, right-click on the callout and select  **Edit Comment** or  **Show Comment**.

## Profiling/Conditional Text Preferences

Oxygen XML Author lets you configure how *profiling and conditional text* is displayed in **Author** mode. It has built-in support for the standard conditional text features of DITA and DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.

To configure **Profiling/Conditional Text** options, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.

**Note:** Note the following when configuring these settings:

- This preferences page is used to define how profiled elements are treated in **Author** mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.
- This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.
- If you are using the DITA XML vocabulary and a DITA *subject scheme map* is defined in the *root map* of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

### Import from DITAVAL

This button allows you to import profiling attributes from *DITAVAL files*. You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Author displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.

**Note:** When importing profiling attributes from DITAVAL files, Oxygen XML Author automatically creates condition sets based on these files.

### Profiling Attributes section

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the **New** button at the bottom of the table *to add profiling attributes*, the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Author uses the one that is positioned highest in the table.

### Report invalid profiling attribute values

If selected, it means the following:

- In DITA, the automatic validation will display a warning when a value that is not defined is found in the document.
- In the DITA  **Validate and Check for Completeness** dialog box, the *Report attributes and values that conflict with profiling preferences option* is not displayed. This means that the validation will behave the same as if that option was selected and it will always report such values.

### Allow contributing extra profiling attribute values

This option is selected by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the **Edit Profiling**

**Attributes** action from the contextual menu in **Author** mode (or for DITA topics, the  **Edit Properties** action in the *DITA Maps Manager*), the *Profiling Values Conflict dialog box* will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. If deselected, Oxygen XML Author behaves as if the **Preserve the configuration** option has been chosen in the *Profiling Values Conflict dialog box* and that dialog box will never appear.

### Configure profiling colors and styles link

Use this link to open the *profiling Colors and Styles preference page*.

### Profiling Condition Sets section

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for your content. You can use the **New** button at the bottom of the table *to add condition sets*, the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons

to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Author uses the one that is positioned highest in the table.

### Show excluded content

Toggles whether or not the [Show Excluded Content option](#) in the  **Profiling / Conditional Text** drop-down menu is enabled by default.

## Colors and Styles Preferences

Oxygen XML Author lets you set the colors and styles used to display *profiling / conditional text* in the [Author mode editor](#). To set Colors and Styles preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles**.

The preference page includes the following options and sections:

### Show profiling colors and styles

Toggles whether or not the [Show Profiling Colors and Styles option](#) in the  **Profiling / Conditional Text** drop-down menu is enabled by default.

### Import from DITAVAL

Allows you to import profiling styles from `.ditaaval` files. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Author displays a dialog box containing two tables: the first one previews the imported styles and the second one previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones.

### Profiling Colors and Styles Table

You can use buttons below this table to set specific colors and styles for the listed profiling attribute values. The table includes two categories:

- **Defined attributes values** - Contains the styles for profiling attribute values defined in the [Profiling / Conditional Text](#) preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the **Defined attributes values** category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name and value). This is the reason why a style from this category can only be *reset*, not deleted.
- **Other** - This category contains styles for attribute values that are not marked as profiling values, in the [Profiling / Conditional Text](#) preferences page. In this category are listed:
  - All the styles that were defined in other projects (with other profiling attribute value sets).
  - All the styles set for the profiling attributes defined in a [subject scheme map](#).

### Automatic styling button

If you click this button, Oxygen XML Author will apply automatic styling to the profiling attribute values that do not have a style defined.

### New button

Opens the **Add Profiling Style** dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

**Note:** You can define a default style for a specific attribute by setting the **Attribute value** field to `<ANY>`. This style is applied for attribute values that do not have a specific style associated with it.

### Edit button

Open the **Edit Profiling Style** dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

### Clear style button

Resets the style for the selected value to its default setting (no color or decoration).

### Delete button

Delete the selected style from the **Other** category.

### Related Information:

[Filtering Profiling Values with a DITAVAL File](#) on page 1603

## Attributes Rendering Preferences

Oxygen XML Author lets you [display the profiling attributes applied to your content](#) in the **Author** mode editor. To configure how the profiling attributes appear, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes Rendering**. When the [Show Profiling Attributes option](#) is selected, the **Author** mode displays conditional text markers at the end of conditional text blocks. Use the options in this page to customize the rendering of these text markers.

The following options are available:

### Show profiling attributes

Toggles whether or not the [Show Profiling Attributes option](#) in the  **Profiling / Conditional Text** drop-down menu is enabled by default.

### Show profiling attribute name

If selected, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.

### Background color

Sets the background color used to display the profiling attributes.

### Attribute name foreground color

Sets the foreground color used to display the names of the profiling attributes.

### Attribute values foreground color

Sets the foreground color used to display values of the profiling attributes.

### Border color

Sets the color of the border of the block that displays the profiling attributes.

## MathML Preferences

Oxygen XML Author allows you to [edit MathML](#) equations and displays the results in a preview window. For a more specialized *MathML* editor, you can [install Design Science MathFlow](#), which is a commercial product that requires a separate license.

To configure the *MathML* editor or to enter your *MathFlow* license information, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > MathML**.

You can configure the following options:

### Equation minimum font size

The minimum size of the font used for rendering mathematical symbols when editing in the **Author** mode.

### MathFlow installation directory

The installation folder for the *MathFlow* components product (*MathFlow* SDK).

### MathFlow license file

The license file for the *MathFlow* components product (*MathFlow* SDK).

### MathFlow preferred editor

A *MathML* formula can be edited in one of three editors of *MathFlow* components product (*MathFlow* SDK).

- **Structure Editor** (default selection) - Targets professional XML workflow users.
- **Style Editor** - Tailored to the needs of content authors.
- **Simple Editor** - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.

### Save special characters

Specifies how special characters are saved in the XML file.

- **As entity names** - Saves the characters in `&name;` format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek *Omega* character is saved as `&Omega;`.

- **As character entities** (default selection) - Saves the characters in a hexadecimal value, using the `&#xNNN` format. For example, the Greek *Omega* character is saved as `&#x3a9` ; .
- **As character values** - Saves the characters as the actual symbol. For example, the Greek *Omega* character is saved as  $\Omega$ .

More documentation is available on the [Design Science MathFlow](#) website.

### AutoCorrect Preferences

Oxygen XML Author includes an option to automatically correct misspelled words as you type in **Author** mode. To enable and configure this [AutoCorrect feature](#), [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect**.

The following options are available:

#### Enable AutoCorrect

When selected (default state), while editing in **Author** mode, if you type anything that is listed in the **Replace** column of the Replacements table displayed in this preferences page, Oxygen XML Author will automatically replace it with the value listed in the **With** column.

#### Use additional suggestions from the spell checker

If selected, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Author will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

**Note:** The *AutoCorrect* feature shares the same options configured in the [Language options](#) and [Ignore elements](#) sections in the **Spell Check** preferences page.

#### Spell Check options link

Use this link to navigate to the [Spell Check Preferences page](#).

#### Replacements Table section

The *AutoCorrect* feature uses the Replacements table to automatically replace anything that is listed in the **Replace** column with the value listed in the **With** column for each language.

#### Replacements for language drop-down menu

You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the *AutoCorrect* feature. It is simply the language for the Replacements table.

#### Replacements Table

You can double-click on cells in either column to edit the listed items. Use the **Add** button to insert new items and the **Remove** button to delete rows from the table.

**Note:** Any changes, additions, or deletions you make to this table are saved to a path that is specified in the [AutoCorrect Dictionaries preferences page](#).

#### Smart quotes section

You can also choose to automatically convert double and single quotes to a quotation characters of your choice by using the following options in the **Smart quotes** section:

- **Replace "Single quotes"** - Replaces single quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.
- **Replace "Double quotes"** - Replaces double quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.

#### Global Options

If this option is selected, the options are stored on your local computer, in a folder that is not accessible to other users.

#### Project Options

If this option is selected, the options are stored in the project file and can be shared with other users.

Selecting [Project Options](#) will only save your selections in [Enable AutoCorrect](#), [Use additional suggestions from the spell checker](#), and the options in the [Smart quotes section](#). Changes to the Replacements table are

not saved in this page. To save changes to the Replacements table at project level you need to specify a custom location in [the \*User-defined replacements\* section of the \*AutoCorrect Dictionaries preferences\* page](#) and select **Project Options** from that preferences page instead.

### Restore Defaults

Restores the options in this preferences page to their default values and **also deletes any changes you have made to the *Replacements table***.

## AutoCorrect Dictionaries Preferences

To set the Dictionaries preferences for the *AutoCorrect feature*, open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries**. This page allows you to specify the location of the dictionaries that Oxygen XML Author uses for the *AutoCorrect* feature and the location for saving user-defined replacements.

The following options are available in this preferences page:

### Dictionaries default folder

Displays the default location where the dictionaries that Oxygen XML Author uses for the *AutoCorrect* feature are stored.

### Include dictionaries from

Selecting this option allows you to specify a location where you have stored *AutoCorrect* dictionaries that you want to include, along with the default ones.

**Important:** Consider the following notes in regards to this option:

- The *AutoCorrect* mechanism takes into account *AutoCorrect* dictionaries collected both from the default and custom locations and multiple dictionaries from the same language are merged (for example, en\_UK . dat from the default location is merged with en\_US . dat from a custom location).
- If you have a generic *AutoCorrect* dictionary file (one that just has a two letter language code for its file name, such as en . dat) saved in either the default or custom location, the other more specific dictionaries (for example, en\_UK . dat and en\_US . dat) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

### How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Author User Guide that explains how to [add dictionaries for the \*AutoCorrect\* feature](#).

### Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

**Tip:** To save changes to [the \*Replacement table\* \(in the \*AutoCorrect preferences\* page\)](#) at *project level*, select a custom location for the **User-defined replacements** and select [Project Options](#) at the bottom of the page.

### Related Information:

[Add Dictionaries for the \*AutoCorrect\* Feature](#) on page 437

## Spell Check Preferences

Oxygen XML Author provides support for spell checking in the **Text** and **Author** editing modes. To configure the **Spell Check** options, open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Spell Check**.

The following options are available:

### Automatic spell check

This option is not selected by default. When selected, Oxygen XML Author automatically checks the spelling as you type and highlights misspelled words in the document.

- **Select editors** - You can select which editors (and therefore which file types) will be automatically spell checked. File types (such as CSS and DTD), in which automatic spell checking is not usually helpful, are excluded by default.

## Spell check highlight color

Use this option to set the color used by the spell check engine to highlight spelling errors.

## Language options section

This section includes the following language options:

### Default language

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can [add additional dictionaries to the spell check engines](#).

### Use "lang" and "xml:lang" attributes

When this option is selected, the contents of an element with one of the `lang` or `xml:lang` attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- **Use the default language** - If the `lang` and `xml:lang` attributes are missing, the selection in the [Default language list](#) is used.
- **Do not check** - If the `lang` and `xml:lang` attributes are missing, the element is not checked.

## XML spell checking in section

You can choose to check the spelling inside the following XML items:

- **Comments**
- **Attribute values**
- **Text**
- **CDATA**

## Options section

This section includes the following other options:

### Check capitalization

When selected, the spell checker reports capitalization errors (for example, a word that starts with lowercase after *etc.* or *i.e.*).

### Check punctuation

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

### Ignore mixed case words

When selected, the spell checker does not check words containing mixed case characters (for example, *SpellChecker*).

### Ignore acronyms

Available only for the **Hunspell Spell Checker**. When selected, acronyms are not reported as errors.

### Ignore words with digits

When selected, the spell checker does not check words containing digits (for example, *b2b*).

### Ignore duplicates

When selected, the spell checker does not signal two successive identical words as an error.

### Ignore URL

When selected, the spell checker ignores words recognized as URLs or file names (for example, *www.oxygenxml.com* or *c:\boot.ini*).

### Allow compounds words

When selected, all words formed by concatenating two legal words with a hyphen (hyphenated compounds) are accepted. If recognized by the language, two words concatenated without hyphen (closed compounds) are also accepted.

### Allow file extensions

When selected, the spell checker accepts any word ending with recognized file extensions (for example, *myfile.txt* or *index.html*).

## Ignore elements section

You can use the **Add** and **Remove** buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- '/' and '/'/' separators
- '\*' wildcard

An example of an allowed XPath expression is: `/a/*/b`.

## AutoCorrect options link

Use this link to navigate to the [AutoCorrect preferences page](#).

## Spell Check Dictionaries Preferences

To set the Dictionaries preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Spell Check > Dictionaries**. This page allows you to configure the dictionaries (.dic files) and term lists (.tdi files) that Oxygen XML Author uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Author uses the Hunspell spell checking engine:

### Dictionaries and term lists default folder

Displays the default location where the dictionaries and term lists that Oxygen XML Author uses are stored.

### Include dictionaries and term list from

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

**Important:** Consider the following notes in regards to this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, en\_UK.dic from the default location is merged with en\_US.dic from a custom location).
- If you have a generic dictionary file (one that just has a two letter language code for its file name, such as en.dic) saved in either the default or custom location, the other more specific dictionaries (for example, en\_UK.dic and en\_US.dic) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

## How to add more dictionaries and term lists link

Use this link to open a topic in the Oxygen XML Author User Guide that explains how to [add more dictionaries and term lists](#).

## Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

## Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

## Related Information:

[Adding Spell Check Dictionaries](#) on page 431

[Adding Spell Check Term Lists](#) on page 432

## Document Checking Preferences

To configure the **Document Checking** (validation) options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Document Checking**. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

### Maximum number of validation highlights

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is displayed at the right side of the editor panel. This option applies to both [automatic validation](#) and [manual validation](#).

### Validation error highlight color

The color used to highlight validation errors in the document.

### Validation warning highlight color

The color used to highlight validation warnings in the document.

### Validation info highlight color

The color used to highlight validation info messages in the document.

### Validation success color

The color used to highlight the success indicator of the validation operation in the vertical ruler bar.

### Always show validation status

If this option is selected, the current validation error or warning is always visible in the message line at the bottom of the editor panel. This is useful when the **Enable automatic validation** option is selected and the vertical scroll bar changes position due to an error message being displayed.

### Enable automatic validation

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Author.

### Delay after the last key event (s)

The period of keyboard inactivity before starting a new validation (in seconds).

At the bottom of the preferences page you can [choose whether or not the saved options will be shared with other users by selecting \*\*Global\*\* or \*\*Project\*\* storage options](#).

## Format Preferences

This preferences page contains various formatting options that influence editing and formatting in both the **Text** and **Author** editing modes. To control additional options specifically for the **Author** mode editor, see [Whitespace Handling in Author Mode](#) on page 493.

**Note:** These settings apply to the formatting of source documents. The formatting of output documents is determined by the [transformation scenarios that create them](#).

To configure the **Format** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format**.

The following options are available:

### Detect indent on open

If selected, Oxygen XML Author detects how a document is indented when it is opened. Oxygen XML Author uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Author detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

**Tip:** If you want to minimize the formatting differences created by the **Format and Indent** operation in a document edited in the **Text** edited mode, make sure that both the **Detect indent on open** and [Detect line width on open](#) options are selected.

### Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all your document have no indentation and you want to keep them that way.

## Indent with tabs

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the [Detect indent on open](#) option.

## Indent size

The meaning of this setting depends on the following:

- If the [Detect indent on open option](#) is selected and TAB characters are detected at the beginning of the line, the *indent size* is the width of a TAB character. Otherwise, the *indent size* value is ignored and Oxygen XML Author uses the number of detected SPACE characters.
- If the [Indent with tabs option](#) is selected, the *indent size* is the width of a TAB character.
- If neither of these options are selected, the *indent size* is the number of SPACE characters used for indenting the text lines.

For additional information about changing the *indent size*, see [Setting an Indent Size to Zero](#) on page 470.

For information about when this setting is used, see [Where Indent Size and Line Width Settings are Used in Oxygen XML Author](#) on page 96.

## Indent on enter

If selected, when you press Enter to insert a line break in the **Text** editing mode, an indentation will be added to the new line.

### Enable smart enter

If selected, when you press the Enter key between a start and an end XML tag in the **Text** editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

## Format and indent the document on open

If selected, an XML document is formatted and indented before opening it in Oxygen XML Author.

**Note:** Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

## Detect line width on open

If selected, Oxygen XML Author automatically detects the line width when the document is opened.

## Hard line wrap (Limit to "Line width - Format and Indent")

If selected, when typing content in the **Text** editing mode and the maximum line width is reached, a line break is automatically inserted.

## Line width - Format and Indent

Defines the number of characters after which the **Format and Indent** (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a **Format and Indent** action, the longest line will have a maximum of 100 characters. This setting is also used when saving XML content edited in the **Author** editing mode.

**Note:** To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the **Line width - Format and Indent** setting. The remaining space is reserved for text.

For information about when this setting is used, see [Where Indent Size and Line Width Settings are Used in Oxygen XML Editor](#).

## Clear undo buffer before Format and Indent

The **Format and Indent** operation can be *undone*, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Author will be used for storing the undo states. If this option is selected, Oxygen XML Author empties the undo buffer before doing a **Format and Indent** operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (**OutOfMemoryError**) when performing the **Format and Indent** operation.

## Where Indent Size and Line Width Settings are Used in Oxygen XML Author

The values set in the **Indent Size** and **Line Width - Format and Indent** options are used in various places in the application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press ENTER to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to "Line width - Format and Indent")** option is selected and the maximum line width is reached while editing in the **Text** mode.
- When the XML is serialized by saving content in the **Author** editing mode.

For more information about the formatting options offered by Oxygen XML Author, watch our video demonstration:

## XML Preferences

To configure the **XML** Formatting options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > XML**.

The following options are available:

### Format Section

This section includes the following drop-down boxes:

#### Preserve empty lines

The **Format and Indent** operation preserves all empty lines found in the document.

#### Preserve text as it is

The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

#### Preserve line breaks in attributes

Line breaks found in attribute values are preserved.

**Note:** When this option is selected, the [Break long attributes option](#) is automatically disabled.

#### Break long attributes

The **Format and Indent** operation breaks long attribute values.

#### Indent inline elements

The [inline elements](#) are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```
<root>
  text <parent> <child></child> </parent>
</root>
```

**Indent inline elements** selected:

```
<root> text <parent>
  <child/>
</parent>
</root>
```

**Indent inline elements** not selected:

```
<root> text <parent> <child/> </parent> </root>
```

#### Expand empty elements

The **Format and Indent** operation outputs empty elements with a separate closing tag (for example, `<a atr1="v1"></a>`). When not selected, the same operation represents an empty element in a more compact form (`<a atr1="v1" />`).

#### Sort attributes

The **Format and Indent** operation sorts the attributes of an element lexicographically.

#### Add space before slash in empty elements

Inserts a space character before the trailing / and > of empty elements.

### Break line before an attribute name

The **Format and Indent** operation breaks the line before the attribute name.

### Element Spacing Section

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use *AND/OR* boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName` Note: The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.
- `//xs:documentation[@lang="en"]`

The tabs are as follows:

#### Preserve space

List of elements for which the **Format and Indent** operation preserves the whitespaces (such as blanks, tabs, and newlines).

#### Default space

List of elements for which the content is normalized (multiple contiguous whitespaces are replaced by a single space), before applying the **Format and Indent** operation.

#### Mixed content

The elements from this list are treated as mixed content when applying the **Format and Indent** operation. The lines are split only when whitespaces are encountered.

#### Line break

List of elements for which line breaks will be inserted, regardless of their content. You can choose to break the line *before* the element, *after*, or *both*.

### Schema aware format and indent

The **Format and Indent** operation takes the schema information into account with regards to the *space preserve*, *mixed*, or *element only* properties of an element.

### Indent Section

Includes the following options:

### Indent (when typing) in preserve space elements

Normally, the *Preserve space* elements (identified by the `xml:space` attribute set to `preserve` or by their presence in the [Preserve space tab of the Element Spacing list](#)) are ignored by the **Format and Indent** operation. When this option is selected and you edit one of these elements, its content is formatted.

### Indent on paste - sections with number of lines less than 300

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, deselect this option.

### Whitespaces Preferences

When Oxygen XML Author formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Author allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the **Whitespace** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > XML > Whitespaces**.

This table lists the Unicode whitespace characters. Select any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The **Format and Indent** action is applied on an XML document.
- You switch from **Text** mode to **Author** mode.
- You switch from **Author** mode to **Text** mode.

**Note:** The whitespace normalization process replaces any sequence of characters declared as whitespaces in the **Whitespaces** table with a single space character (U+0020). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the **Whitespaces** table.

**Important:** The characters with the codes U+0009 (TAB), U+000A (LF), U+000D (CR) and U+0020 (SPACE) are always considered to be whitespace characters and cannot be deselected.

### CSS Preferences

Oxygen XML Author can format and indent your CSS files. To configure the **CSS** formatting options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > CSS**.

The following options control how your CSS files are formatted and indented:

#### Class body on new line

If selected, the *class* body (including the curly brackets) is placed on a new line. This option is not selected by default.

#### Indent class content

When selected (default state), the *class* content is indented.

#### Add space before the value of a CSS property

When selected (default state), whitespaces are added between the `:` (colon) and the value of a style property.

#### Add new line between classes

If selected, an empty line is added between two classes. This option is not selected by default.

#### Preserve empty lines

When selected (default state), the empty lines from the CSS content are preserved.

#### Allow formatting embedded CSS

When selected (default state), CSS content that is embedded in XML is also formatted when the XML content is formatted.

### JavaScript Preferences

To configure the **JavaScript** format options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > JavaScript**.

The following options control the behavior of the **Format and Indent** action:

- **Start curly brace on new line** - Opening curly braces start on a new line.

- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is selected by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Author to format embedded JavaScript code, taking precedence over the [Schema aware format and indent](#) option. This option is selected by default.

### Content Completion Preferences

Oxygen XML Author provides a [Content Completion Assistant](#) that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the **Content Completion** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion**. These options control how the *Content Completion Assistant* works.

The following options are available:

#### Auto close the last opened tag

When selected, Oxygen XML Author automatically closes the last open tag when you type `</`.

#### Automatically rename/delete/comment matching tags

If you rename, delete, or comment out a start tag, Oxygen XML Author automatically renames, deletes, or comments out the matching end tag.

**Note:** If you select **Toggle comment** for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

#### Enable content completion

Toggles the content completion feature on or off.

#### Close the inserted element

When you choose an entry from the *Content Completion Assistant* list of proposals, Oxygen XML Author inserts both start and end tags. The following additional options are available in regards to closing the element:

- **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.
- **Add element content** - Oxygen XML Author inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is [associated with the edited XML document](#).
  - **Add optional content** - If selected, Oxygen XML Author inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
  - **Add first Choice particle** - If selected, Oxygen XML Author inserts the first **choice** particle specified in the DTD, XML Schema, or RELAX NG schema.

#### Case sensitive search

When selected, the search in the *Content Completion Assistant* is case-sensitive when you type a character ('a' and 'A' are different characters).

**Note:** This option is ignored when the current language itself is not case sensitive. For example, the case is ignored in the CSS language.

#### Position cursor between tags

When selected, Oxygen XML Author automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the [Insert the required attributes option](#) is not selected.

#### Show all entities

Oxygen XML Author displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, `&`).

#### Insert the required attributes

Oxygen XML Author inserts automatically the required attributes taken from the DTD or XML Schema.

### Insert the fixed attributes

If selected, Oxygen XML Author automatically inserts any FIXED attributes from the DTD or XML Schema for an element inserted with the help of the *Content Completion Assistant*.

### Show recently used items

When selected, Oxygen XML Author remembers the last inserted items from the *Content Completion Assistant* window. The number of items to be remembered is limited by the **Maximum number of recent items shown** list box. These most frequently used items are displayed on the top of the content completion window and are separated from the rest of the suggestions by a thin gray line .

#### Maximum number of recent items shown

Specifies the limit for the number of recently used items presented at the top of the *Content Completion Assistant* window.

### Learn attributes values

When selected, Oxygen XML Author learns the attribute values used in a document.

### Learn on open document

Oxygen XML Author automatically learns the document structure when the document is opened.

### Learn words (Dynamic Abbreviations, available on **Ctrl+Space (Command+Space on OS X)**)

When selected, Oxygen XML Author learns the typed words and makes them available in a content completion fashion by pressing **Ctrl + Space (Command + Space on OS X)** on your keyboard;

**Note:** In order to be learned, the words need to be separated by space characters.

### Activation delay of the proposals window (ms)

Delay in milliseconds from last key press until the *Content Completion Assistant* is displayed.

### Related Information:

[Configuring the Proposals for Attribute and Element Values](#) on page 1183

### Annotations Preferences

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Author can display these annotations when offering content completion suggestions. To configure the **Annotations** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > Annotations**.

The following options are available:

#### Show annotations in Content Completion Assistant

Oxygen XML Author displays the schema annotations of an element, attribute, or attribute value currently selected in the *Content Completion Assistant* proposals list.

#### Show annotations in tooltip

Oxygen XML Author displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the [Elements view](#).

#### Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. When this option is not selected, the annotations are converted and displayed as plain text.

#### Prefer DTD comments that start with "doc:" as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Author recommends prefixing with the doc : particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

When this option is selected, Oxygen XML Author uses the following mechanism to collect annotations:

- If at least one doc : comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no doc : comment is found in the entire DTD, all comments are considered annotations and displayed as such.

When the option is not selected, all comments, regardless of their type, are considered annotations and displayed as such.

### Use all Relax NG annotations as documentation

When this option is selected, any element outside the Relax NG namespace, that is `http://relaxng.org/ns/structure/1.0`, is considered annotation and is displayed in the annotation window next to the *Content Completion Assistant* window and in the *Model view*. When this option is not selected, only elements from the Relax NG annotations namespace, that is `http://relaxng.org/ns/compatibility/annotations/1.0` are considered annotations.

### Related Information:

[Schema Annotations in Text Mode](#) on page 457

### XPath Preferences

Oxygen XML Author provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > XPath**.

The following options are available:

- **Enable content completion for XPath expressions** - Enables the *Content Completion Assistant* in XPath expressions that you enter in the `match`, `select`, and `test` XSL attributes and also in the *XPath toolbar*.
  - **Include XPath functions** - When this option is selected, XPath functions are included in the content completion suggestions.
  - **Include XSLT functions** - When this option is selected, XSLT functions are included in the content completion suggestions.
  - **Include axes** - When this option is selected, XSLT axes are included in the content completion suggestions.
- **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip.
- **Function signature window background** - Specifies the background color of the tooltip window.
- **Function signature window foreground** - Specifies the foreground color of the tooltip window.

### JavaScript Preferences

Oxygen XML Author can provide content completion suggestions when you are writing JavaScript files. To configure content completion support for JavaScript, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > JavaScript**. You can configure the following options:

#### Enable content completion

Enables the content completion support for JavaScript files.

#### Use built-in libraries

Allows Oxygen XML Author to include components (object names, properties, functions, and variables) collected from the built-in JavaScript library files when making suggestions.

#### Use defined libraries

Oxygen XML Author can also use JavaScript libraries to when making suggestions. List the paths (URIs) of any JavaScript files you want Oxygen XML Author to use when making suggestions.

**Note:** The paths can contain *editor variables* such as `${pdu}`, or `${oxygenHome}`. You can make these paths relative to the project directory or installation directory.

### Syntax Highlight Preferences

Oxygen XML Author supports syntax highlighting in the **Text** mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, CSS, LESS, Markdown, Text, , and more.

To configure syntax highlighting, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight**.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed.

The results of your changes are displayed in the **Preview** panel. If you do not know the name of the syntax token that you want to configure, click that token in the **Preview** area to select it.

**Note:** All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor > Syntax Highlight** preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the **Preview** area has a separate tab for each of them when **XML** is selected in the top pane.

The **Enable nested syntax highlight** option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

### Elements/Attributes by Prefix Preferences

Oxygen XML Author allows you to specify syntax highlighting colors for XML elements and attributes with specific namespace prefixes. To configure the **Elements/Attributes by Prefix** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight > Elements/Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

**Note:** Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix (and not the whole element or attribute name) to be styled with a particular color, select the **Draw only the prefix with a separate color** option.

### Open/Save Preferences

Oxygen XML Author lets you control how files are opened and saved. To configure the options for opening and saving documents, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Open/Save**.

The following options are available:

#### Open section

##### Lock local resources

When this option is selected and you open a file from the local file system or a shared network drive, Oxygen XML Author locks the file for the current user and the file becomes read-only for other users while the lock exists. Locked and read-only files have a lock icon (🔒) displayed on their editor tabs. Newly created files are *locked* when you first save them. If you select this option with files already opened in Oxygen XML Author, it will *lock* all the currently opened files. If you deselect this option with files already opened, it will unlock them by deleting the corresponding `.lock` files. When you try to save locked (read-only) files, a **Save As** dialog box will be displayed to avoid overwriting the initial resource.

##### Restore cursor position

Selected by default, it ensures that the last position of the cursor will be remembered when a document is re-opened. If this option is not selected, the cursor will always be positioned at the beginning of the document.

##### Open each document in a tab next to the current one

When selected (default), each new document is opened in a tab next to the currently opened tab. If not selected, each new document is opened in a tab at the end of the current tab stack.

#### Support for Special Characters section

**Note:** The options in this section only affect the **Text** editing mode.

##### When bidirectional text, Asian languages, or other special characters are detected

You can choose how you want Oxygen XML Author to handle bidirectional text, Asian languages, or other special characters when they are detected in **Text** mode. You can choose one of the following:

- **Enable support for special characters** - The support for special characters will always be enabled. For details about what this means, see [Bidirectional Text Support in Text Mode - Enabled](#).

- **Disable support for special characters** - The support for special characters will always be disabled. For details about what this means, see [Bidirectional Text Support in Text Mode - Disabled](#).
- **Prompt for each document** (default setting) - You will be prompted to choose whether or not to enable the support for special characters whenever they are detected in a newly opened document. For details about which setting to choose, see [Special Character Support in Text Mode](#) on page 219.

#### **Disable special characters support for documents larger than (characters)**

Enabling bidirectional text editing support can affect performance on large files. When this option is selected, bidirectional editing is disabled for files exceeding the specified size (even if the [Enable support for special characters option](#) is selected). The default limit is 300 MB. You can change it to 500 MB or 800 MB, but it is recommended that you always leave this option selected regardless of the limit that is set.

### **Save section**

#### **Show "Save as" option to save newly created documents in the "New" document wizard**

It is selected by default, but if you deselect this option, the [Save as option](#) will not be available in the [New Document wizard](#), so you will not have the ability to change the default name and path of the new file.

#### **Safe save (only for local files)**

In the unlikely event of a failure when attempting a **Save** action, this option provides increased protection from corruption of the original file. When this option is selected, it saves the content to a temporary file and if the save is unsuccessful, the editor preserves its unsaved state status.

#### **On Save, make backup copy with extension (only for local files)**

If selected, a backup copy is made when saving the edited document. This option is available only for local files (files that are stored on the local file system). The default backup file extension is `.bak`, but that can be changed in the text field.

#### **Automatically save the document every**

If selected, your documents are automatically saved after a preset time interval that is specified in the drop-down list.

#### **Save all files before transformation or validation**

Saves all opened files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

#### **Check errors on save**

If selected, Oxygen XML Author runs a validation that checks your document for errors before saving it.

#### **Save all files before calling external tools**

If selected, all files are saved before executing an [external tool](#).

### **Performance section**

#### **Optimize loading in the Text edit mode for files over (MB)**

File loading is optimized for reduced memory usage for any file whose size is larger than the value specified in this drop-down list. This is useful for editing large files, but there are [several restrictions](#) for memory-intensive operations.

#### **Show warning when loading large documents**

Oxygen XML Author will warn you if you open a file that is bigger than the specified size.

#### **Optimize loading for documents with lines longer than (Characters)**

*Line wrap* is automatically performed for documents that contain lines that exceed the length specified in this text field. For a list of the restrictions applied to a document with long lines, see [Editing Documents with Long Lines](#).

#### **Show warning when loading documents with long lines**

When selected, Oxygen XML Author will warn you when you open a file with lines longer than the specified length. To reduce the length of lines in a file, [format and indent the document](#) after it is opened in the editor panel. For a list of the restrictions applied to a document with long lines, see [Editing Documents with Long Lines](#) on page 693.

### Clear undo buffer on save

If selected, Oxygen XML Author clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter **out of memory** errors when editing large documents.

### Consider application bundles to be directories when browsing (OS X only)

This option is available only on the Mac OS X platform. When selected, the file browser dialog box allows you to browse inside an application bundle, as in a regular folder. Otherwise, it is not allowed (the same as the Finder application on Mac OS X).

**Note:** The same effect can be obtained by setting the `apple.awt.use-file-dialog-packages` property to **true** or **false** in the `Info.plist` descriptor file of the Oxygen XML Author application:

```
<key>apple.awt.use-file-dialog-packages</key>  
<string>>false</string>
```

### Save Hooks Preferences

Oxygen XML Author includes an option for automatically compiling LESS stylesheets. To set this option, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Open/Save > Save Hooks**.

The following option is available:

#### Automatically compile LESS to CSS when saving

If selected, when you save a LESS file it will automatically be compiled to CSS (deselected by default).

**Important:** If this option is selected, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

### Templates Preferences

This page simply allows you to navigate to the preference pages for code templates or document templates.

#### Code Templates Preferences

[Code templates](#) are code fragments that can be inserted at the current editing position. Oxygen XML Author includes a set of built-in templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also define your own code templates for any type of file and share them with your colleagues using the template export and import functions.

To configure **Code Templates**, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Templates > Code Templates**.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

#### New

Opens the **Code template** dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the [Content Completion Assistant](#). HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
  - M2 represents the **Shift** key.
  - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.

- M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.

### Edit

Opens the **Code template** dialog box and allows you to edit an existing code template. You can edit the following fields:

- **Description** - The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant*. HTML markup can be used for better rendering.
- **Shortcut key** - Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
  - M2 represents the **Shift** key.
  - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
  - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.

### Duplicate

Creates a duplicate of the currently selected code template.

### Delete

Deletes the currently selected code template. This action is not available for the built-in code templates.

### Export

Exports a file with code templates.

### Import

Imports a file with code templates that was created by the **Export** action.

You can use the following *editor variables* when you define a code template in the **Content** text box:

- **`\${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a *selection plugin*.
- **`\${selection}** - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a *selection plugin*.
- **`\${ask('message', type, ('real\_value1':'rendered\_value1'; 'real\_value2':'rendered\_value2'; ...), 'default\_value'))}** - To prompt for values at runtime, use the *ask('message', type, ('real\_value1':'rendered\_value1'; 'real\_value2':'rendered\_value2'; ...), 'default-value')* editor variable. You can set the following parameters:
  - **'message'** - The displayed message. Note the quotes that enclose the message.
  - **type** - Optional parameter, with one of the following values:

**Note:** The title of the dialog box will be determined by the type of parameter and as follows:

- For *url* and *relative\_url* parameters, the title will be the name of the parameter and the value of the *'message'*.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Parameter	
url	<b>Format:</b> <code>`\${ask('message', url, 'default_value')}</code>
	<b>Description:</b> Input is considered a URL. Oxygen XML Author checks that the provided URL is valid.

Parameter	
	<p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Input URL', url)}</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL.</li> <li>• <code>\${ask('Input URL', url, 'http://www.example.com')}</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. The input field displays the default value <i>http://www.example.com</i>.</li> </ul>
password	<p><b>Format:</b> <code>\${ask('message', password, 'default')}</code></p> <p><b>Description:</b> The input is hidden with bullet characters.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Input password', password)}</code> - The displayed dialog box has the name <i>Input password</i> and the input is hidden with bullet symbols.</li> <li>• <code>\${ask('Input password', password, 'abcd')}</code> - The displayed dialog box has the name <i>Input password</i> and the input hidden with bullet symbols. The input field already contains the default <b>abcd</b> value.</li> </ul>
generic	<p><b>Format:</b> <code>\${ask('message', generic, 'default')}</code></p> <p><b>Description:</b> The input is considered to be generic text that requires no special handling.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Hello world!'')}</code> - The dialog box has a <i>Hello world!</i> message displayed.</li> <li>• <code>\${ask('Hello world!', generic, 'Hello again!'')}</code> - The dialog box has a <i>Hello world!</i> message displayed and the value displayed in the input box is <i>Hello again!</i>.</li> </ul>
relative_url	<p><b>Format:</b> <code>\${ask('message', relative_url, 'default')}</code></p> <p><b>Description:</b> Input is considered a URL. Oxygen XML Author tries to make the URL relative to that of the document you are editing.</p> <p><b>Note:</b> If the <code>\$ask</code> editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Author will transform it into an absolute URL.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('File location', relative_url, 'C:/example.txt')}</code> - The dialog box has the name <i>File location</i>. The URL inserted in the input box is made relative to the current edited document location.</li> </ul>
combobox	<p><b>Format:</b> <code>\${ask('message', combobox, ('real_value1':'rendered_value1';...;real_valueN':'rendered_valueN'), 'default')}</code></p> <p><b>Description:</b> Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated value (<i>real_value</i>).</p> <p><b>Note:</b> The <i>'default'</i> parameter specifies the default selected value and can match either a key or a value.</p>

Parameter	
	<p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.</li> </ul> <p><b>Note:</b> In this example, the default value is indicated by the <code>osx</code> key. However, the same result could be obtained if the default value is indicated by <code>Mac OS X</code>, as in the following example: <code>\${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}</code></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}</code></li> </ul>
editable_combobox	<p><b>Format:</b> <code>\${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p><b>Description:</b> Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated real value (<code>real_value</code>) or the value inserted when you edit a list entry.</p> <p><b>Note:</b> The <code>'default'</code> parameter specifies the default selected value and can match either a key or a value.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</li> </ul>
radio	<p><b>Format:</b> <code>\${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p><b>Description:</b> Displays a dialog box that offers a series of radio buttons. Each radio button displays a <code>rendered_value</code> and will return an associated <code>real_value</code>.</p> <p><b>Note:</b> The <code>'default'</code> parameter specifies the default selected value and can match either a key or a value.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.</li> </ul> <p><b>Note:</b> In this example <code>Mac OS X</code> is the default selected value and if selected it would return <code>osx</code> for the output.</p>

- `'default-value'` - optional parameter. Provides a default value.
- **\$(timeStamp)** - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.

- **\${uuid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java [UUID](#) class.
- **\${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **\${cfm}** - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- **\${cfne}** - Current file name with extension. The current file is the one currently opened and selected.
- **\${cf}** - Current file as file path, that is the absolute file path of the current edited document.
- **\${cfd}** - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- **\${frameworksDir}** - The path (as file path) of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- **\${pd}** - The file path to the folder that contains the current project file (.xpr).
- **\${oxygenInstallDir}** - Oxygen XML Author installation folder as file path.
- **\${homeDir}** - The path (as file path) of the user home folder.
- **\${pn}** - Current project name.
- **\${env(VAR\_NAME)}** - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **\${system(var.name)}** editor variable.
- **\${system(var.name)}** - Value of the `var.name` Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the **\${env(VAR\_NAME)}** editor variable instead.
- **\${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`;

**Note:** This editor variable supports both the `xs:date` and `xs:datetime` parameters. For details about `xs:date`, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about `xs:datetime`, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

#### Related Information:

[Code Templates](#) on page 463

#### Document Templates Preferences

Oxygen XML Author provides a selection of document templates that make it easier to create new documents in a variety of formats. The list of available templates is presented when you create a new document. You can also [create your own templates](#) and share them with others. You can store your custom file templates in the existing `templates` folder in the Oxygen XML Author installation directory or store them in a custom directory. If you store them in a custom direction, you need to add that directory to the list of template directories that Oxygen XML Author uses.

To add a template directory, follow these steps:

1. [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Templates > Document Templates**.
2. Use the **New** button to select a location of the new document template folder.

This will add the folder to the list in this preferences page and it will now appear in the [New document wizard](#).

**Note:** For DITA templates, they will also appear in the dialog box for creating new DITA topics from the [DITA Maps Manager](#), but if you create a [corresponding properties file](#), you need to set the type property to **dita**.

You can also use the **Edit** or **Delete** buttons to manage folders in the list, and you can alter the order in which Oxygen XML Author looks in these directories by using the **Up** and **Down** buttons.

#### Custom Validation Engines Preferences

As the name implies, the **Custom Validation Engines** preferences page displays the list of custom validation engines that can be associated to a particular editor and used for validating documents. To access this page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Custom Validation Engines**.

If you want to add a new custom validation tool or edit the properties of an existing one, you can use the **Custom Validator** dialog box displayed by pressing the **New** or **Edit** button.

**Figure 26: Custom Validator Dialog Box**

The **Custom Validator** dialog box allows you to configure the following parameters:

**Name**

Name of the custom validation engine that will be displayed in the  **Validation** toolbar drop-down menu.

**Executable path**

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

**Working directory**

The working directory of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

**Associated editors**

The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

**Command line arguments for detected schemas**

Command line arguments used in the commands that validate the currently edited file against various types of schema (W3C XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as -rng) and the following *editor variables*:

- **\${cf}** - Current file as file path, that is the absolute file path of the current edited document.
- **\${currentFileURL}** - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- **\${ds}** - The path of the detected schema as a local file path for the current validated XML document.
- **\${dsu}** - The path of the detected schema as a URL for the current validated XML document.

**Related Information:**

[Editor Variables](#) on page 164

**Increasing the Stack Size for Validation Engines**

To prevent the appearance of a **StackOverflowException** error, use one of the following methods:

- Use the **com.oxygenxml.stack.size.validation.threads** property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify  $1 \times 1024 \times 1024 = 1048576$ .
- Increase the value of the **-Xss** parameter.

**Note:** Increasing the value of the **-Xss** parameter affects all the threads of the application.

#### Related Information:

[Setting a Java Virtual Machine Parameter when Launching Oxygen XML Author](#) on page 173

## CSS Validator Preferences

To configure the **CSS Validator** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **CSS Validator**.

You can configure the following options for the built-in **CSS Validator** of Oxygen XML Author:

- **Profile** - Selects one of the available validation profiles: **CSS 1, CSS 2, CSS 2.1, CSS 3, CSS 3 with Oxygen extensions, SVG, SVG Basic, SVG Tiny, Mobile, TV Profile, ATSC TV Profile**. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the [CSS extensions specific for Oxygen](#) that can be used in [Author mode](#). That means all Oxygen specific extensions are accepted in a CSS stylesheet by [the built-in CSS validator](#) when this profile is selected.
- **Media type** - Selects one of the available mediums: **all, aural, braille, embossed, handheld, print, projection, screen, tty, tv, presentation, oxygen**.
- **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: **All, Normal, Most Important, No Warnings**.
- **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. As wildcards you can use:
  - \* to match any string.
  - ? to match any character.
- **Recognize browser CSS extensions (also applies to content completion)** - If selected, Oxygen XML Author recognizes (no validation is performed) browser-specific CSS properties. The [Content Completion Assistant](#) lists these properties at the end of its list, prefixed with the following particles:
  - -moz- for Mozilla.
  - -ms- for Internet Explorer or Edge.
  - -o- for Opera.
  - -webkit- for Safari/Webkit.

## XML Preferences

This section describes the panels that contain the user preferences related with XML.

### XML Catalog Preferences

To configure options that pertain to [XML Catalogs](#), [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Catalog**.

The following options are available:

#### Prefer

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document for which both a public identifier and a system identifier has been specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

- **system** - If selected, the system identifier in the document is used.
- **public** - If selected, the URI supplied in the matching public catalog entry is used. Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **public** should usually be used for your catalogs.

**Note:** If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

### Verbosity

When using catalogs it is sometimes useful to see what catalog files are parsed, if they are valid or not, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the *XML catalog* resolver that will be displayed in the **Catalogs** table at the bottom of the window. You can choose between the following:

- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the *XML catalogs* specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

### Resolve schema locations also through system mappings

If selected, Oxygen XML Author analyzes both *uri* and *system* mappings to resolve the location of schema.

**Note:** This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

### Process "schemaLocation" namespaces through URI mappings for XML Schema

If selected, the target namespace of the imported XML Schema is resolved through the *uri* mappings. The namespace is taken into account only when the schema specified in the *schemaLocation* attribute was not resolved successfully. If not selected, the system IDs are used to resolve the schema location.

### Use default catalog

If this option is selected and Oxygen XML Author cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see [How Oxygen XML Author Determines which Catalog to Use](#) on page 648.

### Catalogs table

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

#### Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  ▾ **Browse** drop-down list.

#### Edit

Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  ▾ **Browse** drop-down list.

#### Delete

Deletes the currently selected catalog from the list.

#### Up

Moves the selection to the previous resource.

#### Down

Moves the selection to the following resource.

**Note:** When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run [a manual Validate action](#) so that the changes take full effect.

You can also add or configure catalogs at *framework* level from the [Catalogs tab](#) in the [Document Type configuration dialog box](#).

### Related Information:

[Controlling the Catalog Resolver](#)

[Working with XML Catalogs](#) on page 647

## XML Parser Preferences

To configure the **XML Parser** options, *open the [Preferences dialog box \(Options > Preferences\)](#)* and go to **XML > XML Parser**.

The configurable options of the built-in XML parser are as follows:

### Enable parser caching (validation and content completion)

Enables re-use of internal models when validating and provides content completion in opened XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

### Ignore the DTD for validation if a schema is specified

Forces validation against a referenced schema (W3C XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against a W3C XML Schema or a Relax NG schema.

**Note:** Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

### Enable XInclude processing

Enables XInclude processing. If selected, the XInclude support in Oxygen XML Author is turned on for validation, rendering in **Author** mode and transformation of XML documents.

### Base URI fix-up

According to the specification for XInclude, processors must add an `xml:base` attribute to elements included from locations with a different base URI. Without these attributes, the resulting infocset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow `xml:base` attributes to appear on elements that might be included from different base URIs.

If the addition of `xml:base` and / or `xml:lang` is not desired by your application, you can deselect this option.

### Language fix-up

The processor will preserve language information on a top-level included element by adding an `xml:lang` attribute if its include parent has a different [language] property. If the addition of `xml:lang` is not allowed by your application, you can deselect this option.

### DTD post-validation

Select this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using XInclude was resolved. If you deselect this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using XInclude is resolved.

## XML Schema Preferences

To configure options in regards to XML Schema, *open the [Preferences dialog box \(Options > Preferences\)](#)* and go to **XML > XML Parser > XML Schema**.

This preferences page allows you to configure the following options:

### Default XML Schema version

Allows you to select the version of W3C XML Schema to be used as the default. You can choose XML Schema **1.0** or XML Schema **1.1**.

**Note:** You are also able to set the XML Schema version using the **Customize** option in the [New document wizard](#).

### Default XML Schema validation engine

Allows you to select the default validation engine to be used for XML Schema. You can choose **Xerces** or **Saxon EE**.

## Xerces validation features section

### Enable full schema constraint checking

Sets the *schema-full-checking* feature to `true`. This enables a validation of the parsed XML document against a schema (W3C XML Schema or DTD) while the document is parsed.

### Enable honour all schema location feature

Sets the *honour-all-schema-location* feature to `true`. All the files that declare W3C XML Schema components from the same namespace are used to compose the validation model. If this option is not selected, only the first W3C XML Schema file that is encountered in the XML Schema import tree is taken into account.

### Enable full XPath 2.0 in assertions and alternative types

When selected (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

### Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

## Saxon EE validation features section

### Multiple schema imports

Forces `xs:import` to fetch the referenced schema document. By default, the `xs:import` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

### Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

## Relax NG Preferences

To configure options in regards to Relax NG, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > Relax NG**.

The following options are available in this page:

### Check feasibly valid

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

**Note:** Selecting this option disables the **Check ID/IDREF** option.

### Check ID/IDREF

Checks the ID/IDREF matches when a Relax NG document is validated.

### Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

### Ignore "data-" attributes in XHTML

This option is selected by default, which means that when XHTML documents are validated with an RNG schema, any **data-** attributes detected in the document will not be taken into account by the validation engine.

## Schematron Preferences

To configure options in regards to Schematron, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > Schematron**.

The following options are available in this preferences page:

## ISO Schematron Section

### Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should select this option for faster ISO Schematron validation.

### Allow foreign elements (allow-foreign)

Enables support for allow-foreign on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

### Use associated XML Schema to expand default attribute values

When selected (default value), if the validated XML document has an XML Schema associated that contains default values for attributes defined in the XML content, the Schematron will be able to match on those default attributes.

### Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When selected, Saxon EE is used for xslt2/xslt3 query binding. If this option is not selected, Saxon PE is used.

### Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for [Quick Fixes](#) in Schematron files. This option is selected by default.

### Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: **xslt1**, **xslt2**, or **xslt3**.

**Note:** To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a queryBinding attribute on the schema root element.

### Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in [the Global Preferences page](#) will be used and only the validation messages that match that language will be presented. You can use the **Change application language** link to navigate to the preferences page where you can specify the language to be used in the application.
- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the xml:lang attribute from the Schematron root will be used and only the validation message that match that language will be presented.
- **Ignore the language and show all message** - All messages are displayed in whatever language is defined within the Schematron schema.
- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

**Note:** In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language is defined within the Schematron schema.

## Schematron 1.5 Section

### XPath Version

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: **1.0**, **2.0**, or **3.0**. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

## XProc Preferences

Oxygen XML Author includes a built-in XProc engine called *Calabash*. You can add or configure external XProc engines by using the XProc preferences page. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XProc**.

When **Show XProc messages** is selected all messages emitted by the XProc processor during a transformation will be presented in the [Results view](#).

To add an external engine click the **New** button. To configure an existing engine, click the **Edit** button. This opens the **Custom Engine** dialog box that allows you to configure an external engine.

**Figure 27: Creating an XProc external engine**

The following options can be configure in this dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

**Note:** You can configure the built-in Saxon processor using the `saxon.config` file. For further details about configuring this file go to <http://www.saxonica.com/documentation9.5/index.html#!configuration/configuration-file>. You can configure the built-in Calabash processor by using the `calabash.config` file. These files are located in `[OXYGEN_INSTALL_DIR]\lib\xproc\calabash\lib`. If they do not exist, you have to create them.

### XSLT-FO-XQuery Preferences

To configure options in regards to XSLT, XQuery, and FO processors, *open the **Preferences dialog box (Options > Preferences)*** and go to **XML > XSLT-FO-XQuery**. This panel contains only the most generic options for working with XSLT/XSL-FO/XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this **Preferences** page.

There is only one generic option available:

#### **Create transformation temporary files in system temporary directory**

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.

## XSLT Preferences

To configure the XSLT options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT**.

Oxygen XML Author offers the possibility of using an XSLT transformer implemented in Java (other than the XSLT transformers that come bundled with Oxygen XML Author). To use another XSLT transformer, specify the name of the transformer factory class. Oxygen XML Author sets this transformer factory class as the value of the Java property: `javax.xml.transform.TransformerFactory`.

The XSLT preferences page allows you to customize the following options:

### JAXP XSLT Transformer - Value

Allows you to set the value of the TransformerFactory Java class.

### Saxon6 Preferences

To configure the **Saxon 6** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon6**.

**Figure 28: Saxon 6 XSLT Preferences Panel**

The built-in Saxon 6 XSLT processor can be configured with the following options:

- **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.
- **Disable calls on extension functions** - If selected, external function calls are not allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.
- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
  - **recover silently** - Continue processing without reporting the error.
  - **recover with warnings** - Issue a warning but continue processing.
  - **signal the error and do not attempt recovery** - Issue an error and stop processing.

### Saxon-HE/PE/EE Preferences

To configure global options for XSLT transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon-HE/PE/EE**.

### Saxon-HE/PE/EE Options

Oxygen XML Author allows you to configure the following XSLT options for the Saxon 9.7.0.19 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

#### Use a configuration file ("-config")

Sets a Saxon 9.7.0.19 configuration file that is executed for XSLT transformation and validation processes.

#### Version warnings ("-versmsg")

Warns you when the transformation is applied to an XSLT 1.0 stylesheet.

### Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

### Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

### DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:** Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

### Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

### Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

### Optimization level ("-opt")

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

### Saxon-PE/EE Options

The following options are available for Saxon 9.7.0.19 Professional Edition (PE) and Enterprise Edition (EE) only:

#### Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

#### Register Saxon-CE extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.7.0.19 processors.

#### Enable assertions ("-ea")

In XSLT 3.0, you can use the `xsl:assert` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `xsl:assert` instructions are enabled. If it is not selected (default), the assertions are ignored.

## Saxon-EE Options

The options available specifically for Saxon 9.7.0.19 Enterprise Edition (EE) are as follows:

### Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using document ( ) or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

### Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

### Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

### Generate bytecode ("--generateByteCode:(on|off)")

If you select this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#!javadoc>.

## Saxon-HE/PE/EE Advanced Preferences

To configure the **Saxon HE/PE/EE Advanced** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced**.

**Figure 29: Saxon HE/PE/EE XSLT Advanced Preferences Panel**

You can configure the following advanced XSLT options for the Saxon 9.7.0.19 transformer (all three editions: Home Edition, Professional Edition, Enterprise Edition):

- **URI Resolver class name ("-r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 9.7.0.19 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from [the dialog box for configuring the XSLT extension](#) for the particular transformation scenario.
- **Collection URI Resolver class name ("-cr")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 9.7.0.19 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from [the dialog box for configuring the XSLT extension](#) for the particular transformation scenario.

## XSLTProc Preferences

To configure **XSLTProc** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > XSLTProc**.

The following options are available in this preferences page:

- **Enable XInclude processing** - If selected, XInclude references will be resolved when XSLTProc is used as transformer in [XSLT transformation scenarios](#).

- **Skip loading the document's DTD** - If selected, the DTD specified in the DOCTYPE declaration will not be loaded.
- **Do not apply default attributes from document's DTD** - If selected, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- **Do not use Internet to fetch DTD's, entities or docs** - If selected, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.
- **Verbosity** - If selected, the transformation will output detailed status messages about the transformation process in the **Warnings** view.
- **Show version of libxml and libxslt used** - If selected, Oxygen XML Author will display in the **Warnings** view the version of the **libxml** and **libxslt** libraries invoked by XSLTProc.
- **Show time information** - If selected, the **Warnings** view will display the time necessary for running the transformation.
- **Show debug information** - If selected, the **Warnings** view will display debug information about what templates are matched, parameter values, and so on.
- **Show all documents loaded during processing** - If selected, Oxygen XML Author will display in the **Warnings** view the URL of all the files loaded during transformation.
- **Show profile information** - If selected, Oxygen XML Author will display in the **Warnings** view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
- **Show the list of registered extensions** - If selected, Oxygen XML Author will display in the **Warnings** view a list with all the registered extension functions, extension elements and extension modules.
- **Refuses to write to any file or resource** - If selected, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.
- **Refuses to create directories** - If selected, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

### MSXML Preferences

To configure the MSXML options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > MSXML**.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

#### Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

#### Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

#### Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

#### Show time information

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

## Start transformation in this mode

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

### MSXML.NET Preferences

To configure the **MSXML.NET** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > MSXML.NET**.

The options in this preferences page for the MSXML.NET processor are as follows:

#### Enable XInclude processing

If selected, XInclude references will be resolved when MSXML.NET is used as the transformer in the [XSLT transformation scenario](#).

#### Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

#### Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

#### Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

#### Show time information

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

#### Forces ASCII output encoding

There is a known problem with the .NET 1.X XSLT processor (*System.Xml.Xsl.XslTransform* class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as ' ? '. Usually this happens when output encoding is set to ASCII. If this option is selected, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (&#nnnn ; form).

#### Allow multiple output documents

This option allows you to create multiple result documents using the [exsl:document extension element](#).

#### Use named URI resolver class

This option allows you to specify a custom URI resolver class to resolve URI references in `xsl:import` and `xsl:include` instructions (during XSLT stylesheet loading phase) and in `document()` functions (during XSL transformation phase).

#### Assembly file name for URI resolver class

This option specifies a file name of the assembly where the specified resolver class can be found. The [Use named URI resolver class option](#) specifies a partially or fully qualified URI resolver class name (for example, *Acme.Resolvers.CacheResolver*). Such a name requires additional assembly specification using this option or the [Assembly GAC name for URI resolver class option](#), but fully qualified class name (which always includes an assembly specifier) is *all-sufficient*. See MSDN for more info about [fully qualified class names](#).

#### Assembly GAC name for URI resolver class

This option specifies partially or fully qualified name of the assembly in the [global assembly cache](#) (GAC) where the specified resolver class can be found. See MSDN for more info about [partial assembly names](#).

## List of extension object class names

This option allows to specify *extension object* classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

## Use specified EXSLT assembly

MSXML.NET supports a rich library of the *EXSLT* and *EXSLT.NET extension functions* embedded or in a *plugin* EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

## Credential loading source xml

This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the *username:password@domain* format (all parts are optional).

## Credential loading stylesheet

This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the *username:password@domain* format (all parts are optional).

## FO Processors Preferences

Oxygen XML Author includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Author provides an easy way to add two of the most commonly used commercial FO processors: **RenderX XEP** and **Antenna House Formatter**. You can easily add *RenderX XEP* as an external FO processor if you have the XEP installed. Also, if you have the *Antenna House Formatter*, Oxygen XML Author uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for *DITA OT transformations scenarios* and *XML with XSLT transformation scenarios*.

To configure the options for the FO Processors, *open the Preferences dialog box (Options > Preferences)* and go to **XML > XSLT-FO-XQuery > FO Processors**. The **FO Processors** preferences page is displayed.

Figure 30: FO Processors Preferences Page

## Apache FOP Section

In this section you can configure options for the built-in Apache processor. The following options are available:

### Use built-in Apache FOP

Instructs Oxygen XML Author to use the built-in Apache FO processor. To see the version of the built-in XSL-FO processor for your installation, go to **Help > About > Libraries** and search for *Apache FOP*.

### Use other Apache FOP

Instructs Oxygen XML Author to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

### Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Author window, including warning messages about FO instructions not supported by Apache FOP.

### Memory available to the built-in FOP

If your Apache FOP transformations fail with an Out of Memory error (**OutOfMemoryError**), use this combo box to select a bigger value for the amount of memory reserved for FOP transformations.

### Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special *true type* font). You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

### Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

**Note:** All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in [Add a font to the built-in FOP](#).

**Note:** You cannot use the `<filterList>` key in the configuration file since the FOP would generate the following error: *The Filter key is prohibited when PDF/A-1 is active.*

## External FO Processors Section

In this section you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the **RenderX XEP** or **Antenna House Formatter** commercial FO processors.

### Add 'XEP' FO processor (executable file is needed)

If **RenderX XEP** is already installed on your computer, you can use this button to choose the XEP executable script (`xep.bat` for Windows, `xep` for Linux).

### Add 'Antenna House' FO processor (executable file is needed)

If **Antenna House Formatter** is already installed on your computer, you can use this button to choose the Antenna House executable script (`AHFCmd.exe` or `XSLCmd.exe` for Windows, and `run.sh` for Linux/Mac OS).

**Note:** The built-in **Antenna House Formatter GUI** transformation scenario requires that you configure an external FO processor that runs `AHFormatter.exe` (Windows only). In the [external FO Processor configuration dialog box](#), you could use `"${env(AHF63_64_HOME)}\AHFormatter.exe" -d ${fo} -s` for the value in the **Command line** field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see <https://github.com/AntennaHouse/focheck/wiki/focheck>.

You can also add external processors or configure existing ones. Press the **New** button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (**Edit**,  **Duplicate**, **Delete**, **Up**, **Down**) to configure existing external processors.

**Figure 31: External FO Processor Configuration Dialog Box**

The external **FO Processor** configuration dialog box includes the following options:

**Name**

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

**Description**

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

**Working directory**

The directory where the intermediate and final results of the processing is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button. You can use one of the following *editor variables*:

- **\${homeDir}** - The path to the user home directory.
- **\${cfd}** - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- **\${pd}** - The project directory.
- **\${oxygenInstallDir}** -The Oxygen XML Author installation directory.

**Command line**

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button. You can use one of the following *editor variables*:

- **\${method}** - The FOP transformation method: **pdf**, **ps**, or **txt**.
- **\${fo}** - The input FO file.
- **\${out}** - The output file.
- **\${pd}** - The project directory.
- **\${frameworksDir}** - The path of the frameworks subdirectory of the Oxygen XML Author installation directory.
- **\${oxygenInstallDir}** - The Oxygen XML Author installation directory.
- **\${ps}** - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

**Output Encoding**

The encoding of the FO processor output stream that is displayed in a *Results panel* at the bottom of the Oxygen XML Author window.

## Error Encoding

The encoding of the FO processor error stream that is displayed in a [Results panel](#) at the bottom of the Oxygen XML Author window.

## XPath Preferences

To configure XPath options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XPath**.

Oxygen XML Author allows you to customize the following options:

### Unescape XPath expression

If selected, the entities of an XPath expressions that you type in the [XPath/XQuery Builder](#) and the [XPath toolbar](#) are unescaped during their execution. For example, the expression:

```
//varlistentry[starts-with(@os, '&#x73;')]
```

is equivalent to:

```
//varlistentry[starts-with(@os, 's')]
```

### Multiple XPath results

Select this option to display the results of an XPath expression in separate tabs in the [Results view](#).

### XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Author considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Author considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Author considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

### Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the **New** button to add mappings to the list and the **Delete** button to remove mappings.

### Custom Engines Preferences

Oxygen XML Author allows you to configure custom processors to be used for running XSLT and XQuery transformations.

#### Note:

To configure the **Custom Engines** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > Custom Engines**.

The table in this preferences page displays the custom engines that have been defined. Use the **New** or **Edit** button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

**Figure 32: Parameters of a Custom Engine**

The following parameters can be configured for a custom engine:

#### **Engine type**

Specifies the transformer type. You can choose between XSLT and XQuery engines.

#### **Name**

The name of the transformer displayed in the dialog box for editing transformation scenarios.

#### **Description**

A textual description of the transformer.

#### **Working directory**

The start directory of the executable program for the transformer. The following [editor variables](#) are available for making the path to the working directory independent of the location of the input files:

- **\${homeDir}** - The user home directory in the operating system.
- **\${cfd}** - The path to the directory of the current file.
- **\${pd}** - The path to the directory of the current project.
- **\${oxygenInstallDir}** - The Oxygen XML Author install directory.

#### **Command line**

The command line that must be executed by Oxygen XML Author to perform a transformation with the engine. The following [editor variables](#) are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- **\${xml}** - The XML input document as a file path.
- **\${xmlu}** - The XML input document as a URL.
- **\${xsl}** - The XSL / XQuery input document as a file path.
- **\${xslu}** - The XSL / XQuery input document as a URL.
- **\${out}** - The output document as a file path.
- **\${outu}** - The output document as a URL.
- **\${ps}** - The platform separator that is used between library file names specified in the class path.

#### **Output Encoding**

The encoding of the transformer output stream.

#### **Error Encoding**

The encoding of the transformer error stream.

## Ant Preferences

To set Ant preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > Ant**. This panel allows you to choose the directory containing the *Apache Ant* libraries (the so-called *Ant Home*) that Oxygen XML Author uses to handle Ant build files.

There are two options available:

- **Built-in** - the path to the Ant distribution that comes bundled with Oxygen XML Author installation kit.
- **Custom** - the path to an Ant distribution of your choice.

## Import Preferences

To configure importing options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > Import**. This page allows you to configure how empty values and null values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

### Create empty elements for empty values

If selected, an empty value from a database column or from a text file is imported as an empty element.

### Create empty elements for null values

If selected, null values from a database column are imported as empty elements.

### Escape XML content

Selected by default, this option instructs Oxygen XML Author to escape the imported content to an XML-safe form.

### Add annotations for generated XML Schema

If selected, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

### Date / Time Format section

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (`yyyy-MM-dd 'T' HH:mm:ss` for `datetime`, `yyyy-MM-dd` for `date` and `HH:mm:ss` for `time`). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.
- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

**Table 4: Pattern Letters**

Letter	Date or Time Component	Presentation	Examples
G	Era designator	Text	AD
y	Year	Year	1996; 96
M	Month in year	Month	July; Jul; 07
w	Week in year	Number	27
W	Week in month	Number	2
D	Day in year	Number	189
d	Day in month	Number	10

Letter	Date or Time Component	Presentation	Examples
F	Day of week in month	Number	2
E	Day in week	Text	Tuesday; Tue
a	Am / pm marker	Text	PM
H	Hour in day (0-23)	Number	0
k	Hour in day (1-24)	Number	24
K	Hour in am / pm (0-11)	Number	0
h	Hour in am / pm (1-12)	Number	12
m	Minute in hour	Number	30
s	Second in minute	Number	55
S	Millisecond	Number	978
z	Time zone	General time zone	Pacific Standard Time; PST; GMT-08:00
Z	Time zone	RFC 822 time zone	-0800

Pattern letters are usually repeated, as their number determines the exact presentation:

- *Text* - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- *Number* - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- *Year* - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- *Month* - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- *General time zone* - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
  - *GMTOffsetTimeZone* - GMT Sign Hours : Minutes
  - *Sign* - one of + or -
  - *Hours* - one or two digits
  - *Minutes* - two digits
  - *Digit* - one of 0 1 2 3 4 5 6 7 8 9

Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.
- *RFC 822 time zone*: The RFC 822 4-digit time zone format is used:
  - *RFC822TimeZone*
  - *TwoDigitHours* (must be between 00 and 23)

### XML Signing Certificates Preferences

Oxygen XML Author provides two types of [keystores](#) for certificates that are used for digital signatures of XML documents: Java Keystore (**JKS**) and Public-Key Cryptography Standards version 12 (**PKCS-12**). A keystore file is protected by a password. To configure a certificate keystore, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Signing Certificates**. You can customize the following parameters of a keystore:

**Figure 33: Certificates Preferences Panel**

- **Keystore type** - The type of [keystore](#) that Oxygen XML Author uses (**JKS** or **PKCS-12**).
- **Keystore file** - The location of the imported file.
- **Keystore password** - The password that is used for protecting the privacy of the stored keys.
- **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the [keystore](#).
- **Private key password** - The private key password of the certificate (required only for JKS [keystores](#)).
- **Validate** - Press this button to verify the configured [keystore](#) and the validity of the certificate.

### XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Refactoring**. The following option is available in this preferences page:

#### Load additional refactoring operations from

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the **Browse** button.

## DITA Preferences

To access the DITA Preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **DITA**. This preferences page includes the following sections and options:

### DITA Open Toolkit section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Author installation) to be used for validating and publishing DITA content. You can select from the following:

#### Built-in DITA-OT 1.8

If this is set, all defined DITA transformation scenarios will run with DITA-OT 1.8.5. The built-in DITA OT 1.8.5 directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT`.

#### Built-in DITA-OT 2.x (with support for DITA 1.3 and Lightweight DITA)

Starting with Oxygen 18.0, this is the default setting. All defined DITA transformation scenarios will run with DITA-OT 2.5.2. This also gives you access to DITA 1.3 file templates when you [create new documents from templates](#). The default DITA OT 2.5.2 directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT2.x`.

#### Custom

Allows you to specify a custom directory for your DITA OT distribution.

#### Location

You can either provide a new file path for the specific DITA OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the **Browse** button.

### DITA Maps file patterns

Allows you to specify the extension types that will be handled as *DITA maps* when opened in Oxygen XML Author.

## When opening a map

Oxygen XML Author can open a *DITA map* in the regular editor view or in the [DITA Maps Manager](#). This options allows you to specify how a map will be opened. You can choose one of the following options:

- **Always open in the DITA Maps Manager** - A *DITA map* file is always opened in the **DITA Maps Manager** view.
- **Always open as XML** - A *DITA map* file is always opened in the XML editor.
- **Always ask** - When opening a *DITA map*, you are prompted to choose between opening it in the XML editor panel or in the **DITA Maps Manager** view.

## Prefer navigation title for topicref rendering

If selected and there is a `navtitle` attribute set on a `topicref`, then the `navtitle` is used to render the title of the topic in the [DITA Maps Manager](#).

## Insert topic reference section

Allows you to specify that when inserting a topic reference (using the [Insert Reference dialog box](#) and [Edit Properties dialog box](#)), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `scope` attribute will always be automatically populated with a detected value.
- **Type** - If selected, the `type` attribute will always be automatically populated with a detected value.
- **Navigation title** - If selected, the `navtitle` attribute will always be automatically populated with a detected value.

## Insert link section

Allows you to specify that when a link reference is inserted (using actions in the  **Link** drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `scope` attribute will always be automatically populated with a detected value.
- **Type** - If selected, the `type` attribute will always be automatically populated with a detected value.

## Use '#' instead of the ID of the parent topic (DITA 1.3)

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with "#." (`#./elementId`). For more information, see <https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html>.

## Profiling Attributes link

Opens the [Profiling/Conditional Text preferences page](#) where you can configure profiling attributes and condition sets.

## DITA New Topics Preferences

To access the DITA New Topics preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **DITA > New topics**. This preferences page includes the following options:

### Use the title to generate the file name

This option (and its sub-options) pertain to the rules that will be used to generate file names in the [New DITA File dialog box](#). Select this option to use the text entered in the **Title** field to automatically generate a file name (the generated name can be seen in the **Save as** field). By default, the generated name will replace spaces with underscores (`_`), all illegal characters will be removed, and all upper case characters changed to lower case, but you can use the sub-options to change this.

### Replace spaces with

If selected, the file name generation mechanism will replace spaces in the title with the character entered in this option.

### Lower case only

If selected, the file name generation mechanism will only use lower case letters.

### Use camel case

If selected, the file name generation mechanism will convert the title to a file name using the *camel case* convention where the first word starts with a lower case letter and all subsequent words begin with upper case (for example, myFileName).

### Upper case first letter

Select this option if you want the file name generation mechanism to convert the title to a file name using the *camel case* convention but with an upper case letter for the first word (for example, MyFileName).

### Use the file name as the value of the root ID attribute

Select this option to use the file name (as seen in the **Save as** field but without the file extension) as the value of the root id attribute for the new topic.

## DITA Logging Preferences

To access the DITA Logging preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **DITA > Logging**. This preferences page includes the following sections and options:

### Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

### Show the following types of messages in a new tab

This section allows you to specify which types of messages will be displayed in separate tabs in the message panel at the bottom of the editor if a DITA transformation results in errors or warnings. You can choose whether or not to display the following types of messages:

- DITA-OT errors
- DITA-OT warnings
- DITA-OT info
- FOP errors
- FOP warnings
- FOP info
- XSLT problems

## Data Sources Preferences

To configure the **Data Sources** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see [Download Links for Database Drivers](#) on page 135.

### Connection Wizards Section

#### Create eXist-db XML connection

Click this link to open the dedicated [Create eXist-db XML connection dialog box](#) that provides a quick way to create an eXist connection.

### Data Sources Section

This section allows you to add and configure data sources.

**Figure 34: Data Sources Preferences Panel**

The following buttons are available at the bottom of the **Data Sources** panel:

**+ New**

Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

**Figure 35: Data Sources Drivers Dialog Box**

The following options are available in the **Data Source Drivers** dialog box:

- **Name** - The name of the new data source driver that will be used for creating connections to the database.
- **Type** - Selects the data source type from the supported driver types.
-  **Help button** - Opens the User Manual at [the list of the sections](#) where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.
- **Driver files (JAR, ZIP)** - Lists [download links for database drivers](#) that are necessary for accessing databases in Oxygen XML Author.
- **Add Files** - Adds the driver class library.
- **Add Recursively** - Adds driver files recursively.
- **Remove** - Removes the selected driver class library from the list.
- **Detect** - Detects driver file candidates.
- **Stop** - Stops the detection of the driver candidates.

- **Driver class** - Specifies the driver class for the data source driver.

### Edit

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. To edit a data source, there must be no connections using that data source driver.

### Duplicate

Creates a copy of the selected data source.

### Delete

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

## Connections Section

This section allows you to add and configure data source connections.

**Figure 36: Connections Preferences Panel**

The following buttons and options are available at the bottom of the **Connections** panel:

### New

Opens the **Connection** dialog box that allows you to configure a new database connection.

**Figure 37: Connection Dialog Box**

The following options are available in the **Connection** dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the **Data Source Drivers** dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.
- **Collection** - One of the available collections for the specified data source.
- **Environment home directory** - Specifies the home directory (only for a Berkeley database).
- **Verbosity** - Sets the verbosity level for output messages (only for a Berkeley database).
- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

#### **Edit**

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

#### **Duplicate**

Creates a copy of the selected connection.

#### **Delete**

Deletes the selected connection.

#### **Move Up**

Moves the selected connection up one row in the list.

#### **Move Down**

Moves the selected connection down one row in the list.

### **Limit the number of cells**

For performance issues, you can set the maximum number of cells that will be displayed in the [Table Explorer view](#) for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the [Table Explorer view](#), a warning dialog box will inform you that the table is only partially shown.

### **Maximum number of children for container nodes**

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the [Data Source Explorer view](#) would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. You can navigate to other contained resources from the same container by using the *Up* and *Down* buttons in the [Data Source Explorer view](#). This limited number is set in the field. The default value is 200 nodes.

### **Table Filters Preferences**

The **Table Filters** preferences page allows you to choose the types of tables to be shown in the [Data Source Explorer view](#). To open this preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources > Table Filters**.

You can choose to display the following types of tables:

- **Alias**
- **Global Temporary**
- **Local Temporary**

- **Synonym**
- **System Table**
- **Table**
- **View**

### Download Links for Database Drivers

For a list of major relational databases and the drivers that are available for them, see [https://www.oxygenxml.com/database\\_drivers.html](https://www.oxygenxml.com/database_drivers.html).

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Author:

- **Berkeley DB XML database** - Copy the *jar* files from the Berkeley database install directory into the Oxygen XML Author install directory as described in [the procedure for configuring a Berkeley DB data source](#).
- **IBM DB2 Pure XML database** - Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the *db2jcc.jar* and *db2jcc\_license\_cu.jar* files in Oxygen XML Author for [configuring a DB2 data source](#).
- **eXist database** - Copy the *jar* files from the eXist database install directory to the Oxygen XML Author install directory as described in [the procedure for configuring an eXist data source](#).
- **MarkLogic database** - Download the MarkLogic driver from [MarkLogic Community site](#).
- **Microsoft SQL Server 2005 / 2008 database** - Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to <http://www.microsoft.com/en-us/download/details.aspx?id=21599>. For SQL Server 2012 and 2014 go to <http://www.microsoft.com/en-us/download/details.aspx?id=11774>.
- **Oracle 11g database** - Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called *ojdbc6.jar*.
- **PostgreSQL 8.3 database** - Go to <http://jdbc.postgresql.org/download.html> and download the PostgreSQL 8.3 JDBC3 driver.
- **Documentum xDB (X-Hive/DB) 10 XML database** - Copy the *jar* files from the Documentum xDB (X-Hive/DB) 10 database install directory to the Oxygen XML Author install directory as described in [the procedure](#) for configuring a Documentum xDB (X-Hive/DB) 10 data source.

### SVN Preferences

To configure the options for the SVN client tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN**. Some other preferences for the embedded SVN client tool can be set in the global files called *config* and *servers*. These files contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their computer login account. To open these files for editing, launch the embedded SVN client tool (**Tools > SVN Client**) and select **Global Runtime Configuration > Edit 'config' file** or **Global Runtime Configuration > Edit 'servers' file** from the SVN client **Options** menu.

Figure 38: SVN Preferences Panel

The following SVN options can be configured in this preferences page:

### **Enable symbolic link support (available only on Mac OS X and Linux)**

Apache Subversion™ has the ability to put a symbolic link under version control, via the usual SVN `add` command. The Subversion repository has no internal concept of a symbolic link. It stores a versioned symbolic link as an ordinary file with a `svn:special` property attached. On Unix/Linux, the SVN client sees the property and translates the file into a symbolic link in the working copy. If the symbolic link support is disabled, the versioned symbolic links appear as a text file instead of symbolic link.

**Note:** Windows file systems have no symbolic links, so a Windows client will not do any such translation and the object appears as a normal file.

**Important:** It is recommended to disable symbolic links support if you do not have versioned symbolic links in your repository, since the SVN operations will work faster. However, you should not disable this option when you do have versioned symbolic links in repository. In that case a workaround would be to reference the working copy by its real path, instead of a path that includes a symbolic link.

### **Allow unversioned obstructions**

Controls how to handle a situation where working copy resources are ignored / unversioned when performing an update operation and incoming files (from the repository) with the same name and location intersect with those being ignored / unversioned. If the option is selected, the incoming items will become BASE revisions of the ones already present in the working copy, and those present will be made versioned resources and will be marked as modified (exactly as if the user first made the update operation and then modified the files). If the option is not selected, the update operation will fail when encountering files in this situation, possibly leaving other files not updated. By default, this option is selected.

### **Use unsafe copy operations**

Sometimes when the working copy is accessed through Samba and the SVN client cannot make a safe copy of the committed file due to a delay in getting a write permission, the result is that the committed file will be saved with zero length (the content is removed) and an error will be reported. In this case, this option should be selected so that the SVN client does not try to make the safe copy.

### **HTTPS encryption protocols (available if you are using Java version 1.6 or older)**

Sets a specific encryption protocol to be used when the [application accesses a repository through HTTPS protocol](#). You can choose one of the following values:

- **SSLv3, TLSv1** (default value)
- **SSLv3 only**
- **TLSv1 only**

### **Results Console**

Specifies the maximum number of lines displayed in the **Console** view. The default value is 1000.

### **Annotations View**

Sets the color used in the editor panel for highlighting all the changes contributed to a resource by the revision selected in [the Annotations view](#).

### **Revision Graph**

Enables caching for the action of computing a revision graph. When a new revision graph is requested, one of the caches from the previous actions may be used that will avoid running the whole query again on the SVN server. If a cache is used, it will finish the action much faster.

### **Working Copy Preferences**

To configure the **Working Copy** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN > Working Copy**. The options in this preferences page are specific to SVN working copies and they include the following:

#### **Working copies location**

Allows you to define a location where you keep your working copies. This location is automatically suggested when you checkout a new working copy.

### Working copy administrative directory

Allows you to customize the directory name where the SVN entries are kept for each directory in the working copy.

### When loading an old format working copy

You can instruct the SVN client to do one of the following:

- **Always ask** - You are notified when such a working copy is used and you are allowed to choose what action to be taken - to upgrade or not the format of the current working copy.
- **Never upgrade** - Older format working copies are left untouched. No attempt to upgrade the format is made.

**Note:** SVN 1.6 and older working copies still need to be upgraded before loading them.

### Enable working copy caching

If selected, the content of the working copies is cached for refresh operations.

### Automatically refresh the working copy

If selected, the working copy is refreshed from cache. Only the new changes (modifications with a date/time that follows the last refresh operation) are refreshed from disk. This option is not selected by default.

### Allow moving/renaming mixed revision directories

If selected, Oxygen XML Author will allow you to move or rename a directory even if its child items have a different revision. Otherwise, an error message is displayed when there are multiple revisions to avoid unnecessary conflicts. It is recommended to leave this option deselected and to **Update** the subtree to a single revision before moving or renaming it.

### When synchronizing with repository

The action that will be executed automatically after the **Synchronize** action. The possible actions are:

- **Always switch to 'Modified' mode** - The **Synchronize** action is followed automatically by a switch to **Modified** mode of **Working Copy** view, if **All Files** mode is currently selected.
- **Never switch to 'Modified' mode** - Keeps the currently selected view mode unchanged.
- **Always ask** - The user is always asked if they want to switch to **Modified** mode.

### Application global ignores

Allows you to set file patterns that may include the \* and ? wildcards for unversioned files and folders that must be ignored when displaying the working copy resources in *the Working Copy view*. These patterns are case-sensitive. For example, \*.txt matches file.txt, but does not match file.TXT.

### Diff Preferences

To configure the SVN Diff options, *open the Preferences dialog box (Options > Preferences)* and go to **Diff**.

The following option is available:

#### Compare With External Application

Specifies an external application to be launched for compare operations in the following cases:

- When two history revisions are compared.
- When the working copy file is compared with a history revision.
- When a conflict is edited.

The parameters `${firstFile}` and `${secondFile}` specify the positions of the two compared files in the command line for the external diff application. The parameter `${ancestorFile}` specifies the common ancestor (that is, the BASE revision of a file) in a three-way comparison. The working copy version of a file is compared with the repository version, with the BASE revision (the latest revision read from the repository by an Update or Synchronize operation) being the common ancestor of these two compared versions.

**Important:** If the path to the external compare application includes spaces (or any of the subsequent options or arguments), then each of these paths or *tokens* must be double-quoted for the Oxygen XML Author to correctly parse and identify them. For example, `C:\Program Files\compareDir\app name.exe` must be written as `"C:\Program Files\compareDir\app name.exe"`.

## Messages Preferences

The **Messages** preferences page allows you to disable certain warning messages that may appear in the application. To configure these options, *open the Preferences dialog box (Options > Preferences)* and go to **SVN > Messages**.

This preferences page allows you to disable the following warning messages:

### Show confirmation dialog when using the "Update All" action

Allows you to avoid performing accidental update operations by requesting you to confirm them before execution.

### Show confirmation dialog for drag and drop actions in Working Copy

This option avoids doing a drag and drop when you just want to select multiple files in the **Working Copy** view.

### Show warning dialog when editing conflicts

When the **Edit Conflicts** action is executed, a warning dialog box notifies you that the action overwrites the conflicted version of the file created by an update operation. The conflicted file is overwritten with the version of the same file that existed in the working copy before the update operation and then *proceeds with the visual editing of the conflicting file*.

### Show warning dialog when "svn:externals" definitions are ignored

A warning dialog box is displayed when "svn:externals" definitions are ignored before performing any operation that updates resources of the working copy (such as *Update* and *Override and Update*).

## Diff Preferences

The Diff Preferences Page has sub-pages for configuring File Comparisons and Directory Comparisons.

### Files Comparison Preferences

To configure the **Files Comparison** options, *open the Preferences dialog box (Options > Preferences)* and go to **Diff > Files Comparison**.

**Diff / Files Comparison**

Enable file comparison in Author mode

Ignore Whitespaces

**Two-Way Diff**

Default algorithm: Auto

Algorithm strength: Medium

**Three-Way Diff**

Default algorithm: Auto

Algorithm strength: Medium

Show pseudo conflicts

**XML Diff**

Ignore:

Node/Type

Processing Instruction

Comments

CDATA

DOCTYPE

Text

Namespaces/Prefixes

Namespaces

Prefixes

Namespace declarations

Order

Attribute order

Ignore nodes by XPath:

Merge adjacent differences

Mark end tags as different for modified elements

Ignore expansion state for empty elements

**Figure 39: Files Comparison Preferences Page**

This preferences page allows you to configure the following options:

### Enable file comparison in Author mode

When selected, a visual **Author** mode is available in the file comparison tool. It displays the files in a visual mode similar to the **Author** editing mode in Oxygen XML Editor/Author. This visual mode is available when both compared files are detected as being XML and from a recognized document type.

### Ignore Whitespaces

If selected, before performing the comparison, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces.

**Note:** If the **Ignore Whitespaces** checkbox is selected, comparing the a b sequence with a b, Oxygen XML Author finds no differences, because after normalization, all whitespaces from the first sequence are collapsed into a single space character. However, when comparing a b with ab (no whitespace between a and b), Oxygen XML Author signals a difference.

### Two-Way Diff section

#### Default algorithm

The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.

- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Author, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

#### Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

### Three-Way Diff section

#### Default algorithm

The default algorithm used for performing a three-way comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

#### Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

#### Show pseudo conflicts

Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).

### XML Diff section (these options do not apply when the file comparison is in Author mode)

#### Ignore

Allows you to specify the types of XML nodes that will be ignored in the file comparison for the **XML Fast** and **XML Accurate** algorithms.

#### Ignore nodes by XPath

If selected, you can enter an *XPath expression* to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. The XPath expression specified in this option is used as the default ignore instructions **only** when the application is started. If you enter an XPath expression in the similar option on the **Diff Files** toolbar, that expression will be used instead.

#### Merge adjacent differences

If selected, the application considers two adjacent differences as one when the differences are painted in the side-by-side editors. If not selected, every difference is represented separately.

#### Mark end tags as different for modified elements

If selected, end tags of modified elements are also presented as differences. Otherwise, only the start tags are presented as differences.

#### Ignore expansion state for empty elements

If selected, empty elements in both expansion states are considered matched (that is `<element />` and `<element></element>` are considered equal).

## Appearance Preferences

To configure the appearance options for the Files Comparison tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Files Comparison > Appearance**. This preferences page offers the following options:

**Figure 40: Files Comparison Appearance Preferences Panel**

### Line wrap

Wraps the lines presented in the two diff panels at the right margin of each panel, so no horizontal scrollbar is necessary.

### Incoming color

Specifies the color used on the vertical bar for incoming changes.

### Outgoing color

Specifies the color used on the vertical bar for outgoing changes.

### Conflict color

Specifies the color used on the vertical bar for conflicts between the compared files.

## Directories Comparison Preferences

To configure the **Directories Comparison** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Directories Comparison**.

**Figure 41: Diff Preferences Page**

You can specify the following options for the directories comparison tool:

### Compare files by

Controls the method used for comparing two files:

- **Content** - The file content is compared using the current [diff algorithm](#). This option is applied for a pair of files only if that file type is associated with a built-in editor type (either associated by default or associated by the user when prompted to do so on opening a file of that type for the first time).

You can use the **Configure content comparison** link to open the [Files Comparison preferences page](#) where you can configure options for comparing files. However, the **Ignore nodes by XPath** option is ignored when using the **Compare Directories** tool.

- **Binary Compare** - The files are compared at byte level.
- **Timestamp (last modified date / time)** - The files are compared only by their last modified timestamp.

### Look in archives

If selected, [known archive types](#) are considered directories and their content is compared just like regular files.

### Navigation

This options control the behavior of the differences traversal actions (**Go to previous modification**, **Go to next modification**) when the first or last difference in a file is reached:

- **Ask what to do next** - A dialog box is displayed asking you to confirm that you want the application to display modifications from the previous or next file.
- **Go to the next/previous file** - The application opens the next or previous file without waiting for your confirmation.
- **Do nothing** - No further action is taken.

### Appearance Preferences

To configure the appearance options for the Directories Comparison tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Directories Comparison > Appearance**.

Figure 42: Diff Appearance Preferences Panel

- **Added/Deleted** - Color used for marking added or deleted files and folders.
- **Modified** - Color used for marking modified files.

### Archive Preferences

To configure *Archive* options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Archive**.

The following options are available in the **Archive** preferences page:

#### Archive backup options

Controls if the application makes backup copies of the modified archives. The following options are available:

- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

**Note:** Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

#### Archive types

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Author. You can use the **Edit** button at the bottom of the table to edit an existing mapping or the **New** button to create a new one and associate your own list of extensions to an archive format.

**Figure 43: Edit Archive Extension Mappings**

**Important:** You have to restart Oxygen XML Author after removing an extension from the table for that extension to not be recognized as an archive extension.

### Store Unicode file names in Zip archives

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

## Plugins Preferences

You can add *plugins* that extend the functionality of Oxygen XML Author. The *plugins* are shipped as separate packages. To check for new *plugins*, go to [http://www.oxygenxml.com/oxygen\\_sdk.html](http://www.oxygenxml.com/oxygen_sdk.html).

A *plugin* consists of a separate sub-folder in the Plugins folder of the Oxygen XML Author installation folder (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`). This sub-folder must contain a valid `plugin.xml` file in accordance with the `plugin.dtd` file located in the Plugins folder.

Oxygen XML Author automatically detects and loads *plugins* installed correctly in the Plugins folder and displays them in the **Plugins** preferences page. To configure *plugins*, *open the Preferences dialog box (Options > Preferences)* and go to **Plugins**.

You can use the checkboxes in front of each *plugin* to enable or disable them. To display the properties of a *plugin* in the second section of the **Plugins** preferences page, click the name of the *plugin*.

**Figure 44: Plugins Preferences Panel**

Also, you can install a *plugin* as an add-on. For further details about this, go to [Deploying Add-ons](#)

## External Tools Preferences

A command-line tool can be started in the Oxygen XML Author user interface as if from the command line of the operating system shell. The **External Tools** preferences page allows you to add and configure these external tools that could be used while working with Oxygen XML Author. To access this preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).

This preferences page presents a list of the external tools that have been configured. You can use the buttons at the bottom of the page to configure the items in the list. Once a tool has been configured, you can open it by selecting it from the **Tools > External Tools** menu or from the  **External Tools** drop-down menu on the toolbar (the **Tools** toolbar needs to be selected in the [Configure Toolbars dialog box](#)).

### How to Configure an External Tool

To configure an external tool in the **External Tools** preferences page, use any of the following buttons at the bottom of the page:

- **New** - Adds a new external tool to the list.
- **Edit** - Allows you to configure an existing external tool, selected from the list.
- **Duplicate** - Duplicates an existing external tool, selected from the list, to use as a template for configuring a similar tool.

Any of those three buttons opens the **External Tools** configuration dialog box.

**Figure 45: External Tools Configuration Dialog Box**

This configuration dialog box includes the following options:

#### **Name**

The name of tool that will be displayed in the **Tools > External Tools** menu and in the  **External Tools** drop-down menu on toolbar.

#### **Description**

A description of the tool displayed as a tooltip where the tool name is used.

#### **Working directory**

The directory that the external tool will use to store intermediate and final results. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button. You can use one of the following editor variables: `${cfd}`, `${pd}`, `${oxygenInstallDir}`, `${homeDir}`, `${system(var.name)}`, `${date(pattern)}`, `${xpath_eval(expression)}`. You can also use the browsing tools to select the directory.

#### **Command line**

The command line that will start the external tool. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button. You can use one of the following editor variables: `${homeDir}`, `${home}`, `${cfn}`, `${cfne}`, `${cf}`, `${currentFileURL}`, `${cfd}`, `${cfdu}`, `${tsf}`, `${pd}`, `${pdu}`, `${oxygenInstallDir}`, `${oxygenHome}`, `${frameworksDir}`, `${frameworks}`, `${ps}`, `${timeStamp}`, `${uuid}`, `${id}`, `${afn}`, `${afne}`, `${af}`, `${afu}`, `${afd}`, `${afdu}`, `${ask('message', type, 'default_value')}`, `${dbgXML}`, `${dbgXSL}`, `${env(VAR_NAME)}`, `${system(var.name)}`, `${date(pattern)}`, and `${xpath_eval(expression)}`. You can also use the browsing tools to select a file path.

#### **Show output messages**

When this option is selected, all the messages emitted by the external tool are displayed in the **Results view**. When this option is not selected, only the error messages are displayed. You can also choose the output encoding and content type:

- **Output encoding** - The encoding of the output stream of the external tool that will be used by Oxygen XML Author to read the output of the tool.
- **Output content type** - A list of predefined content type formats that instruct Oxygen XML Author how to display the generated output. For example, setting the **Output content type** to `text/xml` enables the syntax coloring of XML output.

## Error Encoding

The encoding of the error stream of the external tool that will be used by Oxygen XML Author to read the error stream.

## Shortcut key

You can choose a keyboard shortcut that can be used to launch the external tool.

## Menu Shortcut Keys Preferences

You can use the **Menu Shortcut Keys** preferences page to configure shortcut keys for the actions available in Oxygen XML Author. The shortcuts assigned to actions are displayed in a table in this preference page. To access the full list of shortcut keys, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Menu Shortcut Keys** (or simply go to **Options > Menu Shortcut Keys**).

For a list of the most commonly used shortcuts, see [Frequently Used Shortcut Keys](#) on page 18.

Name	Category	Shortcut key
Remove all	Bookmarks	Ctrl+F7
Remove all	Breakpoints	Ctrl+Shift+F7
Remove all	Highlights	
Remove all	Results	
Remove comment(s)	Edit	
Remove from Disk	Project	Shift+Delete
Remove from Project	Project	Delete
Remove from version control	Working copy	
Remove highlight(s)	Edit	
Remove selected	Results	Delete
Rename	Archive Browser	F2
Rename	File	F2
Rename	Markup	
Rename	Project	F2
Rename	SharePoint	F2
Repositories	Perspective	

Figure 46: Menu Shortcut Keys Preferences Page

The **Menu Shortcut Keys** preferences page also contains the [shortcuts that you define at document type level](#).

**Note:** A shortcut defined at *document type* level overwrites a default shortcut.

To find a specific action, you can use the filter text field to search through any of the columns in the table. You can also press shortcut key combinations on your keyboard to filter the list and click on a column header to sort that column.

The table includes the following columns or options:

- **Description** - A short description of the action.
- **Category** - A classification of the actions in categories for easier management and more flexibility in assigning multiple keys for the same action.
- **Shortcut key** - The combination of keyboard keys that can be used to launch the action. To add or change a shortcut key, you can either double-click a row or select the row and press the **Edit** button.
- **'Home' and 'End' keys are applied at line level** (available on Mac OS X only) - Controls the way the HOME and END keys are interpreted. If selected, the default behavior of these keys is overridden and the cursor only moves on the current line.

## How to Assign a Shortcut Key or Edit an Existing Shortcut

To assign a shortcut key to an action or edit an existing shortcut configuration, follow these steps:

1. Select the action in the table.
2. Click the **Edit** button.

**Step Result:** The **Shortcut key** configuration dialog box is displayed.

**Figure 47: Shortcut Key Configuration Dialog Box**

3. Press the desired shortcut keys on your keyboard.
4. If you need the shortcut to work on multiple platforms, select the **Enable platform-independent shortcut keys** option. In this case, the following modifiers are used:
  - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
  - M2 represents the **Shift** key.
  - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
  - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
5. Click **OK** to save your configuration.

### Related Information:

[Frequently Used Shortcut Keys](#) on page 18

## File Types Preferences

Oxygen XML Author offers built-in editing support for a wide variety of file types, but you can also add new file extensions and associate them with whatever editor type fits your needs. The associations set here between a file extension and the type of editor will determine which editor will be opened for editing purposes when that type of file is created or opened.

To configure the **File Types** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **File Types**.

**Figure 48: File Types Preferences Page**

The table contains the following columns:

- **Extension** - The extensions of the files that will be associated with an editor type.
- **Editor** - The type of editor which the extensions will be associated with. Some editors provide easy access to frequent operations via toolbars (XML editor, XSL editor, DTD editor) while others provide just a syntax highlight scheme (Java editor, SQL editor, Shell editor, etc.).

If the editor set here is not one of the XML editors (XML editor, XSL editor, XSD editor, RNG editor, WSDL editor) then the encoding set in the [Encoding for non XML files option](#) is used for opening and saving a file of this type.

The files that match the **Binary file patterns** patterns are handled as binary and opened in the associated system application. Also, they are excluded from the following actions available in the [Project view](#): **File/Replace in Files, Check Spelling in Files, Validate**.

## Open/Find Resource Preferences Page

You can configure various options that pertain to the [Open/Find Resource dialog box](#) and [Open/Find Resource view](#). To access these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Open/Find Resource**.

The following options are available in this **Open/Find Resource** preferences page:

### Limit search results to

Specifies the maximum number of results that are displayed in the [Open/Find Resource dialog box/view](#).

### Enable searching in content

This option is selected by default and it allows you to use the [Open/Find Resource dialog box/view](#) to search in content or reviews, as well as in file paths. If this option is not selected, you can only use the **Open/Find Resource** feature to search in file paths.

### Content search scope section

#### Ignore content of these files

Allows you to select specific directories, files, or file types that are ignored when you perform a search. For example, `*.txt` ignores all the `.txt` files, `*/topics/*` ignores all the files from the `topics` directory, regardless of their depth, and `file:/C:/tmp/*` ignores everything from the `tmp` directory.

**Note:** The specified pattern must begin with the desired protocol (in our case *file*) and also contain forward slash (/).

#### Index the content of remote resources

Controls the indexing of resources that are not local. For example, the resources referenced in a [DITA map](#) opened from a remote server (from a CMS or from a WebDAV location) are not indexed by default. To index the content of these resources, select this option.

**Note:** Selecting this option may lead to delays when the indexing is computed.

### Content search options section

#### Content language

Use this option to specify a language for the search engine to use for the current document. This is helpful if you have multiple languages within the content of a document. The search engine will use a set of *stop words* and analyzers tuned specifically for that specific language. By default, it is mapped to the [UI language specified in the Global preferences page](#). Therefore, you need to change this option only if the language of the text you want to perform the search in differs from the UI language.

**Tip:** If you select **<Generic language (no stemming)>** from the drop-down list, no word stemming is performed when creating the index. This might be useful if your content has many technical terms that should be indexed as they are.

#### Stop words

A list of *stop words* that will be filtered out of the search processing. The list is automatically populated based upon the specified **Content language**, but you can add or remove words from the list.

### When searching in content, return

This option specifies how matches are returned when doing searches in content. You can choose between two options:

- **Exact matches** - The search results match the exact whole words that you enter in the search field of the **Open/Find Resource** dialog box/view.
- **Prefix matches** (default) - The search results match documents that contain words starting with the search terms. For instance, searching for "pref page" will also find documents containing "preference page".

### Automatically join search terms using:

Allows you to select the default boolean operator that Oxygen XML Author applies when you perform a search. For example, if the AND operator is selected and you search for "car assembly", the matches must contain both of the words. If you choose OR, the matches must contain one of the selected search terms and results that contain both words are promoted to the top of the list.

### Enable XML-aware searching

When selected, you can perform *XML-specific searches* for XML elements and attributes.

**Note:** Selecting this option may slow down the indexing of your documents and increase the index size on the disk.

### Index files with size less than (KB)

Since indexing can be slowed down when the *Enable XML-aware searching option* is active, you can use this option to set a maximum file size to be indexed.

### Stop Words

A list of comma separated *stop words*, meaning that the words added in this list are filtered out prior to processing a search query.

### Related Information:

[Open/Find Resource View](#) on page 205

[Open/Find Resource Dialog Box](#) on page 424

## Custom Editor Variables Preferences

An *editor variable* is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the *built-in editor variables*.

Custom editor variables are created and configured in the **Custom Editor Variables** preferences page. To access this page, *open the Preferences dialog box (Options > Preferences)* and go to **Custom Editor Variables**.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable **Name**, its **Value**, and its **Description**. To create a new variable, click the **New** button at the bottom of the table and define your custom editor variable in the subsequent dialog box. To edit an existing custom editor variable, click the **Edit** button and configure the variable in the subsequent dialog box. You can also use the **Delete** button to remove custom editor variables that are no longer needed.

Custom Editor Variables		
Name	Value	Description
<code>\${startDir}</code>	<code>.././bin</code>	Start directory of command line validator
<code>\${standardParams}</code>	<code>-c config.xml -v -level 5 -list</code>	List of command line standard parameters

Figure 49: Custom Editor Variables Table

## Network Connection Settings Preferences

This section presents the options available in the **Network Connection Settings** preferences pages.

### Proxy Preferences

Some networks use proxy servers to provide internet services to LAN clients. Therefore, clients behind the proxy may only connect to the Internet via the proxy service. If you are not sure if your computer is required to use a proxy server to connect to the Internet or you do not know the proxy parameters, consult your network administrator.

To configure the **Proxy** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > Proxy**. The following options are available:

#### Proxy section

Specifies how HTTP(S) connections go through the proxy server. You can choose between the following three options:

- **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
- **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.

**Attention:** The system settings for the proxy cannot be read correctly from the operating system on some Linux systems. The system settings option should work properly on Gnome based Linux systems, but it does not work on KDE based ones as the Java virtual machine does not offer the necessary support yet.

- **Manual proxy configuration** - HTTP(S) connections will go through the proxy server specified in the **Web Proxy (HTTP/HTTPS)** section.

#### Web Proxy (HTTP/HTTPS) section

##### Address

The address of the proxy server used for manual configurations.

##### Port

The port of the proxy server used for manual configurations.

##### No proxy for

Specifies the hosts that the connections must not go through a proxy server. A host needs to be written as a fully qualified domain name (for example, `myhost.example.com`) or as a domain name (for example, `example.com`). Use a comma to separate multiple hosts.

##### User

The user name for authentication with the proxy server.

## Password

The password for authentication with the proxy server.

## SOCKS Proxy section

### Address

The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.

### Port

The port of a SOCKS proxy that all connections will pass through.

## Using a Proxy Auto-Configuration Script (PAC)

If you have set up the path to a Proxy auto-configuration script in your system, Oxygen XML Author cannot detect this setting out of the box.

You can create a new folder (`[OXYGEN_INSTALL_DIR]\lib\endorsed`) in which you should copy two additional Java libraries: `deploy.jar` and `plugin.jar`. These libraries can be found in the `[OXYGEN_INSTALL_DIR]\jre\lib` folder if the application came with a bundled Java VM (otherwise, in the Java VM installation used to run the application).

## HTTP(S)/WebDAV Preferences

To set the **HTTP(S)/WebDAV** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > HTTP(S)/WebDAV**. The following options are available:

### Internal Apache HttpClient Version

Oxygen XML Author uses the Apache HttpClient to establish connections to HTTP servers. For Oxygen XML Author to benefit from particular sets of features provided by different versions, you may choose between v3 and v4.

**Note:** For a full list of features, go to <http://hc.apache.org/httpclient-3.x/> and <http://hc.apache.org/httpcomponents-client-ga/>.

### Maximum number of simultaneous connections per host

Defines the maximum number of simultaneous connections established by the application with a distinct host. Servers might consider multiple connections opened from the same source to be a **Denial of Service** attack. You can avoid that by lowering the value of this option.

**Note:** The minimum value that can be set in this option is 5.

### Read Timeout (seconds)

The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

### Enable HTTP 'Expect: 100-continue' handshake (for HTTP/1.1 protocol)

Activates *Expect: 100-Continue* handshake. The purpose of the *Expect: 100-Continue* handshake is to allow a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the *Expect: 100-continue* handshake can result in noticeable performance improvement when working with databases. The *Expect: 100-continue* handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support the HTTP/1.1 protocol.

### Use the 'Content-Type' header field to determine the content type

When selected, Oxygen XML Author tries to determine a resource type using the **Content-Type** header field. This header indicates the *Internet media type* of the message content, consisting of a type and subtype. For example:

```
Content-Type: text/xml
```

When unchecked, the resource type is determined by analyzing its extension. For example, a file ending in `.xml` is considered to be an XML file.

### Automatic retry on recoverable error

When selected, if an HTTP error occurs when Oxygen XML Author communicates with a server via HTTP (for example, sending or receiving a SOAP request to or from a Web services server) and the error is recoverable, Oxygen XML Author tries to re-send the request to the server.

### Automatically accept a security certificate, even if invalid

When selected, the HTTPS connections that Oxygen XML Author attempts to establish with will accept all security certificates, even if they are invalid.

**Important:** By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate's issuer.

### Lock WebDAV files on open

If selected, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

## (S)FTP Preferences

To configure the (S)FTP options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > (S)FTP**. You can customize the following options:

Figure 50: (S)FTP Configuration Preferences Panel

- **Encoding for FTP control connection** - The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding Oxygen XML Author will use it for communication. Otherwise, it will use ISO-8859-1.
- **Public known hosts file** - File containing the list of all SSH server host keys that you have determined are accurate. The default value is ``${homeDir}/.ssh/known_hosts`.
- **Private key file** - The path to the file containing the private key used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in [the Open URL dialog box](#).
- **Passphrase** - The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in [the Open URL dialog box](#).

## Trusted Hosts Preferences

This preferences page contains a list of domains that have been identified as trusted. You can add or remove domains from the list and Oxygen XML Author will allow connections to the listed hosts without requesting user confirmation.

To configure the **Trusted Hosts** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > Trusted Hosts**. The following options are available:

- **New** - Allows you to manually add a new entry to the list of trusted hosts.  
**Tip:** You can specify a specific port at the end of the URL (for instance, `www.example.com:8080`). Otherwise, if no port is specified, connections will be allowed on all ports for the particular host.
- **Delete** - Allows you to remove an entry from the list of trusted hosts.

## SSH Preferences

To configure the **SSH** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Connection settings > SSH**. The following options are available:

- **SSH** - Specifies the command line for an external SSH client that will be used when connecting to a SVN+SSH repository. Absolute paths are recommended for the SSH client executable and the file paths given as arguments (if any). Depending on the SSH client used and your SSH server configuration, you may need to specify the user name and/or private key/passphrase in the command line. You can also choose whether to use the **Default SVN user** (the same user name as the SSH client user) or **Prompt for a SVN user** for SVN repository operations whenever SVN authentication is required. For example, on Windows the following command line uses the `plink.exe` tool as the external SSH client for connecting to the SVN repository with SVN+SSH:

```
C:\plink-install-folder\plink.exe -l username -pw password -ssh -batch  
host_name_or_IP_address_of_SVN_server
```

## XML Structure Outline Preferences

To configure options in regards to the **Outline view**, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML Structure Outline**. It contains the following options:

### Preferred attribute names for display

The preferred attribute names when displaying the attributes of an element in the **Outline view**. If there is no preferred attribute name specified, the first attribute of an element is displayed.

### Enable outline drag and drop

Drag and drop is disabled for the tree displayed in the **Outline view** only if there is a possibility to accidentally change the structure of the document by such operations.

## Views Preferences

The **Views** preferences page allows you to configure some options in regards to certain views. To edit these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Views**.

The following options are available:

### Project view section

#### Enable drag-and-drop in Project view

Enables drag and drop support in the **Project view**. It should be disabled only if there is a possibility of accidentally changing the structure of the project by drag and drop actions.

### Information view section

#### Maximum number of lines

Specifies the maximum number of lines that can be written in the **Information view**.

### Elements view section

#### Show only items allowed at cursor position

If selected, when editing in **Author** mode, only the elements that are allowed at the current cursor position will be listed in the **Elements view**. If not selected, two additional tabs (**Before** and **After**) will be displayed at the bottom of the view (in **Author** mode only). These tabs list the elements that are allowed before or after the element at the current cursor position.

## Messages Preferences

The **Messages** preference page allows you to specify whether or not certain messages are displayed. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Messages**.

The following warning messages can be enabled or disabled:

### Show confirmation dialog when moving resources

Specifies whether or not to display a confirmation dialog box when you move a resource in the **Project view**, **Data Source Explorer view**, and **Archive Browser**. In the confirmation dialog box, there is an option to choose

to not show this dialog box in the future. To reset that behavior, simply select **Restore Defaults** at the bottom of this preferences page.

#### Show warning when adding resources already included in the project

Specifies whether or not to display a dialog box that warns you if you try to add files that already exist in your project.

#### Show warning for document size limit for bidirectional text, Asian languages, and other special characters

Specifies whether or not to display a warning message when an opened file that contains bidirectional characters is too large and bidirectional support is disabled.

#### Show warning message when changing the text orientation in the editor

Specifies whether or not to display a warning message when you change the text orientation in the editor.

#### Show warning when editing long expressions in the XPath toolbar

Specifies whether or not to display an information dialog box that allows you to specify if you want to use the [XPath/XQuery Builder](#) view when editing long XPath expressions.

#### Show MathFlow recommendation

Specifies whether or not to display an information dialog box that recommends using the [MathFlow Editor](#) to edit MathML equations.

#### Show SFTP certificate warning dialog

Specifies whether or not to display a warning dialog box each time the authenticity of the SFTP server host cannot be established.

#### Show Enterprise license related message when trying to connect to a Microsoft SharePoint server

Specifies whether or not to display an error message if you try to connect to a Microsoft SharePoint server without having the proper license.

#### Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions

Specifies whether or not to display a dialog box that allows you to choose a specific encoding whenever you use the **Encode Selection** or **Decode Selection** actions for [Base64](#), [Base32](#), or [Hex conversions](#). In the dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select **Restore Defaults** at the bottom of this preferences page.

## Configuring Options

---

A set of options controls the behavior of Oxygen XML Author, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Author includes several distinct layers of option values.

**Figure 51: Option Lookup Priority**

The option layers are as follows (sorted from high priority to low):

- [Project Options](#)

Allows project managers to establish a set of rules for a specific project. These rules standardize the information exchanged by the team members (for example, if the project is stored in a repository, a common

set of formatting rules avoid conflicts that may appear when documents modified by various team members are committed to the repository).

- [Global Options](#)

Allows individual users to personalize Oxygen XML Author according to their specific needs.

- [Customized Default Options](#)

Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

**Note:** Once this layer is set, it represents the initial state of Oxygen XML Author when an end-user uses the [Restore defaults](#) or [Reset Global Options](#) actions.

- **Default Options**

The predefined default or built-in values, tuned so that Oxygen XML Author behaves optimally in most working environments.

**Important:** If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

## Customizing Default Options

Oxygen XML Author has an extensive set of options that you can configure. When Oxygen XML Author is installed, these options are set to default values. You can provide a different set of default values for an installation using an XML *options file*.

### Creating an XML Options File

To create an *options file*, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Author and [open the Preferences dialog box \(Options > Preferences\)](#).
3. Go through the options and set them to the desired defaults. Make sure that [Global Options](#) is selected in each page.
4. Click **OK** and close the **Preferences** dialog box.
5. Go to **Options > Export Global Options** to create an XML options file.

### Controlling Which Options are Stored in the Default Options File

If you want to control exactly which option pages will be stored in the default options file, you can choose to attach them to a project file (.xpr file extension) by following this procedure:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In the [Project view](#), create a project or open an existing one.
3. [Open the Preferences dialog box \(Options > Preferences\)](#).
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to [Project Options](#) in each page.

**Note:** Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

5. Click **OK** and close the **Preferences** dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

## Configuring an Installation to Use Customized Default Options

There are several methods that you can use to configure an Oxygen XML Author installation to use the customized default options from the created XML options file.

**Warning:** The disadvantage of customizing the default options is that if the end user manually changes an option, the default value will no longer be used. An alternative would be to [use a plugin to impose a set of options](#).

The possible methods for using customized default options during an installation include:

- **Copy the XML Options File to the Installation Directory**

In the `[OXYGEN_INSTALL_DIR]`, create a folder called `preferences` and copy the created XML options file into it (for example, `[OXYGEN_INSTALL_DIR]/preferences/default.xml`).

- **Specify a Path to the XML Options File in a Startup Parameter**

Set the path to the XML options file as the value of the `com.oxygenxml.default.options` system property in the [startup parameters](#). The path can be specified with any of the following:

- A URL or file path relative to the application installation folder. For example:

```
-Dcom.oxygenxml.default.options=options/default.xml
```

- A system variable that specifies the file path. For example:

```
com.oxygenxml.default.options=${system(CONFIG)}/default.xml
```

- An environmental variable that specifies the file path. For example:

```
com.oxygenxml.default.options=${env(CONFIG)}/default.xml
```

**Note:** If you are using the [Java Webstart distribution](#), use the [optionsDir property](#) to specify the path of the options file (in this case, the file must be named `default.xml`), or you can edit the [.jnlp file](#) that launches the application and set the `com.oxygenxml.default.options` parameter using a property element, as in the following example:

```
<property name="oxy:com.oxygenxml.default.options" value="http://host/path/to/default.xml"/>
```

## Impose a Set of Options Using a Plugin

The [Oxygen XML SDK](#) includes a sample Java-based **oxygen-sample-plugin-impose-options** plugin that shows how to impose a set of options for the end users every time the API is called. It is possible to use this plugin to impose options but still allow the end user to change options by calling the API only once, the first time the plugin starts alongside Oxygen XML Author.

A similar JavaScript-based sample **impose-options** plugin is also available here: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins>. This plugin imports a fixed set of options (saved in XML format) when Oxygen XML Author starts.

### Related Information:

[Sharing Application Settings](#) on page 157

## Storing Global and Project Level Options

When you configure the Oxygen XML Author options, you can store them globally or bind them to a specific project by choosing the appropriate setting in the preferences pages. They can then be [shared with others by exporting the global options](#) or by [sharing the stored project-level files](#). The same is true with transformation and validation scenarios.

For each preferences page, you can choose between [Global Options](#) and [Project Options](#) depending upon how you want to store the options in that particular preferences page.

**Notice:** Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

If changes have been made to the options in a preferences page and you switch between **Project Options** and **Global Options**, a dialog box will be displayed that allows you to select one of the following:

- **Overwrite** - The existing options from the current preferences page will be overwritten.
- **Preserve** - The existing options from the current preferences page will be preserved.

**Figure 52: Controlling the Storage Options for the Preferences**

### Global Options

By default, **Global Options** is selected in the preferences pages, meaning that the options are stored locally on your computer and are not accessible to other users (unless you [export them into an XML options file that can then be shared](#)).

Global options are stored locally in option files (for example, oxyOptionsSa18.1.xml for a standalone distribution of Oxygen XML Editor version 18.1) located in the following directories:

- **Windows (Vista, 7, 8, 10)** - [user\_home\_directory]\AppData\Roaming\com.oxygenxml
- **Windows XP** - [user\_home\_directory]\Application Data\com.oxygenxml
- **Mac OS X** - [user\_home\_directory]/Library/Preferences/com.oxygenxml
- **Linux/Unix** - [user\_home\_directory]/.com.oxygenxml

### Project Options

If you select **Project Options**, the preferences are stored in the project file (.xpr), which can easily be [shared with other users](#).

**Notice:** Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

#### Related Information:

[Sharing Application Settings](#) on page 157

[Customizing Default Options](#) on page 155

[Importing/Exporting/Resetting Global Options](#) on page 158

## Sharing Application Settings

There are a variety of ways that you can share the settings in Oxygen XML Author with other members of your team so that you all use a common set of options. This topic describes various possibilities.

### Share Settings Through a Project File

Most of the preference pages in Oxygen XML Author include a **Project Options** button that allows you to pass changes to the settings to the current project file that is opened in the **Project view**. That project file can then be shared with other users. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have access to the same option configuration that you stored in the project file.

For more information about sharing projects, see [Sharing a Project - Team Collaboration](#) on page 416.

### Share Settings by Exporting/Importing Global Options

Oxygen XML Author includes actions in the **Options** menu that allow you to export and import the [global settings](#). The **Export Global Options** action will save the global settings as an XML properties file. You can then share those settings with others by using the **Import Global Options** action to import that properties file on their computer.

For more information about global options, see [Importing/Exporting/Resetting Global Options](#) on page 158.

## Share Settings with a Custom Options File During Installation

When Oxygen XML Author is installed, all the settings are set to default values. You can customize the set of default values by creating an XML *options file* that you will use when installing Oxygen XML Author on each computer. You can then copy the XML options file to the installation directory or specify its path in a startup parameter.

For more information about creating and referencing a custom options file, see [Customizing Default Options](#) on page 155.

## Share Settings by Imposing Fixed Options with an API

The Maven-based *Oxygen XML SDK* includes a sample *plugin* called **ImposeOptions** that imposes a fixed set of options when the application starts. This can be achieved by using the `PluginWorkspaceProvider.getPluginWorkspace().setGlobalObjectProperty(key, value)` API method.

For more information about this API, see [PluginWorkspaceProvider Class](#).

### Related Information:

[Sharing Validation Scenarios](#) on page 623

[Customizing Default Options](#) on page 155

[Importing/Exporting/Resetting Global Options](#) on page 158

[Sharing a Framework \(Document Type\)](#) on page 1176

## Importing/Exporting/Resetting Global Options

Actions for importing, exporting, and resetting global options are available in the **Options** menu. The export operation allows you to save [global preferences](#) as an XML properties file and the import operation allows you to load the property file. You can use this file to reload saved options on your computer or to [share with others](#).

The following actions are available in the **Options** menu:

### Reset Global Options

Restores the preference to the factory defaults or to [customized defaults](#). This action also resets the transformation and validation scenarios to the default scenarios and clears recently used file templates.

### Import Global Options

Allows you to import a set of *Global Options* from an exported XML properties file. You can also select a [project-level options file](#) (.xpr) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can select the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

### Export Global Options

Allows you to export *Global Options* to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

Oxygen XML Author automatically stores your global options in an XML properties file. Depending on the platform you are using, this file is located in the following directories:

- [user-home-folder]\AppData\Roaming\com.oxygenxml.author for Windows
- [user-home-folder]/Library/Preferences/com.oxygenxml.author for OS X
- [user-home-folder]/.com.oxygenxml.author for Linux

The name of the options file of Oxygen XML Author 19.1 is oxyAuthorOptionsSa19.1.xml.

## Associating a File Extension with Oxygen XML Author

---

To associate a file extension with Oxygen XML Author on Windows:

1. Go to the Windows **Start** menu and open **Control Panel**.
2. Go to **Default Programs**.
3. Click **Associate a file type or protocol with a program**.
4. Click the file extension you want to associate with Oxygen XML Author, then click the **Change program** button.
5. In the subsequent dialog box, browse for and choose Oxygen XML Author.
6. Click **OK**.

To associate a file extension with Oxygen XML Author on Mac OS:

1. In **Finder**, select a file and from the contextual menu select **Get Info**.
2. In the **Open With** subsection, select **Other** from the application combo box.
3. Browse to and select Oxygen XML Author.
4. Select the **Always Open With** option, then click **Add**.
5. If you want all files of that type to be opened in Oxygen XML Author, click the **Change All** button and then the **Continue** button in the subsequent confirmation dialog box.

## Configuring the Layout of the Views and Editors

---

All the Oxygen XML Author views available in the **Editor perspective** are *dockable* and there are various ways to configure and arrange the layout of the views and editing panes. You can also *configure the layout of the toolbars*.

To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the **X** button at the top-right corner of the view, or with the **Window > Hide current view** action.

### Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Author window. Once you create a layout that suites your needs, you can save it from **Window > Export Layout**. Oxygen XML Author creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

**Note:** The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the *preferences directory* of Oxygen XML Author.

To gain more editing space in the Oxygen XML Author window, click  **Toggle auto-hide** in any view. This button sets the view in the *auto-hide* state, making it visible only as a vertical tab, at the margins of the Oxygen XML Author window. To display a view in the *auto-hide* state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere. A view can also be set to a floating state by using the **Toggle floating** action, making it independent from the rest of the Oxygen XML Author window.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In this example, the `personal.xml` file was dragged over the `personal-schema.xml` file. When doing this, a dark gray rectangle marks the rearranged layout.

Figure 53: Drag and Drop Editors

### Tile/Stack Editor Actions

You can also tile or stack all open editors, both in the *Editor perspective* or in the *Database perspective*, using the following actions from the **Editor** toolbar or **Window** menu:

#### **Tile Editors Horizontally**

Splits the editing area into horizontal tiles, one for each open file.

#### **Tile Editors Vertically**

Splits the editing area into vertical tiles, one for each open file.

#### **Stack Editors**

The reverse of the **Tile Editors Horizontally/Vertically** actions. Stacks all open editors.

#### **Synchronous Scrolling**

Select this action to scroll through the tiled editors at the same time.

**Note:** When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

### Split Editor Actions

You can divide the editing area vertically and horizontally using the following actions available in the **Editor** toolbar and **Window** menu:

-  **Split Editor Horizontally** - Splits the editor horizontally. This is useful for comparing and merging content between two documents.
-  **Split Editor Vertically** - Splits the editor vertically. This is useful for comparing and merging content between two documents.
-  **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize/Restore Editor Area**.

### Switch or Move Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them.

#### Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

##### Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many tabs opened to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

##### Buttons on the Far-Right of the Tab Stripe (◀▶☰)

You can use the arrow buttons (◀▶) on the right side of the tab stripe to scroll to the left or right and the ☰ **Show List** button opens a pop-up window that displays all the opened file tabs and allows you to select and switch to a specific opened file.

##### **Ctrl + Tab (Command + Tab on OS X) [NOTE: Ctrl + Page Down (Ctrl + Alt + Right Arrow on OS X) does the same]**

Switches to the next opened tab in the order specified in the [Order of switching between editor tabs option](#).

##### **Ctrl + Shift + Tab (Command + Shift + Tab on OS X) [NOTE: Ctrl + Page Up (Ctrl + Alt + Left Arrow on OS X) does the same]**

Switches to the previous opened tab in the order specified in the [Order of switching between editor tabs option](#).

##### **Window > Switch editor tab (Ctrl + F9 (Command + F9 on OS X))**

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of file tabs opened and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific opened file tabs.

**Figure 54: Switch Editor Tab Dialog Box**

The **Switch Editor Tab** dialog box contains the following options and features:

### **Search Filter**

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific opened files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, \* to match any sequence of characters or ? to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

### **Match all terms**

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

### **Include file paths**

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

### **Case sensitive**

If this option is selected, the search operation will be case-sensitive.

### **List of Opened File Tabs**

All files that are currently opened are displayed in the main pane of the dialog box. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

### **Moving Editor Tabs**

You can move editor tabs by using any of the following methods:

#### **Mouse Drag**

You can use your mouse to drag editor tabs to a new location on the tab stripe.

#### **Ctrl + Alt + Comma**

Moves the current file tab one position to the left.

#### **Ctrl + Alt + Period**

Moves the current file tab one position to the right.

For more information about configuring the interface of Oxygen XML Author, watch our video demonstration:

#### **Related Information:**

[Configuring Toolbars](#) on page 162

## **Configuring Toolbars**

---

You can configure the toolbars in Oxygen XML Author to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (**Text**, **Author**, or **Grid**) and in the current *perspective* (**Editor** or **Datbase**). You can also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

**Figure 55: Configure Toolbars Dialog Box**

The **Configure Toolbars** dialog box provides the following features:

**Filter Text Box**

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

**Show or Hide Toolbars**

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current *perspective* and editing mode.

**Show or Hide Actions in a Toolbar**

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

**Add Actions to a Toolbar**

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from *frameworks* or 3rd party *plugins*.

**Remove Actions from a Toolbar**

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

**Move Actions in a Toolbar**

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Author.

**Customize My Toolbar**

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar" Toolbar** action that is available when you right-click anywhere in the toolbar area.

**Drop-down Menu Actions**

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

## Configure External Tools Action

There is a  **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

**Note:** If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

### Reset Toolbars

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

### Reset Layout

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

### Export Layout

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

### Hide Toolbars

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

### Related Information:

[Configuring the Layout of the Views and Editors](#) on page 159

## Import/Export Transformation or Validation Scenarios

---

You can export global transformation and validation scenarios into specialized *scenarios* files. You can import transformation and validation scenarios from various sources (such as project files, *framework* option files, or exported scenario files). The import and export scenario actions are available in the **Options** menu. The following actions are available:

### Import Transformation Scenarios

Loads a set of transformation scenarios from a project file, *framework* options file, or exported scenarios file.

### Export Global Transformation Scenarios

Stores a set of global transformation scenarios in a specialized *scenarios* file.

### Import Validation Scenarios

Loads a set of validation scenarios from a project file, *framework* options file, or exported scenarios file.

### Export Global Validation Scenarios

Stores a set of global validation scenarios in a specialized *scenarios* file.

The **Export Global Transformation Scenarios** and **Export Global Validation Scenarios** options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the **Import Transformation Scenarios** and **Import Validation Scenarios** actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word *import*.

## Editor Variables

---

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Author includes a variety of built-in editor variables. You can also create your own [custom editor variables](#) by using the [Custom Editor Variables preferences page](#).

You can use the following editor variables in Oxygen XML Author commands of external engines or other external tools, and in various places in the application, such as in transformation scenarios, **Author** mode operations, and validation scenarios:

- **`\${activeConditionSet}`** - Current active [profiling condition set](#) name. If there is no active condition set, the variable will be replaced with an *empty string*.
- **`\${af}`** - The local file path of the ZIP archive that includes the current edited document.
- **`\${afd}`** - The local directory path of the ZIP archive that includes the current edited document.
- **`\${afdu}`** - The URL path of the directory of the ZIP archive that includes the current edited document.
- **`\${afn}`** - The file name (without parent directory and without file extension) of the zip archive that includes the current edited file.
- **`\${afne}`** - The file name (with file extension, for example .zip or .epub, but without parent directory) of the zip archive that includes the current edited file.
- **`\${afu}`** - The URL path of the ZIP archive that includes the current edited document.
- **`\${ask('message', type, ('real\_value1': 'rendered\_value1'; 'real\_value2': 'rendered\_value2'; ...), 'default\_value')}`** - To prompt for values at runtime, use the `ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default-value')` editor variable. You can set the following parameters:
  - **'message'** - The displayed message. Note the quotes that enclose the message.
  - **type** - Optional parameter, with one of the following values:

**Note:** The title of the dialog box will be determined by the type of parameter and as follows:

- For `url` and `relative_url` parameters, the title will be the name of the parameter and the value of the `'message'`.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Parameter	
url	<b>Format:</b> <code>`\${ask('message', url, 'default_value')}`</code>
	<b>Description:</b> Input is considered a URL. Oxygen XML Author checks that the provided URL is valid.
	<b>Example:</b> <ul style="list-style-type: none"> <li>• <code>`\${ask('Input URL', url)}`</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL.</li> <li>• <code>`\${ask('Input URL', url, 'http://www.example.com')}`</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. The input field displays the default value <i>http://www.example.com</i>.</li> </ul>
password	<b>Format:</b> <code>`\${ask('message', password, 'default')}`</code>
	<b>Description:</b> The input is hidden with bullet characters.
	<b>Example:</b> <ul style="list-style-type: none"> <li>• <code>`\${ask('Input password', password)}`</code> - The displayed dialog box has the name <i>Input password</i> and the input is hidden with bullet symbols.</li> <li>• <code>`\${ask('Input password', password, 'abcd')}`</code> - The displayed dialog box has the name <i>Input password</i> and the input hidden with bullet symbols. The input field already contains the default <b>abcd</b> value.</li> </ul>
generic	<b>Format:</b> <code>`\${ask('message', generic, 'default')}`</code>
	<b>Description:</b> The input is considered to be generic text that requires no special handling.

Parameter	
	<p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Hello world')}</code> - The dialog box has a <i>Hello world!</i> message displayed.</li> <li>• <code>\${ask('Hello world!', generic, 'Hello again')}</code> - The dialog box has a <i>Hello world!</i> message displayed and the value displayed in the input box is <i>Hello again!</i>.</li> </ul>
relative_url	<p><b>Format:</b> <code>\${ask('message', relative_url, 'default')}</code></p> <p><b>Description:</b> Input is considered a URL. Oxygen XML Author tries to make the URL relative to that of the document you are editing.</p> <p><b>Note:</b> If the <code>\$ask</code> editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Author will transform it into an absolute URL.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('File location', relative_url, 'C:/example.txt')}</code> - The dialog box has the name <i>File location</i>. The URL inserted in the input box is made relative to the current edited document location.</li> </ul>
combobox	<p><b>Format:</b> <code>\${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p><b>Description:</b> Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated value (<i>real_value</i>).</p> <p><b>Note:</b> The <i>'default'</i> parameter specifies the default selected value and can match either a key or a value.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name <i>Operating System</i>. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.</li> </ul> <p><b>Note:</b> In this example, the default value is indicated by the <i>osx</i> key. However, the same result could be obtained if the default value is indicated by <i>Mac OS X</i>, as in the following example: <code>\${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}</code></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}</code></li> </ul>
editable_combobox	<p><b>Format:</b> <code>\${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p><b>Description:</b> Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated real value (<i>real_value</i>) or the value inserted when you edit a list entry.</p> <p><b>Note:</b> The <i>'default'</i> parameter specifies the default selected value and can match either a key or a value.</p>

Parameter	
	<p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</li> </ul>
radio	<p><b>Format:</b> <code>\${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p><b>Description:</b> Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated <i>real_value</i>.</p> <p><b>Note:</b> The 'default' parameter specifies the default selected value and can match either a key or a value.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code>\${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.</li> </ul> <p><b>Note:</b> In this example Mac OS X is the default selected value and if selected it would return osx for the output.</p>

- 'default-value' - optional parameter. Provides a default value.
  - **`\${author.name}** - Expands to the current author name that is set in the [Review preferences page](#).
  - **`\${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
  - **`\${cf}** - Current file as file path, that is the absolute file path of the current edited document.
  - **`\${cfd}** - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
  - **`\${cfdU}** - Current file folder as URL, that is the path of the current edited document up to the name of the parent folder, represented as a URL.
  - **`\${cfn}** - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
  - **`\${cfne}** - Current file name with extension. The current file is the one currently opened and selected.
  - **`\${configured.ditaot.dir}** - The default directory of the DITA Open Toolkit distribution, as configured in the [DITA preferences page](#).
  - **`\${cp}** - Current page number. Used to display the current page number on each printed page in the **Editor / Print Preferences page**.
  - **`\${currentFileURL}** - Current file as URL, that is the absolute file path of the current edited document represented as URL.
  - **`\${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`;
- Note:** This editor variable supports both the `xs:date` and `xs:datetime` parameters. For details about `xs:date`, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about `xs:datetime`, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.
- **`\${dbgXML}** - The local file path to the XML document that is current selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).
  - **`\${dbgXSL}** - The local file path to the XSL/XQuery document that is current selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).

- **`\${dita.dir.url}`** - A special local contextual editor variable that gets expanded only in the **Libraries** dialog box that is accessible from the **Advanced** tab of DITA transformation scenarios. The **Libraries** dialog box allows you to specify additional libraries (*JAR* files or additional class paths) to be used by the transformer. This *`\${dita.dir.url}`* editor variable gets expanded to the value of the *dita.dir* parameter from the **Parameters** tab of the DITA transformation scenario.
- **`\${ds}`** - The path of the detected schema as a local file path for the current validated XML document.
- **`\${dsu}`** - The path of the detected schema as a URL for the current validated XML document.
- **`\${env(VAR\_NAME)}`** - Value of the *VAR\_NAME* environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **`\${system(var.name)}`** editor variable.
- **`\${framework(fr\_name)}`** - The path (as URL) of the *fr\_name framework*.
- **`\${framework}`** - The path (as URL) of the current *framework*, as part of the *[OXYGEN\_INSTALL\_DIR]/frameworks* directory.
- **`\${frameworkDir(fr\_name)}`** - The path (as file path) of the *fr\_name framework*.

**Note:** Since multiple *frameworks* might have the same name (although it is not recommended), for both *`\${framework(fr\_name)}`* and *`\${frameworkDir(fr\_name)}`* editor variables Oxygen XML Author employs the following algorithm when searching for a given *framework* name:

- All *frameworks* are sorted, from high to low, according to their **Priority** setting from the **Document Type configuration dialog box**. Only *frameworks* that have the **Enabled** checkbox selected are taken into account.
- Next, if the two or more *frameworks* have the same name and priority, a further sorting based on the **Storage** setting is made, in the exact following order:
  - *Frameworks* stored in the internal Oxygen XML Author options.
  - Additional *frameworks* added in the **Locations preferences page**.
  - *Frameworks* installed using the add-ons support.
  - *Frameworks* found in the **main framework location (Default or Custom)**.
- **`\${frameworkDir}`** - The path (as file path) of the current *framework*, as part of the *[OXYGEN\_INSTALL\_DIR]/frameworks* directory.
- **`\${frameworks}`** - The path (as URL) of the *[OXYGEN\_INSTALL\_DIR]* directory.
- **`\${frameworksDir}`** - The path (as file path) of the *[OXYGEN\_INSTALL\_DIR]/frameworks* directory.
- **`\${home}`** - The path (as URL) of the user home folder.
- **`\${homeDir}`** - The path (as file path) of the user home folder.
- **`\${i18n(key)}`** - Editor variable used only at *framework*-level to allow translating names and descriptions of **Author** mode actions in multiple actions. For more details, see **Localizing Frameworks** on page 1141.
- **`\${id}`** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **`\${makeRelative(base,location)}`** - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

**Example:**

```
`${makeRelative(`${currentFileURL}`, `${dictionaryURL}#gogu)}`
```

- **`\${oxygenHome}`** - Oxygen XML Author installation folder as URL.
- **`\${oxygenInstallDir}`** - Oxygen XML Author installation folder as file path.
- **`\${pd}`** - The file path to the folder that contains the current project file (.xpr).
- **`\${pdu}`** - The URL path to the folder that contains the current project file (.xpr).
- **`\${pn}`** - Current project name.
- **`\${ps}`** - Path separator, which is the separator that can be used on the current platform (Windows, OS X, Linux) between library files specified in the class path.
- **`\${rootMapDir}`** - Will be expanded to the current root map parent directory file path.
- **`\${rootMapDirURL}`** - Will be expanded to the current root map parent directory URL.
- **`\${rootMapFile}`** - Will be expanded to the current root map file path.
- **`\${rootMapURL}`** - Will be expanded to the current root map URL.

- **`\${selection}`** - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
- **`\${system(var.name)}`** - Value of the *var.name* Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as *-Dvar.name=var.value*. If you are looking for operating system environment variables, use the **`\${env(VAR\_NAME)}`** editor variable instead.
- **`\${timeStamp}`** - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **`\${tp}`** - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- **`\${tsf}`** - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.
- **`\${uuid}`** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java [UUID](#) class.
- **`\${xmlCatalogFilesList}`** - A list of file paths that point to all known XML catalog files, separated by semi-colons (;).
- **`\${xpath\_eval(expression)}`** - Evaluates an XPath 3.0 expression. Depending on the context, the expression can be:
  - **static** - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's **Output** tab.

**Example:**

```
${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
```

- **dynamic** - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

**Example:**

```
${ask('Set new ID attribute', generic, '${xpath_eval(@id)})}
```

**Related Information:**

[Code Templates](#) on page 463

[Selection Plugin Extension](#) on page 1286

This type of [plugin](#) allows you to manage selections of text.

[Installing and Updating Add-ons](#) on page 49

## Custom Editor Variables

An *editor variable* can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the [Custom Editor Variables preferences page](#). To create a custom editor variable, follow these steps:

1. **Open the Preferences dialog box (Options > Preferences)** and go to **Custom Editor Variables**.
2. Click the **New** button at the bottom of the table.
3. Use the subsequent dialog box to specify the **Name**, **Value**, and **Description** for the new editor variable.
4. Click **OK** to save your configuration.

**Related Information:**

[Editor Variables](#) on page 164

## Custom System Properties

A variety of Java system properties can be set in the application to influence its behavior. For information about how to do this, see [Setting a system property](#) on page 174.

**Table 5: Custom System Properties**

Property	Allowed values	Default value	Purpose
<i>com.oxygenxml.disable.http.protocol.handlers</i>	<b>true</b> or <b>false</b>	<b>false</b>	By default, Oxygen XML Author uses the open source Apache HTTP Client software for HTTP(S) connections. If set to <b>True</b> , the default Java Sun HTTP(S) will be used instead. You will also lose <b>WebDAV</b> support and possibly other related features.
<i>com.oxygenxml.present.license.reminders</i>	<b>true</b> or <b>false</b>	<b>true</b>	When set to <b>false</b> , Oxygen XML Author will not display the messages that remind you to renew your Support and Maintenance Pack that covers your current license.
<i>com.oxygenxml.enable.content.reference.caching</i>	<b>true</b> or <b>false</b>	<b>true</b>	Enables content reference caching.
<i>com.oxygenxml.default.java.accessibility</i>	<b>true</b> or <b>false</b>	<b>false</b>	System property that can be set to "true" to force the default detection of java accessibility. If <i>com.sun.java.accessibility.AccessBrid</i> cannot be loaded, Oxygen XML Author forces the Java accessibility to be disabled.
<i>com.oxygenxml.floating.license.timeout</i>			Stores the time interval (in minutes) before floating licenses are released in case of application's inactivity.
<i>com.oxygenxml.language</i>	Language code (for example, <b>en-us</b> )	N/A	Property that holds the language code set during installation.
<i>com.oxygenxml.default.options</i>	A URL-type relative or absolute path.	N/A	Provides the path to an XML file containing default application options. For more details, see <a href="#">Customizing Default Options</a> on page 155.

Property	Allowed values	Default value	Purpose
<i>com.oxygenxml.customOptionsDir</i>	A file system absolute path pointing to a folder.	N/A	Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. See <a href="#">Importing/Exporting/Resetting Global Options</a> on page 158.
<i>com.oxygenxml.ApplicationDataFolder</i> (Windows only)	A file system absolute path pointing to a folder.	%APPDATA%	When the application runs on Windows, you can set this property to change the location where the application considers that the <i>APPDATA</i> folder is located.
<i>com.oxygenxml.editor.frameworks.url</i>	A URL-type absolute path.	OXYGEN_DIR\frameworks	Changes the folder where the application considers that the main <i>frameworks</i> are installed. It has the same effect as changing the custom <i>frameworks</i> directory value in the <a href="#">Location preferences page</a> .
<i>com.oxygenxml.MultipleInstances</i>	<b>true</b> or <b>false</b>	<b>false</b>	If set to <b>true</b> , multiple instances of the application are allowed to be started.
<i>com.oxygenxml.xep.location</i>	A file system absolute path pointing to a folder.	N/A	Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the <a href="#">FO Processors preferences page</a> .
<i>com.oxygenxml.additional.classpath</i>	A list of <a href="#">JAR</a> -type resources separated by a classpath separator.	N/A	An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the <b>lib</b> folder.
<i>com.oxygenxml.user.home</i> (Windows only)	A file system absolute path pointing to a folder.	USERPROFILE\Folder	Overwrites the user home directory that was implicitly detected for the application.

Property	Allowed values	Default value	Purpose
<i>com.oxygenxml.use.late.delegation.for.author.extensions</i>	<b>true</b> or <b>false</b>	<b>true</b>	All Java extensions in a <i>framework</i> configuration are instantiated in a separate class loader. When <b>true</b> , the JAR libraries used in a certain document type will have priority to resolve classes before delegating to the parent class loader. When <b>false</b> , the parent class loader will take precedence.
<i>com.oxygenxml.stack.size.validation.threads</i>	The number of bytes used for validation threads.	5*1024*1024	Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger <b>Thread</b> stack size to parse complex schemas. The default value should be more than enough.
<i>com.oxygenxml.jing.skip.validation.xhtml.data.attrs</i>	<b>true</b> or <b>false</b>	<b>true</b>	By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.
<i>com.oxygenxml.report.problems.url</i>	User defined URL	N/A	The URL where a problem reported through the <b>Report Problem</b> dialog box is sent. The report is sent in XML format using the <b>report</b> parameter with the POST HTTP method.
<i>com.oxygenxml.parallel.title.computing.threads</i>	Integers	4	The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the <b>DITA Maps Manager</b> view.

## Localizing the User Interface

---

You can select the language of the Oxygen XML Author user interface. Oxygen XML Author ships with the following languages: English, French, German, Japanese, and Dutch. To change the interface language, go to **Options > Preferences > Global** preferences page, then choose the appropriate language from the **Language** drop-down menu.

You can also localize the interface in another language by [creating an interface localization file](#).

### Creating an Interface Localization File

You can change the language of the Oxygen XML Author user interface by creating an interface localization file. The example in this procedure is based on the Spanish language, and a standard Oxygen XML Author Windows distribution.

1. Identify the code for the new language you want to translate the interface. It is composed from a language code (two or three lowercase letters that conform to the [ISO 639 standard](#)), followed by an underscore character, and a region code (two or three uppercase letters that conform to the [ISO 3166 standard](#)).
2. Write an email to the Oxygen XML Author support team and ask them to send you the `translation.xml` sample file.
3. Open `translation.xml` in Oxygen XML Author. The file contains all the interface messages that can be translated and is updated at every new release with the latest additions. Here is a sample of its content:

```
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
  </languageList>
  <key value="New">
    <comment>The File/New action. Creates a new document.</comment>
    <val lang="en_US">New</val>
  </key>
  <key value="New_folder">
    <comment>Creates a folder in the Project View.</comment>
    <val lang="en_US">New Folder</val>
  </key>
  .....
</translation>
```

4. Update the language element to reflect the new language. Set the `description` attribute to Spanish and the `lang` attribute to `es_ES`.
5. For each key element translate the `comment` (optional) and `val` elements. Set the `lang` attribute to `es_ES`.

**Note:** After you are finished, the file should look like this:

```
<translation>
  <languageList>
    <language description="Español" lang="es_ES"/>
  </languageList>
  <key value="New">
    <comment>El Archivo / Nueva acción. Crea un nuevo documento.</comment>
    <val lang="es_ES">Nuevo</val>
  </key>
  <key value="New_folder">
    <comment>Crea una carpeta en la vista del proyecto.</comment>
    <val lang="es_ES">Nueva carpeta</val>
  </key>
  .....
</translation>
```

6. **Open the Preferences dialog box (Options > Preferences)**, go to **Global**, and select the **Other language option**. Browse for the `translation.xml` file.
7. Restart the application.

## Setting a Java Virtual Machine Parameter when Launching Oxygen XML Author

---

You can set Java Virtual Machine parameters (for example, if you want to increase the maximum amount of memory available) for the Oxygen XML Author [application launchers](#) or [command-line scripts](#). You can also create a [custom startup parameters file](#).

## Setting Parameters for the Application Launchers

### Increasing the amount of memory that Oxygen XML Author uses on Windows and Linux

For Windows and Linux installations of Oxygen XML Author, the startup launchers for the application and its executable internal tools (**Tree Editor**, **XML Schema Regular Expressions Builder**, **Large File Viewer**, **SVN Client**, **Compare Directories**, and **Compare Files**) include a default `.vmoptions` file in the installation directory that contain some startup parameters (such the `-Xmx` parameter, which is used for allocating memory for that particular application). If your installation contains these `.vmoptions` files, you can edit the parameters in them so that the applications will launch with your desired values. However, if you re-install the application, install an update for the application, or deploy it to other users or machines, those parameters will be reset to their default values.

To increase the memory available to Oxygen XML Author on Windows:

- Browse to the installation directory of Oxygen XML Author.
- Locate the `-Xmx` parameter in the `oxygenAuthor19.1.vmoptions` file.

**Note:** For 32-bit Windows modify the parameter to `-Xmx1024m` or larger, but not over `-Xmx1200m`. Make sure you do not exceed your physical RAM. For 64-bit Windows modify the parameter to a larger value (for example, `-Xmx2048m`). We recommended you to not use more than half of your existing physical RAM.

Restart Oxygen XML Author. Go to **Help > About** and verify the amount of memory that is actually available (see the **JVM Memory Used** in the last row in the **Copyright** tab). If Oxygen XML Author does not start and you receive an error message saying that it could not start the JVM, decrease the `-Xmx` parameter and try again.

For Windows Vista/7/8/10, copy the `oxygenAuthor19.1.vmoptions` to your desktop (or to any other folder with write access), modify it there, then copy it back to the Oxygen XML Author installation folder.

**Note:** The parameters from the `.vmoptions` file are used when you start Oxygen XML Author with the `oxygen` launcher (or with the desktop shortcut). In case you use the command line script `oxygen.bat/oxygen.sh`, modify the `-Xmx` parameter in the script file.

### Increasing the amount of memory that Oxygen XML Author uses on OS X

To increase the memory available to Oxygen XML Author on OS X:

- **Ctrl + Single-Click (Command + Single-Click on OS X)** (or right-click) the Oxygen XML Author icon in **Finder**.
- From the contextual menu, select **Show Package Contents**.
- Go to the contents directory and edit the `Info.plist` file.

**Note:** You can open this file either with the **Property List Editor**, or the **TextEdit**.

- Look for the **VMOptions** key and adjust the `-Xmx` parameter to a larger value (for example, `-Xmx1500m`)

**Note:** For a Mac kit bundled with Java 8, look for the **VMOptionArray** key and add the `-Xmx` parameter in a new string element from the array element. For example, for 1500 MB use the following:

```
<string>-Xmx1500m</string>
```

**Tip:** Try not to use more than half of your existing physical RAM if possible.

### Setting a system property

To set a system property, edit the application launcher and add a parameter after the `%OXYGEN_JAVA%` token, using the following form:

```
-Dproperty.name=value
```

You can also set a system property through a parameter prefixed with `-Doxy` in the command line used to start the application:

```
oxygenAuthor19.0.exe "-Doxyproperty.name=value"
```

All system properties are displayed in the **System properties** tab of the **About** dialog box.

To view the list of Oxygen XML Author system properties, go to [Custom System Properties](#) on page 170.

## Disabling DPI Scaling

Some users may prefer the look of smaller icons in an HiDPI display. To achieve this, display scaling needs to be disabled for high DPI settings. To disable the DPI scaling, set the following property in `.vmoptions` (or in the `.bat` script):

```
sun.java2d.dpiaware=false
```

## Setting Parameters in the Command Line Scripts

If you start Oxygen XML Author with the `oxygenAuthor.bat` command line script, you have to add or modify the **-Xmx** parameter to the java command at the end of the script.

For example, to set the maximum amount of Java memory to 600 MB in **Windows**, modify the **-Xmx** parameter like this:

```
java -Xmx600m -Dsun.java2d.noddraw=true ...
```

On **Mac OS X**, the java command should look like this:

```
java "-Xdock:name=Author"\  
-Dcom.oxygenxml.editor.plugins.dir="$AUTHOR_HOME/plugins"\  
-Xmx600m\  
...
```

On **Linux**, the Java command should look like this:

```
java -Xmx600m\  
"-Dcom.oxygenxml.editor.plugins.dir=$AUTHOR_HOME/plugins"
```

## Creating Custom Startup Parameters File

You can create your own custom `.vmoptions` files and the application and the executable tools will automatically include your custom parameters at startup. The following custom files are recognized by the application and the executable tools:

- `custom_commons.vmoptions` - The parameters and their values of this file will be included in all the startup launchers.
- `custom_<app name>.vmoptions` - The `<app name>` is the name of the executable application or tool (for example, `custom_diffFiles.vmoptions` for the **Compare Files** tool). The parameters and their values of this file will be included in the startup launcher for this particular executable.

**For example:** To specify a different language for all launchers you can use the custom `vmoptions` file called `custom_commons.vmoptions` and the content would look like this:

```
-Dcom.oxygenxml.language=French
```

**For example:** To increase the memory available for a specific tool, such as the **Compare Files** tool (`diffFiles.exe`), you can use a custom `vmoptions` file called `custom_diffFiles.vmoptions` and the content would look like this:

```
-Xmx1000m
```

To be recognized and included, these custom startup parameter files must be saved in the installation directory of Oxygen XML Author.

## How to Increase the Amount of Available Memory

Determining how to increase the amount of memory that is allocated to Oxygen XML Author depends on how you launch the application.

- **Windows/Linux Application Launcher** - If you start Oxygen XML Author using the default startup launcher that was created during a Windows or Linux installation, see [Increasing the amount of memory that Oxygen XML Author uses on Windows and Linux](#) on page 174.
- **Mac OS X Application Launcher** - If you start Oxygen XML Author using the default startup launcher that was created during a Mac OS X installation, see [Increasing the amount of memory that Oxygen XML Author uses on OS X](#) on page 174.
- **Command Line Script** - If you start Oxygen XML Author using a command line script, see [Setting Parameters in the Command Line Scripts](#) on page 175.
- **Custom Startup Parameters File** - You can also create your own custom startup parameters file and increase the memory using this file. For more information, see [Creating Custom Startup Parameters File](#) on page 175.

# Perspectives

---

## Topics:

- [Editor Perspective](#)
- [Database Perspective](#)

An Oxygen XML Author *perspective* is an interface layout geared towards a specific use. The Oxygen XML Author interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several *perspectives* that you can use to work with documents in Oxygen XML Author. You can change the *perspective* by selecting the respective icon ( ) in the top-right corner of Oxygen XML Author or by selecting the *perspective* from the **Window > Open Perspective** menu.

## Editor Perspective

---

The **Editor *perspective*** is the most commonly used *perspective* and it is the default *perspective* when you start Oxygen XML Author for the first time. It is the *perspective* that you will use to edit the content of your XML documents.

To switch the focus to this *perspective*, select the  **Editor** button in the top-right corner of Oxygen XML Author (or select **Editor** from the **Window > Open perspective** menu)

The layout of this *perspective* is composed of the following components:

### Menus

Provides menu driven access to all the features and functions available in Oxygen XML Author. Most of the menus are common for all types of documents. However, Oxygen XML Author also includes some context-sensitive and *framework*-specific menus that are only available for a specific context or type of document.

### Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, **Author** mode also includes *framework*-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a *DITA Author Custom Actions* toolbar is available that includes operations that are specific to DITA documents). The *toolbars can be configured* to suit your specific needs.

### Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

### Views

Oxygen XML Author includes a large variety of *dockable* views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the **Window > Show View** menu. The *layout of the views can also be configured* according to your preferences.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the toggle controls located on the top corner of the view ( [ on Mac OS X]).

Some of the most helpful views in the **Editor *perspective*** include the following:

- **Project view** - Enables the definition of projects and logical management of the documents they contain.

- [DITA Maps Manager view](#) - For DITA document types, this view helps you organize, manage, and edit DITA topics and maps.
- [Open/Find Resource view](#) - Designed to offer advanced search capabilities in various scopes.
- [Outline view](#) - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- [Results view](#) - Displays the messages generated as a result of user actions such as [validations](#), [transformation scenarios](#), [spell checking in multiple files](#), search operations, and others. Each message is a link to the location related to the event that triggered the message.
- [Attributes view](#) - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode. **Author** mode also includes an [in-place attribute editor](#).
- [Model view](#) - Presents the current edited element structure model and additional documentation as defined in the schema.
- [Elements view](#) - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In **Author mode** [this view](#) includes tabs that present additional information relative to the cursor location.
- [Entities view](#) - Displays a list with all entities declared in the current document as well as built-in ones.
- [Transformation Scenarios view](#) - Displays a list with all currently configured transformation scenarios.
- [XPath/XQuery Builder view](#) - Displays the results from running an XPath expression.

**Related Information:**

[Configuring the Layout of the Views and Editors](#) on page 159

## Database Perspective

---

The [Database perspective](#) allows you to manage databases. To switch the focus to this *perspective*, select the  **Database** button in the top-right corner of Oxygen XML Author or **Window > Open perspective > Database** from the **Window > Open perspective** menu.

The **Database perspective** offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both *Relational* and *Native XML* databases.
- Browsing the structure of databases.
- Viewing tables from databases.
- Inspecting or modifying data.
- Specifying XML Schemas for XML fields.
- SQL execution.
- XQuery execution.
- Data export to XML.

### Supported Databases

Oxygen XML Author supports numerous types of databases, including:

- Oracle Berkeley DB XML Database
- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only)
- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL 8.3 (Enterprise edition only)

- Documentum xDB (X-Hive/DB) 10 XML Database (Enterprise edition only)
- Documentum (CMS) 6.5 (Enterprise edition only)
- SharePoint (CMS)

**Note:** For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Author. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Author [go to the Oxygen XML Author website](#).

### Supported Capabilities

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.
- Opening a database table in the [Table Explorer view](#).
- Handling the values from **XML Type** columns as String values.

**Note:** The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Author by registering the database driver as a *Generic JDBC* type driver when defining the data source for accessing the database. For more information, see [Database Connection Support](#) on page 1040.

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Author editor panel.
- Handling the values from **XML Type** columns as XML instance documents that can be opened and edited in an Oxygen XML Author editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)

**Tip:** Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

### Layout of the Database Perspective

The layout of this *perspective* is composed of the following components:

#### Menus

Provides menu driven access to all the features and functions available in the **XQuery Debugger**.

#### Toolbars

Contains all actions needed to configure and control the debugging process. The [toolbars can be configured](#) to suit your specific needs.

#### Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

#### [Data Source Explorer View](#)

Provides browsing support for the configured connections.

#### [Table Explorer View](#)

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

#### Related Information:

[Working with Databases](#) on page 1036

[Data Source Explorer View](#) on page 1036

[Table Explorer View](#) on page 1037

## Editing Modes

---

### Topics:

- [Text Editing Mode](#)
- [Grid Editing Mode](#)
- [Author Editing Mode](#)

The main editing area in Oxygen XML Author includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Author offers the following editing modes:

- **Text** - This mode presents the source of an XML document.
- **Grid** - This mode displays an XML document as a structured grid of nested tables.
- **Author** - This mode enables you to edit in a WYSIWYG-like editor.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the [Allow Document Type specific edit mode setting to override the general mode setting option](#) is selected in the **Edit Modes** preferences page, then the edit mode specified in the [Document Type configuration dialog box](#) is used when that particular type of document is initially opened.
- If the [Allow Document Type specific edit mode setting to override the general mode setting option](#) is not selected, then the edit mode specified in the [table in the Edit Modes preferences page](#) is used when that particular type of document is initially opened.

## Text Editing Mode

---

The **Text** mode editor in Oxygen XML Author is designed to be a simple, yet powerful, XML source editor. It provides support to help you edit, transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Author also includes specialized editing actions, a powerful [Content Completion Assistant](#), a helpful [Outline view](#), and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.

### Related Information:

[Editing XML Documents in Text Mode](#) on page 444

## Navigating the Document Content in Text Mode

Oxygen XML Author includes some useful features to help you navigate XML documents in **Text** mode.

### Using the Keyboard

Oxygen XML Author allows you to quickly navigate through a document using the **Ctrl + CloseBracket (Command + CloseBracket on OS X)** key to go to the next XML node and **Ctrl + OpenBracket (Command + OpenBracket on OS X)** to go to the previous one.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. To position the cursor at the beginning or end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

## Navigation Buttons

Oxygen XML Author includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Available after you use the **Back** button at least once.

## Navigating with the Outline View

Oxygen XML Author includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 56: Outline View Navigation in Text Mode

## Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 57: Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

## Navigating with the Go To Dialog Box

In **Text** mode, you can navigate precisely to a location in the document you are editing by using the **Go to** dialog box. To open this dialog box, go to **Find > Go to (Ctrl+L (Command+L on OS X))**.

Figure 58: Go to Dialog Box

The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

## Navigating with Bookmarks

By using *bookmarks*, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct *bookmarks* in any document. Shortcut keys are available to place the *bookmarks* or to return to any of the marked positions. You can configure these shortcut keys in the [Options > Menu Shortcut Keys](#) menu.

```
1 86 <xsl:template name="customizePageTop">
87   <xsl:param name="page"/>
88   <xsl:param name="chapter"/>
89   <xsl:param name="linksection"/>
90   <xsl:param name="siteElement"/>
2 91   <xsl:param name="element"/>
92   <xsl:param name="product"/>
```

Figure 59: Editor Bookmarks

A *bookmark* can be inserted in **Text** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Select the  **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A *bookmark* can be removed by right-clicking its icon on the vertical stripe and selecting **Remove** or **Remove all (Ctrl+F7 (Command+F7 on OS X))**.

You can navigate the *bookmarks* by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

## Smart Editing in Text Mode

Oxygen XML Author includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag></tag>`).
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Author will mirror-edit the name of the matching end tag. This feature can be controlled from the [Content Completion option page](#).
- **Auto-breaking the edited line** - The [Hard line wrap option](#) automatically breaks the edited line when its length exceeds the maximum line length [defined for the format and indent operation](#).
- **Indent on Enter** - The [Indent on Enter option](#) indents the new line inserted when you press **Enter**.
- **Smart Enter** - The [Smart Enter option](#) inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
  - Otherwise, a double-click selects contiguous text.
- **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
  - If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is immediately before an attribute, then the entire attribute and its value is selected.
  - If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.

- Otherwise, it selects the entire current line.

## Shortcut Actions in Text Mode

Oxygen XML Author includes numerous shortcut actions to help you edit content in the **Text** editing mode.

### Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

#### **Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))**

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the [Enable mouse-wheel zooming option](#) in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### **Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))**

Decreases the font size (zooms out) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the [Enable mouse-wheel zooming option](#) in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### **Normal editor font (Ctrl + 0 (Command + 0 on OS X))**

Resets the font size to [the value of the editor font set in the Fonts preferences page](#).

### Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

#### **Undo (Ctrl + Z (Command + Z on OS X))**

Reverses a maximum of 200 editing actions (configurable with the [Undo history size option](#) in the **Editor** preferences page) to return to the preceding state.

**Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

#### **Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))**

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

### Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

#### **Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

#### **Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

#### **Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

#### **Select All (Ctrl + A (Command + A on OS X))**

Selects the entire content of the current document.

### Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:

### **Ctrl + Alt + UpArrow (Command + Alt + UpArrow on OS X)**

Moves the node up one line.

### **Ctrl + Alt + DownArrow (Command + Alt + DownArrow on OS X)**

Moves the node down one line.

**Note:** The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

### **Miscellaneous Shortcut Actions in Text Mode**

Oxygen XML Author also includes the following other miscellaneous shortcut actions in **Text** mode:

#### **Ctrl + Delete (Command + Delete on OS X)**

Deletes the next word.

#### **Ctrl + Backspace (Command + Backspace on OS X)**

Deletes the previous word.

#### **Ctrl + W (Command + W on OS X)**

Cuts the previous word.

#### **Ctrl + K (Command + K on OS X)**

Cuts to end of line.

#### **Ctrl + Single-Click (Command + Single-Click on OS X)**

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `schemaLocation`, `noNamespaceSchemaLocation`, `href` and others.
- Processing instructions used for associating resources, `xml-models`, `xml-stylesheets`.

#### **Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)**

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

#### **Related Information:**

[Frequently Used Shortcut Keys](#) on page 18

## **Editing XML Markup in Text Mode**

Oxygen XML Author includes some useful actions that allow you to easily edit XML markup in **Text** mode. These actions are available in the **Refactoring** submenu of the contextual menu and in the **Document > Markup** menu, and many of the actions can also be done with simple keyboard shortcuts.

### **Using the Breadcrumb**

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 60: Breadcrumb in Text Mode**

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the *breadcrumb* selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

## Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

## Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

## Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

## Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

## Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

## Cut

Removes the selected element and copies it to the clipboard.

## Copy

Copies the selected element to the clipboard.

## Delete

Deletes the currently selected element.

## Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

### Alt + UpArrow

Moves the current node or selected nodes in front of the previous node.

### Alt + DownArrow

Moves the current node or selected nodes after the subsequent node.

## Rename Elements

You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### Rename Prefix (**Alt + Shift + P (Command + Shift + P on OS X)**)

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Author will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from p1 to p5 without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.

- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

### Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Surround with submenu

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

#### Surround with Tags (Ctrl + E (Command + E on OS X))

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the *Position cursor between tags option* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the *Position cursor between tags option* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

#### Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.

### Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))

Deletes the start and end tag of the current element.

### Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Join elements (Alt + Shift + J (Command + Alt + J on OS X))

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

#### Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

### Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

#### Attributes submenu

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

##### Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

##### Convert attribute to element

Allows you to change an attribute into an element.

##### Delete attribute

Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert conrefs to conkeyrefs**

Use this operation to convert conref attributes to conkeyref attributes.

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

### Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

### Wrap element

Allows you to surround elements with element tags.

### Wrap element content

Allows you to surround the content of elements with element tags.

## Fragments submenu

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

### Insert XML fragment

Allows you to insert an XML fragment.

### Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

### Replace element with XML fragment

Allows you to replace elements with an XML fragment.

## JATSKit submenu

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

### Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

### Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

### Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

## Related Information:

[Refactoring XML Documents](#) on page 655

[Contextual Menu Actions in Text Mode](#) on page 473

[Frequently Used Shortcut Keys](#) on page 18

## Folding XML Elements in Text Mode

When working with a large document, the [folding](#) support in Oxygen XML Author can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the [folding](#) feature is enabled in Oxygen XML Author, but it can be disabled in the **Text** preferences page with the [Enable folding option](#).

```
> <xsl:template match="articledescription"> [28 lines]
v <xsl:template match="articledescriptions">
  <xsl:apply-templates/>
</xsl:template>
v <xsl:template match="code">
  <ul>
  <p class="textSmall">
  > <xsl:for-each select="coderow"> [2 lines]
  </p>
  </ul>
</xsl:template>
```

Figure 61: Folding of XML Elements in Text Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Author. The next time you open the document the folds are restored to its last state.

### Folding Actions in Text Mode

Element folds are marked with a small triangle ( ▾ / ▸ ) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

▸ **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**

Folds all the elements except the current element.

▸ **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**

Folds the child elements that are indented one level inside the current element.

▾ **Expand Child Folds**

Unfolds all child elements of the currently selected element.

⊞ **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**

Unfolds all elements in the current document.

For more information about the *folding* support in Oxygen XML Author, watch our video demonstration:

### Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

### Selecting Content in Text Mode

Oxygen XML Author includes a variety of keyboard shortcuts that allow you to select content in **Text** mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in **Text** mode.

#### Standard Continuous Selection Shortcuts

**Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

**Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

**Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

**Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

**Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

**Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

**Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

### **Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

### **Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

### **Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

### **Double-Click**

Selects certain text, depending on the position of the click in the document. See [Smart Editing Double-Click](#) for the specifics.

### **Triple-Click**

Selects entire regions of text, depending on the position of the click in the document. See the [Smart Editing Triple-Click](#) for the specifics.

### **Right-Click > Select > Element**

Selects the entire element at the current cursor position.

### **Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

### **Right-Click > Select > Attributes**

Selects all the attributes of the element at the current cursor position.

### **Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

## **Rectangular Selection Shortcuts**

Oxygen XML Author also includes some keyboard shortcuts that allow you to select a rectangular block of content in **Text** mode and you can then copy, cut, paste, delete, or edit the selection.

**Attention:** The rectangular selection shortcuts will not work if the [Line Wrap option](#) is selected in the **Text** preferences page.

The following shortcuts can be used to create a rectangular selection:

### **Alt + Mouse Click + Mouse Movement (Alt + Meta + Mouse Click + Mouse Movement on Mac OS X)**

Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse. Release **Alt (Alt + Meta on Mac OS X)** to enter the [in-place editing mode](#).

### **Shift + Alt + Left/Right Arrow Keys (Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

### **Shift + Alt + Up/Down Arrow Keys (Shift + Alt + Meta + Up/Down Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

### **Ctrl + Shift + Alt + Left/Right Arrow Keys (Ctrl + Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

### **Shift + Alt + Home (Shift + Alt + Meta + Home on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

### **Shift + Alt + End (Shift + Alt + Meta + End on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it to the end of the current line.

### **Shift + Alt + PageUp (Shift + Alt + Meta + PageUp on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it up one screen page.

## Shift + Alt + PageDown (Shift + Alt + Meta + PageDown on Mac OS X)

Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

## In-Place Editing Mode

To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the **Alt** key (on Mac OS X, release both **Alt & Meta**). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either **Enter** or **Esc**.

## Content Completion Assistant in Text Mode

Oxygen XML Author includes an intelligent *Content Completion Assistant* that offers rapid, inline identification and insertion of structured language elements, attributes, and attribute values. Oxygen XML Author shows the available entries that are valid in the current editing context.

Figure 62: Content Completion Assistant

The *Content Completion Assistant* feature is schema-driven (XML Schema, DTD, and RELAX NG) and status information about the detected schema is logged in the *Information view*.

The *Content Completion Assistant* is enabled by default. To disable it, *open the Preferences dialog box (Options > Preferences)*, go to **Editor > Content Completion**, and deselect the *Enable content completion option*.

## Using the Content Completion Assistant in Text Mode

The feature is activated in **Text** mode in the following situations:

- After you press the **<** character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the *Activation delay of the proposals window (ms)* option from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space (Command + Space on OS X)** or **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

**Note:** When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the *Add Element Content option* (in the **Content Completion** preferences page) is selected. The *Content Completion Assistant* can also add optional content and first choice

particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the **Add optional content** and **Add first Choice particle** options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document
- After the > character of the start tag if the element has no attributes.

### Where the Content Completion Assistant is Displayed

The *Content Completion Assistant* is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

### Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

#### Element Structure Specified in DTD or Schema

The proposals that populate the *Content Completion Assistant* depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

**Note:** The *Content Completion Assistant* is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

#### Current Cursor Position

The number and type of elements displayed by the *Content Completion Assistant* is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

#### Unique ID Attribute Values

A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Author checks the uniqueness and correctness of the ID attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

#### Values for *xml:id* Attributes

Values of all the `xml:id` attributes are handled as ID attributes. They are collected and displayed by the *Content Completion Assistant* as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

#### ID Values for DITA Key References

In DITA, when inserting key references (`keyref`) or content key references (`conkeyref`), the ID values that are defined in the key reference are presented as possible targets. The *Content Completion Assistant* will only propose targets that are valid in the current context.

#### Element and Attribute Values

For documents that use an XML Schema or Relax NG schema, the *Content Completion Assistant* offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if

a default value or fixed value is defined in the schema, then that value is offered in the *Content Completion Assistant*.

### Related Information:

[Customizing the Content Completion Assistant](#) on page 1178

### Set Schema to be Used for Content Completion in Text Mode

The list of proposals in the *Content Completion Assistant* depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the *Content Completion Assistant* is specified in the following methods, in the order of their precedence:

- The *schema specified explicitly in the document*. In this case, Oxygen XML Author reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The *default schema declared* in the *Document Type configuration dialog box* that matches the edited document type.

Oxygen XML Author creates the content completion lists by analysing the detected schema and the current context (the position in the editor). If you change the schema, then the list of tags to be inserted is also updated.

Figure 63: Example: Content Completion Driven by DocBook DTD

### Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The *Content Completion Assistant*.
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the **F2** shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the *Show annotations in Content Completion Assistant* option in the **Annotations** preferences page.

### Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the *Show annotations using HTML format, if possible* option in the **Annotations** preferences page. When this options is deselected, the annotations are converted and displayed

as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins a new paragraph, br breaks the current line, ul encloses a list of items, and li encloses an item of the list.

### Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Author looks for an annotation in the type definition of that element or attribute.

### Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person. </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
    <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the [Use all Relax NG annotations as documentation](#) option in the **Annotations** preferences page.

### Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
## Information about a person.
element person { name, email*}
```

### Collecting Annotation from DTDs

For DTD, Oxygen XML Author defines a custom mechanism for annotations using comments enabled by the [Prefer DTD comments that start with "doc:" as annotations](#) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

### Content Completion Helper Views

Information about the current element being edited is also available in various *dockable* views, such as the [Model view](#), [Attributes view](#), [Elements view](#), and [Entities view](#). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful [Outline view](#), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

#### Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 64: Model View

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

### Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 65: Element Structure Panel

### Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 66: Annotation panel

### Attributes View in Text Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 67: Attributes View

### Expand/Collapse Button

There is an **Expand/Collapse** (  ) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the  **Remove** button to delete an attribute and its value from the selected element.

### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the  **Update** button (or press **Enter**) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

#### Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the *Allow only insertion of valid elements and attributes* schema-aware option is selected.

#### Set empty value

Specifies the current attribute value as empty.

#### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

#### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

#### Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

### Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.

**Figure 68: Elements View in Text Mode**

## Entities View

*Entities* provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (&lt ;, &gt ;, &amp ;, &apos ;, &quot ;).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

**Figure 69: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

## Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Author includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also [define your own code templates for any type of file and share them with others](#).

To get a complete list of available code templates, press **Ctrl + Shift + Space** in **Text** mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a  symbol in the content completion list.

When the [Content Completion Assistant](#) is invoked (**Ctrl + Space (Command + Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

For more information about code templates, watch our video demonstration:

## Text Mode Views

There is a variety of [dockable](#) helper views that are displayed by default in **Text** mode. There are also a large selection of additional views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Text** mode.

### Project View

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allow you to create XML projects and provide shortcuts to various operations for the project documents.

**Figure 70: Project View**

By default, the view is positioned on the left side of the Oxygen XML Author window, above the [Outline view](#). If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

#### **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### **New Project**

Creates a new, empty project.

The following actions are grouped in the upper right corner:

### **Collapse All**

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

### **Link with Editor**

When selected, the project tree highlights the currently edited file, if it is found in the project files.

**Note:** This button is disabled automatically when you move to the **Debugger perspective**.

### **Settings**

A submenu that contains the following actions:

#### **Filters**

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

#### **Show Full Path**

When selected, linked files and folders are presented with a full file path.

#### **Enable Master Files Support**

Select this option to enable the [Master Files support](#).

#### **Change Search and Refactor operations scope**

Allows you to change the collection of documents that define the context of the [search and refactor operations](#).

- **Use only Master Files, if enabled** - Restricts Oxygen XML Author to perform the search and refactor operations starting from the [master files](#) that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- **Logical folders** - marked with a blue icon on Windows and Unix/Linux () and a magenta icon on Mac OS X (). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action  **Remove from Project** can be used to remove them from the project.
- **Physical folders and files** - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action  **Remove from Disk (Shift +Delete)** can be used to remove them from the project and local file system.
- **Shortcut folders and files** - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions  **Remove from Project** and  **Remove from Disk (Shift**

**+Delete**) are available for shortcuts. ✖ **Remove from Project** just removes the shortcut from the project, while 🗑 **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

Figure 71: Project View with Examples of all Three Types of Resources

### Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

#### **New Project**

Creates a new, empty project.

### Creating New Project Items

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

#### **New >** **File**

Opens a *New file dialog box* that helps you create a new file and adds it to the project structure.

#### **New >** **Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

#### **New >** **Logical Folder**

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

#### **New >** **Logical Folders from Web**

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

### Managing Physical Folders and Files

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

### Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the contextual menu action  **Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action  **Remove from Disk (Shift+Delete)**. The  **Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

**CAUTION:** In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Author and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

### Moving Files and Folders

You can *move the resources of the project* with drag and drop operations on the files and folders of the tree (the **Enable drag-and-drop in Project view** option must be selected in the [View preferences page](#)).

You can also use the usual  **Cut**,  **Copy**, and  **Paste** actions to move resources in the **Project** view.

### Renaming Files and Folders

There are three ways you can *rename an item in the Project view*. Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

**Note:** The **Rename** action is also available on *logical* files.

### Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

### Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

### Linked Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be selected in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root.

To create a file inside a linked folder, select the **New** >  **File** action from the contextual menu. This opens the [New Document wizard](#).

**Note:** The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

## Logical Folders

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

### Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X .

### Add Files

Adds links to files on the local file system.

### Add Edited File

Adds a link to the currently edited file in the project.

## Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

### Check Well-Formedness

Checks if the selected file or files are well-formed.

### Validate

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a **Validate and Check for Completeness** operation.

## Validate with Schema

Validates the selected file of files against a specified schema.

### Configure Validation Scenario(s)

Allows you to configure and run a *validation scenario*.

## Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

### Apply Transformation Scenario(s)

Obtains the output with one of the *built-in scenarios*.

### Configure Transformation Scenario(s)

Opens a *dialog box* that allows you to configure pre-defined transformation scenarios.

### Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

## Refactoring Actions (Available for certain document types (such as XML))

Oxygen XML Author includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

### Rename resource

Allows you to change the name of a resource.

### Move resource

Allows you to change the location on disk of a resource.

## XML Refactoring

Opens [the XML Refactoring tool wizard](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

### Other XML Refactoring Actions

For your convenience, the last 5 [XML Refactoring tool operations](#) that were finished or previewed will also appear in this submenu.

### Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

#### Open

Opens the selected files in the corresponding editor.

#### Open with submenu

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: [DITA Maps Manager](#), [Archive Browser](#), [MathML Editor](#), [Large File Viewer](#), [Hex Viewer](#), [SVG Viewer](#).

#### Show in Explorer (or Show in Finder on OS X)

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

#### Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

#### Refresh

Refreshes the content and the dependencies between the resources in [the Master Files directory](#).

#### Find/Replace in Files

Opens the [Find/Replace in Files dialog box](#) that allows you to find and replace text in multiple files.

#### XPath in Files

Opens the [XPath/XQuery Builder view](#) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

#### Open/Find Resource

Opens the [Open/Find Resource dialog box](#).

#### Check Spelling in Files

Allows you to [check the spelling of multiple files](#).

#### Format and Indent Files

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent ([pretty-print](#)) action that will be applied on the selected documents.

#### Open in SVN Client

[Syncro SVN Client](#) tool is opened and it highlights the selected resource in its corresponding working copy.

#### Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the [Compare Files](#) or [Compare Directories](#) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

#### Properties

Displays the properties of the current file in a **Properties** dialog box.

## Menu Level Actions

The following actions are available in the **Project** menu:

### **New Project**

Creates a new, empty project.

### **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### **Save Project As**

Allows you to save the current project under a different name.

### **Validate all project files**

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

### **Filters**

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

### **Enable Master Files Support**

Allows you to enable the **Master Files Support** for each project you are working on.

### **Change Search and Refactor operations scope**

Opens a dialog box that allows you to define the context of search and refactor operations.

### **Show Project View**

Displays the **Project** view.

### **Reopen Project**

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

### **Open/Find Resource View**

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Author layout, next to the [Project view](#) or [DITA Maps Manager](#). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 72: Open/Find Resource View**

You can use this view to find a file in the current Oxygen XML Author project or in one of the *DITA maps* opened in *the DITA Maps Manager view* by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content) by selecting the *In reviews option*.

**Note:** Full support for searching in document edits (the **In reviews** option) is available only in the Enterprise edition of Oxygen XML Author. The Professional edition offers limited support to search through a maximum of 10 edits.

### Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the *Results view* at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for car you get the same results as when you search for Car.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for \*ing with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for \*/samples/\*.gif with the **in file paths** option selected, you will find all the *gif* images from the samples directory.

### Options Available in the View

The **Open/Find Resource** view offers the following options:

-  **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.

- **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
- **Options** - Opens the [Open/Find Resource preferences page](#) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, *tracked change* insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

### Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Author internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

### Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the [Open/Find Resource preferences page](#).

### Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Author project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

### Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in [the editor associated with the type of the file](#).

**Note:** You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

## Related Information:

[Open/Find Resource Dialog Box](#) on page 424

## Outline View in Text Mode

The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

## Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

## Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

## Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

**Figure 73: Outline View in Text Mode**

### Related Information:

[Outline View in Author Mode](#) on page 255

### Outline View Filters in Text Mode

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

The following actions are available in the **Settings** menu of the **Outline** view when editing in **Text** mode:

#### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

#### Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

#### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

#### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

#### Show element name

Show/hide element name.

#### Show text

Show/hide additional text content for the displayed elements.

#### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

#### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

### Outline View Contextual Menu Actions in Text Mode

The following actions are available from the contextual menu in the **Outline** view in **Text** mode:

## Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

## Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

## Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

## Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

## Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

## Cut

Cuts the currently selected component.

## Copy

Copies the currently selected component.

## Delete

Deletes the currently selected component.

Expands the structure of a component in the **Outline** view.

## Collapse All

Collapses the structure of all the component in the **Outline** view.

## Attributes View in Text Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Attribute	Value
abstract	false
<b>block</b>	false
default	true
final	
fixed	
id	
name	email
nillable	false
substitutionGroup	
type	xs:string

**Figure 74: Attributes View**

### Expand/Collapse Button

There is an **Expand/Collapse** (  ) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the  **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the  **Update** button (or press **Enter**) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

#### Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the *Allow only insertion of valid elements and attributes* schema-aware option is selected.

#### Set empty value

Specifies the current attribute value as empty.

#### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

#### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

#### Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.

## Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

**Figure 77: Annotation panel**

## Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.

**Figure 78: Elements View in Text Mode**

## Entities View

*Entities* provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (&lt ; , &gt ; , &amp ; , &apos ; , &quot ; ;).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbs	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 79: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

### Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages.

**Tip:** To shift focus to the opened **Results** view without using the mouse, there is an action in the **Window > Results** menu called **Focus Results** that can be used for this purpose and you can [assign a keyboard shortcut](#) to this action.

The actions that contribute messages to this view include:

- [Validation actions](#)
- [Transformation actions](#)
- [Check Spelling in Files action](#)
- **Find All** action from the [Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)
- [XPath expression results](#)
- [SQL results](#)

Description - 12 items	Resource	Location
<ul style="list-style-type: none"> <li> <ul style="list-style-type: none"> <li>D: \Projects\UserGuide\DITA\topics\batch-transformation.dita (2 items) <ul style="list-style-type: none"> <li>href="results-view.dita#results-view" format="dita"&gt;Results View&lt;/xref&gt;. All entries in the Results View point to the location of the code that triggered them. &lt;/p&gt;</li> </ul> </li> </ul> </li> </ul>	batch-transformation.dita	29:61
<ul style="list-style-type: none"> <li> <ul style="list-style-type: none"> <li>D: \Projects\UserGuide\DITA\topics\editor-perspective.dita (1 item) <ul style="list-style-type: none"> <li>&lt;li&gt;&lt;uicontrol&gt;Results view&lt;/uicontrol&gt; - Displays result messages obtained by performing user</li> </ul> </li> </ul> </li> </ul>	editor-perspective.dita	52:22

Figure 80: Results View

## Results View Toolbar Actions

The view includes a toolbar with the following actions:

### Grouping options drop-down menu

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

This drop-down menu also includes the following additional grouping actions:

#### Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

#### Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

#### Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [Check Spelling in Files action](#).
- No grouping rule for the results of [applying an XPath expression](#).

### Highlight all results in editor

Oxygen XML Author highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

**Note:** To customize highlighting behavior, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

### Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

### Remove all

Removes all messages from the view.

## Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

## Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

## ↑ Previous message

Navigates to the message above the current selection.

## ↓ Next message

Navigates to the message below the current selection.

## × Remove selected

Removes selected messages from the view.

## \* Remove all

Removes all messages from the view.

## Copy

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- The path of the *master file* (in the case of a *validation scenario*, it is the path of the file from which the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of *validation scenario*.
- The line and column in the file that triggered the message.

## Select All

Extends the selection to all the messages from the view.

## Print Results

Sends the complete list of messages to a printer. For each message, the included details are the same as the ones for the *Copy action*. This action is also available in the **Window > Results** menu.

## Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the *Copy action*. This action is also available in the **Window > Results** menu.

## Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the *Copy action*.

## Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the *Copy action*.

## Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

## Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

## Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

## Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the *Check Spelling in Files action*.

- No grouping rule for the results of *applying an XPath expression*.

#### **Expand All**

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

#### **Collapse All**

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

## Syntax Highlighting in XML Documents

Oxygen XML Author supports syntax highlighting in XML documents to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)**.
2. Go to **Editor > Syntax Highlight**.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:** Oxygen XML Author also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page**.

#### **Related Information:**

[Customize Syntax Highlight colors](#) on page 102

## Syntax Highlight Depending on Namespace Prefix

The *syntax highlight scheme of an XML file type* allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. *Marking tags with different colors based on the namespace prefix* allows easier identification of the tags.

```

3 <xsl:template match="name">
4   <fo:list-item>
5     <fo:list-item-label end-indent="label-end0">
6       <fo:block text-align="end" font-weight="bold">Full Name</fo:block>
7     </fo:list-item-label>
8     <fo:list-item-body start-indent="body-start0">
9       <xsl:apply-templates select="*"/>
10    </fo:list-item-body>
11  </fo:list-item>
12 </xsl:template>

```

**Figure 81: Example of Coloring XML Tags by Prefix**

#### **Related Information:**

[Changing the colors displayed in the Text Mode Editor](#) on page 102

## Presenting Validation Errors in Text Mode

Oxygen XML Author can be configured to *automatically validate documents* while editing in the **Text** mode, and actions are also available to *manually validate documents* on-request.

**Figure 82: Presenting Validation Errors in Text Mode**

### **Validation Marker Locations**

In **Text** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes view**, with the attribute and its value colored according to the type of issue.

### **Validation Marker Colors**

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes view** are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes view** are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes view** are colored in blue.

You can configure the color for each type in the [Document Checking preferences page](#).

### **Validation Markers in the Right-Side Stripe**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

#### **Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

#### **Middle Part of the Stripe**

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights option**.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the [Document Checking preferences page](#)).

## Bottom Part of the Stripe

Two navigation arrows (↔) allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**. Also, the ✕ button can be used to clear all the validation markers.

## Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and *possible quick fixes* (if available for that issue) or links to specifications. Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes or links and **Space** to trigger them.

## Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page](#) where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the [Information view](#).
- If you want to see all the validation messages grouped in the [Results panel](#), you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

## Related Information:

[Validating XML Documents Against a Schema](#) on page 608

## Special Character Support in Text Mode

If bidirectional text, such as Arabic or Hebrew languages, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters) are detected in a document, Oxygen XML Author displays a **Special Characters Detected** dialog box that prompts you to **Enable** or **Disable** support for these special characters (you can also enable or disable the support for special characters in the [Open/Save preferences page](#)).

### Enabled

If you choose to enable support for special characters and as long as you *chose a font* that supports the particular special characters, this means that the *glyphs* will be rendered properly in **Text** mode and the cursor navigation mechanism will recognize them as they are shown.

**Example:** The Â glyph could be inserted using a consecutive combination of two characters (**U+00C2** followed by **U+0323**). With the special characters support enabled and the **SansSerif** font chosen, that glyph will be rendered properly (a capital letter A with a circumflex above it and a dot below) and you can navigate through the glyph in one step (pressing the right/left arrow key once).

**Restriction:** When support for special characters is enabled, the *folding support* is not available.

### Disabled

If you choose to disable support for special characters, it may affect text rendering, cursor navigation, and text management operations. However, this is helpful if you need to open *very large documents* since disabling the bidirectional editing support can enhance performance.

**Example:** The Â glyph could be inserted using a consecutive combination of two characters (**U+00C2** followed by **U+0323**). With the special characters support disabled, that glyph may or may not be rendered properly and when navigating through the glyph, it would take two steps (pressing the right/left arrow key twice).

**Restriction:** Bidirectional content in the **Text** mode cannot be rendered using **Bold** or **Italic**.

## Related Information:

[Special Character Support in Author Mode](#) on page 382

[Special Character Support in Grid Mode](#) on page 237

[Inserting Special Characters](#) on page 438

## Inserting or Opening a File at Cursor Location

When editing content in **Text** mode, the following actions (in regards to inserting, opening, or comparing files) are available in the **Document > File** menu:

### Insert File

Inserts the content of the file with the specified file path into the current document, at the current position of the cursor.

### Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

### Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

### Compare

Opens the current file in [the Compare Files tool](#).

## Adjusting the Transparency of XML Markup

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Author offers the option of reducing the visibility of the markup by increasing their transparency when displayed in **Text** mode.

To change the level of transparency, use the  **Tags Transparency Selector** drop-down menu that is available from the **Source** toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using [the Configure Toolbars action](#). There are several levels of transparency that can be adjusted to make the content more or less visible:

-  **Normal Contrast** - Resets the transparency level back to normal.
-  **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
-  **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
-  **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.
-  **Transparent Markup** - Greatly reduces the visibility of the XML markup to place even greater emphasis on the visibility of the text.

Figure 83: Tags Transparency Selector

## Locking and Unlocking XML Markup

For documents with fixed markup, such as forms in which the XML tags are not allowed to be modified (only their text content), the possibility to edit the XML tag names can be toggled on or off with the  **Lock / Unlock the XML tags** action available in **Text** editing mode from the **Source** submenu from the contextual menu (or **Document > Source** menu).

You can set the default lock state for all opened editors using the [Lock the XML tags option in the Text preferences page](#).

## Formatting and Indenting XML Documents

Oxygen XML Author creates XML documents using several *edit modes*. In **Text mode**, you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Author must decide how to format and indent the XML. Oxygen XML Author will also format and indent your XML for you in **Text** mode if you use one of the Format and Indent options:

- **Document > Source >  Format and Indent** - Formats and indents the whole document.
- **Document > Source >  Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.
- **Document > Source >  Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

A number of settings affect how Oxygen XML Author formats and indents XML. Many of these settings have to do with how whitespace is handled.

### Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom,
or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise
destroyed; nor will we not pass upon him, nor condemn him, but by lawful
judgment of his Peers, or by the <xref
href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html"
scope="external">Law of the land</xref>.
We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}
</codeblock>
```

Here every whitespace character between the codeblock tags should be treated as significant.

## How Oxygen XML Author determines when whitespace is significant

When Oxygen XML Author formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Author needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Author assigns each element in the document to one of four categories:

### Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

### Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

### Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
<p>The file is located in <i>HOME</i>/<i>USER</i>/hello.  
  This is a <strong>big</strong>  
  
<emphasis>deal</emphasis>.  
</p>
```

In this example, whitespace should not be introduced around the `i` tags as it would introduce extra significant whitespace into the document. The space between the end `</strong>` tag and the beginning `<emphasis>` tag should be normalized to a single space, not zero spaces.

### Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Author consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Author consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an `xml:space="preserve"` attribute in the source file, it will be assigned to the preserve space category. If an element has the `xml:space="default"` attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Author consults information from the following sources:

#### **xml:space**

If the XML element contains the `xml:space` attribute, the element is promoted to the appropriate category based on the value of the attribute.

## CSS whitespace property

If the CSS stylesheet controlling the **Author** mode editor applies the `whitespace: pre` setting to an element, it is promoted to the preserve space category.

## CSS display property

If a text node contains only white-spaces:

- If the node has a parent element with the CSS display property set to `inline` then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS display property set to `inline` then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS display property set to `table` then the node is assigned to the ignore space category.

## Schema aware formatting

If a schema is available for the XML document, Oxygen XML Author can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value `preserve`.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for **Author** mode, *open the Preferences dialog box (Options > Preferences)*, go to **Editor > Edit modes > Author > Schema aware**, and select/deselect the *Schema aware normalization, format and indent option*.
- To turn it on or off for the **Text** editing mode, *open the Preferences dialog box (Options > Preferences)*, go to **Editor > Format > XML**, and select/deselect the *Schema aware format and indent option*.

## Preserve space elements list

If an element is listed in the *Preserve space tab of the Element Spacing list* in the *XML formatting preferences*, it is promoted to the preserve space category.

## Default space elements list

If an element is listed in the *Default space tab of the Element Spacing list* in the *XML formatting preferences*, it is promoted to the default space category.

## Mixed content elements list

If an element is listed in the *Mixed content tab of the Element Spacing list* in the *XML formatting preferences*, it is promoted to the mixed content category.

## Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

## Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

## Exception to the Rule

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In **Author** mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as *blocks* by the associated CSS (that is, they have a CSS property of `display: block`). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only *block elements*. In these cases, any whitespace they contain cannot be significant.

and they can be treated as space ignore elements. This exception can be turned on or off using the [Schema Aware Editing option](#) in the **Schema-Aware** preferences page.

### How Oxygen XML Author formats and indents XML

You can control how Oxygen XML Author formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- [Format preferences page](#)
- [XML Formatting preferences page](#)
- [Whitespaces preferences page](#)

### When Oxygen XML Author formats and indents XML

Oxygen XML Author formats and indents a document, or part of it, on the following occasions:

- In **Text** mode when you select one of the format and indent actions (**Document > Source > Format and Indent**, **Document > Source > Indent Selection**, or **Document > Source > Format and Indent Element**).
- When saving documents in **Author** mode.
- When switching from **Author** mode to another mode.
- When saving or switching to **Text** mode from **Grid** mode, if the [Format and indent when passing from grid to text or on save option](#) is selected in the **Grid** preferences page.

### Setting an Indent Size to Zero

Oxygen XML Author will automatically [format and indent](#) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

**Note:** Changing the indent size does not override the rules that Oxygen XML Author uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

### Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Author to maintain a zero indent when editing or formatting those documents:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Format](#).
2. Select **Detect indent on open**.
3. Select **Use zero-indent if detected**.

Oxygen XML Author will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Author will use the indent closest to what it detects in the document.

### Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Format](#).
2. Deselect **Detect indent on open**.
3. Set **Indent size** to 0.

All documents will be formatted and indented with an indent of zero.

**Warning:** Setting the indent size to zero can change the meaning of some file types, such as Python source files.

## Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Author provides support for formatting and indenting (*pretty-print*) multiple files at once. This action is available for any document in XML format, as well as for CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the **Project view** or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

**Figure 84: Format and Indent Files Dialog Box**

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The *pretty-print* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the *pretty-print* is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the *pretty-print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the *pretty-print* is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Author makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.

## Managing Highlighted Content

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Author includes a feature, **Manage Highlighted Content**, that is designed to help you achieve this.

When you are in **Text** mode and you perform a search operation or apply an XPath that highlights multiple results, you can select the **Manage Highlighted Content** action from the contextual menu of any highlight in the document, and the following options are available in its submenu:

- **Modify All** - Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Note:** If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the [Find/Replace operation](#), or continue the operation.

- **Surround All** - Use this option to surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.
- **Remove All** - Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

- **Modify All Matches** - Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Quick Assist Support for IDs and IDREFS

The [Quick Assist support](#) is activated automatically when you place the cursor inside an ID or IDREF in **Text** mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the *Quick Assist* menu from the contextual menu or by pressing **Alt+1 (Command+Alt+1 on Mac OS X)** on your keyboard.

The following actions are available:

### **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and [choose the scope of the rename operation](#). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

### **Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### **Change scope**

Opens the [Select the scope for the Search and Refactor operations](#) dialog box.

### **Rename in File**

Renames the ID you are editing and all its occurrences from the current file.

### **Search Occurrences**

Searches for the declaration and references of the ID located at the cursor position in the current document.

### **Related Information:**

[Working with Modular XML Files in the Master Files Context](#) on page 644

## Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

**Note:** Highlighted ID declarations are rendered with a different color than highlighted ID references.

## Related Information:

[Working with Modular XML Files in the Master Files Context](#)

## Contextual Menu Actions in Text Mode

When editing XML documents in **Text** mode, Oxygen XML Author provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu):

 **Cut**,  **Copy**,  **Paste**

Executes the typical editing actions on the currently selected content.

### Copy XPath

Copies the XPath expression of the current element or attribute from the current editor to the clipboard.

### **Toggle Comment (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

### Go to submenu

This submenu includes the following actions:

#### **Go to Matching Tag (Ctrl + Shift + G)**

Moves the cursor to the end tag that matches the start tag, or vice versa.

#### **Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on OS X))**

Moves the cursor to the end of the next tag.

#### **Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on OS X))**

Moves the cursor to the end of the previous tag.

### Select submenu

This submenu allows you to select the following:

#### **Element**

Selects the entire element at the current cursor position.

#### **Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

#### **Attributes**

Selects all the attributes of the element at the current cursor position.

#### **Parent**

Selects the parent element at the current cursor position.

### Source submenu

This submenu includes the following actions:

#### **Shift Right (Tab)**

Shifts the currently selected block to the right.

#### **Shift Left (Shift + Tab)**

Shifts the currently selected block to the left.

#### **Indent selection (Ctrl + I (Command + I on OS X))**

Corrects the indentation of the selected block of lines if it does not follow the current *indenting preferences*.

### **Escape Selection**

Escapes a range of characters by replacing them with the corresponding character entities.

### **Unescape Selection**

Replaces the character entities with the corresponding characters.

### **Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X))**

*Pretty-prints* the element that surrounds the current cursor position.

### **To Upper Case**

Converts the selected content to upper case characters. This works with contiguous and multiple selections.

### **To Lower Case**

Converts the content selection to lower case characters. This works with contiguous and multiple selections.

### **Capitalize Lines**

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

### **Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

### **Base64 Encode/Decode submenu**

This submenu include the following actions for encoding or decoding **base64** schemes:

#### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

#### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

#### **Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

#### **Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

#### **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base32** schemes:

### Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding **hex** schemes:

### Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

## Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Join and Normalize Lines (Ctrl + J (Command + J on OS X))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

## Insert new line after (Ctrl + Alt + Enter (Command + Alt + Enter on OS X))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

## Insert XInclude

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

**Note:** In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **Preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

## Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files `chapter1.xml` and `chapter2.xml` inserts the following section in the DOCTYPE:

```
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

## Lock / Unlock the XML Tags

Disables or enables the ability to edit XML tags.

## Canonicalize

Opens the **Canonicalize** dialog box that allows you to select a *canonicalization* algorithm to standardize the format of the document.

## Sign

Opens the **Sign** dialog box that allows you to configure a digital signature for the document.

## Verify Signature

Allows you to specify the location of a file to verify its digital signature.

## Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

### Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### Surround All

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

### Remove All

Removes all the highlighted content.

## Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you to select whether you want to modify only matches with the same letter case or all matches.

## Go to Definition (Ctrl + Shift + Enter)

Moves the cursor to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a “type” belonging to the “<http://www.w3.org/2001/XMLSchema-instance>” namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute.

## Refactoring submenu

This submenu includes the following actions:

### Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Author will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from p1 to p5 without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

### Surround with submenu

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

### Surround with Tags (Ctrl + E (Command + E on OS X))

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the [Position cursor between tags option](#) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the [Position cursor between tags option](#) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

### Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.

### Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))

Deletes the start and end tag of the current element.

### Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

## **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

### **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

#### **Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

#### **Convert attribute to element**

Allows you to change an attribute into an element.

#### **Delete attribute**

Allows you to remove one or more attributes.

#### **Rename attribute**

Allows you to rename an attribute.

#### **Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

### **Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

#### **Delete comments**

Allows you to delete comments found inside one or more elements.

### **DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

#### **Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

#### **Convert conrefs to conkeyrefs**

Use this operation to convert conref attributes to conkeyref attributes.

#### **Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

#### **Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

#### **Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

#### **Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

#### **Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

#### **Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

## Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

## Elements submenu

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

### Delete element

Allows you to delete elements.

### Delete element content

Allows you to delete the content of elements.

### Insert element

Allows you to insert new elements.

### Rename element

Allows you to rename elements.

### Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

### Wrap element

Allows you to surround elements with element tags.

### Wrap element content

Allows you to surround the content of elements with element tags.

## Fragments submenu

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

### Insert XML fragment

Allows you to insert an XML fragment.

### Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

### Replace element with XML fragment

Allows you to replace elements with an XML fragment.

## JATSKit submenu

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

### Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

### Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

### Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

## Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

### Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and *choose the scope of the rename operation*. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

### Rename in File

Renames the ID you are editing and all its occurrences from the current file.

### Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### Search References in

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

### Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

### Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

### Quick Assist (Alt + 1 (Command + Alt + 1 on OS X))

Available when the cursor is inside an ID or IDREF, this action opens the [Quick Assist](#) window that allows you to select some search and refactoring actions for the selected ID or IDREF.

### Open submenu

The following actions are available in this submenu:

#### Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

#### Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

### Compare

Opens the current file in [the Compare Files tool](#).

### Resource Hierarchy

Opens the [Resource Hierarchy/Dependencies view](#) that allows you to see the resource hierarchy for an XML document.

### Resource Dependencies

Opens the [Resource Hierarchy/Dependencies view](#) that allows you to see the resource dependencies for an XML document.

## Grid Editing Mode

---

The Oxygen XML Author **Grid** editing mode displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations.

To switch to this mode, select **Grid** at the bottom of the editing area. Text **Grid** Author

**Figure 85: Grid Editing Mode**

For more information about some of the features available in the **Grid** editor, watch our video demonstration:

**Related Information:**

[Editing XML Documents in Grid Mode](#) on page 481

**Layouts: Grid and Tree**

The **Grid** editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

**Figure 86: Grid Layout**

The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

**Figure 87: Tree Layout**

To switch between the two modes, select **Document > Grid Layout > Grid mode/Tree mode**.

## Grid Mode Navigation

When you first open a document in **Grid** mode, the content is collapsed. Only the root element and its attributes are displayed. An arrow sign (➤) displayed at the left of the node name indicates that this node has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (➤). The expand/collapse actions can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu or from **Document > Grid Expand/Collapse**.

### Expand/Collapse Submenu

The following actions are available on the **Expand/Collapse** submenu:

#### Expand All

Expands the selection and all its children.

#### Collapse All

Collapses the selection and all its children.

#### Expand Children

Expands all the children of the selection but not the selection.

#### Collapse Children

Collapses all the children of the selection but not the selection.

#### Collapse Others

Collapses all the siblings of the current selection but not the selection.

### Keyboard Shortcuts

A variety of other keyboard shortcuts are also available in **Grid** mode:

**Table 6: Shortcuts in the Grid Mode**

Key	Action
<b>Tab</b>	Moves the cursor to the next editable value in a table row.
<b>Shift + Tab</b>	Moves the cursor to the previous editable value in a table row.
<b>Enter</b>	Begins editing and lets you insert a new value. Also commits the changes after you finish editing.
<b>UpArrow/PageUp</b>	Navigates toward the beginning of the document.
<b>DownArrow/PageDown</b>	Navigates toward the end of the document.
<b>Shift</b>	Used in conjunction with the navigation keys to create a continuous selection area.
<b>Ctrl (Command on OS X) key</b>	Used in conjunction with the mouse cursor to create discontinuous selection areas.

The following key combinations can be used to scroll the grid:

- **Ctrl + UpArrow (Command + UpArrow on OS X)** - scrolls the grid upwards.
- **Ctrl + DownArrow (Command + DownArrow on OS X)** - scrolls the grid downwards.
- **Ctrl + LeftArrow (Command + LeftArrow on OS X)** scrolls the grid to the left.
- **Ctrl + RightArrow (Command + RightArrow on OS X)** scrolls the grid to the right.

#### Related Information:

[Editing Actions in Grid Mode](#) on page 481

## Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation** (**Ctrl + Shift + O** (**Command + Shift + O on OS X**)) action that is available from the **Edit** menu in the **Grid** editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

**Note:** This change applies only to the text from the cells, and not to the layout of the grid editor.

<?xml	version="1.0" encoding="UTF-8"
sample	#text
(9 rows)	
1	عندما يريد العالم أن يتكلم، فهو يتحدث بلغة يونيكود.
2	Quan el món vol conversar, parla Unicode
3	כאשר העולם רוצה לדבר, הוא מדבר ב-Unicode
4	Ha a világ beszélni akar, azt Unicode-ul mondja
5	Quando il mondo vuole comunicare, parla Unicode
6	世界的に話すなら、Unicode です。
7	세계를 향한 대화, 유니코드로 하십시오
8	Når verden vil snakke, snakker den Unicode
9	Når verda ønskjer å snakke, talar ho Unicode

Figure 88: Default left to right text orientation

[Inserting Special Characters](#)

## Editing Actions in Grid Mode

Since **Grid** mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the [Content Completion Assistant](#) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Author provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

**Tip:** There are two different types of layouts available in **Grid** mode. Most people prefer to leave it on the default **Grid mode** layout, but there is also a **Tree mode** layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the **Document > Grid Layout** menu.

### Expanding/Collapsing Nodes

An arrow sign (↗) displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (↖). The expand/collapse actions can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select  **Expand All** from the **Expand/Collapse** submenu. To collapse all node, right-click any cell and select  **Collapse All** from the **Expand/Collapse** submenu.

### Editing Elements or Attributes

To edit elements or attributes in **Grid** mode, simply double-click the cell that contains the element or attribute (or select the cell and press **(Enter)**) to invoke the *Content Completion Assistant*. This opens a pop-up window that offers a list of proposals that are valid for that particular node.

### Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press **Enter** (or double-click the cell), and start editing.

To stop editing a cell value, press **Enter** again.

To cancel the editing without saving the current changes in the document, press the **Esc** key.

### Editing the Structure of the Nested Tables

To edit the structure of the nested tables in **Grid** mode, Oxygen XML Author provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu, or the toolbar):

#### **Cut**, **Copy**, **Paste**, **Delete** common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

#### **Paste as Child**

Pastes the copied content as the last child of the current selection.

#### **Duplicate**

Creates a new node by duplicating the currently selected one.

#### **Insert Before**

Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

#### **Insert After**

Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

#### **Append Child**

Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

#### **Sort Ascending**, **Sort Descending**

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between *numerical* and *alphabetical*.

#### **Insert Row**

Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press **Enter**.

#### **Insert Column**

Inserts a column after the current selection.

#### **Clear Content**

Removes all content from the current cell.

### Expand/Collapse > Expand All

Expands the selection and all its children.

### Expand/Collapse > Collapse All

Collapses the selection and all its children.

### Expand/Collapse > Expand Children

Expands all the children of the selection but not the selection.

### Expand/Collapse > Collapse Children

Collapses all the children of the selection but not the selection.

### Expand/Collapse > Collapse Others

Collapses all the siblings of the current selection but not the selection.

### Refresh Selected

Forces the layout to be recomputed.

#### Related Information:

[Grid Mode Navigation](#) on page 236

[Copy and Paste in the Grid Editing Mode](#) on page 483

[Drag and Drop in the Grid Editing Mode](#) on page 483

[Content Completion Assistant in Grid Mode](#) on page 485

## Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the **Grid** editor and text from other applications into the **Grid**.

**Tip:** When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the  **Refresh Selected** action that is available in the contextual menu and in the **Document > Grid Edit** menu.

## Copy and Paste in the Grid Editing Mode

Selecting content in the **Grid** mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

### Pasting Content Within Grid Mode

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

-  **Paste (Ctrl + V (Command + V on OS X))** - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

### Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the **Grid** editor can also be pasted into **Text** mode or other external applications. When pasting copied content from **Grid** mode, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

Figure 90: Copying from Grid to Other Editors

### Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab-separated values from other editors into the **Grid** editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

Figure 91: Pasting XML Data into Grid

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the **Grid** editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

**Figure 92: Pasting Tab-Separated Values into Grid**

If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the **Insert row** or **Insert column** actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

## Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the **Grid** editing mode offers a *Content Completion Assistant* for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press **Enter** on your keyboard).

**Figure 93: Content Completion in Grid Editing Mode**

## Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from **Grid** mode to Excel or other spreadsheet applications, follow this procedure:

1. Open the XML document in Oxygen XML Author and switch to **Grid** mode.
2. *Expand the nodes* to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export ( **Copy** from the contextual menu or **Ctrl+C**).
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Author also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in **Grid** mode). For more information, see [Import from MS Excel Files – Grid Mode Method](#).

For more information about exchanging data between Oxygen XML Author and spreadsheet applications, watch our video demonstration:

[Import from MS Excel Files - Grid Mode Method](#) on page 1093

## Author Editing Mode

---

The **Author** editing mode in Oxygen XML Author allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. Oxygen XML Author provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, DocBook, TEI, and XHTML. Adding text content is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output.

To switch to this mode, click the **Author** button at the bottom of the editing area. 

To see more about some of the features available in the visual **Author** editing mode, watch our video demonstration:

### Related Information:

[Editing XML Documents in Author Mode](#) on page 486

## Author Mode User Roles

There are two main types of users for the **Author** mode: *framework developers* and *content authors*.

### Framework Developers

A *framework developer* is a technical person with advanced XML knowledge who defines the *framework* for authoring XML documents in the visual editor. Once the *framework* is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The *framework* (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in **Author** mode.

The *framework* details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- Configuration of [XML Catalogs](#).
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Author includes some ready-to-use predefined document types for XML *frameworks*, such as DocBook, DITA, TEI, JATS, and XHTML.

### Content Authors

A *content author* does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the *framework* set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

## Styling XML Documents in Author Mode

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in a visual editor. For more information about schema association, see [Associating a Schema to XML Documents](#) on page 626. The **Author** mode renders the content of the XML documents visually, based on a CSS stylesheet associated with the document.

## Associating a Stylesheet with an XML Document

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the [version 2.1 of the CSS specification](#) from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the `<?xml-stylesheet` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, [you should create a new document type \(framework\)](#).

CSS example:

```
<?xml-stylesheet type="text/css" href="test.css"?>
```

LESS example:

```
<?xml-stylesheet type="text/css" href="test.less"?>
```

**Note:** XHTML documents need a `link` element, with the `href` and `type` attributes in the head child element, as specified in the [W3C CSS specification](#). XHTML example:

```
<link href="/style/screen.css" rel="stylesheet" type="text/css"/>
```

**Tip:** You can also insert the `<?xml-stylesheet` processing instruction by using the  **Associate XSLT/CSS Stylesheet** action that is available on the toolbar or in the **Document > XML Document** menu.

2. Add a new CSS or LESS file to a [framework](#) (document type). To do so, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Edit the appropriate *framework*, open the **Author** tab, then the **CSS** subtab. Press the **+ New** button to add a new CSS or LESS file.

**Note:** The predefined *frameworks* are read-only, so you need to [Extend](#) or [Duplicate](#) them to configure them as custom *frameworks*.

You can read more about associating a CSS to a document type in [Customizing the Main CSS of a Framework](#) on page 1175.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

Figure 94: Document with no CSS association default rendering

## Selecting and Combining Multiple CSS Styles

Oxygen XML Author provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate) CSS style* and multiple *alternate CSS styles*. This makes it easy to change the look of the document as it appears in **Author** mode and the output without having to continually edit the CSS stylesheets.

**Tip:** For information about configuring the **Styles** drop-down menu, see [Configuring and Managing Multiple CSS Styles](#) on page 1194.

You can select a *main CSS style* that applies to the whole document and then *alternate styles* that are applied as layers to specific parts of the document. For example, in the subsequent figure, a DITA document has the **Century** style selected for the *main CSS* and the *alternate styles* **Full width**, **Show table column specification**, **Hints**, and **Inline actions** are combined for additive styling to specific parts of the document.

The selections from the **Styles** drop-down menu are persistent, meaning that Oxygen XML Author will remember the selections when subsequent documents are opened.

Figure 95: Styles Drop-down Menu in a DITA Document

## Navigating the Document Content in Author Mode

Oxygen XML Author includes some useful features to help you navigate XML documents.

## Using the Keyboard

Oxygen XML Author allows you to quickly navigate through a document using the **Tab** key to move the cursor to the next XML node and **Shift + Tab** to go to the previous one. If you encounter a *space-preserved element* when you navigate through a document and you do not press another key, pressing the **Tab** key will continue the navigation. However, if the cursor is positioned in a *space-preserved element* and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. Entities and hidden elements are skipped. To position the cursor at the beginning or at the end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

## Navigation Buttons

Oxygen XML Author includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position after the **Back** button has been used at least once.

## Navigating with the Outline View

Oxygen XML Author includes a very useful *Outline view* that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 96: Outline View Navigation in Author Mode

## Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 97: Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

## Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc), the **linking support** is useful for navigating between the documents. In the predefined customizations that are bundled with Oxygen XML Author, links are marked with an icon representing a chain link (). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system

browser. The same effect can be obtained by using the **Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X))** action when the cursor is inside a link element.

**Note:** Depending on the referenced file type, the target link will either be opened in the Oxygen XML Author or in the default system application. If the target file does not exist, Oxygen XML Author prompts you to create it.

## Navigating with Bookmarks

A position in a document can be marked with a *bookmark*. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The *bookmarks* are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct *bookmarks* in any document. Shortcut keys are available to place the *bookmarks* or to return to any of the marked positions. You can configure these shortcut keys in the **Options > Menu Shortcut Keys** menu.

**Figure 98: Editor Bookmarks**

A *bookmark* can be inserted in **Author** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor.
- Select the  **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A *bookmark* can be removed by right-clicking its icon on the vertical stripe and select **Remove** or **Remove all (Ctrl +F7 (Command+F7 on OS X))**.

You can navigate the *bookmarks* by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

## Author Mode Views

The content author is supported by a variety of *dockable* helper views that are displayed by default when editing in **Author** mode. These views are automatically synchronized with the current editing context of the editor panel. They present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.

There is also a large selection of additional useful views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Author** mode.

### Project View

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allow you to create XML projects and provide shortcuts to various operations for the project documents.

**Figure 99: Project View**

By default, the view is positioned on the left side of the Oxygen XML Author window, above the [Outline view](#). If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

#### **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

#### **New Project**

Creates a new, empty project.

The following actions are grouped in the upper right corner:

#### **Collapse All**

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

#### **Link with Editor**

When selected, the project tree highlights the currently edited file, if it is found in the project files.

**Note:** This button is disabled automatically when you move to the [Debugger perspective](#).

#### **Settings**

A submenu that contains the following actions:

##### **Filters**

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

##### **Show Full Path**

When selected, linked files and folders are presented with a full file path.

##### **Enable Master Files Support**

Select this option to enable the [Master Files support](#).

##### **Change Search and Refactor operations scope**

Allows you to change the collection of documents that define the context of the [search and refactor operations](#).

- **Use only Master Files, if enabled** - Restricts Oxygen XML Author to perform the search and refactor operations starting from the *master files* that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- **Logical folders** - marked with a blue icon on Windows and Unix/Linux (📁) and a magenta icon on Mac OS X (📁). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action **Remove from Project** can be used to remove them from the project.
- **Physical folders and files** - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.
- **Shortcut folders and files** - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions **Remove from Project** and **Remove from Disk (Shift+Delete)** are available for shortcuts. **Remove from Project** just removes the shortcut from the project, while **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

**Figure 100: Project View with Examples of all Three Types of Resources**

### Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

## **New Project**

Creates a new, empty project.

### **Creating New Project Items**

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

#### **New > File**

Opens a [New file dialog box](#) that helps you create a new file and adds it to the project structure.

#### **New > Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

#### **New > Logical Folder**

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

#### **New > Logical Folders from Web**

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

### **Managing Physical Folders and Files**

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

### **Removing Files and Folders**

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the contextual menu action  **Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action  **Remove from Disk (Shift+Delete)**. The  **Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

**CAUTION:** In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Author and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

### **Moving Files and Folders**

You can [move the resources of the project](#) with drag and drop operations on the files and folders of the tree (the **Enable drag-and-drop in Project view** option must be selected in the [View preferences page](#)).

You can also use the usual  **Cut**,  **Copy**, and  **Paste** actions to move resources in the **Project** view.

### **Renaming Files and Folders**

There are three ways you can [rename an item in the Project view](#). Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

**Note:** The **Rename** action is also available on *logical* files.

### **Locating and Opening Files**

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

### Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

### Linked Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be selected in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root.

To create a file inside a linked folder, select the **New** >  **File** action from the contextual menu. This opens the [New Document wizard](#).

**Note:** The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

### Logical Folders

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

#### **Add Folder**

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X .

#### **Add Files**

Adds links to files on the local file system.

#### **Add Edited File**

Adds a link to the currently edited file in the project.

### Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

#### **Check Well-Formedness**

Checks if the selected file or files are well-formed.

#### **Validate**

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a [Validate and Check for Completeness](#) operation.

### Validate with Schema

Validates the selected file or files against a specified schema.

#### **Configure Validation Scenario(s)**

Allows you to configure and run a [validation scenario](#).

## Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

### **Apply Transformation Scenario(s)**

Obtains the output with one of the *built-in scenarios*.

### **Configure Transformation Scenario(s)**

Opens a *dialog box* that allows you to configure pre-defined transformation scenarios.

### **Transform with**

Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

## Refactoring Actions (Available for certain document types (such as XML))

Oxygen XML Author includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

### **Rename resource**

Allows you to change the name of a resource.

### **Move resource**

Allows you to change the location on disk of a resource.

### **XML Refactoring**

Opens *the XML Refactoring tool wizard* that presents refactoring operations to assist you with managing the structure of your XML documents.

### **Other XML Refactoring Actions**

For your convenience, the last 5 *XML Refactoring tool operations* that were finished or previewed will also appear in this submenu.

## Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

### **Open**

Opens the selected files in the corresponding editor.

### **Open with submenu**

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: *DITA Maps Manager*, *Archive Browser*, *MathML Editor*, *Large File Viewer*, *Hex Viewer*, *SVG Viewer*.

### **Show in Explorer (or Show in Finder on OS X)**

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

### **Copy Location**

Copies an application-specific URL for the selected resource to the clipboard.

### **Refresh**

Refreshes the content and the dependencies between the resources in *the Master Files directory*.

### **Find/Replace in Files**

Opens the *Find/Replace in Files dialog box* that allows you to find and replace text in multiple files.

### **XPath in Files**

Opens the *XPath/XQuery Builder view* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

### **Open/Find Resource**

Opens the [Open/Find Resource dialog box](#).

### **Check Spelling in Files**

Allows you to [check the spelling of multiple files](#).

### **Format and Indent Files**

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent ([pretty-print](#)) action that will be applied on the selected documents.

### **Open in SVN Client**

[Syncro SVN Client](#) tool is opened and it highlights the selected resource in its corresponding working copy.

### **Compare**

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the [Compare Files](#) or [Compare Directories](#) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

### **Properties**

Displays the properties of the current file in a **Properties** dialog box.

### **Menu Level Actions**

The following actions are available in the **Project** menu:

#### **New Project**

Creates a new, empty project.

#### **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### **Save Project As**

Allows you to save the current project under a different name.

#### **Validate all project files**

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

#### **Filters**

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

### **Enable Master Files Support**

Allows you to enable the [Master Files Support](#) for each project you are working on.

#### **Change Search and Refactor operations scope**

Opens a dialog box that allows you to define the context of search and refactor operations.

### **Show Project View**

Displays the **Project** view.

## Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

## Open/Find Resource View

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the *Apache Lucene - Query Parser Syntax*. By default, the view is presented in the left side of the Oxygen XML Author layout, next to the *Project view* or *DITA Maps Manager*. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 101: Open/Find Resource View**

You can use this view to find a file in the current Oxygen XML Author project or in one of the *DITA maps* opened in *the DITA Maps Manager view* by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content) by selecting the *In reviews option*.

**Note:** Full support for searching in document edits (the *In reviews* option) is available only in the Enterprise edition of Oxygen XML Author. The Professional edition offers limited support to search through a maximum of 10 edits.

## Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the *Results view* at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for car you get the same results as when you search for Car.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for \*ing with the *in content* option selected, you will find

documents that contain the word *presenting*. If you search for `*/samples/*.gif` with the **in file paths** option selected, you will find all the *gif* images from the `samples` directory.

### Options Available in the View

The **Open/Find Resource** view offers the following options:

-  **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
  - **Options** - Opens the [Open/Find Resource preferences page](#) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, *tracked change* insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

### Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Author internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

### Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the [Open/Find Resource preferences page](#).

### Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Author project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

## Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in *the editor associated with the type of the file*.

**Note:** You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

### Related Information:

[Open/Find Resource Dialog Box](#) on page 424

## Outline View in Author Mode

The **Outline** view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

### Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

### Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

### Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

**Tip:** You can select and drag multiple nodes in the **Outline** view when editing in **Author** mode.

**Figure 102: Outline View**

### Outline View Filters in Author Mode

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

The following actions are available in the  **Settings** menu of the **Outline** view when editing in **Author** mode:

#### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

#### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

#### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

#### Show element name

Show/hide element name.

#### Show text

Show/hide additional text content for the displayed elements.

#### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

#### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

### Outline View Contextual Menu Actions in Author Mode

The contextual menu of the **Outline** view in **Author** mode contains the following actions:

## Edit Attributes

Displays an *in-place attributes editor* that allows you to edit the attributes of a selected node.

## Edit Profiling Attributes

Allows you to change the *profiling attributes* defined on all selected elements.

## Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

## Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

## Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

## Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

## Paste before

Inserts a well-formed copied element before the currently selected element.

## Paste after

Inserts a well-formed copied element after the currently selected element.

## Paste as XML

Pastes copied content that is considered to be valid XML, preserving its XML structure.

## Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

## Rename Element

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

## Expand More

Expands the structure tree of the currently selected element.

## Collapse All

Collapses all of the structure tree of the currently selected node.

**Tip:** You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

## Related Information:

[Attributes View in Author Mode](#) on page 257

## Attributes View in Author Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the *-oxy-editable* property associated with the element.
- The element is entirely included in a deleted *Track Changes* marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column . If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 103: Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

### Expand/Collapse Button

There is an **Expand/Collapse** (  ) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the  **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion

window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

#### Set empty value

Specifies the current attribute value as empty.

#### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **Delete** or **Backspace** keys.

#### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

#### Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

### In-place Attributes Editor

Oxygen XML Author includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

Figure 104: In-place Attributes Editor

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 105: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

### Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 106: Model View**

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

## Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 107: Element Structure Panel

## Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 108: Annotation panel

## Elements View in Author Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position option** is not selected in the **Views preferences page**, two additional tabs (**Before** and **After**) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing **F2** with an element selected will display information about that particular element.

**Figure 109: Elements View in Author Mode**

### Entities View

*Entities* provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (&lt ;, &gt ;, & ;, &apos ;, &quot ;).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbs	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 110: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

## Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages.

**Tip:** To shift focus to the opened **Results** view without using the mouse, there is an action in the **Window > Results** menu called **Focus Results** that can be used for this purpose and you can [assign a keyboard shortcut](#) to this action.

The actions that contribute messages to this view include:

- [Validation actions](#)
- [Transformation actions](#)
- [Check Spelling in Files action](#)
- **Find All** action from the [Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)
- [XPath expression results](#)
- [SQL results](#)

Figure 111: Results View

## Results View Toolbar Actions

The view includes a toolbar with the following actions:

### Grouping options drop-down menu

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

This drop-down menu also includes the following additional grouping actions:

#### Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

#### Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

#### Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [Check Spelling in Files action](#).
- No grouping rule for the results of [applying an XPath expression](#).

### **Highlight all results in editor**

Oxygen XML Author highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

**Note:** To customize highlighting behavior, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

### **Remove selected**

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

### **Remove all**

Removes all messages from the view.

## **Results View Contextual Menu Actions**

The following actions are available when the contextual menu is invoked in this view:

### **Show message**

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

### **Previous message**

Navigates to the message above the current selection.

### **Next message**

Navigates to the message below the current selection.

### **Remove selected**

Removes selected messages from the view.

### **Remove all**

Removes all messages from the view.

### **Copy**

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- The path of the [master file](#) (in the case of a [validation scenario](#), it is the path of the file from which the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of [validation scenario](#).
- The line and column in the file that triggered the message.

### **Select All**

Extends the selection to all the messages from the view.

### **Print Results**

Sends the complete list of messages to a printer. For each message, the included details are the same as the ones for the [Copy action](#). This action is also available in the **Window > Results** menu.

### Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the [Copy action](#). This action is also available in the **Window > Results** menu.

### Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the [Copy action](#).

### Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the [Copy action](#).

### Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

### Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

### Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

### Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [Check Spelling in Files action](#).
- No grouping rule for the results of [applying an XPath expression](#).

### Expand All

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

### Collapse All

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

### CSS Inspector View

The purpose of the **CSS Inspector** view is to display information about the styles applied to the currently selected element. You can use this view to examine the structure and layout of the CSS rules that match the element. The matching rules displayed in this view include a link to the line in the CSS file that defines the styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link to open the associated CSS for editing purposes.

**Figure 112: CSS Inspector View**

### Displaying the CSS Inspector View

You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

### Displaying Rules

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the link in the top-right corner of a rule Oxygen XML Author opens the associated CSS file at the line number where the properties of the rule are defined.

**Figure 113: CSS Inspector View - Displaying Rules**

The **CSS Inspector** view contains five tabs:

- **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
- **:before** - Displays the rules matching the **:before** pseudo-element.
- **:after** - Displays the rules matching the **:after** pseudo-element.
- **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.

- **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane
- **Show empty rules** - forces the view to show all the matching rules, even if they do not declare any CSS properties (by default, the empty rules are not displayed)

## Displaying the Markup

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

The following dedicated tag modes are available from the  **Tags Display Mode** drop-down menu (available on the toolbar):

### Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline* elements.

### Full Tags

Displays full tag names without attributes for both *block* and *inline* elements.

### Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

### Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

### Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

### No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### Configure Tags Display Mode

Opens the [Author preferences page](#) where you can configure options in regards to tags, such as the default **Tags Display Mode**, **Tags Background Color**, **Tags Foreground Color**, **Tags Font**, and whether or not Oxygen XML Author will use a **Compact Tag Layout** for displaying the tags (this option tries to group consecutive block tags on the same line).

**Note:** The associated CSS information is used to determine whether a tag should be considered *inline* or *block*. If the current document does not have an associated CSS stylesheet, then the **Full Tags** mode will be used.

## Displaying Referenced Content

The references to entities, XInclude, DITA conrefs, and constructs in other vocabularies [with displayable referenced content](#) are expanded by default in **Author** mode and the referenced content is displayed. You can control this behavior from the [Author preferences page](#). The referenced resources are loaded and displayed inside the element or entity that references them, but the displayed content cannot be modified directly in current document.

Figure 114: XInclude reference

Figure 115: External entity reference

When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the icon) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the [XML Catalog](#) set in the [XML Catalog preferences page](#).

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Author.
- On demand, by using the [Refresh references action](#). This is useful when the referenced content is modified outside the Oxygen XML Author scope.

**Related Information:**

[Configuring a References Resolver](#) on page 1164

**Visual Hints for the Cursor Position**

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

- **Before first block** - The cursor is positioned before the first *block* child of the current node.

- **Between two block elements** - The cursor is positioned between two *block elements*.

- **After last block** - The cursor is positioned after the last *block element* child of the current node.

- **Inside a node** - The cursor is positioned inside a node.

- **Before an inline element** - The cursor is positioned inside an element, before a child *inline element*.

- **Between two inline elements** - The cursor is positioned between two *inline elements*.

- **After an inline element** - The cursor is positioned inside an element, after an child *inline element*.

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, *open the Preferences dialog box (Options > Preferences)*, go to **Author > Cursor Navigation**, and deselect the *Show cursor position tooltip option*. Even if this option is deselected, you can still display the position tooltip by pressing **Shift+F2**.

**Note:** The position information tooltip is not displayed if *Full Tags with Attributes or Full Tags is selected in the Tags display mode drop-down menu*.

### Location Tooltip

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Author displays a transparent preview of the position information, called the **Location Tooltip**:

**Figure 116: Location Tooltip**

Oxygen XML Author displays a **Location Tooltip** when the following conditions are met:

- You are editing the document in one of the following *tags display modes*: **Inline Tags, Partial Tags, No Tags**.
- The mouse pointer is moved between *block elements*.

To activate or deactivate this feature, use the *Show location tooltip on mouse move option* in the *Cursor Navigation preferences page*.

### Presenting Validation Errors in Author Mode

Oxygen XML Author can be configured to *automatically validate documents* while editing in the **Author** mode, and actions are also available to *manually validate documents* on-request.

**Figure 117: Presenting Validation Errors in Author Mode**

### **Validation Marker Locations**

In **Author** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes view**, with the attribute and its value colored according to the type of issue.

### **Validation Marker Colors**

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the [Document Checking preferences page](#).

### **Validation Markers in the Right-Side Stripe**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

#### **Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

#### **Middle Part of the Stripe**

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the [Maximum number of validation highlights option](#).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the [Document Checking preferences page](#)).

## Bottom Part of the Stripe

Two navigation arrows () allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**. Also, the  button can be used to clear all the validation markers.

## Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and *possible quick fixes* (if available for that issue) or links to specifications. Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes or links and **Space** to trigger them.

## Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page](#) where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the [Information view](#).
- If you want to see all the validation messages grouped in the [Results panel](#), you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

## Related Information:

[Validating XML Documents Against a Schema](#) on page 608

## Whitespace Handling in Author Mode

When you edit a document in **Author** mode, Oxygen XML Author must serialize the resulting document as XML. Oxygen XML Author serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Author *formats and indents the XML document* according to the current *format and indent settings*.

### Minimizing Whitespace Differences Between Versions

When serializing a document to XML, **Author** mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

### Entering Whitespace in Author Mode

Oxygen XML Author controls the entry of whitespace characters in **Author** mode according the [XML whitespace rules](#), which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Author is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Author will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its [predefined document types](#), Oxygen XML Author is *correctly configured to recognize preserve space elements* and to allow you to enter additional spaces in them.

If you are using a predefined document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is *configured correctly* so that Oxygen XML Author recognizes that the current element is a preserve-space element.

## Serialization Options for Author Mode

The [Author preferences page](#) (open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author**) includes a [Serialization section](#) that contains some options that control how the formatting and indenting is applied when a document is saved in **Author** mode or when switching from **Author** to **Text** mode. It also includes a [Compatibility with other tools option](#) that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.

## Editing Content in Author Mode

The **Author** mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

### Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

#### **Undo (Ctrl + Z (Command + Z on OS X))**

Reverses a maximum of 200 editing actions (configurable with the [Undo history size option](#) in the **Editor** preferences page) to return to the preceding state.

**Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

#### **Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))**

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

### Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

#### **Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

#### **Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

#### **Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

#### **Select All (Ctrl + A (Command + A on OS X))**

Selects the entire content of the current document.

### Entering Text in Elements

By default, you can only enter text in elements that accept text content. If the element is declared as *empty* or *element only* in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

**Figure 118: Editing in empty element warning**

To allow text to be inserted in these instances, go to the **Schema-Aware** preferences page and deselect the [Reject action when its result is invalid option in the Typing actions section](#).

### Editing Text Content Without Modifying the XML Markup

You can use the options in the  [Tags Display Mode drop-down menu](#) (available on the toolbar) to control how tags are displayed in **Author** mode. This can help you to clearly see where the current cursor position is within the

tag structure so that you can avoid making unintended modifications to the XML markup. You can also switch to the [Grid editing mode](#) to modify text content without affecting the XML tags.

### Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

#### **Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))**

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the [Enable mouse-wheel zooming option](#) in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### **Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))**

Decreases the font size (zooms out) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the [Enable mouse-wheel zooming option](#) in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### **Normal editor font (Ctrl + 0 (Command + 0 on OS X))**

Resets the font size to [the value of the editor font set in the Fonts preferences page](#).

[Frequently Used Shortcut Keys](#) on page 18

## Editing XML Markup in Author Mode

Oxygen XML Author includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

### Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Author is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the [breadcrumb](#) displayed at the top of the editing window.
- **Outline View** - Click the element name in the [Outline view](#).
- **Full Tags Mode** - While editing in [Full Tags mode](#), click the start or end tag of the element in the editor.
- **Mouse Selection** - While editing in [Full Tags mode](#), click before the start tag of the element, drag the selection, and release the mouse button after the end tag.
- **Shift + Arrow Keys** - While editing in [Full Tags mode](#), place the cursor before the start tag of the element, press and hold **Shift**, and use the arrow keys to make the selection (including the end tag).

**Note:** If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Author will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in [well-formed XML](#).

### Using the Breadcrumb in Author Mode

A [breadcrumb](#) on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 119: Breadcrumb in Author Mode**

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

** Edit Attributes**

Opens the *in-place attributes editor* that allows you to easily edit the attributes of an element.

**Edit Profiling Attributes**

Allows you to select the *profiling attributes* that apply to a certain element.

**Append child**

Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

**Insert before**

Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

**Insert after**

Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

** Cut**

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

** Copy**

Copies the selected element to the clipboard, while preserving the styles of the copied content.

** Paste**

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

**Paste before**

Insert a well-formed element (from the clipboard) before the currently selected element.

**Paste after**

Insert a well-formed element (from the clipboard) after the currently selected element.

**Paste as XML**

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

** Delete**

Deletes the currently selected element.

** Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

** Rename Element**

Opens the **Rename** dialog box that allows you to rename the currently selected element and other elements with the same name.

**Tip:** The tag names displayed in the *breadcrumb* can be customized with an **Author** mode extension class that implements the *AuthorBreadcrumbCustomizer* API. See the *Oxygen SDK* for more details.

**Move Nodes**

You can move XML nodes in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### Move Up (**Alt + UpArrow**)

Moves the current node or selected nodes in front of the previous node.

### Move Down (**Alt + DownArrow**)

Moves the current node or selected nodes after the subsequent node.

**Tip:** The easiest way to move nodes is to use the **Alt + UpArrow** and **Alt + DownArrow** shortcut keys.

### Promote/Demote List Item Nodes

You can easily promote or demote selected list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

#### Promote (**Shift + Tab**)

Promotes an entirely selected list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

#### Demote (**Tab**)

Demotes an entirely selected list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

### Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Join Elements

Joins two adjacent *block elements* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

**Tip:** Specifically, the **Delete** or **Backspace** keys can be used to join *block elements* in the following situations:

- The cursor is located before the end position of the first element and **(Delete)** key is pressed.
- The cursor is located after the end position of the first element and **(Backspace)** key is pressed.
- The cursor is located before the start position of the second element and **(Delete)** key is pressed.
- The cursor is located after the start position of the second element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

#### Split Element (**Alt + Shift + D (Ctrl + Alt + D on OS X)**)

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

### Rename Elements

You can rename elements by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the *Position cursor between tags option* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the *Position cursor between tags option* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

### **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

## **Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Tip:** Specifically, the **Delete** or **Backspace** keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and **(Delete)** key is pressed.
- The cursor is located after the start position of the element and **(Backspace)** key is pressed.
- The cursor is located before the end position of the element and **(Delete)** key is pressed.
- The cursor is located after the end position of the element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

## **Remove Markup from Blocks of Content**

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Tip:** You can use the **(Delete)** or **(Backspace)** keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

## **Remove Text from Selected Markup**

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Remove Text**

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

## **Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

### **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert conrefs to conkeyrefs**

Use this operation to convert conref attributes to conkeyref attributes.

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments submenu**

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**JATSKit submenu**

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

**Related Information:**

[Editing Content in Author Mode](#) on page 494

[Displaying the Markup](#) on page 267

[Refactoring XML Documents](#) on page 655

[Selecting Content in Author Mode](#) on page 504

[Content Completion Assistant in Author Mode](#) on page 505

[Contextual Menu Actions in Author Mode](#) on page 599

[Frequently Used Shortcut Keys](#) on page 18

**Editing Attributes in Author Mode**

You can easily edit attributes in **Author** mode by using the [Attributes View](#) and Oxygen XML Author also allows you to edit attribute and element values in-place, directly in the **Author** mode, using an in-place attribute editor.

**In-place Attributes Editor**

Oxygen XML Author includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.

- Double-click any named start tag when the document is edited in one of the following *display modes*: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

**Figure 120: In-place Attributes Editor**

### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 121: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

### Related Information:

[Attributes View in Author Mode](#) on page 257

## Folding XML Elements in Author Mode

When working with a large document, the *folding* support in Oxygen XML Author can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Figure 122: Folding of XML Elements in Author Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Author, meaning the next time you open the document the folds are restored to its last state.

### Folding Actions in Author Mode

*Foldable elements* are marked with a small triangle (  ) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the *foldable* area. To toggle the fold, simply click the icon. Also, the following actions are available in the **Folding** sub-menu of the contextual menu or from the **Document > Folding** menu:

-  **Toggle Fold (or you can simply click on the  arrow)**  
Toggles the state of the current fold.
-  **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**  
Folds all the elements except the current element.
-  **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**  
Folds the child elements that are indented one level inside the current element.
-  **Expand Child Folds**  
Unfolds all child elements of the currently selected element.
-  **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**  
Unfolds all elements in the current document.

For more information about the *folding* support in Oxygen XML Author, watch our video demonstration:

## Drag and Drop in Author Mode

The Oxygen XML Author **Author** mode includes support for dragging and dropping content in XML documents.

When editing content in **Author** mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the **Author** mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the **Author** mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the **Author** mode editor is inserted without changes.

### Related Information:

[Smart Paste Mechanism](#) on page 503

## Smart Paste Mechanism

The **Author** editing mode includes a *Smart Paste* feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Author, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Author preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in **Author** mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

**Tip:** When pasting text fragments formatted with the *Courier New* font, the *Smart Paste* mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a `codeph` element).

### Smart Paste Options

By default, the *Smart Paste* feature is enabled in Oxygen XML Author. There are several options in the [Schema Aware preferences page](#) that control the *Smart Paste* mechanism:

- **Smart paste and drag and drop** - This option determines whether or not Oxygen XML Author will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.
- **Reject action when its result is invalid** - If you select this option, Oxygen XML Author will not let you paste content into a position where it would be invalid. This option is deselected by default.
- **Convert external content on paste** - This option determines whether or not Oxygen XML Author will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.
- **Convert even when pasting inside space-preserve elements** - If you select this option, the *Smart Paste* feature will also work when pasting external content into a *space-preserve* element (such as a `codeblock`). This option is deselected by default.

### Smart Paste Supported Document Types

The *Smart Paste* feature is supported for the following document types ([frameworks](#)):

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
- JATS

For more information about the *Smart Paste* support, watch our video demonstration:

#### Related Information:

[Customizing Smart Paste Support](#) on page 1149

## Selecting Content in Author Mode

Oxygen XML Author includes a variety of keyboard shortcuts that allow you to easily select content in **Author** mode.

### Selection Shortcuts in Author Mode

#### **Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

### **Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

### **Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

### **Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

### **Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

### **Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

### **Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

### **Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

### **Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

### **Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

### **Double-Click**

Selects the word at the cursor position.

### **Triple-Click**

Selects the node at the cursor position.

### **Right-Click > Select > Element**

Selects the entire element at the current cursor position.

### **Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

### **Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

## **Content Completion Assistant in Author Mode**

One of the most useful features in **Author** mode is the *Content Completion Assistant*. It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

**Figure 123: Content Completion Assistant in Author Mode**

The *Content Completion Assistant* is enabled by default. To disable it, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Content Completion**, and deselect the [Enable content completion option](#).

### Using the Content Completion Assistant in Author Mode

To activate the feature in **Author** mode, use any of the following shortcut keys:

- **Enter**
- **Ctrl + Space (Command + Space on OS X)**
- **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Author** mode, simply press **Enter**.

### Types of Proposals Listed in the Content Completion Assistant

The *Content Completion Assistant* offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert [code templates](#).
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in [Full Tags mode](#)), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.
- If the [Show all possible elements in the content completion list option from the Schema-Aware preferences page](#) is selected, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

**Note:** By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the [Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page](#).

### Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the *Content Completion Assistant* in certain contexts:

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the *Content Completion Assistant* is a **New <Element>** item. Selecting this item will insert an empty element.

Figure 124: Example (New [Element Name])

- If the cursor is positioned somewhere inside the element, the first entry in the *Content Completion Assistant* is a **Split <Element>** item. In most cases, you can only split the closest *block element* to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting **Split <Element>** splits the content of the specified element around the cursor position.

**Figure 125: Example (Split [Element Name])**

- If the cursor is positioned inside a *space-preserved element* (for example, a *codeblock*), the first choice in the *Content Completion Assistant* is **Enter**, which will insert a new line in the content of the element, followed by **New <Element>**.

**Figure 126: Example ('ENTER' New Line)**

- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in **Full Tags mode**), it will allow you to rename the element.

**Figure 127: Example (Rename)**

- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

**Figure 128: Example (Surround)**

**Related Information:**

[Customizing the Content Completion Assistant](#) on page 1178

## Set the Schema to be Used for Content Completion

The proposals that are presented in the *Content Completion Assistant* depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the *Content Completion Assistant* is specified in the following methods, in the order of their precedence:

- The *schema specified explicitly in the document*. In this case, Oxygen XML Author reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The *default schema declared* in the **Schema tab of the Document Type configuration dialog box** for the particular document type.

## Schema Annotations in Author Mode

A *schema annotation* is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the *Content Completion Assistant*.

**Figure 129: Schema Annotation in the Content Completion Assistant**

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the *Show annotations in Content Completion Assistant* option in the **Annotations** preferences page.

## Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the *Show annotations using HTML format, if possible* option in the **Annotations** preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`p`, `br`, `ul`, `li`), they are rendered as an HTML document loaded in a web browser. For example, `p` begins a new paragraph, `br` breaks the current line, `ul` encloses a list of items, and `li` encloses an item of the list.

## Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Author looks for an annotation in the type definition of that element or attribute.

## Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the <documentation> element from the <http://relaxng.org/ns/compatibility/annotations/1.0> namespace like this:

```
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person. </a:documentation>
    <ref name="name" />
    <zeroOrMore>
    <ref name="email" />
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (<http://relaxng.org/ns/structure/1.0>) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the [Use all Relax NG annotations as documentation](#) option in the **Annotations** preferences page.

## Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
## Information about a person.
element person { name, email*}
```

## Collecting Annotation from DTDs

For DTD, Oxygen XML Author defines a custom mechanism for annotations using comments enabled by the [Prefer DTD comments that start with "doc:" as annotations](#) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

### Related Information:

[Customizing the Rendering of Elements](#) on page 1185

[Annotations for XML Elements and Attributes in Content Completion Assistant](#) on page 1188

## Content Completion Helper Views

Information about the current element being edited is also available in various *dockable* views, such as the [Model view](#), [Attributes view](#), [Elements view](#), and [Entities view](#). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful [Outline view](#), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

### Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 132: Annotation panel**

### Attributes View in Author Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the *-oxy-editable* property associated with the element.
- The element is entirely included in a deleted *Track Changes* marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 133: Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

### Expand/Collapse Button

There is an **Expand/Collapse** (  ) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the  **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the  **Update** button (or press **Enter**) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

#### Set empty value

Specifies the current attribute value as empty.

#### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

#### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

#### Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

### In-place Attributes Editor

Oxygen XML Author includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*:  **Full Tags with Attributes**,  **Full Tags**,  **Block Tags**, or  **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

**Figure 134: In-place Attributes Editor**

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 135: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

### Elements View in Author Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position option** is not selected in the **Views preferences page**, two additional tabs (**Before** and **After**) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing **F2** with an element selected will display information about that particular element.

**Figure 136: Elements View in Author Mode**

## Entities View

*Entities* provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (&lt ;, &gt ;, &amp ;, &apos ;, &quot ;).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbsp	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 137: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

## Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position . Oxygen XML Author includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also [define your own code templates for any type of file and share them with others](#).

To get a complete list of available code templates, press **Ctrl + Shift + Space** in **Text** mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a  symbol in the content completion list.

When the [Content Completion Assistant](#) is invoked (**Ctrl + Space (Command + Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

For more information about code templates, watch our video demonstration:

## Finding and Replacing Text

You can search for a specific word or string of characters using the following features:

- [Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)
- [Quick Find toolbar](#)
- [Find all Elements dialog box](#)

Complex search operations may take some time to complete. If a search operation takes more than 5 seconds, you are prompted to decide whether you want to continue the operation or stop it.

## Reviewing Documents

Oxygen XML Author includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

### Tracking Document Changes

The [Track Changes feature](#) is a way to keep track of the changes you make in a document. The [Track Changes](#) feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the [Track Changes feature is activated](#), insertions are rendered in **Author** mode with an underline while deletions are rendered with a strike through.

The *tracked changes* are also displayed in the [Review view](#) and you can also choose to present the changes in [callouts](#) by selecting the [Track Changes Deletions](#) and [Track Changes Insertions](#) options in the [Callouts preferences page](#).

### Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of *read-only* text. The difference between using comments and *change tracking* is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in [callouts](#) with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the [Review preferences page](#).

### Highlighting Content

Oxygen XML Author includes a highlighting feature that allows you to create digital markers to emphasise important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

### Using the Review View

Oxygen XML Author includes a [Review view](#) that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The **Review** view is also useful for managing *tracked changes* and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

## Printing Review Information

When you print a document from **Author** mode, whatever review information is shown in the main editing area will be included in the printed output. For example, *tracked changes* will be included and as long as the **Comments option** is selected in the **Callouts preferences page**, comment callouts will also be included (same with *tracked change* callouts if their corresponding options are selected in the **Callouts preferences page**).

## Managing Tracked Changes

Oxygen XML Author includes a **Track Changes feature** that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review view**.

The **Track Changes** feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the **Review view** and **Attributes view**.

## Types of Tracked Changes

The types of *tracked changes* include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a **Split** operation
- Performing a **Surround with** operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)

**Important:** If you copy content in **Author** mode that contains *tracked changes*, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

## Activating the Change Tracking Feature

To activate the **Track Changes** feature for the current document, use any of the following methods:

- Click the  **Track Changes** button on the toolbar.
- Select  **Track Changes** from the **Review** submenu of the contextual menu in the main editing area in **Author** mode.
- Select  **Track Changes** from the **Edit > Review** menu.

To activate the **Track Changes** feature globally for all documents that you open in Oxygen XML Author, change the **Initial State option to Always On** in the **Review preferences page**.

## Rendering Tracked Changes in Author Mode

When **Track Changes** is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the **Review preferences page**, along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

Docbook 4 supports **XHTML** tables:

*Sample XHTML Table with fixed width and proportional column widths*

```
col[span:1, width:2.08*]
col[span:1, width:0.46*]
```

Person Name	Age
Jane	26
Bart	24
Alexander	22
John	25

*They belongare all students of the computer science department*

Inserted by John Doe  
Wed Apr 08 16:10:32 EEST 2009

This is a list of useful **XML** links:

**Figure 138: Change Tracking in Author Mode**

When hovering over a change a tooltip displays information about the author and modification time.

### Change Tracking Contextual Menu Actions

You can right-click any change in **Author** mode to access the following contextual menu actions:

#### ✓ Accept Change(s)

Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

#### ✗ Reject Change(s)

Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

#### 🗨 Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or *tracking changes* (similar actions are also available in the **Edit > Review** menu and the **Review** submenu of the contextual menu):

#### 🔍 Track Changes

Enables or disables the *Track Changes* support for the current document.

#### ✓ ▾ Accept Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- ✓ **Accept Change(s) and Move to Next** - Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

-  **Accept Change(s)** - Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection.
-  **Accept All Changes** - Accepts all *Tracked Changes* in the current document.

**Tip:** You can *assign shortcut keys* for these actions to make it easier to access them.

### **Reject Change(s) combo box**

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

-  **Reject Change(s) and Move to Next** - Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.
-  **Reject Change(s)** - Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection.
-  **Reject All Changes** - Rejects all *Tracked Changes* in the current document.

**Tip:** You can *assign shortcut keys* for these actions to make it easier to access them.

### **Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### **Track Changes Visualization Modes Drop-Down Menu**

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

-  **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the **Author** mode.
-  **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.
-  **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
-  **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to **View All Changes/Comments**.

**Note:** If you use  **View Final** mode and  **View Original** mode, *callouts* are not displayed for comments or changes. To display callouts, use the  **View All Changes/Comments** mode.

### **Highlight**

Enables or disables the *Highlight tool*. Use the  **Highlight** drop-down menu to select a new color.

### **Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

### **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

### **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

## Manage Reviews

Opens the [Review view](#).

### Tracked Change Callouts

You can also choose to display insertion and deletion changes in [callouts](#) in **Author** mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the [Track Changes Deletions](#) and [Track Changes Insertions](#) options in the [Callouts preferences page](#). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see [Author Callouts](#) on page 528.

### Tracked Changes in the Review View

The [Review view](#) is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see [Review View](#) on page 532.

### Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validations or transformations. For each change, the author name and the modification time are preserved.

**Example - Insertion Change:** The following processing instruction is an example of how an *insertion* change is stored in a document:

```
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

**Example - Deletion Change:** The following processing instruction is an example of how a *deletion* change is stored in a document:

```
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

For more information about the *Track Changes* support, watch our video demonstration:

[Review View](#) on page 532

### Tracked Changes Behavior

The behavior of the [Track Changes feature](#) depends on the context, the type of change, and whether or not it is activated.

#### Inserting Content

If the *Track Changes* feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the *Track Changes* feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
  - If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If we insert in regular content, the current inserted content appears marked as an **Insert** change.

### Surrounding Content

If the *Track Changes* feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a **Delete** change results in nothing happening.
- Making a surround in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  - If the original **Insert** change was made by the same user, the existing change is just expanded to contain the surrounded content.
- Making a surround in regular content results in the operation being marked as a surround change.

### Deleting Characters

If the *Track Changes* feature is disabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in nothing happening.
- Deleting content in an existing **Insert** change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
- Deleting in regular content results in a regular deletion.

If the *Track Changes* feature is enabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in the following:
  - If the same author created the **Delete** change, the previous change is marked as deleted by the current author.
  - If another author created the **Delete** change, nothing happens.
- Deleting content in an existing **Insert** change results in the following:
  - If the same author created the **Insert** change, the content is deleted and the **Insert** change shrinks accordingly.
  - If another author created the **Insert** change, the **Insert** change is split in two and the deleted content appears marked as a **Delete** change by the current author.
- Deleting in regular content results in the content being marked as a **Delete** change by the current author.

### Deleting Selections of Content

If the *Track Changes* feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change disappears and the content is deleted.
- If the selection intersects with a **Delete** change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire **Insert** change, the change disappears and the content is deleted.
- If the selection intersects with an **Insert** change (starts or ends in one), the **Insert** change is shrunk and the content is deleted.

If the *Track Changes* feature is enabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
- If the selection contains an entire **Insert** change, the following is possible:
  - If the **Insert** is made by the same author, the change disappears and the content is deleted.
  - If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

### Deleting Tags

Assuming you are using any of the [Tag Display Modes](#) other than  **No Tags** and the *Track Changes* feature is disabled, the following behavior is possible:

- If you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the [Tag Display Modes](#) other than  **No Tags** and the *Track Changes* feature is enabled, the following behavior is possible:

- If you delete a start tag of an *inline element*, both the start and end tag are marked as a **Delete** change by the current author, while any content that was inside the element is preserved.

### Copying Content

If the *Track Changes* feature is disabled and you copy content, the following behavior is possible:

- If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are also copied to the clipboard.

If the *Track Changes* feature is enabled and you copy content, the following behavior is possible:

- If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

### Pasting Content

If the *Track Changes* feature is disabled and you paste content, the following behavior is possible:

- If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), they will be preserved on paste.

If the *Track Changes* feature is enabled and you paste content, the following behavior is possible:

- If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

### Tracked Changes Limitations

There are some inherent limitations to the [Change Tracking](#) feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.
- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.
- **Limitations to using certain actions** - Some actions cannot be implemented with the [Track Changes feature](#) enabled. For example, some of the table-related actions ( **Delete Row(s)**,  **Delete Column(s)**,  **Join Cells**,  **Split Cell**) ignore the *Track Changes* feature when executing the action.

### Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the [Track Changes feature](#):

Edit Type	Processing Instruction Start Marker	Processing Instruction End Marker	Attributes
Insertion	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp
Split	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp, type="split"
Surround	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp, type="surround"
Deletion	<?oxy_delete?>	_	author, timestamp, content
Comment	<?oxy_comment_start?>	<?oxy_comment_end?>	author, timestamp, comment, mid
Attribute Change	<?oxy_attributes?>	_	id, type, oldValue, author, timestamp

If a comment intersects another, the `mid` attribute is used to correctly identify start and end processing instruction markers.

### Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of *read-only* content. The difference between using comments and [tracked changes](#) is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the **Author** mode as [callouts](#) (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the [Comments option](#) in the [Callouts preferences page](#). Comments are also displayed in the [Review view](#).

Figure 139: Comments in Author Mode

### Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in **Author** mode.

#### Add Comment

To insert a comment at the cursor position or on a specific selection of content, select the  **Add Comment** action from the toolbar (or in the **Review** submenu of the contextual menu).

#### Show/Edit Comments

To edit an existing comment that you have added in the main editing area in **Author** mode, select the  **Show/Edit Comments** action from the toolbar (or in the **Review** submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

#### Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select  **Remove Comment(s)** from the toolbar (or in the **Review** submenu of the contextual menu).

**Tip:** When adding or editing a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

## Managing Comments in Callouts

As long as the **Comments option** is selected in the **Callouts preferences page**, comments are also displayed in **callouts**. By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

### Reply

Opens a dialog box that allows you to add a reply to a comment or **Tracked Changes**. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view**.

### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for **Tracked Changes** that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

### Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

### Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

### Callouts Options

Select this option to open the **Callouts preference page** where you can configure various callout options.

**Tip:** When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

## Managing Comments in the Review View

The **Review view** is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the **Review** view, the contextual menu includes the following actions.

### Reply

Opens a dialog box that allows you to add a reply to a comment or **Tracked Changes**. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view**.

### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for **Tracked Changes** that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

## Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

## Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

### Show only reviews by '<author name>'

Filters the comments to only show comments for the particular author.

### Remove all Comments

Removes all comments from the document.

## Comments XML Source Code

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300"
comment="Do not change this content"?>
  Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `parentID` attribute and its value is the same as the `id` value of the parent comment.

```
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200"
comment="We should not forget about recycling the oil and oil filter!"
parentID="vws_x41_1v" mid="4"?>
```

[Review View](#) on page 532

## Managing Highlights

Use the  **Highlight** tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that needs additional editing or to draw the attention of others to particular content.

### Using the Highlight Tool

You can find the  **Highlight** action on the main toolbar, in the **Edit > Review** menu, or in the **Review** submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to **Stop highlighting** from the same menus.

To highlight content, follow these steps:

1. Click the  **Highlight** icon on the toolbar.  
**Step Result:** The highlighting mode is on and the cursor changes to a dedicated symbol.
2. Click the small arrow next to the  **Highlight** icon and select the color that you want to use for the highlighting.
3. Select the content you want to highlight. To mark multiple parts of a document, press and hold **Ctrl (Meta on Mac OS)** and select the parts you want to highlight.
4. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press **Ctrl + A (Command + A on OS X)** if you want to select all of the text.

2. Click the small arrow next to the  **Highlight** icon and select **No color (erase)**, or right-click the highlighted content and select **Remove highlight(s)**.
3. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

**Note:** Oxygen XML Author preserves the highlighting of a document between working sessions.

## Review View

The [Review view](#) is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with [tracked changes](#) and comments. The following actions are available in the contextual menu of each highlight in the **Review** view:

### Change Color

Allows you to change the color of an existing highlight by selecting the new color from this menu.

### Remove Highlight

Removes the selected highlight.

### Remove Highlights with the Same Color

Removes the selected highlight and all others that have the same color.

### Remove All Highlights

Removes all highlights from the document.

## Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>  
The highlights are stored<?oxy_custom_end?>
```

For more information about using the **Highlight** tool, watch our video demonstration:

### Related Information:

[Review View](#) on page 532

## Author Callouts

Oxygen XML Author uses [callouts](#) to present comments and [tracked change](#) modifications that you or other members of your team have added to the document.

## Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in **Author** mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the [Review preferences page](#). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the **Fixed** option for the particular type of change and choose a color from the color box. If the **Automatic** option is selected, Oxygen XML Author automatically assigns a color based upon the [Colors for automatic assignment list](#).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the [Show all connecting lines option](#) in the **Callouts** preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

**Figure 140: Multiple Author Callouts**

**Note:** Oxygen XML Author displays callouts only if **View All Changes/Comments** or **View Only Changes/Comments** by is selected in the **Track Changes Visualization Modes** drop-down menu. Oxygen XML Author does not display callouts in **View Final** and **View Original** modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or *space-preserved elements* that contain long fragments (such as a DITA *codeblock* element or program listing in DocBook). To help you view the text under the covered area, Oxygen XML Author applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

**Figure 141: Transparent Callout**

### Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the *Initial Width option* in the **Callouts** preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the *Text Lines Count Limit option*. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

### Type of Callouts in Oxygen XML Author

Oxygen XML Author uses callouts to display comments and *Tracked Changes* that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the *Callouts preferences page*. You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the [Comments option](#) is selected in the [Callouts preferences page](#), comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the [Show review time option](#) to include timestamp information in the comment callouts.

**Figure 142: Comment Callouts**

There are several types of comments that can be added in **Author** mode:

- *Author Review Comments* - Comments that you associate with specific content. To insert this type of comment, select the content and use the **Add Comment** action that is available on the toolbar (or in the **Review** submenu of the contextual menu).
- *Comments Added to Tracked Changes* - Comments that you add to an already existing *tracked change* insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select **Comment Change**.
- *Replies to Comments* - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in the its callout and select **Reply**. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

**Figure 143: Callout for a Comment with Replies**

**Tip:** When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the [Track Changes Deletions option](#) is selected in the [Callouts preferences page](#), deletions that are made while the *Track Changes* feature is enabled are displayed in callouts. A deletion callout contains the type of callout (**Deleted**) and the name of the author that made the deletion. You can also select the [Show deleted content in callout option](#) to display the actual deleted content in the callout. Additionally, you can select the [Show review time option](#) to include timestamp information in the deletion callouts.

**Figure 144: Deletion Callouts**

- **Tracked Change Insertion Callouts** - As long as the [Track Changes Insertions option](#) is selected in the [Callouts preferences page](#), insertions that are done while the *Track Changes* feature is enabled are displayed in callouts. An insertion callout contains the type of callout (**Inserted**) and the name of the author that inserted the content. You can also select the [Show inserted content in callout option](#) to display the actual deleted content

in the callout. Additionally, you can select the [Show review time option](#) to include timestamp information in the deletion callouts.

Figure 145: Insertion Callouts

## Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

### Insertion or Deletion Callout Actions

The following actions are available in the contextual menu of an insertion or deletion callout:

#### Reply

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#).

#### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### ✓ Accept Change

Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

#### ✗ Reject Change

Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

#### Comment Change

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](#). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

#### Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

#### Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

## Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

#### Reply

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#).

#### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the

callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

#### **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

#### **Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

#### **Callouts Options**

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

### **Printing Callouts**

When you print a document from **Author** mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to **File > Print Preview**.

### **Review View**

The [Review view](#) is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see [Review View](#) on page 532.

To watch our video demonstration about the Callouts support, see our video demonstration:

#### **Related Information:**

[Managing Tracked Changes](#) on page 518

[Managing Comments](#) on page 525

[Review View](#) on page 532

### **Review View**

The **Review** view is an independent panel, available both for built-in and custom XML document [frameworks](#). It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and [tracked changes](#) using a single view.

The **Review** view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the **Review** view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Figure 146: Review View

### Activating the Review View

To activate the **Review** view, do one of the following:

- Click the  **Manage reviews** button on the toolbar.
- Right-click anywhere in a document and select **Review > Manage reviews**.
- Open it from the **Window > Show View** menu.

### Review View Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. Use the small arrow symbol from the right side of the search field to display the search history.

The  **Settings** menu includes the following options:

- **Show highlights** - Controls whether or not the **Review** view displays the highlighting in your document.
- **Show comments** - Controls whether or not the **Review** view displays the comments in the document you are editing.
- **Show track changes** - Controls whether or not the **Review** view displays the inserted and deleted content in your document.
- **Show review time** - Displays the time when the edits from the **Review** view were made.
-  **Configure review options** - Opens the [Review preferences page](#) where you can configure various options for review information.

### Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the **Review** view:

#### Remove

Available for highlights and comments presented in the **Review** view and it removes the particular highlight or comment from your document and moves to the next change.

#### Accept

Available for inserted and deleted content presented in the **Review** view and it accepts the particular change in your document and moves to the next change.

#### Reject

Available for inserted and deleted content presented in the **Review** view and it rejects the particular change in your document and moves to the next change.

## Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the **Review** view:

### Reply

Opens the **Reply** dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

### Mark as Done

This toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

### Show Comment

Available for comments added by other users and you can use this option to view it in a **Show comment** dialog box.

### Edit Comment

Available for comments you have added and you can use this action to edit a comment.

### Remove Comment

Use this action to remove the selected comment.

### Show only Reviews by '<author name>'

Use this action to filter the edits to only show them for a certain author.

### Remove All Comments

Use this action to remove all the comments that appear in the edited document.

### Change Color

Available for highlights and it opens a palette that allows you to choose a new color for the highlighted content.

### Remove Highlight

Use this action to remove the selected highlight.

### Remove Highlights with the Same Color

Use this action to remove all the highlights with the same color from the entire document.

### Remove All Highlights

Use this action to remove all the highlights in your document.

### Accept Change

Accepts the selected change and moves to the next change.

### Reject change

Rejects the selected change and moves to the next change.

### Comment change

Available for insertions or deletions and you can use this option to add a comment for the particular change.

### Accept all changes

Accepts all the changes in the current document.

### Reject all changes

Rejects all the changes in the current document.

For more information about the **Review** view, watch our video demonstration:

## Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appear in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for *expert* users and another section for *novice* users, while unmarked sections are included in all renditions.

### Profiling Attributes and Condition Sets

Oxygen XML Author allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in **Author** mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

**Figure 147: Example: Profiling Content**

Oxygen XML Author includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the [Profiling/Conditional Text preferences page](#). You can also define your own profiling attributes and condition sets for each document type (*framework*) and your profiling configuration can be shared amongst content authors through the project file.

For information about creating and editing profiling attributes, see [Creating and Editing Profiling Attributes](#) on page 535 (for information about sharing them, see [Sharing Profiling Attribute Configurations](#) on page 538).

For information about creating and editing condition sets, see [Creating and Editing Profiling Condition Sets](#) on page 540 (for information about sharing them, see [Sharing Condition Set Configurations](#) on page 541).

#### Related Information:

[Customizing Elements that Wrap Profiled Content](#) on page 1153

### Creating and Editing Profiling Attributes

Oxygen XML Author includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (*framework*). You can then apply the profiling attributes to content in **Author** mode to see how the profiling will affect the output.

#### Create Profiling Attributes

To create custom profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
3. In the **Profiling Attributes section**, press the **New** button.

**Step Result:** The **Profiling Attribute** configuration dialog box is opened.

**Figure 148: Profiling Attribute Dialog Box**

4. Configure your profiling attributes as desired. The following options are available in this dialog box:

#### **Document type**

Select the document type (*framework*) for which you have defined profiling attributes.

**Tip:** You can use the \* or ? wildcards in this combo box. For example, DITA\* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

#### **Attribute name**

The name of the new profiling attribute.

#### **Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

#### **Attribute Values Table**

This table displays the values for the profiling attribute and allows you to configure them by using the following buttons at the bottom of the table:

#### **New**

Opens a dialog box that allows you to insert a new value. The fields that can be configured in this dialog box correspond to the columns in the table and are as follows:

- **Value** - The attribute value.

- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in **Author** mode ([Edit Profiling Attributes dialog box](#), [Condition Set dialog box](#), [Profiling tab in the Edit Properties dialog box](#), [DITA Maps Manager](#)). If the **Label** is not specified, the **Value** will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

#### **Edit**

Use this button or double-click an attribute value to modify it.

#### **Delete**

Removes the selected attributed value.

#### **Single value**

Select this option if you want the attribute to only accept a single value.

#### **Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between *space*, *comma*, and *semicolon*, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

5. Click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
6. Click **Apply** to save the profiling attribute.

### **Editing Existing Profiling Attributes**

To modify an existing profiling attribute or its values, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
2. In the [Profiling Attributes section](#), press the **Edit** button to modify an existing profiling attribute (you can also use **Delete** button to remove a profiling attribute or the **Up** and **Down** buttons to change their priority).

**Step Result:** If you use the **Edit** button, the **Profiling Attributes** configuration dialog box is opened:

3. Modify your profiling attribute as desired.
4. To add or modify attribute values, use the **New**, **Edit**, or **Delete** buttons under the attribute values table.
5. Click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
6. Click **Apply** to save your modifications.

### **Adding or Editing Profiling Attribute Values**

There are several ways to add values to existing profiling attributes.

- Use the procedure in the [Editing Existing Profiling Attributes](#) section to edit an existing attribute and use the **Profiling Attribute** configuration dialog box to add, edit, or delete values for existing profiling attributes.
- You can add values directly to the existing profiling attributes in a document using the [In-Place Attributes Editor](#) in **Author** mode, the [Attributes view](#), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the [Profiling / Conditional Text preferences page](#) where you can edit the profiling configuration.

**Note:** If the [Allow contributing extra profiling attribute values](#) option is not selected in the **Profiling / Conditional Text** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this second method will not be possible.

**Figure 149: Profiling Values Conflict Dialog Box**

### Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see [Sharing a Project - Team Collaboration](#) on page 416.

#### Related Information:

[Applying Profiling Attributes](#) on page 538

[Applying Profiling Condition Sets](#) on page 541

[Showing and Filtering Profiled Content in Author Mode](#) on page 543

### Applying Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements in the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To apply a profiling attribute to content in **Author** mode, follow these steps:

1. To apply a profiling attribute to content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile an entire element, position the cursor inside the element, right-click, and select **Edit Profiling Attributes** (you can also right-click the element in the [breadcrumb](#) or [Outline](#) view).

**Step Result:** The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (*framework*). If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/**Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If you have [defined profiling attribute values](#) for the DITA document type in the [Profiling/Conditional Text preferences page](#) and you store them at *project-level*, those values are displayed in the dialog box.
- If you have [defined profiling attribute values](#) for the DITA document type in the [Profiling/Conditional Text preferences page](#) and you store them at *global-level*, those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

**Figure 150: Edit Profiling Attributes Dialog Box**

2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the *document fragment*.
3. Click **OK** to finish the profiling configuration.

**Result:** The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the *Show Profiling Attributes option* (available in the **Profiling / Conditional Text** toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 151: Profiling Attribute Value Form Control Pop Up**

**Related Information:**

- [Applying Profiling Condition Sets](#) on page 541
- [Showing and Filtering Profiled Content in Author Mode](#) on page 543

## Creating and Editing Profiling Condition Sets

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A *Profiling Condition Set* is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

### Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
2. In the **Profiling Condition Sets section**, press the **New** button.

**Step Result:** The **Condition Set** configuration dialog box is opened.

**Figure 152: Condition Set Dialog Box**

3. Configure your condition set as desired. The following options are available in this dialog box:

#### Name

The name of the new condition set.

#### Document type

Select the document type (*framework*) for which you have defined profiling attributes.

#### Use DITAVAL file

For DITA projects, select this option if you want the *Profiling Condition Set* to reference a *DITAVAL file*. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

#### Include the content matching the following conditions

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

### Shortcut key

You can click the **Choose** button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save the condition set. All saved profiling condition sets are available in the  **Profiling / Conditional Text toolbar drop-down menu**.

### Editing Existing Profiling Condition Sets

To modify an existing profiling condition set, follow these steps:

1. *Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.*
2. In the **Profiling Condition Sets section**, press the **Edit** button to modify an existing condition set (you can also use **Delete** button to remove a condition set or the **Up** and **Down** buttons to change their priority).

**Step Result:** If you use the **Edit** button, the **Condition Set** configuration dialog box is opened:

3. Modify your condition set as desired.
4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save your modifications.

### Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see [Sharing a Project - Team Collaboration](#) on page 416.

#### Related Information:

[Applying Profiling Condition Sets](#) on page 541

[Creating and Editing Profiling Attributes](#) on page 535

[Applying Profiling Attributes](#) on page 538

[Showing and Filtering Profiled Content in Author Mode](#) on page 543

### Applying Profiling Condition Sets

All defined **Profiling Condition Sets** are available as shortcuts in the  **Profiling / Conditional Text toolbar menu**. Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode, **Outline view**, and **DITA Maps Manager view** (for DITA documents). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the value covered by the condition set.

#### EXAMPLE:

Suppose that you have the following document:

Spray painting	
Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.	
Context:	
The garage is a good place to spray paint.	
<b>Step 1</b>	Move the car out of the garage to avoid getting paint on it. Audience [novice]
<b>Step 2</b>	Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]
<b>Step 3</b>	Place the object to be painted on the covered area. Audience [expert] Other [prop2]
<b>Step 4</b>	Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]
<b>Step 5</b>	Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

If you apply the following condition set, it means that you want to filter out the content to only include content written for an expert audience and content that has the *Other* attribute value of *prop1*.

This is how the document looks after you apply the condition set:

▼ **Spray painting**

**Short Description:** When paint is applied using a spray nozzle, it is referred to as spray painting.

**Context:**

▼ The garage is a good place to spray paint.

**Step 1**

Move the car out of the garage to avoid getting paint on it. Audience [novice]

**Step 2**

Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

**Step 3**

Place the object to be painted on the covered area. Audience [expert] Other [prop2]

**Step 4**

Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

**Step 5**

Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

[Creating and Editing Profiling Attributes](#) on page 535

[Applying Profiling Attributes](#) on page 538

[Showing and Filtering Profiled Content in Author Mode](#) on page 543

#### Showing and Filtering Profiled Content in Author Mode

You can visualize the effects of profiled content in **Author** mode by using the options in the  **Profiling/Conditional Text** drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

##### Show Profiling Colors and Styles

Select this option to show colors and styles for profiled content in **Author** mode. You can configure the colors and styles or specify whether or not this option is selected by default in the [Profiling/Conditional Text > Colors and Styles preferences page](#).

##### Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in **Author** mode. You can specify whether or not this option is selected by default in the [Profiling/Conditional Text > Attributes Rendering preferences page](#).

##### Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in **Author** mode and the **Outline** view. When this option is selected and a [condition set is selected in this drop-down menu](#), the filtered content is grayed-out. If this option is not selected and a [condition set is selected in this drop-down menu](#), the filtered content is hidden. You can specify whether or not this option is selected by default in the [Profiling/Conditional Text preferences page](#).

##### Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

##### List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in **Author** mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the **More** submenu or by using the [Choose Condition Set option](#) to access a dialog box that presents all of them.

## ⚙️ Profiling Settings

Opens the [Profiling/Conditional Text preferences page](#) where you can add and edit profiling attributes and condition sets.

Figure 153: Example: Filtering Profiled Content in Author Mode

If the [Show Profiling Attributes option](#) is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 154: Profiling Attribute Value Form Control Pop Up

### Related Information:

[Creating and Editing Profiling Attributes](#) on page 535

[Applying Profiling Attributes](#) on page 538

[Creating and Editing Profiling Condition Sets](#) on page 540

[Applying Profiling Condition Sets](#) on page 541

### Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode, allowing you to easily recognize the differences.

**Figure 155: Example: Profiling Colors and Styles**

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

### Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles option** from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings** from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text preferences page**.
3. Go to the **Colors and Styles preferences page** to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes Rendering preferences page** to configure how you want the profiling attributes to appear in Oxygen XML Author.

**Result:** The styling is now applied in the **Author** editing mode and the **Outline view**. Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes dialog box** and in the inline form control pop up that allows you to quickly set the profiling attributes.

**Figure 156: Profiling Attribute Value Form Control Pop Up**

**Related Information:**

- [Showing and Filtering Profiled Content in Author Mode](#) on page 543

**Adding Tables in Author Mode**

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in various *frameworks* (DITA, DocBook, TEI, and XHTML). This opens the **Insert Table** dialog box. Each *framework* has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Author includes some general editing actions for configuring tables in **Author** mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

**Editing Tables in Author Mode**

Oxygen XML Author provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in **Author** mode and they include the following:

**Adjusting Column Width**

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a **colspecs** section that appears above the table in **Author** mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The predefined DITA, DocBook, and XHTML *frameworks* support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

**Figure 157: Resizing a Table Column in Author Mode**

## Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to  for row selection and to  for column selection and that specific row or column is highlighted. You can use the **Ctrl** and **Shift** keys to select multiple rows.

## Selecting Cells

To select a cell in a table, press and hold the **Ctrl** key and click anywhere inside the cell. You can also use the **Ctrl** and **Shift** keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a *RTL document*) to select it. The cursor changes to  when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

## Drag and Drop

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Author decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

## Copy/Cut and Paste

In Oxygen XML Author, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Author introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a *CALS* table, Oxygen XML Author preserves column width information. This information is then used when you paste the column into another *CALS* table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.

## Deleting Content

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

## Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the *Quick navigation in tables option* is not selected in the **Cursor Navigation** preferences

page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

#### Related Information:

[Adding Tables in DocBook](#) on page 548

[Adding Tables in DITA Topics](#) on page 555

[Adding Tables in XHTML Documents](#) on page 565

### Adding Tables in DocBook

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.

### Inserting a CALS Table Model in DocBook

To insert a *CALS* table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure a few more properties than the *HTML* model.

**Figure 158: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

#### Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is 1\*.
- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

### Frame

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

### Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Alignment

Specifies the alignment of the text within the table (`a l i g n` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 159: CALS Table in DocBook

## Inserting an HTML Table Model

To insert an *HTML* table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **HTML** for the table **Model**.

**Figure 160: Insert Table Dialog Box - Simple Model**

The dialog box allows you to configure the following options when you select the **HTML** table model:

### Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

### Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

### Column widths

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a `col` element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1\*.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0\*" (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

## Frame

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

## Alignment

Specifies the alignment of the text within the table (`a l i g n` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the [Author mode](#), it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.

## Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view](#) (**Window > Show View > Attributes**).

You can also use the  [Table Properties \(Ctrl + T \(Command + T on OS X\)\)](#) action from the toolbar or contextual menu to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to [Text mode](#).

## DocBook Table Layouts

The DocBook [framework](#) supports the following two table model layouts:

- [CAL S table model](#)
- [HTML table model](#)

## CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`a l i g n` attribute). Although they appear as part of the [Author mode](#), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

▼ *Sample CALS Table with no specified width and proportional column widths*

▼ colspecs...

column name  number  width  align   colsep  rowsep

Horizontal Span		a3	a4	a5
<i>f1</i>	<i>f2</i>	<i>f3</i>	<i>f4</i>	<i>f5</i>
b1	b2	b3	b4	▶Vertical◀ Span
c1	Spans ▶Both◀ directions		c4	
d1			d4	d5

Figure 161: CALS Table in DocBook

### HTML Table Model Layout

Choosing an **HTML** table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an *HTML* table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although these properties appear as part of the *Author mode*, they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

*Sample HTML Table*

column title  span  width  align

column title  span  width  align

Column 1	Column 2
Data A	Data B
Data C	Data C

Figure 162: HTML Table in DocBook

### Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the *CALS* model. If you want to overwrite this behavior and instruct Oxygen XML Author to convert them to *HTML* tables, set the `docbook.html.table` parameter to 1. You can find this parameter in the following stylesheet:

- `[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml12db5Driver.xsl` for DocBook 5
- `[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml12db4Driver.xsl` for DocBook 4

### Table Validation in DocBook

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

#### CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.

- The number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- The value of the cols, rowsep, or colsep attributes are not numeric.
- The namest, nameend, or colname attributes point to an incorrect column name.

### HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the colspan, rowspan, or span attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

#### *Editing Table Properties in DocBook*

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view](#) (**Window > Show View > Attributes**).

You can use the  **Table Properties (Ctrl + T (Command + T on OS X))** action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

**Figure 163: Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)**

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the `colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the `rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

**Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a `thead`, `tbody`, or `tfoot` attribute).

## Edit Table Properties for an HTML Table Model

For an **HTML** table model, the **Table properties** dialog box includes four tabs of options (**Table**, **Row**, **Column**, and **Cell**) and the options include a **Preview** pane that shows a representation of the modification.

The options in the four tabs include the following:

### Frame (Available only in the Table tab)

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

### Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a `thead`, `tbody`, or `tfoot` attribute).

### Horizontal alignment (Available in the Row, Column, and Cell tabs)

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

### Vertical alignment (Available in the Row, Column, and Cell tabs)

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`valign` attribute). The allowed values are:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the `bottom` value. However, if the fonts are different sizes, the `baseline` value often makes the table look better.

### Related Information:

[Editing Tables in Author Mode](#) on page 546

## Adding Tables in DITA Topics

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- [DITA Simple table model](#) - This is the most commonly used model for basic tables.
- [CAL S table model \(OASIS Exchange Table Model\)](#) - This is used for more advanced functionality.
- [DITA Choice table model](#) - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- [DITA Properties table model](#) - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Author toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

## Inserting a Simple Table Model

To insert a **Simple** DITA table, select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

**Figure 164: Insert Table Dialog Box - Simple Model**

The dialog box allows you to configure the following options when you select the **Simple** table model:

#### **Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

#### **Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### **Column widths**

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

#### **Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

### Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (**CALS**), select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

**Figure 165: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

#### **Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

#### **Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

#### **Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### **Column widths**

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

## Frame

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

## Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

## Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

## Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.  
**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 166: CALS Table in DITA

### Inserting a Choice Table Model

To insert a **Choice** table within a step element in a DITA Task document, select the  **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **choicetable** from the *Content Completion Assistant*. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 167: Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is 1\*.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in

**Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `step` element).

### Inserting a Properties Table Model

To insert a **Properties** table within a `refbody` element in a DITA Reference document, select the  **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the *Content Completion Assistant*. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

**Figure 168: Insert Table Dialog Box - Properties Model**

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `refbody` element).

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the *Attributes view* (**Window > Show View > Attributes**). See the [DITA documentation](#) for a full explanation of these attributes.

You can also use the  **Table Properties (Ctrl + T (Command + T on OS X))** action from the toolbar or contextual menu (or **DITA** menu) to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to *Text mode*.

#### Related Information:

[Editing Tables in Author Mode](#) on page 546

### DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- [CALs table model](#)
- [Simple table model](#)
- [Choice table model](#)
- [Properties table model](#)

### CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the *Author mode*, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

▼ *Sample CALS Table with no specified width and proportional column widths*

▼ colspecs...

column name  number  width  align   colsep  rowsep

Horizontal Span		a3	a4	a5
<i>f1</i>	<i>f2</i>	<i>f3</i>	<i>f4</i>	<i>f5</i>
b1	b2	b3	b4	Vertical Span
c1	Spans Both directions		c4	
d1			d4	d5

Figure 169: CALS Table in DITA

### Simple Table Model Layout

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Header 1	Header 2
Column 1	Column 2

Figure 170: DITA Simple Table

### Choice Table Model Layout

A **Choice** table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `choicetable` element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting **choicetable** from the *Content Completion Assistant* (within a step element) or by using the **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Option	Description
Opt A	
Opt B	
Opt C	

Figure 171: DITA Choice Table

### Properties Table Model Layout

A **Properties** table model is used within a `refbody` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting **properties(wizard)** from the *Content Completion Assistant* (within a `refbody` element) or by using the **Insert Table** action on the toolbar (or from the contextual menu) and selecting **Properties** for the **Model**. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Property Type	Property Value	Property Description
A	B	C

**Figure 172: DITA Properties Table**

### Table Validation in DITA

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. When you validate a *DITA map* with the  **Validate and Check for Completeness** action, if the **Report table layout problems option is selected in the DITA Map Completeness Check dialog box**, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

#### CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

#### Simple or Choice Tables

- A row has fewer cells than the number of table columns.

#### Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties** (**Ctrl + T (Command + T on OS X)**) action from the toolbar or the **Table** submenu of the contextual menu (or **DITA** menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

#### Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

**Figure 173: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)**

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the `colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the `rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

### Frame (Available only in the Table tab)

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `con ref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `con ref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

### Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple, Choice, Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

#### Table tab

##### Frame

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `con ref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `con ref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

#### Row tab (not available for *Properties* tables)

##### Row type

Allows you change the row to a body or header type of row.

#### Related Information:

[Adding Tables in DITA Topics](#) on page 555

[Editing Tables in Author Mode](#) on page 546

#### Adding Tables in XHTML Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the **Insert Table** dialog box.

**Figure 174: Insert Table Dialog Box in XHTML**

The dialog box allows you to configure the following options:

#### **Caption**

If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

#### **Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

#### **Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### **Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

#### **Column widths**

Allows you to specify the type of properties for column widths (`width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `width` attribute (in a `col` element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `width` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `width` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form `"0*"` (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

#### **Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

#### **Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode**.

### XHTML Table Layout

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an XHTML table includes a **colspecs** section that allows you to easily configure some properties. For example, you can change the value of column widths (`width` attribute) or the text alignment (`align` attribute). Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

colspecs...

*A table with merged cells, fixed column widths, and fixed total width.*

x	y	Spans Horizontally	
Spans Vertically	Spans Both		b
		e	f
g	h	i	k

Figure 175: Table Layout in XHTML Documents

### Table Validation in XHTML

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

#### HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `colspan`, `rowspan`, or `span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

### Adding Tables in TEI Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

**Figure 176: Insert Table Dialog Box in TEI**

The dialog box allows you to configure the following options:

#### **Head**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

#### **Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

#### **Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Note:** The options in the **Insert Table** dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

#### **Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view](#) (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to [Text mode](#).

## **Sorting Content in Tables and List Items**

Oxygen XML Author offers support for sorting the content of tables and list items of ordered and unordered lists.

What do you want to do?

- [Sort an entire table.](#)
- [Sort a selection of rows in a table.](#)
- [Sort a table that contains cells merged over multiple rows.](#)
- [Sort list items.](#)

#### **Sorting a Table**

To sort rows in a table, select the entire table (or specific rows) and use the  **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

**Figure 177: Sort Dialog Box**

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

**Note:** When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

### Sorting a Selection of Rows

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose **Sort**, or click **Sort** on the main toolbar. This opens the **Sort** dialog box.

**Figure 178: Sort Selected Rows**

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

### Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, select the rest of boxes in the **Criteria** section of the **Sort** dialog box, configure the applicable items, and click **OK** to complete the sorting operation.

**Figure 179: Sorting Based on Multiple Criteria**

### Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain *rowspans*.

**Note:** For this type of table, the **Sort** dialog box keeps the **All rows** option disabled even if you perform the sorting operation over a selection of rows.

### Sorting List Items

A sorting operation can be performed on various types of lists and list items. Oxygen XML Author provides support for sorting the following types of lists:

- Ordered list (o1)
- Unordered list (u1)
- Parameter list (parm1)

- Simple list (s1)
- Required conditions (reqconds)
- Supplies list (supplyli)
- Spare parts list (sparesli)
- Safety conditions (safety)
- Definitions list (d1)

The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the  **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

**Figure 180: Sorting List Items**

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

**Note:** When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

## Inserting Images

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the  **Insert Image** action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Author tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the file `/C:/project/xml/dir/img1.jpg` image into the file `/C:/project/xml/doc1.xml` document, Oxygen XML Author inserts a reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.

**Note:** The  **Insert Image** action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the href attribute in an image element:

```
<image href=" ../images/image_file.png" />
```

**Tip:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Author will automatically update the reference to the new image.

- Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Author will insert it as a reference to the image file the same as the drag/drop method.
- Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Author will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

#### Related Information:

[Image Map Editor](#) on page 575

[Image Rendering in Author Mode](#) on page 572

[Adding Video, Audio, and Embedded HTML Resources in DITA Topics](#) on page 1513

### Image Rendering in Author Mode

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.

**Table 7: Supported Image Formats**

Image Type	Support	Additional Information
GIF	built-in	Animations not yet supported
JPG, JPEG	built-in	<a href="#">JPEG images with CMYK color profiles</a> are properly rendered only if color profile is inside the image.
PNG	built-in	
SVG, SVGZ, WMF	built-in	Rendered using the open-source Apache Batik library that supports SVG 1.1.
BMP	built-in	
TIFF	built-in	Rendered using a part of the Java JAI Image library.
EPS	built-in	Renders the preview TIFF image inside the EPS.
AI	built-in	Renders the preview image inside the Adobe Illustrator file.
JPEG 2000, WBMP	plugin	Renders by <a href="#">installing the Java Advanced Imaging (JAI) Image I/O Tools plug-in</a> .
PDF	plugin	Renders by <a href="#">installing the Apache PDF Box library</a> .

When an image cannot be rendered, Oxygen XML Author **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Select the [Show very large images option](#).
- The image format is not supported by default. It is recommended to [install the Java Advanced Imaging \(JAI\) Image I/O Tools plug-in](#).

### Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

- If you specify only the width attribute of an image, the height of the image is proportionally applied.

- If you specify only the height attribute of an image, the width of the image is proportionally applied.
- If you specify width and height attributes of an image, both of them control the rendered image.
- If you want to scale both the width and height of an image proportionally, use the `scale` attribute.

**Note:** As a Java application, Oxygen XML Author uses the *Java Advanced Imaging* API that provides a pluggable support for new image types. If you have an *ImageIO* library that supports additional image formats, just copy this library to the `[OXYGEN_INSTALL_DIR]/lib` directory.

### Rendering CGM Images (Experimental Support)

Oxygen XML Author offers a few add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste <http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml> in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Oxygen CGM support** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** You should be able to see CGM images in **Author** mode.

### Alternate Method for ISOView Active X Component

**Restriction:** This support will only work on 32 bit versions of Oxygen XML Author.

If you already have the *ISOView Active X* component for Internet Explorer installed, you may want to use it to render CGM images instead of the components provided in the plugin described above.

To use your existing *ISOView Active X* component to render CGM images, follow these steps:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste <http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml> in the **Show add-ons from** field or select it from the drop-down menu.
3. Select **CGM Form control (Active X-based)** plugin and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.
6. The **CGM Form Control** plugin automatically renders CGM files in DITA, DocBook, and XHTML, so for those *frameworks*, this step is not necessary. For other *frameworks*, modify your CSS according to your particular *framework*.

If you have an XML:

```
<image href="MyCGMFile.cgm" />
```

You need a CSS rule like this:

```
image[href$=".cgm"],
image[href$=".CGM"]{
    content: oxy_editor(
        saHeavyFormControlClassName , "com.oxygenxml.activev.fctrl.ActiveXFormControl",
        href, oxy_url(oxy_base-uri() , attr(href)));
}
```

You should be able to see CGM images in **Author** mode.

### Rendering PDF Images (Experimental Support)

Oxygen XML Author provides experimental support for PDF images using the Apache PDFBox library.

To allow the rendering of PDF images in **Author** mode, follow this procedure:

1. Go to <http://pdfbox.apache.org/downloads.html> and download the pre-built PDFBox standalone binary *JAR* files: **pdfbox-2.0.3.jar**, **fontbox-2.0.3.jar**, and **xmpbox-2.0.3.jar**. Alternatively, you can use the 1.8.12 version of these files, as they have been tested and work properly.

**Note:** It is not recommended to use `pdfbox-app-2.0.3.jar` file instead of the three specified files because it contains additional classes that may cause conflicts elsewhere in Oxygen XML Author.

2. Create a subfolder called `pdfImageJars` in the `[OXYGEN_INSTALL_DIR]\lib` directory.

3. Copy the downloaded JAR libraries to that newly created subfolder.
4. Restart the application.

### Rendering PSD Images

Oxygen XML Author provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in **Author** mode, follow this procedure:

1. Download the following JAR files:
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-lang/3.1.0/common-lang-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-io/3.1.0/common-io-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-core/3.1.0/imageio-core-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-psd/3.1.0/imageio-psd-3.1.0.jar>
2. Copy the downloaded JAR libraries to the `[OXYGEN_INSTALL_DIR]\lib` directory.
3. Restart the application.

### Rendering EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Author tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Author cannot render the image.
- The EPS image includes a TIFF preview picture.

**Note:** Some newer versions of the TIFF picture preview are rendered in gray-scale.

- The AI image contains a JPEG preview picture. Oxygen XML Author renders the image correctly.

### Rendering Special Images with Java Advanced Imaging (JAI) Plugin

Certain special image types can be rendered in Oxygen XML Author by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

#### How to Install JAI Image I/O Tools Plugin

To install this plug, follow this procedure:

1. Start Oxygen XML Author and open the **Help > About** dialog box. Go to the **System properties** tab and look for the `java.runtime.name` and `java.home` properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the `java.runtime.name` property). A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html>.

**Note:** The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.

3. Run the installer. When the installation wizard displays the **Choose Destination Location** page, fill-in the **Destination Folder** field with the value of the `java.home` property. Continue with the installation procedure and follow the on-screen instructions.

### OS X Workaround

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this OS X workaround:

1. Download a Linux (tar .gz) distribution of the JAI Image I/O Tools plugin. A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html>.
2. In the `[OXYGEN_INSTALL_DIR]/lib` directory, create a directory named endorsed (`[OXYGEN_INSTALL_DIR]/lib/endorsed`).
3. Unpack the tar .gz. Copy the `clibwrapper_jiio.jar` and `jai_imageio.jar` files from its lib directory and paste them in the `[OXYGEN_INSTALL_DIR]/lib/endorsed` directory.
4. Restart the application and the JAI Image I/O support will be up and running.

### Retina/HiDPI Images in Author Mode

Oxygen XML Author provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include `@2x` in the name (for example, `myImage@2x.png`).

You can reference an image to style an element in a CSS by using the `url` function in the content property, as in the following example:

```
listItem:before{
  content: url('../img/myImage.png');
}
```

This would place the image that is loaded from the `myImage.png` file just before the `listItem` element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a *normal* DPI image and a *high* DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Author interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Author will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Author would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the *normal* resolution image file (`myImage.png`).

Oxygen XML Author also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the *normal* image is used.

### Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Author:

Color Theme	Referred Image File	Double Density Image File	Triple Density Image File
normal	<code>../img/myImage.png</code>	<code>../img/myImage@2x.png</code>	<code>../img/myImage@3x.png</code>
dark	<code>../img/myImage_dark.png</code>	<code>../img/myImage_dark@2x.png</code>	<code>../img/myImage_dark@3x.png</code>

## Image Map Editor

Oxygen XML Author includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent.

The main purpose of an **image map** is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Author is available for images in DITA, DocBook, TEI, and XHTML document types (*frameworks*). To create an image map on an existing image and open the **Image Map Editor**, right-click the image and select **Image Map Editor**.

**Figure 181: Image Map Rendered in Author Mode**

### **Image Maps in DITA**

Oxygen XML Author includes support for **image maps** in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 182: Image Map Editor in DITA**

### Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

#### Toolbar

 **New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

 **New Circle**

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

 **New Polygon**

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

 **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

### Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.

### Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

 **Add Point**

Adds a point to *Polygon* or *Free Form* shapes.

 **Remove Point**

Removes the current point from *Polygon* or *Free Form* shapes.

 **Duplicate**

Create a duplicate of the currently selected shape.

### **Delete**

Delete the currently selected shape.

### **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### **New Circle**

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

### **New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### **Undo**

Use this action to undo the last action.

### **Redo**

Use this action to redo the last action that was undone.

## Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## Properties

### Type

Displays information about the selected coordinate.

### Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of [inserting links in DITA](#) by using the identical  **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `xref` element will be inserted with either an `href` attribute or a `keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see [Inserting a Link in Oxygen XML Author](#) on page 1565.

### Description

You can enter an optional description for the selected area (shape) that will be displayed in the [Image Map Details section](#) in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

## How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**,  **New Circle**, or  **New Polygon**).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar](#) to adjust its layer and color, or to perform other editing actions.
 

**Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful [contextual menu actions](#). For example, the easiest way to remove a point is to right-click the point and select **✕ Remove Point**.
4. With the shape selected, use one of the [linking options](#) in the  **Link** drop-down menu to select a target resource (or enter its path in the [Target](#) text field).
5. (Optional) Enter a [Description](#) for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Figure 183: Image Map Details**

### How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the [Image Map Editor toolbar](#)). To change the layer order for a shape, use the layer buttons on the [Image Map Editor toolbar](#) (.

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Related Information:**

- [DITA 'imagemap' Element Specifications](#)
- [Adding Images in DITA Topics](#) on page 1511

**Image Maps in DocBook**

Oxygen XML Author includes support for **image maps** in DocBook documents through the use of the `areaspec` element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 184: Image Map Editor in DocBook**

**Image Map Editor Interface in DocBook**

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**

-  **New Rectangle**  
Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.
-  **Duplicate**  
Use this button to create a duplicate of the currently selected shape.
-  **Delete**  
Use this button to delete the currently selected shape.

### Undo

Use this button to undo the last action.

### Redo

Use this button to redo the last action that was undone.

### Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

### Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

### Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

### Send Shape Backward

Use this button to send the currently selected shape back one layer.

### Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

### Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

### Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

### Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.

### Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

### Duplicate

Create a duplicate of the currently selected shape.

### Delete

Delete the currently selected shape.

### New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### Undo

Use this action to undo the last action.

Use this action to redo the last action that was undone.

### Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

### Properties

#### Type

Displays information about the selected coordinate.

#### ID

The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular area element.

#### Target

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference** or **Web Link**. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an `xlink:href` attribute.

#### Description

You can enter an optional description for the selected area that will be displayed in the [Image Map Details section](#) in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

### How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting the  **New Rectangle** button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar](#) to adjust its layer and color, or to perform other editing actions.

**Tip:** You can right-click any of the shapes or anywhere in the Image Pane to access various helpful [contextual menu actions](#).

4. With the shape selected, enter an **ID** and use one of the [linking options](#) in the  **Link** drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select  **New Rectangle** button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

### How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Note:** If you want to link a set of related area elements, you can use `areaset` elements. To add `areaset` elements, and `area` elements to the `areaset`s, switch to **Text** mode and insert them manually.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the *Image Map Editor toolbar*). To change the layer order for a shape, use the layer buttons on the *Image Map Editor toolbar* (.

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

### Image Maps in TEI

Oxygen XML Author includes support for **image maps** in TEI documents through the use of the `facsimile` element. In TEI documents, this feature provides an easy way to create areas (using `zone` elements) in an image where the end user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.

Figure 185: Image Map Editor in TEI

### Image Map Editor Interface in TEI

The interface of the **Image Map Editor** consists of the following sections and actions:

#### Toolbar

##### **New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

##### **New Polygon**

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

##### **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

##### **Duplicate**

Use this button to create a duplicate of the currently selected shape.

##### **Delete**

Use this button to delete the currently selected shape.

### Undo

Use this button to undo the last action.

### Redo

Use this button to redo the last action that was undone.

### Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

### Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

### Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

### Send Shape Backward

Use this button to send the currently selected shape back one layer.

### Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

### Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

### Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

### Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.

### Contextual Menu Actions

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

#### Add Point

Adds a point to *Polygon* or *Free Form* shapes.

#### Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

#### Duplicate

Create a duplicate of the currently selected shape.

#### Delete

Delete the currently selected shape.

### **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### **New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### **Undo**

Use this action to undo the last action.

### **Redo**

Use this action to redo the last action that was undone.

## **Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## **Properties**

### **Type**

Displays information about the selected coordinate.

### **ID**

The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

## **How to Create an Image Map in TEI**

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (graphic) must be inside a facsimile element to support the **Image Map Editor** feature.
2. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons ( **New Rectangle** or  **New Polygon**).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.

**Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful *contextual menu actions*. For example, the easiest way to remove a point is to right-click the point and select

### **Remove Point.**

5. With the shape selected, enter an **ID**.
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

## How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Restriction:** Currently, if zone elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the zone elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the [Image Map Editor toolbar](#)). To change the layer order for a shape, use the layer buttons on the [Image Map Editor toolbar](#) (.

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

### Image Maps in XHTML

Oxygen XML Author includes support for **image maps** in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an `img` element) may be associated with an image map (in the form of a `map` element) by specifying a `usemap` attribute on the `img` element. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 186: Image Map Editor in XHTML**

### Image Map Editor Interface in XHTML

The interface of the **Image Map Editor** consists of the following sections and actions:

#### Toolbar

#### **New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

#### **New Circle**

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

#### **New Polygon**

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

#### **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

#### **Duplicate**

Use this button to create a duplicate of the currently selected shape.

#### **Delete**

Use this button to delete the currently selected shape.

### Undo

Use this button to undo the last action.

### Redo

Use this button to redo the last action that was undone.

### Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

### Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

### Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

### Send Shape Backward

Use this button to send the currently selected shape back one layer.

### Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

### Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

### Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

### Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.

### Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

#### Add Point

Adds a point to *Polygon* or *Free Form* shapes.

#### Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

#### Duplicate

Create a duplicate of the currently selected shape.

#### Delete

Delete the currently selected shape.

### **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### **New Circle**

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

### **New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### **Undo**

Use this action to undo the last action.

### **Redo**

Use this action to redo the last action that was undone.

## Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the **Alternative** property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## Properties

### Type

Displays information about the selected coordinate.

### Href

Specifies the hyperlink target for the selected area. This will become the value of the `href` attribute for the particular area element. The possible values are:

- **An Absolute URL** - A URL of another web site (for example, `http://www.example.com/index.htm`).
- **A Relative URL** - A link to a file within your web site (for example, `index.htm`).
- **An Element** - A link to the ID of an element within the page (for example, `#top`).
- **Other Protocols** - A specified path using other protocols (such as `https://`, `ftp://`, `mailto:`, `file:`).
- **A Script** - A link to a script (for example, `javascript:alert('Hello');`)

### Alternate

The description for the selected area. The value is inserted in an `alt` attribute in the particular area element. This is a required attribute to present a text alternative for browsers that do not display images.

### Target

Specifies where to open the linked resource. The allowed values are:

- **\_blank** - Opens the linked resource in a new window or tab.
- **\_self** - Opens the linked resource in the same frame as it was clicked.
- **\_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

## How to Create an Image Map in XHTML

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**,  **New Circle**, or  **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
 

**Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful *contextual menu actions*. For example, the easiest way to remove a point is to right-click the point and select  **Remove Point**.
4. With the shape selected, specify the hyperlink target in the *Href field* and enter a description for the selected area in the *Alternate field*.
5. (Optional) Specify where the hyperlink resource will be opened in the *Target field*.
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

### How to Edit an Existing Image Map in XHTML

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

In **Author** mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the *Image Map Editor toolbar*). To change the layer order for a shape, use the layer buttons on the *Image Map Editor toolbar* (.

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

### Related Information:

[HTML Image Map Specifications](#)

## Adding Video, Audio, and Embedded HTML Resources

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in **Author** mode and in all HTML5-based outputs. There is a toolbar button () that allows you to insert and configure a reference to the media

resource. You can also drag media files from your system explorer or the [Project view](#) and drop them into your documents (or copy and paste them).

**Table 8: Supported Media Types**

Media	Description	Type	Supported Size Properties
mp3	Moving Picture Experts Group Layer-3 Audio	audio	Width
wav	Windows Wave	audio	Width
pcm	Pulse Code Modulation	audio	Width
m4a	Moving Picture Experts Group Layer-4 Audio	audio	Width
aif	Audio Interchange Format	audio	Width
mp4	Moving Picture Experts Group Layer-4 Video	video	Width & Height
flv	Flash Video	video	Width & Height
m4v	Itunes Video File	video	Width & Height
avi	Audio Video Interleaved	video	Width & Height
embedded video (such as YouTube or Vimeo)	Embedded Iframe Code	iframe	Width & Height

### Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the  **Insert Media Resource** action from the toolbar. A **Chose Media** dialog box appears.

**Note:** You can also drag media files from your system explorer or the [Project view](#) and drop them into your documents (or copy and paste them).

3. Select the URL for the media resource and click **Ok**.

**Result in Author Mode:** A reference to the specified media object is inserted and rendered in **Author** mode so that it can be played directly from there.

**Result in Output:** In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

### Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Author includes a pre-installed [plugin](#) that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```

<foreign outputclass="html-embed"><![CDATA[
  <iframe width="420" height="315"

```

```

src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
]]></foreign>
....

```

The converted HTML output would look like this:

```

.....
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
.....

```

The *plugin* is also available on the [oxygenxml GitHub projects page](#).

**Related Information:**

[Adding Video and Audio Objects in DITA WebHelp Output](#) on page 935

## Editing MathML Notations

The **Author** editor includes a built-in editor for *MathML* notations. To start the *MathML* editor, double-click a *MathML* notation (for embedded notations, you can also select the **Edit Equation** action from its contextual menu). In the *MathML* editor you can edit the mathematical symbols of a *MathML* notation. You can open a *MathML* file of your current project directly in the *MathML* editor. To do this, select **Open with > MathML editor** from the contextual menu in the [Project view](#).

**Figure 187: Default MathML Editor**

The font size and font family that is used for the equations is based upon the context in which the MathML equation appears. To configure the minimum font size of the equation, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > MathML**.

## Configure the MathFlow Editor

The *MathFlow* Components product can replace the default *MathML* editor with a specialized *MathML* editor. You have to [purchase a MathFlow Component from Design Science](#) and configure it in Oxygen XML Author with the following procedure:

1. Install *MathFlow* by using the *Universal* installer (for versions prior to 2.1, use the *MathFlow SDK*).
2. Set the path to the *MathFlow* install folder [in the MathML preferences page](#).
3. Set the path to the *MathFlow* license file [in the MathML preferences page](#).

Figure 188: Default MathFlow Editor

## MathML Equations in HTML Output

Currently, only **Firefox** can render **MathML** equations embedded in the **HTML** code. [MathJax](#) is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DocBook or DITA content that has embedded **MathML** equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript"
  src="https://cdn.mathjax.org/mathjax/latest/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

For DITA documents, you can also use the following procedure:

1. [Edit the DITA Map WebHelp transformation scenario](#) and open the **Parameters** tab.
2. Set the following parameter to point to an XML resource file that contains your script, depending on your type of WebHelp system.
  - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your resource file.
  - **WebHelp Classic Systems** - Set the `webhelp.head.script` parameter to point to your resource file.
3. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

## Refreshing the Content

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the  **Reload** action.

To refresh the content of the referenced resources you can use the  **Refresh references** action that is available in the current *framework* menu (for example, the **DITA** or **DocBook5** menu) . However, this action will not refresh the expanded external entities, for which you will need to use the  **Reload** action.

## Generating IDs for Elements in Author Mode

Oxygen XML Author allows you to manually assign or edit values of `id` attributes in **Author** mode by using the **Attributes View** or an *in-place attribute editor*. Oxygen XML Author also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

### Generate IDs On-Request

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu or the *framework*-specific menu (**DITA**, **DocBook**, or **TEI**). This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options dialog box**. To open this dialog box, select **ID Options** from the *framework*-specific menu (**DITA**, **DocBook**, or **TEI**)

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

### Automatically Generate IDs

Oxygen XML Author includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options dialog box** that is displayed when you select the **ID Options** action from the *framework*-specific menu (**DITA**, **DocBook**, or **TEI**). If this **Auto generate IDs for elements** option is selected, Oxygen XML Author automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

### ID Options Dialog Box

To configure options for generating IDs, select **ID Options** from the *framework*-specific menu (**DITA**, **DocBook**, or **TEI**).

Figure 189: ID Options Dialog Box

The **ID Options** dialog box allows you to configure the following options in regards to generating ID values:

### **ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author [Editor Variables](#).

### **Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### **Auto generate IDs for elements**

If selected, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### **Remove IDs when copying content in the same document (DITA or TEI)**

When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

### **Remove IDs when copying content (DocBook)**

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

### **Duplicating Elements with Existing IDs**

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the [Auto generate IDs for elements option](#) is selected and you duplicate elements with existing IDs, Oxygen XML Author assigns new, unique ID values to the duplicates.
- If the [Auto generate IDs for elements option](#) is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
- For DITA and TEI, if the [Remove IDs when copying content in the same document option](#) is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected and this option has no effect on elements that are duplicated in other documents.
- For DocBook, if the [Remove IDs when copying content option](#) is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected.

### **Controlling the Default ID Generation Options**

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the `frameworks` folder for each of those document types, there is an XML configuration file called `idGenerationDefaultOptions.xml` that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the `resources` folder within the particular [framework](#). For example, the configuration file for the DITA *framework* is located in: `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources/idGenerationDefaultOptions.xml`.

## Sharing Default ID Generation Options

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the `idGenerationDefaultOptions.xml` file for your *framework* according to your needs.
2. Bundle a modified version of the entire *framework* folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita/`). To do this:
  - a. **Open the Preferences dialog box (Options > Preferences)** and go to **Document Type Association**.
  - b. Select your document type and click the **Extend** button.
  - c. In the **Document type configuration dialog box** that is now displayed, select **External** for the **Storage** option. By default, this will save the extension in a new folder in the `frameworks` folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita-extension (1)`), but you can also use the  **Browse** button to specify a specific name and folder.
  - d. In this new extension folder, create a new folder called `resources` and add your modified `idGenerationDefaultOptions.xml` file to this new `resources` folder.
  - e. Go back to the **Document Type Association** preferences page, select the extended *framework*, and click **Edit**.
  - f. Go to the **Classpath tab**, add a reference to your new `resources` folder, and move this reference up (using the  **Move Up** button) so that it is the first one that appears in the list.
  - g. Click **OK** and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in [Sharing a Framework \(Document Type\)](#) on page 1176.

## Using Form Controls in Author Mode

You can use form controls in **Author** mode in a variety of ways to make it easier to capture, organize, and edit content. Oxygen XML Author includes *built-in form controls* that can be used by content authors in **Author** mode. The types of built-in form controls that you can use include the following:

- *Audio* - A media object that plays audio clips.
- *Browser* - A media object that renders HTML frames or interact with SVG documents
- *Button* - A graphical user interface object that performs a specific action.
- *Button Group* - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- *Checkbox* - A graphical user interface box that you can click to select or deselect a value.
- *Combo Box* - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- *Date Picker* - A form control object that allows you to select a date in a specified format.
- *HTML Content* - A graphical user interface box that is used for rendering HTML content.
- *Pop-up* - A contextual menu that provides quick access to various actions.
- *Text Area* - A box that allows you to enter multiple lines of text.
- *Text Field* - A graphical user interface box that allows you to enter a single line of text.
- *URL Chooser* - A dialog box that allows you to select the location of local or remote resources.
- *Video* - A media object that plays videos.

You can also *implement custom form controls* for more specific needs.

The following image is an example of how form controls can be used by content authors in **Author** mode. It includes several button form controls, a combo box, and a text field. The  icon is a button form control that is assigned a specific action that changes the layout to an editing mode. The **[ + ]** and **[ - ]** icons are also button form controls that are assigned specific actions to add or delete records from the document. The *Direct manager* row includes a combo box form control that is both a drop-down menu and an editable text field, while the *Homepage* row includes a simple editable text field form control.

**Figure 190: Example of Form Controls in Author Mode**

You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled *samples* project (located in the *samples* folder inside the Oxygen XML Author installation directory) contains a file called *personal.xml* that contains form controls. You can use this file, along with its corresponding *personal.css* file (form controls are defined in the CSS) to experiment with an example of how form controls can be implemented in **Author** mode.

## Contextual Menu Actions in Author Mode

Oxygen XML Author includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in **Author** mode, the contextual menu includes *general* actions that are available for all of the recognized document types and *framework*-specific actions that are configured for each document type.

### General Contextual Menu Actions in Author Mode

The *general* actions that are available in the contextual menu (some of them are also available in the submenus of the **Document** menu) for all document types include the following:

#### Quick Fix (**Alt + 1 (Command + Alt + 1 on OS X)**)

Available when the contextual menu is invoked on an error where *Oxygen XML Author can provide a Quick Fix*.

#### Open Image

Available when the contextual menu is invoked on an image. This action allows you to open an image in the Oxygen XML Author *Image Viewer* or in a default system application associated with the current image type.

#### Track Changes Actions

Available when the *Track Changes feature* is enabled and the contextual menu is invoked on a change. The following options are available:

##### ✓ Accept Change(s)

Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

##### ✗ Reject Change(s)

Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

## **Comment Change**

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](#). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### **Author Callout Actions**

Available when the contextual menu is invoked on a [callout](#). If the corresponding options in the [Show review callouts section](#) are selected in the [Callouts preferences page](#), the callouts are displayed in **Author** mode for comments, tracked insertion changes, or tracked deletion changes.

### **Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu when invoked on an *insertion* or *deletion* callout box:

#### **Reply**

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#).

#### **Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### **Accept Change(s)**

Accepts the [Tracked Change](#) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

#### **Reject Change(s)**

Rejects the [Tracked Change](#) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

## **Comment Change**

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](#). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### **Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

### **Callouts Options**

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

### **Comment Callout Actions**

The following actions are available in the contextual menu when invoked on a *comment* callout box:

#### **Reply**

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#).

## Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

## Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

## Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

## Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

## Edit Attributes

Displays an [in-place attributes editor](#) that allows you to manage the attributes of an element.

## Edit Profiling Attributes

Allows you to change the [profiling attributes](#) defined on all selected elements.

## Insert submenu

This submenu includes insert actions that are specific to each [framework](#), along with the following general action:

### Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `<decimal value>` - e. g. #65
- `&#<decimal value>;` - e. g. &#65
- `&#x<hexadecimal value>` - e. g. #x41
- `&#x<hexadecimal value>;` - e. g. &#x41

## Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

## Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

## Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

## Paste special submenu

This submenu includes special paste actions that are specific to each [framework](#), as well as the following general paste actions:

### Paste As XML

Pastes clipboard content that is considered to be XML, preserving its XML structure.

### Paste As Text

Pastes clipboard content, ignoring any structure or styling markup.

## Select submenu

This submenu allows you to select the following:

## Element

Selects the entire element at the current cursor position.

## Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

## Parent

Selects the entire parent element at the current cursor position.

## Text submenu

This submenu contains the following actions:

### To Lower Case

Converts the selected content to lower case characters.

### To Upper Case

Converts the selected content to upper case characters.

### Capitalize Sentences

Converts to upper case the first character of every selected sentence.

### Capitalize Words

Converts to upper case the first character of every selected word. 0034

### Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:** The content marked as deleted with *change tracking* is ignored when counting words.

### Convert Hexadecimal Sequence to Character (**Ctrl + Shift + X (Command + Shift + X on OS X)**)

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

## Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

### **Toggle Comment**

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

### **Move Up (Alt + UpArrow)**

Moves the current node or selected nodes in front of the previous node.

### **Move Down (Alt + DownArrow)**

Moves the current node or selected nodes after the subsequent node.

### **Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

### **Join Elements**

Joins two adjacent *block elements* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

### **Surround with Tags (Ctrl + E (Command + E on OS X) )**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the *Position cursor between tags option* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the *Position cursor between tags option* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

### **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

### **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

### **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

### **Remove Text**

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

## **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

### **Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

### **Convert attribute to element**

Allows you to change an attribute into an element.

### **Delete attribute**

Allows you to remove one or more attributes.

### **Rename attribute**

Allows you to rename an attribute.

### **Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

## **Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

### **Delete comments**

Allows you to delete comments found inside one or more elements.

## **DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

### **Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

### **Convert conrefs to conkeyrefs**

Use this operation to convert conref attributes to conkeyref attributes.

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments submenu**

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

## JATSKit submenu

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

### Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

### Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

### Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

## Review submenu

This submenu includes the following actions:

### Track Changes

Enables or disables the *Track Changes* support for the current document.

### Accept Change(s) and Move to Next

Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

### Accept All Changes

Accepts all *Tracked Changes* in the current document.

### Reject Change(s) and Move to Next

Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

### Reject All Changes

Rejects all *Tracked Changes* in the current document.

### Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### Highlight

Enables the highlighting tool that allows you to mark text in your document.

## Colors

Allows you to select the color for highlighting text.

## Stop highlighting

Use this action to deactivate the highlighting tool.

## Remove highlight(s)

Use this action to remove highlighting from the document.

### Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

### Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

### **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

### **Manage Reviews**

Opens the [Review view](#).

## **Manage IDs submenu**

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

### **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

### **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### **Search References in**

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

### **Search Occurrences in file**

Searches for the occurrences of the ID in the current document.

## **Folding submenu**

This submenu includes the following actions:

### **Toggle Fold**

Toggles the state of the current fold.

### **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**

Folds all the elements except the current element.

### **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**

Folds the elements indented with one level inside the current element.

### **Expand Child Folds**

Unfolds all child elements of the currently selected element.

### **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**

Unfolds all elements in the current document.

## **Inspect Styles**

Opens the [CSS Inspector view](#) that allows you to examine the CSS rules that match the currently selected element.

## **Options**

Opens the [Author mode options page](#).

## **Document Type-Specific Contextual Menu Actions in Author Mode**

Other *document type-specific* actions are available in the contextual menu of **Author** mode for the following document types (click the links to see the default actions that are available for each specific document types):

- [DocBook4 Author Actions](#)
- [DocBook5 Author Actions](#)
- [DITA Author Actions](#)
- [DITA Map Author Actions](#)

- [XHTML Author Actions](#)
- [TEI ODD Author Actions](#)
- [TEI P5 Author Actions](#)
- [JATS Author Actions](#)

## Special Character Support in Author Mode

Oxygen XML Author offers support for bidirectional text, such as Arabic or Hebrew languages that require right to left scripts, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters). To achieve this, Oxygen XML Author implements the [Unicode Bidirectional Algorithm](#), as specified by the Unicode consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in **Author** mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the [Arrow keys move the cursor in the writing direction](#) option in the **Cursor Navigation** preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

**Tip:** If you experience performance issues when editing documents that contain bidirectional text, you could try one of the following solutions:

- The Eclipse plugin distribution of Oxygen XML Author is faster than the standalone version when working with bidirectional text.
- You could try changing the font. For example, you could try using the **David** font in Hebrew content. If it is not already installed in your operating system, this font is available at: <https://www.microsoft.com/typography/fonts/family.aspx?FID=234>. To change the font in Oxygen XML Author, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Appearance > Fonts**, and change the font in the [Author default font](#) option.

For more information about the bidirectional text support in the **Author** mode, watch our video demonstration:

[Inserting Special Characters](#)

### Controlling the Text Direction Using XML Markup

Oxygen XML Author Supports the following CSS properties:

**Table 9: CSS Properties Controlling Text Direction**

<b>direction</b>	Specifies the writing direction of the text. The possible values are <b>ltr</b> (the text direction is left to right), <b>rtl</b> (the text direction is right to left), and <b>inherit</b> (the direction property is inherited from the parent element).
<b>unicodeBidi</b>	Used along with the <b>direction</b> property to create levels of embedded text with different text directions in the same document. The possible values of this property are <b>bidi-override</b> (creates an additional level of embedding and forces all strong characters to the direction specified in the <b>direction</b> ), <b>embed</b> (creates an additional level of embedding), <b>normal</b> (does not use an additional level of embedding), and <b>inherit</b> (the value of the <b>unicodeBidi</b> property is inherited from parent element).

For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

XML File:

```
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLpara>
</article>
```

Associated CSS File:

```
myRTLpara{
  direction:rtl;
  unicode-bidi:embed;
}
```

Oxygen XML Author recognizes the **dir** attribute on any XML document. The supported values are:

<b>ltr</b>	The text from the current element is Left to Right, embedded.
<b>rtl</b>	The text from the current element is Right to Left, embedded.
<b>lro</b>	The text from the current element is Left to Right, embedded.
<b>rlo</b>	The text from the current element is Right to Left, embedded.

The following XML document types make use of the **dir** attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

**Note:** When the *inline element* tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the **No Tags** mode versus viewing it in the **Full Tags** mode.

### Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

**Table 10: Directional Formatting Codes**

U+202A (LRE)	LEFT-TO-RIGHT EMBEDDING	Treats the following text as embedded left-to-right.
U+202B (RLE)	RIGHT-TO-LEFT EMBEDDING	Treats the following text as embedded right to left.
U+202D (LRO)	LEFT-TO-RIGHT OVERRIDE	Forces the following characters to be treated as strong left-to-right characters.
U+202E (RLO)	RIGHT-TO-LEFT OVERRIDE	Forces the following characters to be treated as strong right-to-left characters.
U+202C (PDF)	POP DIRECTIONAL FORMATTING CODE	Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.
U+200E (LRM)	LEFT-TO-RIGHT MARK	Left-to-right strong zero-width character.
U+200F (RLM)	RIGHT-TO-LEFT MARK	Right-to-left strong zero-width character.

To insert Unicode Direction Formatting Codes, use the [Character Map](#) dialog box. To easily find such a code, you can either enter directly the hexadecimal value, or use the **Details** tab to enter the codes name.

Oxygen XML Author offers the support for bi-directional text in all the side views ([Outline view](#), [Attributes view](#) and so on) and text fields.

# Editing Documents

- [Editing Documents with Long Lines](#)
- [Handling Read-Only Files](#)
- [Scratch Buffer](#)
- [XML Digital Signatures](#)
- [Compare Files or Directories](#)

This chapter includes a large amount of information about editing numerous types of documents, how to create and work with documents, working with projects, and various editing features that are provided in Oxygen XML Author. Each type of document has unique features and options when editing them in Oxygen XML Author, while some editing features are available for all document types. This chapter also includes information about some of the special tools that are included in Oxygen XML Author, such as the file and directory comparison tools.

## Getting Familiar with the Interface

---

Oxygen XML Author includes several [perspectives](#) and [editing modes](#) to help you accomplish a wide range of tasks. Each [perspective](#) and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

There are various ways that you can [configure the layout of the views or editors](#), and you can [customize the toolbars](#).

Regardless of the [perspective](#) or [editing mode](#) that you are working with, the default layout consists of the following areas:

## Menus

Menu driven access to all the features and functions available in Oxygen XML Author. Most of the menus are common for all types of documents, but Oxygen XML Author also includes some context-sensitive and *framework*-specific menus and actions that are only available for a specific context or type of document.

## Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all *perspectives*, editing modes, and types of documents, while others are specific to the particular *perspective* or mode. Some toolbars are also *framework*-specific, depending on the type of document that is being edited. All the *toolbars can be configured* to suit your specific needs.

## Helper Views

Oxygen XML Author includes a large variety of *dockable* views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each *perspective* and editing mode are displayed by default and you can choose to display others to suit your specific needs. The *layout of the views can also be configured* according to your preferences.

## Editor Pane

The main editing area in the center of the application. Each *editing mode* provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each *editing mode* also includes a variety of contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane and there are *several ways to switch between tabs or move them*.

## Perspectives

Oxygen XML Author includes *several different perspectives* that you can use to work with your documents. The **Editor perspective** is the most commonly used *perspective* used for displaying and editing the content of your XML documents, and it is the default *perspective* when you start Oxygen XML Author for the first time. Oxygen XML Author also includes a **Database perspective** that allows you to manage databases.

## Status Bar

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The *Unicode value* for the character directly to the right of the current cursor position.
- The status of the current document. The status of **Modified** is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In *Text editing mode*, the current line and character position is displayed.
- If the *Check for notifications option* is selected, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Author website, the announcement of upcoming webinars and conferences where the Oxygen XML Author team will participate, and more.
- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the *Show memory status option* is selected, a  **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

## Configuring the Layout of the Views and Editors

All the Oxygen XML Author views available in the **Editor perspective** are *dockable* and there are various ways to configure and arrange the layout of the views and editing panes. You can also *configure the layout of the toolbars*.

To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the **×** button at the top-right corner of the view, or with the **Window > Hide current view** action.

## Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Author window. Once you create a layout that suites your needs, you can save it from **Window > Export Layout**. Oxygen XML Author creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

**Note:** The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the [preferences directory](#) of Oxygen XML Author.

To gain more editing space in the Oxygen XML Author window, click  **Toggle auto-hide** in any view. This button sets the view in the *auto-hide* state, making it visible only as a vertical tab, at the margins of the Oxygen XML Author window. To display a view in the *auto-hide* state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere. A view can also be set to a floating state by using the **Toggle floating** action, making it independent from the rest of the Oxygen XML Author window.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In this example, the `personal.xml` file was dragged over the `personal-schema.xml` file. When doing this, a dark gray rectangle marks the rearranged layout.

Figure 191: Drag and Drop Editors

## Tile/Stack Editor Actions

You can also tile or stack all open editors, both in the [Editor perspective](#) or in the [Database perspective](#), using the following actions from the **Editor** toolbar or **Window** menu:

### **Tile Editors Horizontally**

Splits the editing area into horizontal tiles, one for each open file.

### **Tile Editors Vertically**

Splits the editing area into vertical tiles, one for each open file.

### **Stack Editors**

The reverse of the **Tile Editors Horizontally/Vertically** actions. Stacks all open editors.

### **Synchronous Scrolling**

Select this action to scroll through the tiled editors at the same time.

**Note:** When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

## **Split Editor Actions**

You can divide the editing area vertically and horizontally using the following actions available in the **Editor** toolbar and **Window** menu:

-  **Split Editor Horizontally** - Splits the editor horizontally. This is useful for comparing and merging content between two documents.
-  **Split Editor Vertically** - Splits the editor vertically. This is useful for comparing and merging content between two documents.
-  **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize/Restore Editor Area**.

## **Switch or Move Editor Tabs**

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them.

### **Switching Editor Tabs**

You can switch between editor tabs by using any of the following methods:

#### **Mouse and Scroll Wheel**

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many tabs opened to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

#### **Buttons on the Far-Right of the Tab Stripe (◀▶☐)**

You can use the arrow buttons (◀▶) on the right side of the tab stripe to scroll to the left or right and the ☐ **Show List** button opens a pop-up window that displays all the opened file tabs and allows you to select and switch to a specific opened file.

#### **Ctrl + Tab (Command + Tab on OS X) [NOTE: Ctrl + Page Down (Ctrl + Alt + Right Arrow on OS X) does the same]**

Switches to the next opened tab in the order specified in the [Order of switching between editor tabs option](#).

#### **Ctrl + Shift + Tab (Command + Shift + Tab on OS X) [NOTE: Ctrl + Page Up (Ctrl + Alt + Left Arrow on OS X) does the same]**

Switches to the previous opened tab in the order specified in the [Order of switching between editor tabs option](#).

#### **Window > Switch editor tab (Ctrl + F9 (Command + F9 on OS X))**

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of file tabs opened and you want to

switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific opened file tabs.

**Figure 192: Switch Editor Tab Dialog Box**

The **Switch Editor Tab** dialog box contains the following options and features:

#### **Search Filter**

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific opened files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, \* to match any sequence of characters or ? to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

#### **Match all terms**

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

#### **Include file paths**

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

#### **Case sensitive**

If this option is selected, the search operation will be case-sensitive.

#### **List of Opened File Tabs**

All files that are currently opened are displayed in the main pane of the dialog box. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

### **Moving Editor Tabs**

You can move editor tabs by using any of the following methods:

#### **Mouse Drag**

You can use your mouse to drag editor tabs to a new location on the tab stripe.

#### **Ctrl + Alt + Comma**

Moves the current file tab one position to the left.

#### **Ctrl + Alt + Period**

Moves the current file tab one position to the right.

For more information about configuring the interface of Oxygen XML Author, watch our video demonstration:

#### **Related Information:**

[Configuring Toolbars](#) on page 162

## Configuring Toolbars

You can configure the toolbars in Oxygen XML Author to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (**Text**, **Author**, or **Grid**) and in the current *perspective* (**Editor** or **Database**). You can also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

**Figure 193: Configure Toolbars Dialog Box**

The **Configure Toolbars** dialog box provides the following features:

### Filter Text Box

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

### Show or Hide Toolbars

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current *perspective* and editing mode.

### Show or Hide Actions in a Toolbar

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

### Add Actions to a Toolbar

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from *frameworks* or 3rd party *plugins*.

### Remove Actions from a Toolbar

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

### Move Actions in a Toolbar

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Author.

## Customize My Toolbar

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar" Toolbar** action that is available when you right-click anywhere in the toolbar area.

## Drop-down Menu Actions

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

## Configure External Tools Action

There is a  **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

**Note:** If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

### Reset Toolbars

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

### Reset Layout

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

### Export Layout

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

### Hide Toolbars

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

### Related Information:

[Configuring the Layout of the Views and Editors](#) on page 159

## Creating and Working with Documents

---

Oxygen XML Author includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

### Creating New Documents and Templates

Oxygen XML Author includes a handy **New Document** wizard that allows you to customize and create new files from a large list of document types and predefined new file templates. You can also create your own templates and share them with others.

#### New Document Wizard

Oxygen XML Author supports a wide range of document types. The **New Document** wizard presents the default associations between a file extension and the type of editor that opens the file. To customize these default associations, [open the Preferences dialog box \(Options > Preferences\)](#) and go to [File Types](#).

The **New Document** wizard only creates a skeleton document. It may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type.

## New Document Wizard

The **New Document** wizard allows you to create various types of documents and provides some options that help you to configure the new document. To use this wizard to create a new document in Oxygen XML Author, follow these steps:

1. Click the  **New** button on the toolbar or select **File > New**.

**Result:** The **New Document** wizard is displayed:

**Figure 194: New Document Wizard**

The first page of the wizard displays the supported document types and groups them in the following categories:

- **Recently Used** - Contains the list of the most recently used file types.
  - **New Document** - Contains the list of all supported document types. This list includes XML, CSS, Text, PHP, JavaScript.
  - **Global Templates** - Contains the list of predefined templates as well as user-defined custom templates. You can [create your own custom file templates](#) and add them to the templates folder of the Oxygen XML Author installation directory. You can also specify an additional directory to use for the templates in the [Document Templates preferences page](#).
  - **Framework Templates** - Contains the list of templates defined in the [Document Type configuration dialog box \(Templates tab\)](#) for each *framework*.
2. Select the type of document that you want to create.

**Tip:** You can use the text filter field at the top of the dialog box to search for a specific template.

3. If you want to change the default name and path of the file, select the **Save as** option and specify the file path (the [Show "Save as" option to save newly created documents in the "New" document wizard option](#) must be selected in the **Open/Save** preferences page). Otherwise, the file will be opened in a new tab with a default *untitled* name and the document path will not yet exist until you save it.

**Note:** For DITA documents, the dialog box includes some additional options for generating a title, file name, and root ID attribute. For more information, see [Creating a New DITA Topic](#) on page 1503.

4. If you want to use the default settings in the creation process, select **Create** at the bottom of the dialog box.

**Result:** The document is created using the default settings and the new file is opened in the appropriate editor.

5. If you want to configure properties before creating the file, select **Customize**. This action is available for XML, XML Schema, Schematron, and XSL documents.

**Result:** A new file configuration dialog box is opened that allows you to customize various options, depending on the document type you selected. After configuring the options in this wizard, click **Create** to create the file and open it in the appropriate editor.

## XML Document File Type

**Figure 195: New XML Document Configuration Wizard Page**

If you selected  **XML Document** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Schema URL** - Specifies the path to the schema file. When you select a file, Oxygen XML Author analyzes its content and tries to fill in the rest of the dialog box.
- **Schema Type** - Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.
- **Public ID** - Specifies the PUBLIC identifier declared in the document prolog.
- **Namespace** - Specifies the document namespace.
- **Prefix** - Specifies the prefix for the namespace of the document root.
- **Root Element** - Populated with elements defined in the specified schema, enables selection of the element used as document root.
- **Description** - A small description of the selected document root.
- **Add Optional Content** - If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.
- **Add First Choice Particle** - If you select this option, Oxygen XML Author generates the first element of an `xs:choice` schema element in the skeleton XML document. Oxygen XML Author creates this document in a new editor panel when you click **OK**.

## XSLT Stylesheet File Type

Figure 196: New XSLT Stylesheet Configuration Wizard Page

If you selected  **XSLT Stylesheet** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Stylesheet version** - Allows you to select the Stylesheet version number. You can select from: 1 . 0, 2 . 0, and 3 . 0.
- **Add documentation annotations** - Select this option to generate the stylesheet annotation documentation.

## XML Schema File Type

Figure 197: New XML Schema Configuration Wizard Page

If you selected  **XML Schema** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Default XML Schema version** - Uses the XML Schema version defined in the [XML Schema preferences page](#).
- **XML Schema 1.0** - Sets the minVersion attribute to **1.0** and the maxVersion attribute to **1.1**.
- **XML Schema 1.1** - Sets the minVersion attribute to **1.1**.
- **Target namespace** - Allows you to specify the schema target namespace.
- **Namespace prefix declaration table** - This table contains namespace prefix declarations. Table information can be managed using the **+** **New** and **X** **Delete** buttons.

## Schematron File Type

**Figure 198: New Schematron Configuration Wizard Page**

If you selected  **Schematron** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following option:

- **Schematron version** - Specifies the Schematron version. Possible options: 1.5 (deprecated) and ISO.

**Note:** Starting with version 16.0 of Oxygen XML Author, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

## Creating New Document Templates

Oxygen XML Author allows you to create your own custom document templates and they will appear in the **Global templates** folder (or another specified folder) within the [New document wizard](#).

### Creating a New Document Template

To create your own custom document template and have it appear in the new file wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.

**Tip:** You can use [editor variables](#) in the template file content and they will be expanded when the files are opened.

2. Save the new file template in one of the following locations:

- The templates directory of the Oxygen XML Author installation directory (`[OXYGEN_INSTALL_DIR]/templates`). File templates saved in this directory will appear in the **Global templates** category in the [New document wizard](#).
- You can also use any other directory of your choice, but you must add that directory to the list of templates in the [Document Templates preferences page](#). This user-defined directory will appear in the [New document wizard](#) with the new file templates that you save in it.

**Attention:** The name that you use to save the template will be the name that appears in the new file wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as **My Custom Template1**).

3. Open the new file wizard ( **New** toolbar button or **File > New**) and you should see your custom template in the appropriate folder. For DITA templates, they will also appear in the dialog box for creating new DITA topics

from the **DITA Maps Manager**, but if you create a corresponding properties file (see the procedure below), you need to set the type property to **dita**.

#### Related Information:

[Customizing Document Templates](#) on page 395

### Customizing Document Templates

Oxygen XML Author allows you to customize certain aspects of predefined or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the [New document wizard](#).

#### Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one.
  - If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`). This properties file will specify the paths to the icons that will be used in the new file wizard. You can find some examples in the `templates` directory of the Oxygen XML Author installation directory to help you get started.

When defining the icons, the properties file should look like this:

```
type=general
smallIcon=../icons/Article_16.png
bigIcon=../icons/Article_48.png
```

**Important:** For DITA files, the type property needs to be set to **dita**. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the [DITA Maps Manager](#). For all other types of files, set it to **general**. The icons specified in this properties file will only be used for the new file wizards and not in any other part of the interface.

**Note:** If you created a new template and chose to use a custom directory for the new template (in [step 2 of the new template procedure](#)), make sure the path to the icons is relative to that directory.

- If you edit an existing template, simply define the icon paths as specified [above](#).
2. Save the properties file in the same directory as the document template.
  3. Open the new file wizard (**File > New**) and you should see your custom icons next to the document template in the appropriate folder.

#### Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you click the  **New** button on the toolbar (or **File > New**). The prefix or suffix is added to the name of the file in the **Save as** field.
- The new document dialog box that appears when you select **New > File** from the contextual menu in the [Project view](#). The prefix or suffix is added to the name of the file in the **File name** field.
- For DITA files, it also applies to the new document dialog box that appears when you select **Append Child > New, Insert Before > New, or Insert After > New** from the [DITA Maps Manager](#). The prefix or suffix is added to the name of the file in the **Save as** field.
- For DITA files, it also applies to the [Fast Create Topics dialog box](#) that you can use to create multiple skeleton topics at once.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.

- If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`). This properties file will specify the prefix/suffix that will be used to propose the file name in the new file wizards.

When defining the prefix/suffix, the properties file should look something like this:

```
type=general
filenamePrefix=prod_
filenameSuffix=_test
```

**Important:** For DITA files, the `type` property needs to be set to **dita**. For all other types of files, set it to **general**.

- If you edit an existing template, simply define the prefix/suffix as specified [above](#).
2. Save the properties file in the same directory as the document template.
  3. Open the new document wizard ([using the methods described above](#)) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

### Configure the Displayed Names for Document Templates

To change the name that is displayed for a document template, use the following procedure:

1. Create a new properties file or edit an existing one. If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`).
2. Add a `displayName` property in the properties file:

```
displayName=myTemplateName
```

**Tip:** The names for [framework](#)-specific document templates (such as DITA *Topic* or DocBook *Article* as you would see in the **Framework templates** section in the **New** file wizard) can be translated via the internationalization support. In this case, the properties file should contain something like:

```
displayName=${i18n(tag)}
```

where *tag* refers to an entry in the `translation.xml` file for that specific framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/i18n/translation.xml` for DITA).

3. Save the properties file in the same directory as the document template.
4. Open the new file wizard (**File > New**) and you should see the new name for the template.

### Adding Placeholders or Hints in a Document Template

Document templates sometimes contain empty elements and it may not be clear to the Author what should be inserted. You can define placeholders in document templates that provide hints for Authors to help them understand what type of content should be added in any particular empty element within the document. The placeholder text is specified using a processing instruction and the placeholders are removed when the Author inserts content in the corresponding element.

To define placeholders in a document template to provide authors with hints, follow this procedure:

1. Edit the document template.
2. Add placeholders in the form of processing instructions within the elements where you want hints to be displayed when an Author creates a document from the template. For example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="pi">
  <title><?oxy-placeholder content="Please give a title"?></title>
  <shortdesc><?oxy-placeholder content="Writing short descriptions
induces the writer to clarify the main thesis of the topic.
We recommended a 50 word limit."?></shortdesc>
  <body>
    <p><?oxy-placeholder content="A paragraph element should be a self-contained
unit dealing with one idea or point."?></p>
  </body>
</topic>
```

3. Save the template file.

- Use the [New document wizard](#) to create a new document using your customized template and you should see the hints in the opened document.

**Related Information:**

[Creating New Document Templates](#) on page 394

## Opening Documents

To open a document in Oxygen XML Author, do one of the following:

- Go to **File** >  **Open (Ctrl + O (Command + O on OS X))** or click the  **Open** toolbar button to display the **Open File** dialog box. The start folder of the **Open** dialog box can be either the last folder visited by this dialog box or the folder of the currently edited file. This can be [configured in the user preferences](#).
- Go to **File** > **Open URL** or click the  **Open URL** toolbar button to display a dialog box that allows you to access any resource identified through a URL (defined by a protocol, host, resource path, and an optional port). The following actions are available in the drop-down action list:
  -  **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local file.
  -  **Browse for remote file** - Displays the [Open URL dialog box](#) that allows you to open a remotely stored file.
  -  **Browse for archived file** - Displays the [Archive Browser](#) that allows you to browse the content of an archive and choose a file.
  -  **Browse Data Source Explorer** - Opens the [Data Source Explorer](#) that allows you to browse the data sources defined in the [Data Sources preferences page](#).

**Tip:** You can open the **Data Sources** preferences page by using the **Configure Database Sources** shortcut from the **Open URL** dialog box.
-  **Search for file** - Displays the [Open/Find Resource dialog box](#) that allows you to search for a file.
- Click the  **Open/Find Resource** toolbar button to search for a file to open.
- Go to **File** >  **Reload** to load the last saved file content. All unsaved modifications are lost.
- Go to **File** > **Reopen** to reopen one of the recently opened document files. The list containing recently opened files can be emptied by invoking the **Clear history** action.
- Select the **Open** or **Open with** action from the contextual menu of the [Project view](#).

**Related Information:**

[Opening Local Files at Start-up](#) on page 397

### Opening the Current Document in a System Application

To open the currently edited document in the associated system application, use the  **View in Browser/System Application** action that is available in the **File** menu and on the **File** toolbar. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

### Opening Local Files at Start-up

To open a local file at start-up when you open Oxygen XML Author from the command line, add the paths for one or more local files as parameters in the command line:

- `scriptName [pathToXMLFile1] [pathToXMLFile2]`
  - scriptName** is the name of the startup script for your platform ( `oxygenAuthor.bat` on Windows, `oxygenAuthor.sh` on Mac OS X and Linux).
  - pathToXMLFileN** is the name of a local XML file.

The two possibilities of opening files at startup by specifying them in the command line are explained also if the startup script receives one of the `-h` or `--help` parameters.

## Related Information:

[Opening a File at a Specific Location Using the Command Line Interface](#) on page 398

## Opening a File at a Specific Location Using the Command Line Interface

Oxygen XML Author offers support for opening a file at a specific position using the command line interface, by transmitting parameters to the Oxygen XML Author batch script file. The following methods are available, depending on how you identify the position that is needed:

### 1. Specific position values (line and column number, or character offset)

Oxygen XML Author supports the following position parameters:

- `line` - The line number.
- `column` - The column number (has meaning if the `line` parameter is also defined).
- `char` - The character offset.

#### Examples for Windows:

The following examples show how you can open an XML document in Oxygen XML Author:

```
author.bat file:samples/personal.xml#line=4
author.bat file:samples/personal.xml#line=4column=5
author.bat file:samples/personal.xml#line=4;column=5
author.bat file:samples/personal.xml#char=334
```

### 2. Simplified XPath index path

Oxygen XML Author will open an XML file and select one of its elements identified by a simplified XPath index path. For example, an index path of the form `1/5/7` identifies the seventh child of the fifth child of the root element.

**Restriction:** Oxygen XML Author will display a selection that starts with the first character of the content of the identified element and spans until the end of the line.

#### Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Author and select the third child of the root element:

```
author.bat file:samples/personal.xml#element(1/3)
```

### 3. Anchors identified by ID attribute values

Oxygen XML Author will open an XML file and select the element whose `id` attribute value is an exact match of the [anchor](#) attached to a command line instruction.

#### Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Author and select the element that has the `id` element set to `titleID`:

```
author.bat file:samples/personal.xml#titleID
```

## Related Information:

[Opening Local Files at Start-up](#) on page 397

## Saving Documents

You can save the document you are editing with one of the following actions:

- **File >  Save.**
- ** Save** toolbar button - If the document was not yet saved, it displays the **Save As** dialog box.
- **File > Save As** - Displays the **Save As** dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- **File > Save To URL** - Displays a **Save to URL** dialog box that can be used to save a file identified by its URL (defined by a protocol, host, resource path, and an optional port). Use the drop-down action list to choose one of the available save actions:

-  **Browse for local file** - Opens a local file browser dialog box allowing you to save the document locally.
  -  **Browse for remote file** - Displays a **Save to URL** dialog box that allows you to save the document to a remote location (accessible through FTP, SFTP or WebDAV).
  -  **Browse for archived file** - Displays the [Archive Browser](#) that allows you to save the document inside an archive.
  -  **Browse Data Source Explorer** - Opens a [Data Source Explorer](#) that allows you to browse the data sources defined in the [Data Sources preferences page](#).
- Tip:** You can get to the **Data Sources** preferences page, using the **Configure Database Sources** shortcut from the **Save to URL** dialog box.
-  **Search for file** - Displays the [Open/Find Resource dialog box](#).
  - **File > Save All** - Saves all open documents. If any document does not have a file, displays the **Save As** dialog box.

## Opening and Saving Remote Documents

Oxygen XML Author supports editing remote files, using the FTP, SFTP, WebDAV, SharePoint, and SharePoint Online for Office 365 protocols. You can edit remote files in the same way you edit local files. For example, you can add remote files to a project, or use them in XSL and FO transformations.

You can open one or more remote files in [the Open URL dialog box](#).

A WebDAV resource can be locked when it is opened in Oxygen XML Author by selecting the [Lock WebDAV files on open option](#) to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Author displays an error message that contains the lock owner's name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Author.

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out** the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Author and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current [WebDAV Connection](#) details can be saved by switching to the **Database perspective** and then you can browse and manage the connection in the [Data Source Explorer view](#).

### Open URL

To open this dialog box, go to **File >  Open URL** (or click the  **Open URL** toolbar button), then choose the  **Browse for remote file** option from the drop-down action list.

**Figure 199: Open URL Dialog Box**

The displayed dialog box is composed of the following:

#### **Server URL**

Specifies the protocol (HTTP, HTTPS or FTP) and the host name or IP of the server.

**Tip:** When specifying a URL, follow these rules:

- To access an FTP server, write the protocol, host, and port (if using a non-standard one). For example, `ftp://server.com` or `ftp://server.com:7800/`.
- To access a WebDAV server, write the path to the directory of the WebDAV repository along with the protocol and the host name. For example, `https://www.some-webdav-server.com:443/webdav-repository/`.

**Important:** Make sure that the repository directory ends in a slash "/". For example, `https://www.some-webdav-server.com:443/webdav-repository/`

#### **Autoconnect**

If selected, the browse action is performed every time when you open the dialog box.

#### **User and Password**

To browse for a file on a server, you have to specify the user and password for the server. This information is bound to the selected URL displayed in the **File URL** combo box, and used further in opening/saving the file. If the **Save** option is selected, then the user and password are saved between editing sessions. The password is kept encrypted in the options file.

**Note:** Your password is well protected. If the options file is used on another machine by a user with a different username, the password will become unreadable since the encryption is dependent on the username. This is also true if you add URLs that contain a username and password to your project.

## Connect

When you press this button, the directory listing will be shown in the main section of the dialog box. If the selected URL points to a SharePoint server, a dedicated SharePoint browsing component is presented.

## Browser view

- If you are browsing a WebDAV or FTP repository, the items are presented in a tree-like fashion. You can browse the directories, and make multiple selections. Additionally, you may use the **Rename**, **Delete**, and **New Folder** actions to manage the file repository.

**Note:** The file names are sorted in a case-insensitive way.

- When you browse a SharePoint repository, a specialized component renders the SharePoint site content.

**Figure 200: Browsing a SharePoint Repository**

The left side navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as *sites*, *libraries*, and *folders*).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

**Note:** The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

**Figure 201: Drop-Down Menu to Select Which Items to Display**

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

**Note:** A column can be filtered or sorted only if it was configured this way on the server side.

**Figure 202: Column Filter**

### File URL

You can use this combo box to directly specify the URL to be opened or saved. You can type a URL such as `http://some.site/test.xml` (if the file is accessible through normal HTTP protocol), or `ftp://anonymous@some.site/home/test.xml` (if the file is accessible through anonymous FTP).

This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

### Changing File Permissions on a Remote FTP Server

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP/WebDAV file browser dialog box by right-clicking a tree node and selecting the *Change permissions* menu item.

In this dialog box, the usual Unix file permissions *Read*, *Write*, and *Execute* are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the *Permissions* text field when it is modified with one of the checkboxes.

### WebDAV over HTTPS

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Author allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Author will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Author. This means that Oxygen XML Author can find the certificate in the key store of the Java Runtime Environment in which it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

### Troubleshooting HTTPS

When Oxygen XML Author cannot connect to an HTTPS-capable server, most likely there is no certificate set in the *Java Runtime Environment (JRE)* that Oxygen XML Author runs into. The following procedure describes how to:

- Export a certificate to a local file using any HTTPS-capable Web browser (for example, Internet Explorer).
- Import the certificate file into the JRE using the keytool tool that comes bundled with Oxygen XML Author.

**Tip:** To make Oxygen XML Author accept a certificate even if it is invalid, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Connection settings > HTTP(S)/WebDAV**, and select the **Automatically accept a security certificate, even if invalid** option.

1. Export the certificate into a local file

- a) Point your HTTPS-aware Web browser to the repository URL.

If this is your first visit to the repository it will be displayed a security alert stating that the security certificate presented by the server is not trusted.

**Figure 203: Security alert - untrusted certificate**

- b) Go to menu **Tools > Internet Options**.  
**Internet Options** dialog box is opened.
  - c) Select **Security** tab.
  - d) Select **Trusted sites** icon.
  - e) Press **Sites** button.  
This will open **Trusted sites** dialog box.
  - f) Add repository URL to **Websites** list.
  - g) Close the **Trusted sites** and **Internet Options** dialog boxes.
  - h) Try again to connect to the same repository URL in Internet Explorer.  
The same error page as above will be displayed.
  - i) Select **Continue to this website** option.  
A clickable area with a red icon and text **Certificate Error** is added to Internet Explorer address bar.
  - j) Click the **Certificate Error** area.  
A dialog box containing a **View certificates** link is displayed.
  - k) Click the **View certificates** link.  
**Certificate** dialog box is displayed.
  - l) Select **Details** tab of **Certificate** dialog box.
  - m) Press **Copy to File** button.  
**Certificate Export Wizard** is started.
  - n) Follow indications of wizard for DER encoded binary X.509 certificate. Save certificate to local file server .cer.
2. Import the local file into the JRE running Oxygen XML Author.
    - a) Open a text-mode console with administrative rights.  
If Oxygen XML Author has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases administrative rights will be required.
    - b) Go to the `lib/security` directory of the JRE running Oxygen XML Author. You find the home directory of the JRE in the `java.home` property that is displayed in the **About** dialog box (**System properties** tab).  
On Mac OS X systems, the `lib/security` directory is usually located in `/System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home` directory.

On OS X, if you have installed a distribution of Oxygen XML Author that is not bundled with a JRE, a JRE from Apple is required. The Apple Java version 1.6 stores the certificates in `/System/Library/Java/Support/CoreDeploy.bundle/Contents/Home/lib/security/cacerts` with a symbolic link pointing to it from `/System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home/lib/security/cacerts`.

On OS X, if you have installed a distribution of Oxygen XML Author that bundles the JRE from Oracle, the JRE uses the `.install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts` path within its installation directory.

c) Run the following command:

```
..\..\bin\keytool -import -trustcacerts -file server.cer -keystore cacerts
```

The `server.cer` file contains the server certificate, created during the previous step. `keytool` requires a password before adding the certificate to the JRE [keystore](#). The default password is `changeit`. If someone changed the default password, then that person is the only one who can perform the import.

**Tip:** If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the `-alias` command line argument, as in the following example:

```
..\..\bin\keytool -import -alias myalias1 -trustcacerts -file
server1.cer -keystore cacerts

..\..\bin\keytool -import -alias myalias2 -trustcacerts -file
server2.cer -keystore cacerts
```

3. Restart Oxygen XML Author.

#### Related Information:

[HTTP\(S\)/WebDAV Preferences](#) on page 151

### HTTP Authentication Schemes

Oxygen XML Author supports the following HTTP authentication schemes:

- **Basic** - The *basic* authentication scheme defined in the [RFC2617 specifications](#).
- **Digest** - The *digest* authentication scheme defined in the [RFC2617 specifications](#).
- **NTLM** - The *NTLM* scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

**Note:** For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

```
domain\username
```

- **Kerberos** - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

### Single Sign-on

Oxygen XML Author implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the **Kerberos** protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Author obtains from the operating system.

To turn on the **Kerberos**-based authentication, you need to add the following system property in the `.vmoptions` configuration file or start-up script:

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

## Switching and Moving Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them.

## Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

### Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many tabs opened to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

### Buttons on the Far-Right of the Tab Stripe (◀▶☰)

You can use the arrow buttons (◀▶) on the right side of the tab stripe to scroll to the left or right and the ☰ **Show List** button opens a pop-up window that displays all the opened file tabs and allows you to select and switch to a specific opened file.

### **Ctrl + Tab (Command + Tab on OS X) [NOTE: Ctrl + Page Down (Ctrl + Alt + Right Arrow on OS X) does the same]**

Switches to the next opened tab in the order specified in the [Order of switching between editor tabs option](#).

### **Ctrl + Shift + Tab (Command + Shift + Tab on OS X) [NOTE: Ctrl + Page Up (Ctrl + Alt + Left Arrow on OS X) does the same]**

Switches to the previous opened tab in the order specified in the [Order of switching between editor tabs option](#).

### **Window > Switch editor tab (Ctrl + F9 (Command + F9 on OS X))**

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of file tabs opened and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific opened file tabs.

**Figure 204: Switch Editor Tab Dialog Box**

The **Switch Editor Tab** dialog box contains the following options and features:

#### Search Filter

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific opened files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, \* to match any sequence of characters or ? to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

#### Match all terms

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

#### Include file paths

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

#### Case sensitive

If this option is selected, the search operation will be case-sensitive.

## List of Opened File Tabs

All files that are currently opened are displayed in the main pane of the dialog box. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

## Moving Editor Tabs

You can move editor tabs by using any of the following methods:

### Mouse Drag

You can use your mouse to drag editor tabs to a new location on the tab stripe.

### **Ctrl + Alt + Comma**

Moves the current file tab one position to the left.

### **Ctrl + Alt + Period**

Moves the current file tab one position to the right.

## Closing Documents

To close open documents, use one of the following actions that are available in the contextual menu of the current editor tab (or from the **File** menu):

### **Close (Ctrl + W (Command + W on OS X))**

Closes the currently selected editor.

### **Close Other Files**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs except for the current one.

### **Close Files to the Right**

Available only from the contextual menu of the current editor tab and it closes all opened editors to the right of the currently selected editor.

### **Close All**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs.

## Contextual Menu of the Current Editor Tab

A contextual menu is available when you right-click the current editor tab label.

The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

### **Close (Ctrl + W (Command + W on OS X))**

Closes the currently selected editor.

### **Close Other Files**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing.

### **Close Files to the Right**

Closes all opened editors to the right of the currently selected editor.

### **Close All**

If multiple files are opened, this action is available to close all opened editors.

### **Move editor tab to the left (Ctrl + Alt + Comma)**

Moves the current editor tab one position to the left.

### **Move editor tab to the right (Ctrl + Alt + Period)**

Moves the current editor tab one position to the right.

### **Reopen last closed editor Ctrl + Alt + T (Command + Alt + T on OS X)**

Reopens the last closed editor.

### **Maximize/Restore Editor Area**

Collapses all the side views and spans the editing area to cover the entire width of the main window.

### **Add to project**

Adds the file you are editing to the current project.

### **Add all to project**

If multiple files are opened, this action is available to add all the opened files in the current group/stack of tabs to the current project.

### **Copy Location**

Copies the disk location of the file.

### **Show in Explorer (Show in Finder on OS X)**

Opens the Explorer to the file path of the file.

## **Viewing File Properties**

The **Properties** view displays information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from **Window > Show View > Properties**.

To copy a value from the **Properties** view in the clipboard (for example, the full file path), use the **Copy** action available on the contextual menu of the view.

## **Using Projects to Group Documents**

---

Oxygen XML Author includes a **Project view** that helps you organize your projects. Oxygen XML Author offers a variety of helpful features for working with projects and makes it easy to share your projects with other members of your team. This section presents various unique features that will help you to create and work with projects.

### **Creating a New Project**

Oxygen XML Author allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also [share your project settings and transformation/validation scenarios](#) with other users. Use the **Project view** to manage projects, and the files and folders contained within.

#### **Creating a New Project**

To create a new project, select  **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the **Project view**.

## Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

### New > File

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

### New > Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

### New > Logical Folder

Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

### New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

### Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X .

### Add Files

Adds links to files on the local file system.

### Add Edited File

Adds a link to the currently edited file in the project.

## Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the  **Refresh (F5)** action from the toolbar or contextual menu and the *Project view* will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting  **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the *Project view* with bold text. To create a file inside a linked folder, select the **New >  File** action from the contextual menu. The linked files presented in the *Project view* are marked with a special icon.

**Note:** Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project View](#) on page 199.

For more details about how you can share projects with other users, see [Sharing a Project - Team Collaboration](#) on page 416.

### Related Information:

[Using Projects to Group Documents](#) on page 407

## Project View

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allow you to create XML projects and provide shortcuts to various operations for the project documents.

**Figure 205: Project View**

By default, the view is positioned on the left side of the Oxygen XML Author window, above the [Outline view](#). If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

#### **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

#### **New Project**

Creates a new, empty project.

The following actions are grouped in the upper right corner:

#### **Collapse All**

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

#### **Link with Editor**

When selected, the project tree highlights the currently edited file, if it is found in the project files.

**Note:** This button is disabled automatically when you move to the [Debugger perspective](#).

#### **Settings**

A submenu that contains the following actions:

##### **Filters**

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

##### **Show Full Path**

When selected, linked files and folders are presented with a full file path.

##### **Enable Master Files Support**

Select this option to enable the [Master Files support](#).

##### **Change Search and Refactor operations scope**

Allows you to change the collection of documents that define the context of the [search and refactor operations](#).

- **Use only Master Files, if enabled** - Restricts Oxygen XML Author to perform the search and refactor operations starting from the *master files* that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- **Logical folders** - marked with a blue icon on Windows and Unix/Linux (📁) and a magenta icon on Mac OS X (📁). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action **Remove from Project** can be used to remove them from the project.
- **Physical folders and files** - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.
- **Shortcut folders and files** - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions **Remove from Project** and **Remove from Disk (Shift+Delete)** are available for shortcuts. **Remove from Project** just removes the shortcut from the project, while **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

**Figure 206: Project View with Examples of all Three Types of Resources**

### Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

## **New Project**

Creates a new, empty project.

### **Creating New Project Items**

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

#### **New > File**

Opens a [New file dialog box](#) that helps you create a new file and adds it to the project structure.

#### **New > Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

#### **New > Logical Folder**

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

#### **New > Logical Folders from Web**

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

### **Managing Physical Folders and Files**

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

### **Removing Files and Folders**

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the contextual menu action  **Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action  **Remove from Disk (Shift+Delete)**. The  **Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

**CAUTION:** In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Author and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

### **Moving Files and Folders**

You can [move the resources of the project](#) with drag and drop operations on the files and folders of the tree (the **Enable drag-and-drop in Project view** option must be selected in the [View preferences page](#)).

You can also use the usual  **Cut**,  **Copy**, and  **Paste** actions to move resources in the **Project** view.

### **Renaming Files and Folders**

There are three ways you can [rename an item in the Project view](#). Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

**Note:** The **Rename** action is also available on *logical* files.

### **Locating and Opening Files**

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

### Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

### Linked Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be selected in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root.

To create a file inside a linked folder, select the **New** >  **File** action from the contextual menu. This opens the [New Document wizard](#).

**Note:** The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

### Logical Folders

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

#### **Add Folder**

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X .

#### **Add Files**

Adds links to files on the local file system.

#### **Add Edited File**

Adds a link to the currently edited file in the project.

### Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

#### **Check Well-Formedness**

Checks if the selected file or files are well-formed.

#### **Validate**

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a [Validate and Check for Completeness](#) operation.

### Validate with Schema

Validates the selected file or files against a specified schema.

#### **Configure Validation Scenario(s)**

Allows you to configure and run a [validation scenario](#).

## Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

### **Apply Transformation Scenario(s)**

Obtains the output with one of the [built-in scenarios](#).

### **Configure Transformation Scenario(s)**

Opens a [dialog box](#) that allows you to configure pre-defined transformation scenarios.

### **Transform with**

Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

## Refactoring Actions (Available for certain document types (such as XML))

Oxygen XML Author includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

### **Rename resource**

Allows you to change the name of a resource.

### **Move resource**

Allows you to change the location on disk of a resource.

### **XML Refactoring**

Opens [the XML Refactoring tool wizard](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

### **Other XML Refactoring Actions**

For your convenience, the last 5 [XML Refactoring tool operations](#) that were finished or previewed will also appear in this submenu.

## Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

### **Open**

Opens the selected files in the corresponding editor.

### **Open with submenu**

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: [DITA Maps Manager](#), [Archive Browser](#), [MathML Editor](#), [Large File Viewer](#), [Hex Viewer](#), [SVG Viewer](#).

### **Show in Explorer (or Show in Finder on OS X)**

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

### **Copy Location**

Copies an application-specific URL for the selected resource to the clipboard.

### **Refresh**

Refreshes the content and the dependencies between the resources in [the Master Files directory](#).

### **Find/Replace in Files**

Opens the [Find/Replace in Files dialog box](#) that allows you to find and replace text in multiple files.

### **XPath in Files**

Opens the [XPath/XQuery Builder view](#) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

### **Open/Find Resource**

Opens the [Open/Find Resource dialog box](#).

### **Check Spelling in Files**

Allows you to [check the spelling of multiple files](#).

### **Format and Indent Files**

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent ([pretty-print](#)) action that will be applied on the selected documents.

### **Open in SVN Client**

[Syncro SVN Client](#) tool is opened and it highlights the selected resource in its corresponding working copy.

### **Compare**

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the [Compare Files](#) or [Compare Directories](#) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

### **Properties**

Displays the properties of the current file in a **Properties** dialog box.

### **Menu Level Actions**

The following actions are available in the **Project** menu:

#### **New Project**

Creates a new, empty project.

#### **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### **Save Project As**

Allows you to save the current project under a different name.

#### **Validate all project files**

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

#### **Filters**

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

### **Enable Master Files Support**

Allows you to enable the [Master Files Support](#) for each project you are working on.

#### **Change Search and Refactor operations scope**

Opens a dialog box that allows you to define the context of search and refactor operations.

### **Show Project View**

Displays the **Project** view.

## Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

## Moving/Renaming Resources in the Project View

The [Project view](#) allows you to move or rename files in the current project.

### Moving Resources

To move a file or directory in the [Project view](#), drag and drop it to the new location in the tree structure (the **Enable drag-and-drop in Project view** option must be selected in the [View preferences page](#)), or use the usual  **Cut**,  **Copy**, and  **Paste** actions from the contextual menu or **Edit** menu.

You can also move certain types of files (such as XML) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can [select or configure the scope](#) by using the  button.

### Renaming Resources

To quickly rename a file or a directory, use the in-place editing either by pressing **F2** or by selecting **Rename** from the contextual menu.

You can also rename certain types of files (such as XML) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can [select or configure the scope](#) by using the  button.

### Problems Updating References of Moved/Renamed Resources

In some cases, the references of a moved or a renamed resource can not be updated. For example, when a resource is resolved through an [XML Catalog](#) or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Author displays a warning dialog box.

**Figure 207: Problems Dialog Box**

### Image Preview from the Project View

Images and SVG files from the **Project view** can be previewed in a separate panel.

To preview an image, either double-click the image name or click the **Preview** action from the contextual menu of the **Project view**. Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the **Preview** panel using the actions from the contextual menu, you can scale the image to its original size (1:1 action) or scale it down to fit in the view's available area (**Scale to fit** action).

To preview an **SVG file**, click the **Preview** action from the contextual menu of the **Project view**. Once the SVG is displayed in the **Preview** panel, the following actions are available on the contextual menu: **Zoom in**, **Zoom out**, **Rotate** and **Refresh**.

**Note:** You can drag an image from the **Image Preview** view and drop it in a DITA, DocBook, or TEI document.

## Sharing a Project - Team Collaboration

You can use XML projects to make team collaboration and synergy efficient and effective. Not only can you share the project files and folders, but Oxygen XML Author also allows you to store preferences, transformation scenarios, and validation scenarios at **project level** in a **project file** (.xpr file extension). It can be saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, so that your team will have access to the same resources stored in the project file.

### Sharing Preferences (Creating a Project-Level Options File)

To share options that are configured in certain preferences pages, you can store them in a **project file** (.xpr file extension) that can easily be shared with others. To do so, follow these steps:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In the **Project view**, create a project or open an existing one.
3. **Open the Preferences dialog box (Options > Preferences)**.
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to **Project Options** in each page.

**Note:** Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

5. Click **OK** and close the **Preferences** dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### Sharing Transformation Scenarios

To share created and edited transformation scenarios, you can store them in a *project file* (.xpr file extension) by following these steps:

1. In the **Project view**, create a project or open an existing one.
2. When you *create a new transformation scenario* or *edit an existing one*, there is a **Storage** option. Switch the storage preference to **Project Options** in each transformation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same transformation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### Sharing Validation Scenarios

To share created and edited validation scenarios, you can store them in a *project file* (.xpr file extension) by following these steps:

1. In the **Project view**, create a project or open an existing one.
2. When you *create a new validation scenario* or *edit an existing one*, there is a **Storage** option. Switch the storage preference to **Project Options** in each validation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same validation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### Synco SVN Client (Apache Subversion™)

To assist you with team collaboration and sharing projects, Oxygen XML Author includes an embedded **SVN (Subversion) Client**. Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Synco SVN Client allows you to easily share it with the rest of your team.

It can be accessed from the **Tools** menu and can be used for synchronizing your working copy with a central repository.

It can also be started by selecting the  **Open in SVN Client** action from the contextual menu of the **Project view**. This action opens the Syncro SVN Client and shows the selected project file in the **Working Copy** view.

#### **Related Information:**

[Sharing Application Settings](#) on page 157

[Sharing Transformation Scenarios](#) on page 895

[Sharing Validation Scenarios](#) on page 623

#### **Minimize Differences Between Versions Saved on Multiple Computers**

The number of differences between versions of the same file saved by multiple content authors on multiple computers can be minimized by imposing the same set of formatting options when saving the file, for all the content authors. An example, the following procedure can be used to minimize the differences:

1. Create an Oxygen XML Author project file (.xpr) that will be shared by all content authors.
2. Configure your own formatting preferences. To do this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Format**, configure the appropriate options in this page, then go to **Editor > Format > XML** and configure the options there.
3. Save the configured options into your project file by selecting [Project Options](#) in both of the preferences pages.
4. Save the project and commit the project file to your versioning system so all the content authors can use it.
5. Make sure the project is opened in the **Project view**.
6. Open and save your XML files in the **Author** mode.
7. Commit the saved XML files to your versioning system.

When other content authors change the files, only the changed lines will be displayed in your diff tool instead of one big change that does not allow you to see the changes between two versions of the file.

## **Master Files Support**

Oxygen XML Author allows you to define [Master Files](#) at project level. These *master files* are automatically used by Oxygen XML Author to determine the context for operations such as validation, content completion, refactoring, or searches for XML modules. Oxygen XML Author maintains the hierarchy of the *master files*, helping you to determine the editing context.

Oxygen XML Author also provides unique support for using the *Master Files* support in DITA projects. In DITA, when you rename or move non-DITA resources, it allows you to update all the references to these resources in the scope of the *Master Files* (in this case the [main DITA map \(root map\)](#)). For more information, see [Master Files Support in DITA](#) on page 1611.

For more information about the *Master Files* support for XML documents, watch our video demonstrations:

#### **Master Files Benefits**

Using the *Master Files* support in Oxygen XML Author includes the following benefits:

- When the module is validated, Oxygen XML Author automatically identifies the *master files* that include the module and validates all of them.
- The [Content Completion Assistant](#) presents all the components that are collected from the *master files* for the modules they include.
- The *master files* that are defined for the current module determines the [scope of the search and refactoring actions](#). Oxygen XML Author performs the search and refactoring actions in the context that the *master files* determine, thus improving the speed of execution.

## Enabling the Master Files Support

Oxygen XML Author stores the *master files* in a folder located in the [Project view](#), as the first child of the project root. The *Master Files Support* is disabled by default and Oxygen XML Author allows you to enable or disable the *Master Files Support* for each project you are working on.

To enable *Master Files* support, do one of the following:

- Select **Enable Master Files Support** from the  **Settings** menu in the top-right corner of the [Project view](#).
- Select **Enable Master Files Support** from the contextual menu of the project root folder in the [Project view](#). If a disabled *Master Files* folder exists, you can also select that option from its contextual menu.
- Click the **Enable** button in the tooltip located at the bottom of the [Project view](#). This tooltip window is displayed when the *Master Files* support is disabled. Clicking the **Read more** link takes you to the user guide. Clicking the **Enable** button opens the **Enable Master Files** dialog box. This dialog box contains general information about the **Master Files Support** and allows you to enable it. You can also use the **Detect and Enable** button in this dialog box to detect the *master files* from the current project.

**Warning:** Once you close this window tip, Oxygen XML Author hides it for all projects. You can make the window tip reappear by [resetting Oxygen XML Author to its default settings](#). However, doing so will result in you losing your customized options.

### Related Information:

[Detecting Master Files](#) on page 419

[Adding Files to the Master File Directory](#) on page 420

## Detecting Master Files

Oxygen XML Author allows you to detect the *master files* using the  **Detect Master Files** option. This action applies to the folders you select in the project.

To detect *master files* over the entire project, do one of the following:

- Right-click the root of the project and select  **Detect Master Files**.
- Use the  **Detect Master Files from Project** option, available in the contextual menu of the *Master Files* folder.

Both of these options display the **Detect Master Files** wizard. The detected *master files* are presented in a tree-like fashion. The resources are grouped into three categories:

- **Possible *master files*** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as *master files*.  
**Note:** For DITA projects, only [DITA Maps](#) are reported as possible *master files*.
- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any of the files presented on the first level of a cycle is a possible *master file*.
- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as *master files*.

To set them as *master files*, simply select their checkboxes. Oxygen XML Author marks all the children of a *master file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *master files*. A module can be accessed from multiple *master files*.

The *master files* that are already defined in the project are automatically marked in the tree and cannot be removed. The only way to disable a *master file* is to delete it from the *Master Files* folder.

The next panel displays a list with the selected *master files*. Click the **Finish** button to add the *master files* in the *Master Files* folder.

You can use the **Select Master Files** option to automatically mark all *master files*. This action sets all the resources from the **Possible Master Files** category and the first resource of each **Cycle** as *master files*. The **Deselect All** button simply removes all of your selections.

**Tip:** We recommend that you to only add top-level files (files that are at the root of the include/import graph) in the *Master Files* directory. Keep the file set to a minimum and only add files that import or include other files.

**Attention:** If the **Master Files Support** is disabled, the Master Files directory is rendered only if it contains *master files*.

#### Related Information:

[Enabling the Master Files Support](#) on page 419

[Adding Files to the Master File Directory](#) on page 420

### Adding Files to the Master File Directory

The Master Files directory only contains logical folders and linked files. To add files in the Master Files directory, use one of the following methods:

- Right-click a file from your project and select **Add to Master Files** from the contextual menu.
- Select **Add Files** or **Add Edited File** from the contextual menu of the Master Files directory.
- Drag and drop files into the Master Files directory.
- From the contextual menu of the [Resource Hierarchy Dependencies view](#), use the **Add to Master Files** action.

You can view the *master files* for the current resource by selecting [Properties from the contextual menu](#) of the [Project view](#) and the *master files* for the current editor in the [Properties](#) and [Information](#) views.

#### Related Information:

[Enabling the Master Files Support](#) on page 419

[Detecting Master Files](#) on page 419

### Project Validation and Transformation

The *Master Files Support* is also useful for [project-level](#) validation and transformation scenarios. When you hover the cursor over a file in the Master Files directory, Oxygen XML Author displays the **Validate** and **Transform** buttons at the right of the file. Select one of these buttons to run a transformation or validation scenario. If the current node is selected, Oxygen XML Author executes a batch transformation and validation. If the current node is not selected, Oxygen XML Author executes the validation and transformation for the current node only. The behavior of these actions is the same as the behavior of the [corresponding actions that are available in the contextual menu](#).

**Note:** The tooltip of the **Validate** and **Transform** buttons displays the associated scenarios that you can apply.

When you hover the cursor over the Master Files directory itself, Oxygen XML Author also displays a **Help** button. Use this button (or press **F1** on your keyboard) to open the **Help** section regarding the *Master Files Support*.

### Contextual Menu of the Master Files

The contextual menu of the Master Files directory contains the following actions:

#### New

Allows you to create a **File, Logical Folder, or Project**.

#### **Add Files**

Allows you to add *master files* to the Master Files directory.

#### **Add Edited File**

Use this option to add the currently edited file to the Master Files directory.

#### Open

Opens all the files of the Master Files directory.

#### **Paste**

Pastes the files you copy in the Master Files directory.

## Rename

Allows you to rename a file in the Master Files directory.

## Refresh

Refreshes the content of the Master Files directory.

## Find/Replace in Files

Opens the [Find/Replace dialog box](#).

## XPath in Files

Opens the [XPath/XQuery Builder view](#) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

## Open/Find Resource

Opens the [Open/Find Resource dialog box](#).

## Check Spelling in Files

Opens the [Check Spelling in Files dialog box](#).

## Format and Indent Files

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent (*pretty-print*) action that will be applied on the selected documents.

## Transform

Provides access to one of the following actions:

### Apply Transformations Scenario(s)

[Applies the transformation scenarios](#) associated with the Master Files directory.

### Configure Transformation Scenario(s)

Opens the [Configure Transformation Scenario dialog box](#).

### Transform with

Opens the **Transform with** dialog box that allows you to select the transformation scenario you want to execute.

## Validate

Provides access to one of the following actions:

### Check Well-Formedness

Allows you to check if a document is *Namespace Well-Formed XML*.

### Validate

Oxygen XML Author performs the validation of the *master files*.

### Validate with Schema

Opens the **Validate with** dialog box. Oxygen XML Author performs the validation of the *master files* using a schema.

### Configure Validation Scenario(s)

Opens the [Configure Validation Scenario dialog box](#).

## Detect Master Files from Project

Enables automatic detection of *master files*.

## Enable Master Files Support

Select this option to enable the **Master Files Support**.

## Searching Documents

Oxygen XML Author includes advanced search capabilities to help you locate documents and resources.

### Open/Find Resource View

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Author layout, next to the [Project view](#) or [DITA Maps Manager](#). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 208: Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Author project or in one of the [DITA maps](#) opened in [the DITA Maps Manager view](#) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content) by selecting the [In reviews option](#).

**Note:** Full support for searching in document edits (the **In reviews** option) is available only in the Enterprise edition of Oxygen XML Author. The Professional edition offers limited support to search through a maximum of 10 edits.

### Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the [Results view](#) at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for car you get the same results as when you search for Car.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *\*ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for *\*/samples/\*.gif* with the **in file paths** option selected, you will find all the *gif* images from the *samples* directory.

### Options Available in the View

The **Open/Find Resource** view offers the following options:

-  **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
  - **Options** - Opens the [Open/Find Resource preferences page](#) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, *tracked change* insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

### Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Author internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

### Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the [Open/Find Resource preferences page](#).

### Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Author project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

## Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in *the editor associated with the type of the file*.

**Note:** You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

### Related Information:

[Open/Find Resource Dialog Box](#) on page 424

## Open/Find Resource Dialog Box

The **Open/Find Resource** dialog box offers advanced search capabilities. To open the dialog box, go to **Find > Open/Find Resource (Ctrl + Shift + R (Command + Shift + R on OS X))**. You can also click the  **Open/Find Resource** toolbar button or use the  **Search for file** action that is available in some URL input fields.

**Figure 209: Open/Find Resource Dialog Box**

You can use this dialog box to find a file in the current Oxygen XML Author project or in one of the *DITA maps* opened in *the DITA Maps Manager view* by typing a few letters of the file name or a fragment of the content you are searching for. The **Open/Find Resource** dialog box also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

**Note:** Full support for searching in document edits (the **In reviews** option) is available only in the Enterprise edition of Oxygen XML Author. The Professional edition offers limited support to search through a maximum of 10 edits.

### Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results

list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the [Results view](#) at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for car you get the same results as when you search for Car.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for \*ing with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for \*/samples/\*.gif with the **in file paths** option selected, you will find all the *gif* images from the samples directory.

### Options Available in the Dialog Box

The **Open/Find Resource** dialog box includes the following options:

- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, *tracked change* insertions/deletions, or highlights in your resources.
- **Options** - Opens the [Open/Find Resource preferences page](#) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **Clear Index** - Clears the index.
- **Reindex** - Use this option to reindex your resources.

### Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Author internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

### Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the [Open/Find Resource preferences page](#).

### Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Author project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

## Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in *the editor associated with the type of the file*.

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

### Related Information:

[Open/Find Resource View](#) on page 205

[Open/Find Resource Preferences Page](#) on page 148

## Searching in Content

To perform a search through the content of your resources, open the [Open/Find Resource dialog box](#) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the [Open/Find Resource view](#) (by default, located on the left side of the editor), select the **in content** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature is powered by [Apache Lucene](#). Apache Lucene is a free open source information retrieval software library.

You can use the **Open/Find Resource** feature to either perform a simple text search or a more complex search using the [Apache Lucene - Query Parser Syntax](#).

### Complex Query Patterns Using Lucene Syntax

Using the [Apache Lucene - Query Parser Syntax](#) means you can perform any of the following searches:

- **Term Searches**

Searching for plain text:

```
Garden Preparation
```

- **Element-Specific Searches**

Searching for content that belongs to a specific element:

```
title:"Garden Preparation"
```

- **Wildcard Searches**

Using wildcards to make your search more permissive:

```
Garden Prepar?tion
```

- **Fuzzy Searches**

If you are not sure of the exact form of a term that you are interested in, use the fuzzy search to find the terms that are similar to the search term. To perform a fuzzy search, use the ~ symbol after the word that you are not sure of:

```
Garden Preparing~
```

- **Proximity Searches**

Use proximity searches to find words that are within a specific distance away. To perform a proximity search, use the ~ symbol at the end of your search. For example, to search for the word **Garden** and the word **Preparation** within 6 words of each other use:

```
"Garden Preparation"~6
```

- **Range Searches**

Use range searches to match documents whose element values are between the lower and upper bound specified in the range query. For example, to find all documents whose titles are between **Iris** and **Lilac**, use:

```
title:{Iris TO Lilac}
```

The curly brackets denote an exclusive query. The results you get when using this query are all the documents whose titles are between **Iris** and **Lilac**, but not including **Iris** and **Lilac**. To create an inclusive query use square brackets:

```
title:[Iris to Lilac]
```

- **Term Boosting Searches**

Use term prioritising searches if the fragment of text that you are searching for contains certain words that are more important to your search than the rest of them. For example, if you are searching for **Autumn Flowers**, a good idea is to prioritize the word **Autumn** since the word **Flowers** occurs more often. To prioritize a word use the **^** symbol:

```
Autumn^6 Flowers
```

- **Searches Using Boolean Operators**

You can use the **AND**, **+**, **OR**, **-**, and **NOT** operators.

To search for documents that contain both the words **Garden** and **Preparation**, use:

```
Garden AND Preparation
```

To search for documents that must contain the word **Garden** and may contain the word **Preparation**, use:

```
+Garden Preparation
```

To search for documents that contain either the word **Garden** or the word **Preparation**, use:

```
Garden OR Preparation
```

To search for documents that contain **Garden Preparation** but not **Preparation of the Flowers**, use:

```
"Garden Preparation" - "Preparation of the Flowers"
```

- **Searches Using Grouping**

To search either for the word **Garden** or **Preparation**, and the word **Flowers**, use:

```
(Garden OR Preparation) AND Flowers
```

- **Searches Using Element Grouping**

To search for a title that contains both the word **Flowers** and the phrase **Garden Preparation**, use:

```
title:(+Flowers +"Garden Preparation")
```

- **Searching for Special Characters**

Sometimes you might need to search your content for special character, such as:

```
+ - && || ! ( ) { } [ ] ^ ~ * ? : \
```

In this case, you should surround your search query with quotes. For example, to search for (Hydrogen + Oxygen)=Water, use:

```
"(Hydrogen + Oxygen)=Water"
```

## Searching in File Paths

To perform a search in the file paths of your resources, open the [Open/Find Resource dialog box](#) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the [Open/Find Resource view](#) (by default, located

on the left side of the editor), select the **In file paths** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature allows you to search for a resource either by its name or by its path (or by a fragment of its path).

You can use wildcards when you perform such searches:

- Use "\*" to match any sequence of characters.
- Use "?" to match any single character.

For example, if you search for **\*-preferences-page** you will find all the resources that contain the *-preferences-page* fragment in their name. If you search for **\*/samples/\*.gif**, you will find all the .gif images from the samples directory.

## Searching in Reviews

To perform a search in the edits of your resources, open the [Open/Find Resource dialog box](#) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the [Open/Find Resource view](#) (by default, located on the left side of the editor), select the **In reviews** option, and in the search field enter the terms that you want to search for.

The following options are available:

- **Type** - Specifies whether you want to search for content in comments, tracked change insertions/deletions, or highlighted content.
- **Author** - Displays all the authors of the edits in your resources. The authors are collected when indexing. You can set a specific author for your search or search all of them.
- **Time** - Specifies the time when the edits that you are searching through were created.

Both the view and the dialog box display the edits that contain the search results and their parent topics along with a short description. To hide this description, go to **Settings** and deselect the **Show Description** option.

## Technical Aspects

When Oxygen XML Author performs the indexing of your resources, the refereed content from your documents is not taken into account. For example, when DITA documents are indexed, the content from the `conref` elements is not parsed. The files that make up the index are stored on disk in the `[user_home_directory]\AppData\Roaming\com.oxygenxml.author\lucene` folder.

## Spell Checking

---

Oxygen XML Author includes an [automatic \(as-you-type\) spell checking feature](#), as well as a manual spell checking action to open a **Spelling** dialog box that offers a variety of options.

To manually check spelling in the current document, use the  **Check Spelling** action on the toolbar or from the **Edit** menu.

**Figure 210: Check Spelling Dialog Box**

The **Spelling** dialog box contains the following:

**Unrecognized word**

Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.

**Replace with**

The character string that will replace the misspelled word.

**Guess**

Displays a list of words suggested to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

**Default language**

Allows you to select the default language dictionary used by the spelling engine.

**Paragraph language**

In an XML document, you can mix content written in multiple languages. You can set the language code in the lang or xml:lang attribute for any particular section and Oxygen XML Author will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

**Begin at cursor position**

Instructs the spell checker to begin checking the document starting from the current cursor position.

**Action Buttons**

**Replace**

Use this button to replace the unrecognized word with the selected word from the **Replace with** field.

**Replace All**

Use this button to replace all occurrences of the unrecognized word with the selected word from the **Replace with** field.

**Ignore**

Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Author skips the content of the XML elements *marked to be ignored*.

**Ignore All**

Ignores all instances of the unrecognized word in the current document.

## Learn

Adds the unrecognized word to the list of valid words.

## Options

Opens the [Spell Check preferences page](#) where you can configure various options in regards to the feature.

## Related Information:

[AutoCorrect Misspelled Words](#) on page 436

## Spell Check Dictionaries and Term Lists

Oxygen XML Author uses the **Hunspell** engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Author includes the following built-in dictionaries for the spell checker:

- English (US) [en\_US]
- English (UK) [en\_GB]
- French [fr]
- German [de\_DE]
- Spanish [es\_ES]

### Other Hunspell Dictionaries

You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Author spell checker. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow [these instructions](#) and then add the dictionary to the Oxygen XML Author spell checker by following [this procedure](#).

### Personalized Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Author provides a way of [adding personalized term lists](#) to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Author uses for storing [learned words](#).

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, *legal*, *medical*, *automotive*). They can also be used to control forbidden words.

## Related Information:

[Adding Spell Check Dictionaries](#) on page 431

[Adding Spell Check Term Lists](#) on page 432

[Building and Testing Hunspell Dictionaries](#)

### Adding Custom Dictionaries and Term Lists

The Oxygen XML Author spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a `.dic` file extension) and an affix file (with an `.aff` file extension). The personalized term lists are custom files (with a `.tdi` file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Author spell checker.

You can [add dictionaries](#) and [personalized term lists](#) to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the [Spell Check Dictionaries preferences page](#) and the [Include dictionaries and term list from option](#) allows you to choose a custom storage location. All the dictionaries and term lists for a particular language that are found in either location are merged and used by the spell checker in Oxygen XML Author.

## Related Information:

[Replacing a Spell Check Dictionary](#) on page 433

## Adding Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Author spell checker:

- You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
- You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
- You can build your own full Hunspell dictionary and add it to the spell checking mechanism.

## Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a `.dic` file extension) and an *affix* file (with an `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

**Important:** The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

2. Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Spell Check > Dictionaries**.
3. Choose one of the following two options for adding the downloaded files.
  - a. Copy both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder option**.
  - b. Copy both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from option**, and select that directory. If you choose this option, make sure you read [this important note](#).
4. Restart the application for the spell checker to start using the new dictionary.

## Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a *dictionary* file (with a `.dic` file extension) and an *affix* file (with an `.aff` file extension). The affix file (`.aff`) can be left empty, but it is needed for the mechanism to work properly.

**Important:** The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

2. In the dictionary file (`.dic` extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

```
2
parabola
asimptotic
```

3. Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Spell Check > Dictionaries**.
4. Choose one of the following two options for saving the files.
  - a. Save both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder option**.
  - b. Save both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from option**, and select that directory. If you choose this option, make sure you read [this important note](#).

- Restart the application for the spell checker to start using the new dictionary.

### Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

- Follow these instructions: [Building and Testing Hunspell Dictionaries](#).

**Result:** You should end up with a *dictionary* file (with a `.dic` file extension) and an *affix* file (with an `.aff` file extension). The affix file (`.aff`) can be empty, but it is needed for the mechanism to work properly.

**Important:** The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

- Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Spell Check > Dictionaries**.
- Choose one of the following two options for saving the files.
  - Save both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder option**.
  - Save both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from option**, and select that directory. If you choose this option, make sure you read [this important note](#).
- Restart the application for the spell checker to start using the new dictionary.

#### Related Information:

[Adding Spell Check Term Lists](#) on page 432

### Adding Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries and the spell checker will merge them with all the dictionaries and other term lists for a particular language.

#### Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:

- Create a *term list* file (with a `.tdi` file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, `en_US_myterms.tdi` for term list in the US version of the English language or `en_myterms.tdi` for a less specific English term list). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).
- In the term list file (`.tdi` extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

```
parabola
asimptotic
*hyperbola
```

- Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Spell Check > Dictionaries**.
- Choose one of the following two options for saving the file.
  - Save the file (`.tdi`) to the default directory displayed in the **Dictionaries and term lists default folder option**.
  - Save the file (`.tdi`) to any other directory, select the **Include dictionaries and term list from option**, and select that directory. If you choose this option, make sure you read [this important note](#).
- Restart the application for the spell checker to start using the new term list.

#### Related Information:

[Adding Spell Check Dictionaries](#) on page 431

## Replacing a Spell Check Dictionary

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Author spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
- You can build your own full Hunspell dictionary and replace an existing dictionary with it.

### Download a Pre-Built Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a `.dic` file extension) and an *affix* file (with an `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.
2. *Open the Preferences dialog box (Options > Preferences)* and go to *Editor > Spell Check > Dictionaries*.
3. Choose one of the following two options to replace existing files.

- a. Replace the existing files (`.dic` and `.aff`) for the particular language in the default directory displayed in the *Dictionaries and term lists default folder option*. Leave the **Include dictionaries and term list from** option deselected.
- b. Replace existing files (`.dic` and `.aff`) for the particular language in a directory specified in the *Include dictionaries and term list from option*. If you choose this option, make sure you read *this important note*.

**Important:** Do not alter the naming convention. The name of the files must begin with a two letter prefix that indicates the language it should be attached to (for example, `en_US.dic` for a US English dictionary or `en.dic` for a less specific English dictionary). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

4. Restart the application for the spell checker to start using the new dictionary.

### Build a Full Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: *Building and Testing Hunspell Dictionaries*.

**Result:** You should end up with a *dictionary* file (with a `.dic` file extension) and an *affix* file (with an `.aff` file extension). The affix file (`.aff`) can be empty, but it is needed for the mechanism to work properly.

2. *Open the Preferences dialog box (Options > Preferences)* and go to *Editor > Spell Check > Dictionaries*.
3. Choose one of the following two options to replace existing files.
  - a. Replace the existing files (`.dic` and `.aff`) for the particular language in the default directory displayed in the *Dictionaries and term lists default folder option*. Leave the **Include dictionaries and term list from** option deselected.
  - b. Replace existing files (`.dic` and `.aff`) for the particular language in a directory specified in the *Include dictionaries and term list from option*. If you choose this option, make sure you read *this important note*.
4. Restart the application for the spell checker to start using the new dictionary.

#### Related Information:

[Adding Custom Dictionaries and Term Lists](#) on page 430

## Learned Words

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select **Learn word**.
- Press the **Learn** button from the *Spelling dialog box* that is invoked by using the  **Check Spelling** action on the toolbar.

**Note:** To delete items from the list of learned words, use the **Delete learned words** option in the [Editor > Spell Check > Dictionaries preferences page](#).

## Ignored Words (Elements)

There are certain XML elements (such as `programlisting`, `codeblock`, `codeph`, `filepath`, or `screen`) in which you may want the content to always be skipped during the spell check process. This can be done in one of several ways:

- You can skip through them manually, word by word, using the **Ignore** button in [the Spelling dialog box](#) that is invoked by using the  **Check Spelling** action on the toolbar.
- You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the [Ignore elements section](#) in the **Spell Check** preferences page.

## Automatic Spell Check

Oxygen XML Author includes an option to automatically check the spelling as you type. Not only does it check spelling when you are typing in the main editor, but also when you are typing in a [comment](#). This feature is disabled by default, but it can be enabled and configured in the [Spell Check preferences page](#). When the [Automatic Spell Check option](#) is selected, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

**Figure 211: Automatic Spell Checking in Author Mode**

**Figure 212: Automatic Spell Checking in Text Mode**

The contextual menu includes the following actions:

### Delete Repeated Word

Allows you to delete words that were repeated in consecutive order.

### List of Suggestions

A list of words suggested by the spell checking engine as possible replacements for the unknown word.

## Learn Word

Allows you to add the current unknown word to the persistent dictionary of *learned words*.

## Spell check options (Available in Author mode only)

Opens the [Spell Check preferences page](#).

## Other actions

This submenu give you access to all the usual contextual menu actions.

## Related Information:

[Learned Words](#) on page 433

## Spell Check Multiple Files

The  **Check Spelling in Files** action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

- The **Edit** menu.
- The contextual menu of the [Project view](#).
- When editing DITA documents, the contextual menu of the [DITA Maps Manager view](#).

This action opens the **Check Spelling in Files** dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the **Check All** button to check the spelling in all specified files. The spelling corrections are displayed in the [Results view](#) at the bottom of the editor and you can group the reported errors as a tree with two levels.

**Figure 213: Check Spelling in Files Dialog Box**

The following scopes are available:

- **All opened files** - The spell check is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the spell check is also performed in the hidden files.

- **Spell Check Options** - The spell check processor uses the options available in the [Spell Check preferences panel](#).

When working with DITA documents, if you invoke the **Check Spelling in Files** action in the [DITA Maps Manager view](#), a slightly different version of the dialog box is displayed:

**Figure 214: Check Spelling in Files Dialog Box (Invoked from the DITA Maps Manager View)**

The following scopes are available when you check the spelling in files from the [DITA Maps Manager](#):

- **Current DITA Map hierarchy** - All the files referenced in the currently selected [DITA map](#), opened in the **DITA Maps Manager** view.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

## AutoCorrect Misspelled Words

Oxygen XML Author includes an *AutoCorrect* feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in **Author** mode. Oxygen XML Author includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the *AutoCorrect* feature use suggestions from the main spell checker. The suggestions will only be used if the misspelled words are not found in the [Replacements Table](#).

When enabled, the *AutoCorrect* feature can be used to do the following:

- Automatically correct misspelled words while you edit in **Author** mode.
- Easily insert symbols. For example, if you want to insert a ® character, you would type (R).
- Quickly insert text fragments.

*AutoCorrect* is enabled by default. To configure this feature, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect**.

The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters ( , . ; : ? ! ' " ) ] } ). After a correction, the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following options:

- **Change back to "[original word]"** - Reverts the correction back to its original form.
- **Stop Automatically Correcting "[original word]"** - This option is presented if the correction is performed based on the [AutoCorrect Replacements Table](#) and selecting it will delete the corresponding entry from the Replacements Table.
- **Learn Word "[original word]"** - This option is presented if the [Use additional suggestions from the spell checker option](#) is selected in the [AutoCorrect preferences page](#) and the correction is performed based on the *Spell Checker*. Selecting this option will add the item to the list of *learned words*.
- **AutoCorrect options** - Opens the [AutoCorrect preferences page](#) that allows you to configure the feature.

**Figure 215: AutoCorrect Widget**

The *AutoCorrect* feature results in the following types of substitutions in regards to case-sensitivity:

- Words with all lower-case characters will be replaced with lower-case substitutions (for example, "abotu" is replaced with "about").
- Words with irregular-case characters will be replaced with lower-case substitutions ("ABotU" is replaced with "about").
- Words with all upper-case characters will be replaced with upper-case substitutions ("ABOTU" is replaced with "ABOUT").
- Words starting with an upper-case character will be replaced with substitutions having the same pattern ("Abotu" is replaced with "About").

The *AutoCorrect* feature also uses the list of [ignored elements from the Spell Check preferences page](#). All elements (along with their descendant elements) included in this list will be ignored by the *AutoCorrect* engine.

**Related Information:**

[Spell Checking](#) on page 428

## Add Dictionaries for the AutoCorrect Feature

To add new dictionaries for the [AutoCorrect mechanism](#), or to replace an existing one, follow these steps:

1. Download an *AutoCorrect* dictionary file for the desired language. The file needs to have a .dat file extension. An example of a website that includes some *AutoCorrect* dictionary files is: [OpenOffice Extensions Search Page](#).
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Edit Modes > Author > AutoCorrect > Dictionaries](#).
3. Choose one of the following two options for adding the downloaded files.
  - a. Copy the downloaded .dat file to the default directory displayed in the [Dictionaries default folder option](#). Note that if you are replacing an existing dictionary file, this is the best option.
  - b. Copy the downloaded .dat file to any other directory, select the [Include dictionaries from option](#), and select that directory. If you choose this option, make sure you read [this important note](#).
4. Restart the application for the *AutoCorrect* mechanism to start using the new dictionary.

## Working with Special Characters

---

Oxygen XML Author provides support for special characters in various ways:

- You can [insert special characters using the Character Map feature](#).
- Oxygen XML Author provides [support for the Unicode characters](#).
- For special characters that are not included in any of the default fonts, Oxygen XML Author will try to find that symbol in a [fallback font](#).
- Oxygen XML Author includes some encoding options and features to help determine how to handle [documents with unsupported characters](#).
- Oxygen XML Author allows you to [choose the fonts to be used in the various editing modes](#) and in some cases, changing the font may be a solution when special characters are not rendered as expected.
- Oxygen XML Author supports bidirectional text, such as Arabic, Hebrew, and certain Asian languages, or other special characters that are combined into a single glyph. In **Text** mode, you can enable or disable the support for special characters. See [Special Character Support in Text Mode](#) on page 219 for details about which option to choose.

- Oxygen XML Author includes a contextual menu action that [converts a sequence of hexadecimal characters to the corresponding Unicode character](#).
- In **Text** mode, Oxygen XML Author includes several contextual menu actions (in the **Source** submenu) for [encoding or decoding base64 schemes](#), [base32 schemes](#), or [hex schemes](#). There are also several encoding options in the [Encoding preferences page](#).

**Tip:** To edit documents written in languages that use special characters (such as Japanese or Chinese), change the font to one that supports the specific characters (a Unicode font). For the Windows platform, *Arial Unicode MS* or *MS Gothic* is recommended. To change the font in Oxygen XML Author, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Appearance > Fonts**. This preferences page allows you to select a font for each editing mode.

## Inserting Special Characters

You can insert symbols and other special characters by using the **Character Map** dialog box that can be opened with the **Edit > Ω Insert from Character Map** action. If you have [chosen to display the Symbols toolbar](#) (in the [Configure Toolbars dialog box](#)), you can also use the Ω **Symbols** drop-down menu to insert some of the most commonly used symbols and selecting **More symbols** from that menu will also open the **Character Map** dialog box.

**Figure 216: Character Map Dialog Box**

The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

### Font

Use this drop-down list to choose the font for which you want to display characters.

### Unicode Block

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

### Search

Use this filter to search for a character by one of the following attributes:

- **hexadecimal**
- **decimal**
- **description**

**Note:** Selecting **description** opens the [Details tab](#). If you enter a character description in the **Search** field, **description** is selected automatically.

### Character Table Section

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

### Recently Used Characters Section

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

### Character Mode Section

The next section of the dialog box allows you to select how you want the character to appear in the **Text** editing mode. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**

You can see the character or code that will be inserted in **Text** mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in **Author** mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Press the **Insert** button to insert the selected character in the current editor at cursor position. You will see the character in the editor if [the editor font](#) is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

**Note:** The **Character Map** dialog box cannot be used to insert Unicode characters in the [Grid editor](#). Accordingly, the **Insert** button of the dialog box will be disabled if the current document is edited in **Grid** mode.

## Unicode Fallback Font Support

Oxygen XML Author provides fonts for most common Unicode ranges. However, if you [use special symbols or characters](#) that are not included in the default fonts, they will be rendered as small rectangles. A *fallback* font is a reserve typeface that contains symbols for as many [Unicode characters](#) as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Author will try to find that symbol in a *fallback* font.

### Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the wheelchair symbol (♿ - U+267F) into your content in a Windows operating system. By default, Oxygen XML Author does not render this symbol correctly since it is not included in any of the default fonts. It is included in **Segoe UI Symbol**, but this font is not part of the default fonts that come with Oxygen XML Author. To allow Oxygen XML Author to recognize and render the symbol correctly, you can add **Segoe UI Symbol** as a *fallback* font.

### Add a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Author installation, use the following procedure:

1. Start Windows Explorer and browse to the `[OXYGEN_INSTALL_DIR]/jre/lib/fonts` directory.
2. Create a directory called `fallback` (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

**Tip:** You could, for example, copy the **Segoe UI Symbol Regular** font from `C:\Windows\Fonts`.

4. Restart Oxygen XML Author for the changes to take full effect.

**Result:** Whenever Oxygen XML Author finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the `fallback` folder.

### Alternate Solution for Other Platforms

For Mac OS X or other platforms, you could use the following approach:

1. Use a font editor (such as *FontForge*) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Author, *open the Preferences dialog box (Options > Preferences)*, go to **Appearance > Fonts**.
4. Click the **Choose** button for the particular editing mode (**Editor** for **Text** mode) and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Author for the font changes to take full effect.

### Related Information:

[Working with Unicode](#) on page 440

[Inserting Special Characters](#) on page 438

## Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Author reads the document prolog to determine the specified encoding type. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart. When the encoding type cannot be determined, Oxygen XML Author displays the **Available Java Encodings** dialog box that provides a list of all encodings supported by the Java platform.

If the opened document contains an unsupported character, Oxygen XML Author applies *the policy specified in the Encoding Errors Handling option*. If the policy is set to REPORT, Oxygen XML Author displays an error dialog box with a message about the character not allowed by the encoding. If the policy is set to IGNORE, the character is removed from the document displayed in the editor panel. If the policy is set to REPLACE, the character is replaced with a standard replacement character for that encoding.

While in most cases you are using UTF-8, simply changing the encoding name causes the application to save the file using the new encoding.

When saving a document edited in the **Text**, **Grid**, or **Design** modes, if it contains characters not included in the encoding declared in the document prolog, Oxygen XML Author presents a notification that you need to resolve the conflict before saving the document.

When saving a document edited in the **Author** mode, all characters that fall outside the detected encoding will be automatically converted to hexadecimal character entities.

When a document with a UTF-16 encoding is edited and saved in Oxygen XML Author, the saved document has a byte order mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is *UnicodeLittle*) has a different BOM than one created on a Mac OS platform (where the byte order mark is *UnicodeBig*). The byte order and the BOM of an existing document are preserved when the document is edited and saved. This behavior can be changed in Oxygen XML Author from the [Encoding preferences page](#).

## Working with Unicode

Unicode provides a unique number for every character, independent of the platform and language. Unicode is internationally recognized and is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.).

Oxygen XML Author provides support for the Unicode standard, enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Author uses 16 bit characters covering the Unicode Character set.

As a Java application, Oxygen XML Author includes a default Java input method for typing characters with Unicode codes. However, the default input method does not cover all the Unicode codes (for example, the codes for some accented characters or characters found in East Asian languages). Such characters can be inserted in

the editor panel of Oxygen XML Author either with [the Character Map dialog box](#) available from **Edit > Insert from Character Map** or by installing a Java input method that supports the insertion of the needed characters. The [installation of a Java input method](#) depends on the platform (Windows, Mac OS X, Linux, etc.) and is the same for any Java application.

**Note:** Oxygen XML Author may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

**Tip:** On windows, you can enable the support for **CJK** (Chinese, Japanese, Korean) languages from **Control Panel / Regional and Language Options / Languages / Install files for East Asian languages**.

**Related Information:**

[Unicode Fallback Font Support](#) on page 439

[Inserting Special Characters](#) on page 438

## Special Character Support in Text Mode

If bidirectional text, such as Arabic or Hebrew languages, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters) are detected in a document, Oxygen XML Author displays a **Special Characters Detected** dialog box that prompts you to **Enable** or **Disable** support for these special characters (you can also enable or disable the support for special characters in the [Open/Save preferences page](#)).

### Enabled

If you choose to enable support for special characters and as long as you [chose a font](#) that supports the particular special characters, this means that the [glyphs](#) will be rendered properly in **Text** mode and the cursor navigation mechanism will recognize them as they are shown.

**Example:** The Â glyph could be inserted using a consecutive combination of two characters (**U+00C2** followed by **U+0323**). With the special characters support enabled and the **SansSerif** font chosen, that glyph will be rendered properly (a capital letter A with a circumflex above it and a dot below) and you can navigate through the glyph in one step (pressing the right/left arrow key once).

**Restriction:** When support for special characters is enabled, the [folding support](#) is not available.

### Disabled

If you choose to disable support for special characters, it may affect text rendering, cursor navigation, and text management operations. However, this is helpful if you need to open [very large documents](#) since disabling the bidirectional editing support can enhance performance.

**Example:** The Â glyph could be inserted using a consecutive combination of two characters (**U+00C2** followed by **U+0323**). With the special characters support disabled, that glyph may or may not be rendered properly and when navigating through the glyph, it would take two steps (pressing the right/left arrow key twice).

**Restriction:** Bidirectional content in the **Text** mode cannot be rendered using **Bold** or **Italic**.

**Related Information:**

[Special Character Support in Author Mode](#) on page 382

[Special Character Support in Grid Mode](#) on page 237

[Inserting Special Characters](#) on page 438

## Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation**(**Ctrl + Shift + O** (**Command + Shift + O on OS X**)) action that is available from the **Edit** menu in the **Grid** editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

**Note:** This change applies only to the text from the cells, and not to the layout of the grid editor.

<?xml	version="1.0" encoding="UTF-8"
sample	#text
(9 rows)	
1	عندما يريد العالم أن يتكلم، فهو يتحدث بلغة يونيكود.
2	Quan el món vol conversar, parla Unicode
3	כאשר העולם רוצה לדבר, הוא מדבר ב-Unicode
4	Ha a világ beszélni akar, azt Unicode-ul mondja
5	Quando il mondo vuole comunicare, parla Unicode
6	世界的に話すなら、Unicode です。
7	세계를 향한 대화, 유니코드로 하십시오
8	Når verden vil snakke, snakker den Unicode
9	Når verda ønskjer å snakke, talar ho Unicode

Figure 217: Default left to right text orientation

## Special Character Support in Author Mode

Oxygen XML Author offers support for bidirectional text, such as Arabic or Hebrew languages that require right to left scripts, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters). To achieve this, Oxygen XML Author implements the [Unicode Bidirectional Algorithm](#), as specified by the Unicode consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in **Author** mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the [Arrow keys move the cursor in the writing direction](#) option in the **Cursor Navigation** preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

**Tip:** If you experience performance issues when editing documents that contain bidirectional text, you could try one of the following solutions:

- The Eclipse plugin distribution of Oxygen XML Author is faster than the standalone version when working with bidirectional text.
- You could try changing the font. For example, you could try using the **David** font in Hebrew content. If it is not already installed in your operating system, this font is available at: <https://www.microsoft.com/typography/fonts/family.aspx?FID=234>. To change the font in Oxygen XML Author, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Appearance > Fonts**, and change the font in the [Author default font option](#).

For more information about the bidirectional text support in the **Author** mode, watch our video demonstration:

[Inserting Special Characters](#) on page 438

## Controlling the Text Direction Using XML Markup

Oxygen XML Author Supports the following CSS properties:

**Table 11: CSS Properties Controlling Text Direction**

<b>direction</b>	Specifies the writing direction of the text. The possible values are <b>ltr</b> (the text direction is left to right), <b>rtl</b> (the text direction is right to left, and <b>inherit</b> (the direction property is inherited from the parent element).
<b>unicodeBidi</b>	Used along with the <b>direction</b> property to create levels of embedded text with different text directions in the same document. The possible values of this property are <b>bidi-override</b> (creates an additional level of embedding and forces all strong characters to the direction specified in the <b>direction</b> ), <b>embed</b> (creates an additional level of embedding), <b>normal</b> (does not use an additional level of embedding), and <b>inherit</b> (the value of the <b>unicodeBidi</b> property is inherited from parent element).

For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

XML File:

```
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLpara>
</article>
```

Associated CSS File:

```
myRTLpara{
  direction:rtl;
  unicode-bidi:embed;
}
```

Oxygen XML Author recognizes the **dir** attribute on any XML document. The supported values are:

<b>ltr</b>	The text from the current element is Left to Right, embedded.
<b>rtl</b>	The text from the current element is Right to Left, embedded.
<b>lro</b>	The text from the current element is Left to Right, embedded.
<b>rlo</b>	The text from the current element is Right to Left, embedded.

The following XML document types make use of the **dir** attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

**Note:** When the *inline element* tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the **No Tags** mode versus viewing it in the **Full Tags** mode.

## Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

**Table 12: Directional Formatting Codes**

U+202A (LRE)	LEFT-TO-RIGHT EMBEDDING	Treats the following text as embedded left-to-right.
U+202B (RLE)	RIGHT-TO-LEFT EMBEDDING	Treats the following text as embedded right to left.
U+202D (LRO)	LEFT-TO-RIGHT OVERRIDE	Forces the following characters to be treated as strong left-to-right characters.
U+202E (RLO)	RIGHT-TO-LEFT OVERRIDE	Forces the following characters to be treated as strong right-to-left characters.
U+202C (PDF)	POP DIRECTIONAL FORMATTING CODE	Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.
U+200E (LRM)	LEFT-TO-RIGHT MARK	Left-to-right strong zero-width character.
U+200F (RLM)	RIGHT-TO-LEFT MARK	Right-to-left strong zero-width character.

To insert Unicode Direction Formatting Codes, use the [Character Map](#) dialog box. To easily find such a code, you can either enter directly the hexadecimal value, or use the **Details** tab to enter the codes name.

Oxygen XML Author offers the support for bi-directional text in all the side views ([Outline view](#), [Attributes view](#) and so on) and text fields.

## Editing XML Documents

---

This section explains the various features in Oxygen XML Author for editing XML documents. It includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

### Related Information:

[Text Editing Mode](#) on page 180

[Author Editing Mode](#) on page 242

[Grid Editing Mode](#) on page 234

## Editing XML Documents in Text Mode

The Oxygen XML Author **Text** editing mode is designed to be a simple, yet powerful, XML source editor. You can use this mode to edit XML code, markup, and text and it provides support to help you transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Author also includes specialized editing actions, a powerful [Content Completion Assistant](#), a helpful [Outline view](#), and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area. 

### Navigating the Document Content in Text Mode

Oxygen XML Author includes some useful features to help you navigate XML documents in **Text** mode.

## Using the Keyboard

Oxygen XML Author allows you to quickly navigate through a document using the **Ctrl + CloseBracket (Command + CloseBracket on OS X)** key to go to the next XML node and **Ctrl + OpenBracket (Command + OpenBracket on OS X)** to go to the previous one.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. To position the cursor at the beginning or end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

## Navigation Buttons

Oxygen XML Author includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Available after you use the **Back** button at least once.

## Navigating with the Outline View

Oxygen XML Author includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 219: Outline View Navigation in Text Mode

## Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 220: Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

## Navigating with the Go To Dialog Box

In **Text** mode, you can navigate precisely to a location in the document you are editing by using the **Go to** dialog box. To open this dialog box, go to **Find > Go to (Ctrl+L (Command+L on OS X))**.

**Figure 221: Go to Dialog Box**

The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

### Navigating with Bookmarks

By using *bookmarks*, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct *bookmarks* in any document. Shortcut keys are available to place the *bookmarks* or to return to any of the marked positions. You can configure these shortcut keys in the [Options > Menu Shortcut Keys](#) menu.

**Figure 222: Editor Bookmarks**

A *bookmark* can be inserted in **Text** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Select the  **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A *bookmark* can be removed by right-clicking its icon on the vertical stripe and selecting **Remove** or **Remove all (Ctrl+F7 (Command+F7 on OS X))**.

You can navigate the *bookmarks* by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

### Smart Editing in Text Mode

Oxygen XML Author includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag>|</tag>`).
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Author will mirror-edit the name of the matching end tag. This feature can be controlled from the [Content Completion option page](#).
- **Auto-breaking the edited line** - The [Hard line wrap option](#) automatically breaks the edited line when its length exceeds the maximum line length [defined for the format and indent operation](#).
- **Indent on Enter** - The [Indent on Enter option](#) indents the new line inserted when you press **Enter**.
- **Smart Enter** - The [Smart Enter option](#) inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.

- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
  - Otherwise, a double-click selects contiguous text.
- **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
  - If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is immediately before an attribute, then the entire attribute and its value is selected.
  - If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.
  - Otherwise, it selects the entire current line.

### Shortcut Actions in Text Mode

Oxygen XML Author includes numerous shortcut actions to help you edit content in the **Text** editing mode.

### Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

#### **Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))**

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the [Enable mouse-wheel zooming option](#) in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### **Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))**

Decreases the font size (zooms out) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the [Enable mouse-wheel zooming option](#) in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### **Normal editor font (Ctrl + 0 (Command + 0 on OS X))**

Resets the font size to [the value of the editor font set in the Fonts preferences page](#).

### Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

#### **Undo (Ctrl + Z (Command + Z on OS X))**

Reverses a maximum of 200 editing actions (configurable with the [Undo history size option](#) in the **Editor** preferences page) to return to the preceding state.

**Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

#### **Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))**

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

## Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

### **Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

### **Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

### **Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

### **Select All (Ctrl + A (Command + A on OS X))**

Selects the entire content of the current document.

## Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:

### **Ctrl + Alt + UpArrow (Command + Alt + UpArrow on OS X)**

Moves the node up one line.

### **Ctrl + Alt + DownArrow (Command + Alt + DownArrow on OS X)**

Moves the node down one line.

**Note:** The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

## Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Author also includes the following other miscellaneous shortcut actions in **Text** mode:

### **Ctrl + Delete (Command + Delete on OS X)**

Deletes the next word.

### **Ctrl + Backspace (Command + Backspace on OS X)**

Deletes the previous word.

### **Ctrl + W (Command + W on OS X)**

Cuts the previous word.

### **Ctrl + K (Command + K on OS X)**

Cuts to end of line.

### **Ctrl + Single-Click (Command + Single-Click on OS X)**

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `schemaLocation`, `noNamespaceSchemaLocation`, `href` and others.
- Processing instructions used for associating resources, `xml-models`, `xml-stylesheets`.

### **Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)**

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

## Related Information:

[Frequently Used Shortcut Keys](#) on page 18

## Editing XML Markup in Text Mode

Oxygen XML Author includes some useful actions that allow you to easily edit XML markup in **Text** mode. These actions are available in the **Refactoring** submenu of the contextual menu and in the **Document > Markup** menu, and many of the actions can also be done with simple keyboard shortcuts.

### Using the Breadcrumb

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 223: Breadcrumb in Text Mode**

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the *breadcrumb* selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

#### Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

#### Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

#### Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

#### Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

#### Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

#### Cut

Removes the selected element and copies it to the clipboard.

#### Copy

Copies the selected element to the clipboard.

#### Delete

Deletes the currently selected element.

### Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

#### **Alt + UpArrow**

Moves the current node or selected nodes in front of the previous node.

#### **Alt + DownArrow**

Moves the current node or selected nodes after the subsequent node.

### Rename Elements

You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

## **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

## **Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))**

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Author will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from p1 to p5 without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

## **Surround Content with Tags (Wrap)**

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Surround with submenu**

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

### **Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option** is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option** is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

### **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

## **Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**

Deletes the start and end tag of the current element.

## **Join or Split Elements**

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

### **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

## Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

### Attributes submenu

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

#### Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

#### Convert attribute to element

Allows you to change an attribute into an element.

#### Delete attribute

Allows you to remove one or more attributes.

#### Rename attribute

Allows you to rename an attribute.

#### Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

### Comments submenu

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

#### Delete comments

Allows you to delete comments found inside one or more elements.

### DITA submenu

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

#### Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

#### Convert conrefs to conkeyrefs

Use this operation to convert conref attributes to conkeyref attributes.

#### Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

#### Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

#### Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

#### Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

#### Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

#### Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

## Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

## Elements submenu

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

### Delete element

Allows you to delete elements.

### Delete element content

Allows you to delete the content of elements.

### Insert element

Allows you to insert new elements.

### Rename element

Allows you to rename elements.

### Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

### Wrap element

Allows you to surround elements with element tags.

### Wrap element content

Allows you to surround the content of elements with element tags.

## Fragments submenu

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

### Insert XML fragment

Allows you to insert an XML fragment.

### Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

### Replace element with XML fragment

Allows you to replace elements with an XML fragment.

## JATSKit submenu

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

### Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

### Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

### Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

## Related Information:

[Refactoring XML Documents](#) on page 655

[Frequently Used Shortcut Keys](#) on page 18

## Folding XML Elements in Text Mode

When working with a large document, the [folding](#) support in Oxygen XML Author can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the *folding* feature is enabled in Oxygen XML Author, but it can be disabled in the **Text** preferences page with the *Enable folding option*.

```
<xsl:template match="articledescription"> [28 lines]
<xsl:template match="articledescriptions">
  <xsl:apply-templates/>
</xsl:template>
<xsl:template match="code">
  <ul>
    <p class="textSmall">
      <xsl:for-each select="coderow"> [2 lines]
    </p>
  </ul>
</xsl:template>
```

**Figure 224: Folding of XML Elements in Text Mode**

The fact that the folds are persistent is a unique feature of Oxygen XML Author. The next time you open the document the folds are restored to its last state.

### Folding Actions in Text Mode

Element folds are marked with a small triangle ( ▾ / ▸ ) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

▸ **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**

Folds all the elements except the current element.

▸ **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**

Folds the child elements that are indented one level inside the current element.

▾ **Expand Child Folds**

Unfolds all child elements of the currently selected element.

⊞ **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**

Unfolds all elements in the current document.

For more information about the *folding* support in Oxygen XML Author, watch our video demonstration:

### Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

### Selecting Content in Text Mode

Oxygen XML Author includes a variety of keyboard shortcuts that allow you to select content in **Text** mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in **Text** mode.

#### Standard Continuous Selection Shortcuts

**Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

**Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

### **Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

### **Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

### **Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

### **Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

### **Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

### **Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

### **Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

### **Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

### **Double-Click**

Selects certain text, depending on the position of the click in the document. See [Smart Editing Double-Click](#) for the specifics.

### **Triple-Click**

Selects entire regions of text, depending on the position of the click in the document. See the [Smart Editing Triple-Click](#) for the specifics.

### **Right-Click > Select > Element**

Selects the entire element at the current cursor position.

### **Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

### **Right-Click > Select > Attributes**

Selects all the attributes of the element at the current cursor position.

### **Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

## **Rectangular Selection Shortcuts**

Oxygen XML Author also includes some keyboard shortcuts that allow you to select a rectangular block of content in **Text** mode and you can then copy, cut, paste, delete, or edit the selection.

**Attention:** The rectangular selection shortcuts will not work if the [Line Wrap option](#) is selected in the **Text** preferences page.

The following shortcuts can be used to create a rectangular selection:

### **Alt + Mouse Click + Mouse Movement (Alt + Meta + Mouse Click + Mouse Movement on Mac OS X)**

Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse. Release **Alt (Alt + Meta on Mac OS X)** to enter the [in-place editing mode](#).

### **Shift + Alt + Left/Right Arrow Keys (Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

### **Shift + Alt + Up/Down Arrow Keys (Shift + Alt + Meta + Up/Down Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

### **Ctrl + Shift + Alt + Left/Right Arrow Keys (Ctrl + Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

### **Shift + Alt + Home (Shift + Alt + Meta + Home on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

### **Shift + Alt + End (Shift + Alt + Meta + End on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it to the end of the current line.

### **Shift + Alt + PageUp (Shift + Alt + Meta + PageUp on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it up one screen page.

### **Shift + Alt + PageDown (Shift + Alt + Meta + PageDown on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

### **In-Place Editing Mode**

To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the **Alt** key (on Mac OS X, release both **Alt & Meta**). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either **Enter** or **Esc**.

### **Content Completion Assistant in Text Mode**

Oxygen XML Author includes an intelligent *Content Completion Assistant* that offers rapid, inline identification and insertion of structured language elements, attributes, and attribute values. Oxygen XML Author shows the available entries that are valid in the current editing context.

**Figure 225: Content Completion Assistant**

The *Content Completion Assistant* feature is schema-driven (XML Schema, DTD, and RELAX NG) and status information about the detected schema is logged in the [Information view](#).

The *Content Completion Assistant* is enabled by default. To disable it, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Content Completion**, and deselect the [Enable content completion option](#).

### **Using the Content Completion Assistant in Text Mode**

The feature is activated in **Text** mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the [Activation delay of the proposals window \(ms\) option](#) from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space (Command + Space on OS X)** or **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

**Note:** When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the [Add Element Content option](#) (in the **Content Completion** preferences page) is selected. The *Content Completion Assistant* can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the [Add optional content](#) and [Add first Choice particle](#) options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the `>` character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document
- After the `>` character of the start tag if the element has no attributes.

### Where the Content Completion Assistant is Displayed

The *Content Completion Assistant* is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

### Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

#### Element Structure Specified in DTD or Schema

The proposals that populate the *Content Completion Assistant* depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

**Note:** The *Content Completion Assistant* is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

#### Current Cursor Position

The number and type of elements displayed by the *Content Completion Assistant* is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

## Unique ID Attribute Values

A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Author checks the uniqueness and correctness of the ID attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

## Values for *xml:id* Attributes

Values of all the `xml:id` attributes are handled as ID attributes. They are collected and displayed by the *Content Completion Assistant* as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

## ID Values for DITA Key References

In DITA, when inserting key references (`keyref`) or content key references (`conkeyref`), the ID values that are defined in the key reference are presented as possible targets. The *Content Completion Assistant* will only propose targets that are valid in the current context.

## Element and Attribute Values

For documents that use an XML Schema or Relax NG schema, the *Content Completion Assistant* offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the *Content Completion Assistant*.

## Related Information:

[Customizing the Content Completion Assistant](#) on page 1178

## Set Schema to be Used for Content Completion in Text Mode

The list of proposals in the *Content Completion Assistant* depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the *Content Completion Assistant* is specified in the following methods, in the order of their precedence:

- The *schema specified explicitly in the document*. In this case, Oxygen XML Author reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The *default schema declared* in the **Document Type configuration dialog box** that matches the edited document type.

Oxygen XML Author creates the content completion lists by analysing the detected schema and the current context (the position in the editor). If you change the schema, then the list of tags to be inserted is also updated.

Figure 226: Example: Content Completion Driven by DocBook DTD

## Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The *Content Completion Assistant*.
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the **F2** shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the [Show annotations in Content Completion Assistant](#) option in the **Annotations** preferences page.

### Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the [Show annotations using HTML format, if possible](#) option in the **Annotations** preferences page. When this options is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`p`, `br`, `ul`, `li`), they are rendered as an HTML document loaded in a web browser. For example, `p` begins a new paragraph, `br` breaks the current line, `ul` encloses a list of items, and `li` encloses an item of the list.

### Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Author looks for an annotation in the type definition of that element or attribute.

### Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person. </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
    <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the [Use all Relax NG annotations as documentation](#) option in the **Annotations** preferences page.

### Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
## Information about a person.
element person { name, email*}
```

Figure 228: Element Structure Panel

### Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 229: Annotation panel

### Attributes View in Text Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Attribute	Value
abstract	false
block	false
default	true
final	
fixed	
id	
name	email
nillable	false
substitutionGroup	
type	xs:string

**Figure 230: Attributes View**

### Expand/Collapse Button

There is an **Expand/Collapse** (  ) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the  **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the  **Update** button (or press **Enter**) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

#### Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the *Allow only insertion of valid elements and attributes* schema-aware option is selected.

#### Set empty value

Specifies the current attribute value as empty.

#### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

#### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

#### Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.

- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

#### *Elements View in Text Mode*

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.

**Figure 231: Elements View in Text Mode**

#### *Entities View*

*Entities* provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (&lt ;, &gt ;, & ;, &apos ;, &quot ;).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbsp	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 232: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

### Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Author includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also [define your own code templates for any type of file and share them with others](#).

To get a complete list of available code templates, press **Ctrl + Shift + Space** in **Text** mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a  symbol in the content completion list.

When the [Content Completion Assistant](#) is invoked (**Ctrl + Space (Command + Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

For more information about code templates, watch our video demonstration:

### Syntax Highlighting in XML Documents

Oxygen XML Author supports syntax highlighting in XML documents to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the [Preferences dialog box \(Options > Preferences\)](#).
2. Go to [Editor > Syntax Highlight](#).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:** Oxygen XML Author also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the [Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page](#).

## Related Information:

[Customize Syntax Highlight colors](#) on page 102

## Outline View in Text Mode

The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

## Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

## Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

## Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

**Figure 233: Outline View in Text Mode**

### Related Information:

[Outline View in Author Mode](#) on page 255

### Outline View Filters in Text Mode

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

The following actions are available in the  **Settings** menu of the **Outline** view when editing in **Text** mode:

#### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

#### Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

#### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

#### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

#### Show element name

Show/hide element name.

#### Show text

Show/hide additional text content for the displayed elements.

#### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

#### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

### Outline View Contextual Menu Actions in Text Mode

The following actions are available from the contextual menu in the **Outline** view in **Text** mode:

## Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

## Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

## Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

## Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

## Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

## Cut

Cuts the currently selected component.

## Copy

Copies the currently selected component.

## Delete

Deletes the currently selected component.

Expands the structure of a component in the **Outline** view.

## Collapse All

Collapses the structure of all the component in the **Outline** view.

## Inserting or Opening a File at Cursor Location

When editing content in **Text** mode, the following actions (in regards to inserting, opening, or comparing files) are available in the **Document > File** menu:

### Insert File

Inserts the content of the file with the specified file path into the current document, at the current position of the cursor.

### Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

### Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

### Compare

Opens the current file in [the Compare Files tool](#).

## Adjusting the Transparency of XML Markup

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Author offers the option of reducing the visibility of the markup by increasing their transparency when displayed in **Text** mode.

To change the level of transparency, use the  **Tags Transparency Selector** drop-down menu that is available from the **Source** toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using

the [Configure Toolbars](#) action. There are several levels of transparency that can be adjusted to make the content more or less visible:

-  **Normal Contrast** - Resets the transparency level back to normal.
-  **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
-  **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
-  **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.
-  **Transparent Markup** - Greatly reduces the visibility of the XML markup to place even greater emphasis on the visibility of the text.

Figure 234: Tags Transparency Selector

### Locking and Unlocking XML Markup

For documents with fixed markup, such as forms in which the XML tags are not allowed to be modified (only their text content), the possibility to edit the XML tag names can be toggled on or off with the  **Lock / Unlock the XML tags** action available in **Text** editing mode from the **Source** submenu from the contextual menu (or **Document > Source** menu).

You can set the default lock state for all opened editors using the [Lock the XML tags option in the Text preferences page](#).

### Formatting and Indenting XML Documents

Oxygen XML Author creates XML documents using several *edit modes*. In **Text mode**, you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Author must decide how to format and indent the XML. Oxygen XML Author will also format and indent your XML for you in **Text** mode if you use one of the Format and Indent options:

- **Document > Source >  Format and Indent** - Formats and indents the whole document.
- **Document > Source >  Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.
- **Document > Source >  Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

A number of settings affect how Oxygen XML Author formats and indents XML. Many of these settings have to do with how whitespace is handled.

## Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom,
or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise
destroyed; nor will we not pass upon him, nor condemn him, but by lawful
judgment of his Peers, or by the <xref
href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html"
scope="external">Law of the land</xref>.
We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}
</codeblock>
```

Here every whitespace character between the codeblock tags should be treated as significant.

## How Oxygen XML Author determines when whitespace is significant

When Oxygen XML Author formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Author needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Author assigns each element in the document to one of four categories:

### Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

### Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

### Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
<p>The file is located in <i>HOME</i>/<i>USER</i>/hello.  
  This is a <strong>big</strong>  
  
<emphasis>deal</emphasis>.  
</p>
```

In this example, whitespace should not be introduced around the `i` tags as it would introduce extra significant whitespace into the document. The space between the end `</strong>` tag and the beginning `<emphasis>` tag should be normalized to a single space, not zero spaces.

### Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Author consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Author consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an `xml:space="preserve"` attribute in the source file, it will be assigned to the preserve space category. If an element has the `xml:space="default"` attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Author consults information from the following sources:

#### **xml:space**

If the XML element contains the `xml:space` attribute, the element is promoted to the appropriate category based on the value of the attribute.

#### **CSS whitespace property**

If the CSS stylesheet controlling the **Author** mode editor applies the `whitespace: pre` setting to an element, it is promoted to the preserve space category.

#### **CSS display property**

If a text node contains only white-spaces:

- If the node has a parent element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS `display` property set to `table` then the node is assigned to the ignore space category.

#### **Schema aware formatting**

If a schema is available for the XML document, Oxygen XML Author can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value `preserve`.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for **Author** mode, *open the Preferences dialog box (Options > Preferences)*, go to **Editor > Edit modes > Author > Schema aware**, and select/deselect the *Schema aware normalization, format and indent option*.
- To turn it on or off for the **Text** editing mode, *open the Preferences dialog box (Options > Preferences)*, go to **Editor > Format > XML**, and select/deselect the *Schema aware format and indent option*.

### Preserve space elements list

If an element is listed in the [Preserve space tab of the Element Spacing list](#) in the *XML formatting preferences*, it is promoted to the preserve space category.

### Default space elements list

If an element is listed in the [Default space tab of the Element Spacing list](#) in the *XML formatting preferences*, it is promoted to the default space category.

### Mixed content elements list

If an element is listed in the [Mixed content tab of the Element Spacing list](#) in the *XML formatting preferences*, it is promoted to the mixed content category.

### Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

### Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

### Exception to the Rule

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In **Author** mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as *blocks* by the associated CSS (that is, they have a CSS property of `display: block`). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only [block elements](#). In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the [Schema Aware Editing option](#) in the **Schema-Aware** preferences page.

### How Oxygen XML Author formats and indents XML

You can control how Oxygen XML Author formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- [Format preferences page](#)
- [XML Formatting preferences page](#)
- [Whitespaces preferences page](#)

### When Oxygen XML Author formats and indents XML

Oxygen XML Author formats and indents a document, or part of it, on the following occasions:

- In **Text** mode when you select one of the format and indent actions (**Document > Source > Format and Indent**, **Document > Source > Indent Selection**, or **Document > Source > Format and Indent Element**).
- When saving documents in **Author** mode.
- When switching from **Author** mode to another mode.
- When saving or switching to **Text** mode from **Grid** mode, if the [Format and indent when passing from grid to text or on save option](#) is selected in the **Grid** preferences page.

### Setting an Indent Size to Zero

Oxygen XML Author will automatically [format and indent](#) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

**Note:** Changing the indent size does not override the rules that Oxygen XML Author uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

### Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Author to maintain a zero indent when editing or formatting those documents:

1. Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Format**.
2. Select **Detect indent on open**.
3. Select **Use zero-indent if detected**.

Oxygen XML Author will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Author will use the indent closest to what it detects in the document.

### Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Format**.
2. Deselect **Detect indent on open**.
3. Set **Indent size** to 0.

All documents will be formatted and indented with an indent of zero.

**Warning:** Setting the indent size to zero can change the meaning of some file types, such as Python source files.

### Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Author provides support for formatting and indenting (*pretty-print*) multiple files at once. This action is available for any document in XML format, as well as for CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the **Project view** or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

**Figure 235: Format and Indent Files Dialog Box**

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The *pretty-print* is performed in all opened files.

- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the *pretty-print* is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the *pretty-print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the *pretty-print* is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Author makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

## Managing Highlighted Content

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Author includes a feature, **Manage Highlighted Content**, that is designed to help you achieve this.

When you are in **Text** mode and you perform a search operation or apply an XPath that highlights multiple results, you can select the **Manage Highlighted Content** action from the contextual menu of any highlight in the document, and the following options are available in its submenu:

- **Modify All** - Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.  
  
**Note:** If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the *Find/Replace operation*, or continue the operation.
- **Surround All** - Use this option to surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.
- **Remove All** - Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

- **Modify All Matches** - Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Quick Assist Support for IDs and IDREFS

The *Quick Assist support* is activated automatically when you place the cursor inside an ID or IDREF in **Text** mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the *Quick Assist* menu from the contextual menu or by pressing **Alt+1 (Command+Alt+1 on Mac OS X)** on your keyboard.

The following actions are available:

### **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and *choose the scope of the rename operation*. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

## **Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

## **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

## **Change scope**

Opens the [Select the scope for the Search and Refactor operations](#) dialog box.

## **Rename in File**

Renames the ID you are editing and all its occurrences from the current file.

## **Search Occurrences**

Searches for the declaration and references of the ID located at the cursor position in the current document.

## **Related Information:**

[Working with Modular XML Files in the Master Files Context](#)

## **Highlight ID Occurrences in Text Mode**

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

**Note:** Highlighted ID declarations are rendered with a different color than highlighted ID references.

## **Related Information:**

[Working with Modular XML Files in the Master Files Context](#)

## **Contextual Menu Actions in Text Mode**

When editing XML documents in **Text** mode, Oxygen XML Author provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu):

### **Cut**, **Copy**, **Paste**

Executes the typical editing actions on the currently selected content.

## **Copy XPath**

Copies the XPath expression of the current element or attribute from the current editor to the clipboard.

## **Toggle Comment (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

## **Go to submenu**

This submenu includes the following actions:

### **Go to Matching Tag (Ctrl + Shift + G)**

Moves the cursor to the end tag that matches the start tag, or vice versa.

### **Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on OS X))**

Moves the cursor to the end of the next tag.

### **Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on OS X))**

Moves the cursor to the end of the previous tag.

## Select submenu

This submenu allows you to select the following:

### Element

Selects the entire element at the current cursor position.

### Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

### Attributes

Selects all the attributes of the element at the current cursor position.

### Parent

Selects the parent element at the current cursor position.

## Source submenu

This submenu includes the following actions:

### Shift Right (Tab)

Shifts the currently selected block to the right.

### Shift Left (Shift + Tab)

Shifts the currently selected block to the left.

### Indent selection (Ctrl + I (Command + I on OS X))

Corrects the indentation of the selected block of lines if it does not follow the current *indenting preferences*.

### ⌘& Escape Selection

Escapes a range of characters by replacing them with the corresponding character entities.

### &⌘ Unescape Selection

Replaces the character entities with the corresponding characters.

### Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X))

*Pretty-prints* the element that surrounds the current cursor position.

### To Upper Case

Converts the selected content to upper case characters. This works with contiguous and multiple selections.

### To Lower Case

Converts the content selection to lower case characters. This works with contiguous and multiple selections.

### Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

### Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

### Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base64** schemes:

### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### **Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### **Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## **Base32 Encode/Decode submenu**

This submenu include the following actions for encoding or decoding **base32** schemes:

### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### **Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### **Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

## Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding **hex** schemes:

### Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

## Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Join and Normalize Lines (Ctrl + J (Command + J on OS X))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

## Insert new line after (Ctrl + Alt + Enter (Command + Alt + Enter on OS X))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

## Insert XInclude

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

**Note:** In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **Preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

## Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities.

For instance, choosing the files `chapter1.xml` and `chapter2.xml` inserts the following section in the DOCTYPE:

```
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

### **Lock / Unlock the XML Tags**

Disables or enables the ability to edit XML tags.

### **Canonicalize**

Opens the **Canonicalize** dialog box that allows you to select a *canonicalization* algorithm to standardize the format of the document.

### **Sign**

Opens the **Sign** dialog box that allows you to configure a digital signature for the document.

### **Verify Signature**

Allows you to specify the location of a file to verify its digital signature.

## **Manage Highlighted Content submenu**

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

### **Modify All**

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### **Surround All**

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

### **Remove All**

Removes all the highlighted content.

## **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### **Go to Definition (Ctrl + Shift + Enter)**

Moves the cursor to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a “type” belonging to the “<http://www.w3.org/2001/XMLSchema-instance>” namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute.

## **Refactoring submenu**

This submenu includes the following actions:

### **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### **Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))**

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent

element, then Oxygen XML Author will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.

- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

#### **Surround with submenu**

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

#### **Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the *Position cursor between tags option* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the *Position cursor between tags option* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

#### **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

#### **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**

Deletes the start and end tag of the current element.

#### **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

#### **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

### **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

#### **Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

#### **Convert attribute to element**

Allows you to change an attribute into an element.

#### **Delete attribute**

Allows you to remove one or more attributes.

#### **Rename attribute**

Allows you to rename an attribute.

#### **Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

### **Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

#### **Delete comments**

Allows you to delete comments found inside one or more elements.

## DITA submenu

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

### Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

### Convert conrefs to conkeyrefs

Use this operation to convert conref attributes to conkeyref attributes.

### Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

### Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

### Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

### Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

### Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

### Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

### Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

## Elements submenu

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

### Delete element

Allows you to delete elements.

### Delete element content

Allows you to delete the content of elements.

### Insert element

Allows you to insert new elements.

### Rename element

Allows you to rename elements.

### Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

### Wrap element

Allows you to surround elements with element tags.

### Wrap element content

Allows you to surround the content of elements with element tags.

## Fragments submenu

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

### Insert XML fragment

Allows you to insert an XML fragment.

### Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

### Replace element with XML fragment

Allows you to replace elements with an XML fragment.

## JATSKit submenu

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

### Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

### Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

### Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

## Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

### Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and *choose the scope of the rename operation*. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

### Rename in File

Renames the ID you are editing and all its occurrences from the current file.

### Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the *Select the scope for the Search and Refactor operations* dialog box, this scope will be used instead.

### Search References in

Searches for the references of the ID. Selecting this action opens the *Select the scope for the Search and Refactor operations*.

### Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the *Select the scope for the Search and Refactor operations* dialog box, this scope will be used instead.

### Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the *Select the scope for the Search and Refactor operations*.

### Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

## Quick Assist (**Alt + 1** (**Command + Alt + 1** on OS X))

Available when the cursor is inside an ID or IDREF, this action opens the *Quick Assist* window that allows you to select some search and refactoring actions for the selected ID or IDREF.

## Open submenu

The following actions are available in this submenu:

### Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

### Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

### Compare

Opens the current file in [the Compare Files tool](#).

### Resource Hierarchy

Opens the [Resource Hierarchy/Dependencies view](#) that allows you to see the resource hierarchy for an XML document.

### Resource Dependencies

Opens the [Resource Hierarchy/Dependencies view](#) that allows you to see the resource dependencies for an XML document.

## Editing XML Documents in Grid Mode

The **Grid** mode in Oxygen XML Author displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple contextual menu actions, drag/drop, or copy/paste operations. The text content can be modified simply by editing the value of cells that contain the text and a useful [Content Completion Assistant](#) is also available to help you edit or insert XML elements.

To switch to this mode, select **Grid** at the bottom of the editing area. 

For more information about some of the features available in the **Grid** editor, watch our video demonstration:

### Editing Actions in Grid Mode

Since **Grid** mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the [Content Completion Assistant](#) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Author provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

**Tip:** There are two different types of layouts available in **Grid** mode. Most people prefer to leave it on the default **Grid mode** layout, but there is also a **Tree mode** layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the **Document > Grid Layout** menu.

### Expanding/Collapsing Nodes

An arrow sign () displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (). The expand/collapse actions can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select  **Expand All** from the **Expand/Collapse** submenu. To collapse all node, right-click any cell and select  **Collapse All** from the **Expand/Collapse** submenu.

## Editing Elements or Attributes

To edit elements or attributes in **Grid** mode, simply double-click the cell that contains the element or attribute (or select the cell and press **(Enter)**) to invoke the *Content Completion Assistant*. This opens a pop-up window that offers a list of proposals that are valid for that particular node.

## Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press **Enter** (or double-click the cell), and start editing.

To stop editing a cell value, press **Enter** again.

To cancel the editing without saving the current changes in the document, press the **Esc** key.

## Editing the Structure of the Nested Tables

To edit the structure of the nested tables in **Grid** mode, Oxygen XML Author provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu, or the toolbar):

### **Cut**, **Copy**, **Paste**, **Delete** common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

### **Paste as Child**

Pastes the copied content as the last child of the current selection.

### **Duplicate**

Creates a new node by duplicating the currently selected one.

### **Insert Before**

Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

### **Insert After**

Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

### **Append Child**

Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

### **Sort Ascending**, **Sort Descending**

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between *numerical* and *alphabetical*.

### **Insert Row**

Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press **Enter**.

### **Insert Column**

Inserts a column after the current selection.

### **Clear Content**

Removes all content from the current cell.

### **Expand/Collapse** > **Expand All**

Expands the selection and all its children.

### **Expand/Collapse** > **Collapse All**

Collapses the selection and all its children.

### Expand/Collapse > Expand Children

Expands all the children of the selection but not the selection.

### Expand/Collapse > Collapse Children

Collapses all the children of the selection but not the selection.

### Expand/Collapse > Collapse Others

Collapses all the siblings of the current selection but not the selection.

### Refresh Selected

Forces the layout to be recomputed.

### Related Information:

[Grid Mode Navigation](#) on page 236

[Copy and Paste in the Grid Editing Mode](#) on page 483

[Drag and Drop in the Grid Editing Mode](#) on page 483

[Content Completion Assistant in Grid Mode](#) on page 485

### Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the **Grid** editor and text from other applications into the **Grid**.

**Tip:** When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the  **Refresh Selected** action that is available in the contextual menu and in the **Document > Grid Edit** menu.

### Copy and Paste in the Grid Editing Mode

Selecting content in the **Grid** mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

### Pasting Content Within Grid Mode

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

-  **Paste (Ctrl + V (Command + V on OS X))** - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

### Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the **Grid** editor can also be pasted into **Text** mode or other external applications. When pasting copied content from **Grid** mode, the inserted string represents the nodes serialization. The nodes

from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

**Figure 236: Copying from Grid to Other Editors**

### Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab-separated values from other editors into the **Grid** editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

**Figure 237: Pasting XML Data into Grid**

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the **Grid** editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

**Figure 238: Pasting Tab-Separated Values into Grid**

If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the **Insert row** or **Insert column** actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

### Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the **Grid** editing mode offers a *Content Completion Assistant* for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press **Enter** on your keyboard).

**Figure 239: Content Completion in Grid Editing Mode**

### Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from **Grid** mode to Excel or other spreadsheet applications, follow this procedure:

1. Open the XML document in Oxygen XML Author and switch to **Grid** mode.
2. [Expand the nodes](#) to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export ( **Copy** from the contextual menu or **Ctrl+C**).
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Author also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in **Grid** mode). For more information, see [Import from MS Excel Files – Grid Mode Method](#).

For more information about exchanging data between Oxygen XML Author and spreadsheet applications, watch our video demonstration:

### Related Information:

[Import from MS Excel Files - Grid Mode Method](#) on page 1093

## Editing XML Documents in Author Mode

The **Author** editing mode in Oxygen XML Author allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. This makes structured authoring easier for people who are not familiar with XML and it also provides easier access to the XML structure for XML experts. Oxygen XML Author provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, DocBook, TEI, and XHTML.

Adding text content in **Author** mode is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output. You can even play audio and video objects directly in **Author** mode and it includes an intuitive [Image Map Editor](#). You can easily change the rendering by selecting one of the preset [main styles](#) from the [Styles drop-down menu](#) (available on the toolbar) and combine multiple [alternate styles](#) that behave like layers. You can also use the options in the  [Tags Display Mode drop-down menu](#) to control how much XML markup is displayed in **Author** mode and there are various features and views that provide information about the XML structure based upon your current location within the document.

**Author** mode provides numerous helpful editing actions, many of which are specific to the type of document you are editing and it includes a variety of other powerful editing features, such as keyboard shortcuts, [drag and drop support](#), a [Smart Paste mechanism](#), and an [intelligent Content Completion Assistant](#). **Author** mode also allows you to visualize and [manage profiled content](#), you can collaborate with others with various [review features](#) (such as the ability to add comments, track changes, or highlight content), and includes many other unique features.

To switch to this mode, click the **Author** button at the bottom of the editing area. 

For more information about some of the features available in the visual **Author** editing mode, watch our video demonstration:

### Author Mode User Roles

There are two main types of users for the **Author** mode: *framework developers* and *content authors*.

#### Framework Developers

A *framework developer* is a technical person with advanced XML knowledge who defines the [framework](#) for authoring XML documents in the visual editor. Once the *framework* is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The *framework* (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in **Author** mode.

The *framework* details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- Configuration of [XML Catalogs](#).
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Author includes some ready-to-use predefined document types for XML *frameworks*, such as DocBook, DITA, TEI, JATS, and XHTML.

#### Content Authors

A *content author* does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the *framework* set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

## Styling XML Documents in Author Mode

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in a visual editor. For more information about schema association, see [Associating a Schema to XML Documents](#) on page 626. The **Author** mode renders the content of the XML documents visually, based on a CSS stylesheet associated with the document.

### Associating a Stylesheet with an XML Document

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the [version 2.1 of the CSS specification](#) from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the `xml-stylesheet` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, [you should create a new document type \(framework\)](#).

CSS example:

```
<?xml-stylesheet type="text/css" href="test.css"?>
```

LESS example:

```
<?xml-stylesheet type="text/css" href="test.less"?>
```

**Note:** XHTML documents need a `link` element, with the `href` and `type` attributes in the head child element, as specified in the [W3C CSS specification](#). XHTML example:

```
<link href="/style/screen.css" rel="stylesheet" type="text/css"/>
```

**Tip:** You can also insert the `xml-stylesheet` processing instruction by using the  **Associate XSLT/CSS Stylesheet** action that is available on the toolbar or in the **Document > XML Document** menu.

2. Add a new CSS or LESS file to a [framework](#) (document type). To do so, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Edit the appropriate *framework*, open the **Author** tab, then the **CSS** subtab. Press the **+ New** button to add a new CSS or LESS file.

**Note:** The predefined *frameworks* are read-only, so you need to [Extend](#) or [Duplicate](#) them to configure them as custom *frameworks*.

You can read more about associating a CSS to a document type in [Customizing the Main CSS of a Framework](#).

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

**Figure 240: Document with no CSS association default rendering**

### Selecting and Combining Multiple CSS Styles

Oxygen XML Author provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate) CSS style* and multiple *alternate CSS styles*. This makes it easy to change the look of the document as it appears in **Author** mode and the output without having to continually edit the CSS stylesheets.

**Tip:** For information about configuring the **Styles** drop-down menu, see [Configuring and Managing Multiple CSS Styles](#) on page 1194.

You can select a *main CSS style* that applies to the whole document and then *alternate styles* that are applied as layers to specific parts of the document. For example, in the subsequent figure, a DITA document has the **Century** style selected for the *main CSS* and the *alternate styles* **Full width**, **Show table column specification**, **Hints**, and **Inline actions** are combined for additive styling to specific parts of the document.

The selections from the **Styles** drop-down menu are persistent, meaning that Oxygen XML Author will remember the selections when subsequent documents are opened.

Figure 241: Styles Drop-down Menu in a DITA Document

#### Navigating the Document Content in Author Mode

Oxygen XML Author includes some useful features to help you navigate XML documents.

#### Using the Keyboard

Oxygen XML Author allows you to quickly navigate through a document using the **Tab** key to move the cursor to the next XML node and **Shift + Tab** to go to the previous one. If you encounter a *space-preserved element* when you navigate through a document and you do not press another key, pressing the **Tab** key will continue the navigation. However, if the cursor is positioned in a *space-preserved element* and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. Entities and hidden elements are skipped. To position the cursor at the beginning or at the end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

## Navigation Buttons

Oxygen XML Author includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position after the **Back** button has been used at least once.

## Navigating with the Outline View

Oxygen XML Author includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 242: Outline View Navigation in Author Mode

## Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 243: Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

## Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc), the **linking support** is useful for navigating between the documents. In the predefined customizations that are bundled with Oxygen XML Author, links are marked with an icon representing a chain link (). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the **Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X))** action when the cursor is inside a link element.

**Note:** Depending on the referenced file type, the target link will either be opened in the Oxygen XML Author or in the default system application. If the target file does not exist, Oxygen XML Author prompts you to create it.

## Navigating with Bookmarks

A position in a document can be marked with a *bookmark*. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The *bookmarks* are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct *bookmarks* in any

document. Shortcut keys are available to place the *bookmarks* or to return to any of the marked positions. You can configure these shortcut keys in the [Options > Menu Shortcut Keys](#) menu.

**Figure 244: Editor Bookmarks**

A *bookmark* can be inserted in **Author** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor.
- Select the  **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A *bookmark* can be removed by right-clicking its icon on the vertical stripe and select **Remove** or **Remove all (Ctrl+F7 (Command+F7 on OS X))**.

You can navigate the *bookmarks* by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

### Displaying the Markup

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

The following dedicated tag modes are available from the  **Tags Display Mode** drop-down menu (available on the toolbar):

#### **Full Tags with Attributes**

Displays full tag names with attributes for both *block* and *inline* elements.

#### **Full Tags**

Displays full tag names without attributes for both *block* and *inline* elements.

#### **Block Tags**

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

#### **Inline Tags**

Displays full tag names for *inline elements*, while *block elements* are not displayed.

#### **Partial Tags**

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

#### **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### Configure Tags Display Mode

Opens the [Author preferences page](#) where you can configure options in regards to *tags*, such as the default **Tags Display Mode**, **Tags Background Color**, **Tags Foreground Color**, **Tags Font**, and whether or not Oxygen XML Author will use a **Compact Tag Layout** for displaying the tags (this option tries to group consecutive block tags on the same line).

**Note:** The associated CSS information is used to determine whether a tag should be considered *inline* or *block*. If the current document does not have an associated CSS stylesheet, then the **Full Tags** mode will be used.

### Displaying Referenced Content

The references to entities, XInclude, DITA conrefs, and constructs in other vocabularies [with displayable referenced content](#) are expanded by default in **Author** mode and the referenced content is displayed. You can control this behavior from the [Author preferences page](#). The referenced resources are loaded and displayed

inside the element or entity that references them, but the displayed content cannot be modified directly in current document.

Figure 245: XInclude reference

Figure 246: External entity reference

When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the icon) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the [XML Catalog](#) set in the [XML Catalog preferences page](#).

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Author.
- On demand, by using the [Refresh references action](#). This is useful when the referenced content is modified outside the Oxygen XML Author scope.

**Related Information:**

[Configuring a References Resolver](#) on page 1164

**Visual Hints for the Cursor Position**

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

- **Before first block** - The cursor is positioned before the first *block* child of the current node.

- **Between two block elements** - The cursor is positioned between two *block elements*.

- **After last block** - The cursor is positioned after the last *block element* child of the current node.

- **Inside a node** - The cursor is positioned inside a node.

- **Before an inline element** - The cursor is positioned inside an element, before a child *inline element*.

- **Between two inline elements** - The cursor is positioned between two *inline elements*.

- **After an inline element** - The cursor is positioned inside an element, after an child *inline element*.

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, *open the Preferences dialog box (Options > Preferences)*, go to **Author > Cursor Navigation**, and deselect the *Show cursor position tooltip option*. Even if this option is deselected, you can still display the position tooltip by pressing **Shift+F2**.

**Note:** The position information tooltip is not displayed if *Full Tags with Attributes or Full Tags is selected in the Tags display mode drop-down menu*.

### Location Tooltip

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Author displays a transparent preview of the position information, called the **Location Tooltip**:

**Figure 247: Location Tooltip**

Oxygen XML Author displays a **Location Tooltip** when the following conditions are met:

- You are editing the document in one of the following *tags display modes*: **Inline Tags, Partial Tags, No Tags**.
- The mouse pointer is moved between *block elements*.

To activate or deactivate this feature, use the *Show location tooltip on mouse move option* in the *Cursor Navigation preferences page*.

### Whitespace Handling in Author Mode

When you edit a document in **Author** mode, Oxygen XML Author must serialize the resulting document as XML. Oxygen XML Author serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Author *formats and indents the XML document* according to the current *format and indent settings*.

## Minimizing Whitespace Differences Between Versions

When serializing a document to XML, **Author** mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

## Entering Whitespace in Author Mode

Oxygen XML Author controls the entry of whitespace characters in **Author** mode according to the [XML whitespace rules](#), which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Author is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Author will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its [predefined document types](#), Oxygen XML Author is [correctly configured to recognize preserve space elements](#) and to allow you to enter additional spaces in them.

If you are using a predefined document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is [configured correctly](#) so that Oxygen XML Author recognizes that the current element is a preserve-space element.

## Serialization Options for Author Mode

The [Author preferences page](#) (open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author**) includes a [Serialization section](#) that contains some options that control how the formatting and indenting is applied when a document is saved in **Author** mode or when switching from **Author** to **Text** mode. It also includes a [Compatibility with other tools option](#) that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.

## Editing Content in Author Mode

The **Author** mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

## Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

### **Undo (Ctrl + Z (Command + Z on OS X))**

Reverses a maximum of 200 editing actions (configurable with the [Undo history size option](#) in the **Editor** preferences page) to return to the preceding state.

**Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

### **Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))**

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

## Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

### **Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

### **Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

## **Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

## **Select All (Ctrl + A (Command + A on OS X))**

Selects the entire content of the current document.

## **Entering Text in Elements**

By default, you can only enter text in elements that accept text content. If the element is declared as *empty* or *element only* in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

**Figure 248: Editing in empty element warning**

To allow text to be inserted in these instances, go to the **Schema-Aware** preferences page and deselect the **Reject action when its result is invalid** option in the **Typing actions** section.

## **Editing Text Content Without Modifying the XML Markup**

You can use the options in the  **Tags Display Mode drop-down menu** (available on the toolbar) to control how tags are displayed in **Author** mode. This can help you to clearly see where the current cursor position is within the tag structure so that you can avoid making unintended modifications to the XML markup. You can also switch to the **Grid editing mode** to modify text content without affecting the XML tags.

## **Changing the Font Size (Zoom)**

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

### **Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))**

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the **Enable mouse-wheel zooming option** in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

### **Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))**

Decreases the font size (zooms out) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the **Enable mouse-wheel zooming option** in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

### **Normal editor font (Ctrl + 0 (Command + 0 on OS X))**

Resets the font size to *the value of the editor font set in the **Fonts** preferences page*.

[Frequently Used Shortcut Keys](#) on page 18

## Editing XML Markup in Author Mode

Oxygen XML Author includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

### Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Author is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the *breadcrumb* displayed at the top of the editing window.
- **Outline View** - Click the element name in the *Outline view*.
- **Full Tags Mode** - While editing in *Full Tags mode*, click the start or end tag of the element in the editor.
- **Mouse Selection** - While editing in *Full Tags mode*, click before the start tag of the element, drag the selection, and release the mouse button after the end tag.
- **Shift + Arrow Keys** - While editing in *Full Tags mode*, place the cursor before the start tag of the element, press and hold **Shift**, and use the arrow keys to make the selection (including the end tag).

**Note:** If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Author will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in *well-formed XML*.

### Using the Breadcrumb in Author Mode

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 249: Breadcrumb in Author Mode**

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

#### **Edit Attributes**

Opens the *in-place attributes editor* that allows you to easily edit the attributes of an element.

#### **Edit Profiling Attributes**

Allows you to select the *profiling attributes* that apply to a certain element.

#### **Append child**

Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

#### **Insert before**

Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

#### **Insert after**

Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

#### **Cut**

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

#### **Copy**

Copies the selected element to the clipboard, while preserving the styles of the copied content.

#### **Paste**

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

### Paste before

Insert a well-formed element (from the clipboard) before the currently selected element.

### Paste after

Insert a well-formed element (from the clipboard) after the currently selected element.

### Paste as XML

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

### Delete

Deletes the currently selected element.

### Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

### Rename Element

Opens the **Rename** dialog box that allows you to rename the currently selected element and other elements with the same name.

**Tip:** The tag names displayed in the *breadcrumb* can be customized with an **Author** mode extension class that implements the *AuthorBreadCrumbCustomizer* API. See the [Oxygen SDK](#) for more details.

### Move Nodes

You can move XML nodes in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Move Up (**Alt + UpArrow**)

Moves the current node or selected nodes in front of the previous node.

#### Move Down (**Alt + DownArrow**)

Moves the current node or selected nodes after the subsequent node.

**Tip:** The easiest way to move nodes is to use the **Alt + UpArrow** and **Alt + DownArrow** shortcut keys.

### Promote/Demote List Item Nodes

You can easily promote or demote selected list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

#### Promote (**Shift + Tab**)

Promotes an entirely selected list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

#### Demote (**Tab**)

Demotes an entirely selected list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

### Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Join Elements

Joins two adjacent *block elements* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

**Tip:** Specifically, the **Delete** or **Backspace** keys can be used to join *block elements* in the following situations:

- The cursor is located before the end position of the first element and (**Delete**) key is pressed.

- The cursor is located after the end position of the first element and **(Backspace)** key is pressed.
- The cursor is located before the start position of the second element and **(Delete)** key is pressed.
- The cursor is located after the start position of the second element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

### **Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

## **Rename Elements**

You can rename elements by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

## **Surround Content with Tags (Wrap)**

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option** is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option** is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

### **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

## **Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Tip:** Specifically, the **Delete** or **Backspace** keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and **(Delete)** key is pressed.
- The cursor is located after the start position of the element and **(Backspace)** key is pressed.
- The cursor is located before the end position of the element and **(Delete)** key is pressed.
- The cursor is located after the end position of the element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

## **Remove Markup from Blocks of Content**

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Tip:** You can use the **(Delete)** or **(Backspace)** keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

### **Remove Text from Selected Markup**

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Remove Text**

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

### **Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

#### **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

##### **Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

##### **Convert attribute to element**

Allows you to change an attribute into an element.

##### **Delete attribute**

Allows you to remove one or more attributes.

##### **Rename attribute**

Allows you to rename an attribute.

##### **Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

#### **Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

##### **Delete comments**

Allows you to delete comments found inside one or more elements.

#### **DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

##### **Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

##### **Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

##### **Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

##### **Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

### **Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

### **Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

### **Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

### **Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

### **Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

## **Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

### **Delete element**

Allows you to delete elements.

### **Delete element content**

Allows you to delete the content of elements.

### **Insert element**

Allows you to insert new elements.

### **Rename element**

Allows you to rename elements.

### **Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

### **Wrap element**

Allows you to surround elements with element tags.

### **Wrap element content**

Allows you to surround the content of elements with element tags.

## **Fragments submenu**

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

### **Insert XML fragment**

Allows you to insert an XML fragment.

### **Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

### **Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

## **JATSKit submenu**

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

### **Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

## Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

## Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

[Frequently Used Shortcut Keys](#) on page 18

## Editing Attributes in Author Mode

You can easily edit attributes in **Author** mode by using the [Attributes View](#) and Oxygen XML Author also allows you to edit attribute and element values in-place, directly in the **Author** mode, using an in-place attribute editor.

### In-place Attributes Editor

Oxygen XML Author includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following [display modes](#):  **Full Tags with Attributes**,  **Full Tags**,  **Block Tags**, or  **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

Figure 250: In-place Attributes Editor

### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 251: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

**Related Information:**

[Attributes View in Author Mode](#) on page 257

**Folding XML Elements in Author Mode**

When working with a large document, the *folding* support in Oxygen XML Author can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

**Figure 252: Folding of XML Elements in Author Mode**

The fact that the folds are persistent is a unique feature of Oxygen XML Author, meaning the next time you open the document the folds are restored to its last state.

**Folding Actions in Author Mode**

*Foldable elements* are marked with a small triangle ( ▾ / ▸ ) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the *foldable* area. To toggle the fold, simply click the icon. Also, the following actions are available in the **Folding** sub-menu of the contextual menu or from the **Document > Folding** menu:

- ▾ / ▸ **Toggle Fold (or you can simply click on the ▾ / ▸ arrow)**  
Toggles the state of the current fold.

### **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**

Folds all the elements except the current element.

### **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**

Folds the child elements that are indented one level inside the current element.

### **Expand Child Folds**

Unfolds all child elements of the currently selected element.

### **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**

Unfolds all elements in the current document.

For more information about the *folding* support in Oxygen XML Author, watch our video demonstration:

## **Drag and Drop in Author Mode**

The Oxygen XML Author **Author** mode includes support for dragging and dropping content in XML documents.

When editing content in **Author** mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the **Author** mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the **Author** mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the **Author** mode editor is inserted without changes.

### **Related Information:**

[Smart Paste Mechanism](#) on page 503

## **Smart Paste Mechanism**

The **Author** editing mode includes a *Smart Paste* feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Author, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Author preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in **Author** mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

**Tip:** When pasting text fragments formatted with the *Courier New* font, the *Smart Paste* mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a codeph element).

## **Smart Paste Options**

By default, the *Smart Paste* feature is enabled in Oxygen XML Author. There are several options in the [Schema Aware preferences page](#) that control the *Smart Paste* mechanism:

- **Smart paste and drag and drop** - This option determines whether or not Oxygen XML Author will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.
- **Reject action when its result is invalid** - If you select this option, Oxygen XML Author will not let you paste content into a position where it would be invalid. This option is deselected by default.
- **Convert external content on paste** - This option determines whether or not Oxygen XML Author will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.

- **Convert even when pasting inside space-preserve elements** - If you select this option, the *Smart Paste* feature will also work when pasting external content into a *space-preserve* element (such as a `codeblock`). This option is deselected by default.

### Smart Paste Supported Document Types

The *Smart Paste* feature is supported for the following document types (*frameworks*):

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
- JATS

For more information about the *Smart Paste* support, watch our video demonstration:

### Related Information:

[Customizing Smart Paste Support](#) on page 1149

### Selecting Content in Author Mode

Oxygen XML Author includes a variety of keyboard shortcuts that allow you to easily select content in **Author** mode.

### Selection Shortcuts in Author Mode

#### **Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

#### **Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

#### **Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

#### **Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

#### **Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

#### **Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

#### **Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

#### **Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

#### **Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

#### **Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

#### **Double-Click**

Selects the word at the cursor position.

### Triple-Click

Selects the node at the cursor position.

### Right-Click > Select > Element

Selects the entire element at the current cursor position.

### Right-Click > Select > Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

### Right-Click > Select > Parent

Selects the entire parent element at the current cursor position.

## Content Completion Assistant in Author Mode

One of the most useful features in **Author** mode is the *Content Completion Assistant*. It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

Figure 253: Content Completion Assistant in Author Mode

The *Content Completion Assistant* is enabled by default. To disable it, *open the Preferences dialog box (Options > Preferences)*, go to **Editor > Content Completion**, and deselect the *Enable content completion option*.

## Using the Content Completion Assistant in Author Mode

To activate the feature in **Author** mode, use any of the following shortcut keys:

- **Enter**
- **Ctrl + Space (Command + Space on OS X)**
- **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Author** mode, simply press **Enter**.

## Types of Proposals Listed in the Content Completion Assistant

The *Content Completion Assistant* offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert *code templates*.
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in **Full Tags mode**), it will allow you to rename the element.

- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.
- If the [Show all possible elements in the content completion list option from the Schema-Aware preferences page](#) is selected, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

**Note:** By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the [Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page](#).

### Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the *Content Completion Assistant* in certain contexts:

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the *Content Completion Assistant* is a **New <Element>** item. Selecting this item will insert an empty element.

**Figure 254: Example (New [Element Name])**

- If the cursor is positioned somewhere inside the element, the first entry in the *Content Completion Assistant* is a **Split <Element>** item. In most cases, you can only split the closest *block element* to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting **Split <Element>** splits the content of the specified element around the cursor position.

**Figure 255: Example (Split [Element Name])**

- If the cursor is positioned inside a *space-preserved element* (for example, a *codeblock*), the first choice in the *Content Completion Assistant* is **Enter**, which will insert a new line in the content of the element, followed by **New <Element>**.

**Figure 256: Example ('ENTER' New Line)**

- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in [Full Tags mode](#)), it will allow you to rename the element.

**Figure 257: Example (Rename)**

- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

**Figure 258: Example (Surround)**

**Related Information:**

[Customizing the Content Completion Assistant](#) on page 1178

**Set the Schema to be Used for Content Completion**

The proposals that are presented in the [Content Completion Assistant](#) depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the [Content Completion Assistant](#) is specified in the following methods, in the order of their precedence:

- The [schema specified explicitly in the document](#). In this case, Oxygen XML Author reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The [default schema declared](#) in the [Schema tab of the Document Type configuration dialog box](#) for the particular document type.

**Schema Annotations in Author Mode**

A *schema annotation* is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the [Content Completion Assistant](#).

**Figure 259: Schema Annotation in the Content Completion Assistant**

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the [Show annotations in Content Completion Assistant](#) option in the **Annotations** preferences page.

## Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the [Show annotations using HTML format, if possible](#) option in the **Annotations** preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`p`, `br`, `ul`, `li`), they are rendered as an HTML document loaded in a web browser. For example, `p` begins a new paragraph, `br` breaks the current line, `ul` encloses a list of items, and `li` encloses an item of the list.

## Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Author looks for an annotation in the type definition of that element or attribute.

## Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person. </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
    <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the [Use all Relax NG annotations as documentation](#) option in the **Annotations** preferences page.

## Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
## Information about a person.
element person { name, email* }
```

## Collecting Annotation from DTDs

For DTD, Oxygen XML Author defines a custom mechanism for annotations using comments enabled by the [Prefer DTD comments that start with "doc:" as annotations](#) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

### Related Information:

[Customizing the Rendering of Elements](#) on page 1185

[Annotations for XML Elements and Attributes in Content Completion Assistant](#) on page 1188

**Figure 261: Element Structure Panel**

### Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

**Figure 262: Annotation panel**

### Attributes View in Author Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the *-oxy-editable* property associated with the element.
- The element is entirely included in a deleted *Track Changes* marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as *list* in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 263: Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

### Expand/Collapse Button

There is an **Expand/Collapse** (  ) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the  **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the  **Update** button (or press **Enter**) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

#### Set empty value

Specifies the current attribute value as empty.

#### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

#### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.

- Empty, if the attribute does not appear in the edited document and has no default value set.

## Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

## In-place Attributes Editor

Oxygen XML Author includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*:  **Full Tags with Attributes**,  **Full Tags**,  **Block Tags**, or  **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

**Figure 264: In-place Attributes Editor**

### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 265: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

#### *Elements View in Author Mode*

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position option** is not selected in the **Views preferences page**, two additional tabs (**Before** and **After**) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing **F2** with an element selected will display information about that particular element.

**Figure 266: Elements View in Author Mode**

## Entities View

*Entities* provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (&lt ;, &gt ;, &amp ;, &apos ;, &quot ;).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbs	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 267: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

## Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position . Oxygen XML Author includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also [define your own code templates for any type of file and share them with others](#).

To get a complete list of available code templates, press **Ctrl + Shift + Space** in **Text** mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a  symbol in the content completion list.

When the *Content Completion Assistant* is invoked (**Ctrl + Space (Command + Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

For more information about code templates, watch our video demonstration:

### Outline View in Author Mode

The **Outline** view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

### Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

### Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

### Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the (**Ctrl (Command on OS X)**) key after dragging, a copy operation will be performed instead of a move.

**Tip:** You can select and drag multiple nodes in the **Outline** view when editing in **Author** mode.

Figure 268: Outline View

### Outline View Filters in Author Mode

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

The following actions are available in the  **Settings** menu of the **Outline** view when editing in **Author** mode:

#### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

#### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

#### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

#### Show element name

Show/hide element name.

#### Show text

Show/hide additional text content for the displayed elements.

#### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

#### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

### Outline View Contextual Menu Actions in Author Mode

The contextual menu of the **Outline** view in **Author** mode contains the following actions:

#### Edit Attributes

Displays an [in-place attributes editor](#) that allows you to edit the attributes of a selected node.

## Edit Profiling Attributes

Allows you to change the *profiling attributes* defined on all selected elements.

## Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

## Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

## Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

## Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

## Paste before

Inserts a well-formed copied element before the currently selected element.

## Paste after

Inserts a well-formed copied element after the currently selected element.

## Paste as XML

Pastes copied content that is considered to be valid XML, preserving its XML structure.

## Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

## Rename Element

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

## Expand More

Expands the structure tree of the currently selected element.

## Collapse All

Collapses all of the structure tree of the currently selected node.

**Tip:** You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

## Related Information:

[Attributes View in Author Mode](#) on page 257

## Finding and Replacing Text

You can search for a specific word or string of characters using the following features:

- [Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)
- [Quick Find toolbar](#)
- [Find all Elements dialog box](#)

Complex search operations may take some time to complete. If a search operation takes more than 5 seconds, you are prompted to decide whether you want to continue the operation or stop it.

## Reviewing Documents

Oxygen XML Author includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

### Tracking Document Changes

The [Track Changes feature](#) is a way to keep track of the changes you make in a document. The *Track Changes* feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the [Track Changes feature is activated](#), insertions are rendered in **Author** mode with an underline while deletions are rendered with a strike through.

The *tracked changes* are also displayed in the [Review view](#) and you can also choose to present the changes in *callouts* by selecting the [Track Changes Deletions](#) and [Track Changes Insertions](#) options in the [Callouts preferences page](#).

### Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of *read-only* text. The difference between using comments and *change tracking* is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in *callouts* with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the [Review preferences page](#).

### Highlighting Content

Oxygen XML Author includes a highlighting feature that allows you to create digital markers to emphasise important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

### Using the Review View

Oxygen XML Author includes a [Review view](#) that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The **Review** view is also useful for managing *tracked changes* and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

### Printing Review Information

When you print a document from **Author** mode, whatever review information is shown in the main editing area will be included in the printed output. For example, *tracked changes* will be included and as long as the [Comments option](#) is selected in the [Callouts preferences page](#), comment callouts will also be included (same with *tracked change* callouts if their corresponding options are selected in the [Callouts preferences page](#)).

### Managing Tracked Changes

Oxygen XML Author includes a [Track Changes feature](#) that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the [Review view](#).

The *Track Changes* feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the [Review view](#) and [Attributes view](#).

## Types of Tracked Changes

The types of *tracked changes* include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a **Split** operation
- Performing a **Surround with** operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)

**Important:** If you copy content in **Author** mode that contains *tracked changes*, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

## Activating the Change Tracking Feature

To activate the *Track Changes* feature for the current document, use any of the following methods:

- Click the  **Track Changes** button on the toolbar.
- Select  **Track Changes** from the **Review** submenu of the contextual menu in the main editing area in **Author** mode.
- Select  **Track Changes** from the **Edit > Review** menu.

To activate the *Track Changes* feature globally for all documents that you open in Oxygen XML Author, change the *Initial State* option to **Always On** in the [Review preferences page](#).

## Rendering Tracked Changes in Author Mode

When *Track Changes* is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the [Review preferences page](#), along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

Docbook 4 supports >XHTML< tables:

*Sample XHTML Table with fixed width and proportional column widths*

```
col[span:1, width:2.08*]  
col[span:1, width:0.46*]
```

Person Name	Age

This is a list of useful >XML< links:

Figure 269: Change Tracking in Author Mode

When hovering over a change a tooltip displays information about the author and modification time.

### Change Tracking Contextual Menu Actions

You can right-click any change in **Author** mode to access the following contextual menu actions:

#### ✓ Accept Change(s)

Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

#### ✗ Reject Change(s)

Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

#### Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or *tracking changes* (similar actions are also available in the **Edit > Review** menu and the **Review** submenu of the contextual menu):

#### Track Changes

Enables or disables the *Track Changes* support for the current document.

#### ✓ ▾ Accept Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- ✓ **Accept Change(s) and Move to Next** - Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.
- ✓ **Accept Change(s)** - Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection.
- ✓ **Accept All Changes** - Accepts all *Tracked Changes* in the current document.

**Tip:** You can *assign shortcut keys* for these actions to make it easier to access them.

#### ✗ ▾ Reject Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- ✗ **Reject Change(s) and Move to Next** - Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.
- ✗ **Reject Change(s)** - Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection.
- ✗ **Reject All Changes** - Rejects all *Tracked Changes* in the current document.

**Tip:** You can *assign shortcut keys* for these actions to make it easier to access them.

## **Comment Change**

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](#). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

## **Track Changes Visualization Modes Drop-Down Menu**

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

-  **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the **Author** mode.
-  **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.
-  **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
-  **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to **View All Changes/Comments**.

**Note:** If you use  **View Final** mode and  **View Original** mode, [callouts](#) are not displayed for comments or changes. To display callouts, use the  **View All Changes/Comments** mode.

## **Highlight**

Enables or disables the [Highlight tool](#). Use the  **Highlight** drop-down menu to select a new color.

## **Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

## **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

## **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

## **Manage Reviews**

Opens the [Review view](#).

## **Tracked Change Callouts**

You can also choose to display insertion and deletion changes in [callouts](#) in **Author** mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the [Track Changes Deletions](#) and [Track Changes Insertions](#) options in the [Callouts preferences page](#). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see [Author Callouts](#) on page 528.

## **Tracked Changes in the Review View**

The [Review view](#) is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see [Review View](#) on page 532.

### Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validations or transformations. For each change, the author name and the modification time are preserved.

**Example - Insertion Change:** The following processing instruction is an example of how an *insertion* change is stored in a document:

```
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

**Example - Deletion Change:** The following processing instruction is an example of how a *deletion* change is stored in a document:

```
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

For more information about the *Track Changes* support, watch our video demonstration:

[Review View](#) on page 532

### Tracked Changes Behavior

The behavior of the [Track Changes feature](#) depends on the context, the type of change, and whether or not it is activated.

### Inserting Content

If the *Track Changes* feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the *Track Changes* feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
  - If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If we insert in regular content, the current inserted content appears marked as an **Insert** change.

### Surrounding Content

If the *Track Changes* feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a **Delete** change results in nothing happening.
- Making a surround in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  - If the original **Insert** change was made by the same user, the existing change is just expanded to contain the surrounded content.

- Making a surround in regular content results in the operation being marked as a surround change.

### Deleting Characters

If the *Track Changes* feature is disabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in nothing happening.
- Deleting content in an existing **Insert** change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
- Deleting in regular content results in a regular deletion.

If the *Track Changes* feature is enabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in the following:
  - If the same author created the **Delete** change, the previous change is marked as deleted by the current author.
  - If another author created the **Delete** change, nothing happens.
- Deleting content in an existing **Insert** change results in the following:
  - If the same author created the **Insert** change, the content is deleted and the **Insert** change shrinks accordingly.
  - If another author created the **Insert** change, the **Insert** change is split in two and the deleted content appears marked as a **Delete** change by the current author.
- Deleting in regular content results in the content being marked as a **Delete** change by the current author.

### Deleting Selections of Content

If the *Track Changes* feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change disappears and the content is deleted.
- If the selection intersects with a **Delete** change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire **Insert** change, the change disappears and the content is deleted.
- If the selection intersects with an **Insert** change (starts or ends in one), the **Insert** change is shrunk and the content is deleted.

If the *Track Changes* feature is enabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
- If the selection contains an entire **Insert** change, the following is possible:
  - If the **Insert** is made by the same author, the change disappears and the content is deleted.
  - If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

### Deleting Tags

Assuming you are using any of the *Tag Display Modes* other than  **No Tags** and the *Track Changes* feature is disabled, the following behavior is possible:

- If you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the *Tag Display Modes* other than  **No Tags** and the *Track Changes* feature is enabled, the following behavior is possible:

- If you delete a start tag of an *inline element*, both the start and end tag are marked as a **Delete** change by the current author, while any content that was inside the element is preserved.

### Copying Content

If the *Track Changes* feature is disabled and you copy content, the following behavior is possible:

- If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are also copied to the clipboard.

If the *Track Changes* feature is enabled and you copy content, the following behavior is possible:

- If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

### Pasting Content

If the *Track Changes* feature is disabled and you paste content, the following behavior is possible:

- If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), they will be preserved on paste.

If the *Track Changes* feature is enabled and you paste content, the following behavior is possible:

- If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

### Tracked Changes Limitations

There are some inherent limitations to the *Change Tracking* feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.
- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.
- **Limitations to using certain actions** - Some actions cannot be implemented with the *Track Changes feature* enabled. For example, some of the table-related actions ( **Delete Row(s)**,  **Delete Column(s)**,  **Join Cells**,  **Split Cell**) ignore the *Track Changes* feature when executing the action.

### Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the *Track Changes feature*:

Edit Type	Processing Instruction Start Marker	Processing Instruction End Marker	Attributes
Insertion	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp
Split	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp, type="split"
Surround	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp, type="surround"
Deletion	<?oxy_delete?>	_	author, timestamp, content
Comment	<?oxy_comment_start?>	<?oxy_comment_end?>	author, timestamp, comment, mid
Attribute Change	<?oxy_attributes?>	_	id, type, oldValue, author, timestamp

If a comment intersects another, the `mid` attribute is used to correctly identify start and end processing instruction markers.

## Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of *read-only* content. The difference between using comments and *tracked changes* is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the **Author** mode as *callouts* (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the *Comments option* in the *Callouts preferences page*. Comments are also displayed in the *Review view*.

Figure 270: Comments in Author Mode

## Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in **Author** mode.

### Add Comment

To insert a comment at the cursor position or on a specific selection of content, select the  **Add Comment** action from the toolbar (or in the **Review** submenu of the contextual menu).

### Show/Edit Comments

To edit an existing comment that you have added in the main editing area in **Author** mode, select the  **Show/Edit Comments** action from the toolbar (or in the **Review** submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

### Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select  **Remove Comment(s)** from the toolbar (or in the **Review** submenu of the contextual menu).

**Tip:** When adding or editing a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

## Managing Comments in Callouts

As long as the *Comments option* is selected in the *Callouts preferences page*, comments are also displayed in *callouts*. By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

### Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and *Review view*.

### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to

the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

#### **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

#### **Callouts Options**

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

**Tip:** When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

### **Managing Comments in the Review View**

The [Review view](#) is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the **Review** view, the contextual menu includes the following actions.

#### **Reply**

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#).

#### **Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

#### **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

#### **Show only reviews by '<author name>'**

Filters the comments to only show comments for the particular author.

#### **Remove all Comments**

Removes all comments from the document.

### **Comments XML Source Code**

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300"
comment="Do not change this content?">
  Important content
```

```
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `parentID` attribute and its value is the same as the `id` value of the parent comment.

```
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200"  
comment="We should not forget about recycling the oil and oil filter!"  
parentID="vws_x41_1v" mid="4"?>
```

[Review View](#) on page 532

## Managing Highlights

Use the  **Highlight** tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that needs additional editing or to draw the attention of others to particular content.

### Using the Highlight Tool

You can find the  **Highlight** action on the main toolbar, in the **Edit > Review** menu, or in the **Review** submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to **Stop highlighting** from the same menus.

To highlight content, follow these steps:

1. Click the  **Highlight** icon on the toolbar.  
**Step Result:** The highlighting mode is on and the cursor changes to a dedicated symbol.
2. Click the small arrow next to the  **Highlight** icon and select the color that you want to use for the highlighting.
3. Select the content you want to highlight. To mark multiple parts of a document, press and hold **Ctrl (Meta on Mac OS)** and select the parts you want to highlight.
4. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press **Ctrl + A (Command + A on OS X)** if you want to select all of the text.
2. Click the small arrow next to the  **Highlight** icon and select **No color (erase)**, or right-click the highlighted content and select **Remove highlight(s)**.
3. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

**Note:** Oxygen XML Author preserves the highlighting of a document between working sessions.

### Review View

The **Review view** is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with *tracked changes* and comments. The following actions are available in the contextual menu of each highlight in the **Review** view:

#### Change Color

Allows you to change the color of an existing highlight by selecting the new color from this menu.

#### Remove Highlight

Removes the selected highlight.

#### Remove Highlights with the Same Color

Removes the selected highlight and all others that have the same color.

## Remove All Highlights

Removes all highlights from the document.

## Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>  
The highlights are stored<?oxy_custom_end?>
```

For more information about using the **Highlight** tool, watch our video demonstration:

### Related Information:

[Review View](#) on page 532

## Author Callouts

Oxygen XML Author uses *callouts* to present comments and *tracked change* modifications that you or other members of your team have added to the document.

## Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in **Author** mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the [Review preferences page](#). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the **Fixed** option for the particular type of change and choose a color from the color box. If the **Automatic** option is selected, Oxygen XML Author automatically assigns a color based upon the [Colors for automatic assignment list](#).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the [Show all connecting lines option](#) in the **Callouts** preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

**Winter Flowers**

Winter is the season of cold weather. The season occurs during December - February in Northern hemisphere. **Deleted [Mary]:** Delete any extra spacing before and after punctuation marks.

**Deleted [Mary]:** Also use a single space between words.

occurs during June - August.

Some of the flowers blooming **Commented [John]:** We should include one more topic with information about Narcissus.

Acashia, Alstromeria, Amaryllis, Carnation, Chrysanthemums, Cyclamen, Evergreens, Gerbera, Daisy, Ginger, Helleborus, Holly berry, Lily, Asiatic Lily, Casa Blanca Lily, Narcissus, Orchid, Pansy, Pepperberry, Phlox, Protea, Queen Ann's Lace, **Commented [Bob]:** It's a good idea to add more plants (consider including also Roses).

Roses, Star of Bethlehem, Statice.

Figure 271: Multiple Author Callouts

**Note:** Oxygen XML Author displays callouts only if **View All Changes/Comments** or **View Only Changes/Comments** is selected in the **Track Changes Visualization Modes** drop-down menu. Oxygen XML Author does not display callouts in **View Final** and **View Original** modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or *space-preserved elements* that contain long fragments (such as a DITA *codeblock* element or *programlisting* in DocBook). To help you view the text under the covered area, Oxygen XML Author applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

**Figure 272: Transparent Callout**

### Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the *Initial Width option* in the **Callouts** preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the *Text Lines Count Limit option*. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

### Type of Callouts in Oxygen XML Author

Oxygen XML Author uses callouts to display comments and *Tracked Changes* that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the *Callouts preferences page*. You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the *Comments option* is selected in the *Callouts preferences page*, comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the *Show review time option* to include timestamp information in the comment callouts.

**Figure 273: Comment Callouts**

There are several types of comments that can be added in **Author** mode:

- *Author Review Comments* - Comments that you associate with specific content. To insert this type of comment, select the content and use the **Add Comment** action that is available on the toolbar (or in the **Review** submenu of the contextual menu).
- *Comments Added to Tracked Changes* - Comments that you add to an already existing *tracked change* insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select **Comment Change**.
- *Replies to Comments* - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in the its callout and select **Reply**. A single callout is presented for a

root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

Figure 274: Callout for a Comment with Replies

**Tip:** When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the *Track Changes Deletions option* is selected in the *Callouts preferences page*, deletions that are made while the *Track Changes* feature is enabled are displayed in callouts. A deletion callout contains the type of callout (**Deleted**) and the name of the author that made the deletion. You can also select the *Show deleted content in callout option* to display the actual deleted content in the callout. Additionally, you can select the *Show review time option* to include timestamp information in the deletion callouts.

Figure 275: Deletion Callouts

- **Tracked Change Insertion Callouts** - As long as the *Track Changes Insertions option* is selected in the *Callouts preferences page*, insertions that are done while the *Track Changes* feature is enabled are displayed in callouts. An insertion callout contains the type of callout (**Inserted**) and the name of the author that inserted the content. You can also select the *Show inserted content in callout option* to display the actual deleted content in the callout. Additionally, you can select the *Show review time option* to include timestamp information in the deletion callouts.

Figure 276: Insertion Callouts

### Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

#### Insertion or Deletion Callout Actions

The following actions are available in the contextual menu of an insertion or deletion callout:

##### Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and *Review view*.

## Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

## ✓ Accept Change

Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

## ✗ Reject Change

Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

## Comment Change

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](#). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

## Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

## Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

## Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

### Reply

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#).

### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

## Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

## Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

## Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

## Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

## Printing Callouts

When you print a document from **Author** mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to **File > Print Preview**.

## Review View

The **Review view** is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see [Review View](#) on page 532.

To watch our video demonstration about the Callouts support, see our video demonstration:

### Related Information:

[Managing Tracked Changes](#) on page 518

[Managing Comments](#) on page 525

[Review View](#) on page 532

## Review View

The **Review** view is an independent panel, available both for built-in and custom XML document *frameworks*. It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and *tracked changes* using a single view.

The **Review** view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the **Review** view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Figure 277: Review View

### Activating the Review View

To activate the **Review** view, do one of the following:

- Click the  **Manage reviews** button on the toolbar.
- Right-click anywhere in a document and select **Review > Manage reviews**.

- Open it from the **Window > Show View** menu.

### Review View Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. Use the small arrow symbol from the right side of the search field to display the search history.

The  **Settings** menu includes the following options:

- **Show highlights** - Controls whether or not the **Review** view displays the highlighting in your document.
- **Show comments** - Controls whether or not the **Review** view displays the comments in the document you are editing.
- **Show track changes** - Controls whether or not the **Review** view displays the inserted and deleted content in your document.
- **Show review time** - Displays the time when the edits from the **Review** view were made.
-  **Configure review options** - Opens the [Review preferences page](#) where you can configure various options for review information.

### Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the **Review** view:

#### Remove

Available for highlights and comments presented in the **Review** view and it removes the particular highlight or comment from your document and moves to the next change.

#### Accept

Available for inserted and deleted content presented in the **Review** view and it accepts the particular change in your document and moves to the next change.

#### Reject

Available for inserted and deleted content presented in the **Review** view and it rejects the particular change in your document and moves to the next change.

### Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the **Review** view:

#### Reply

Opens the **Reply** dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

#### Mark as Done

This toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

#### Show Comment

Available for comments added by other users and you can use this option to view it in a **Show comment** dialog box.

#### Edit Comment

Available for comments you have added and you can use this action to edit a comment.

#### Remove Comment

Use this action to remove the selected comment.

#### Show only Reviews by '<author name>'

Use this action to filter the edits to only show them for a certain author.

## Remove All Comments

Use this action to remove all the comments that appear in the edited document.

## Change Color

Available for highlights and it opens a palette that allows you to choose a new color for the highlighted content.

## Remove Highlight

Use this action to remove the selected highlight.

## Remove Highlights with the Same Color

Use this action to remove all the highlights with the same color from the entire document.

## Remove All Highlights

Use this action to remove all the highlights in your document.

## ✓ Accept Change

Accepts the selected change and moves to the next change.

## ✗ Reject change

Rejects the selected change and moves to the next change.

## Comment change

Available for insertions or deletions and you can use this option to add a comment for the particular change.

## ✓✓ Accept all changes

Accepts all the changes in the current document.

## ✗✗ Reject all changes

Rejects all the changes in the current document.

For more information about the **Review** view, watch our video demonstration:

[Managing Highlights](#) on page 527

[Author Callouts](#) on page 528

## Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appear in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for *expert* users and another section for *novice* users, while unmarked sections are included in all renditions.

### Profiling Attributes and Condition Sets

Oxygen XML Author allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in **Author** mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

**Figure 278: Example: Profiling Content**

Oxygen XML Author includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the [Profiling/Conditional Text preferences page](#). You can also define your own profiling attributes and condition sets for each document type (*framework*) and your profiling configuration can be shared amongst content authors through the project file.

For information about creating and editing profiling attributes, see [Creating and Editing Profiling Attributes](#) on page 535 (for information about sharing them, see [Sharing Profiling Attribute Configurations](#) on page 538).

For information about creating and editing condition sets, see [Creating and Editing Profiling Condition Sets](#) on page 540 (for information about sharing them, see [Sharing Condition Set Configurations](#) on page 541).

#### **Related Information:**

[Customizing Elements that Wrap Profiled Content](#) on page 1153

#### **Creating and Editing Profiling Attributes**

Oxygen XML Author includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (*framework*). You can then apply the profiling attributes to content in **Author** mode to see how the profiling will affect the output.

#### **Create Profiling Attributes**

To create custom profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
3. In the [Profiling Attributes section](#), press the **New** button.

**Step Result:** The **Profiling Attribute** configuration dialog box is opened.

**Figure 279: Profiling Attribute Dialog Box**

- Configure your profiling attributes as desired. The following options are available in this dialog box:

#### **Document type**

Select the document type (*framework*) for which you have defined profiling attributes.

**Tip:** You can use the \* or ? wildcards in this combo box. For example, DITA\* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

#### **Attribute name**

The name of the new profiling attribute.

#### **Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

#### **Attribute Values Table**

This table displays the values for the profiling attribute and allows you to configure them by using the following buttons at the bottom of the table:

#### **New**

Opens a dialog box that allows you to insert a new value. The fields that can be configured in this dialog box correspond to the columns in the table and are as follows:

- **Value** - The attribute value.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in **Author** mode (*Edit Profiling Attributes dialog box*, *Condition Set dialog box*, *Profiling tab in the Edit Properties dialog box*, *DITA Maps Manager*). If the **Label** is not specified, the **Value** will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

### Edit

Use this button or double-click an attribute value to modify it.

### Delete

Removes the selected attributed value.

### Single value

Select this option if you want the attribute to only accept a single value.

### Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between *space*, *comma*, and *semicolon*, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

5. Click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
6. Click **Apply** to save the profiling attribute.

## Editing Existing Profiling Attributes

To modify an existing profiling attribute or its values, follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
2. In the **Profiling Attributes section**, press the **Edit** button to modify an existing profiling attribute (you can also use **Delete** button to remove a profiling attribute or the **Up** and **Down** buttons to change their priority).

**Step Result:** If you use the **Edit** button, the **Profiling Attributes** configuration dialog box is opened:

3. Modify your profiling attribute as desired.
4. To add or modify attribute values, use the **New**, **Edit**, or **Delete** buttons under the attribute values table.
5. Click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
6. Click **Apply** to save your modifications.

## Adding or Editing Profiling Attribute Values

There are several ways to add values to existing profiling attributes.

- Use the procedure in the **Editing Existing Profiling Attributes** section to edit an existing attribute and use the **Profiling Attribute** configuration dialog box to add, edit, or delete values for existing profiling attributes.
- You can add values directly to the existing profiling attributes in a document using the **In-Place Attributes Editor** in **Author** mode, the **Attributes view**, or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the **Profiling / Conditional Text preferences page** where you can edit the profiling configuration.

**Note:** If the **Allow contributing extra profiling attribute values** option is not selected in the **Profiling / Conditional Text** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this second method will not be possible.

**Figure 280: Profiling Values Conflict Dialog Box**

### Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see [Sharing a Project - Team Collaboration](#) on page 416.

#### Related Information:

[Applying Profiling Attributes](#) on page 538

[Creating and Editing Profiling Condition Sets](#) on page 540

[Applying Profiling Condition Sets](#) on page 541

[Showing and Filtering Profiled Content in Author Mode](#) on page 543

### Applying Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements in the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To apply a profiling attribute to content in **Author** mode, follow these steps:

1. To apply a profiling attribute to content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile an entire element, position the cursor inside the element, right-click, and select **Edit Profiling Attributes** (you can also right-click the element in the [breadcrumb](#) or [Outline](#) view).

**Step Result:** The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (*framework*). If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/**Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If you have [defined profiling attribute values](#) for the DITA document type in the [Profiling/Conditional Text preferences page](#) and you store them at *project-level*, those values are displayed in the dialog box.
- If you have [defined profiling attribute values](#) for the DITA document type in the [Profiling/Conditional Text preferences page](#) and you store them at *global-level*, those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

**Figure 281: Edit Profiling Attributes Dialog Box**

2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the *document fragment*.
3. Click **OK** to finish the profiling configuration.

**Result:** The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the *Show Profiling Attributes option* (available in the **Profiling / Conditional Text** toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 282: Profiling Attribute Value Form Control Pop Up**

**Related Information:**

- [Creating and Editing Profiling Attributes](#) on page 535
- [Creating and Editing Profiling Condition Sets](#) on page 540
- [Applying Profiling Condition Sets](#) on page 541
- [Showing and Filtering Profiled Content in Author Mode](#) on page 543

## Creating and Editing Profiling Condition Sets

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A *Profiling Condition Set* is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

### Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
2. In the **Profiling Condition Sets section**, press the **New** button.

**Step Result:** The **Condition Set** configuration dialog box is opened.

**Figure 283: Condition Set Dialog Box**

3. Configure your condition set as desired. The following options are available in this dialog box:

#### Name

The name of the new condition set.

#### Document type

Select the document type (*framework*) for which you have defined profiling attributes.

#### Use DITAVAL file

For DITA projects, select this option if you want the *Profiling Condition Set* to reference a *DITAVAL file*. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

#### Include the content matching the following conditions

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

### Shortcut key

You can click the **Choose** button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save the condition set. All saved profiling condition sets are available in the  **Profiling / Conditional Text toolbar drop-down menu**.

### Editing Existing Profiling Condition Sets

To modify an existing profiling condition set, follow these steps:

1. *Open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.*
2. In the **Profiling Condition Sets section**, press the **Edit** button to modify an existing condition set (you can also use **Delete** button to remove a condition set or the **Up** and **Down** buttons to change their priority).

**Step Result:** If you use the **Edit** button, the **Condition Set** configuration dialog box is opened:

3. Modify your condition set as desired.
4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save your modifications.

### Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see [Sharing a Project - Team Collaboration](#) on page 416.

#### Related Information:

[Applying Profiling Condition Sets](#) on page 541

[Creating and Editing Profiling Attributes](#) on page 535

[Applying Profiling Attributes](#) on page 538

[Showing and Filtering Profiled Content in Author Mode](#) on page 543

### Applying Profiling Condition Sets

All defined **Profiling Condition Sets** are available as shortcuts in the  **Profiling / Conditional Text toolbar menu**. Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode, **Outline view**, and **DITA Maps Manager view** (for DITA documents). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the value covered by the condition set.

#### EXAMPLE:

Suppose that you have the following document:

Spray painting	
Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.	
Context:	
The garage is a good place to spray paint.	
<b>Step 1</b>	Move the car out of the garage to avoid getting paint on it. Audience [novice]
<b>Step 2</b>	Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]
<b>Step 3</b>	Place the object to be painted on the covered area. Audience [expert] Other [prop2]
<b>Step 4</b>	Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]
<b>Step 5</b>	Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

If you apply the following condition set, it means that you want to filter out the content to only include content written for an expert audience and content that has the *Other* attribute value of *prop1*.

This is how the document looks after you apply the condition set:

<span>▽</span> <b>Spray painting</b>	
<b>Short Description:</b> When paint is applied using a spray nozzle, it is referred to as spray painting.	
<b>Context:</b>	
<span>▽</span> The garage is a good place to spray paint.	
<b>Step 1</b>	
Move the car out of the garage to avoid getting paint on it.	Audience [novice]
<b>Step 2</b>	
Place newspaper, cardboard, or a drop-cloth on the garage floor.	Audience [expert]
<b>Step 3</b>	
Place the object to be painted on the covered area.	Audience [expert] Other [prop2]
<b>Step 4</b>	
Follow the directions on the paint can to paint the object.	Audience [expert] Other [prop1]
<b>Step 5</b>	
Let the paint dry thoroughly before you move the object.	Audience [novice] Other [prop1]

### Related Information:

[Creating and Editing Profiling Attributes](#) on page 535

[Applying Profiling Attributes](#) on page 538

[Showing and Filtering Profiled Content in Author Mode](#) on page 543

### Showing and Filtering Profiled Content in Author Mode

You can visualize the effects of profiled content in **Author** mode by using the options in the Y≡ ▾ **Profiling/Conditional Text** drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

#### Show Profiling Colors and Styles

Select this option to show colors and styles for profiled content in **Author** mode. You can configure the colors and styles or specify whether or not this option is selected by default in the [Profiling/Conditional Text > Colors and Styles preferences page](#).

#### Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in **Author** mode. You can specify whether or not this option is selected by default in the [Profiling/Conditional Text > Attributes Rendering preferences page](#).

#### Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in **Author** mode and the **Outline** view. When this option is selected and a [condition set is selected in this drop-down menu](#), the filtered content is grayed-out. If this option is not selected and a [condition set is selected in this drop-down menu](#), the filtered content is hidden. You can specify whether or not this option is selected by default in the [Profiling/Conditional Text preferences page](#).

#### Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

#### List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in **Author** mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the **More** submenu or by using the [Choose Condition Set option](#) to access a dialog box that presents all of them.

## ⚙️ Profiling Settings

Opens the [Profiling/Conditional Text preferences page](#) where you can add and edit profiling attributes and condition sets.

Figure 284: Example: Filtering Profiled Content in Author Mode

If the [Show Profiling Attributes option](#) is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 285: Profiling Attribute Value Form Control Pop Up

### Related Information:

[Creating and Editing Profiling Attributes](#) on page 535

[Applying Profiling Attributes](#) on page 538

[Creating and Editing Profiling Condition Sets](#) on page 540

[Applying Profiling Condition Sets](#) on page 541

### Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode, allowing you to easily recognize the differences.

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
  - Remove the oil fill cap;
  - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;

product [Gasoline]

- Sharpen the blades:
  - Clamp the blade to a vice or to the edge of a solid surface;
  - Using an electric grinder or audience [ExpertUser] a file, grind the length of the blade until it is sharp;

Check the electric cable for any signs of wear. Replace it if worn; product [Electric]

- Clean the mower's underside for debris; product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower; product [Manual]

**Figure 286: Example: Profiling Colors and Styles**

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

### Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles option** from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings** from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text preferences page**.
3. Go to the **Colors and Styles preferences page** to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes Rendering preferences page** to configure how you want the profiling attributes to appear in Oxygen XML Author.

**Result:** The styling is now applied in the **Author** editing mode and the **Outline view**. Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes dialog box** and in the inline form control pop up that allows you to quickly set the profiling attributes.

**Figure 287: Profiling Attribute Value Form Control Pop Up**

**Related Information:**

- [Creating and Editing Profiling Attributes](#) on page 535
- [Applying Profiling Attributes](#) on page 538

- [Showing and Filtering Profiled Content in Author Mode](#) on page 543

**Adding Tables in Author Mode**

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in various *frameworks* (DITA, DocBook, TEI, and XHTML). This opens the **Insert Table** dialog box. Each *framework* has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Author includes some general editing actions for configuring tables in **Author** mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

**Editing Tables in Author Mode**

Oxygen XML Author provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in **Author** mode and they include the following:

**Adjusting Column Width**

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a **colspecs** section that appears above the table in **Author** mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The predefined DITA, DocBook, and XHTML *frameworks* support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

**Figure 288: Resizing a Table Column in Author Mode**

## Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to  for row selection and to  for column selection and that specific row or column is highlighted. You can use the **Ctrl** and **Shift** keys to select multiple rows.

## Selecting Cells

To select a cell in a table, press and hold the **Ctrl** key and click anywhere inside the cell. You can also use the **Ctrl** and **Shift** keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a *RTL document*) to select it. The cursor changes to  when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

## Drag and Drop

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Author decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

## Copy/Cut and Paste

In Oxygen XML Author, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Author introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a *CALS* table, Oxygen XML Author preserves column width information. This information is then used when you paste the column into another *CALS* table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.

## Deleting Content

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

## Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the *Quick navigation in tables option* is not selected in the **Cursor Navigation** preferences

page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

#### Related Information:

[Adding Tables in DocBook](#) on page 548

[Adding Tables in DITA Topics](#) on page 555

[Adding Tables in XHTML Documents](#) on page 565

### Adding Tables in DocBook

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.

### Inserting a CALS Table Model in DocBook

To insert a *CALS* table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure a few more properties than the *HTML* model.

**Figure 289: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

#### Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is 1\*.
- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

### Frame

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

### Row separator

Specifies whether or not to include row separators (`r o w s e p` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Column separator

Specifies whether or not to include column separators (`c o l s e p` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Alignment

Specifies the alignment of the text within the table (`a l i g n` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 290: CALS Table in DocBook

## Inserting an HTML Table Model

To insert an *HTML* table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **HTML** for the table **Model**.

**Figure 291: Insert Table Dialog Box - Simple Model**

The dialog box allows you to configure the following options when you select the **HTML** table model:

### Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

### Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

### Column widths

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a `col` element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1\*.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0\*" (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

## Frame

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

## Alignment

Specifies the alignment of the text within the table (`a l i g n` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the [Author mode](#), it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.

## Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view](#) (**Window > Show View > Attributes**).

You can also use the  [Table Properties \(Ctrl + T \(Command + T on OS X\)\)](#) action from the toolbar or contextual menu to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to [Text mode](#).

### DocBook Table Layouts

The DocBook [framework](#) supports the following two table model layouts:

- [CALs table model](#)
- [HTML table model](#)

## CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`a l i g n` attribute). Although they appear as part of the [Author mode](#), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

▼ *Sample CALS Table with no specified width and proportional column widths*

▼ colspecs...

column name  number  width  align   colsep  rowsep

Horizontal Span		a3	a4	a5
<i>f1</i>	<i>f2</i>	<i>f3</i>	<i>f4</i>	<i>f5</i>
b1	b2	b3	b4	▶Vertical◀ Span
c1	Spans ▶Both◀ directions		c4	
d1			d4	d5

Figure 292: CALS Table in DocBook

### HTML Table Model Layout

Choosing an **HTML** table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an *HTML* table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although these properties appear as part of the *Author mode*, they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

*Sample HTML Table*

column title  span  width  align

column title  span  width  align

Column 1	Column 2
Data A	Data B
Data C	Data C

Figure 293: HTML Table in DocBook

### Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the *CALS* model. If you want to overwrite this behavior and instruct Oxygen XML Author to convert them to *HTML* tables, set the `docbook.html.table` parameter to 1. You can find this parameter in the following stylesheet:

- `[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml12db5Driver.xsl` for DocBook 5
- `[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml12db4Driver.xsl` for DocBook 4

### Table Validation in DocBook

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

#### CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.

- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

### HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `colspan`, `rowspan`, or `span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

### Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view](#) (**Window > Show View > Attributes**).

You can use the  **Table Properties (Ctrl + T (Command + T on OS X))** action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

**Figure 294: Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)**

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the `colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the `rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

**Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a `thead`, `tbody`, or `tfoot` attribute).

## Edit Table Properties for an HTML Table Model

For an **HTML** table model, the **Table properties** dialog box includes four tabs of options (**Table**, **Row**, **Column**, and **Cell**) and the options include a **Preview** pane that shows a representation of the modification.

The options in the four tabs include the following:

### Frame (Available only in the Table tab)

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

### Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a `thead`, `tbody`, or `tfoot` attribute).

### Horizontal alignment (Available in the Row, Column, and Cell tabs)

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

### Vertical alignment (Available in the Row, Column, and Cell tabs)

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`valign` attribute). The allowed values are:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the `bottom` value. However, if the fonts are different sizes, the `baseline` value often makes the table look better.

### Related Information:

[Editing Tables in Author Mode](#) on page 546

## Adding Tables in DITA Topics

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- [DITA Simple table model](#) - This is the most commonly used model for basic tables.
- [CALs table model \(OASIS Exchange Table Model\)](#) - This is used for more advanced functionality.
- [DITA Choice table model](#) - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- [DITA Properties table model](#) - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Author toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

## Inserting a Simple Table Model

To insert a **Simple** DITA table, select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

**Figure 295: Insert Table Dialog Box - Simple Model**

The dialog box allows you to configure the following options when you select the **Simple** table model:

#### **Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

#### **Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### **Column widths**

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

#### **Frame**

Allows you to specify a value for the `f` frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

### Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (**CALS**), select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

**Figure 296: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

#### **Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

#### **Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

#### **Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### **Column widths**

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

## Frame

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

## Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

## Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

## Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.  
**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 297: CALS Table in DITA

### Inserting a Choice Table Model

To insert a **Choice** table within a step element in a DITA Task document, select the  **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **choicetable** from the *Content Completion Assistant*. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 298: Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in

**Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `step` element).

### Inserting a Properties Table Model

To insert a **Properties** table within a `refbody` element in a DITA Reference document, select the  **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the *Content Completion Assistant*. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

**Figure 299: Insert Table Dialog Box - Properties Model**

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `refbody` element).

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the *Attributes view* (**Window > Show View > Attributes**). See the *DITA documentation* for a full explanation of these attributes.

You can also use the  **Table Properties (Ctrl + T (Command + T on OS X))** action from the toolbar or contextual menu (or **DITA** menu) to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to *Text mode*.

#### Related Information:

[Editing Tables in Author Mode](#) on page 546

#### DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- [CALs table model](#)
- [Simple table model](#)
- [Choice table model](#)
- [Properties table model](#)

### CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the *Author mode*, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

▼ *Sample CALS Table with no specified width and proportional column widths*

▼ colspecs...

column name  number  width  align   colsep  rowsep

Horizontal Span		a3	a4	a5
<i>f1</i>	<i>f2</i>	<i>f3</i>	<i>f4</i>	<i>f5</i>
b1	b2	b3	b4	Vertical Span
c1	Spans Both directions		c4	
d1			d4	d5

Figure 300: CALS Table in DITA

### Simple Table Model Layout

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Header 1	Header 2
Column 1	Column 2

Figure 301: DITA Simple Table

### Choice Table Model Layout

A **Choice** table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `choicetable` element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting **choicetable** from the *Content Completion Assistant* (within a step element) or by using the **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Option	Description
Opt A	
Opt B	
Opt C	

Figure 302: DITA Choice Table

### Properties Table Model Layout

A **Properties** table model is used within a `refbody` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting **properties(wizard)** from the *Content Completion Assistant* (within a `refbody` element) or by using the **Insert Table** action on the toolbar (or from the contextual menu) and selecting **Properties** for the **Model**. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Property Type	Property Value	Property Description
A	B	C

**Figure 303: DITA Properties Table**

### Table Validation in DITA

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. When you validate a *DITA map* with the  **Validate and Check for Completeness** action, if the **Report table layout problems option is selected in the DITA Map Completeness Check dialog box**, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

#### CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

#### Simple or Choice Tables

- A row has fewer cells than the number of table columns.

### Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties** (**Ctrl + T (Command + T on OS X)**) action from the toolbar or the **Table** submenu of the contextual menu (or **DITA** menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

**Figure 304: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)**

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the `colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the `rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

### Frame (Available only in the Table tab)

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `con ref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `con ref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

### Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple, Choice, Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

#### Table tab

##### Frame

Allows you to specify a value for the `f r a m e` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `con ref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `con ref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

#### Row tab (not available for *Properties* tables)

##### Row type

Allows you change the row to a body or header type of row.

#### Related Information:

[Adding Tables in DITA Topics](#) on page 555

[Editing Tables in Author Mode](#) on page 546

#### Adding Tables in XHTML Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the **Insert Table** dialog box.

**Figure 305: Insert Table Dialog Box in XHTML**

The dialog box allows you to configure the following options:

**Caption**

If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (`width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `width` attribute (in a `col` element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `width` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `width` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form `"0*"` (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode**.

#### XHTML Table Layout

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an XHTML table includes a **colspecs** section that allows you to easily configure some properties. For example, you can change the value of column widths (`width` attribute) or the text alignment (`align` attribute). Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

colspecs...

*A table with merged cells, fixed column widths, and fixed total width.*

x	y	Spans ▾ Horizontally ▾	
Spans ▾ Vertically ▾	Spans ▾ Both ▾		d
	e	f	
g	h	i	k

**Figure 306: Table Layout in XHTML Documents**

### Table Validation in XHTML

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

#### HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `colspan`, `rowspan`, or `span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

#### Adding Tables in TEI Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

**Figure 307: Insert Table Dialog Box in TEI**

The dialog box allows you to configure the following options:

#### **Head**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

#### **Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

#### **Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Note:** The options in the **Insert Table** dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

#### **Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view](#) (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to [Text mode](#).

#### **Sorting Content in Tables and List Items**

Oxygen XML Author offers support for sorting the content of tables and list items of ordered and unordered lists.

What do you want to do?

- [Sort an entire table.](#)
- [Sort a selection of rows in a table.](#)
- [Sort a table that contains cells merged over multiple rows.](#)
- [Sort list items.](#)

#### **Sorting a Table**

To sort rows in a table, select the entire table (or specific rows) and use the  **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

**Figure 308: Sort Dialog Box**

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

**Note:** When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

### Sorting a Selection of Rows

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose  **Sort**, or click  **Sort** on the main toolbar. This opens the **Sort** dialog box.

**Figure 309: Sort Selected Rows**

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

### Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, select the rest of boxes in the **Criteria** section of the **Sort** dialog box, configure the applicable items, and click **OK** to complete the sorting operation.

**Figure 310: Sorting Based on Multiple Criteria**

### Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain *rowspans*.

**Note:** For this type of table, the **Sort** dialog box keeps the **All rows** option disabled even if you perform the sorting operation over a selection of rows.

### Sorting List Items

A sorting operation can be performed on various types of lists and list items. Oxygen XML Author provides support for sorting the following types of lists:

- Ordered list (o1)
- Unordered list (u1)
- Parameter list (parml)

- Simple list (s1)
- Required conditions (reqconds)
- Supplies list (supplyli)
- Spare parts list (sparesli)
- Safety conditions (safety)
- Definitions list (d1)

The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the  **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

**Figure 311: Sorting List Items**

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

**Note:** When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

## Inserting Images

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the  **Insert Image** action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Author tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the file `/C:/project/xml/dir/img1.jpg` image into the file `/C:/project/xml/doc1.xml` document, Oxygen XML Author inserts a reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.

**Note:** The  **Insert Image** action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the href attribute in an image element:

```
<image href=" ../images/image_file.png" />
```

**Tip:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Author will automatically update the reference to the new image.

- Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Author will insert it as a reference to the image file the same as the drag/drop method.
- Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Author will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

#### Related Information:

[Image Map Editor](#) on page 575

[Image Rendering in Author Mode](#)

[Adding Video, Audio, and Embedded HTML Resources in DITA Topics](#) on page 1513

#### Image Rendering in Author Mode

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.

**Table 13: Supported Image Formats**

Image Type	Support	Additional Information
GIF	built-in	Animations not yet supported
JPG, JPEG	built-in	<a href="#">JPEG images with CMYK color profiles</a> are properly rendered only if color profile is inside the image.
PNG	built-in	
SVG, SVGZ, WMF	built-in	Rendered using the open-source Apache Batik library that supports SVG 1.1.
BMP	built-in	
TIFF	built-in	Rendered using a part of the Java JAI Image library.
EPS	built-in	Renders the preview TIFF image inside the EPS.
AI	built-in	Renders the preview image inside the Adobe Illustrator file.
JPEG 2000, WBMP	plugin	Renders by <a href="#">installing the Java Advanced Imaging (JAI) Image I/O Tools plug-in</a> .
PDF	plugin	Renders by <a href="#">installing the Apache PDF Box library</a> .

When an image cannot be rendered, Oxygen XML Author **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Select the [Show very large images option](#).
- The image format is not supported by default. It is recommended to [install the Java Advanced Imaging \(JAI\) Image I/O Tools plug-in](#).

#### Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

- If you specify only the width attribute of an image, the height of the image is proportionally applied.

- If you specify only the height attribute of an image, the width of the image is proportionally applied.
- If you specify width and height attributes of an image, both of them control the rendered image.
- If you want to scale both the width and height of an image proportionally, use the `scale` attribute.

**Note:** As a Java application, Oxygen XML Author uses the *Java Advanced Imaging* API that provides a pluggable support for new image types. If you have an *ImageIO* library that supports additional image formats, just copy this library to the `[OXYGEN_INSTALL_DIR]/lib` directory.

#### Rendering CGM Images (Experimental Support)

Oxygen XML Author offers a few add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste <http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml> in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Oxygen CGM support** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** You should be able to see CGM images in **Author** mode.

#### Alternate Method for ISOView Active X Component

**Restriction:** This support will only work on 32 bit versions of Oxygen XML Author.

If you already have the *ISOView Active X* component for Internet Explorer installed, you may want to use it to render CGM images instead of the components provided in the plugin described above.

To use your existing *ISOView Active X* component to render CGM images, follow these steps:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste <http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml> in the **Show add-ons from** field or select it from the drop-down menu.
3. Select **CGM Form control (Active X-based)** plugin and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.
6. The **CGM Form Control** plugin automatically renders CGM files in DITA, DocBook, and XHTML, so for those *frameworks*, this step is not necessary. For other *frameworks*, modify your CSS according to your particular *framework*.

If you have an XML:

```
<image href="MyCGMFile.cgm" />
```

You need a CSS rule like this:

```
image[href$=".cgm"],
image[href$=".CGM"]{
    content: oxy_editor(
        saHeavyFormControlClassName , "com.oxygenxml.activev.fctrl.ActiveXFormControl",
        href, oxy_url(oxy_base-uri() , attr(href)));
}
```

You should be able to see CGM images in **Author** mode.

#### Rendering PDF Images (Experimental Support)

Oxygen XML Author provides experimental support for PDF images using the Apache PDFBox library.

To allow the rendering of PDF images in **Author** mode, follow this procedure:

1. Go to <http://pdfbox.apache.org/downloads.html> and download the pre-built PDFBox standalone binary *JAR* files: **pdfbox-2.0.3.jar**, **fontbox-2.0.3.jar**, and **xmpbox-2.0.3.jar**. Alternatively, you can use the 1.8.12 version of these files, as they have been tested and work properly.

**Note:** It is not recommended to use `pdfbox-app-2.0.3.jar` file instead of the three specified files because it contains additional classes that may cause conflicts elsewhere in Oxygen XML Author.

2. Create a subfolder called `pdfImageJars` in the `[OXYGEN_INSTALL_DIR]\lib` directory.

3. Copy the downloaded JAR libraries to that newly created subfolder.
4. Restart the application.

### Rendering PSD Images

Oxygen XML Author provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in **Author** mode, follow this procedure:

1. Download the following JAR files:
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-lang/3.1.0/common-lang-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-io/3.1.0/common-io-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-core/3.1.0/imageio-core-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar>
  - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-psd/3.1.0/imageio-psd-3.1.0.jar>
2. Copy the downloaded JAR libraries to the `[OXYGEN_INSTALL_DIR]\lib` directory.
3. Restart the application.

### Rendering EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Author tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Author cannot render the image.
- The EPS image includes a TIFF preview picture.
  - Note:** Some newer versions of the TIFF picture preview are rendered in gray-scale.
- The AI image contains a JPEG preview picture. Oxygen XML Author renders the image correctly.

### Rendering Special Images with Java Advanced Imaging (JAI) Plugin

Certain special image types can be rendered in Oxygen XML Author by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

#### How to Install JAI Image I/O Tools Plugin

To install this plug, follow this procedure:

1. Start Oxygen XML Author and open the **Help > About** dialog box. Go to the **System properties** tab and look for the `java.runtime.name` and `java.home` properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the `java.runtime.name` property). A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html>.
  - Note:** The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.
3. Run the installer. When the installation wizard displays the **Choose Destination Location** page, fill-in the **Destination Folder** field with the value of the `java.home` property. Continue with the installation procedure and follow the on-screen instructions.

#### OS X Workaround

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this OS X workaround:

1. Download a Linux (tar .gz) distribution of the JAI Image I/O Tools plugin. A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html>.
2. In the `[OXYGEN_INSTALL_DIR]/lib` directory, create a directory named endorsed (`[OXYGEN_INSTALL_DIR]/lib/endorsed`).
3. Unpack the tar .gz. Copy the `clibwrapper_jiio.jar` and `jai_imageio.jar` files from its lib directory and paste them in the `[OXYGEN_INSTALL_DIR]/lib/endorsed` directory.
4. Restart the application and the JAI Image I/O support will be up and running.

### Retina/HiDPI Images in Author Mode

Oxygen XML Author provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include `@2x` in the name (for example, `myImage@2x.png`).

You can reference an image to style an element in a CSS by using the `url` function in the content property, as in the following example:

```
listItem:before{
  content: url('../img/myImage.png');
}
```

This would place the image that is loaded from the `myImage.png` file just before the `listItem` element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a *normal* DPI image and a *high* DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Author interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Author will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Author would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the *normal* resolution image file (`myImage.png`).

Oxygen XML Author also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the *normal* image is used.

### Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Author:

Color Theme	Referred Image File	Double Density Image File	Triple Density Image File
normal	<code>../img/myImage.png</code>	<code>../img/myImage@2x.png</code>	<code>../img/myImage@3x.png</code>
dark	<code>../img/myImage_dark.png</code>	<code>../img/myImage_dark@2x.png</code>	<code>../img/myImage_dark@3x.png</code>

#### Related Information:

[Adding Retina/HiDPI Icons in a Framework](#) on page 1134

### Image Map Editor

Oxygen XML Author includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent.

The main purpose of an **image map** is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Author is available for images in DITA, DocBook, TEI, and XHTML document types (*frameworks*). To create an image map on an existing image and open the **Image Map Editor**, right-click the image and select **Image Map Editor**.

**Figure 312: Image Map Rendered in Author Mode**

### **Image Maps in DITA**

Oxygen XML Author includes support for **image maps** in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 313: Image Map Editor in DITA**

### Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

#### Toolbar

 **New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

 **New Circle**

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

 **New Polygon**

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

 **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

### Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.

### Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

 **Add Point**

Adds a point to *Polygon* or *Free Form* shapes.

 **Remove Point**

Removes the current point from *Polygon* or *Free Form* shapes.

 **Duplicate**

Create a duplicate of the currently selected shape.

### **Delete**

Delete the currently selected shape.

### **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### **New Circle**

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

### **New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### **Undo**

Use this action to undo the last action.

### **Redo**

Use this action to redo the last action that was undone.

## Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## Properties

### Type

Displays information about the selected coordinate.

### Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of [inserting links in DITA](#) by using the identical  **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `xref` element will be inserted with either an `href` attribute or a `keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see [Inserting a Link in Oxygen XML Author](#) on page 1565.

### Description

You can enter an optional description for the selected area (shape) that will be displayed in the [Image Map Details section](#) in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

## How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**,  **New Circle**, or  **New Polygon**).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.

**Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful *contextual menu actions*. For example, the easiest way to remove a point is to right-click the point and select **✕ Remove Point**.

4. With the shape selected, use one of the *linking options* in the **🔗 Link** drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Figure 314: Image Map Details**

### How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the *Image Map Editor toolbar*). To change the layer order for a shape, use the layer buttons on the *Image Map Editor toolbar* (📄, 📄, 📄, 📄).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Related Information:**

- [DITA 'imagemap' Element Specifications](#)
- [Adding Images in DITA Topics](#) on page 1511

**Image Maps in DocBook**

Oxygen XML Author includes support for **image maps** in DocBook documents through the use of the `areaspec` element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 315: Image Map Editor in DocBook**

**Image Map Editor Interface in DocBook**

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**

-  **New Rectangle**  
Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.
-  **Duplicate**  
Use this button to create a duplicate of the currently selected shape.
-  **Delete**  
Use this button to delete the currently selected shape.

### Undo

Use this button to undo the last action.

### Redo

Use this button to redo the last action that was undone.

### Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

### Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

### Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

### Send Shape Backward

Use this button to send the currently selected shape back one layer.

### Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

### Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

### Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

### Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.

### Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

### Duplicate

Create a duplicate of the currently selected shape.

### Delete

Delete the currently selected shape.

### New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### Undo

Use this action to undo the last action.

Use this action to redo the last action that was undone.

## Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## Properties

### Type

Displays information about the selected coordinate.

### ID

The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular area element.

### Target

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference** or **Web Link**. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an `xlink:href` attribute.

### Description

You can enter an optional description for the selected area that will be displayed in the [Image Map Details section](#) in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

## How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting the  **New Rectangle** button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar](#) to adjust its layer and color, or to perform other editing actions.

**Tip:** You can right-click any of the shapes or anywhere in the Image Pane to access various helpful [contextual menu actions](#).

4. With the shape selected, enter an **ID** and use one of the [linking options](#) in the  **Link** drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select  **New Rectangle** button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

## How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Note:** If you want to link a set of related area elements, you can use a `areaset` elements. To add a `areaset` elements, and area elements to the `areaset`s, switch to **Text** mode and insert them manually.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the *Image Map Editor toolbar*). To change the layer order for a shape, use the layer buttons on the *Image Map Editor toolbar* (.

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

### Related Information:

[DocBook 'areaspec' Element Specifications](#)

### Image Maps in TEI

Oxygen XML Author includes support for **image maps** in TEI documents through the use of the `facsimile` element. In TEI documents, this feature provides an easy way to create areas (using zone elements) in an image where the end user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.

Figure 316: Image Map Editor in TEI

### Image Map Editor Interface in TEI

The interface of the **Image Map Editor** consists of the following sections and actions:

#### Toolbar

##### **New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

##### **New Polygon**

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

##### **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

##### **Duplicate**

Use this button to create a duplicate of the currently selected shape.

##### **Delete**

Use this button to delete the currently selected shape.

### Undo

Use this button to undo the last action.

### Redo

Use this button to redo the last action that was undone.

### Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

### Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

### Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

### Send Shape Backward

Use this button to send the currently selected shape back one layer.

### Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

### Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

### Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

### Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.

### Contextual Menu Actions

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

#### Add Point

Adds a point to *Polygon* or *Free Form* shapes.

#### Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

#### Duplicate

Create a duplicate of the currently selected shape.

#### Delete

Delete the currently selected shape.

### **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### **New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### **Undo**

Use this action to undo the last action.

### **Redo**

Use this action to redo the last action that was undone.

## **Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## **Properties**

### **Type**

Displays information about the selected coordinate.

### **ID**

The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

## **How to Create an Image Map in TEI**

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (graphic) must be inside a facsimile element to support the **Image Map Editor** feature.
2. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons ( **New Rectangle** or  **New Polygon**).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar](#) to adjust its layer and color, or to perform other editing actions.

**Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful [contextual menu actions](#). For example, the easiest way to remove a point is to right-click the point and select

### **Remove Point**.

5. With the shape selected, enter an **ID**.
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

## How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Restriction:** Currently, if zone elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the zone elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the [Image Map Editor toolbar](#)). To change the layer order for a shape, use the layer buttons on the [Image Map Editor toolbar](#) (.

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

### Related Information:

[TEI 'facsimile' Element Specifications](#)

### Image Maps in XHTML

Oxygen XML Author includes support for **image maps** in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an `img` element) may be associated with an image map (in the form of a `map` element) by specifying a `usemap` attribute on the `img` element. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 317: Image Map Editor in XHTML**

### Image Map Editor Interface in XHTML

The interface of the **Image Map Editor** consists of the following sections and actions:

#### Toolbar

#### **New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

#### **New Circle**

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

#### **New Polygon**

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

#### **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

#### **Duplicate**

Use this button to create a duplicate of the currently selected shape.

#### **Delete**

Use this button to delete the currently selected shape.

### Undo

Use this button to undo the last action.

### Redo

Use this button to redo the last action that was undone.

### Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

### Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

### Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

### Send Shape Backward

Use this button to send the currently selected shape back one layer.

### Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

### Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

### Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

### Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.

### Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

#### Add Point

Adds a point to *Polygon* or *Free Form* shapes.

#### Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

#### Duplicate

Create a duplicate of the currently selected shape.

#### Delete

Delete the currently selected shape.

### **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### **New Circle**

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

### **New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### **Undo**

Use this action to undo the last action.

### **Redo**

Use this action to redo the last action that was undone.

## **Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the **Alternative** property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## **Properties**

### **Type**

Displays information about the selected coordinate.

### **Href**

Specifies the hyperlink target for the selected area. This will become the value of the `href` attribute for the particular area element. The possible values are:

- **An Absolute URL** - A URL of another web site (for example, `http://www.example.com/index.htm`).
- **A Relative URL** - A link to a file within your web site (for example, `index.htm`).
- **An Element** - A link to the ID of an element within the page (for example, `#top`).
- **Other Protocols** - A specified path using other protocols (such as `https://`, `ftp://`, `mailto:`, `file:`).
- **A Script** - A link to a script (for example, `javascript:alert('Hello');`)

### **Alternate**

The description for the selected area. The value is inserted in an `alt` attribute in the particular area element. This is a required attribute to present a text alternative for browsers that do not display images.

### **Target**

Specifies where to open the linked resource. The allowed values are:

- **\_blank** - Opens the linked resource in a new window or tab.
- **\_self** - Opens the linked resource in the same frame as it was clicked.
- **\_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

## **How to Create an Image Map in XHTML**

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**,  **New Circle**, or  **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
 

**Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful *contextual menu actions*. For example, the easiest way to remove a point is to right-click the point and select  **Remove Point**.
4. With the shape selected, specify the hyperlink target in the *Href field* and enter a description for the selected area in the *Alternate field*.
5. (Optional) Specify where the hyperlink resource will be opened in the *Target field*.
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

### How to Edit an Existing Image Map in XHTML

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

In **Author** mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the *Image Map Editor toolbar*). To change the layer order for a shape, use the layer buttons on the *Image Map Editor toolbar* (.

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

### Related Information:

[HTML Image Map Specifications](#)

### Adding Video, Audio, and Embedded HTML Resources

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in **Author** mode and in all HTML5-based outputs. There is a toolbar button () that allows you to insert and configure a reference to the media

resource. You can also drag media files from your system explorer or the [Project view](#) and drop them into your documents (or copy and paste them).

**Table 14: Supported Media Types**

Media	Description	Type	Supported Size Properties
mp3	Moving Picture Experts Group Layer-3 Audio	audio	Width
wav	Windows Wave	audio	Width
pcm	Pulse Code Modulation	audio	Width
m4a	Moving Picture Experts Group Layer-4 Audio	audio	Width
aif	Audio Interchange Format	audio	Width
mp4	Moving Picture Experts Group Layer-4 Video	video	Width & Height
flv	Flash Video	video	Width & Height
m4v	Itunes Video File	video	Width & Height
avi	Audio Video Interleaved	video	Width & Height
embedded video (such as YouTube or Vimeo)	Embedded Iframe Code	iframe	Width & Height

### Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the  **Insert Media Resource** action from the toolbar. A **Chose Media** dialog box appears.

**Note:** You can also drag media files from your system explorer or the [Project view](#) and drop them into your documents (or copy and paste them).

3. Select the URL for the media resource and click **Ok**.

**Result in Author Mode:** A reference to the specified media object is inserted and rendered in **Author** mode so that it can be played directly from there.

**Result in Output:** In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

### Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Author includes a pre-installed [plugin](#) that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```

...
<foreign outputclass="html-embed"><![CDATA[
  <iframe width="420" height="315"

```

```

src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
]]></foreign>
....

```

The converted HTML output would look like this:

```

.....
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
.....

```

The *plugin* is also available on the [oxygenxml GitHub projects page](#).

#### Related Information:

[Adding Video and Audio Objects in DITA WebHelp Output](#) on page 935

#### Editing MathML Notations

The **Author** editor includes a built-in editor for *MathML* notations. To start the *MathML* editor, double-click a *MathML* notation (for embedded notations, you can also select the **Edit Equation** action from its contextual menu). In the *MathML* editor you can edit the mathematical symbols of a *MathML* notation. You can open a *MathML* file of your current project directly in the *MathML* editor. To do this, select **Open with > MathML editor** from the contextual menu in the [Project view](#).

Figure 318: Default *MathML* Editor

The font size and font family that is used for the equations is based upon the context in which the *MathML* equation appears. To configure the minimum font size of the equation, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > MathML**.

## Configure the MathFlow Editor

The *MathFlow* Components product can replace the default *MathML* editor with a specialized *MathML* editor. You have to [purchase a MathFlow Component from Design Science](#) and configure it in Oxygen XML Author with the following procedure:

1. Install *MathFlow* by using the *Universal* installer (for versions prior to 2.1, use the *MathFlow SDK*).
2. Set the path to the *MathFlow* install folder [in the MathML preferences page](#).
3. Set the path to the *MathFlow* license file [in the MathML preferences page](#).

Figure 319: Default MathFlow Editor

## MathML Equations in HTML Output

Currently, only **Firefox** can render **MathML** equations embedded in the **HTML** code. [MathJax](#) is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DocBook or DITA content that has embedded **MathML** equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript"
src="https://cdn.mathjax.org/mathjax/latest/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

For DITA documents, you can also use the following procedure:

1. [Edit the DITA Map WebHelp transformation scenario](#) and open the **Parameters** tab.
2. Set the following parameter to point to an XML resource file that contains your script, depending on your type of WebHelp system.
  - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your resource file.
  - **WebHelp Classic Systems** - Set the `webhelp.head.script` parameter to point to your resource file.
3. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

## Refreshing the Content

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the  **Reload** action.

To refresh the content of the referenced resources you can use the  **Refresh references** action that is available in the current *framework* menu (for example, the **DITA** or **DocBook5** menu) . However, this action will not refresh the expanded external entities, for which you will need to use the  **Reload** action.

### Generating IDs for Elements in Author Mode

Oxygen XML Author allows you to manually assign or edit values of `id` attributes in **Author** mode by using the **Attributes View** or an *in-place attribute editor*. Oxygen XML Author also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

### Generate IDs On-Request

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu or the *framework*-specific menu (**DITA**, **DocBook**, or **TEI**). This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options dialog box**. To open this dialog box, select **ID Options** from the *framework*-specific menu (**DITA**, **DocBook**, or **TEI**)

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

### Automatically Generate IDs

Oxygen XML Author includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options dialog box** that is displayed when you select the **ID Options** action from the *framework*-specific menu (**DITA**, **DocBook**, or **TEI**). If this **Auto generate IDs for elements** option is selected, Oxygen XML Author automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

### ID Options Dialog Box

To configure options for generating IDs, select **ID Options** from the *framework*-specific menu (**DITA**, **DocBook**, or **TEI**).

Figure 320: ID Options Dialog Box

The **ID Options** dialog box allows you to configure the following options in regards to generating ID values:

### **ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author [Editor Variables](#).

### **Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### **Auto generate IDs for elements**

If selected, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### **Remove IDs when copying content in the same document (DITA or TEI)**

When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

### **Remove IDs when copying content (DocBook)**

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

### **Duplicating Elements with Existing IDs**

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the [Auto generate IDs for elements option](#) is selected and you duplicate elements with existing IDs, Oxygen XML Author assigns new, unique ID values to the duplicates.
- If the [Auto generate IDs for elements option](#) is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
- For DITA and TEI, if the [Remove IDs when copying content in the same document option](#) is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected and this option has no effect on elements that are duplicated in other documents.
- For DocBook, if the [Remove IDs when copying content option](#) is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected.

### **Controlling the Default ID Generation Options**

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the `frameworks` folder for each of those document types, there is an XML configuration file called `idGenerationDefaultOptions.xml` that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the `resources` folder within the particular [framework](#). For example, the configuration file for the DITA *framework* is located in: `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources/idGenerationDefaultOptions.xml`.

## Sharing Default ID Generation Options

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the `idGenerationDefaultOptions.xml` file for your *framework* according to your needs.
2. Bundle a modified version of the entire *framework* folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita/`). To do this:
  - a. **Open the Preferences dialog box (Options > Preferences)** and go to **Document Type Association**.
  - b. Select your document type and click the **Extend** button.
  - c. In the **Document type configuration dialog box** that is now displayed, select **External** for the **Storage** option. By default, this will save the extension in a new folder in the `frameworks` folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita-extension (1)`), but you can also use the  **Browse** button to specify a specific name and folder.
  - d. In this new extension folder, create a new folder called `resources` and add your modified `idGenerationDefaultOptions.xml` file to this new `resources` folder.
  - e. Go back to the **Document Type Association** preferences page, select the extended *framework*, and click **Edit**.
  - f. Go to the **Classpath tab**, add a reference to your new `resources` folder, and move this reference up (using the  **Move Up** button) so that it is the first one that appears in the list.
  - g. Click **OK** and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in [Sharing a Framework \(Document Type\)](#) on page 1176.

## Using Form Controls in Author Mode

You can use form controls in **Author** mode in a variety of ways to make it easier to capture, organize, and edit content. Oxygen XML Author includes [built-in form controls](#) that can be used by content authors in **Author** mode. The types of built-in form controls that you can use include the following:

- [Audio](#) - A media object that plays audio clips.
- [Browser](#) - A media object that renders HTML frames or interact with SVG documents
- [Button](#) - A graphical user interface object that performs a specific action.
- [Button Group](#) - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- [Checkbox](#) - A graphical user interface box that you can click to select or deselect a value.
- [Combo Box](#) - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- [Date Picker](#) - A form control object that allows you to select a date in a specified format.
- [HTML Content](#) - A graphical user interface box that is used for rendering HTML content.
- [Pop-up](#) - A contextual menu that provides quick access to various actions.
- [Text Area](#) - A box that allows you to enter multiple lines of text.
- [Text Field](#) - A graphical user interface box that allows you to enter a single line of text.
- [URL Chooser](#) - A dialog box that allows you to select the location of local or remote resources.
- [Video](#) - A media object that plays videos.

You can also [implement custom form controls](#) for more specific needs.

The following image is an example of how form controls can be used by content authors in **Author** mode. It includes several button form controls, a combo box, and a text field. The  icon is a button form control that is assigned a specific action that changes the layout to an editing mode. The **[ + ]** and **[ - ]** icons are also button form controls that are assigned specific actions to add or delete records from the document. The *Direct manager* row includes a combo box form control that is both a drop-down menu and an editable text field, while the *Homepage* row includes a simple editable text field form control.

**Figure 321: Example of Form Controls in Author Mode**

You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled *samples* project (located in the *samples* folder inside the Oxygen XML Author installation directory) contains a file called *personal.xml* that contains form controls. You can use this file, along with its corresponding *personal.css* file (form controls are defined in the CSS) to experiment with an example of how form controls can be implemented in **Author** mode.

### Contextual Menu Actions in Author Mode

Oxygen XML Author includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in **Author** mode, the contextual menu includes *general* actions that are available for all of the recognized document types and *framework*-specific actions that are configured for each document type.

### General Contextual Menu Actions in Author Mode

The *general* actions that are available in the contextual menu (some of them are also available in the submenus of the **Document** menu) for all document types include the following:

#### Quick Fix (**Alt + 1** (**Command + Alt + 1** on OS X))

Available when the contextual menu is invoked on an error where *Oxygen XML Author can provide a Quick Fix*.

#### Open Image

Available when the contextual menu is invoked on an image. This action allows you to open an image in the Oxygen XML Author *Image Viewer* or in a default system application associated with the current image type.

#### Track Changes Actions

Available when the *Track Changes feature* is enabled and the contextual menu is invoked on a change. The following options are available:

##### ✓ Accept Change(s)

Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

##### ✗ Reject Change(s)

Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

## **Comment Change**

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](#). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### **Author Callout Actions**

Available when the contextual menu is invoked on a [callout](#). If the corresponding options in the [Show review callouts section](#) are selected in the [Callouts preferences page](#), the callouts are displayed in **Author** mode for comments, tracked insertion changes, or tracked deletion changes.

### **Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu when invoked on an *insertion* or *deletion* callout box:

#### **Reply**

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#).

#### **Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### **Accept Change(s)**

Accepts the [Tracked Change](#) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

#### **Reject Change(s)**

Rejects the [Tracked Change](#) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

## **Comment Change**

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](#). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### **Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

### **Callouts Options**

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

### **Comment Callout Actions**

The following actions are available in the contextual menu when invoked on a *comment* callout box:

#### **Reply**

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#).

## Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

## Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

## Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

## Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

## Edit Attributes

Displays an [in-place attributes editor](#) that allows you to manage the attributes of an element.

## Edit Profiling Attributes

Allows you to change the [profiling attributes](#) defined on all selected elements.

## Insert submenu

This submenu includes insert actions that are specific to each [framework](#), along with the following general action:

### Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `<decimal value>` - e. g. #65
- `&#<decimal value>`; - e. g. &#65
- `&#x<hexadecimal value>` - e. g. #x41
- `&#x<hexadecimal value>`; - e. g. &#x41

## Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

## Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

## Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

## Paste special submenu

This submenu includes special paste actions that are specific to each [framework](#), as well as the following general paste actions:

### Paste As XML

Pastes clipboard content that is considered to be XML, preserving its XML structure.

### Paste As Text

Pastes clipboard content, ignoring any structure or styling markup.

## Select submenu

This submenu allows you to select the following:

## Element

Selects the entire element at the current cursor position.

## Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

## Parent

Selects the entire parent element at the current cursor position.

## Text submenu

This submenu contains the following actions:

### To Lower Case

Converts the selected content to lower case characters.

### To Upper Case

Converts the selected content to upper case characters.

### Capitalize Sentences

Converts to upper case the first character of every selected sentence.

### Capitalize Words

Converts to upper case the first character of every selected word. 0034

### Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:** The content marked as deleted with *change tracking* is ignored when counting words.

### Convert Hexadecimal Sequence to Character (**Ctrl + Shift + X (Command + Shift + X on OS X)**)

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

## Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

### →! Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

### Move Up (**Alt + UpArrow**)

Moves the current node or selected nodes in front of the previous node.

### Move Down (**Alt + DownArrow**)

Moves the current node or selected nodes after the subsequent node.

### ⌘ Split Element (**Alt + Shift + D (Ctrl + Alt + D on OS X)**)

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

### ⌘ Join Elements

Joins two adjacent *block elements* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

### **Surround with Tags (Ctrl + E (Command + E on OS X) )**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the *Position cursor between tags option* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the *Position cursor between tags option* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

### **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

### **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

### **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

### **Remove Text**

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

## **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

### **Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

### **Convert attribute to element**

Allows you to change an attribute into an element.

### **Delete attribute**

Allows you to remove one or more attributes.

### **Rename attribute**

Allows you to rename an attribute.

### **Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

## **Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

### **Delete comments**

Allows you to delete comments found inside one or more elements.

## **DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

### **Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

### **Convert conrefs to conkeyrefs**

Use this operation to convert conref attributes to conkeyref attributes.

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments submenu**

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

## JATSKit submenu

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

### Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

### Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

### Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

## Review submenu

This submenu includes the following actions:

### Track Changes

Enables or disables the *Track Changes* support for the current document.

### Accept Change(s) and Move to Next

Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

### Accept All Changes

Accepts all *Tracked Changes* in the current document.

### Reject Change(s) and Move to Next

Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

### Reject All Changes

Rejects all *Tracked Changes* in the current document.

### Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

### Highlight

Enables the highlighting tool that allows you to mark text in your document.

## Colors

Allows you to select the color for highlighting text.

## Stop highlighting

Use this action to deactivate the highlighting tool.

## Remove highlight(s)

Use this action to remove highlighting from the document.

### Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

### Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

### **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

### **Manage Reviews**

Opens the [Review view](#).

## **Manage IDs submenu**

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

### **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

### **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### **Search References in**

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

### **Search Occurrences in file**

Searches for the occurrences of the ID in the current document.

## **Folding submenu**

This submenu includes the following actions:

### **Toggle Fold**

Toggles the state of the current fold.

### **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**

Folds all the elements except the current element.

### **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**

Folds the elements indented with one level inside the current element.

### **Expand Child Folds**

Unfolds all child elements of the currently selected element.

### **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**

Unfolds all elements in the current document.

## **Inspect Styles**

Opens the [CSS Inspector view](#) that allows you to examine the CSS rules that match the currently selected element.

## **Options**

Opens the [Author mode options page](#).

## **Document Type-Specific Contextual Menu Actions in Author Mode**

Other *document type-specific* actions are available in the contextual menu of **Author** mode for the following document types (click the links to see the default actions that are available for each specific document types):

- [DocBook4 Author Actions](#)
- [DocBook5 Author Actions](#)
- [DITA Author Actions](#)
- [DITA Map Author Actions](#)

- [XHTML Author Actions](#)
- [TEI ODD Author Actions](#)
- [TEI P5 Author Actions](#)
- [JATS Author Actions](#)

## Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Author provides validation functions that allow you to easily identify errors and their location.

### Related Information:

[Working with Modular XML Files in the Master Files Context](#)

### Checking XML Well-Formedness

A *Well-formed XML* document is a document that conforms to the XML syntax rules. A *Namespace Well-Formed XML* document is a document that is *Well-formed XML* and is also *Namespace-wellformed* and *Namespace-valid*.

### Well-Formedness Rules

The XML Syntax rules for *Well-formed XML* are as follows:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The *Namespace-wellformed* rules are as follows:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The *Namespace-valid* rules are as follows:

- The *xml* prefix is by definition bound to the namespace name: *http://www.w3.org/XML/1998/namespace*. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The *xmlns* prefix is used only to declare namespace bindings and is by definition bound to the namespace name: *http://www.w3.org/2000/xmlns/*. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence *x, m, l*, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
- The namespace prefix (unless it is *xml* or *xmlns*) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

## Check for Well-Formedness

To check if a document is *Namespace Well-Formed XML* and *Namespace-valid*, select the  **Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on OS X))** action from the **Document > Validate** menu or from the  **Validation** drop-down menu on the toolbar.

The selected files in the current project can also be checked for well-formedness with a single action by selecting the  **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the [Project view](#).

If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

### Example: A non Well-formed XML Document

```
<root><tag></root>
```

When **Check Well-Formedness** is performed the following error is raised:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert `</tag>`.

### Example: A non Namespace-wellformed Document

```
<x::y></x::y>
```

When **Check document form** is performed the following error is raised:

```
Element does not match QName production: QName::=(NCName'')?NCName.
```

### Example: A non Namespace-valid Document

```
<x:y></x:y>
```

When **Check document form** is performed the following error is raised:

```
The prefix "x" for element "x:y" is not bound.
```

## Validating XML Documents Against a Schema

A *Valid XML* document is a *Well-Formed XML* document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

The  **Validate** function ensures that your document is compliant with the rules defined by an associated DTD, XML Schema, Relax NG, or Schematron schema. XML Schema or Relax NG schema also allows you to embed Schematron rules. For Schematron validations you can also select the **validation phase**.

### Related Information:

[Associating a Schema to XML Documents](#) on page 626

### Automatic Validation

Oxygen XML Author can be configured to automatically mark validation errors in the document as you are editing. The [Enable automatic validation option](#) in the [Document Checking preferences page](#) controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a *configurable delay* from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is long and it is not displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line or on the error line displays an information dialog box with the full error message. You can use the arrow buttons in this dialog box to navigate through the errors issued by the Automatic Validation feature.

[Presenting Validation Errors in Author Mode](#) on page 269

### Manual Validation Actions

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Author.

#### Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

##### **Validate (Ctrl + Shift + V (Command + Shift + V on OS X))**

Available from the  **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu in the *Project view*.

An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also re-parses the *XML Catalogs* and resets the schema used for content completion.

##### **Validate (cached)**

Available from the  **Validation** drop-down menu on the toolbar or the **Document > Validate** menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

**Note:** Automatic validation also caches the associated schema.

#### Validate with

Available from the  **Validation** drop-down menu on the toolbar, (or **Document > Validate** menu).

This action opens a dialog box that allows you to *specify a schema for validating the current document*.

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

**Note:** The **Validate with** action does not work for files loaded through an *Oxygen XML Author custom protocol plugin* developed independently and added to Oxygen XML Author after installation.

#### Validate with Schema

Available from the **Validate** submenu when invoking contextual menu in the *Project view*.

This action opens a dialog box that allows you to *specify a schema for validating all selected files*.

#### Other Validation Options

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

The  **Validation options** button, available in the **Document > Validate** menu, allows you to quickly access to the [validation options](#) for the built-in validator in the Oxygen XML Author preferences page.

**Tip:** If a large number of validation errors are detected and the validation process takes too long, you can [limit the maximum number of reported errors in the Document Checking preferences page](#).

#### Related Information:

[Automatic Validation](#) on page 608

[Presenting Validation Errors in Text Mode](#) on page 217

[Presenting Validation Errors in Author Mode](#) on page 269

### Presenting Validation Errors in Text Mode

Oxygen XML Author can be configured to [automatically validate documents](#) while editing in the **Text** mode, and actions are also available to [manually validate documents](#) on-request.

Figure 322: Presenting Validation Errors in Text Mode

### Validation Marker Locations

In **Text** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the [Attributes view](#), with the attribute and its value colored according to the type of issue.

### Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the [Document Checking preferences page](#).

### Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

#### Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues

are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

### Middle Part of the Stripe

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, *open the Preferences dialog box (Options > Preferences)*, go to **Editor > Document checking**, and specify the desired limit in the *Maximum number of validation highlights option*.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the *Document Checking preferences page*).

### Bottom Part of the Stripe

Two navigation arrows () allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**. Also, the  button can be used to clear all the validation markers.

### Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and *possible quick fixes* (if available for that issue) or links to specifications. Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes or links and **Space** to trigger them.

### Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the *Document Checking preferences page* where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the *Information view*.
- If you want to see all the validation messages grouped in the *Results panel*, you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

### Presenting Validation Errors in Author Mode

Oxygen XML Author can be configured to *automatically validate documents* while editing in the **Author** mode, and actions are also available to *manually validate documents* on-request.

Figure 323: Presenting Validation Errors in Author Mode

## **Validation Marker Locations**

In **Author** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes view**, with the attribute and its value colored according to the type of issue.

## **Validation Marker Colors**

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the [Document Checking preferences page](#).

## **Validation Markers in the Right-Side Stripe**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

### **Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

### **Middle Part of the Stripe**

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page](#)).

### **Bottom Part of the Stripe**

Two navigation arrows () allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**. Also, the  button can be used to clear all the validation markers.

## **Hovering Over Validation Issues**

Hovering over a validation issue presents a tooltip message with more details about the problem and [possible quick fixes](#) (if available for that issue) or links to specifications. Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes or links and **Space** to trigger them.

## **Details About Validation Issues**

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page](#) where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the [Information view](#).

- If you want to see all the validation messages grouped in the [Results panel](#), you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

#### Related Information:

[Validating XML Documents Against a Schema](#) on page 608

#### Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the `assert` and `assertion` elements, set the message attribute on these elements.

- For Xerces, the message attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the message attribute has to belong to the `http://saxon.sourceforge.net/` namespace.

The value of the message attribute is the error message displayed if the assertion fails.

#### Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the [Custom Validation Engines preferences page](#). After a custom validation engine is [properly configured](#), it can be applied on the current document by selecting it from the list of custom validation engines in the  **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the [output message format](#) of Oxygen XML Author for linked messages:

- **LIBXML** - Included in Oxygen XML Author (Windows edition only). It is associated to XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. Support for [XML Catalogs](#) (the `--catalogs` parameter) and XInclude processing (`--xinclude`) are enabled by default in the preconfigured LIBXML validator. The `--postvalid` parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the `--dtdvalid ${ds}` parameter manually to the DTD validation command line. `${ds}` represents the detected DTD declaration in the XML document.

**CAUTION:** File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in [XML Catalog](#) files of the predefined document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Author is installed in the default location on Windows (C : \Program Files) because the built-in [XML catalog](#) files are stored in the `frameworks` subfolder of the installation folder and in this case, the file path contains at least one space character.

**Attention:** On OS X, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

- **Saxon-EE** - Included in Oxygen XML Author. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be [configured in Preferences](#).
- **MSXML 4.0** - Included in Oxygen XML Author (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **MSXML.NET** - Included in Oxygen XML Author (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **XSV** - Not included in Oxygen XML Author. Windows and Linux distributions of XSV can be downloaded from <http://www.cogsci.ed.ac.uk/~ht/xsv-status.html>. The executable path is [already configured in Oxygen XML Author](#) for the `[OXYGEN_INSTALL_DIR]/xsv` installation folder. If it is installed in a different folder, the predefined executable path must be [corrected in Preferences](#). It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.

- **SQC (Schema Quality Checker from IBM)** - Not included in Oxygen XML Author. It can be downloaded [from here](#) (it comes as a .zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory `[OXYGEN_INSTALL_DIR]/sqc`. If it is installed in a different folder, the predefined executable path and working directory must be [corrected in the Preferences page](#). It is associated to XSD Editor.

A custom validator cannot be applied on files loaded through an [Oxygen XML Author custom protocol plugin](#) developed independently and added to Oxygen XML Author after installation.

#### Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Author window. If such an output message (**warning, error, fatal error**, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type:** [F|E|W] (the string *Type*: followed by a letter for the type of the message: fatal error, error, warning). This property is optional in a linked message.
  - **SystemID:** A system ID of a file (the string *SystemID*: followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
  - **Line:** A line number (the string *Line*: followed by the number of the line that will be highlighted).
  - **Column:** A column number (the string *Column*: followed by the number of the column where the highlight will start on the highlighted line). This property is optional in a linked message.
  - **EndLine:** A line number (the string **EndLine**: followed by the number of the line where the highlight ends). This property is optional in a linked message.
  - **EndColumn:** A column number (the string **EndColumn**: followed by the number of the column where the highlight ends on the end line). This property is optional in a linked message.
- Note:** The **Line/Column** pair works in conjunction with the **EndLine/EndColumn** pair. Thus, if both pairs are specified, then the highlight starts at **Line/Column** and ends at **EndLine/EndColumn**. If the **EndLine/EndColumn** pair is missing, the highlight starts from the beginning of the line identified by the **Line** parameter and ends at the column identified by the **Column** parameter.
- **AdditionalInfoURL:** The URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
  - **Description:** Message content (the string *Description*: followed by the content of the message that will be displayed in the output view).

#### Example:

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/errors.html#errorID
Description: custom validator message
```

#### Validation Scenarios

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Author validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and `param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `chunk-code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without being redefined.

Validating chunk-code .xsl as an individual XSLT stylesheet generates misleading errors in regards to parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and in which it is validated. To validate such a module, define a validation scenario to set the main module of the stylesheet and the validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 6.5, Xalan, and MSXML 4.0 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Author (Saxon 9) or any connection to a database that supports validation (Berkeley DB XML Database, eXist XML Database, Documentum xDB (X-Hive/DB) 10 XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document in which the *master file* includes smaller fragment files using XML entity references.

**Note:** If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see [Master Files Support](#) on page 418 or [Working with Modular XML Files in the Master Files Context](#) on page 644.

For more information about how to use a validation scenario in Oxygen XML Author, watch our video demonstration:

#### Related Information:

[Validating XML Documents Against a Schema](#) on page 608

[Presenting Validation Errors in Author Mode](#) on page 269

[Presenting Validation Errors in Text Mode](#) on page 217

#### Creating a New Validation Scenario

To create a validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document** > **Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the [Project View](#) on page 199).

The **Configure Validation Scenario(s)** dialog box is displayed. It contains predefined and user-defined scenarios. The predefined scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework* are rendered in bold.

**Note:** If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see [Master Files Support](#) on page 418 or [Working with Modular XML Files in the Master Files Context](#) on page 644.

**Figure 324: Configure Validation Scenario Dialog Box**

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the  **Settings** button allows you to configure the following options:

**Show all scenarios**

Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**

Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

**Show associated scenarios**

Select this option to only display the scenarios associated with the document you are editing.

 **Import scenarios**

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Author adds `imported` to the name of the imported scenario.

 **Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. To add a scenario, click the **New** button.  
The **New scenarios** dialog box is displayed and it lists all the validation units for the scenario.

**Figure 325: Create New Validation Scenario**

This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**Storage**

You can choose between storing the scenario in the *Project Options* or *Global Options*.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an *editor variable* or a *custom editor variable*.

```

${Desktop} - My Desktop
${start-dir} - Start directory of custom validator
${standard-params} - List of standard params for command line
${cfm} - The current file name without extension
${currentFileURL} - The path of the currently edited file (URL)
${cfdu} - The path of current file directory (URL)
${frameworks} - Oxygen frameworks directory (URL)
${pdu} - Project directory (URL)
${oxygenHome} - Oxygen installation directory (URL)
${home} - The path to user home directory (URL)
${pn} - Project name
${env(VAR_NAME)} - Value of environment variable VAR_NAME
${system(var.name)} - Value of system variable var.name

```

**Figure 326: Insert an Editor Variable**

**File type**

The type of the document that is validated in the current validation unit. Oxygen XML Author automatically selects the file type depending on the value of the **URL of the file to validate** field.

## Validation engine

You can select one of the engines available in Oxygen XML Author for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page](#), [XML Schema preferences page](#)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the **DITA Maps Manager**  [Validate and Check for Completeness action](#), but for a local file rather than an entire [DITA map](#)).

The **Table Layout Validation** engine looks for table layout problems (for more information, see [Report table layout problems](#) on page ).

## Automatic validation

If this option is selected, the validation operation defined by this row is also applied by [the automatic validation feature](#). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#), then this option is ignored, as the preference setting has a higher priority.

## Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

### Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

Figure 327: Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

### Use detected schema

Uses the [schema detected for the particular document](#).

### Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

#### ⬆ **Move Up**

Moves the selected scenario up one spot in the list.

#### ⬇ **Move Down**

Moves the selected scenario down one spot in the list.

#### **Add**

Adds a new validation unit to the list.

#### **Remove**

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
4. Press **OK**.  
The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and press the **Apply associated** button to run the validation scenario.

#### *Editing a Validation Scenario*

To edit an existing validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the [Project View](#) on page 199).

The **Configure Validation Scenario(s)** dialog box is displayed. It contains predefined and user-defined scenarios. The predefined scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework* are rendered in bold.

**Note:** If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see [Master Files Support](#) on page 418 or [Working with Modular XML Files in the Master Files Context](#) on page 644.

**Figure 328: Configure Validation Scenario Dialog Box**

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the  **Settings** button allows you to configure the following options:

**Show all scenarios**

Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**

Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

**Show associated scenarios**

Select this option to only display the scenarios associated with the document you are editing.

 **Import scenarios**

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Author adds `imported` to the name of the imported scenario.

 **Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and press the **Edit** button. If you try to edit one of the *read-only* predefined scenarios, you will receive a warning message that Oxygen XML Author needs to create a customizable duplicate (you can also use the **Duplicate** button). The **Edit scenario** dialog box is displayed and it lists all the validation units for the scenario.

**Figure 329: Edit Validation Scenario**

This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**Storage**

You can choose between storing the scenario in the *Project Options* or *Global Options*.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an *editor variable* or a *custom editor variable*.

```

${_Desktop} - My Desktop
${start-dir} - Start directory of custom validator
${standard-params} - List of standard params for command line
${cfn} - The current file name without extension
${currentFileURL} - The path of the currently edited file (URL)
${cfdu} - The path of current file directory (URL)
${frameworks} - Oxygen frameworks directory (URL)
${pdu} - Project directory (URL)
${oxygenHome} - Oxygen installation directory (URL)
${home} - The path to user home directory (URL)
${pn} - Project name
${env(VAR_NAME)} - Value of environment variable VAR_NAME
${system(var.name)} - Value of system variable var.name

```

**Figure 330: Insert an Editor Variable**

**File type**

The type of the document that is validated in the current validation unit. Oxygen XML Author automatically selects the file type depending on the value of the **URL of the file to validate** field.

## Validation engine

You can select one of the engines available in Oxygen XML Author for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page](#), [XML Schema preferences page](#)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the **DITA Maps Manager**  [Validate and Check for Completeness action](#), but for a local file rather than an entire [DITA map](#)).

The **Table Layout Validation** engine looks for table layout problems (for more information, see [Report table layout problems](#) on page ).

## Automatic validation

If this option is selected, the validation operation defined by this row is also applied by [the automatic validation feature](#). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#), then this option is ignored, as the preference setting has a higher priority.

## Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

### Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

**Figure 331: Specify Schema Dialog Box**

The **Specify Schema** dialog box contains the following options:

### Use detected schema

Uses the [schema detected for the particular document](#).

### Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

#### ↑ Move Up

Moves the selected scenario up one spot in the list.

#### ↓ Move Down

Moves the selected scenario down one spot in the list.

#### Add

Adds a new validation unit to the list.

#### Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
4. When you are done configuring the scenario, press **OK**.  
The modified validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word *copy* at the end of its name.

### Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by saving them at *project level* or by *exporting them to a specialized scenarios file* that can then be imported. When you create a new validation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options** or **Global Options**.

Storage:  Project Options  Global Options

Selecting **Project Options** stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options** stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing validation scenarios by using the **Change storage** action from the contextual menu of the list of scenarios.

[Sharing Application Settings](#) on page 157

### Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an *XML Catalog*.

For example, if the XML document contains a reference to a remote schema docbook . rng like this:

```
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
  type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
```

```
uri="rng/docbook.rng"/>
```

An *XML Catalog* can also be used to map a W3C XML Schema specified with a URN in the `xsi:schemaLocation` attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

the URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
  uri="topic.xsd"/>
```

### Validation Example - A DocBook Validation Error

In the following DocBook 4 document, the content of the `listitem` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
  "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
  <title>Article Title</title>
  <sect1>
    <title>Section1 Title</title>
    <itemizedlist>
      <listitem>
        <link>a link here</link>
      </listitem>
    </itemizedlist>
  </sect1>
</article>
```

The  **Validate Document** action will return the following error:

```
Unexpected element "link". The content of the parent element type must match
"(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist

```

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `listitem` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that “The content of element type must match”.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to lookup the element and read about it. In this case, you should learn about the child elements of `listitem` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

## XML Quick Fixes

The Oxygen XML Author [Quick Fix support](#) helps you resolve errors that appear in an XML document by offering *Quick Fixes* to problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and **Author** mode

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals may be presented in a tooltip pop-up window and the available quick *Quick Fixes* include a link that can be used to perform the fix.

Figure 332: Quick Fix Presented in a Tooltip in Text Mode

Figure 333: Quick Fix Presented in a Tooltip in Author Mode

- When hovering over the error or warning in **Author** mode, a small *Quick Fix* drop-down menu is presented. You can use the drop-down menu to display a list of available *Quick Fixes* to select from for the particular error or warning.

Figure 334: Quick Fix Drop-Down Menu in Author Mode

- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Author displays the list of available fixes.

Figure 335: Quick Fix Menu Invoked by Clicking on the 💡 Icon

- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Alt + 1 on OS X)** on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of *Quick Fixes* is recomputed to ensure that you always have valid proposals.

**Note:** A *Quick Fix* that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the [Content Completion preferences](#) are configured.

### Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Author offers *Quick Fixes* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:** For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

*Quick Fixes* are available in **Text** mode and **Author** mode.

Oxygen XML Author provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

#### Related Information:

[Schematron Quick Fixes \(SQF\)](#) on page 626

#### Schematron Quick Fixes (SQF)

Oxygen XML Author provides support for Schematron [Quick Fixes](#) (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog post: <http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html>.

#### Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode and **Author** mode.

Figure 336: Example of a Schematron Quick Fix

#### Related Information:

[Schematron Quick Fix Specifications](#)

### Associating a Schema to XML Documents

Oxygen XML Author relies on schemas to validate XML documents and to compute valid proposals for the [Content Completion Assistant](#).

#### Supported Types of Schema

The following schema types are supported:

- W3C XML Schema 1.0 and 1.1 (with and without embedded Schematron rules)
- DTD
- Relax NG - XML syntax (with and without embedded Schematron rules)
- Relax NG - compact syntax
- NVDL
- Schematron (both ISO Schematron and Schematron 1.5)

### Detecting a Schema

For the purposes of using validation and content completion mechanisms, Oxygen XML Author tries to detect a schema by searching multiple locations, in the following order:

- The *schema defined in a validation scenario*.
- The *schema defined in the validation scenarios associated with the particular document type* (if defined).
- The *schema that is associated directly in the XML document*.

**Note:** If a DTD schema is specified in the document, the content completion for **Author** mode is based on this schema (even if there is already one detected from the validation scenario).

- The *schema defined in the framework (document type) configuration*.

In addition, the locations of the schema can be mapped through the use of an [XML Catalog](#). For more information, see [Resolving Schema Locations Through XML Catalogs](#) on page 634.

**Tip:** To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

### Related Information:

[Working with Modular XML Files in the Master Files Context](#)

### Associating a Schema Through a Validation Scenario

Oxygen XML Author uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in [validation scenarios](#) and there are several methods that can be used to do so.

### Configure a Validation Scenario and Specify the Schema

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the [Project View](#) on page 199).
2. Press the **New** button to create a new validation scenario or the **Edit** button to modify an existing one.
3. [Add or configure validation units](#) according to your needs and click the  **Specify Schema** button.

**Step Result:** The **Specify Schema** dialog box is displayed:

**Figure 337: Specify Schema Dialog Box**

The **Specify Schema** dialog box contains the following options:

**Use detected schema**

Uses the *schema detected for the particular document*.

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
5. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with that validation scenario whenever it is invoked.

**Use the Validate with Action to Specify a Schema for Validating the Current Document**

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **Document > Validate** menu).

**Step Result:** The **Validate with** dialog box is displayed:

**Figure 338: Validate with Dialog Box**

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
  - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
  - **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
  - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
  - **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* to be used during the validation.
  - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.
  3. Click **OK**.

**Result:** The current document is validated using the schema you specified.

**Tip:** To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

### Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the **Project** view .
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

**Step Result:** The **Validate with** dialog box is displayed:

**Figure 339: Validate with Dialog Box**

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  ▾ **Browse** drop-down list.
  - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
  - **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
  - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
  - **Extensions** - Opens a dialog box that allows you to specify *Java extension JARs* to be used during the validation.
  - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.
  4. Click **OK**.

**Result:** The selected documents are validated using the schema you specified.

### Associating a Schema in Validation Scenarios Defined in the Document Type

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Author uses rules defined in the schema that is detected in the validation scenarios that are associated to each particular document type.

To associate a schema in validation scenarios defined in the *framework* (document type) configuration, follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)** and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing *framework* (or use the **New** button to create a new one).

**Step Result:** This opens a *Document type configuration dialog box*.

3. Go to the **Validation tab**.
4. Create or edit a validation scenario:
  - a. To *create a new validation scenario*, click the  **New** button.
  - b. To *edit the properties of an existing validation scenario*, select it and click the  **Edit** button (you can also use the  **Duplicate** button to copy an existing scenario and edit its properties).
5. *Add or configure validation units* according to your needs and click the  **Specify Schema** button.

**Step Result:** The **Specify Schema** dialog box is displayed:

**Figure 340: Specify Schema Dialog Box**

The **Specify Schema** dialog box contains the following options:

#### **Use detected schema**

Uses the *schema detected for the particular document*.

#### **Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.

7. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with the validation scenario you just configured for that particular document type.

### **Associating a Schema Directly in XML Documents**

#### **Associate Schema Action**

The schema used by the *Content Completion Assistant* and document validation engine can be associated with the current document by using the  **Associate Schema** action. For most of the schema types, it uses *the xml-model processing instruction*, with the exceptions of:

- **W3C XML Schema** - The `xsi:schemaLocation` attribute is used.
- **DTD** - The DOCTYPE declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of *framework* level.

To associate a schema to the current document, follow these steps:

1. Select the  **Associate Schema** action from the toolbar (or **Document > Schema** menu).

**Step Result:** The **Associate Schema** dialog box is displayed:

**Figure 341: Associate Schema Dialog Box**

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).
  - **Use path relative to file location** - Select this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.
  - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
  - **Add additional association for embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
  - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
  - **Keep existing schema associations** - Select this option to use the existing schema associations of the currently edited document.
2. Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.
  3. Click **OK**.

**Result:** The schema association is created based upon the specified type.

- **XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
  - `xsi:schemaLocation` attribute, if the root element of the document sets a default namespace with an `xmlns` attribute.
  - `xsi:noNamespaceSchemaLocation` attribute, if the root element does not set a default namespace.

- **DTD** - The association with a DTD is added as a DOCTYPE declaration.
- **Other** - The association with a Relax NG, Schematron, or NVDL schema is added as [xml-model processing instruction](#).

**Tip:** To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

### Associate Schema with the xml-model Processing Instruction

The `xml-model` processing instruction associates a schema with the XML document that contains the processing instruction. It must be added at the beginning of the document, just after the XML prolog. The following code snippet contains an `xml-model` processing instruction declaration:

```
<?xml-model href="../../../schema.sch" type="application/xml"
  schematypens="http://purl.oclc.org/dsdl/schematron" phase="ALL"
  title="Main schema"?>
```

It is available in the [Content Completion Assistant](#), before XML document root element, and includes the following attributes:

- `href` (required) - The schema file location.
- `type` - The content type of the schema. This is an optional attribute with the following possible values for each specified type:
  - DTD - The recommended value is `application/xml-dtd`.
  - W3C XML Schema - The recommended value is `application/xml`, or can be left unspecified.
  - RELAX NG XML Syntax - The recommended value is `application/xml`, or can be left unspecified.
  - RELAX NG Compact Syntax - The recommended value is `application/relax-ng-compact-syntax`.
  - Schematron - The recommended value is `application/xml`, or can be left unspecified.
  - NVDL - The recommended value is `application/xml`, or can be left unspecified.
- `schematypens` - The namespace for the schema language of the referenced schema with the following possible values:
  - DTD - Not specified.
  - W3C XML Schema - The recommended value is `http://www.w3.org/2001/XMLSchema`.
  - RELAX NG XML Syntax - The recommended value is `http://relaxng.org/ns/structure/1.0`.
  - RELAX NG Compact Syntax - Not specified.
  - Schematron - The recommended value is `http://purl.oclc.org/dsdl/schematron`.
  - NVDL - The recommended value is `http://purl.oclc.org/dsdl/nvdl/ns/structure/1.0`.
- `phase` - The phase name for the validation function in Schematron schema. This is an optional attribute. To run all phases from the Schematron, use the special **#ALL** value. If the phase is not specified, the default phase that is configured in the Schematron will be applied.
- `title` - The title for the associated schema. This is an optional attribute.

Older versions of Oxygen XML Author used the oxygen processing instruction with the following attributes:

- `RNGSchema` - Specifies the path to the Relax NG schema that is associated with the current document.
- `type` - Specifies the type of Relax NG schema. It is used along with the `RNGSchema` attribute and can have the value **xml** or **compact**.
- `NVDLSchema` - Specifies the path to the NVDL schema that is associated with the current document.
- `SCHSchema` - Specifies the path to the SCH schema that is associated with the current document.

**Note:** Documents that use the oxygen processing instruction are compatible with newer versions of Oxygen XML Author.

[Validating XML Documents](#) on page 607

[Content Completion Assistant in Text Mode](#) on page 455

[Content Completion Assistant in Author Mode](#) on page 505

## Associating a Schema in a Framework (Document Type) Configuration

The schema used to compute valid proposals in the *Content Completion Assistant* and by the document validation engine to report errors and warnings can be defined in each particular *framework* (document type). This schema will be used only if one is not *detected in the current XML file*.

To associate a schema in a particular *framework* (document type), follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)** and go to **Document Type Association**.
2. Select your particular document type and click the **Edit, Extend**, or **Duplicate** button to modify an existing *framework* (or use the **New** button to create a new one).

**Step Result:** This opens a *Document type configuration dialog box*.

3. Go to the **Schema tab**.
4. Select the schema type and its URI.
5. Click **OK**.

**Result:** The schema is now associated with the particular document type and will be used by the *Content Completion Assistant* and validation engine if a schema is not detected in the current XML document.

## Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an *XML Catalog*. Oxygen XML Author resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (*uri, uriSuffix, rewriteUri, delegateUri* mappings from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Resolve schema locations also through system mappings option** is selected, it attempts to resolve the schema location as a system ID (*system, systemSuffix, rewriteSuffix, rewriteSystem* from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Process "schemaLocation" namespaces through URI mappings for XML Schema option** is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the *schemaLocation* attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual *schema location* is used.

### Related Information:

[Working with XML Catalogs](#) on page 647

## Learn Document Structure when Schema is not Detected

When working with documents that do not specify a schema, or for which the schema is not known or does not exist, Oxygen XML Author is able to learn and translate the document structure to a DTD. You can choose to save the learned structure to a file to provide a DTD as an initialization source for *content completion* and *document validation*. This feature is also useful for producing DTDs for documents that contain personal or custom element types.

When you open a document that is not associated with a schema, Oxygen XML Author automatically learns the document structure and uses it for *content completion*. To disable this feature, deselect the **Learn on open document option in the user preferences**.

### Related Information:

[Detecting a Schema](#) on page 626

## Create a DTD from Learn Document Structure Option

When there is no schema associated with an XML document, Oxygen XML Author can learn the document structure by parsing the document internally. This feature is enabled by the **Learn on open document option** that is available in the user preferences.

To create a DTD from the learned structure, follow these steps:

1. Open the XML document for which a DTD will be created.
2. Go to **Document > XML Document > Learn Structure (Ctrl + Shift + L (Command + Shift + L on OS X))**.

The **Learn Structure** action reads the mark-up structure of the current document. The **Learn completed** message is displayed in the application status bar when the action is finished.

3. Go to **Document > XML Document > Save Structure (Ctrl + Shift + S (Command + Shift + S on OS X))** and enter the DTD file path.
4. Press the **Save** button.

## Finding and Replacing Text

This section presents the find and replace features available in Oxygen XML Author.

- The [Find/Replace in Files feature](#) enables you to define *Search for* or *Search for and Replace* operations across multiple files.
- The [Find/Replace dialog box](#) allows you to search through the current project or selected resources and offers a set of options to improve your search.
- The [Find All Elements/Attributes dialog box](#) allows you to search through the structure of the current document for elements and attributes.
- As an alternative to the dedicated search operations, you can also use the [Quick Find toolbar](#).

### Related Information:

[Open/Find Resource Dialog Box](#) on page 424

[Open/Find Resource View](#) on page 205

### Find/Replace Dialog Box

To open the **Find/Replace** dialog box, use the  **Find/Replace** action that is available in the **Find** menu, on the toolbar, or by pressing **Ctrl + F (Command + F on OS X)**. It is also invoked by the **Find/Replace** contextual menu action found in certain views.

You can use the **Find/Replace** dialog box to perform the following operations:

- Replace occurrences of target defined in the **Find** area with a new fragment of text defined in **Replace with** area.
- Find all the occurrences of a word or string of characters (that can span over multiple lines) in the document you are editing. This operation also takes into account all the whitespaces contained in the fragment you are searching for. The **Find/Replace** dialog box counts the number of occurrences of the text you are searching for and displays it at the bottom of the dialog box, above the **Close** button. This number is also displayed in [the Results view](#) after you press the **Find All** button.

The *find* operation works on multiple lines, meaning that a find match can cover characters on multiple lines of text. To input multiple-line text in the **Find** and **Replace with** areas, do one of the following:

- Press **Ctrl + Enter (Command + Enter on OS X)** on your keyboard.
- Use the **Insert newline** contextual menu action.

You can use [Perl-like regular expressions syntax](#) to define patterns. A content completion assistance window is available in the **Find** and **Replace with** areas to help you edit regular expressions. It is activated every time you type `\`(backslash key) or on-demand if you press **Ctrl + Space (Command + Space on OS X)** on your keyboard.

The *replace* operation can bind regular expression capturing groups (`$1`, `$2`, etc.) from the find pattern.

**Tip:** To replace the tag-name start tag and its attributes with the new-tag-name tag use as **Find** the expression `<tag-name(\s+)(.*)>` and as **Replace with** the expression `<new-tag-name$1$2>`.

The **Find/Replace** dialog box contains the following options:

- **Find** - The target character string to search for. You can search for Unicode characters specified in the `\uNNNN` format. Also, hexadecimal notation (`\xNNNN`) and octal notation (`\0NNNN`) can be used. In this case you have to select the [Regular expression option](#). For example, to search for a space character you can use the `\u0020` code.
- **Replace with** - The character string with which to replace the target. The string for replace can be on a line or on multiple lines. It can contain Perl notation capturing groups, only if the search expression is a regular expression and the [Regular expression option](#) is selected.

**Note:** Some regular expressions can indefinitely block the application. If the execution of the regular expression does not end in about 5 seconds, the application displays a dialog box that allows you to interrupt the operation.

**Tip:** Special characters such as *newline* and *tab* can be inserted in the **Find** and **Replace with** text boxes using dedicated actions in the contextual menu (**Insert newline** and **Insert tab**).

Unicode characters in the \uNNNN format can also be used in the **Replace with** area.

- The  **History** button - Contain lists of the last find and replace expressions. Use the **\* Clear history** action from the bottom of the lists to remove these expressions.

- **XPath** - The XPath 2.0 expression you input in this combo is used for restricting the search scope.

**Note:** The *Content Completion Assistant* helps you input XPath expressions, valid in the current context.

- **Direction** - Specifies if the search direction is from current position to end of file (**Forward**) or to start of file (**Backward**).
- **Scope** - Specifies whether the **Find/Replace** operation is executed over the entire content of the edited document (**All** option), or over the selected content (**Only selected content** option in **Author** mode or **Only selected lines** in **Text** mode).
- **Case sensitive** - When selected, the search operation follows the exact letter case of the text entered in the **Find** field.
- **Whole words only** - Only entire occurrences of a word are included in the search operation. This option is automatically disabled if the *Regular expression option* is selected.
- **Incremental** - The search operation is started every time you type or delete a letter in the **Find** text box.
- **Regular expression** - When this option is selected, you can use regular expressions in *Perl-like regular expressions syntax* to look for specific pieces of text.
  - **Dot matches all** - A dot used in a regular expression also matches end of line characters.
  - **Canonical equivalence** - If selected, two characters will be considered a match if, and only if, their full *canonical* decompositions match. For example, the ã symbol can be inserted as a single character or as two characters (the a character, followed by the tilde character). This option is not selected by default.
- **Wrap around** - When the end of the document is reached, the search operation is continued from the start of the document, until its entire content is covered.
- **Enable XML search options** - This option is only available when editing in **Text** mode. It provides access to a set of options that allow you to search specific XML component types:
  - **Element names** - Only the element names are included in the search operation that ignores XML-tag notations (<', '/', '>'), attributes or white-spaces.
  - **Element contents** - Search in the text content of XML elements.
  - **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
  - **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
  - **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').
  - **PIs (Processing Instructions)** - Only the content is searched, skipping '<?', '?>'. e. g.: `<?processing instruction?>`
  - **CDATA** - Searches inside content of CDATA sections.
  - **DOCTYPE** - Searches inside content of DOCTYPE sections.
  - **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

**Note:** Even if you select all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, deselect **Enable XML search options**.

- **Find All Elements** - Available when editing in **Author** mode, you can use this link to extend the search scope to XML-specific markup (names and values of both attributes and elements).
- **Find** - Executes a find operation for the next occurrence of the target. It stops after highlighting the find match in the editor panel.

- **Replace** - Executes a replace operation for the target followed by a find operation for the next occurrence.
- **Find All** - Executes a find operation and displays all results in the [Results view](#). The results are *displayed in the Results view*.
- **Replace All** - Executes a replace operation in the entire scope of the document.
- **Replace to End** - Executes a replace operation starting from current target until the end of the document, in the direction specified by the current selection of the **Direction** switch (**Forward** or **Backward**).

### Find/Replace in Multiple Files

The **Find/Replace in Files** feature enables you to define *Search for* or *Search for and Replace* operations across multiple files (for example, in DITA projects you can search in the scope of an entire [DITA map](#)). To open the **Find/Replace in Files** dialog box, use the  **Find/Replace in Files** action that is available in the following locations:

- The **Find** menu.
- The main toolbar.
- The contextual menu of the [DITA Maps Manager view](#).
- The contextual menu of the [Project view](#).
- The contextual menu of the [Data Source Explorer view](#) for most types of database connections.

The operation works on both local and remote files from an (S)FTP, WebDAV or [CMS](#) server.

### Accepted Search Pattern Notes

- You can use [Perl-like regular expression syntax](#) to match patterns in text content. The *replace* operation can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.
- Exclusion patterns are accepted. For example, \*.java, !\*Test.java would search for all files with a .java extension, with the exception of any file whose name ends in *Test*.
- To replace the tag-name start tag and its attributes with the new-tag-name tag use as **Text to find** the expression `<tag-name(\s+)(.*)>` and as **Replace with** the expression `<new-tag-name$1$2>`.

### Other Notes

- The encoding used to read and write the files is detected from the XML header or from the BOM. If a file does not have an XML header or BOM Oxygen XML Author uses by default the UTF-8 encoding for files of type XML, that is for files with one of the extensions: .xml, .xsl, .fo, .xsd, .rng, .nvd1, .sch, .wsd1 or [an extension associated with the XML editor type](#). For the other files it uses [the encoding configured for non-XML files](#).
- You can cancel a long operation at any time by pressing the **Cancel** button of the progress dialog box displayed when the operation is executed.
- Since the content of read-only files cannot be modified, the **Replace** operation does not process those files. For every such file, a warning message is displayed in the message panel.

## Find/Replace in Files Dialog Box

Figure 342: Find / Replace in Files Dialog Box

The dialog box contains the following options:

- **Text to find** - The target character string to search for. You can search for Unicode characters specified in the `\uNNNN` format. Also, hexadecimal notation (`\xNNNN`) and octal notation (`\0NNNN`) can be used. In this case you have to select the **Regular expression** option. For example, to search for a space character you can use the `\u0020` code.
- **Case sensitive** - When selected, the search operation follows the exact letter case of the value entered in the **Text to find** field.
- **Whole words only** - Only entire occurrences of a word are included in the search operation. This option is automatically disabled if either the **Ignore extra whitespaces** or **Regular expression** options are selected.
- **Ignore extra whitespaces** - If selected, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation.
- **Regular expression** - When this option is selected, you can use regular expressions in *Perl-like regular expressions syntax* to look for specific pieces of text.
  - **Dot matches all** - A dot used in a regular expression also matches end of line characters.
  - **Canonical equivalence** - If selected, two characters will be considered a match if, and only if, their full *canonical* decompositions match. For example, the ã symbol can be inserted as a single character or as two characters (the a character, followed by the tilde character). This option is not selected by default.
- **XPath** - The XPath 2.0 expression you input in this combo is used for restricting the search scope.

**Note:** The *Content Completion Assistant* helps you input XPath expressions, valid in the current context.

- **Enable XML search options** - This option is only available when editing in **Text** mode. It provides access to a set of options that allow you to search specific XML component types:
  - **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.
  - **Element contents** - Search in the text content of XML elements.
  - **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
  - **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
  - **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').
  - **PIs (Processing Instructions)** - Only the content is searched, skipping '<?', '?>'. e. g.: <?processing instruction?>
  - **CDATA** - Searches inside content of CDATA sections.
  - **DOCTYPE** - Searches inside content of DOCTYPE sections.
  - **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

**Note:** Even if you select all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, deselect **Enable XML search options**.

- **Replace with** - The character string with which to replace the target. It may contain regular expression group markers if the search expression is a regular expression and the **Regular expression** checkbox is selected.
- **Make backup files with extension** - In the replace process Oxygen XML Author makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.
- **Selected project resources** - Searches only in the selected files of the currently opened project. This option is not displayed when this dialog box is opened from the contextual menu of the *DITA Maps Manager view* and *Archive Browser view*.
- **Project files** - Searches in all files from the current project. This option is not displayed when this dialog box is opened from the contextual menu of the *DITA Maps Manager view* and *Archive Browser view*.
- **All opened files** - Searches in all files opened in Oxygen XML Author (regular files or *DITA maps*). You are prompted to save all modified files before any operation is performed. This option is not displayed when this dialog box is started from the contextual menu of the *DITA Maps Manager view* and *Archive Browser view*.
- **Current file directory** - The search is done in the directory of the file opened in the current editor panel. If there is no opened file, this option is not available. Also, this option is not displayed when this dialog box is opened from the contextual menu of the *DITA Maps Manager view* and *Archive Browser view*.
- **Current DITA Map hierarchy** - The search is done in all maps and topics referenced by the currently selected *DITA map*, opened in the *DITA Maps Manager view*.
- **Opened archive** - The search is done in an archive opened in the *Archive Browser view*. Displayed only when this dialog box is opened from the *Archive Browser view*.
- **Specified path** - Chooses the search path.
- **Include files** - Narrows the scope of the operation only to the files that match the given filters.
- **Recurse subdirectories** - When selected, the search is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the search is also performed in the hidden files.
- **Include archives** - When selected, the search is also done in all individual file entries from all supported ZIP-type archives.
- **Show separate results for each search expression** - When selected, the application opens a new tab to display the result of each new search expression. When the option is unchecked, the search results are displayed in the *Find in Files* tab, replacing any previous search results.
- **Find All** - Executes a find operation and returns the result list to the message panel. The results are *displayed in a view* that allows grouping the results as a tree with two levels.
- **Replace All** - Replaces all occurrences of the target contained in the specified files.

When you replace a fragment of text, Oxygen XML Author provides a preview of the changes you make. The **Preview** dialog box is divided in two sections. The first section presents a list of all the documents containing the fragment of text you want to modify. The second section offers a view of the original file and a view of the final result. It also allows you to highlight all changes using the vertical bar from the right side of the view. The **Next change** and **Previous change** buttons allow you to navigate through the changes displayed in the **Preview** dialog box.

**CAUTION:** Use this option with caution. Global search and replace across all project files does not open the files containing the targets, nor does it prompt on a per occurrence basis, to confirm that a replace operation must be performed. As the operation simply matches the string defined in the find field, this may result in replacement of matching strings that were not originally intended to be replaced.

### Find All Elements Dialog Box

To open the **Find All Elements** dialog box, go to **Find > Find All Elements (Ctrl + Shift + E (Command + Shift + E on OS X))** or from the shortcut **Find All Elements** that is available in [the Find / Replace dialog box](#). It assists you in defining XML element / attribute search operations in the current document.

**Figure 343: Find All Elements Dialog Box**

The dialog box can perform the following actions:

- Find all the elements with a specified name
- Find all the elements that contain, or does not contain, a specified string in their text content
- Find all the elements that have a specified attribute
- Find all the elements that have an attribute with, or without, a specified value

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

- **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify *any* element name, leave the field empty.  
**Note:** Use the qualified name of the element (`<namespace prefix>:<element name>`) when the document uses this element notation.
- **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For *any* element text, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements with no text will be found. Select **not contains** to find all elements that do not include the specified text.
- **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For *any* or no attribute name, leave the field empty.  
**Note:** Use the qualified name of the attribute (`<namespace prefix>:<attribute name>`) when the document uses this attribute notation.

- **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For *any* or no attribute value, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select **not contains** to find all elements that have attributes without a specified value.
- **Case sensitive** - When this option is selected, operations are case-sensitive.

When you press **Find All**, Oxygen XML Author tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

### Quick Find Toolbar

A reduced version of the [Find / Replace dialog box](#) is available as a [dockable toolbar](#). To display it press the **Alt + Shift + F (Command + Alt + F on OS X)** key combination or invoke the **Find > Quick Find** action. By default, the toolbar is displayed at the bottom of the Oxygen XML Author window, above the status bar, but can be changed at any time by dragging (and docking) it to a different location. To hide the toolbar, use the **Close** button.

All matches are highlighted in the current editor.

**Figure 344: Quick Find Toolbar**

The toolbar offers the following controls:

- **Search input box** - This is where you can insert the text you want to search for. The input box keeps a history of the last used search text. The background color of the input box turns red when no match is found.
- **Next** - Advances to the next match. You can also use the **Enter** key to jump forward to the next match.
- **Previous** - Jumps to the previous match. You can also use **Shift+Enter** to jump backward to the previous match.
- **All** - Highlights all matches of the search string in the current document.
- **Incremental** - If selected, the search operation is started every time you type or delete a character in the search input box.
- **Case sensitive** - If selected, the search operation follows the exact letter case of the search text.
- **Find/Replace** - Opens the [Find/Replace dialog box](#).
- **Find/Replace in Files** - Opens the [Find/Replace in Files dialog box](#).
- **Close** - Closes the **Quick Find** toolbar.

### Keyboard Shortcuts for Finding the Next and Previous Match

Navigating from one match to the next or previous one is very easy to perform using the **F3** and **Shift + F3 (Command + Shift + G on OS X)** keyboard shortcuts. They are useful for quickly repeating the last find action performed in the [Find / Replace dialog box](#), taking into account the same find options.

**Restriction:** These shortcuts only take XPath expressions into account if the **Find / Replace** dialog box remains opened. Once you close it, the XPath expressions are no longer considered.

### Regular Expressions Syntax

Oxygen XML Author uses the [Java regular expression syntax](#). It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Author does not support the following constructs:

- The conditional constructs  $(\{X\})$  and  $(\{condition\}X|Y)$ .
- The embedded code constructs  $(\{code\})$  and  $(\{?code\})$ .
- The embedded comment syntax  $(\#comment)$ .
- The preprocessing operations  $\backslash l$ ,  $\backslash u$ ,  $\backslash L$ , and  $\backslash U$ .

When using regular expressions, note that some sets of characters from [XPath/XML Schema/Schematron](#) are slightly different than the ones used by Oxygen XML Author/Java in the text searches from the [Find/Replace dialog box](#) and [Find/Replace in Files dialog box](#). The most common example is with the  $\backslash w$  and  $\backslash W$

set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the [Find/Replace dialog box](#) and [Find/Replace in Files dialog box](#):

- `/w` - `[#x0000-#x10FFFF] - [\p{P}\p{Z}\p{C}]` instead of `\w`
- `/W` - `[\p{P}\p{Z}\p{C}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc ]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

## Search and Refactoring Actions for IDs and IDREFS

Oxygen XML Author allows you to search for ID declarations and references (IDREFS) and to [define the scope of the search and refactor operations](#). These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In **Text** mode, these actions are also available in the [Quick Assist](#) menu.

The search and refactor actions from the contextual menu are grouped in the **Manage IDs** section:

### **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and [choose the scope of the rename operation](#). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

### **Rename in File**

Renames the ID you are editing and all its occurrences from the current file.

**Note:** Available in the **Text** mode only.

### **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### **Search References in**

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

### **Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

**Note:** Available in the **Text** mode only.

## Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

**Note:** Available in the **Text** mode only.

## Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

**Tip:** A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on OS X)** navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Author collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

**Figure 345: Selecting an ID in the Author Mode**

[Working with Modular XML Files in the Master Files Context](#)

## Search and Refactor Operations Scope

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the  **Change scope** operation, available in the *Quick Assist* action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple [working sets](#). The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the [Master Files support](#).

**Figure 346: Change Scope Dialog Box**

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* structure.

## Working with Modular XML Files in the Master Files Context

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Author provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the *master files*.

You can set a main XML document either using the *master files support from the Project view*, or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Author warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a *master file* include:

- Correct validation of a module in the context of a larger XML structure.
- *Content Completion Assistant* displays all collected entities and IDs starting from the *master files*.
- Oxygen XML Author uses the schema defined in the *master file* when you edit a module that is included in the hierarchy through the *External Entity* mechanism.
- The *master files* defined for the current module determines the *scope of the search and refactoring actions* for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Author performs the search and refactoring actions in the context that the *master files* determine, improving the speed of execution.

For more information about editing modular XML files in the *master files* context, watch our video demonstration:

### Related Information:

[Master Files Support](#) on page 418

[XML Resource Hierarchy/Dependencies View](#) on page 645

## XML Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to easily see the hierarchy / dependencies for an XML document. The tree structure presented in this view is built based on the *Xlinclude* and *External Entity* mechanisms. To define the scope for calculating the dependencies of a resource, click  **Configure dependencies search scope** on the **Resource Hierarchy/Dependencies** toolbar.

To open this view, go to **Window > Show View > Resource Hierarchy/Dependencies** . As an alternative, right-click the current document and either select **Resource Hierarchy** or **Resource Dependencies**.

**Figure 347: Resource Hierarchy/Dependencies View - Hierarchy for Syncro phone v1.xml**

The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

**Figure 348: Resource Hierarchy/Dependencies View - Dependencies for Insert battery.xml**

The following actions are available in the **Resource Hierarchy/Dependencies** view:

-  **Refresh**  
Refreshes the Hierarchy/Dependencies structure.
-  **Stop**  
Stops the hierarchy/dependencies computing.

### **Show Hierarchy**

Allows you to choose a resource to compute the hierarchy structure.

### **Show Dependencies**

Allows you to choose a resource to compute the dependencies structure.

### **Configure**

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

### **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

#### **Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

#### **Copy location**

Copies the location of the resource.

#### **Move resource**

Moves the selected resource.

#### **Rename resource**

Renames the selected resource.

#### **Show Resource Hierarchy**

Shows the hierarchy for the selected resource.

#### **Show Resource Dependencies**

Shows the dependencies for the selected resource.

### **Add to Master Files**

Adds the currently selected resource in [the Master Files directory](#).

#### **Expand All**

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

#### **Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

**Note:** The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource](#). Only the references made through the *XInclude* and *External Entity* mechanisms are handled.

#### **Related Information:**

[Working with Modular XML Files in the Master Files Context](#) on page 644

[Search and Refactor Operations Scope](#) on page 643

### **Moving/Renaming XML Resources**

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.

- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

## Working with XML Catalogs

Oxygen XML Author uses *XML Catalogs* to resolve references for validations and transformations and they are especially helpful for resolving external resources when internet access is not available or your connection is slow.

Oxygen XML Author supports any *XML Catalog* file that conforms to one of the following:

1. *OASIS XML Catalogs Committee Specification v1.1*.
2. *OASIS Technical Resolution 9401:1997*, including the plain-text flavor described in that resolution.

The version 1.1 of the *OASIS XML Catalog* specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements *systemSuffix* and *uriSuffix*.

Depending on the resource type, Oxygen XML Author uses different catalog mappings.

**Table 15: Catalog Mappings**

Doc Type	Referenced Resource	Mappings
XML	DTD	<i>system</i> or <i>public</i> The <b>Prefer option</b> controls which one of the mappings should be used.
	XML Schema	The following strategy is used (if one step fails to provide a resource, the next is applied):  <ol style="list-style-type: none"> <li>1. resolve the schema using <i>URI</i> catalog mappings.</li> <li>2. resolve the schema using <i>system</i> catalog mappings.</li> </ol> This happens only if the <b>Resolve schema locations also through system mappings option</b> is selected (it is by default).  <ol style="list-style-type: none"> <li>3. resolve the root <i>namespace</i> using <i>URI</i> catalog mappings.</li> </ol>
	Relax NG	
	Schematron	
	NVDL	
XSL	XSL/ANY	<i>URI</i>
CSS	CSS	<i>URI</i>
XML Schema	XML Schema	The following strategy is used (if one step fails to provide a resource, the next is applied):  <ol style="list-style-type: none"> <li>1. resolve schema reference using <i>URI</i> catalog mappings.</li> <li>2. resolve schema reference using <i>system</i> catalog mappings.</li> </ol> This happens only if the <b>Resolve schema locations also through system mappings option</b> is selected (it is by default).  <ol style="list-style-type: none"> <li>3. resolve schema <i>namespace</i> using <i>URI</i> catalog mappings.</li> </ol> This happens only if the <b>Process namespaces through URI mappings for XML Schema option</b> is selected (it is not by default).
Relax NG	Relax NG	

## Creating an XML Catalog with a Template

An *XML Catalog* file can be created quickly in Oxygen XML Author starting from the two document templates called *OASIS XML Catalog 1.0* and *OASIS XML Catalog 1.1*. They are available when [creating new document templates](#).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog
  PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
  "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">

<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">

  <!-- Use "system" and "public" mappings when resolving DTDs -->
  <system
    systemId="http://www.docbook.org/xml/4.4/docbookx.dtd"
    uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>

  <!-- "systemSuffix" matches any system ID ending in a specified string -->
  <systemSuffix
    systemIdSuffix="docbookx.dtd"
    uri="frameworks/docbook/dtd/docbookx.dtd"/>

  <!-- Use "uri" for resolving XML Schema and XSLT stylesheets -->
  <uri
    name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
    uri="frameworks/docbook/5.0/rng/docbookxi.rng"/>

  <!-- The "uriSuffix" matches any URI ending in a specified string -->
  <uriSuffix
    uriSuffix="docbook.xsl"
    uri="frameworks/docbook/xsl/fo/docbook.xsl"/>

</catalog>
```

## How Oxygen XML Author Determines which Catalog to Use

Oxygen XML Author uses *XML Catalogs* to resolve references for validations and transformations and it maps such references to the built-in local copies of the schemas associated with the various *frameworks* (DocBook, DITA, TEI, XHTML, SVG, etc.)

Oxygen XML Author includes default global catalogs as well as default catalogs for each of the built-in *frameworks*, and you can also create your own.

Oxygen XML Author looks for catalogs in the following order:

- Global user-defined catalogs that are set in the [XML Catalog preferences page](#).
- User-defined catalogs that are set for each *frameworks* in the [Catalog tab](#) of the [Document Type configuration dialog box](#).
- Default built-in catalogs.

### Example:

An *XML Catalog* can be used to map a W3C XML Schema specified with an URN in the `xsi:noNamespaceSchemaLocation` attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

The URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
  uri="topic.xsd"/>
```

### Related Information:

[XML Catalog Preferences](#) on page 111

## Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an *XML Catalog*. Oxygen XML Author resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri`, `uriSuffix`, `rewriteUri`, `delegateUri` mappings from the *XML Catalog*). If this succeeds, the process ends here.
- If the [Resolve schema locations also through system mappings option](#) is selected, it attempts to resolve the schema location as a system ID (`system`, `systemSuffix`, `rewriteSuffix`, `rewriteSystem` from the *XML Catalog*). If this succeeds, the process ends here.
- If the [Process "schemaLocation" namespaces through URI mappings for XML Schema option](#) is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the `schemaLocation` attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual [schema location](#) is used.

**Related Information:**

[Working with XML Catalogs](#) on page 647

## Editing Large XML Documents with DTD Entities or XInclude

Consider the case of documenting a large project. It is likely that there will be several people involved. The resulting document can be few megabytes in size. The question becomes how to deal with this amount of data in such a way that work parallelism will not be affected.

Fortunately, XML provides two solutions for this: **DTD Entities** and **XInclude**. A master document can be created, with references to the other document parts, containing the document sections. The users can edit the documents individually, then apply an XSLT stylesheet over the master and obtain the output files in various formats (for example, PDF or HTML).

### Including Document Parts with DTD Entities

There are two conditions for including a part using DTD entities:

- The master document should declare the DTD to be used, while the external entities should declare the XML sections to be referenced.
- The document containing the section must not define again the DTD.

A master document looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [
<!ENTITY testing SYSTEM "testing.xml" > ]
>
<book>
<chapter> ...
```

The referenced document looks like this:

```
<section> ... here comes the section content ... </section>
```

**Note:**

The indicated DTD and the element names (*section*, *chapter*) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

At a certain point in the master document there can be inserted the section *testing.xml* entity:

```
... &testing; ...
```

When splitting a large document and including the separate parts in the [master file](#) using external entities, only the *master file* will contain the Document Type Definition (DTD) or other type of schema. The included sections can not define the schema again because the main document will not be valid. If you want to validate the parts separately you have to [use XInclude](#) for assembling the parts together with the *master file*.

### Including Document Parts with XInclude

XInclude is a standard for assembling XML instances into another XML document through inclusion. It enables larger documents to be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files in the [master file](#). XInclude is targeted as the replacement for External Entities. The advantage of using XInclude is that, unlike the entities method, each of the assembled documents is

permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE. as is the case with External Entities. This makes XInclude a more convenient and effective method for managing XML instances that need to be stand-alone documents and part of a much larger project.

The main application for XInclude is in the document-oriented content such as manuals and Web pages. Employing XInclude enables you to manage content in a modular fashion that is akin to Object Oriented methods used in languages such as Java, C++ or C#.

The advantages of modular documentation include: reusable content units, smaller file units that are easier to be edited, better version control and distributed authoring.

The XInclude support in Oxygen XML Author is enabled by default. It is controlled by the [Enable XInclude processing option](#) in the [XML > XML Parser preferences page](#). When enabled, Oxygen XML Author will be able to validate and transform documents comprised of parts added using XInclude.

### **Example: Using XInclude to Include a Chapter in an Article**

Chapter file (introduction.xml) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE chapter PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.oasis-open.org/docbook/xml/4.3/docbookx.dtd">
<chapter>
  <title>Getting started</title>
  <section>
    <title>Section title</title>
    <para>Para text</para>
  </section>
</chapter>
```

Main article file looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.docbook.org/xml/4.3/docbookx.dtd"
[ <!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/xinclude.mod">
%xinclude;
]>
<article>
  <title>Install guide</title>
  <para>This is the install guide.</para>
  <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
             href="introduction.xml">
    <xi:fallback>
      <para>
        <emphasis>FIXME: MISSING XINCLUDE CONTENT</emphasis>
      </para>
    </xi:fallback>
  </xi:include>
</article>
```

In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the *xi* namespace to certain elements defined by the DocBook DTD.
- The href attribute of the *xi:include* element specifies that the `introduction.xml` file will replace the *xi:include* element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the *xi:fallback* element - a FIXME message.

### **Example: Include only a Fragment**

If you want to include only a fragment of a file in the *master file*, the fragment must be contained in a tag having an `xml:id` attribute and you must use an XPointer expression pointing to the `xml:id` value.

**Notice:** Oxygen XML Author supports the [XPointer Framework](#) and the [XPointer element\(\) Scheme](#), but it does NOT support the [XPointer xpointer\(\) Scheme](#).

For example, if the *master file* is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
```

```
<xi:include href="a.xml" xpointer="a1"
  xmlns:xi="http://www.w3.org/2001/XInclude" />
</test>
```

and the `a.xml` file is:

```
<?xml version="1.0" encoding="UTF-8"?>
<test>
  <a xml:id="a1">test</a>
</test>
```

after resolving the XPointer reference the document is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
  schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
  <a xml:id="a1" xml:base="a.xml">test</a>
</test>
```

## XInclude 1.1 Features

Oxygen XML Author offers partial support for XInclude 1.1 features. This includes support for fragment identifiers and attribute copying.

- **Fragment Identifiers**

You can `xi:include` a text file and specify the `@fragid` value so that you only get part of that text file in the main document. For some examples and to see how `xi:include` gets expanded when the `@fragid` specifies a line range or character range, see [Textual Inclusion Examples with RFC5147 Fragment Identifiers](#).

- **Attribute Copying**

Any *namespaced* attribute defined on the `xi:include` element will be passed to the root element of the included content.

For example, if you have this:

```
<xi:include href="section2.xml" xmlns:xi="http://www.w3.org/2001/XInclude"
  xml:id="sectInner1" />
```

and `section2.xml` looks like this:

```
<sect2 xmlns="http://docbook.org/ns/docbook" version="5.0"
  xmlns:xlink="http://www.w3.org/1999/xlink" xml:id="section2">
  <title>FS2</title>
  <para>P2</para>
</sect2>
```

then the final processed result will have the original `xml:id="section2"` replaced with the value specified in the *xi:included* section.

For more information, see [Attribute Copying when Processing XML](#). Also, to see more examples, see [Attribute Copying Examples](#).

## Viewing Status Information

Status information generated by operations such as *schema detection*, *manual validation*, *automatic validation*, and *transformations* are fed into the **Information** view, allowing you to monitor how the operation is being executed.

**Figure 349: Information view messages**

Messages contain a timestamp, the name of the thread that generated it and the actual status information. The number of displayed messages can be controlled with the *Maximum number of lines* option in the **Views** preference page.

To make the view visible, select **Window > Show View > Information**.

## Making a Persistent Copy of Results

The *Results view* displays the results from the following operations:

- *document validation*
- *checking the form of documents*
- *XSLT or FO transformation*
- *find all occurrences of a string in a file*
- *find all occurrences of a string in multiple files*
- *applying an XPath expression to the current document*

To make a persistent copy of the *Results view*, use one of these actions:

### File > Save Results

Displays the **Save Results** dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the **Results** panel.

### File > Print Results

Displays the **Page Setup** dialog box used to define the page size and orientation properties for printing the result list of the current **Results** panel. The action is also available on the right-click menu of the **Results** panel.

### Save Results as XML from the contextual menu

Saves the content of the **Results** panel in an XML file with the format:

```
<Report>
  <Incident>
    <engine>The engine who provide the error.</engine>
    <severity>The severity level</severity>
    <Description>Description of output message.</Description>
    <SystemID>The location of the file linked to the message.</SystemID>
    <Location>
      <start>
        <line>Start line number in file.</line>
        <column>Start column number in file</column>
      </start>
    <end>
      <line>End line number in file.</line>
  </Incident>
</Report>
```

```
<column>End column number in file<column>
</start>
</Location>
</Incident>
</Report>
```

### Related Information:

[Results View](#) on page 214

## Editor Highlights

An *editor highlight* is a text fragment emphasized by a colored background.

Highlights are generated in both **Text** and **Author** mode when the following actions generate results:

- [Find/Replace in Files](#)
- [Find/Replace](#)
- [Open/Find Resource](#)
- **Find All**
- [Find All Elements](#)
- [XPath in Files](#)

By default, Oxygen XML Author uses a different color for each type of highlight (*XPath in Files*, *Find/Replace*, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the [Editor preferences page](#). The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the editor pane.
- Clicking the **Next** and **Previous** buttons () from the bottom of the range ruler, located at the right side of the editor pane.

**Note:** When there are multiple types of highlights in the document, the **Next** and **Previous** buttons () navigate through highlights of the same type.

- Clicking the messages displayed in the [Results view](#) at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the  **Remove all** button from bottom of the range ruler, located at the right side of the editor pane.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the  **Remove all** button on the right side of the [Results panel](#) at the bottom of the editor.

**Note:** Use the  **Highlight all results in editor** button (on the right side of the **Results** panel) to either display all the highlights or hide them.

## Printing a Document

Printing is supported in **Text**, **Author**, and **Grid** modes.

The **Print**(**Ctrl + P** (**Command + P on OS X**)) action that is available from **File** menu displays a series of dialog boxes that allow you to configure print settings. After defining the settings in each dialog box, click **OK** to continue to the next one.

A **Print Preview** action is also available in the **File** menu. It first opens a **Page Setup** dialog box where you can define some paper, orientation, and margin settings. After you click **OK**, it displays the **Print Preview** dialog box where you can see a preview of how the document will look when it is printed..

Figure 350: Print Preview Dialog Box

The main window is split in three sections:

- **Preview area** - Displays the formatted document page as it will appear on printed paper.
- **Left stripe** - The left-side stripe that displays a list of thumbnail pages. Clicking any of them displays the page content in the main preview area.
- **Toolbar** - The toolbar area at the top that contains controls for printing, page settings, page navigation, print scaling, and zoom.

### Other Printing Features

- If you are printing a document that is opened in the **Author** visual editing mode, you can use the *CSS print media type* to change the styling in the printed output.
- If you are printing a document that is opened in **Author** mode and it contains *Tracked Changes*, you can print (or print preview) a copy of the document as if all changes have been accepted by switching the *Track Changes Visualization Mode* to **View Final**.
- If you are printing a document that is opened in **Text** mode and line numbers are displayed (the *Show line numbers option* is selected), the printed output will include the line numbers.
- If you are printing an XML document that is opened in **Text** mode and the *folding support* is activated (the *Enable folding option* is selected), the printed output will include the current *folded* state. Note that this applies to printing an entire document and not selections within the document.
- If you are printing an XML document that is opened in **Text** mode and a block of content is selected, you have the ability to print only the selection of text rather than the entire document. When you invoke the print action with a block of content selected in **Text** mode, a dialog box will be presented that offers you the choice to print the selection or the entire document.

## Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Author includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

### XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the  **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the [Project view](#).
- The **Refactoring** submenu from the contextual menu in the [DITA Maps Manager view](#).

**Note:** The predefined refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Author considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were *finished* or *previewed* also appear in the **Refactoring** submenu of the contextual menu in the **Project view** and the **DITA Maps Manager**.

### XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

#### Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

**Figure 351: XML Refactoring Wizard**

### Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

**Figure 352: XML Refactoring 2nd Wizard Page (Delete Attribute Operation)**

### Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

**Figure 353: XML Refactoring - Scope and Filters Wizard Page**

### Scope section

In the **Scope** section, you can select from predefined resource sets (such as the current file, your whole project, the current *DITA map* hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a *working set*.

### Filters

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

### Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

### Finish

After clicking the **Finish** button, the operation will be processed and Oxygen XML Author provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

**Trouble:** If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

**Tip:** If an operation takes longer than expected you can use the  **Stop** button in the progress bar to cancel the operation.

### Predefined Refactoring Operations

The XML Refactoring tool includes a variety of predefined operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Author considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

**Tip:** Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following predefined operations are available:

### Refactoring Operations for *Attributes*

#### Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
  - **Local name** - The local name of the affected attribute.
  - **Namespace** - The namespace of the affected attribute.
  - **Value** - The value for the affected attribute.
- **Options** section
  - You can choose between one of the following options for the **Operation mode**:
    - **Add the attribute in the parent elements where it is missing**
    - **Change the value in the parent elements where the attribute already exists**
    - **Both**

#### Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
  - **Local name** - The local name of the affected attribute.
  - **Namespace** - The namespace of the affected attribute.
- **New element** section
  - **Local name** - The local name of the new element.
  - **Namespace** - The namespace of the new element.

#### Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be deleted.

#### Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be renamed.
- **New local name** - The new local name of the attribute.

#### Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

- **Target attribute** section
  - **Element** - The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
  - **Attribute** - The name of the attribute to be modified.
- **Find / Replace** section
  - **Find** - The text fragments to find. You can use Perl-like regular expressions.
  - **Replace with** - The text fragment to replace the target with. This parameter can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

## Refactoring Operations for *Comments*

### Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

- **Element** - The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:** Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

## Refactoring Operations for *DITA*

### Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

### Convert conrefs to conkeyrefs

Use this operation to convert `conref` attributes to `conkeyref` attributes. For more information and instructions for using this operation, see [Converting Conrefs to Conkeyrefs](#) on page 1546.

### Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

### Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see [Converting DITA Topics to Another Type](#) on page 1509.

### Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see [Converting DITA Topics to Another Type](#) on page 1509.

### Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see [Converting DITA Topics to Another Type](#) on page 1509.

### Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see [Converting DITA Topics to Another Type](#) on page 1509.

### Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see [Converting DITA Topics to Another Type](#) on page 1509.

### Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see [Converting DITA Topics to Another Type](#) on page 1509.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.
- **Filters** section

- **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as \* or ?).
- **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
- **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

## Refactoring Operations for *Elements*

### Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element** - The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

### Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element** - The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

### Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element** section
  - **Local name** - The local name of the element to be inserted.
  - **Namespace** - The namespace of the element to be inserted.
- **Location** section
  - **XPath**- An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
  - **Position** - The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

### Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **New local name** - The new local name of the element.

### Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

- **Target elements (XPath)** - The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

### Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  - **Local name** - The local name of the *Wrapper element*.
  - **Namespace** - The namespace of the *Wrapper element*.

### Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  - **Local name** - The local name of the *Wrapper element* that will surround the content of the target.
  - **Namespace** - The namespace of the *Wrapper element* that will surround the content of the target.

## Refactoring Operations for *Fragments*

### Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment** - The XML fragment to be inserted.
- **Location** section
  - **XPath** - An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
  - **Position** - The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

### Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the content of the target element.

### Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the target element.

## Refactoring Operations for *JATSKit*

### Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

### Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

### Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as \* or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

## Additional Notes

**Note:** There are some operations that allow <ANY> for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the <NO\_NAMESPACE> value can be used to select nodes that do not belong to a namespace.

**Note:** Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the [Options > Preferences > XML > XSLT-FO-XQUERY > XPath](#) page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

## Storing and Sharing Refactoring Operations

Oxygen XML Author scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a *framework* you are customizing. To associate the parent directory to the *framework*, you need to add it in the [Classpath tab of the Document type configuration dialog box](#).
- A folder that you specify in the [Load additional refactoring operations from text box](#) in the [XML Refactoring preferences page](#).

**Note:** If you share a project with your team, you can also share the custom operation by doing the following:

1. Save the custom operation in a folder that is part of your project.
  2. Switch the **XML Refactoring** option page to [project level](#):
    - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to [XML > XML Refactoring](#).
    - b. Select [Project Options](#) at the bottom of the dialog box.
  3. In the [Load additional refactoring operations from text box](#), use the [\\${pd} editor variable](#) so that the folder path is declared relative to the project.
- A folder specified by the [XML Refactoring Operations Plugin Extension](#).
  - The refactoring folder from the Oxygen XML Author installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/`).

## Sharing Refactoring Operations

The purpose of Oxygen XML Author scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the refactoring operations to other resources, such as [framework](#) or projects.

After storing operations, you can share them with other users by sharing the resources.

## Localizing XML Refactoring Operations

Oxygen XML Author includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in `[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`.

## Editing CSS Stylesheets

---

Oxygen XML Author includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to [create new CSS documents or templates](#).
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.

- **Syntax highlighting** - The syntax highlighting in Oxygen XML Author makes CSS files more readable.
- **Shortcut to open resources** - You can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

## Validating CSS Stylesheets

Oxygen XML Author includes a built-in *CSS Validator*, integrated with general validation support. This makes the *usual validation features* for presenting errors also available for CSS stylesheets.

When you edit a CSS document, you can access the *CSS validator options* by selecting  **Validation options** from the **Document > Validate** menu.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in *the CSS validation preferences*. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the *CSS extensions specific for Oxygen* that can be used in *Author mode*. That means all Oxygen specific extensions are accepted in a CSS stylesheet by *the built-in CSS validator* when this profile is selected.

### Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

1. Create a file named `CustomProperties.xml` that has the following structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.oxygenxml.com/ns/css
  http://www.oxygenxml.com/ns/css/CssProperties.xsd"
  xmlns="http://www.oxygenxml.com/ns/css">
  <property name="custom">
    <summary>Description for custom property.</summary>
    <value name="customValue"/>
    <value name="anotherCustomValue"/>
  </property>
</css_keywords>
```

2. Go to your desktop and create the `builtin/css-validator/` folder structure.
3. Press and hold **Shift** and right-click anywhere on your desktop. From the contextual menu, select **Open Command Window Here**.
4. In the command line, run the `jar cvf custom_props.jar builtin/` command. The `custom_props.jar` file is created.
5. Go to `[OXYGEN_INSTALL_DIR]/lib` and create the endorsed folder. Copy the `custom_props.jar` file to `[OXYGEN_INSTALL_DIR]/lib/endorsed`.

## Content Completion in CSS Stylesheets

A *Content Completion Assistant*, similar to *the one available for XML documents* offers the CSS properties and the values available for each property. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property. The *Content Completion Assistant* also includes *code templates that can be used to quickly insert code fragments* into CSS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

The properties and values available are dependent on the CSS Profile selected in the *CSS preferences*. The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile *CSS 3 with Oxygen extensions* includes all the CSS 3 standard properties plus the *CSS extensions specific for Oxygen XML Author* that can be used in *Author mode*.

**Proposals for CSS Selectors** - After inserting a CSS *selector*, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

**Proposals for @media and @import Rules** - After inserting `@media` or `@import <url>` rules, the content completion assistance will propose a list of supported media types.

**Related Information:**

[Specify Custom CSS Properties](#) on page 663

## Syntax Highlighting in CSS Files

Oxygen XML Author supports syntax highlighting in CSS files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for CSS files, follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)**.
2. Go to **Editor > Syntax Highlight**.
3. Select and expand the **CSS** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

**Related Information:**

[Syntax Highlight Preferences](#) on page 102

## CSS Outline View

The **Outline** view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Author highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

## Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same [folding features available for XML documents](#) are also available in CSS stylesheets.

**Note:** To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

## Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the [format and indent operation available for XML documents](#) is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

## Minifying CSS Stylesheets

*Minification* (or *compression*) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Author opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Author performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

**Note:** The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

**Note:** To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **Document > Source** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

## Editing LESS Stylesheets

---

Oxygen XML Author provides support for stylesheets coded with the LESS dynamic stylesheet language. LESS extends the CSS language by adding features that allow mechanisms such as *variables*, *nesting*, *mixins*, *operators*, and *functions*. Oxygen XML Author offers additional LESS features that include:

- **Create new LESS files and templates** - You can use the built-in new file wizards to [create new LESS documents or templates](#).
- **Open and Edit LESS files** - LESS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in LESS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Compile to CSS** - Options are available to compile LESS files to CSS.
- **Syntax highlighting** - Oxygen XML Author supports syntax highlighting in LESS files, although there may be some limitations in supporting all the LESS constructs.
- **Shortcut to open resources** - While editing LESS files, you can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

For more information about LESS go to <http://lesscss.org/>.

## Validating LESS Stylesheets

Oxygen XML Author includes a built-in *LESS CSS Validator*, integrated with general validation support. The [usual validation features](#) for presenting errors also available for LESS stylesheets.

Oxygen XML Author provides three validation methods:

- Automatic validation as you type - marks validation errors in the document as you are editing.
- Validation upon request, by pressing the  **Validate** button from the  **Validation** toolbar drop-down menu. An error list is presented in the message panel at the bottom of the editor.
- Validation scenarios, by selecting  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu. Errors are presented in the message panel at the bottom of the editor. This is useful when you need to validate the current file as part of a larger LESS import hierarchy (for instance, you may change the URL of the file to validate to the root of the hierarchy).

## Content Completion in LESS Stylesheets

A [Content Completion Assistant](#) offers the LESS properties and the values available for each property. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property in a LESS file. The *Content Completion Assistant* also includes [code templates](#)

[that can be used to quickly insert code fragments](#) into LESS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

The properties and values available are dependent on the CSS Profile selected in the [CSS preferences](#).

## Syntax Highlighting in LESS Files

Oxygen XML Author supports syntax highlighting in LESS files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for LESS files, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#).
2. Go to [Editor > Syntax Highlight](#).
3. Select and expand the **LESS** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

### Related Information:

[Syntax Highlight Preferences](#) on page 102

## Compiling LESS Stylesheets to CSS

When editing LESS files, you can compile the files into CSS. Oxygen XML Author provides both manual and automatic options to compile LESS stylesheets into CSS.

**Important:** The LESS processor works well only with files having the *UTF-8* encoding. Thus, it is highly recommended that you always use the *utf-8* encoding when working with LESS files or the files they import (other LESS or CSS files). You can use the following directive at the beginning of your files:

```
@charset "utf-8";
```

You have two options for compiling LESS files to CSS:

1. Use the contextual menu in a LESS file and select **Compile to CSS (Ctrl + Shift + C (Command + Shift + C on OS X))**.
2. Select the [Automatically compile LESS to CSS when saving option](#) in the settings ([open the Preferences dialog box \(Options > Preferences\)](#)) and go to **Editor > Open/Save > Save Hooks**. If selected, when you save a LESS file it will automatically be compiled to CSS (this option is deselected by default).

**Important:** If this option is selected, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

## Editing StratML Documents

---

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Author supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- **Strategic Plan** (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** - (StratML Part 2)
- **Strategic Plan** - (StratML Part 2)

You can view the components of a StratML document in the [Outline view](#). Oxygen XML Author implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

## Editing XLIFF Documents

XLIFF (*XML Localization Interchange File Format*) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Author provides the following support for editing XLIFF documents:

XLIFF Version 1.2 and 2.0 Support:

- New file templates for XLIFF documents.
- A default CSS file (`xliff.css`) used for rendering XLIFF content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/css/`.
- Validation and content completion support using local catalogs. The default catalog (`catalog.xml`) for version 1.2 is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/1.2`, and for version 2.0 in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0`.

XLIFF Version 2.0 Enhanced Support:

- Support for validating XLIFF 2.0 documents using modules. The default modules are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0/modules`.

## Editing JavaScript Documents

This section explains the features of the Oxygen XML Author JavaScript Editor and how you can use them.

### JavaScript Editing Actions

Oxygen XML Author allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

```
90 function change_sides(front) {
91     switch ($('#version-switch').text()) {
92         case 'Original':
93             $('#holder').html($('#div .original[id]').html());
94             make_clickable();
95             $('#version-switch').text('Translation 1');
96             break;
97         case 'Translation 1':
98             $('#holder').html($('#div .translation[id]').filter(':first').html());
99             $('#version-switch').text('Translation 2');
100            break;
101         case 'Translation 2':
102             $('#holder').html($('#div .translation[id]').filter(':last').html());
103             $('#version-switch').text('Original');
104             break;
105     }
106 }
```

Figure 354: JavaScript Editor Text Mode

The contextual menu of the **JavaScript** editor offers the following actions:

**Cut**

Allows you to cut fragments of text from the editing area.

**Copy**

Allows you to copy fragments of text from the editing area.

**Paste**

Allows you to paste fragments of text in the editing area.

### →! Toggle Comment

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

### →! Toggle Line Comment

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

### Go to Matching Bracket

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Author moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

**Note:** A rectangle decorates the opening or closing bracket that matches the current one, at all times.

### Source

Allows you to select one of the following actions:

#### To Lower Case

Converts the selection content to lower case characters.

#### To Upper Case

Converts the selection content to upper case characters.

#### Capitalize Lines

Converts to upper case the first character of every selected line.

#### Join and Normalize Lines

Joins all the rows you select to one row and normalizes the content.

#### Insert new line after

Inserts a new line after the line at the cursor position.

### Modify all matches

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### Open

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

### Compare

Select this option to open the **Compare Files** tool to compare the file you are editing with a file you choose in the dialog box.

### Folding

When you invoke the contextual menu from the *folding* triangles in the stripe on the left side of the editor, the following actions are available:

#### ▶ Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

#### ▶ Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))

Folds the elements indented with one level inside the current element.

#### ▶ Expand Child Folds

Unfolds all child elements of the currently selected element.

## **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**

Unfolds all elements in the current document.

## Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Author uses the Mozilla Rhino library for validation. For more information about this library, go to <http://www.mozilla.org/rhino/doc.html>. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Author can validate a JavaScript document both on-request and automatically.

## Content Completion in JavaScript Documents

When you edit a JavaScript document, the *Content Completion Assistant* presents you a list of the elements you can insert at the cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

-  - function
-  - variable
-  - object
-  - property
-  - method

**Note:** These icons decorate both the elements from the content completion list of proposals and from the *Outline view*.

```
12 function newPage(filename, overlay) {
13     divs = document.getElementsByTagName("div");
14
15     if (divs) {
16         var xdiv = divs[0];
17
18         if (xdiv) {
19             var xid =  TypeInfo - TypeInfo
20                  UIEvent - UIEvent
21                  UserDataHandler - UserDataHandler
22             if (mytoc)  alert(msg)
23             mytoc.lastU  blur()
24                  clearInterval(id_setinterval)
25                  clearTimeout(id_settimeout)
26             var tdiv
27
28             if (tdiv) {
29                 var ta = tdiv.getElementsByTagName("a").item(0);
30                 ta.style.textDecoration = "underline";
31                 mytoc.lastUnderlined = ta;
32             }
33         }
34     }
35
36     if (overlay != 0) {
37         overlaySetup('lc');
38     }
}
```

**Figure 355: JavaScript Content Completion Assistant**

The *Content Completion Assistant* collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

## Syntax Highlighting in JavaScript Documents

Oxygen XML Author supports syntax highlighting in JavaScript files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for JavaScript files, follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)**.
2. Go to **Editor > Syntax Highlight**.
3. Select and expand the **JavaScript** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

### Related Information:

[Syntax Highlight Preferences](#) on page 102

## JavaScript Outline View

Oxygen XML Author present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 356: JavaScript Outline View**

The following icons decorate the elements in the **Outline** view depending on their type:

-  - function
-  - variable
-  - object
-  - property
-  - method

The contextual menu of the JavaScript **Outline** view contains the usual  **Cut**,  **Copy**,  **Paste**, and  **Delete** actions. From the  **Settings** menu, you can select the **Update selection on cursor move** option to synchronize the **Outline** view with the editing area.

## Editing SVG Files

SVG (Scalable Vector Graphics) is a platform for two-dimensional graphics. It has two parts: an XML-based file format and a programming API for graphical applications. Some of the key features include support for shapes, text, and embedded raster graphics with many painting styles, scripting through languages such as *ECMAScript*, and support for animation.

SVG is a vendor-neutral, open standard that has important industry support. Companies such as Adobe, Apple, and IBM have contributed to its W3C specifications. Many documentation *frameworks* (including DocBook) have support for SVG by defining the graphics directly in the document.

Oxygen XML Author adds SVG support by using the *Batik distribution* package (an open source project developed by the Apache Software Foundation) and the *default XML Catalog* resolves the SVG DTD.

**Note:** Batik partially supports SVG 1.1. For a detailed list of supported elements, attributes, and properties, see the *Batik Implementation Status* page.

### How to Render SVG Images that Use Java Scripting

1. Copy the `js.jar` library from the *Batik distribution* into the Oxygen XML Author `lib` folder.
2. Restart the application.

### SVG 1.2 Rendering Issues

Oxygen XML Author uses the *Apache Batik* open source library to render SVG images and it only has partial support for SVG 1.2. For more information, see <http://xmlgraphics.apache.org/batik/dev/svg12.html>.

This partial support could lead to some rendering issues in Oxygen XML Author. For example, if you are using the *Inkscape* SVG editor, it is possible for it to save the SVG as 1.1, while using SVG 1.2 elements (such as `flowRoot`) inside it. This means that the image will not be properly rendered inside the application.

**Note:** SVG images shown in the **Author** visual editing mode are rendered as static images, without support for animations and JavaScript.

## Standalone SVG Viewer

Oxygen XML Author includes a simple **SVG Viewer** that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

Figure 357: SVG Viewer

You can browse for and open any SVG file that has the `.svg` or `.svgz` extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the *Project view* and selecting **Open with > SVG Viewer**.

## Actions Available in the SVG Viewer

The following actions are available in the **SVG Viewer**:

### Zoom in

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on OS X)** keyboard shortcut.

### Zoom out

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

### Rotate

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

### Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on OS X)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

### Move

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

### Pan

To pan an image, **click and drag** the image with your mouse.

### Related Information:

[Editing SVG Files](#) on page 671

## Integrated SVG Viewer in the Results Panel

Oxygen XML Author includes an integrated **SVG Viewer** that can render the results of an XSLT transformation scenario that generates SVG images in the **Results panel** at the bottom of the editor. This is useful for developing XSL stylesheets with the capability of producing SVG graphics.

To enable this feature, select **Show in results view as > SVG** in the **Output tab of the XSLT transformation scenario configuration dialog box**. When you run the transformation, the SVG result is then rendered in an integrated SVG viewer in the **Results panel**.

### Example of a Use-Case

Suppose you have an XML document that describes the evolution of your sales over a time period and you want to create a graphic for it. You could use the following steps to accomplish this task:

1. Start with a static SVG image, written directly in Oxygen XML Author or exported from an external graphics tool.
2. Extract the parts that are dependent upon the data from the XML document and create an XSL template to produce the image.
3. Create an **XML transformation with XSLT scenario**.
4. While configuring the transformation scenario, select **Show in results view as > SVG in the Output tab** of the configuration dialog box.

## 5. Run the transformation.

The SVG image is rendered in an integrated SVG viewer in the [Results panel](#) at the bottom of the editor.

Figure 358: Integrated SVG Viewer

## Editing XHTML Documents

Oxygen XML Author provides support for editing XHTML files. Oxygen XML Author includes XHTML catalogs and document templates to help you get started. You can also find a sample file in the `[OXYGEN_INSTALL_DIR]/samples/xhtmll` folder.

The XHTML editing features include:

- **Source Editing** - You can edit XHTML files in the [Text editing mode](#) (XML source editor) using all of its [useful features](#).
- **Visual Editing** - You can edit XHTML files in the [visual Author editing mode](#) using all of its [authoring features](#).
- **Validation** - Easily identify errors and their location with the Oxygen XML Author [XML validation features](#).
- **Content Completion** - The [Content Completion Assistant](#) displays a list of context-sensitive proposals that are valid at the current cursor position. In **Text** mode, it can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut, while in **Author** mode, it is activated by simply pressing **Enter**.
- **Import HTML as XHTML** - Oxygen XML Author includes support for [importing HTML files as an XML document](#).
- **Remote Editing** - Oxygen XML Author has built-in support for [editing documents that are stored on remote servers through FTP, SFTP, and WebDAV protocols](#), allowing you to edit XHTML pages from your web server.
- **Syntax Highlighting** - XHTML documents with embedded CSS, JS, PHP, and JSP scripts are rendered with dedicated coloring schemes. To customize them, [open the Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Syntax Highlight](#). Select and expand the **XHTML** section in the top pane and you can see the effects of your changes in the **Preview** pane.

## Editing Markdown Documents

**Markdown** was created as a lightweight markup language with plain text formatting syntax designed to provide a syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Author provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common amongst most Markdown applications, the editor in Oxygen XML Author also integrates many other

powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in *DITA maps* and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

## Markdown Editor

Oxygen XML Author provides an intuitive, dynamic, and easy-to-use Markdown editor for writing and converting Markdown documents. It is a split-screen editor with two panels that are synchronized in real-time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

### Markdown Text Editor Pane (Left Side)

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Author.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Author uses *an integration of rules* that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Author syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even *customize the colors and styles for the syntax highlighting*.
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Author *automatic spell checking feature* that reports possible misspelled words as you type. You simply need to select the **Automatic spell check option in the Spell Check preferences page**, then click the **Select editors** button and select **Markdown Editor**.
- **Helpful Toolbar and Contextual Menu Actions** - A *variety of unique actions* are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.
- **Shortcut Keys** - Many of the *shortcut keys that are most commonly used* in Oxygen XML Author also work in the Markdown editor.

### WYSIWYG Preview Pane (Right Side)

The right pane is a WYSIWYG *Preview* pane that shows a visual representation of how changes made in the left-side text editor will be converted to HTML or DITA output. The changes you make in the text editor are parsed continually and they are immediately visible in the *Preview* pane. There are two tabs available in the *Preview* pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The *Preview* pane includes the following unique features:

- **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.
- **Export Options** - The **DITA** tab includes a contextual menu action to *export (convert) the current Markdown document to a DITA topic*. Similarly, the **HTML** tab includes a contextual menu action to *export (convert) it to an XHTML document*.
- **Automatic Validation** - As you edit Markdown documents, they are *validated automatically*. The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the *Preview* pane or **Results view** at the bottom of the editor.

- **Print Feature** - The Markdown editor includes a **Print** action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the *Preview* pane.
- **Preview Markup** - The Markdown editor includes a **Tags Display Mode drop-down menu** that is available on the toolbar and it allows you to control the amount of markup that is displayed in the *Preview* pane.
- **Specialized DITA Features** - The Markdown editor includes some unique, *specialized features to integrate it with the powerful DITA support* in Oxygen XML Author.

- [Actions Available in the Markdown Editor](#) on page 676
- [Working with Markdown Documents in DITA](#) on page 681
- [Creating New Markdown Documents](#) on page 675

**Creating New Markdown Documents**

To create a new Markdown document in Oxygen XML Author, follow these steps:

1. Click the **New** button on the toolbar or select **File > New**.
2. Select the **Markdown** file template (in the **New Document** folder).
3. Click the **Create** button.

**Result:** A new Markdown document is created and it is opened in the specialized *Markdown Editor*.

## Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Author for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

### Toolbar Actions

The following default actions are readily available on the toolbar when editing Markdown documents:

#### H<sub>1</sub> Header (1st Level)

Inserts an *atx-style first level header* at the cursor position.

#### H<sub>2</sub> Header (2st Level)

Inserts an *atx-style second level header* at the cursor position.

#### H<sub>3</sub> Header (3rd Level)

Inserts an *atx-style third level header* at the cursor position.

#### — Horizontal Rule

Inserts a *horizontal rule* at the cursor position.

#### Ⓐ Bold (Strong)

Marks the selected text with *bold*.

#### Ⓘ Italic (Emphasis)

Marks the selected text with *italics*.

#### Ⓢ Strikethrough

Marks the selected text with a *strikethrough*.

#### { } Code Block

Inserts (or surrounds selected text in) a *codeblock*.

#### ”” Blockquote

Inserts a *blockquote* at the cursor position.

#### 🔗 Insert Link

Opens the **Insert Link** dialog box that allows you to define a *link* to insert at the cursor position.

**Figure 360: Insert Link Dialog Box**

#### 🖼️ Insert Image

Opens the **Insert Image** dialog box that allows you to define an *image* to insert at the cursor position. You can type the URL of the image you want to insert or use browsing tools in the 📁 **Browse** drop-down menu.

**Figure 361: Insert Link Dialog Box**

### **Insert Ordered List**

Inserts an *ordered list* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an ordered list.

### **Insert Unordered List**

Inserts an *unordered list* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an unordered list.

### **Insert Task List**

Inserts a *task list* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to a task list.

### **Insert Table**

Inserts a *table* at the cursor position.

### **Tags Display Mode drop-down menu**

Allows you to control the amount of markup that is displayed in the *Preview* pane and offers the following choices:

#### **Full Tags with Attributes**

Displays full tag names with attributes for both *block* and *inline* elements.

#### **Full Tags**

Displays full tag names without attributes for both *block* and *inline* elements.

#### **Block Tags**

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

#### **Inline Tags**

Displays full tag names for *inline elements*, while *block elements* are not displayed.

#### **Partial Tags**

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

#### **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### **Configure Tags Display Mode**

Opens the [Author preferences page](#) where you can configure options in regards to *tags*, such as the default **Tags Display Mode**, **Tags Background Color**, **Tags Foreground Color**, and **Tags Font**.

### **Contextual Menu Actions**

The following default actions are available in the contextual menu when editing Markdown documents:

#### **Cut**, **Copy**, **Paste**

Use these actions to execute the typical editing actions on the currently selected content.

## Source submenu

This submenu includes the following actions:

### To Upper Case

Converts the content selection to upper case characters.

### To Lower Case

Converts the content selection to lower case characters.

### Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

### Convert Hexadecimal Sequence to Character (**Ctrl + Shift + X (Command + Shift + X on OS X)**)

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

## Base64 Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **base64** schemes:

### Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Base32 Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **base32** schemes:

### Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

## Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

## Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

## Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

## Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Hex Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **hex** schemes:

### Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page](#).

### Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box

is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### **Join and Normalize Lines (Ctrl + J (Command + J on OS X))**

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

### **Insert new line after (Ctrl + Alt + Enter (Command + Alt + Enter on OS X))**

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

### **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### **Open submenu**

The following actions are available in this submenu:

#### **Open File at Cursor**

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

#### **Open File at Cursor in System Application**

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

### **Compare**

Opens the current file in [the Compare Files tool](#).

### **Show/Hide Preview**

A toggle action that shows or hides the *Preview* pane.

### **Export as DITA Topic**

Converts the current Markdown document into a DITA topic.

### **Export as HTML**

Converts the current Markdown document into an XHTML document.

### **Print (Available in the Preview pane)**

Opens a page setup dialog box that allows you to configure printing options for the current document.

### **Related Information:**

[Markdown Editor](#) on page 674

[Working with Markdown Documents in DITA](#) on page 681

[Markdown Editor Syntax Rules and Specifications](#) on page 682

## **Syntax Highlighting in the Markdown Editor**

Oxygen XML Author supports syntax highlighting in the Markdown editor to improve the readability of the content and make it easier to internalize the semantics of the content.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#).
2. Go to [Editor > Syntax Highlight](#).
3. Select and expand the **Markdown** section in the top pane.

4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

**Related Information:**

[Syntax Highlight Preferences](#) on page 102

[Markdown Editor](#) on page 674

## Automatic Validation in Markdown Documents

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the *Preview* pane. If a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the **DITA** tab or in the [Results view](#) at the bottom of the editor.

The types of errors that will be reported include the following:

- Improper order of headers.
- The syntax in a documents begins with something other than a 1st level header.
- Tags are not closed properly if XHTML markup is used in the document.
- Invalid tag names if XHTML markup is used in the document.
- Markup is not well formed if XHTML markup is used in the document.

**Related Information:**

[Markdown Editor](#) on page 674

## Working with Markdown Documents in DITA

Oxygen XML Author includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the **DITA** tab in the *Preview* pane provides a visualization of how the topic will look after conversion.

### Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The **Export as DITA Topic** action is available in the contextual menu of the left-side text editor and the right-side *Preview* pane when the **DITA** tab selected.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the **Text** editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

### Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Author has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the [DITA Maps Manager](#). The following features are available for Markdown documents in the **DITA Maps Manager** view:

- **Insert Reference to Markdown Document** - You can use the **New**, **Reference**, and **Reference to the currently edited file** actions from the **Append Child**, **Insert Before**, or **Insert After** submenu when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.
- **Validate Markdown Documents in DITA Maps** - When you use the  **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a *DITA map*, Markdown documents that are referenced in the *DITA map* will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming *DITA maps* that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.
- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the **DITA Maps Manager** and select **Refactoring > Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

**Figure 362: Convert Markdown to DITA Topic Dialog Box**

This dialog box includes the following options:

#### **Destination**

The destination path for the new DITA topic.

#### **File Name**

Presents the current name and allows you to change it.

#### **Update references**

Select this option to update all references of the file in the *DITA map* and in the files referenced from the *DITA map*.

#### **Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

#### **Preview**

Select this button to display a preview of the changes Oxygen XML Author is about to make.

#### **Convert**

Select this button to perform the conversion.

**Tip:** Oxygen XML Author comes with a sample ditamap project for converting Markdown to DITA. Go to the [Project view](#), open the sample .xpr project, and navigate to the dita/markdown-dita folder.

#### **Related Information:**

[Actions Available in the Markdown Editor](#) on page 676

[Markdown Editor Syntax Rules and Specifications](#) on page 682

[Automatic Validation in Markdown Documents](#) on page 681

## **Markdown Editor Syntax Rules and Specifications**

The Markdown editor in Oxygen XML Author uses rules that were integrated from the most common set of [default Markdown syntax rules](#) along with many of the [GitHub Flavored Markdown rules](#).

The Oxygen XML Author implementation of the most commonly used syntax rules are as follows:

## Headers

The Markdown editor supports two styles of headers, *Setext* and *Atx*.

- **Setext Style**

Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

**Example: Setext Style Headers**

```
First-Level Header (H1)
=====
Second-Level Header (H2)
-----
```

- **Atx Style**

Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

**Example: Atx Style Headers**

```
# H1 text #
## H2 text
### H3 text #####
#### H4 text
##### H5 text ###
##### H6 text
```

## Horizontal Rules (for HTML output only)

You can produce a horizontal rule tag (<hr />) by placing three or more hyphens, asterisks, or underscores on a line by themselves (they also need to be preceded and followed by a blank line). Optionally, they can be separated by spaces.

- **Example: Horizontal Rules**

```
* * *
*****
-----
- - - -
```

## Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

**Important:** When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag (<br />. When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

- **Example: Paragraphs**

```
This is a paragraph that contains
two lines of text. (In HTML, a break tag is created in between the two lines)

This is a new paragraph.
```

## Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

- **Italic (Emphasis)** - Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.

```
*italic*  
_italic_
```

- **Bold (Strong)** - Text wrapped with two asterisks or underscores produces a bold (strong) tag.

```
**bold**  
__bold__
```

- **Strikethrough** - In HTML only, text wrapped with two tildes (~~) produces a strikethrough tag.

```
~~strikethrough~~
```

**Tip:** You can also combine these styling rules. For example, `**BoldText _ItalicText_ BoldText**` would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as a styling delimiter, you can escape it with a backslash (for example, `\*literal asterisks\*`).

## Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

- **Inline Links**

To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you referencing a local resource on the same server, you can use relative paths.

**Examples: Inline Link**

With a title:

```
Text with [example link text](http://www.example.com/path "Title") an inline link  
with a title.
```

Without a title:

```
Text with [example link text](http://www.example.com/path) an inline link without  
a title.
```

Relative path:

```
Text with [example link text](/relative_path/) an inline link with relative path.
```

- **Reference Links**

Reference-type links use a second set of square brackets that include a label (link identifier) to identify the link (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

```
Text with [link text1][id 1] a reference-type link and [link text2][id_2] another  
one.
```

Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

```
[id 1]: http://example1.com/ "Optional Title"  
[id_2]: <http://example2.com/> "Optional Title2"
```

Other notes about Reference Links:

- You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

```
[id]: http://example.com/long/path/to/resource/here
    "Optional Title Here"
```

- The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

```
[My Link][ ]
```

and then defined as:

```
[My Link]: http://example.com/
```

## Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

**Note:** These automatic links only work properly in HTML conversions. The *Preview* pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

- **URLs**

By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

```
<http://example.com/>
```

For example, in HTML it is converted to:

```
<a href="http://example.com/">http://example.com/</a>
```

- **Email Addresses**

Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting *spambots*.

```
<address@example.com>
```

In HTML, it is converted to something like:

```
<a href="&#x6D;&#x61;i&#x6C;&#x74;&#x6F;:&#x61;&#x64;&#x64;&#x72;&#x65;
&#115;&#115;&#64;&#101;&#120;&#x61;&#109;&#x70;&#x6C;e&#x2E;&#99;&#111;
&#109;">&#x61;&#x64;&#x64;&#x72;&#x65;&#115;&#115;&#64;&#101;&#120;&#x61;
&#109;&#x70;&#x6C;e&#x2E;&#99;&#111;&#109;</a>
```

## Images

The Markdown editor uses an image syntax that is intended to resemble the syntax for links, allowing for the same two types: *inline* and *reference*. In both cases, the syntax for images begin with an exclamation mark, followed by `alt` attribute text surrounded by square brackets., and then followed by a set of parentheses that contain the URL or path to the image.

- **Inline Images**

For inline images, use a set of regular parentheses immediately after the closing square bracket for the `alt` attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

**Examples: Inline Images**

With a title:

Text with ![Alt text](/path/to/img.jpg "Optional title") an inline image with a title.

Without a title:

Text with ![Alt text](/path/to/img.jpg) an inline link without a title.

- **Reference Images**

For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

Text with ![Alt text1][id] a reference-type image.

Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

```
[id]: url/to/image "Optional Title"
```

## Blockquotes

The Markdown editor uses email-style greater than characters (>) for *blockquotes*. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is more clear) if you put a > before every line.

- **Example: Blockquotes**

```
> This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet,  
> consectetur adipiscing elit. Aliquam hendrerit mi posuere lectus.  
> Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.  
>  
> Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse  
> id sem consectetur libero luctus adipiscing.
```

- *Blockquotes* can be nested by adding additional levels of > characters.

**Example: Nested Blockquotes**

```
> This is the first level of quoting.  
>  
> > This is nested blockquote.  
>  
> Back to the first level.
```

- *Blockquotes* can also contain other Markdown elements (such as headers, lists, and code blocks).

**Example: Blockquotes with Other Markdown Elements**

```
> ## This is a header.  
>  
> 1. This is the first list item.  
> 2. This is the second list item.  
>  
> Here's some example code:  
>  
>     return shell_exec("echo $input | $markdown_script")
```

## Quoting Code (Inline and Code Blocks)

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

- **Inline**

You can quote or emphasize code within a sentence (inline) with single backticks (`). The text within the backticks will not be formatted.

#### **Example: Inline Code Emphasis**

This is a normal sentence with a `code` in the middle.

- **Code Blocks**

You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (```) on separate lines.

#### **Example: Code Block**

This is a normal paragraph:

```
    This is a code block
```

This is a normal paragraph:

```
```\n
```

```
This is a code block\n```\n
```

One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

#### **Example: Code Block with Indentation**

```
    tell application "something"\n        beep\n    end tell
```

For example, in HTML the result would look like this:

```
<pre><code>tell application "Foo"\n    beep\nend tell\n</code></pre>
```

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Author Markdown editor supports the following languages: *Java*, *JavaScript*, *CSS*, and *Python*.

#### **Example: Syntax Highlighting in Code Block**

```
```\ncss\ninput[type="submit"] {\n    color: white;\n    font-weight: bold;\n}\n```\n
```

#### **Inline XHTML (for HTML output only)**

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

- **Example: Inline XHTML**

This is a regular paragraph.

```
<table>\n  <tr>\n    <td>Col 1</td>\n    <td>Col 2</td>\n  </tr>\n</table>
```

This is another regular paragraph.

## Lists

The Markdown editor supports ordered and unordered lists. You can also insert *blockquotes* and *code blocks* inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

- **Unordered Lists**

For unordered lists, you can use asterisks (\*), plus signs (+), and hyphens (-) interchangeably.

```
* List item 1
+ List item 2
- List item 3
```

- **Ordered Lists**

For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list and the actual number of list items will determine the numbers in the output.

```
1. List item 1
8. List item 2
5. List item 3
```

- **Nested Lists**

You can create nested lists by indenting lines by two spaces.

```
1. Ordered list item 1
  1. Nested ordered list item 1
  2. Nested ordered list item 2
    * 2nd level nested unordered list item 1
    * 2nd level nested unordered list item 2
    * 3rd level nested unordered list item 1
  2. Ordered list item 2
```

- **Paragraphs Inside Lists**

If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

```
* List item 1
* List item 2
```

For both DITA and HTML output, this would result in:

```
<ul>
<li><p>List item 1</p></li>
<li><p>List item 2</p></li>
</ul>
```

- **Multiple Paragraphs Inside Lists**

List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

```
1. This is a list item with two paragraphs. Lorem ipsum dolor
   sit amet, consectetur adipiscing elit. Aliquam hendrerit
   mi posuere lectus.

   Vestibulum enim wisi, viverra nec, fringilla in, laoreet
   vitae, risus. Donec sit amet nisl. Aliquam semper ipsum
   sit amet velit.

2. Suspendisse id sem consectetur libero luctus adipiscing.
```

- **Blockquotes Inside Lists**

To put a *blockquote* within a list item, the blockquote delimiters (>) need to be indented so that it is under the first letter of the text after the list item marker.

```
* A list item with a blockquote:  
  > This is a blockquote  
  > inside a list item.
```

- **Code Blocks Inside Lists**

To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

```
* A list item with a code block:  
  
    This is a code block inside a list item  
    ...  
    This is a code block inside a list item using the backticks method  
    ```
```

### Task Lists

You can create task lists by prefacing list items with a hyphen followed by a space followed by square brackets (- [ ]). To mark a task as complete, use - [x].

- **Example: Task Lists**

```
- [ ] Unfinished task 1  
- [x] Finished task 2
```

### Definition Lists

You can create definition lists by using a colon plus a space for each list item.

- **Example: Definition Lists**

```
Term 1  
: Definition A  
: Definition B
```

### Tables

You can create tables in the Markdown editor by using pipes (|) and hyphens (-).

- **Creating a Table**

Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

```
| First Header | Second Header |  
|-----|-----|  
| Column 1 Row 1 Cell | Column 2 Row 1 Cell |  
| Column 1 Row 2 Cell | Column 2 Row 2 Cell |
```

- **Formatting Rules in Table Cells**

You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

```
| First Header | Second Header |  
|---|---|  
| `inline code` | Content with bold text inside cell |
```

- **Aligning Text in Tables**

You can align text to the left, right, or center of a column by including colons (:) to the left, right, or on both sides of the hyphens within the header row.

Left-aligned :---	Center-aligned :---:	Right-aligned ---:
Content Cell	Content Cell	Content Cell

- **Joining Cells (Span a Cell Over Multiple Columns)**

You can join cells horizontally (span a cell over multiple columns) by using multiple consecutive pipe characters (|) to the right of the particular cell. The number of consecutive pipes indicate the number of columns the cell will span (| | for two, | | | for three, and so on).

First Header -----	Second Header -----	Third Header -----	Fourth Header -----
Content Cell	*Cell Span Over 3 Columns*		

## Emoji

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (:EMOJICODE:).

- **Example: Emoji**

```
:smile:  
:laughing:
```

The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see [Emoji Cheat Sheet](#).

## Backslash Escapes

You can ignore Markdown formatting by using backslash escapes (\) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

```
\*literal asterisks\*
```

The Markdown editor provides backslash escapes for the following characters:

```
\ backslash  
` backtick  
* asterisk  
_ underscore  
{ } curly braces  
[ ] square brackets  
( ) parentheses  
# hash mark  
+ plus sign  
- minus sign (hyphen)  
. dot  
! exclamation mark
```

## Automatic Escaping for Special Characters

The Markdown editor includes support for automatically escaping special characters such as angle brackets (< >) and ampersands (&). If you want to use them as literal characters, you must escape them as entities, as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example, <b>), they are treated as literal characters and escaping is not necessary.

Literal Character	Escaping Code
<	&lt;
>	&gt;

Literal Character	Escaping Code
&	&amp;

## Footnotes

The Markdown editor in Oxygen XML Author supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

```
Here is a footnote reference, [^1]
```

```
[^1]: Here is the footnote.
```

- **Example: Normal Footnote with Multiple Blocks**

```
Here is a footnote reference, [^longnote]
```

```
[^longnote]: Here is the footnote with multiple blocks.
```

Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they belong to the previous footnote.

- **Example: Inline Footnote**

```
Here is an inline note.^[Inlines notes are easier to write, since you don't have to pick an identifier and move down to type the note.]
```

## Editing Non-XML Files

---

While Oxygen XML Author specializes in XML-related technologies, you can also use it to create and edit various types of non-XML files. Non-XML files are opened in a simple text editor and many of the helpful features that are commonly used when editing XML files in the Oxygen XML Author **Text** editing mode are available in this simple editor.

### Types of Non-XML Files That are Supported

Some of the types of non-XML files that can be created and edited in Oxygen XML Author include:

- [Markdown](#)
- Java
- C++
- C
- PHP
- Perl
- Properties
- SQL
- Shell executables
- Batch
- Python
- Text

## Features Available in the Simple Text Editor

When editing non-XML files in the simple text editor, the features that are available include the following:

- **Project Support** - The unique *features that are designed to help you work with projects* are available for all types of files.
- **Shortcut Actions** - Many of the *shortcut actions that are available in Text mode* are also available in the simple text editor.
- **Drag and Drop** - The normal drag and drop support is available in the simple text editor.
- **Content Selection Features** - The *content selection shortcuts* that are available in **Text** mode (including the *Rectangular Selection* feature) are also available in the simple text editor.
- **Bookmarks** - You can use *bookmarks to mark positions* in any type of file so that you can return to it later.
- **Convert Hexadecimal Characters** - You can *convert a sequence of hexadecimal characters to the corresponding Unicode character*.
- **Encoding/Decoding Actions** - Contextual menu actions are available to *encode or decode Base64, Base 32, and Hex schemes*.
- **Code Templates** - You can define your own *code templates* for any type of file and use the *Content Completion Assistant* to invoke them.
- **Syntax Highlighting** - Non-XML files also support syntax highlighting with dedicated coloring schemes. To customize them, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Syntax Highlight**. Select and expand the appropriate section in the top pane for the type of file you are editing and you can see the effects of your changes in the **Preview** pane.
- **Find/Replace** - You can use the  *Find/Replace action* to find or replace all the occurrences of a word or string of characters in any type of file that you are editing.
- **File Comparison Tool** - The *Compare Files tool* can also be used to compare non-XML files.

## Loading Large Documents

---

When you open a document with a file size larger than the limit configured in *Open/Save preferences*, Oxygen XML Author prompts you to choose whether you want to optimize the loading of the document for large files or for huge files.

If your file has a size smaller than 300 MB, the recommended approach is *Optimize loading for large files*. For documents that exceed 300 MB the recommended approach is *Optimize loading for huge files*.

### File Sizes Smaller than 300 MB

For editing large documents (file size up to 300 Megabytes), a special memory optimization is implemented on loading such a file so that the total memory allocated for the application is not exceeded.

A temporary buffer file is created on disk so you have to make sure that the available free disk space is at least double the size of the large file that you want to edit. For example, Oxygen XML Author can load a 200-Megabytes file using a minimum memory setting of 512 Megabytes and at least 400-Megabytes free disk space.

The increase of the maximum size of editable files includes the following restrictions:

- A file larger than the value of the above option is edited only in **Text** mode.
- The *automatic validation* is not available when editing a very large file.
- The XPath filter is disabled in *the Find/Replace dialog box*.
- The bidirectional Unicode support (right-to-left writing) is disabled.
- *The Format and indent the document on open option* is deselected for non-XML documents. For XML documents, it is done optimizing the memory usage but without respecting the options set in *the Format preferences page*.
- Less precise localizations for the results of an *XPath expression*.

### File Sizes Greater than 300 MB

Files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between different database formats. Traditional text editors simply cannot handle opening these

huge export files, some having sizes exceeding one gigabyte, because all the file content must be loaded in memory before the user can actually view it.

The file is split in multiple pages (each having about 1MB in size). Each page is individually loaded (and edited) in the **Text** mode by using the special horizontal slider located at the top of the editing area. The loading operation is very fast and has no upper limit for the size of the loaded file.

The increase of the maximum size of editable files includes the following restrictions:

- For XML files, only the UTF-8, UTF-16, and ASCII encodings are handled; for all non-XML files, the content is considered to be UTF-8.
- Files can be edited in **Text** editing mode only.
- The *automatic validation* is disabled.
- The XPath filter is disabled in the *Find/Replace dialog box*.
- The bidirectional Unicode support (right-to-left writing) is disabled.
- *The Format and indent the document on open option* is deselected for non-XML documents. For XML documents, the format and indent operation it is done optimizing the memory usage, but it ignores the options set in *the Format preferences page*.
- The *Outline view* is not supported.
- The file content is soft wrapped by default.
- The *Find/Replace dialog box* only supports the **Find** action.
- Saving changes is possible if **Safe save** is activated.
- The **undo** operation is not available if you go to other pages and come back to the modified page. the Undo operation loses its previous states if the back and forth between

## Editing Documents with Long Lines

---

When working with documents that contain lines of text that exceed the boundaries of your monitor, you might want to see the text wrapped. To do so, use one of the following methods:

- Press **Ctrl + Shift + Y (Command + Shift + Y on OS X)** to toggle the line wrap feature for the current document only.
- Select the *Line wrap* option in the **Text** preferences page to apply the line wrap to all documents.

### Features that Might be Affected by Wrapping Lines of Text

Documents that contain thousands of characters per line can affect the performance of Oxygen XML Author **Text** mode. When a certain line length limit is reached (controlled from the *Optimize loading for documents with lines longer than (Characters)* on page option), Oxygen XML Author prompts you to wrap the lines of text. By doing so, the following features may be affected to maintain a reasonable level of productivity:

- The editor uses the Monospaced font.
- You cannot set font styles.
- *Automatic validation* is disabled.
- *Automatic spell checking* is disabled.
- When editing XML documents, the **XPath** field is disabled in the *Find/Replace dialog box*.
- Less precise localization for executed XPath expressions in XML documents. The XPath executions use SAX sources for a smaller memory footprint. We recommend using XPath 2.0 instead of XPath 1.0 because it features an increased execution speed and uses a smaller memory footprint. Running an XPath expression requires additional memory of about 2 or 3 times the size of the document on disk.

## Handling Read-Only Files

---

If a file marked as read-only is opened in Oxygen XML Author you can by default perform modifications to it. This behavior is controlled by the *Can edit read only files option*. When attempting to save such files you will be prompted to save them to another location.

You can check out the read-only state of the file by looking in the [Properties view](#). If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

The read-only state is marked with a lock decoration that appears in the editor tab and specified in the tooltip for a certain tab.

## Scratch Buffer

---

The **Scratch Buffer** view can be used for storing fragments of arbitrary text during the editing process. It can be used to drop bits of paragraphs (including arbitrary XML markup fragments) while rearranging and editing the document and also to drag and drop fragments of text from the Scratch Buffer to the editor panel. The **Scratch Buffer** is basically a text area offering XML syntax highlight. The view's contextual menu contains basic edit actions such as **Cut**, **Copy**, and **Paste**.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

## XML Digital Signatures

---

This chapter explains how to apply and verify digital signatures on XML documents.

### Digital Signatures Overview

*Digital signatures* are widely used as security tokens, not just in XML. A *digital signature* provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A *digital signature* must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The *signature* must provide a way to establish the identity of the data's signer for authentication.
- The *signature* must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A *public key system* is used to create the digital signature and it's also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

*XML Signatures* can be applied to any digital content (data object), including XML (see W3C Recommendation, [XML-Signature Syntax and Processing](#)). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The *XML Signature* is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of [canonicalization](#) and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

Since the signature is dependent on the content it is signing, a signature produced from a *non-canonicalized* document could possibly be different from one produced from a *canonicalized* document. The *canonical* form of an XML document is physical representation of the document produced by the method described in this specification. The *XML canonicalization* method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. *XML canonicalization* is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the *canonical* form of the original document before application processing with the *canonical* form of the document result of the application processing.

A digital signature over the *canonical* form of an XML document or document subset would allow the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the *canonical* form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the *canonical* form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the *canonical* forms for which they were computed) ensures that the information content of the document has not been altered since it was signed.

The following *canonicalization algorithms* are used in Oxygen XML Author:

- **Canonical XML (or Inclusive XML Canonicalization) (XMLE14N)** - Used for XML where the context doesn't change.

*Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Exclusive XML Canonicalization (EXCC14N)** - Designed for *canonicalization* where the context might change.

*Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The *canonicalization* method can specify whether or not comments should be included in the *canonical* form output by the *XML canonicalization* method. If a *canonical* form contains comments corresponding to the comment nodes in the input node-set, the result is called *canonical XML with comments*. In an uncommented *canonical* form comments are removed, including delimiter for comments outside document element.

The three operations, **Canonicalize**, **Sign**, and **Verify Signature**, are available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

#### **Related Information:**

[Certificates](#) on page 695

[Canonicalizing Files](#) on page 696

[Signing Files](#) on page 697

[Verifying Signature](#) on page 698

[Example of How to Digitally Sign XML Files or Content](#) on page 698

## **Certificates**

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called *keystores*.

All *keystore* entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No *keystore* can store an

entity if its alias already exists in that *keystore* and cannot store trusted certificates generated with keys in its *keystore*.

Oxygen XML Author provides two types of *keystores*: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A *keystore* file is protected by a password. In a PKCS 12 *keystore* you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the *keystore*.

To configure the options for a certificate or to validate it, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Signing Certificates**. This opens [the certificates preferences page](#).

#### Related Information:

[Digital Signatures Overview](#) on page 694

## Canonicalizing Files

You can select the [canonicalization](#) algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

**Figure 363: Canonicalization Settings Dialog Box**

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) [canonicalization](#) method is used.

**Note:** *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments [canonicalization](#) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) [canonicalization](#) method is used.

**Note:** *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are

to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive *Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization* method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

**Related Information:**

[Digital Signatures Overview](#) on page 694

## Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

**Figure 364: Signature Settings Dialog Box**

The following options are available:

**Note:** If Oxygen XML Author could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page](#) where you can configure a valid certificate.

Could not obtain a valid certificate. [You must configure a valid certificate.](#)

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the [Digital Signature Overview](#) section for more information about these options.
  - **None** - If selected, no *canonicalization* algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) *canonicalization* method is used.

**Note:** *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments [canonicalization](#) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) [canonicalization](#) method is used.

**Note:** *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments [canonicalization](#) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](#) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview](#) for more information.
- **Append KeyInfo** - If this option is selected, the `ds:KeyInfo` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Author.

**Related Information:**

[Digital Signatures Overview](#) on page 694

[Verifying Signature](#) on page 698

[Example of How to Digitally Sign XML Files or Content](#) on page 698

## Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

**Related Information:**

[Digital Signatures Overview](#) on page 694

[Signing Files](#) on page 697

[Example of How to Digitally Sign XML Files or Content](#) on page 698

## Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Author includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Author installation directory includes a `samples` folder that contains a file called `personal.xml`. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple `person` elements inside the `personnel` element. Suppose you want to digitally sign the specific `person` element that contains the `id=robert.taylor`. To do this, follow this procedure:

1. Open the `persona1.xml` file in Oxygen XML Author in **Text** editing mode.
2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu. The **Sign** dialog box is displayed.

**Tip:** If you want to sign a file but create a new output file so that the original file remains unchanged, use the **Sign** action from the **Tools** menu. Selecting the action from this menu will allow you to choose an input file and output file in the **Sign** dialog box.

3. If Oxygen XML Author cannot find a valid certificate, click the link at the top of the dialog box to **configure a valid certificate**. This opens the [XML Signing Certificates preferences page](#) that allows you to configure and validate a certificate.
4. Once a valid certificate is recognized, continue to configure the **Sign** dialog box.
  - a) Select one of [the Transformation Options](#). For the purposes of this example, select the **Inclusive with comments** option.
  - b) Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type `/personnel/person` in the **XPath** text box.
  - c) Enter the specific **ID** that needs to be signed. For this example, type `robert.taylor` in the **ID** field.
  - d) Select [the Envelope option](#) and leave the other options as their default values.

The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.

5. You can verify the signature by choosing the **Verify Signature** action from the **Source** submenu of the contextual menu.

[Verifying Signature](#) on page 698

## Compare Files or Directories

---

Oxygen XML Author provides a simple means of performing file and folder comparisons. You can see the differences in your files and folders and merge the changes. You can also use the file comparison to compare fragments or files inside zip-based archives.

There are two types of comparison tools: **Compare Directories** or **Compare Files**. These utilities are available from the **Tools** menu or can be opened as stand-alone applications from the Oxygen XML Author installation folder (`diffDirs.exe` and `diffFiles.exe`).

### Starting the Tools from a Command Line

The comparison tools can also be started by using command-line arguments. In the installation folder there are two executable shells (`diffFiles.bat` and `diffDirs.bat` on Windows, `diffFiles.sh` and `diffDirs.sh` on OS X and Linux). To specify files or directories to compare, you can pass command-line arguments to each of these shells. The arguments can point to file or folder paths in directories or archives (supported formats: `zip`, `docx`, and `xlsx`).

### Directory Comparison Example

To start a [comparison between the two directories](#), use the following construct: `diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2]`. If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

### File Comparison Example

To start a [comparison between 2 or 3 files](#), use the following construct: `diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to base file]`.

If three files are specified, the tool will start in the [3-way comparison mode](#). If only two files are specified, the tool will start in the [2-way comparison mode](#). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

For example, to do a 3-way comparison on Windows, the command line would look like this:

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

## Compare Files

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Author installation folder (`diffFiles.exe`).

Figure 365: Compare Files Tool

### Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

#### Compare Files

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.

**Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the  **Perform File Differencing** button from the toolbar.
3. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* for the operation.
4. You can also use the  **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the **XML Fast** or **XML Accurate** algorithms, you can enter an XPath 2.0 expression in the **Ignore nodes by XPath** text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

**Figure 366: Two-Way Differences**

### Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

### Comparing Fragments (Copy/Paste)

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the  **Close (Ctrl + W (Command + W on OS X))** button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

### Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

### Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar](#) and in the [various menus](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

➤ **Append left change to right and** ⬅ **Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

➤ **Copy change from left to right and** ➤ **Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

⊗ **Remove change**

Rejects the change on the particular side and preserves the particular content on the other side.

### Two-Way Diff Algorithms

Oxygen XML Author offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (.xquery, .xq, .xqy, .xqm extensions), DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

For example:

- When comparing XML files or fragments, a token can be one of the following:
  - The name of an XML tag
  - The < character
  - The /> sequence of characters
  - The name of an attribute inside an XML tag
  - The = sign
  - The " character
  - An attribute value
  - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Three-Way Comparisons

Oxygen XML Author also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and

committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

Figure 367: Three-Way Comparison

### Compare Files

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.

**Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the **Three-Way Comparison** button on the toolbar and select the base file in the **Base** field. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.
3. To highlight the differences, click the **Perform File Differencing** button on the toolbar.
4. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* for the operation.
5. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

7	<given>Robert</given>	<given>Helen</given>	8
8	<family>Taylor</family>	<family>Jackson</family>	9
9	</name>	</name>	10
10	<email>robert.taylor@example	<email>helen.jackson@example	11

Figure 368: Three-Way Differences

### Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the *Files Comparison / Appearance preferences page*, but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.

- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

### Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

### Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the *toolbar* and in the *various menus* (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

#### **Append left change to right and Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

#### **Copy change from left to right and Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

#### **Remove change**

Rejects the change on the particular side and preserves the particular content on the other side.

### Three-Way Diff Algorithms

Oxygen XML Author offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Second Level Comparisons

For both two-way and three-way comparisons, Oxygen XML Author automatically performs a second level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second level comparisons for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second level comparison is processed using a *syntax-aware comparison*, meaning that it looks for identical *tokens*. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Figure 369: Second Level Diff Comparison

**Note:** If a modified text fragment contains XML markup (such as processing instructions, XML comments, CDATA, or elements), the second level comparison will not automatically be performed. In this case you can manually select a second level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

**Figure 370: Word Level Comparison**

To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

**Figure 371: Character Level Comparison**

### Author Visual Mode

The **Compare Files** tool includes an **Author** mode that displays the files in a visual mode similar to the **Author** editing mode in Oxygen XML Editor/Author. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool's **Text** or **Author** mode, it detects the [Initial Edit Mode in the Document Type Association configuration](#) and the mode the files were last opened in Oxygen XML Editor/Author.

**Note:** This mode is not available if the [Enable file comparison in Author mode option](#) is not selected in the **Diff > Files Comparison** preferences page.

This visual mode includes unique features such as a  [Tags Display Mode drop-down button](#) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the **Track Changes** feature (although the **Track Changes** feature is not available in the comparison tool).

Figure 372: File Comparison Tool - Author Mode

### Author Mode Algorithms

The visual **Author** mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Second Level Comparisons

The visual **Author** mode automatically performs a second level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second level comparisons is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

#### Related Information:

[Files Comparison Preferences Page](#) on page 138

[Compare Directories](#) on page 714

### Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (`diffFiles.bat` on Windows, `diffFiles.sh` on OS X and Linux). To specify the files to compare, you can pass command-line arguments using the following construct: `diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to 3-way base file]`.

If three files are specified, the tool will start in the *3-way comparison mode*. If only two files are specified, the tool will start in the *2-way comparison mode*. The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing tools at the top of both panels to be hidden, you should use the `-ext` argument as the first

command. There are some additional arguments that are allowed and to see all the details for the command line construct, type `diffFiles.bat --help` in the command line.

### Example:

To do a 3-way comparison, the command line might look like this:

### Windows

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

### Linux

```
diffFiles.sh home/file1 home/file2 home/basefile
```

### Mac OS X

```
diffFiles.sh documents/file1 documents/file2 documents/basefile
```

## How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your `.gitconfig` file and then you can simply start the tool from the command line.

To integrate the **Compare Files** tool with your Git client, follow this procedure:

1. Use one of the following methods to instruct your Git client to use the Oxygen **Compare Files** tool:

- **Manual Configuration** - Locate your Git user-specific configuration file (`.gitconfig`) and edit it with a text editor (for example, in Windows, the `.gitconfig` file is most likely located in your user home directory). Add (or replace) the following lines:

```
[diff]
  tool = oxygendiff
[merge]
  tool = oxygendiff
[difftool "oxygendiff"]
  cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL
[mergetool "oxygendiff"]
  cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $LOCAL $REMOTE $BASE $MERGED
  trustExitCode = true
[difftool]
  prompt = false
```

**Note:** For Mac OS X, the `cmd` lines would start with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, the `cmd` lines would start with something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

- **Command Line Configuration** - To automatically configure the `.gitconfig` file, you can run the following commands from a command line:

```
git config --global diff.tool oxygendiff
git config --global difftool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe -ext $REMOTE $LOCAL $LOCAL'
git config --global merge.tool oxygendiff
git config --global mergetool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe -ext $LOCAL $REMOTE $BASE $MERGED'
git config --global mergetool.oxygendiff.trustExitCode true
```

**Note:** For Mac OS X, the Oxygen file comparison tool would be specified in the second and fourth commands with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, it would be something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

2. To start the **Compare Files** tool and see a comparison of changes for a particular file, run the following command from a command line:

```
git difftool [PathToFile]
```

**Tip:** If the file you want to compare has conflicts, you can start the **Compare Files** tool as a *merge conflict resolution* tool by running the following command:

```
git mergetool [PathToFile]
```

For more information about the Git *diff*tool syntax, see <https://git-scm.com/docs/git-diff>.

For more information about the Git *mergetool* syntax, see <https://git-scm.com/docs/git-mergetool>.

## How to Integrate the File Comparison Tool with SourceTree

The file comparison tool can be integrated with SourceTree so that you can use it to compare changes. The advantages of doing this include:

- The Oxygen **Compare Files** tool presents the files side-by-side and makes it much easier to determine real changes.
- The Oxygen **Compare Files** tool includes XML comparison algorithms.
- The Oxygen **Compare Files** tool includes various options for configuring the comparison.
- The Oxygen **Compare Files** tool allows you to navigate through changes.

To integrate the **Compare Files** tool with SourceTree, follow this procedure, depending on your operating system:

### Windows

1. In SourceTree, go to **Tools > Options**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
  - **External Diff Tool** - Select **Custom**.
  - **Diff Command** - Enter the path of the Oxygen `diffFile.exe` file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
  - **Arguments** - Enter **-ext \$REMOTE \$LOCAL \$LOCAL**.
  - **Merge Tool** - Select **Custom**.
  - **Diff Command** - Enter the path of the Oxygen `diffFile.exe` file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
  - **Arguments** - Enter **-ext \$LOCAL \$REMOTE \$BASE \$MERGED**.
4. Click **OK**.

**Result:** In SourceTree, you can now compare file changes with the Oxygen **Compare Files** tool by simply selecting **External Diff** from the contextual menu, **Actions** menu, or **Ctrl+D**.

### Mac OS X

1. In SourceTree, go to **SourceTree > Preferences**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
  - **External Diff Tool** - Select **Custom**.
  - **Diff Command** - Enter a command line argument to launch the Oxygen `diffFiles.sh` file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
  - **Arguments** - Enter **-ext \$REMOTE \$LOCAL \$LOCAL**.
  - **Merge Tool** - Select **Custom**.
  - **Diff Command** - Enter a command line argument to launch the Oxygen `diffFiles.sh` file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
  - **Arguments** - Enter **-ext \$LOCAL \$REMOTE \$BASE \$MERGED**.
4. Close the preferences dialog box.

**Result:** In SourceTree, you can now compare file changes with the Oxygen **Compare Files** tool by simply selecting **External Diff** from the contextual menu or **Actions** menu.

### Toolbar and Contextual Menu Actions of the Compare Files Tool

The toolbar of the **Compare Files** tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

**Figure 373: Compare Toolbar**

The following actions are available:

### Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Author, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Diff Options

Opens the [Files Comparison preferences page](#) where you can configure various options.

### Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

### Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

### Synchronized scrolling

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

### Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.

### Format and Indent Both Files (**Ctrl + Shift + P** (**Command + Shift + P** on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences. This option is not available when the file comparison is in **Author** mode.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

## Tags Display Mode

Allows you to select the amount of markup to be displayed in the *Author visual mode*. You can choose between:  **Full Tags with Attributes**,  **Full Tags**,  **Block Tags**,  **Inline Tags**,  **Partial Tags**, or  **No Tags**.

## Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

## Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

## Next Block of Changes (**Ctrl + Period (Command + Period on OS X)**)

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

## Previous Block of Changes (**Ctrl + Comma (Command + Comma on OS X)**)

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

## Next Change (**Ctrl + Shift + Period (Command + Shift + Period on OS X)**)

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

## Previous Change (**Ctrl + Shift + Comma (Command + Shift + M on OS X)**)

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

## Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

## Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

## Ignore Nodes by XPath

You can use this text field to enter an *XPath expression* to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

**Note:** If an XPath expression is specified in the *Ignore nodes by XPath option* in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

## First Change (**Ctrl + B (Command + B on OS X)**)

Jumps to the first change.

## Base

Available for *three-way comparisons*. It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

## Left-Side (Source) File

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

 **Save**

Saves the changes made in the source (left-side) file.

 **Reload**

Reloads the source (left-side) file.

 **Close**

Closes the source (left-side) file.

### Right-Side (Target) File

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

 **Save**

Saves the target (right-side) file.

 **Reload**

Reloads the target (right-side) file.

 **Close**

Closes the target (right-side) file.

### Compare Files Tool Menus

The menus in the **Compare Files** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Author menus. The menu actions include:

#### File Menu

**Source >  Open**

Browses for a file that will be displayed in the left panel.

**Source >  Open URL**

Browses for a remote file that will be displayed in the left panel.

**Source >  Open File from Archive**

Browses an archive for a file that will be displayed in the left panel.

**Source >  Reload**

Reloads the file in the left panel.

**Source >  Save**

Saves the changes made to the file in the left panel.

**Source > Save As**

Allows you to choose a destination to save the file in the left panel.

**Source >  Close**

Closes the file in the left panel.

**Target >  Open**

Browses for a file that will be displayed in the right panel.

**Target >  Open URL**

Browses for a remote file that will be displayed in the right panel.

**Target >  Open File from Archive**

Browses an archive for a file that will be displayed in the right panel.

**Target >  Reload**

Reloads the file in the right panel.

**Target >  Save**

Saves the changes made to the file in the right panel.

**Target > Save As**

Allows you to choose a destination to save the file in the right panel.

**Target >  Close**

Closes the file in the right panel.

**Base >  Open**

Browses for a file that will be compared with both files in a *three-way comparison*.

**Base >  Open URL**

Browses for a remote file that will be compared with both files in a *three-way comparison*.

**Base >  Open File from Archive**

Browses an archive for a file that will be compared with both files in a *three-way comparison*.

**Close (Ctrl + W (Command + W on OS X))**

Closes the application.

**Edit Menu**** Cut**

Cut the selection from the currently focused editor panel to the clipboard.

** Copy**

Copy the selection from the currently focused editor panel to the clipboard.

** Paste**

Paste content from the clipboard into the currently focused editor panel.

**Select all**

Selects all content in the currently focused editor panel.

** Undo**

Undo changes in the currently focused editor panel.

** Redo**

Redo changes in the currently focused editor panel.

**Find Menu**** Find/Replace**

Perform *find/replace* operations in the currently focused editor panel.

**Find Next**

Go to the next match using the same options as the last *find* operation. This action runs in both editor panels.

**Find Previous**

Go to the previous match using the same options as the last *find* operation. This action runs in both editor panels.

## Compare Menu

### **Three-Way Comparison**

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

### **Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.
